Definitions

Resolved means to be determined

Collins English Dictionary no date (http://www.collinsdictionary.com/dictionary/english/resolved)

resolved (rɪˈzɒlvd Pronunciation for resolved) Definitions adjective fixed in purpose or intention; determined

We are resolved to affirm biometric consciousness – resolved doesn't have to be a legal action

Merriam Webster no date (http://www.merriam-webster.com/dictionary/resolve)

resolve verb re·solve \ri-ˈzälv, -ˈzȯlv also -ˈzäv or -ˈzȯv\ : to find an answer or solution to (something) : to settle or solve (something) : to make a definite and serious decision to do something

The USFG is a representational government where the citizens shape the policy being created

Encyclopedia Britannica no date (http://www.britannica.com/topic/representation-government)

Representational government: representation, in government, a method or process of enabling the citizenry, or some of them, to participate in the shaping of legislation and governmental policy through deputies chosen by them. The rationale of representative government is that in large modern countries the people cannot all assemble, as they did in the marketplace of democratic Athens or Rome; and if, therefore, the people are to participate in government, they must select and elect a small number from among themselves to represent and to act for them. In modern polities with large populations, representation in some form is necessary if government is to be based on the consent of the governed. Elected representatives are also less likely to reflect the transitory political passions of the moment than are the people, and thus they provide greater stability and continuity of policy to a government. Through the course of long historical evolution, various methods and devices have been developed in attempts to solve the many problems that have arisen in connection with representation. These problems include the qualifications of electors (see suffrage); the apportionment of constituencies (see constituency); apportionment (electoral); the basis of election (see plurality system; proportional representation); methods of nominating candidates (see primary election); and means of ascertaining the wishes of electors (see referendum and initiative). Because of the need to formulate systematically the demands of citizens, political parties have come to act as intermediaries between the citizens and their representatives. Political debate along party lines has thus become a characteristic feature of most representative systems of government. How answerable a representative should be to his electors is an issue that has long been debated. The basic alternatives are that the representatives of the people act as delegates carrying out instructions or that they are free agents, acting in accordance with their best ability and understanding. The representative principle is not limited to government: it is applied in electing executive officers of large social organizations such as trade unions and professional associations.

Roleplaying Bad

Cycles of oppression—standards like switch side debate and roleplaying promote a disinterested approach to argumentation where we sever ourselves from our in round representations and make it possible to advocate for ideas that are bad or ideas that we don't legitimately have an interest in solving. Interrogations of structures of power from a standpoint of the oppressed are key to challenge US exceptionalism. Professor William V. Spanos sat in on a policy debate round and stated that….(begin reading card)

Spanos 6 [Spanos, William V. Prof of Comparative Literature at SUNY Binghamton. (quoted by Joe Miller in Cross-x, and posted on edebate and cross-x.com, http://www.cross-x.com/vb/showthread.php?t=945110)

Dear Joe Miller, Yes, the statement about the American debate circuit you refer to was made by me, though some years ago. I strongly believed then --and still do, even though a certain uneasiness about "objectivity" has crept into the "philosophy of debate" -- that debate in both the high schools and colleges in this country is assumed to take place nowhere, even though the issues that are debated are profoundly historical, which means that positions are always represented from the perspective of power, and a matter of life and death. I find it grotesque that in the debate world, it doesn't matter which position you take on an issue -- say, the United States' unilateral wars of preemption -- as long as you "score points". The world we live in is a world entirely dominated by an "exceptionalist" America which has perennially claimed that it has been chosen by God or History to fulfill his/its "errand in the wilderness." That claim is powerful because American economic and military power lies behind it. And any alternative position in such a world is virtually powerless. Given this inexorable historical reality, to assume, as the protocols of debate do, that all positions are equal is to efface the imbalances of power that are the fundamental condition of history and to annul the Moral authority inhering in the position of the oppressed. This is why I have said that the appropriation of my interested work on education and empire to this transcendental debate world constitute a travesty of my intentions. My scholarship is not "disinterested." It is militant and intended to ameliorate as much as possible the pain and suffering of those who have been oppressed by the "democratic" institutions that have power precisely by way of showing that their language if "truth," far from being "disinterested" or "objective" as it is always claimed, is informed by the will to power over all manner of "others." This is also why I told my interlocutor that he and those in the debate world who felt like him [We] should call into question the traditional "objective" debate protocols and the instrumentalist language they privilege in favor of a concept of debate and of language in which life and death matter[s]. I am very much aware that the arrogant neocons who now saturate the government of the Bush administration -- judges, pentagon planners, state department officials, etc. learned their "disinterested" argumentative skills in the high school and college debate societies and that, accordingly, they have become masters at disarming the just causes of the oppressed. This kind leadership will reproduce itself (along with the invisible oppression it perpetrates) as long as the training ground and the debate protocols from which it emerges remains in tact. A revolution in the debate world must occur. It must force that unworldly world down into the historical arena where positions make a difference. To invoke the late Edward Said, only such a revolution will be capable of "deterring democracy" (in Noam Chomsky's ironic phrase), of instigating the secular critical consciousness that is, in my mind, the sine qua non for avoiding the immanent global disaster towards which the blind arrogance of Bush Administration and his neocon policy makers is leading.

Under a detached worldview, the world must be represented according to an image of thought. This reduces life to objects on the game board of life, like Nazi doctors.

Makau 96 (Josina M., Western Michigan University, Hampton Press, Inc. Responsible Communication, Argumentation Instruction in the Face of Global Perils) 1996

Weisel's critique of German education prior to world war II points to another danger of traditional argumentation instruction **. Like the Nazi doctors, students in traditional argumentation courses are taught "how to reduce life and the mystery of life to abstraction."** Weisel urges educators to teach students what the Nazi doctors never learned – that people are not abstractions. Weisel urges educators to **learn from the Nazi experience the importance of humanizing their charges, of teaching students to view life as special, 'with its own secrets, its own treasures, its own sources of anguish and with some measure of triumph.' Trained as technocrats with powerful sensory skills but little *understanding,* students** participating in traditional argumentation courses would have difficulty either grasping or appreciating the importance of Weisel's critique. Similarly, they would **have difficulty grasping or appreciating** Christian's framework for **an ethic** of technology an approach **that requires** above all, **openness, trust and care**. The notion of conviviality would be particularly alien to these trained technocrats.

Traditionally trained debaters are also likely to fail to grasp the complexity of issues. **Trained to view problems in black and white terms and conditioned to turn to "expertise" for solutions, students, and traditional courses become subject to ethical blindness.** As Benhabib noted, 'Moral blindness implies not necessarily an evil or unprincipled person, but one who can not see the moral texture of the situation confronting him or her.' These traditional **debaters**, deprived of true dialogic encounter, **fail to develop** 'the capacity to represent' to themselves **the 'multiplicity of viewpoints, the variety of perspectives, the layers of meaning, etc. which constitute a situation'. They are thus inclined to lack 'the kind of sensitivity to particulars, which most agree is essential for good and perspicacious judgment.' Encouraging student to embrace the will to control and to gain mastery, to accept uncritically a sovereign view of power, and to maintain distance from their own and others 'situated ness**; the traditional argumentation course provides an unlikely site for nurturing guardians of our world's precious resources. It would appear, in fact, that **the argumentation course foster precisely the 'aggressive and manipulative intellect bred by modern science and discharged into the administration of things' associated with most of the world's human made perils**. And is therefore understandable that feminist and others critics would write so harshly of traditional argumentation of debate.

Their form of detached roleplaying displaces individual identity to that of authority. When we imagine that we're the government, we turn people into statistics, and it becomes a legitimate practice to engage in apocalyptic or dehumanizing rhetoric—Stanford Prison Experiment proves this

Reed 5 [Reed et al, Director of Command and Leadership Studies, U.S. Army War College, 2005 [Professor George E., Guy B. Adams, Professor, Public Affairs, University of Missouri-Columbia, Danny L. Balfour, Professor, Public and Nonprofit Administration, Grand Valley State University, "Putting Cruelty First: Abu Ghraib, Administrative Evil and Moral Inversion," Paper prepared for presentation to "Ethics and Integrity of Governance: A Transatlantic Dialogue," Leuven, Belgium, June 2-5, 2005 http://soc.kuleuven.be/io/ethics/paper/Paper%20WS5_pdf/Guy%20Adams.pdf, 24-28]

Total guard aggression increased daily, even after prisoners had ceased any resistance and deterioration was visible. Prisoner rights were redefined as privileges, to be earned by obedient behavior. The experiment was planned for two weeks, but was terminated after six days. Five prisoners were released because of extreme emotional depression, crying, rage and/or acute anxiety. Guards forced the prisoners to chant filthy songs, to defecate in buckets that were not emptied, and to clean toilets with their bare hands. They acted as if the prisoners were less than human and so did the prisoners (Haney, Banks and Zimbardo, 1973, p.94): At the end of only six days we had to close down our mock prison because what we saw was frightening. It was no longer apparent to us or most of the subjects where they ended and their roles began. The majority had indeed become "prisoners" or "guards," no longer able to clearly differentiate between role-playing and self. There were dramatic changes in virtually every aspect of their behavior, thinking and feeling. In less that a week, the experience of imprisonment undid (temporarily) a lifetime of learning; human values were suspended, self-concepts were challenged, and the ugliest, most base, pathological side of human nature surfaced. We were horrified because we saw some boys ("guards") treat other boys as if they were despicable animals, taking pleasure in cruelty, while other boys ("prisoners") became servile, dehumanized robots who thought only of escape, of their own individual survival, and of their mounting hatred of the guards. This experiment suggests that group and organizational roles and social structures play a far more powerful part in everyday human behavior than most of us would consider. And we can see clearly how individual morality and ethics can be swallowed and effectively erased by social roles and structures. One is rarely confronted with a clear, up-or-down decision on an ethical issue; rather, a series of small, usually ambiguous choices are made, and the weight of commitments and of habit drives out morality. One does not have to be morally degenerate to become caught in a web of wrongdoing that may even cross the line into evil. The skids are further greased if the situation is defined or presented as technical, or calling for expert judgment, or is legitimated, either tacitly or explicitly, by organizational authority, as we shall see below. It becomes an even easier choice if the immoral behavior has itself been masked, redefined through a moral inversion as the "good" or "right" thing to do. Administrative Evil and Dehumanization The Stanford prison experiment provides a fairly powerful explanation for at least some of what happened at Abu Ghraib. But it also does not fully fit the specifics of the situation. Unlike the Stanford experiments, the guards did not act in an isolated and controlled environment, but were part of a larger organizational structure and political environment. They interacted regularly with all sorts of personnel, both directly and indirectly involved with the prisoners. They were in a remarkably chaotic environment, were by and large poorly prepared and trained for their roles, and were faced with both enormous danger and ambiguity. However, like the Stanford Prison Experiment, tacit permission was available to those who chose to accept it. In his ground-breaking book, The Destruction of the European Jews, Raul Hilberg observed that a consensus for and the practice of mass murder coalesced among German bureaucrats in a manner that (Hilberg, 1985, p.55), "…was not so much a product of laws and commands as it was a matter of spirit, of shared comprehension, of consonance and synchronization." In another study of mid-level bureaucrats and the Holocaust, Christopher Browning describes this process in some detail as he also found that direct orders were not needed for key functionaries to understand the direction that policy was to take (Browning, 1992, pp. 141-142): Instead, new signals and directions were given at the center, and with a ripple effect, these new signals set in motions waves that radiated outward… with the situations they found themselves in and the contacts they made, these three bureaucrats could not help but feel the ripples and be affected by the changing atmosphere and course of events. These were not stupid or inept people; they could read the signals, perceive what was expected of them, and adjust their behavior accordingly… It was their receptivity to such signals, and the speed with which they aligned themselves to the new policy, that allowed the Final Solution to emerge with so little internal friction and so little formal coordination If something as horrific and systematic as the Holocaust could be perpetrated

based more on a common understanding than upon direct orders, it should not be difficult to imagine how abuse of detainees in Iraq and elsewhere occurred, with otherwise unacceptable behaviors substituting for ambiguous, standard operating procedures. While the Nazi Holocaust was far, far worse than anything that has happened during the American occupation of Iraq, it has been amply demonstrated that Americans are not immune to the types of social and organizational conditions that make it possible and seemingly permissible to violate the boundaries of morality and human decency, in at least some cases, without believing that they were doing anything wrong. It would be naïve to assume that the "few bad apples" acted alone, and that others in the system did not share and support the abuses as they went about their routines and did their jobs. Before and surrounding overt acts of evil, there are many more and much less obviously evil administrative activities that lead to and support the worst forms of human behavior. Moreover, without these instances of masked evil, the more overt and unmasked acts are less likely to occur (Staub, 1992, pp. 20-21). The apparent willingness and comfort level with taking photos and to be photographed while abusing prisoners seems to reflect the "normalcy" of the acts within the context of at least the night shift on Tiers 1A and 1B at Abu Ghraib (and is hauntingly similar to photos of atrocities sent home by SS personnel in World War II). In the camps and prisons run by the U.S. military in Iraq and Afghanistan, orders and professional standards forbidding the abuse of prisoners and defining the boundaries of acceptable behavior for prison guards could be found in at least some locations posted on some walls, but were widely ignored by the perpetrators. Instead, we find a high stress situation, in which the expectation was to It would be naïve to assume that the "few bad apples" acted alone, and that others in the system did not share and support the abuses as they went about their routines and did their jobs. Before and surrounding overt acts of evil, there are many more and much less obviously evil administrative activities that lead to and support the worst forms of human behavior. Moreover, without these instances of masked evil, the more overt and unmasked acts are less likely to occur (Staub, 1992, pp. 20-21). The apparent willingness and comfort level with taking photos and to be photographed while abusing prisoners seems to reflect the "normalcy" of the acts within the context of at least the night shift on Tiers 1A and 1B at Abu Ghraib (and is hauntingly similar to photos of atrocities sent home by SS personnel in World War II). In the camps and prisons run by the U.S. military in Iraq and Afghanistan, orders and professional standards forbidding the abuse of prisoners and defining the boundaries of acceptable behavior for prison guards could be found in at least some locations posted on some walls, but were widely ignored by the perpetrators. Instead, we find a high stress situation, in which the expectation was to extract usable intelligence from detainees in order to help their comrades suppress a growing insurgency, find weapons of mass destruction, and prevent acts of terrorism. In this context, the power of group dynamics, social structures, and organizational ambiguities is readily seen. The normal inhibitions that might have prevented those who perpetrated the abuses from doing these evil deeds may have been further weakened by the shared belief that the prisoners were somehow less than human, and that getting information out of them was more important than protecting their rights and dignity as human beings. For example, in an interview with the BBC on June 15, 2004, Brig. General Janis Karpinski stated that she was told by General Geoffrey Miller – later placed in charge of Iraqi prisons and former commander at Guantanamo Bay – that the Iraqi prisoners, "...are like dogs and if you allow them to believe at any point that they are more than a dog then you've lost control of them." Just as anti-Semitism was central to the attitudes of those who implemented the policy of mass murder in the Holocaust, the abuses at Abu Ghraib may have been facilitated by an atmosphere that dehumanized the detainees. In effect, these detainees, with their ambiguous legal status, could be seen as a "surplus population," living outside the protections of civilized society (Rubenstein, 1983). And when organizational dynamics combine with a tendency to dehumanize and/or demonize a vulnerable group, the stage is set for the mask of administrative evil.

No reason to prefer role playing over pure discussion- functionally the same for education

Powner & Allendoerfer 08 Leanne C. Powner, PhD in political science from the University of Michigan, where she specialized in international relations, comparative politics, and research methods. Taught at the College of Wooster, OH, where she was the Juliana Wilson Thompson Visiting Assistant Professor of Political Science, and American University's School of International Service and the Johns Hopkins University School of Advanced International Studies, Michelle G. Allendoerfer, Assistant Professor of Political Science at George Washington University as well as Program Coordinator for the U.S. and International Politics Cohort and Women's Leadership Program. "Evaluating Hypotheses about Active Learning," *International Studies Perspectives,* 2008. http://onlinelibrary.wiley.com/store/10.1111/j.1528-3585.2007.00317.x/asset/j.1528-3585.2007.00317.x.pdf?v=1&t=ictftx08&s=6aa04c1c4f1c51743a4000533c64d1c333801c33

We have several sets of findings. One is that, as expected, either treatment improves performance over lecture alone, holding everything else constant; role play improves total quiz scores by about 2.4 points and discussion by 1.9 (both p < 0.05).23 The effects of each treatment, however, are different. Role play boosts performance in the multiple-choice section of the assessment, and discussion in the short-answer portion. This counters theoretical predictions, which expect that performance on analytical tasks like open-ended response items would improve from the more engaging treatment (simulation). Comparing the two active learning techniques head to head, though, reveals that role-play does not produce significantly larger gains than discussion. The coefficient on the simulation variable is statistically insignificant, though we do note that the sign is contrary to our theoretical expectations. This finding holds even when controlling for major alternative explanations like class year, days since the lecture, intensity of participation in the simulation, and the instructor's teaching experience. We can conclude, then, that both techniques are similarly effective; neither is superior to the other for the types of tasks assessed here. That discussion sections add value to a course is probably not surprising; that is, after all, their primary purpose — not just providing employment for graduate students. Many instructors and scholars are more interested, though, in other types of active-learning methods, such as the role-play activities and simulations. One common concern with integrating role-playing activities into classrooms is that these methods are less efficient, preventing instructors from covering as much material in a given time. Our results suggest that this concern may be unwarranted. Although the groups that participated in the role-play activity did not perform statistically better than the groups that were engaged in a traditional discussion section, the role-play groups also did not perform significantly worse in two out of three evaluations (total quiz score and multiple choice score). The lack of significance may be due to the small size and particular nature of the control group as much as it is to the effect of the activity itself. Activities such as the bureaucratic politics role-playing game may serve to engage students whose learning styles benefit from more active approaches to learning. Unfortunately, we were not able to evaluate the hypothesis that students with different learning styles benefit differently from the two treatments in this experiment. Another hypothesis we were unable to evaluate here is whether active learning approaches, such as simulations, produce a more substantial benefit in the long-term than in short-term. As Meizlish and Bernstein (2003) find, the benefits of active learning methods may be more pronounced in long-term knowledge retention than is demonstrated in a short-term recall instrument as we used. These unanswered questions provide interesting directions for future research.

Radical Thought Good

Radical thought and movement necessary for any form of social reform, empirics prove.
Kutner 15

(Robert Kutner, Co-Founder/Editor of "The American Prospect", professor at Brandeis University, The Dance of Liberals and Radicals, http://prospect.org/article/dance-liberals-and-radicals, March 17 2015)

History shows that liberals need radicals. We need radicals because drastic change against entrenched evil and concentrated power requires personal bravery to the point of obsession. It requires a radical sensibility to look beyond today's limits and imagine what seems sheer impossibility within the current social order. And sometimes it's necessary to break the law to redeem the Constitution. No great social change in America has occurred without radicals, beginning with the struggle to end slavery. Causes that now seem mainstream began with radical, impolite and sometimes civil disobedient protest. Martin Luther King, Jr. was the best sort of radical. His tactics broke what was then the law—flawed, biased, oppressive law. But he was above all affirmative and idealistic. He kept in his mind the kind of society America needed to be, and could be. He appealed to the best in America, bore personal witness and shamed his racist oppressors. MLK braved violence and eventually his own assassination, yet his radicalism was always constructive. Birth control began as a radical movement for which some women went to jail and, astonishingly, contraception is still considered radical in some circles today. The demonstrations against the Vietnam War were at first the work of radical protesters. Only later did they become more mannered and mainstream. Some women today may take for granted rights that never would have been achieved without the radicalism of early feminism and then second-wave feminism. Same with LGBT rights, same with disability rights. Sometimes, outrageous tactics are needed to barge into the chamber of civil debate. Even supposedly mainstream principles such as pure food and drugs, or safe working conditions, began with radical protest. The fact that these principles are being relentlessly undermined by corporate elites suggests the need for continued vigilance and radical protest once again. The labor movement has a long history of necessarily confrontational organizing. And radicals, famously, make the best organizers. Unions were largely illegal until the 1930s, so you could not organize one without breaking the law. (Today, it is corporations that break the law to resist unions).

Radical thought in debate space solves for actual social reform
Universal No Date

(Universal Online Classes, https://www.universalclass.com/articles/psychology/understanding-social-movements.htm Understanding Social Movements)

A. Social Movements: Distinguishing Characteristics

Essentially, social movements are a form of concentrated, preplanned group action. Collectively focused on a specific political or social issue, social movements, also known as social reformation movements, strive to implement, oppose, or reverse social change. Furthermore, social movements are characterized as having a purposeful direction and a good deal of internal order. A social movement is a more or less persistent, organized effort on the part of a relatively large number of people to bring about or resist social change. Take, for instance, the women's movement, referred to in a variety of ways, such as women's liberation, suffrage movement, or women's right advocates. The core group of constituents was made up of women intent upon achieving equal liberties with regard to work, pay, respect, and opportunity. Hence, they were, in fact, working toward reversing some of the previously held stereotypes and beliefs about women while putting forth a new view of how women should and ought to be treated. B. Social Movements: Components. To mount and drive an effective social movement

campaign, combinations of different components are required, including creation of special purpose groups and coalitions to explore possibilities, derive a sense as to the opinion held by the general public, and develop strategies. These groups must determine the steps needed to alter the commonly held perspective, such as public or town hall type meetings, processions, rallies, speeches and demonstrations, petition drives to invoke change, lobbying efforts, educational programs and literature, and an unwavering commitment.

By adopting a form of radical thought, the aff solves for for real change. Fitzgerald 14

(Andy Fitzgerald ,Blogger at the New Public Sphere, http://www.theguardian.com/commentisfree/2014/jan/20/we-need-radicals-for-social-change, January 2014)

America has a propensity for dismissing people and ideas with labels. Terms like "socialist" and "communist" are frequently hurled at those who dare to promote substantial programs that address poverty, or suggest that government provide what many other "developed nations" deem fundamental services – like universal healthcare. Anyone who openly identifies with such positions is assumed to have nothing legitimate to contribute to public debate, irrespective of the plausibility, merit, and true ideology informing their arguments. It's a similar scenario with "radical" – a word often used to evoke associations with extremism, instability and an absolutist approach to politics. But the popular usage belies the important role many radicals have played in promoting democracy and justice throughout history, not to mention the continued role radical ideas and activism have to play in unfinished projects.

A recent op-ed in the Chicago Tribune illustrates the common abuse of the term in the media. The columnist, Dennis Byrne, rightly criticizes a tendency in America to privilege individual liberty over community solidarity, but he then attempts a "balanced" perspective by presenting examples of "radicalism" on both sides of the aisle. On abortion, Byrne writes: "Radical individuals on the right and the left demand the supremacy of a woman's body. … For [those who are pro-choice], a woman's rights are nearly absolute." Squaring the false equivalence circle he adds: "Similar absolutist views are held on the right by those who interpret the Constitution's Second Amendment to mean that government regulation of firearms should be extraordinarily limited, if not nonexistent." But the mischaracterization of radicals extends beyond mainstream media and politics. While discussing feminist activism with several friends, one retorted, "there are radicals in every group". I challenged the presumption that radicals were inherently a liability to social movements, given the positive history of radicalism in America. Indeed, it was "radicals" who were responsible for sowing the seeds of two of America's most important social movements: worker rights and racial justice. The labor movement, in its nascent days, was a radical movement. A confrontational approach to management was necessary to win many of the concessions now sorely taken for granted: the minimum wage, the eight-hour day, even the very possibility of forming a union. Prior to the American civil war, "radical abolitionists" occupied the fringe with the seemingly absurd and absolutist demand that people should not be property. Perhaps its most infamous member, John Brown, attempted to lead an armed slave uprising in the south. His failed raid on an armory in Harpers Ferry, Virginia and subsequent execution for treason are portrayed historically as the act of a madman – an idealistic extremist with delusions of grandeur, despite the fact that it inspired greater opposition to slavery – a portrait sociologist James Loewen properly skewers in his book, Lies My Teacher Told Me: Everything Your American History Textbook Got Wrong.

We must radically change the educational sphere, our performance is an act of liberation, visibility, and empowerment, creating a public space for dissent and challenges

Mohanty 03 [Chandra Talpade, Ph.D. and Master's degree from the University of Illinois at Urbana-Champaign, as well as a Master's degree and a bachelor's degree from the University of Delhi in India. Originally a professor of women's studies at Hamilton College in Clinton, New York, she is currently the women's studies department chair at Syracuse University, Feminism Without Borders: Decolonizing Theory, Practicing Solidarity, Duke University Press p. 205-207]

In the intellectual, political and historical context I have sketched thus far, decolonization as a method of teaching and learning is crucial in envisioning democratic education. My own political project involves trying to connect educational discourse to questions of social justice and the creation of citizens who are able to conceive of a democracy which is not the same as "the free market." **Pedagogy in this context needs to be revolutionary to combat business as usual in educational institutions**. After all, the politics of commodification allows the cooptation of most dissenting voices in this age of multiculturalism. Cultures of dissent are hard to create. **Revolutionary pedagogy needs to lead to a consciousness of injustice, self-reflection on the routines and habits of education in the creation of an "educated citizen," and action to transform one's social space in a collective setting.** In other words, the practice of decolonization as defined above. I turn now to a narrative in the tradition of Toni Cade Bambara, a story that "keeps me alive - a story which saves our lives." The story is about a performance by a student at Hamilton College. Yance Ford, an African American studio art major and feminist activist, based her performance, called "This Invisible World," on her three-plus years as a student at the college." She built an iron cage that enclosed her snugly, suspended it ten feet off the ground in the lobby of the social sciences building, She shaved her head and - barefoot and without a watch, wearing a sheet that she had cut up-spent five hours in the cage in total silence. The performance required unimaginable physical and psychic endurance, and it dramatically transformed a physical space that is usually a corridor between offices and classrooms. It had an enormous impact on everyone walking through - no mundane response was possible. Nor was business as usual possible. It disrupted educational routines - many fac*ulty* (including me) sent their classes to the performance and later attempted discussions that proved profoundly unsettling. For the first time in *my* experience at Hamilton, students, faculty, and staff were faced with a performance that could not be "consumed~ or assimilated as part of the "normal" educational process. We were faced with the knowledge that it was impossible to "know" what led to such a performance, and that the knowledge we had, of black women's history of objectification, of slavery, invisibility, and soon, was a radically inadequate measure of the intent or courage and risk it took for Vance to perform "This Invisible World." ~ In talking at length with Vance, other students, and colleagues, and thinking through the effects of this performance on the campus, I have realized that this is potentially a very effective story. Here is how Vance, writing in October 1993, described her project: What is it? I guess or rather I know that it is about survival. About trauma, about loss, about suffering and pain, and about being lost within all of those things. About trying to find the way back to yourself The way back to your sanity, a way to get away from those things which have driven you beyond a point of recognition. Past the point where you no longer recognize or even want to recognize yourself or your past or the possibility that your present may also be your future. That is what my project is about. I call it refuge but I really think I mean rescue or even better, survival, escape, saved. My work to me is about all the things that push you to the edge. Its about not belonging, not liking yourself, not loving yourself, not feeling loved or safe or accepted or tolerated or respected or valued or useful or important or comfortable or safe or part of a larger community. It's about how all these things cause us TO hate ourselves into corners and boxes and addictions and traps and hurtful relationships and cages. It's about how people can see you and look right through you. Most of the time nor knowing you are there. It is about fighting the battle of your life, for your life. And this place that I call refuge is the only place where I am sacred. It is the source of *my* strength, *my* fortitude, my resilience, *my* ability to be for myself what no one else will ever be for me. This is most directly Vance's response and meditation on her three years at a liberal arts college-on her education. In extensive conversations with her, two aspects of this project became clearer to me: her consciousness of being colonized at the college, expressed through the act of being caged like "animals in a science experiment, ~ and **the performance as an act of liberation, of active decolonization of the self, of visibility and empowerment. Vance found a way to tell another story, to speak through a silence that screamed for engagement**. However, in doing so, **she also created a public space for the collective narratives of marginalized peoples**, especially other women of color. **Educational practices became the object of public critique as the hegemonic narrative of a liberal arts education, and its markers of success came under collective scrutiny. This was then a profoundly unsettling and radically decolonizing educational act. This story illustrates the difference between thinking about social justice and radical transformation in our frames of analysis and understanding in relation to race, gender, class, and sexuality versus a multiculturalist consumption and assimilation into a supposedly "democratic" frame of education as usual. It suggests the need to organize to create collective spaces for dissent and challenges** to consolidation of white heterosexual masculinity in academy.

Opening up public space for epistemological standpoints is fundamental to the exposure of power relations – we must make the politics of everyday experience important

Mohanty 03 (Chandra Talpade, Ph.D. and Master's degree from the University of Illinois at Urbana-Champaign, as well as a Master's degree and a bachelor's degree from the University of Delhi in India. Originally a professor of women's studies at Hamilton College in Clinton, New York, she is currently the women's studies department chair at Syracuse University, Feminism Without Borders: Decolonizing Theory, Practicing Solidarity, Duke University Press p. 215-216]

If my argument in this essay is convincing, it suggests why we need to take on questions of race and gender as they are being managed and commodified in the liberal U.S. academy. **One mode of doing this is actively creating public cultures of dissent where these issues can be debated in terms of our pedagogics and institutional practices.**[20] **Creating such cultures in the liberal academy is a challenge in itself, because liberalism allows and even welcomes** "plural"~ or even "alternative" perspectives. **However, a public culture of dissent entails creating spaces for epistemological standpoints that are grounded in the interests of people and that recognize the materiality of conflict, of privilege, and of domination. Thus creating such cultures is fundamentally about making the axes of power transparent in the context of academic, disciplinary, and institutional structures as well as in the interpersonal relationships** (rather than individual relations) **in the academy. It is about taking the politics of everyday life seriously as teachers, students, administrators, and members of hegemonic academic cultures.** Culture itself is thus redefined to incorporate individual and collective memories, dreams, and history that are contested and transformed through the political

Oppression is not a binary force – only by examining our relationship to others can we participate in liberatory political projects

Henze 00 [Brent, Professor of English, "Who Says Who Says?" Reclaiming Identity: Reclaiming Identity: Realist Theory and the Predicament of Postmodernism, Ed. Paula Moya & Michael Hames-Garcia]

One outcome of these approaches to participating in the politics of the oppressed is that **our way of thinking about oppression must be modified. Rather than treat oppression as a binary force either oppressive or unoppressive to ourselves** (and, if unoppressive, also unrelated to ourselves), **we must see it as complex and relational, linking us to others and at the same time making us responsible for how we participate in the matrices of power that sustain oppression. The result of seeing oppression in this way is to enable more effective participation in these systems; by broadening our ways of knowing about the systems within which we operate, we** at least potentially **increase our ability to shape these systems in the long term. It enables us to participate in liberatory political projects more effectively, working in concert with rather than against or in place of those whose experiences of oppression both necessitate and ground this work.**

Micropolitics Good

Micropolitics are a necessary form of resistance and political action
Willner, University of Hamburg, 11

Roland, "Micro-politics: An Underestimated Field of Qualitative Research in Political Science", German Policy Studies, pp. 155-185, https://www.wiso.uni-hamburg.de/fileadmin/sowi/politik/methoden/Roland/GPS_3-2011_Willner.pdf

2 Micro-analysis and micro-politics¶ Political science and especially policy studies focus on political¶ processes, among other things, in order to understand specific¶ policies or institutional pathways of decision-making (Blum and¶ Schubert 2011). The majority of empirical studies concentrate on ¶ macro- as well as meso-phenomena. A micro-analytical perspective¶ does not challenge this focus but tries to answer macro- and¶ meso-questions using discoveries on the micro-level. The prefix¶ "micro" implies a focus on the smallest unit of action between¶ specific actors. Hence, the objects of research are primarily actors¶ and their behavior, but not from a psychological perspective¶ which tries to explain behavior with individual skills or personality¶ traits. **Micro-analyses instead examine daily routines, selfevident¶ behavior patterns, and informal processes** (Schöne 2010:¶ 15). As Patzelt emphasizes, micro-analysis explores the construction,¶ reproduction, modification, and transformation of political¶ policies, processes and structures in concrete situations (Patzelt¶ 2000). Micro-analyses facilitate understanding the inner workings¶ of politics and the decision-making process which leads to¶ specific policies (Nullmeier et al. 2003).¶ In relation to this perspective arises the idea of micro-politics¶ as a specific research concept2¶ For the discussion of micro-political studies in political¶ science, it is necessary to direct the focus onto political organizations.¶ Political, in this case, means the alignment to generally¶ binding decisions. In fact, the vast majority of political decisions¶ are made in political organizations such as parties, parliaments,¶ or ministerial bureaucracies. As a consequence, it is impossible¶ . The research interest is on organizations¶ which are confronted with different actors and their interests,¶ strategies, and power struggles. The underlying definition¶ of organization is based upon March and Simon (1958, 1976).¶ They see organizations as systems of coordinated acts between¶ individuals and groups which have different preferences, information,¶ interests, and knowledge. Organizations from this perspective¶ transform conflict into cooperation. This perspective¶ stresses the role of actors and analyzes structure through the interactions¶ within an organization (Miebach 2007: 11f). Micropolitical¶ concepts share the basic premise of this actor- and¶ process-centered perspective. Organizing is an interactive social¶ process in which actors shape organizations. Hence, organizations¶ are "socially constructed artifacts" (Letiche 2007: 188). to understand politics without examining the organizational context¶ in which decisions are made (Bogumil and Schmid 2001:¶ 21f; Miebach 2007: 11). With this in mind, it is remarkable that¶ political science has neglected the concrete focus on organizations¶ for so long. As early as 1950 Merriam had written that it is¶ confusing to draw a "sharp and exclusive line between political¶ and other forms of organizations" (Merriam 1950: 9). With micro-politics¶ as a heuristic framework it is possible to highlight the¶ similarities in the way of thinking about micro-processes and the¶ fruitful transfer of analytical instruments. Because micro-politics did not evolve out of a systematic research¶ tradition, the development of a common understanding¶ has so far been difficult (Nullmeier et al. 2003: 14). The origins¶ of micro-politics can be found in economic organization theory.¶ The term micro-politics was first mentioned by Burns in his 1961¶ article on "Mechanism of Institutional Change," which emphasizes¶ the role of actors and their interactions. For Burns **the main¶ feature of micro-politics is the use of individual power resources¶ to create and change formal structure**. Other early papers, such as¶ those by Mechanic (1962) and Strauss (1963), also deal with individual¶ political behaviour. In German-language research Bosetzky¶ (1972; 1992) observed in his own working environment¶ that formal hierarchy cannot completely determine actions. He¶ follows Burns in using the term **micro-politics for individual actions¶ which undermine formal rules**. In contrast to other authors,¶ especially in economics, Bosetzky stresses that micro-politics¶ can be seen as an elementary process which assures adjustment¶ to the environment, the achievement of aims, and the integration¶ of actors (Bosetzky 1992: 37).

informal processes (Schöne 2010:¶ 15). Bottom up v. Top down

El Kilombo Intergalactico 2007 [Collective in durham NC that interviewed Subcomandante Insurgente Marcos, *Beyond Resistance: Everything* p. 9-10]

But how might this alternative take shape? In order to begin to address this question, <u>the Zapatistas implore us to relieve ourselves of the positions of "observers" who insist on their own neutrality and distance</u>; this position may be adequate for the *microscope*-wielding academic of the "precision-guided" T.V. audience of the latest bombings over Baghdad, but <u>they</u> are completely insufficient for those who are seeking change. The Zapatistas <u>insist we throw away our microscopes and our televisions, and instead</u> they demand that we <u>equip our "ships" with an "inverted periscope</u>."According to what the Zapatistas have stated, one can never ascertain a belief in or vision of the future by looking at a situation from <u>the position of "neutrality" provided for you by the existing relations of power</u>. These methods <u>will only allow you to see what already is, what the balance of the relations of forces are in your field of inquiry</u>. In other words, such methods allow you to see that field only <u>from the perspective of those who rule</u> at any given moment. In contrast, <u>if one learns to harness the power of the periscope not by honing in on what is happening "above" in the halls of the self-important, but by placing it</u> deep below the earth, <u>below</u> even <u>the very bottom of society, one finds that there are struggles and memories of struggles that allow us to identify not "what is" but</u>

more importantly "what will be." By harnessing the transformative capacity of social movement, as well as the memories of past struggles that drive it, the Zapatistas are able to identify the future and act on it today. It is a paradoxical temporal insight that was perhaps best summarized by "El Clandestino" himself, Manu Chao, when he proclaimed that, "the future happened a long time ago!"

Given this insight afforded by adopting the methodology of the inverted periscope, we are able to shatter the mirror of power, to show that power does not belong to those who rule. Instead, we see that there are two completely different and opposed forms of power in any society: that which emerges from above and is exercised *over* people (Power with a capital "P"), and that which is born below and is able to act with and *through* people (power with a lower case "p"). One is set on maintaining that which *is* (Power), while the other is premised on transformation (power). These are not only not the same thing; they are (literally) worlds apart. According to the Zapatistas, once we have broken the mirror of Power by identifying an alternative source of social organization, we can then see it for what it is—a purely negative capacity to isolate us and make us believe that we are powerless. But once we have broken that mirror spell, we can also see that power does not come from above, from those "in Power," and therefore that it is possible to *exercise* power without *taking* it—that is, without simply changing places with those who rule. In this regard, it is important to quote in its entirety of the famous Zapatista motto that has been circulated in abbreviated form among movements throughout the world: "What we seek, what we need and want is for all those people without a party or an organization to make agreements about what they don't want and what they do want and organize themselves in order to achieve it (preferably through civil and peaceful means), not to take power, but to exercise it." Only now can we understand the full significance of this statement's challenge.

Bottom up approaches are good

A performative concept of participation as resistance explodes the distinction between public and private, between the political and the apolitical. As Foucault explains, what was formerly considered apolitical, or social rather than political, is revealed as the foundation of technologies of state control. Contests over identity and everyday social life are not merely additions to the realm of the political, but actually create the very character of those things traditionally considered political. The state itself is "superstructural in relation to a whole series of power networks that invest the body, sexuality, the family, kinship, knowledge, technology and so forth. Thus it is contestations at the micro-level, over the intricacies of everyday life, that provide the raw material for global domination, and the key to disrupting global strategies of domination. Therefore, the location of political participation extends way beyond the formal apparatus of government, or the formal organization of the workplace, to the intimacy of daily actions and iterations.

Simulation Bad

Simulation Bad

MITCHELL, Assistant Professor of Communications at University of Pittsburgh, **IN 1998** [Gordon, "Pedagogical Possibilities for Argumentative Agency in Academic Debate," *Argumentation and Advocacy*, Fall, ProQuest]

The sense of detachment associated with the spectator posture is highlighted during episodes of alienation in which debaters cheer news of human suffering or misfortune. Instead of focusing on the visceral negative responses to news accounts of human death and misery, debaters overcome with the competitive zeal of contest round competition show a tendency to concentrate on the meanings that such evidence might hold for the strength of their academic debate arguments. For example, news reports of mass starvation might tidy up the "uniqueness of a disadvantage" or bolster the "inherence of an affirmative case" (in the technical parlance of debate-speak). Murchland categorizes cultivation of this "spectator" mentality as one of the most politically debilitating failures of contemporary education: "Educational institutions have failed even more grievously to provide the kind of civic forums we need. In fact, one could easily conclude that the principle purposes of our schools is to deprive successor generations of their civic voice, to turn them into mute and uncomprehending spectators in the drama of political life"The sense of argumentative agency produced through action research is different in kind from those skills that are honed through academic simulation exercises such as policy debate tournaments. Encounters with broader public spheres beyond the realm of the academy can deliver unique pedagogical possibilities and opportunities. By anchoring their work in public spaces, students and teachers can use their talents to change the trajectory of events, while events are still unfolding. These experiences have the potential to trigger significant shifts in political awareness on the part of participants. Academic debaters nourished on an exclusive diet of competitive contest round experience often come to see politics like a picturesque landscape whirring by through the window of a speeding train. They study this political landscape in great detail, rarely (if ever) entertaining the idea of stopping the train and exiting to alter the course of unfolding events. The resulting spectator mentality deflects attention away from the roads that could carry their arguments to wider spheres of public argumentation. However, on the occasions when students and teachers set aside this spectator mentality by directly engaging in broader public audiences, key aspects of the political landscape change, because the point of reference for experiencing the landscape shifts fundamentally.

Simulation is bad

STANNARD 2000 [Matt, director of forensics and associate lecturer in the University of Wyoming Department of Communication and Journalism, "Portraying the Ruling Class: Argument Fields and the Material Antecedents of Policy Debate," http://www.uvm.edu/~debate/stannard300a.html]

Moreover, reliance on mass media sources, the journals of elitist think tanks, and public relations-manufactured press services all serve to construct a particular possibility of argument in policy debates. The advent of electronic research databases has exacerbated this conservatizing tendency since most of these databases are mainstream in content.

To summarize, I am suggesting that discursive inequalities and marginalized identities are not the only objects of criticism in policy debate. These problems are symptoms of the reproduction of <u>the policy field</u>, a field which, <u>in its institutionalized materiality, produces and contains both inequality and marginalization. The field of policy debate is a ritualized and enhanced reproduction of this larger material institution. Debaters are taught, through pedagogy and reward, drawing from policy literature and traditional</u> (uncritical) <u>notions of governing, to imitate the ruling class. Inequality and marginalization are part of the structure governing such imitation</u>.

SSD Bad

Switch Side Bad

GREEN Dpt of Comm Studies, Univ of Minn **& HICKS** Assoc. Prof of Human Comm Studies, Univ of Denver   **2k5**

Day also demonstrated his commitment to free speech more radically than Schlesinger by abandoning Schlesinger's deployment of 'clear and present danger' as an external value to regulate the reasonableness of speech. Yet, Day's defence of debating both sides elides the national particularity of how free speech was being put to work in the global struggle between liberal democracy and totalitarianism. One way that Cold War liberalism helped to transform the national particularity of the United States into a universal form of liberalism was through the constitution of free speech as a democratic norm. **As a cultural technology debating both sides contributed to American exceptionalism by transforming students into the concrete embodied performers of the universal norms of free speech**. In other words, by instantiating a desire for full and free expression, **the** pedagogical **technique of debating both sides became a mechanism by which the student-debater-citizen becomes an exceptional 'American' the bearer of universal norms of liberal democracy.**

SSD is bad

GREEN Dpt of Comm Studies, Univ of Minn **& HICKS** Assoc. Prof of Human Comm Studies, Univ of Denver   **2k5**

The ethical problematization of debating both sides suggests that the globalization of liberalism is not so much registered by universal norms of interaction as the circulation of techniques required for internalizing a series of ethical attributes conducive to democratic citizenship. Surely debate is not alone in the circulation of liberal attributes, one might suggest that teaching professional journalistic norms of objectivity and balance _ norms operationalized by the attempt to offer 'two-sides' to every political issue _ offers a functional equivalent to debating both sides. Increasingly, journalistic norms find uptake as a spectacle of partisan spin and the rhetoric of commitment, far away from the ethical pedagogy of debating both sides. A unique value of debating both sides is that it works as a technique of embodied speech performance. To produce a liberal citizen requires more than the presentation of different points of view to a third party, it requires the empathetic advocacy of views that are not one's own. In a world increasingly dominated by fundamentalism (religious and otherwise) the development of a respect for pluralism, tolerance and free speech remains politically valuable. However, the technical history of cultivating these norms must be evaluated if we might hope to govern ourselves differently. What this paper demonstrates is that debating both sides helps liberalism to produce a governing field between a person's first order convictions and his/her commitment to the process norms of debate, discussion and persuasion. This field is then managed in and through the alteration of different communicative practices. The production and management of this field of governance allows liberalism to trade in cultural technologies in the global cosmopolitan marketplace at the same time as **it creates a field of intervention to transform and change the world one subject (regime) at a time.**

Tolerance Good

Tolerance is good

Brown 2006 [Wendy, Professor of Political Science at UC Berkeley, *Regulating Aversion: Tolerance in the Age of Identity and Empire*, Princeton University Press, pages 22-24]

But liberalism *is* cultural. This is not simply to say that liberalism promotes a certain culture—say, of individualism or of entrepreneurship—though certainly these are truisms. Nor is it simply to say that liberalism is always imbricated with what we call national cultures, although it is and too little contemporary liberal theory has considered what this imbrication implies, even as our histories of political thought have routinely compared the liberalisms emerging from different parts of Europe and the Americas. Nor is it simply to say that there is no pure liberalism but only varieties of it—republican, libertarian, communitarian, social democratic. Nor is it only to say that all liberal orders harbor, affirm, and instantiate in law nonliberal values and practices, although this is also so. Rather, the theoretical claim here is that both the constructive and repressive powers we call those of culture—the powers that produce and reproduce subjects' relations and practices, beliefs and rationalities, and that do so without their express choice or consent—are neither conquered by liberalism nor absent from liberalism. Liberalism is not only itself a cultural form, it also is striated with nonliberal culture wherever it is institutionalized and practiced. Even in the texts of its most abstract analytic theorists, it is impure, hybridized, and fused to values, assumptions, and practices unaccounted by it and unaccountable within it. Liberalism involves a contingent, malleable, and protean set of beliefs and practices about being human and being together; about relating to self, others, and world; about doing and not doing; about valuing and not valuing select things. And liberalism is also always institutionalized, constitutionalized, and governmentalized in articulation with other cultural norms—those of kinship, race, gender, sexuality, work, politics, leisure, and more. This is one reason why liberalism, a protean cultural form, is not analytically synonymous with democracy, a protean political practice of sharing power and governance. The double ruse on which liberalism relies to distinguish itself from culture—on the one hand, casting liberal principles as universal; on the other, juridically privatizing culture—ideologically figures liberalism as untouched by culture and thus as incapable of cultural imperialism. In its self-representation as the sole political doctrine that can harbor culture and religion without being conquered by them, liberalism casts itself as uniquely tolerant of culture from its position above culture. But liberalism is no more above or outside culture than is any other political form, and culture is not always elsewhere from liberalism. Both the autonomy and the universality of liberal principles are myths, crucial to liberalism's reduction of questions about its imperial ambitions or practices to questions about whether forcing others to be free is consonant with liberal principles. In sum, the contemporary "culturalization of politics" reduces nonliberal political life (including radical identity claims within liberal regimes) to something called culture at the same time that it divests liberal democratic institutions of any association with culture. Within this logic, tolerance is invoked *as* a liberal democratic principle but *for* what is named the cultural domain, a domain that comprises all essentialized identities, from sexuality to ethnicity, that produce the problem of difference within contemporary liberalism. Thus, tolerance is invoked as a tool for managing what are construed as (non-liberal because "different" and nonpolitical because "essential") culturalized identity claims or identity clashes. As such, tolerance reiterates the depoliticization of those claims and clashes, at the same time depicting itself as a norm-free tool of liberal governance, a mere means for securing freedom of conscience or (perhaps more apt today) freedom of identity.

Tolerance good

Brown 2006 [Wendy, Professor of Political Science at UC Berkeley, *Regulating Aversion: Tolerance in the Age of Identity and Empire*, Princeton University Press, pages 202-4]

That tolerance is preferable to violent civil conflict is inarguable. What this truism elides, however, is the discursive function of tolerance in legitimating the often violent imperialism of international liberal governmentality conjoined with neoliberal global political economy. The practice of tolerance does not simply anoint the superior or advanced status of the tolerant. Withholding tolerance for designated practices, cultures and regimes does not simply mark them as beyond the pale of civilization. The economy of this offering and this refusal also masks the cultural norms of liberal democratic regimes and of the West by denying their status *as* cultural norms. What becomes clear when we consider together the above-named thinkers is that the discourse of tolerance substantively brokers cultural value—valorizing the West, othering the rest—while feigning to do no more than distinguish civilization from barbarism, protect the former from the latter, and extend the benefits of liberal thought and practices. Insofar as tolerance in its

civilizational mode draws on a political-juridical discourse of cultural neutrality, in which what is at stake is said to be rationality, individual autonomy, and the rule of law rather than the (despotic) rule of culture or religion, tolerance is crucial to liberalism's denial of its imbrication with culture and the colonial projection of culture onto the native. It is crucial to liberalism's conceit of independence from culture, of neutrality with regard to culture . . . a conceit that in turn shields liberal polities from charges of cultural supremacy and cultural imperialism. This was precisely the conceit that allowed George W. Bush to declare, without recourse to the infelicitous language of "crusade," that "we have no intention of imposing our culture" on others while insisting on a set of liberal principles that others cannot brook without risking being bombed (see chapter 6).

Tolerance *conferred* as well as tolerance *withheld* serves this function; both are essential in the circuitry that tolerance travels as a civilizational discourse. *Tolerance conferred* on "foreign" practices shores up the normative standing of the tolerant and the liminal standing of the tolerated—a standing somewhere between civilization and barbarism. It reconfirms, without reference to the orders of power that enable it, the higher civilizational standing of those who tolerate what they do not condone or share—their cosmopolitanism, forbearance, expansiveness, catholicity, remoteness from fundamentalism. It is only against this backdrop that *tolerance withheld* succeeds in marking the other as barbaric without implicating the cultural norms of the tolerant by this marking. When a tolerant civilization meets its limits, it says not that it is encountering political or cultural difference but that it is encountering the limits of civilization itself. At that point, the tolerant civilization is justified not only in refusing to extend tolerance to its Other but in treating it as hostile, both internally oppressive *and* externally dangerous, and, as chapter 6 made clear, externally dangerous *because* internally oppressive. This hostile status in turn legitimates the tolerant entity's suspension of its own civilizational principles in dealing with this Other, principles that range from political self-determination and nation-state sovereignty to rational deliberation, legal and international accountability, and reasoned justification. Such legitimate abrogation of civilizational principles can be carried quite far, up to the point of making preemptive war on the Other.

The circuitry of tolerance in civilizational discourse also abets the slide from terrorism to fundamentalism to anti-Americanism that legitimates the rhetorical Manicheanism often wielded by the Bush regime: "You're either with the civilized world, or you're with the terrorists." It facilitates the slide from Osama bin Laden to Saddam Hussein as the enemy to civilization, and from a war *on* terrorism to wars *for* regime change in Afghanistan and Iraq. And likewise it indulges a slide from a war justified by Iraq's *danger* to the "civilized world" to one justified by the Iraqi people's *need* for liberation (by the West). Tolerance in a liberal idiom, both conferred and withheld, does not merely serve as the *sign* of the civilized and the free: it configures the *right* of the civilized against a barbaric opposite that is both internally oppressive and externally dangerous, neither tolerant nor tolerable.

AT Deliberative Democracy

AT Agonism/Negotiation/Deliberative Democracy

Olson 2009 [Joel, Associate Professor in the Department of Politics & International Affairs at Northern Arizona University, "Friends and Enemies, Slaves and Masters: Fanaticism, Wendell Phillips, and the Limits of Democratic Theory," *Journal of Politics* Vol. 71, No. 1]

Abolitionist talk sought an insurrection of thought and ended up inspiring an insurrection. While pacifists such as Garrison had moral qualms with Brown's actions at first (Mayer 1998), Phillips did not because he saw Harpers Ferry as embodying the function of talk, which is not just deliberation or agonistic engagement but also agitation. Agitation is the use of contentious talk to mold public opinion and thereby shape the laws and customs of society (Phillips 1891, 396). "The work of the agitator," Richard Hofstadter explains, "consists chiefly in talk; his function is . . . to influence the public mind in the interest of some large social transformation" (1948, 136). In other words, talk is a form of action for Phillips. "Our aim is to alter public opinion" (Phillips 1863, 110). Phillips seeks to agitate public opinion to construct a new, more radically democratic ethico-political framework, from which the reorganization of democratic institutions will follow (Phillips 1865, 13–21). As agitation, then, talk is not an end in itself, which is what Schmitt criticizes liberal discussion for being. Rather, it is a means to achieve hegemony.

Agitation does not presume a common ethicopolitical playing field. Rather, it constructs opposing frameworks and encourages conflict between them. Phillips's goal is not to achieve consensus through deliberation or to turn enemies into adversaries but to foster two hostile camps. In a May 1863 speech he provocatively constructs a principle he calls "the North," which represents equality, free speech, freedom of religion, and democracy. The principle of "the South," meanwhile, represents censorship, religious oppression, a sham democracy, and an "aristocracy of the skin" (Phillips 1863, 534). "That South," Phillips thunders, "is to be annihilated . . . This country will never know peace nor union until the South (using the words in the sense I have described) is annihilated, and the North is spread over it" (534– 35). There is little evidence of a desire for a "conflictual consensus" here, even as civil war rages. In another speech, Phillips blasts the Lincoln administration for its early conduct of the war. As of August 1862, Phillips notes, Lincoln was still publicly denying that the Civil War was a war to end slavery.10 Until Lincoln acknowledges this, the war's outcome is in doubt.11 "The war can only be ended by annihilating that oligarchy which formed and rules the South and makes the war,—by annihilating a state of society," Phillips insists. Yet "our present policy neither aims to annihilate that state of things we call 'the South,' made up of pride, idleness, ignorance, barbarism, theft, and murder, nor to replace it with a substitute. Such an aimless war I call wasteful and murderous" (451). Lincoln must not sit on the fence any longer. He must recognize that this war is a struggle for hegemony between the framework of liberty and the framework of slavery, identify his friends and his enemies, and act accordingly to defeat "the South" and install "the North" as the new national common sense.12

Phillips's speeches illuminate two important points regarding fanaticism. First, zealotry is essentially a means rather than an end. It is an approach to politics rather than an ethico-political framework itself. The fanatical approach stands in contrast to political moderation. Fanaticism seeks to exacerbate conflict by dividing the public sphere into friends and enemies, while the moderate approach seeks to avoid extreme positions or solutions in the interest of containing conflict. Both approaches play to the political middle but in very different ways: moderation seeks to preserve the middle as the dominant political voice, while fanaticism seeks to liquidate it by pushing moderates into the friends or enemies camp. Compared to moderation fanaticism is an extraordinary approach to politics, but it is not necessarily an undemocratic, intolerant, irrational, or violent one, and it need not lead to undemocratic, intolerant, irrational, or violent outcomes. As such, it should not automatically be equated with religious fundamentalisms or other authoritarian political systems. Phillips, for example, was a zealot in his means and a radical democrat in his ends. He embraced reason and pluralism and largely eschewed violence, yet the aim of

antislavery politics for him was not to moderate the North-South conflict but to sharpen it. ''Now, wherever there is the war of ideas, every tongue takes a side. There is no neutrality. Even silence is not neutrality; but he who speaks a word of sympathy to his brother-man is on the side of humanity and progress'' (1891, 44). Abolitionist agitation crystallizes politics into freedom and slavery, right and wrong, salvation and sin, democracy and tyranny—and forces people to decide between them.

Second, a comparison with Phillips reveals that deliberative and agonal theories take a moderate approach to expanding democracy. Rather than triangulating the public sphere into friends, enemies, and the moderate middle, these models seek to soften political divisions by restricting them to a common ethico-political framework. Phillips draws sharp lines between friends and enemies in order to mobilize friends and moderates. Gutmann and Thompson and Mouffe want to preclude the likelihood of such lines being drawn. Deliberation for Gutmann and Thompson, for example, is intended to diminish dualistic rhetoric such as ''Either you're for killing babies or you're against killing babies'' (1997, 80). Their goal is to bring opponents together in a way that neutralizes extreme positions and ''sustains a moral community'' (80). Mouffe, meanwhile, seeks to ''tame'' and ''defuse'' antagonism by turning enemies into adversaries (Mouffe 2005a, 19). Both models trim between opposing positions, while Phillips seeks to defeat his enemy. They limit conflict to a common ethicopolitical framework, while Phillips seeks hegemony. They exclude extremists from ''legitimate'' politics, while Phillips uses fanatical abolitionism to defeat fanatical masters. ''No man can fight Stonewall Jackson, a sincere fanatic on the side of slavery, but John Brown, an equally honest fanatic on the other'' (Phillips 1863, 540).

Sort

One type of crisis occurs when the owners go beyond that which they have trained their slaves to think of as 'fair' in terms of wages, hours and conditions. Another type occurs when the owners go beyond that which they have trained their slaves to think of as 'fair' in terms of housing, education and welfare. Sometimes, as with the flooding of New Orleans, the totality of oppression is unveiled. Masters, having successfully confined their slaves' ambition for bread and roses within the horizon of the juridical sometimes, in capitalist desperation, get out ahead of their slaves. In such moments the system of white-over-black experiences a crisis because the slaves see the owners for what the owners are and they also see themselves and what it is they have been doing to themselves. The

slave is _{then} welcomed into the master's house for negotiations. Negotiation requires the slave to pretend that it has something in common with its master. Slaves and masters have nothing in common and there is therefore nothing to negotiate. Negotiation is always already at its beginning the almost-escaped slave's surrender to its almost-former master. There are many mansions in the master's house, each filled with the beauty of yesteryear's dreams of legal emancipation. These legal dreams of equality are the endless prayers offered up by the slaves during the endless crises of capital. These surrenders are the secret of capital time.

Let us suppose that by some combination of activist agitation and deliberative persuasion, **some deliberative settings emerge that approximately represent all those affected by the outcome of certain policy decisions**. Given the world of structural inequality as we know it, the activist believes such a circumstance will be rare at best but is willing to entertain the possibility for the sake of this argument. **The activist remains suspicious of the deliberative democrat's exhortation to engage in reasoned and critical discussion** with people he disagrees with, even on the supposition that the public where he engages in such discussion really includes the diversity of interests and perspectives potentially affected by policies. That is **because he perceives that existing social and economic structures have set unacceptable constraints on the terms of deliberation and its agenda**.

Problems and disagreements in the real world of democratic politics appear and are addressed against the background of a given history and sedimentation of unjust structural inequality, says the activist, which helps set agenda priorities and constrains the alternatives that political actors may consider in their deliberations. **When this is so, both the deliberative agenda and the institutional constraints it mirrors should themselves be subject to criticism, protest, and resistance**.7 **Going to the table to meet with representatives of those interests typically served by existing institutional relations, to discuss how to deal most justly with issues that presuppose those institutional relations, gives both those institutions and deliberative process too much legitimacy.** It co-opts the energy of citizens committed to justice, leaving little time for mobilizing people to bash the institutional constraints and decisionmaking process from the outside. Thus, the responsible citizen ought to withdraw from implicit acceptance of structural and institutional constraints by refusing to deliberate about policies within them. Let me give some examples.

A local anti-poverty advocacy group engaged in many forms of agitation and protest in the years leading up to passage of the Personal Responsibility and Work Opportunity Reconciliation Act by the U.S. Congress in the spring of 1996. This legislation fundamentally changed the terms of welfare policy in the United States. It abolished entitlements to public assistance for the first time in sixty years, allowing states to deny benefits when funds have run out. It requires recipients of Temporary Assistance to Needy Families to work at jobs after a certain period and allows states to vary significantly in their programs. Since passage of the legislation, the anti-poverty advocacy group has organized recipients and others who care about welfare justice to protest and lobby the state house to increase welfare funding and to count serving as a welfare rights advocate in local welfare offices as a "work activity."

In its desire to do its best by welfare clients, the county welfare department proposes to establish an advisory council with significant influence over the implementation and administration of welfare programs in the county. They have been persuaded by advocates of

deliberative democracy that proceedings of this council should be publicly accountable and organized so as to facilitate serious discussion and criticism of alternative proposals. They believe that democratic justice calls for making this council broadly inclusive of county citizens, and they think legitimate deliberations will be served particularly if they include recipients and their advocates on the council. So they invite the anti-poverty advocacy group to send representatives to the council and ask them to name recipient representatives from among the welfare rights organization with which they work.

After deliberating among themselves for some weeks, the welfare activists decline to join the council. The constraints that federal and state law have put on welfare policy, they assert, make it impossible to administer a humane welfare policy. Such a council will deliberate about whether it would be more just to place local welfare offices here or there but will have no power to expand the number of offices. They will decide how best to administer child care assistance, but they will have no power to decide who is eligible for that assistance or the total funds to support the program. The deliberations of a county welfare implementation council face numerous other constraints that will make its outcomes inevitably unjust, according to the activist group. All citizens of the county who agree that the policy framework is unjust have a responsibility to stay outside such deliberations and instead pressure the state legislature to expand welfare options, by, for example, staging sit-ins at the state department of social services.

The deliberative democrat finds such refusal and protest action uncooperative and counterproductive. Surely it is better to work out the most just form of implementation of legislation than to distract lawmakers and obstruct the routines of overworked case workers. The activist replies that it is wrong to cooperate with policies and processes that presume unjust institutional constraints. **The problem is not that policy makers and citizen deliberations fail to make arguments but that their starting premises are unacceptable**.

It seems to me that **advocates of deliberative democracy who believe that deliberative processes are the best way to conduct policies even under the conditions of structural inequality that characterize democracies today have no satisfactory response to this criticism**. Many advocates of deliberative procedures seem to find no problem with structures and institutional constraints that limit policy alternatives in actual democracies, advocating reflective political reasoning within them to counter irrational tendencies to reduce issues to sound bites and decisions to aggregate preferences. In their detailed discussion of the terms of welfare reform in Democracy and Disagreement, for example, Amy Gutmann and Dennis Thompson appear to accept as given that policy action to respond to the needs of poor people must come in the form of poor support rather than changes in tax policy, the relation of private and public investment, public works employment, and other more structural ways of undermining deprivation and income inequality.8 James Fishkin's innovative citizens' forum deliberating national issues in connection with the 1996 political campaign, to take another example, seemed to presume as given all the fiscal, power, and institutional constraints on policy alternatives that the U.S. Congress and mainstream press assumed. To the extent that such constraints assume existing patterns of class inequality, residential segregation, and gender division of labor as given, **the activist's claim is plausible that there is little difference among the alternatives debated, and** he suggests **that the responsible citizen should not consent to these assumptions but instead agitate for deeper criticism and change**.

The ongoing business of legislation and policy implementation will assume existing institutions and their priorities as given unless massive concerted action works to shift priorities and goals. Most of the time, then, politics will operate under the constrained alternatives that are produced by and support structural inequalities. **If the deliberative democrat tries to insert practices of deliberation into existing public policy discussions, she is forced to accept the range of alternatives that existing structural constraints allow**. While two decades ago in the United States, there were few opportunities for theorists of deliberative democracy to try to influence the design and process of public discussion, today things have changed. Some public officials and private foundations have become persuaded that inclusive, reasoned extensive deliberation is good for democracy and wish to implement these ideals in the policy formation process. To the extent that such implementation must presuppose constrained alternatives that cannot question existing institutional priorities and social structures, **deliberation is as likely to reinforce injustice as to undermine it.**

I think that the deliberative democrat has no adequate response to this challenge other than to accept the activist's suspicion of implementing deliberative processes within institutions that seriously constrain policy alternatives in ways that, for example, make it nearly impossible for the structurally disadvantaged to propose solutions to social problems that might alter the structural positions in which they stand. **Only if the theory and practice of deliberative democracy are willing to withdraw from the immediacy of the already given policy trajectory can they respond to this** activist **challenge**. The **deliberative democracy should help create inclusive deliberative settings in which basic social and economic structures can be examined; such settings for the most part must be outside of and opposed to ongoing settings of official policy discussion**.

AT Fairness

no

We have cleverly built power's view of the appropriate standard of conduct **into the very term fair**. Thus, the stronger party is able to have ~~his~~ [their] way and see ~~himself~~ [themselves] as principled at the same time.

Imagine, for example, a man's likely reaction to the suggestion that subjective considerations -- a woman's mood, her sense of pressure or intimidation, how she felt about the man, her unexpressed fear of reprisals if she did not go ahead -- ought to play a part in determining whether the man is guilty of rape. Most men find this suggestion offensive; it requires them to do something they are not accustomed to doing. "Why," they say, "I'd have to be a mind reader before I could have sex with anybody?" "Who knows, anyway, what internal inhibitions the woman might have been harboring?" And "what if the woman simply changed her mind later and charged me with rape?"

What we never notice is that women can "read" men's minds perfectly well. The male perspective is right out there in the world, plain as day, inscribed in culture, song, and myth -- in all the prevailing narratives. These narratives tell us that men want and are entitled to sex, that it is a prime function of women to give it to them, and that unless something unusual happens, the act of sex is ordinary and blameless. We believe these things because that is the way we have constructed women, men, and "normal" sexual intercourse.

Notice what the objective standard renders irrelevant: a downcast look; ambivalence; the question, "Do you really think we should?"; slowness in following the man's lead; a reputation for sexual selectivity; virginity; youth; and innocence. Indeed, only a loud firm "no" counts, and probably only if it is repeated several times, overheard by others, and accompanied by forceful body language such as pushing the man and walking away briskly.

Yet society and law accept only this latter message (or something like it), and not the former, more nuanced ones, to mean refusal. Why? The "objective" approach is not inherently better or more fair. Rather, it is accepted because it embodies the sense of the stronger party, who centuries ago found himself in a position to dictate what permission meant. Allowing ourselves to be drawn into reflexive, predictable arguments about administrability, fairness, stability, and ease of determination points us away from what really counts: the way in which stronger parties have managed to inscribe their views and interests into "external" culture, so that we are now enamored with that way of judging action. First, we read our values and preferences into the culture; then we pretend to consult that culture meekly and humbly in order to judge our own acts. A nice trick if you can get away with it.

[This card was gender paraphrased]

Reps First

Reps must be evaluated prior to questions of policy

Doty 96 [Roxanne Lynn Doty, assistant professor of political science at arizona state university, imperial encounters, p. 5-6, 1996]

This study begins with the premise that representation is an inherent and important aspect of global political life and therefore a critical and legitimate area of inquiry. International relations are inextricably bound up with discursive practices that put into circulation representations that are taken as "truth." The goal of analyzing these practices is not to reveal essential truths that have been obscured, but rather to examine *how* certain representations underlie the production of knowledge and, identities and how these representations make various courses of action possible. As Said (1979: 21) notes, there is no such thing as a delivered presence, but there is *a re-presence,* or representation. Such an assertion does not deny the existence of the material world, but rather suggests that material objects and subjects are constituted as such within discourse. So, for example, **when U.S. troops march into Grenada, this is certainly "real,"** though the march of troops across a piece of geographic space is in itself singularly uninteresting and socially irrelevant outside of the representations that produce meaning. **It is only when "American" is attached to the troops and "Grenada" to the geographic space that meaning is created. What the physical behavior itself is, though, is still far from certain until discursive practices constitute it as an "invasion,"** a "show of force," a "training exercise," a "rescue," and so on. What is "really" going on in such a situation is inextricably linked to the discourse within which it is located. To attempt a neat separation between discursive and nondiscursive practices, understanding the former as purely linguistic, assumes a series of dichotomies—thought/reality, appearance/essence, mind/matter, word/world, **subjective/objective—that a critical genealogy calls into question**. Against this, the perspective taken here affirms the material and'performative character of discourse.'In suggesting that global politics, and specifically the aspect that has to do with relations between the North and the South, is linked to representational practices I am suggesting that the issues and concerns that constitute these relations occur within a "reality" whose content has for the most part been defined by the representational practices of the "first world". Focusing on discursive practices enables one to examine how the processes that produce "truth" and "knowledge" work and how they are articulated with the exercise of political, military, and economic power.

Representations are the most important questions—the representations used are pivotal in determining the persuasiveness of the policy and the likelihood of implementation.

Gorham 99 (Bradley, University of Wisconsin, Howard Journal of Communications, Spring, ebsco)

Racial stereotypes in the media : So what ? Why are stereotypes in the media important, and why should we care ? At first glance, it seems absurd that such questions need to be answered. It is almost a truism that racial stereotypes in the media are important; so much research has been done about stereotypes in the media that they *must* be important. Similarly, there is the intuitively appealing notion that stereotypes in the media are harmful. Stereotypes are often viewed as false overgeneralizations made by socially dominant groups about socially oppressed groups, and since they have been prevalent in the media to varying degrees for many years (Stroman, Merritt, & Matabane, 1989–1990) , they *must* be bad. But why ? If so many people consciously disavow any belief in or endorsement of the stereotypes that circulate through society (Devine, Monteith, Zuwerink, & Elliot, 1991) , why are they important, and why do they exercise their ''badness'' ? These are important questions to answer for several reasons. Critical scholars and others who are concerned about the ideological and social effects of stereotypical media representations need to be able to point to more concrete mechanisms than simply ''learning'' or ''modeling'' if they expect their arguments to carry any weight outside of the academic world. That is, those concerned with the ideological effects of persistent stereotypical portrayals need to be able to lay out the mechanisms by which these representations lead to these effects. By doing so, researchers can not only make their arguments against these representations more convincing, but they can also make it easier to identify areas that are most susceptible to real-world intervention and change. This could also have the added benefit of making it easier for message producers, consumers, and policymakers to see how scholars' theory and research might have practical implications. Conversely, researchers in the empirical tradition must acknowledge the very real ideological effects that may arise from these repeated stereotypical representations. Although the term may make some empirical researchers uncomfortable, ''ideology'' clearly seems to be an important concept in understanding the effects of stereotypical representations. After all, if ideology is ''a kind of collective symbolic self-expression'' that works to promote and legitimate the interests of social groups through ''action-oriented discourse'' (adapted from Eagleton, 1991, p. 29) , then stereotypical images in the media can certainly convey messages about what are not

only appropriate thoughts for members of particular social groups, but also what are appropriate actions and roles. These thus become important effects to understand.

Framework questions should be resolved prior to policymaking because they determine the effectiveness and outcome of policy

The Frameworks Institute 03 ("The FrameWorks Perspective: Strategic Frame Analysis", http://www.frameworksinstitute.org/strategicanalysis/perspective.shtml)

This interdisciplinary work is made possible by the fact that the concept of framing is found in the literatures of numerous academic disciplines across the social, behavioral and cognitive sciences. Put simply, framing refers to the construct of a communication — its language, visuals and messengers — and the way it signals to the listener or observer how to interpret and classify new information. By framing, we mean how messages are encoded with meaning so that they can be efficiently interpreted in relationship to existing beliefs or ideas. Frames trigger meaning. The questions we ask, in applying the concept of frames to the arena of social policy, are as follows: How does the public think about a particular social or political issue? What is the public discourse on the issue? And how is this discourse influenced by the way media frames that issue? How do these public and private frames affect public choices? How can an issue be reframed to evoke a different way of thinking, one that illuminates a broader range of alternative policy choices? This approach is strategic in that it not only deconstructs the dominant frames of reference that drive reasoning on public issues, but it also identifies those alternative frames most likely to stimulate public reconsideration and enumerates their elements (reframing). We use the term reframe to mean changing "the context of the message exchange" so that different interpretations and probable outcomes become visible to the public (Dearing & Rogers, 1994: 98). Strategic frame analysis offers policy advocates a way to work systematically through the challenges that are likely to confront the introduction of new legislation or social policies, to anticipate attitudinal barriers to support, and to develop research-based strategies to overcome public misunderstanding. What Is Communications and Why Does It Matter? The domain of communications has not changed markedly since 1948 when Harold Lasswell formulated his famous equation: *who says what to whom through what channel with what effect?* But what many social policy practitioners have overlooked in their quests to formulate effective strategies for social change is that communications merits their attention because it is an inextricable part of the agenda-setting function in this country. Communications plays a vital role in determining which issues the public prioritizes for policy resolution, which issues will move from the private realm to the public, which issues will become pressure points for policymakers, and which issues will win or lose in the competition for scarce resources. No organization can approach such tasks as issue advocacy, constituency-building, or promoting best practices without taking into account the critical role that mass media has to play in shaping the way Americans think about social issues. As William Gamson and his colleagues at the Media Research and Action Project like to say, media is "an arena of contest in its own right, and part of a larger strategy of social change." One source of our confusion over communications comes in not recognizing that each new push for public understanding and acceptance happens against a backdrop of long-term media coverage, of perceptions formed over time, of scripts we have learned since childhood to help us make sense of our world, and folk beliefs we use to interpret new information. As we go about making sense of our world, mass media serves an important function as the mediator of meaning — telling us what to think about (*agenda-setting*) and how to think about it (*media effects*) by organizing the information in such a way (*framing*) that it comes to us fully conflated with directives (*cues*) about who is responsible for the social problem in the first place and who gets to fix it (*responsibility*). It is often the case that nonprofit organizations want communications to be easy. Ironically, they want soundbite answers to the same social problems whose complexity they understand all too well. While policy research and formulation are given their due as tough, demanding areas of an organization's workplan, communications is seen as "soft." While program development and practice are seen as requiring expertise and the thoughtful consideration of best practices, communications is an "anyone can do it if you have to" task. It is time to retire this thinking. Doing communications strategically requires the same investment of intellect and study that these other areas of nonprofit practice have been accorded. A Simple Explanation of Frame Analysis In his seminal book Public Opinion (1921:16), Walter Lippmann was perhaps the first to connect mass communications to public attitudes and policy preferences by recognizing that the "the way in which the world is imagined determines at any particular moment what men will do." The modern extension of Lippmann's observation is based on the concept of "frames." People use mental shortcuts to make sense of the world. Since most people are looking to process incoming information quickly and efficiently, they rely upon cues within that new information to signal to them how to connect it with their stored images of the world. The "pictures in our heads," as Lippmann called them, might better be thought of as vividly labeled storage boxes - filled with pictures, images, and stories from our past encounters with the world and labeled youth, marriage, poverty, fairness, etc. The incoming information provides cues about which is the right container for that idea or experience. And the efficient thinker makes the connection, a process called "indexing," and moves on. Put another way, how an issue is framed is a trigger to these shared and durable cultural models that help us make sense of our world. When a frame ignites a cultural model, or calls it into play in the interpretation, the whole model is operative. This allows people to reason about an issue, to make inferences, to fill in the blanks for missing information by referring to the robustness of the model, not the sketchy frame.

Questions of policy can't even be attempted to be answered without first examining representations—it proves our framework is critical to more effective policymaking.

Doty 96 (Roxanne, assistant professor of political science at ASU, Imperial Encounters, p. 170-171)

North-South relations have been constituted as a structure of deferral. The center of the structure (alternatively white man, modern man, the united States, the West, real states), has never been absolutely present outside a system of differences. It has itself been constituted as trace-the simulacrum of a presence that dislocates itself, displaces itself, refers itself (ibid.). Because the center is not a fixed locus but a function in which an infinite number of sign substitutions come into play, the domain and play of signification is extended indefinitely (Derrida 1978: z8o). This both opens up and limits possibilities, generates alternative sites of meanings and political resistances that give rise to practices of reinscription that seek to reaffirm identities and relationships. The inherently incomplete and open nature of discourse makes this reaffirmation an ongoing and never finally completed project. In this study I have sought, through an engagement with various discourses in which claims to truth have been staked, to challenge the validity of the structures of meaning and to make visible their complicity with practices of power and domination. By examining the ways in which structures of meaning have been associated with imperial practices, I have suggested that the construction of meaning and the construction of social, political, and economic power are inextricably linked. This suggests an ethical dimension to making meaning and an ethical imperative that is incumbent upon those who toil in the construction of struc-tures of meaning. This is especially urgent in North-South relations today: one does not have to search very far to find a continuing complicity with colonial representations that ranges from a politics of silence and neglect to constructions of terrorism, Islamic fundamentalism, international drug trafficking, and Southern immigration to the North as new threats to global stability and peace. The political stakes raised by this analysis revolve around the question of being able to "get beyond"

the representations or speak outside of the discourses that historically have constructed the North and the South. I do not believe that there are any pure alternatives by which we can escape the infinity of traces to which Gramsci refers. Nor do I wish to suggest that we are always hopelessly imprisoned in a dominant and all-pervasive discourse. Before this question can be answered-indeed. before we can even proceed to attempt an answer—attention must be given to the politics of representation. The price that international relations scholarship pays for its inattention to the issue of representation is perpetuation of the dominant modes of making meaning and deferral of its responsibility and complicity in dominant representations.

Their framework depoliticizes debate and ensures the cooptation of all politics

Holloway 02 (Johnny Holloway, Professor of political science at The American University, 2002, The Military Reflex of the Body Politic: Thinking Critically About the United States' "War on Drugs," March, http://www.isanet.org/noarchive/holloway.html)

What separates critical theory most significantly from other modes of analysis is the value placed on cognition. While critical theory does encompass the positivist elements of reality like observable events and physical matter, its larger focus is on the non-observable elements of reality – thoughts, beliefs, values, language– that govern human interaction (Alway 1995, 105; Campbell 1992, 4-5; Guess 1981, 56). As is elegantly stated in the passage from Michel Foucault above, to be critical is not simply a matter of proffering criticism. Mere disparagement and other expressions of disapproval towards existing conditions are inadequate; true critical theory must address the dominant ideology – the basic thoughts and beliefs that form the bedrock of specific behaviors, policies, actions, etc that in turn formulate, reinforce, and perpetuate existing conditions. The basis of this address is reflection, the intellectual act of holding up a mirror to truly examine – and question – the world-view embraced by both the individual and the larger society of which he or she is a member (Leonard 1990, 4). By weighing the beliefs and assumptions held about (for example) society against the knowledge of the origins of those beliefs and assumptions combined with observable facts (e.g. consistently disproportionate allocation of resources, pervasive injustice, etc), real and rigorous reflection undermines and eventually shatters this world-view. By turning things on its head, the individual becomes enlightened; aware of those coercive elements (both self-imposed and produced and reproduced by the institutions of society) that have formed the ideology that had heretofore permitted the justification of a hypocrisy of incommensurate words and deeds. Moreover, this realization will not permit a simple acknowledgment; it compels action and understandably so – the world (or some aspect of it) as one knew it to be is no 2more. "Although reflection alone can't do away with real social oppression, it can free ... agents from unconscious complicity in thwarting their own legitimate desires" (Guess 1981, 75). At a minimum, reflection can bring about an intellectual freedom that compels advocacy for change through a basic rationality (i.e., one plus one is supposed to equal two; not six). After outlining these elements of critical theory – cognition, reflection, enlightenment – it becomes increasing evident as to the utility of this approach in regards to the question of the War on Drugs. Measurements of such things as total tons of cocaine seized or annual budgets for the Drug Enforcement Agency (DEA) in and of themselves can only offer a description of events – not an explanation for them or the policies that promulgate them. Consider the following assessment: Many Americans approach questions of drug ... policy with standard-issue drug war eyeglasses ... crafted from particular beliefs and values rooted in American political culture. When they hear the word narcotics, they hear danger and crime ... When they consider how the government should respond, they think "get tough"; and when the problem does not improve, they conclude that more force and more threats are needed (Bertram, et al: 57). In order to get to the why's at the heart of the matter (e.g. Why view through this lens and not another? Why use the military metaphor?, etc), any meaningful analysis is going to have address the thoughts, beliefs, assumptions, and language that privileges certain responses over others. Confronted with a policy focused on eradication and interdiction that has been pursued for roughly twenty years, at a cost of billions of dollars, with advocates who claim that "victory" is imminent on one hand and wide scale evidence of an ever increasing supply of drugs at stable (and sometimes decreasing) prices essentially unaffected by that policy on the other, a "what is wrong with the is picture?" frame of analysis is imperative. Recognition of the wrongness of that picture and the reasons why is inherently emancipating – a freedom that may be limited to a personal refusal to accept the platitudes that shroud hypocrisy or may result in adding another voice to the call for greater introspection and larger understanding

Their demand to work only within the policy community forecloses options and prevents real change.

Smith 97 (Steve Smith, Professor of Political Science at the University of Wales, Power and truth; a reply to William Wallace, Review of International Studies, Issue 04, Volume 23, October 1997, Cambridge Journals)

In summary, I think that Wallace fundamentally misrepresents the relationship between theory and practice. His article works very effectively, but only because of its internal logical and political structure. By his setting up of two alternatives (cooption or scholasticism) the logical structure of the article performs a disciplining function by placing anyone outside of his logic of the policy–theory relationship in a predefined position of being self-righteous, self-indulgent, opposed to empirical work, too detached from the world of practice and too fond of theory. Note also the very revealing way in which those defined as having to 'struggle with the dilemmas of power' are policy-makers; there are massive normative and ethical assumptions at work here, ones that undermine his very notion of theory as explanatory and reveal his political project. The trouble is that Wallace's logical structure is a textual construction and is therefore never subjected to any self-critical analysis in the article. My worry is that his prescriptions would make academic International Relations a servant of the state, responding to today's headlines.

Agreeing with Wallace means that academics will run the risk of having to work within the agenda of the policy community, of being unable to stand back and examine the moral, ethical and political implications of that choice. Giving policy advice is not the problem; the problem is if those who give it are unaware of the extent to which they are standing on the policy conveyor-belt of the state. It means problem-solving, it means taking the 'givens' of policy-makers as the starting points of analysis. It means walking the thin line between influence and fitting the values of policymakers. Clearly the discipline wants and needs to give advice on policy, but to whom? Is doing so for policy-makers a requirement for academics in discharging their responsibility to the state? My worry is that policy advice all too often means talking to governments; unfortunately, they may not be the right people to talk to if one's concern is really with 'those who have to struggle with the dilemmas of power'. And, crucially, are policy-makers listening to ideas or are they searching for an intellectual justification for their existing values? Ultimately, Wallace's picture worries me because he has a very restricted view of politics and its relationship to academia. Politics for Wallace is a far more limited activity than I think it is, and that is why I find no academic activity more political or ethical than showing the epistemological assumptions of International Relations theory. For me it is not so much a question of speaking truth to power as of showing how various versions of the power/truth relationship operate between civil society and the state. In that relationship it may well be that those who espouse a restrictive view of theory are the ones who are hiding behind walls, preaching sermons of self-righteousness, and ultimately acting as the discipliners of the discipline. For all of us interested in international relations, Wallace has raised important questions concerning our responsibilities and our self-awareness. I hope that this reply has shown why the picture is not quite as simple as his beguiling argument suggests and why, ultimately, it may be impossible for 'truth to speak to power' in the liberal way that he suggests. After all, if 'truth' itself only gets meaning from the regimes of truth within which it operates, then how can it speak to power when it is itself a construction of those same power relationships? How do we know that it is truth rather than power that we speak when we are speaking to policy-makers? Surely the task of academics is to show how these very relationships between truth and power, and between the empirical and the theoretical, operate. That, rather than the search for influence within the policy-making community, is the ultimate ethical and political engagement with the civil society in which we work and to which we are responsible.

Roleplaying releases sadistic desires and promotes violence—Stanford prison experiment proves

Sherrer 00 (Hans Sherrer, author living in Auburn, Washington, The Inhumanity of Government Bureaucracies, The Independent Review, v.V, n.2, Fall 2000, http://www.21learn.org/arch/articles/sherrer_one.htm)

Bureaucratic structures increase sadistic behavior by permitting and even encouraging it.[2] This effect is produced by the systematic lessening of the moral restraints inherent in personal agency (Kelman 1973, 52). Stanford psychology professor Philip Zim- bardo's "Stanford County Prison" experiment in the early 1970s confirmed this rela- tionship in dramatic fashion (Zimbardo, Haney, and Banks 1973). The experiment revealed that the sadism of people unhealthily obedient to authority can be tapped into and given an expressive outlet by their association with a bureaucratic organization, demonstrating that placing people in an environment in which they can freely exercise their sadistic impulses can have a liberating effect on their doing so. Zimbardo conducted the experiment by setting up a mock jail in the basement of a building and using participants from the general public who had been selected for their normality. Those chosen to participate were randomly assigned the role of a guard or an inmate. To Zimbardo and his fellow researchers' surprise, a majority of the guards began to behave sadistically toward the inmates within hours of initiation of the experiment (1973, 87-97). Just as surprising, the inmates meekly accepted their subservient role and mistreatment. In writing about this experiment, sociologist Zygmunt Bauman noted a "**sudden transmogrification of likable and decent American boys into near monsters** of the kind allegedly to be **found only in places like Auschwitz** or Treblinka" (Bauman 1989, 167). **What began as a make-believe experiment soon degenrated into an all too real microcosm of the interpersonal dynamics of real jails and prisons.** The universality of Zimbardo's finding is confirmed by the fact that the over- whelming majority of the heinous acts committed in Europe during the Nazi era were not perpetrated by fanatics or deranged people. To the contrary, those acts were per- formed by ordinary Germans, French, Poles, Czechs, and others who considered themselves to be legally authorized to act in ways that we retrospectively view as inhumane (Browning 1993, 159-89; Kren and Rappoport 1994, 70, 81-83).

Roleplaying is bad – it overlooks our own role in creating violence

Jayan Nayar, Professor of Law at the University of Warwick, 1999 (Symposium: Re-Framing International Law For The 21st Century: Orders of Inhumanity, Transnational Law & Contemporary Problems, Fall, 9 Transnat'l L. & Contemp. Probs. 599)

The description of the continuities of violence in Section II in many ways is familiar to those who adopt a critical perspective of the world. "We" are accustomed to narrating human wrongs in this way. The failures and betrayals, the victims and perpetrators, are familiar to our critical understanding. From this position of judgment, commonly held within the "mainstream" of the "non-mainstream," there is also a familiarity of solutions commonly advocated for transformation; the "marketplace" for critique is a thriving one as evidenced by the abundance of literature in this respect. Despite this proliferation of enlightenment and the profession of so many good ideas, however, "**things**" appear to remain as they are, or, worse still, [*620] deteriorate. And so, the cycle of critique, proposals for transformation and disappointment continues. Rightly, we are concerned with the question of what can be done to alleviate the sufferings that prevail. But there are necessary prerequisites to answering the "what do we do?" question. We must first ask the intimately connected questions of "about what?" and "toward what end?" These questions, obviously, impinge on our vision and judgment. When we attempt to imagine transformations toward preferred human futures, we engage in the difficult task of judging the present. This is difficult not because we are oblivious to violence or that we are numb to the resulting suffering, but because, outrage with "events" of violence aside, processes of violence embroil and implicate our familiarities in ways that defy the simplicities of straightforward imputability. Despite our best efforts at categorizing violence into convenient compartments--into "disciplines" of study and analysis such as "development" and "security" (health, environment, population, being other examples of such compartmentalization)--the encroachments of order(ing) function at more pervasive levels. And without doubt, the perspectives of the observer, commentator, and actor become crucial determinants. It is necessary, I believe, to question this, "our," perspective, to reflect upon a perspective of violence which not only locates violence as a happening "out there" while we stand as detached observers and critics, but is also one in which we are ourselves implicated in the violence of ordered worlds where we stand very much as participants. For this purpose of a critique of critique, it is necessary to consider the "technologies" of ordering.

Even Rawls agrees that the framework must be debatable

Ed Wingeenbach, Professor at the University of South Carolina, 1999 (Unjust Context: The Priority of Stability in Rawls's Contextualized Theory of Justice, American Journal of Political Science, Vol. 43, No. 1 January)

The recognition that we share no common doctrine except the fundamental intuition that no common doctrine can ever gain widespread acceptance involves a recognition of the underlying indeterminacy of modern democratic politics. Any conception of the political realm appropriate to such conditions **must be one that accepts and institutionalizes this indeterminacy. Democracy should be seen as the political practice which meets these demands**, if by democracy we understand a form of politics which recognizes that the context of politics itself must also be an object of contestation. This means that the framework within which political activity takes place, in Rawls's case the political conception of justice, must be open to debate and reform. Any attempt to take certain subjects or practices "off the table" violates Rawls's fundamental insight into modern democratic societies, namely, that no common doctrine licensing such a removal can achieve legitimate acceptance.

Methodology 1st

Methodology is key to effective policy making – vital to true education

Bartlett '90 (Katharine T., Professor of Law @ Duke University, (*Feminist Legal Methods*, Harvard Law Review, February)

Feminists have developed extensive critiques of law n2 and proposals for legal reform. n3 Feminists have had much less to say, however, about what the "doing" of law should entail and what truth status to give to the legal claims that follow. These methodological issues matter because methods shape one's view of the possibilities for legal practice and reform. Method "organizes the apprehension of truth; it determines what counts as evidence and defines what is taken as verification." n4 Feminists cannot ignore method, because if they seek to challenge existing structures of power with the same methods that [*831] have defined what counts within those structures, they may instead "recreate the illegitimate power structures [that they are] trying to identify and undermine." n5

Method matters also because without an understanding of feminist methods, feminist claims in the law will not be perceived as legitimate or "correct." I suspect that many who dismiss feminism as trivial or inconsequential misunderstand it. Feminists have tended to focus on defending their various substantive positions or political agendas, even among themselves. Greater attention to issues of method may help to anchor these defenses, to explain why feminist agendas often appear so radical (or not radical enough), and even to establish some common ground among feminists.

As feminists articulate their methods, they can become more aware of the nature of what they do, and thus do it better. Thinking about method is empowering. When I require myself to explain what I do, I am likely to discover how to improve what I earlier may have taken for granted. In the process, I am likely to become more committed to what it is that I have improved. This likelihood, at least, is a central premise of this Article and its primary motivation.

Circumvention

Under the state's current understanding of what a population is, there will always be biometric surveillance – to have any semblance of solvency we must work outside legislative action

Natasha Lennard is an assistant news editor at Salon, covering non-electoral politics and general news

http://www.salon.com/2013/05/10/hidden_in_immigration_reform_vast_biometrics_plan/

The very concept of population is one of a certain type of control — namely the mechanisms through which certain groups get to be counted as among, or outside the population. Indeed, to be part of a population — further, a citizenry — is to be countable, databased. It should come as no surprise then, that tucked into the proposed immigration reform bill currently under debate in the Senate is a mandate for ensuring every American is identified, counted and countable constantly. As Wired noted Friday, "Buried in the more than 800 pages of the bipartisan legislation (.pdf) is language mandating the creation of the innocuously-named "photo tool," a massive federal database administered by the Department of Homeland Security and containing names, ages, Social Security numbers and photographs of everyone in the country with a driver's license or other state-issued photo ID."

The aim of the database would be to ensure that employers did not employ illegal immigrants — the would have to check new hires in the database to verify that they match their photo. Privacy advocates have, however, expressed concern for the creeping use of biometrics and enforced identification in every aspect of American life. Wired reports:

Privacy advocates fear the inevitable mission creep, ending with the proof of self being required at polling places, to rent a house, buy a gun, open a bank account, acquire credit, board a plane or even attend a sporting event or log on the internet. Think of it as a government version of Foursquare, with Big Brother cataloging every check-in.

"It starts to change the relationship between the citizen and state, you do have to get permission to do things," said Chris Calabrese, a congressional lobbyist with the American Civil Liberties Union. "More fundamentally, it could be the start of keeping a record of all things."

The privacy advocate's concerns are apt, but fail to point out that such a vast biometrics database is just the latest technology — following from passports, Social Security numbers and the like — to illustrate that inherent to the very concept of population are mechanisms of counting and checking. Which sorts of checks we find unacceptable and violating is then the question we have to ask. That we — as citizens, as a population — are checkable and countable should be well understood.

Reform Bad

Reform is bad

Rodriguez 08 (Dylan Rodriguez, assistant professor at University of California Riverside, "Abolition Now!", p. 93-100)

We are collectively witnessing, surviving, and working in a time of unprecedented state-organized human capture and state-produced physical/social/ psychic alienation, from the 2.5 million imprisoned by the domestic and global US prison industrial complex to the profound forms of informal apartheid and proto- apartheid that are being instantiated in cities, suburbs, and rural areas all over the country. This condition presents a profound crisis – and political possibility – for people struggling against the white supremacist state, which continues to institutionalize the social liquidation and physical evisceration of Black, brown, and aboriginal peoples nearby and far away. If we are to approach racism, neoliberalism, militarism/militarization, and US state hegemony and domination in a legitimately "global" way, it is nothing short of unconscionable to expend significant political energy protesting American wars elsewhere (e.g. Iraq, Afghanistan etc.) when there are overlapping, and no less profoundly oppressive, declarations of and mobilizations for war in our very own, most intimate and nearby geographies of "home." This time of crisis and emergency necessitates a critical examination of the political and institutional logics that structure so much of the US progressive left, and particularly the "establishment" left that is tethered (for better and worse) to the non-profit industrial complex (NPIC). I have defined the NPIC elsewhere as the set of symbiotic relationships that link political and financial technologies of state and owning class social control with surveillance over public political discourse, including and especially emergent progressive and leftist social movements. This definition is most focused on the industrialized incorporation, accelerated since the 1970s, of pro-state liberal and progressive campaigns and movements into a spectrum of government-proctored non-profit organizations.   It is in the context of the formation of the NPIC as a political power structure that I wish to address, with a less-than-subtle sense of alarm, a peculiar and disturbing politics of assumption that often structures, disciplines, and actively shapes the work of even the most progressive movements and organizations within the US establishment left (of which I too am a part, for better and worse): that is, the left's willingness to fundamentally tolerate – and accompanying unwillingness to abolish – the institutionalized dehumanization of the contemporary policing and imprisonment apparatus in its most localized, unremarkable, and hence "normal" manifestations within the domestic "homeland" of the Homeland Security state. Behind the din of progressive and liberal reformist struggles over public policy, civil liberties, and law, and beneath the infrequent mobilizations of activity to defend against the next onslaught of racist, classist, ageist, and misogynist crirninalization, there is an unspoken politics of assumption that takes for granted the mystified permanence of domestic warfare as a constant production of targeted and massive suffering, guided by the logic of Black, brown, and indigenous subjection to the expediencies and essential violence of the American (global) nation-building project. To put it differently: despite the unprecedented forms of imprisonment, social and political repression, and violent policing that compose the mosaic of our historical time, the establishment left (within and perhaps beyond the US) **does not care to envision, much less politically prioritize, the abolition of US domestic warfare** and its structuring white supremacist social logic as its most urgent task of the present and future. Our non-profit left, in particular, seems content to engage in desperate (and usually well-intentioned) attempts to **manage** the casualties of domestic warfare, foregoing the urgency of an abolitionist praxis that openly, critically, and radically addresses the moral, cultural, and political **premises of these wars.** Not long from now, generations will emerge from the organic accumulation of rage, suffering, social alienation, and (we hope) **politically principled rebellion against this living apocalypse** and pose to us some rudimentary questions of radical accountability: How were we able to accommodate, and even culturally and politically normalize the strategic, explicit, and openly racist technologies of state violence that effectively socially neutralized and frequently liquidated entire nearby populations of our people, given that ours are the very same populations that have historically struggled to survive and overthrow such "classical" structures of dominance as colonialism, frontier conquest, racial slavery, and other genocides? In a somewhat more intimate sense, how could we live with ourselves in this domestic state of emergency, and why did we seem to generally forfeit the creative possibilities of radically challenging, dislodging, and transforming the ideological and institutional premises of this condition of domestic warfare in favor of **short-term, "winnable" policy reforms?** (For example, why did we choose to formulate and tolerate a "progressive" political language that reinforced dominant racist notions of "criminality" in the process of trying to discredit the legal basis of "Three Strikes" laws?) What were the fundamental concerns of our progressive organizations and movements during this time, and were they willing to comprehend and galvanize an effective, or even viable opposition to the white supremacist state's terms of engagement (that is, warfare)? 'this radical accountability reflects a variation on anti- colonial liberation theorist Frantz Fanon's memorable statement to his own peers, comrades,

and nemeses: Each generation must discover its mission, fulfill it or betray it, in relative opacity. In the underdeveloped countries preceding generations have simultaneously resisted the insidious agenda of colonialism and paved the way for the emergence of the current struggles. Now that we are in the heat of combat, we must shed the habit of decrying the efforts of our forefathers or feigning incomprehension at their silence or passiveness. Our historical moment suggests the need for a principled political rupturing of existing techniques and strategies that fetishize and fixate on the negotiation, massaging, and management of the worst outcomes of domestic warfare. One political move long overdue is toward grassroots pedagogies of radical dis-identification with the state, in the trajectory of an anti-nationalism or anti-patriotism, that reorients a progressive identification with the creative possibilities of insurgency (this is to consider "insurgency" as a politics that pushes beyond the defensive maneuvering of "resistance"). Reading a few lines down from our first invoking of Fanon's call to collective, liberatory action is clarifying here: "For us who are determined to break the back of colonialism, our historic mission is to authorize every revolt, every desperate act, and every attack aborted or drowned in blood."

AT CTP

The focus on politics proper ignores the ability of the alternative to have effects across the political spectrum and misunderstands the need for new types of political organization

Misoczky and Flores 2012 [Ceci Misoczky Professora Adjunta no Programa de Pós-Graduação em Administração da Universidade Federal do Rio Grande do Sul and Rafael Kruter Flores, Doutorando em Administração no Programa de Pós-Graduação em Administração da Universidade Federal do Rio Grande do Sul, Contributions of Latin American revolutionary intellectuals for the study of the organization of liberating struggles REBELA, v. 2, n. 1, jun. 2012)

In a different direction, we are convinced that <u>the focus on the organization of social anti-capitalist struggles is a relevant academic praxis, because it opposes the hegemonic definition of organization</u> (as a synonym of enterprise) in a context of worldwide dominance of the managerial discourse. <u>The aim is to produce counter-hegemonic knowledge in the very space where the hegemonic managerial discourse is produced and reproduced</u>, and to contribute for the emancipation of OS (or at least ofe the parts of OS which intend to be critical) from the hegemony of management. We believe, with Neuhaus and Calello (2006, p. 2), that <u>researches may "be critical interventions, both in the spaces where they are done - where potential forces of resistance to the hegemonic power are concentrated; and in the researchers themselve</u>s". <u>The first step to widen the ways in which we study requires the abandonment of restrictive understandings of organization as a unit of analysis</u> (Cooke, 2004 and 2010; Dar, 2008). Cooper and Burell (1988, p. 106) and Böhm (2005) had already indicated the direction of an expanded conception of organization as an ongoing process "that occurs within the wider 'body' of society". In our research group, we have been exploring alternative ways of defining organization in order to deal with our focus of interest - the organization of social struggles. <u>Organizations have been conceived as the collective inter-subjective act which is, simultaneously, a means for the praxis of liberation and a learning space for the experimentation of organizational practices compatible with liberating struggles</u> (MISOCZKY, 2010). As part of this research project we felt the need to engage with the thought of Latin American intellectuals. The fact that the development of OS in Latina America can be understood as a distorted version of the functionalist or the critical thought of the Centre has already been recognized. Despite such dominance scholars often express the uncomfortable sense that such approaches do not really explain what happens in their countries, while acknowledging that these frameworks give them recognition in the international arena, which is another way to say that to be allowed in you must deny your own identity (IBARRA- COLADO, 2006). We can say, using the expression of Schwarz (1992), that the hegemonic version of Latin American and Brazilian OS is made of texts which do not express marks of location, which do not offer reflections about the peculiarities of our space of enunciation or about how social and institutional contexts limit and condition the production of ideas. But this is not truth concerning the wider critical (often revolutionary) intellectual Latin American production, marked by a vast and rich cultural tradition. <u>When we mention the Latin American cultural tradition or social thought we are opposing the construction of Latin America as an object of representation</u>. This last expression means, for Moraña (1998), an image that defines its existence through the watching eyes, as the place of the other – an exotic pre-theoretical marginal place when confronted with metropolitan discourses. Instead, <u>we are stating the existence of a creative, original and autonomous tradition, resulting from processes of transculturation.</u>

Current political spheres marginalize the voices of those who don't fit into the image of normativity—our analysis is a good starting point

Dawson 14 (Michael J. Dawson, John D. MacArthur Professor of Political Science at the University of Chicago, "Civic Engagement and America's Racialized, Anti-Democratic Public Sphere, The Democracy Papers, May 2014, http://thedemocracypapers.ssrc.org/civic-engagement-and-americas-racialized-anti-democratic-public-sphere/)

<u>==Racial cleavages in public opinion remain massive==</u> particularly <u>==between black and white citizens==</u>. <u>Gaps of twenty to sixty percent between mean black and white opinion are consistently found</u> on questions such as support for military intervention in the Middle East, economic redistribution, prospects for blacks achieving racial equality in the U.S., whether felons who have served their time should be allowed to vote, whether the government should apologize to blacks for slavery and Jim Crow, and the whether the poor government response to the Katrina disaster was due in part to racial inequality. <u>Group differences of this magnitude are disturbing for a number of reasons.</u> <u>==These differences are indicative of large degrees of==</u>

polarization between black and white citizens, and that political discourse within the U.S. is to a substantial degree structured along racial lines. Even more worrisome, these vast cleavages are also indicative of the anti-democratic nature of public discourse in the U.S. and more generally the public sphere. An important form of civic engagement and political participation is the ability of citizens and groups of citizens to participate in the public sphere, and thereby influence public opinion, shape policy formation and demand accountability from public officials. In the U.S., however, as we saw vividly during the aftermath of Hurricane Katrina, mainstream black political opinion is marginalized, excluded and demonized. Not only are mainstream black political voices rarely heard (as even in this conservative era they anchor the left of the American political spectrum), not only is mainstream black opinion not represented in the institutions of government, these positions and the speakers that utter them are demonized—condemned as being hopelessly out of step with "real American" politics, or worse anti-American. Jean Cohen (1999) points out that multiple publics do not in and of themselves signify an exclusionary set of publics. Multiple publics are a mark, according to Cohen, of any pluralistic society—one can have both multiple publics and multiple different types of publics. The key, however, is that these multiple publics comprised of "readers, listeners, viewers, and now cyber-communicators scattered around the national and international society" must also be part of a larger "public of publics," which allows them to contribute to what Cohen calls "public opinion in general" and what Habermas calls the will-formation process. Much public sphere theory conceptualizes political influence as flowing from public sphere to the policy formation process—from the public to the state. But for subordinate counterpublics, publics that must fight to have their voices heard and considered, the causal arrow is at least partially reversed. In a pluralistic democratic society, for the counterpublic's views to be heard and be influential in the larger "public of publics" and have an impact on the state, the subordinate population must wield sufficient political power for their views would be heard and considered. That political power could come from three sources: (1) local mass mobilization from within black civil society; (2) local political power exercised through the electoral system; and (3) substantial political pressure from outside of any given local area—most likely, as is usually the case for subordinate populations, from their compatriots nationally. In this era of the triumph of neoliberal sensibilities even within black politics, local or national black political mobilization is rare, and the limited leverage provided by black electoral power has had to serve as the main, if not ideal, protector of local black interests. In a racially fragmented civil society the black counterpublic formed in response to the dominant publics has its roots in the relative political, economic, and social powerlessness that African Americans have had historically and continue to have in this era. The relative powerlessness of the black counterpublic has made it difficult for the consensuses that developed within it to be interjected within mainstream publics. The extreme racial polarization found within public opinion surveys is indeed an indication of lack of success that the black counterpublic has had in influencing white mainstream publics. The reverse is also true of course; black publics remain relatively resistant to white opinion, but it is white opinion that molds public policy, and it is white opinion that gets coded as "normal," "rational," and "reasonable." Indeed, as Nancy Fraser (1989) and Michael Warner (2002) both argue, counterpublics are by their nature subordinate to their dominant counterparts (in this case, subordinate to white-dominated civil society, public spheres, and counterpublics) and, as Fraser argues, have subaltern status. Warner makes this point when he states, "Dominant publics are by definition those that can take their discourse pragmatics and their lifeworlds for granted, misrecognizing the indefinite scope of their expansive address as universality or normalcy." But the effect of this misrecognition is that alternative discourses become marginalized and, in this case, with real consequences for the shape of political power and the distribution of life chances. Both the exclusion from civil society as well as exclusion from the "public of publics" has led to a near total lack of access to the policy-making arena. This deadly combination has left black communities especially vulnerable to economic, political and other disasters—a vulnerability that was highlighted in recent years by the natural disaster of Hurricane Katrina and the human-constructed disaster of the aftermath to the storm, and more recently by the financial crisis that has gripped the world. Real threats exist to the ability of blacks and other marginalized populations, particularly Latinos, to participate in traditionally conceived political participation and civic engagement. Minority voting rights are under attack throughout the country. In addition to fighting these attacks, we must also address how to reconstruct political discourse within the U.S. so that the public sphere serves the democratic functions it ought to and no longer be a site of racial exclusion and marginalization. If this does not occur, black (and other) citizens will not fully have the ability to participate in all aspects of democratic life.

The focus on politics proper ignores the ability of the alternative to have effects across the political spectrum and misunderstands the need for new types of political organization

Misoczky and Flores 2012 [Ceci Misoczky Professora Adjunta no Programa de Pós-Graduação em Administração da Universidade Federal do Rio Grande do Sul and Rafael Kruter Flores, Doutorando em Administração no Programa de Pós-Graduação em Administração da Universidade Federal do Rio Grande do Sul, Contributions of Latin American revolutionary intellectuals for the study of the organization of liberating struggles REBELA, v. 2, n. 1, jun. 2012)

In a different direction, we are convinced that <u>the focus on the organization of social anti-capitalist struggles is a relevant academic praxis, because it opposes the hegemonic definition of organization</u> (as a synonym of enterprise) in a context of worldwide dominance of the managerial discourse. <u>The aim is to produce counter-hegemonic knowledge in the very space where the hegemonic managerial discourse is produced and reproduced</u>, and to contribute for the emancipation of OS (or at least ofe the parts of OS which intend to be critical) from the hegemony of management. Instead, <u>we are stating the existence of a creative, original and autonomous tradition, resulting from processes of transculturation.</u>

Civic engagement is a vague concept—their authors are likely referring to different actions as indicators of civic engagement

Ekman and Amna 12 (Joakim Ekman and Erik Amna, "Political participation and civic engagement: Towards a new typology", Human Affairs, Volume 22, Issue 3, p. 283-300, July 2012, http://link.springer.com/article/10.2478%2Fs13374-012-0024-1)

Somewhat provocatively, <u>it has argued that "civic engagement" as a concept is ready for the dustbin.</u> In recent, <u>it has been used as a buzzword</u>, to cover everything from voting in elections to giving money to charity, or from bowling in leagues to participate in political rallies and marches (Berger 2009, 335). <u>Putnam has been identified as the one that popularised the concept, and for him, it was a matter of pointing out the importance of "social capital" for a vital democratic society. In a manner of speaking, his focus was more on "engagement" than on the "civic" or the "political".</u> When analysing citizens' levels of engagement, Putnam covered just about everything from <u>reading newspapers, political participation, social networks and interpersonal trust to associational</u>

involvement. All of this was labelled civic engagement and the point was very simplified that such civic engagement tended to correlate with a functioning democracy and market economy (Putnam 1993). In a few articles and a larger study, Putnam expanded his thesis, and argued that civic engagement was on the decline in the US. American democracy was supposedly eroding from the inside (Putnam 1995; 1997; 2000). This sparked a global debate about the future of the established democracies. But again, Putnam was somewhat unclear about what it was that was actually declining, since "civic engagement" was a bit of everything (Berger 2009). What we have here is a typical example of conceptual stretching (Berger 2009, 336; Sartori 1970). If civic engagement is used by scholars to mean completely different things, it is basically a useless concept—it confuses more than it illuminates. If the crucial issue for the established democracies has to do with declining levels of "civic engagement", as Putnam and others have argued (Pharr, Putnam 2000), then we certainly need to be more clear about what it is that is actually declining or what exactly it is that we so desperately need as much of as we can possibly get. Other scholars too have noted the lack of consensus on what constitute civic engagement. Reviewing existing definitions of the term, Adler and Goggin (2005) conclude that there is no single agreed-upon meaning of civic engagement. That does not mean that all definitions are broad and all-encompassing. As Adler and Goggin point out, there are a number of more confined definitions that restrict civic engagement to apply to very specific action, such as community service, collective action and even political involvement (Adler, Goggin 2005, 238-240).

A lot of things could be civic engagement

Ekman and Amna 12 (Joakim Ekman and Erik Amna, "Political participation and civic engagement: Towards a new typology", Human Affairs, Volume 22, Issue 3, p. 283-300, July 2012, http://link.springer.com/article/10.2478%2Fs13374-012-0024-1)

The two writers ask us to think about the term as a continuum, spanning from the private sphere to the formal or public sphere. The former covers individual action like helping one's neighbours or simply discussing politics with one's friends. The latter encompasses collective action, like activity within a party, an organisation or interest group. Adler and Goggin also propose their own definition of civic engagement; it has basically to do with "how an active citizen participates in the life of a community in order to improve conditions for others or to help shape the community's future" (Adler, Goggin 2005, 241). We certainly like to applaud Adler and Goggin's attempt to conceptualise civic engagement and bring order in the rich flora of definitions of the term. However, we also feel that Berger (2009) has a point when criticising such broad definitions. It is hard not to agree that a term covering everything from helping a neighbour to voting in elections or running for public office in fact entails conceptual stretching. Let us proceed by contrasting the image depicted by Berger (2009) and Adler and Goggin (2005) with another description of a field of research, focusing more narrowly on "political participation". Political science research on citizens' engagement in politics has conventionally focused on electoral participation (cf. Brady 1999; van Deth 2001). For a long time, voting was perceived as the primary way for a citizen to make his or her voice heard in the political system, and voting turnout has been described as the most commonly used measure of citizen participation in the US. When post-war American political scientists thought about political participation, they quite simply thought about acts intentionally aimed at influencing governmental decisions (Verba, Nie 1972; Easton 1953, 134). A frequently cited definition by Verba and his associates, from the 1970s, testifies to the focus on the election of political leaders and the approval of their policies: By political participation we refer to those legal acts by private citizens that are more or less directly aimed at influencing the selection of governmental personnel and/or the actions that they take (Verba, Nie, Kim 1978, 1). Other often-cited definitions from the same era are quite similar: political participation was understood as "actions of private citizens by which they seek to influence or support government and politics" or as "all voluntary activities by individual citizens intended to influence either directly or indirectly political choices at various levels of the political system" (Milbrath, Goel 1977, 2; Kaase, Marsch 1979, 42). At the same time, Verba and others admitted that all allocations of values in society are not determined by political elites alone—also, private and civil society actors could fill this function. Still, most political scientists at the time were not really interested in civic engagement in wider sense or in how citizens acted in relation to social elites outside of the political domain; rather, it was a matter of pointing out that citizens could also, in addition to voting, participate in politics in-between elections (Verba, Nie, Kim 1978, 47). This way of thinking about political participation at least implicitly opened up for analyses of activities that included not only voting behaviour, but also e.g. demonstrations, strikes, boycotts and other forms of protest behaviour. This line of thought was also quite early on followed by Barnes and Kaase in their seminal work on Political Action (Barnes, Kaase et al. 1979; Kaase, Marsh 1979; cf. Verba, Nie 1972; Verba et al. 1995; Montero, Westholm, van Deth 2007, 434). Consequently, actions

directed against all political, societal, media or economic actors (or elites) could be analysed as "political participation" (Teorell et al. 2007, 335-336; Norris 2002, 193).

Political participation takes on many different forms

Ekman and Amna 12 (Joakim Ekman and Erik Amna, "Political participation and civic engagement: Towards a new typology", Human Affairs, Volume 22, Issue 3, p. 283-300, July 2012, http://link.springer.com/article/10.2478%2Fs13374-012-0024-1)

The strength of the typology suggested by Teorell et al. is the explicit focus on manifest political participation in a more narrow sense—i.e. activities intended to influence actual political outcomes by targeting relevant political or societal elites (cf. Brady 1999). At the same time, the typology is wide enough to cover a lot more than just participation in elections. Moreover, the typology is based on previous studies that have demonstrated empirically that different forms of participation seem to be related: citizens involved in one mode or dimension of political behaviour tend to be involved in other forms of political behaviour within the same dimension, but not necessarily involved in political activities in other dimensions. For example, citizens involved in illegal demonstrations also tend to get involved in legal demonstrations, but not necessarily in conventional party activity. However, we would nevertheless like to argue that the typology suggested by Teorell et al. is not optimal. For one thing, it is not obvious that all "protest behaviour" could be tapped with measures like participation in demonstrations, strikes and illegal political action. Certain forms of voting—e.g. blank voting—could be described as a protest as well. Or, for that matter, non-voting, the signing of petitions and political consumption. In the typology suggested by Teorell et al., the two latter forms of participation are called "consumer participation", a label that may in fact obscure the protest character of the specific action. More importantly, the typology does not take into account latent forms of political participation, the kind of engagement that may be regarded "pre-political" or on "standby". This notion of latency is based on the simple observation that citizens actually do a lot of things that may not be directly or unequivocally classified as "political participation", but at the same time could be of great significance for future political activities of a more conventional type. If we are interested in declining levels of political participation, we must not overlook such potentially political forms of engagement. People of all ages and from all walks of life engage socially in a number of ways, formally outside of the political domain, but nevertheless in ways that may have political consequences. Even the relatively extensive typology developed by Teorell et al. ultimately fails to take such "pre-political" actions or activities into account. What do we miss, employing such a theoretical framework? A bit pointedly, only the rest of the iceberg. A lot of citizen engagement in the contemporary democracies seems to be formally non-political or semipolitical on the surface, that is, activities not directly aimed at influencing the people in power, but nevertheless activities that entail involvement in society and current affairs. People in general discuss politics, consume political news in papers and on TV or on the Internet, or talk about societal issues. People are aware of global problems, like environmental issues and the poverty or HIV situation in different parts of the world. People have political knowledge and skills, and hold informed opinions about politics. Some people write to editors in local papers, debating local community affairs. Others express their opinions on-line. Moreover, people with such attention to societal affairs take more active part in society as well, in different ways. People donate money, to support the building of schools or clean water delivery systems in developing countries, or to support research on cancer and heart diseases. People of all ages recycle. People organise car pools to get to work in an environmental friendly way. All of this is excluded from the typology suggested by Teorell et al. Although this is perfectly reasonable, we still feel that it is a shortcoming, since all these things may be important for us to accurately analyse and understand the conditions for political participation in different countries. What is more, if we are interested in explaining different forms of engagement in political affairs among different groups in society, e.g. youth, women, or immigrants, we certainly cannot afford to overlook these aspects of "pre-political" orientations and activities. The closest thing to the notion of "latent participation" we find in the works of Schudson (1996; 1999) and his notion of "monitorial citizens". Schudson's optimistic claim is that citizens today are not uninterested or uninformed

about politics, or lack political efficacy; they just take a deliberate anticipative stand in which they seek out information about politics and stay interested. And (only) when they feel that it is really imperative, they will intervene or act politically. They thus avoid conventional channels of political participation; but it is not correct to say that they are not politically involved; they are, as "monitorial citizens". This notion is close to various ideas about "post-modern" orientations among citizens today (cf. Hooghe, Dejaeghere 2007, 250-251; Inglehart 1990; 1997). As we have demonstrated so far, "civic engagement" has arguably become something of a catch-all concept in recent years, less than ideal for precise empirical analyses of the conditions for citizens' involvement in society. Furthermore, the literature on "political participation" stands out as too narrow in scope, in some respects. Important aspects of citizens' political (or pre-political) engagement are systematically overlooked, using the standard definitions of political participation. Here, the idea is thus to enhance our understanding of the much-debated declining levels of political engagement, low electoral turnout, and eroding public confidence in the institutions of representative democracy, by constructing a new typology of citizens' political and "pre-political" behaviour (here conceptualised as "civic engagement" and "social involvement").

Political participation doesn't necessarily have to relate to or be the government

Ekman and Amna 12 (Joakim Ekman and Erik Amna, "Political participation and civic engagement: Towards a new typology", Human Affairs, Volume 22, Issue 3, p. 283-300, July 2012, http://link.springer.com/article/10.2478%2Fs13374-012-0024-1)

Turning next to manifest political behaviour, the idea is to emphasise that what we refer to as actual "political participation" is quite simply all actions directed towards influencing governmental decisions and political outcomes. It is goal oriented or rational, if you will. It is observable and can be measured straightforwardly. It has to do with the wishes of ordinary citizens to influence politics and political outcomes in society, or the decisions that affect public affairs. Within the framework of a representative democracy, this is what we in our typology refer to as formal political participation. Citizens vote in the general elections, in order to support some parties or candidates, or to make sure others will not gain too much influence. People take part in referenda for similar reasons. To some, it may be a deliberate political act to abstain from voting in an election or a referendum, as a protest against the political order or the incumbents. Or, they may cast a blank vote in an election to demonstrate political dissatisfaction. Other types of formal political participation, on the individual level, cover what other scholars have referred to as "contact activities". Citizens may write to politicians or civil servants, in order to try to influence the political agenda or political outcomes. Also, individuals may run for office themselves, in local or national government. As for "formal" collective forms of political behaviour, the typical example would be membership: in a political party, a trade union, or any organisation with a distinct political agenda, e.g. human rights advocacy groups, peace organisation, or environmental groups. However, political participation need not relate directly to the formal political institutional framework of a country (the parliamentary sphere) or to the conventional actors within that framework (political parties, political actors, trade unions and organisations). In order to influence the political agenda or the political outcomes, citizens may engage in extra-parliamentary activities and manifestations, sometimes referred to as protest behaviour or "unconventional" political participation. Here however, we have deliberately avoided the notion of "unconventional" participation, since such forms of what was once considered protest behaviour—like signing petitions or taking part in demonstrations and strikes—are not really unconventional any more. Instead, we simply talk about extra-parliamentary forms of political participation, and make a special point out of distinguishing between legal and illegal forms of extra-parliamentary activism. Legal forms of extra-parliamentary activities include participation in demonstrations, strikes and other manifest forms of protest actions. Also, under this heading we place membership in (or activity within) groups or parties that deliberately stand outside of the parliamentary sphere, like network-based social movements or political actions groups of various kinds. Such forms of political participation include involvement in e.g. women's rights groups, animal protection organisations, or the global justice movement. Such expressions of political interest and channels for political participation seem to fit young people particularly well; it is not organised in a conventional (or hierarchical) way, like a political party, nor is it just about supporting a good cause. Extra-parliamentary activity within network-based groups provides its members or supporters with a sense of "doing something", an opportunity to personally take a stand and make a difference. For many people, the manifest political activities becomes concentrated to particular and not seldom spectacular events, like the European Social Forum (ESF) meetings or counter-demonstrations at G8 meetings or EU top meetings. Also, on the individual level, extra-parliamentary activism could come in the form of signing or collecting petitions, handing out political leaflets, or boycotting/"boycotting". Certain brands and products are bought—or refuted—for ideological, ethical or environmental reasons. This is also a way for ordinary citizens to directly influence the people in power (not necessarily politicians), and thus a rational form of manifest political action. In an emerging political science literature, such behaviour is referred to as "political consumption" (Stolle, Hooghe, Micheletti 2005). Some forms of extra-parliamentary political activities are unlawful, like participating in illegal demonstrations or violent protests bordering on riots. For example, in Europe, the autonomous radical left has since the 1970s been something of a standing feature in some major cities, like Berlin, Paris and Copenhagen. Other forms of illegal political action encompass animal liberation groups that set animals free or attack stores selling furs or laboratories where animal testing is conducted. Anti-sexist attacks on porn shops by militant feminist groups would also fit this category, alongside all sorts of civil disobedience activities.

Civic engagement can be community-based approaches too

Ekman and Amna 12 (Joakim Ekman and Erik Amna, "Political participation and civic engagement: Towards a new typology", Human Affairs, Volume 22, Issue 3, p. 283-300, July 2012, http://link.springer.com/article/10.2478%2Fs13374-012-0024-1)

Civic engagement conventionally refers to activities by ordinary citizens that are intended to influence circumstances in society that is of relevance to others, outside the own family and circle of close friends (Adler, Goggin 2005, 241). In our typology (Table 1 and 2), the concept refers specifically to such individual or collective actions noted above (cf. Zukin et al. 2006). People engage in society in a number of different ways: they discuss politics, follow political issues, write to editors, donate money, and recycle for environmental reasons. People do voluntary work to help others. People get organised

to solve local problems or to improve conditions for certain groups in society. In Table 1, we place all such activities under the heading civil participation, which we also think of here as latent political participation. To be very clear, the civil actions we refer to are of course manifest (observable) behaviour as well, but "latent" in relation to specific political parliamentary and extra-parliamentary actions. Again, this reflects our wish to cover not only activities intended to influence actual political outcomes by targeting relevant political or societal elites, but activities and forms of engagement that could very well be of great relevance for e.g. future manifest political action, even if "pre-political" or "potentially political" rather than directly political as such. Of course, to cover such actions also gives us a more nuanced picture of the total engagement/participation situation in a given country at a given point in time, and consequently, we become better equipped to analyse supposed crises of democracy and participation. Also, the distinction is made to point out that there are limits to what we would refer to as political participation. Not everything fits this category. Recycling, for example, even if done for environmental reasons, is not "political participation" in our typology, since the action is not directly aimed at any specific actor (like a boycott, for example). Rather, recycling for environmental reasons could be seen as an act of civic engagement in our typology

Debate Space Key

The Debate space is key to analyze questions of oppression

Reid-Brinkley, '08 (Dr. Shanara R. Reid-Brinkley, professor at the University of Georgia focusing on racial studies, argument and performance, and black feminist theory, she is also the director of debate, "The Harsh Realities of" acting Black": How African-American Policy Debaters Negotiate Representation Through Racial Performance and Style", https://getd.libs.uga.edu/pdfs/reid-brinkley_shanara_r_200805_phd.pdf

The attempts at educational reform are not limited to institutional actors such as the local, state, and federal governments. Non-profit organizations dedicated to alleviating the black/white achievement gap have also proliferated. One such organization, the Urban Debate League, claims that "Urban Debate Leagues have proven to increase literacy scores by 25%, to improve grade-point averages by 8 to 10%, to achieve high school graduation rates of nearly 100%, and to produce college matriculation rates of 71 to 91%." The UDL program is housed in over fourteen American cities and targets inner city youths of color to increase their access to debate training. Such training of students defined as "at risk" is designed to offset the negative statistics associated with black educational achievement. The program has been fairly successful and has received wide scale media attention. The success of the program has also generated renewed interest amongst college debate programs in increasing direct efforts at recruitment of racial and ethnic minorities. The UDL program creates a substantial pool of racial minorities with debate training coming out of high school, that college debate directors may tap to diversify their own teams. The debate community serves as a microcosm of the broader educational space within which racial ideologies are operating. It is a space in which academic achievement is performed according to the intelligibility of one's race, gender, class, and sexuality. As policy debate is intellectually rigorous and has historically been closed to those marked by social difference, it offers a unique opportunity to engage the impact of desegregation and diversification of American education. How are black students integrated into a competitive educational community from which they have traditionally been excluded? How are they represented in public and media discourse about their participation, and how do they rhetorically respond to such representations? If racial ideology is perpetuated within discourse through the stereotype, then mapping the intelligibility of the stereotype within public discourse and the attempts to resist such intelligibility is a critical tool in the battle to end racial domination.

State Debate

State Inevitable and Key

State is inevitable and necessary part to get rid of current mechanisms that exist and cause violence

Welsh et al 10 (John F. Welsh, Independent Scholar (Louisville, KY, USA), E. Wayne Ross University of British Columbia Kevin D. Vinson University of the West Indies, "To Discipline and Enforce: Surveillance and Spectacle in State Reform of Higher Education," Vol.3, No. 2 (February 2010) Pp. 25-39)//ghs-VA

At the base of the society of the spectacle is the division of labour produced by the specialization of political power. "The specialized role played by the spectacle is that of spokesperson for all other activities … and the source of the only discourse which society allows itself to hear" (Debord 1994:28). Politically, the spectacle is an endless discourse "upon itself in an uninterrupted monologue of self-praise. The spectacle is the self-portrait of power in the age of power's totalitarian rule over the conditions of existence" (29). The spectacle's division of society into those who wield power and those who passively observe or contemplate the spectacle "is inseparable from the modern State, which, as the product of the social division of labor and the organ of class rule, is the general form of all social division" (30). For Debord, the spectacle maintains its own regime of control and discipline, differentiated from surveillance and the Panopticon. The spectacle exists for its own reproduction and, through the economic and political realms, subordinates all human life to its needs. It controls by isolating and fragmenting, distorting communication, alienating human action, and restructuring communication to ensure oneway, instantaneous messaging. It operates to mitigate community and dialogue and, thus, to control image, conflict, and change. Those who control images have the ability to mystify being and hierarchical power relations within the spectacle. Both Foucault and Debord articulated libertarian and antistatist visions of power, authority, and control in contemporary society. Both are **centrally concerned with the role of the state** and the mechanisms it uses to ensure direct and ideological social control in a society characterized by a loss of community and the structures of civil society that mediate relationships among people. Foucault's studies envisioned a Panopticon of surveillance. Debord's studies envisioned society as a collection of spectacles where appearance is more important than being. What is unique today is the merging of surveillance and spectacle where it is technologically possible and culturally desirable to see and be seen simultaneously and continuously. The potential of a totally administered society becomes more real as culture and technology become media through which everyone can watch everyone across all time and space. At the extreme, society becomes nothing more than a totality of isolated individuals incessantly under surveillance whose relationships are mediated by images. Postsecondary reform provides one case in which the merger of surveillance and spectacle can be understood, and which can itself be understood as surveillance and spectacle. One example of the operation of surveillance is the hierarchical observation of the attitudes, behaviours, and performances of institutions, programs, faculty/staff, and students within higher education. An example of spectacle occurs in the presentation and reporting of institutional and system performance to higher education's many constituencies. Both surveillance and spectacle elevate image above authenticity and operate as vehicles of social control, political domination, and cultural conformity.

State K2 Solve Surveillance

Individual acts of resistance reinforce the surveillance state apparatus – legislative change is key
Monahan 10 (Torin, Professor of Communication Studies at The University of North Carolina at Chapel Hill, "Surveillance in the time of Insecurity," 2010, Chapter 9 pg. 128-130)//ghs-VA

Resistance to surveillance, especially to dominating forms of surveillance, is a vital dimension of power negotiations. As Michel Foucault observes, "Where there is power, there is resistance, and yet, or rather consequently, this resistance is never in a position of exteriority in relation to power."1 Put differently, resistance is not reactive or in dialectical relationship to power; rather, it is co-constitutive of it. There are clearly many forms that resistance to surveillance can take; they range from civil society organizations like the American Civil Liberties Union challenging government spying programs in courts, on one end of the spectrum, to individuals not complying with marketers' requests for personal information like zip codes and e-mail addresses, on the other. People are not simply passive subjects compliantly succumbing to demands for their behaviors, preferences, and beliefs to become more transparent to and controllable by others. Nevertheless, when the field for social action and identity construction is radically constricted, opportunities for effective resistance—at least effective resistance without great personal risk—are diminished. One dominant argument of this book, for instance, is that neoliberal policies and practices have transformed public spaces and rights into private ones and have individualized what might be thought of as collective problems. Demands for people to become insecurity subjects fit neatly within this neoliberal framework because these demands push responsibility onto individuals to meet security needs through consumption, regardless of the veracity of security threats or their probability of actualizing. Resistance to surveillance can also function within and therefore unintentionally reinforce these security cultures **if it does not also challenge the rules** that govern possibilities for resistance. To make this case, this chapter analyzes practices of countersurveillance by activists and media artists—particularly against video and closed circuit television (CCTV) systems in urban areas—and theorizes their political implications. Countersurveillance activism can include disabling or destroying surveillance cameras, mapping paths of least surveillance and disseminating that information over the Internet, employing video cameras to monitor sanctioned surveillance systems and their personnel, or staging public plays to draw attention to the prevalence of surveillance in society. In some cases, marginal groups selectively appropriate technologies that they might otherwise oppose when used by those with institutional power.2 These examples illustrate the underdetermination of technologies and suggest further avenues for political intervention through countersurveillance. However, because surveillance systems evolve through social conflict, countersurveillance practices may implicate opposition groups in the further development of global systems of control. Countersurveillance operates within and in reaction to ongoing global transformations of public spaces and resources. According to social theorists, a crisis in capital accumulation in the 1970s precipitated a shift from mass production to flexible production regimes, catalyzing organizational decentralization, labor outsourcing, computerized automation, just-in-time production, and, increasingly, the privatization of that which has historically been considered "public."3 These structural transformations aggravated conditions of social inequality, leading to the development of new mechanisms of social control to regulate bodies in this unstable terrain. Some of the most effective forms of social control are those that naturalize the exclusion of economically or culturally marginalized groups through architecture or infrastructure. Mass incarceration of over 2.3 million individuals in the United States alone is one extreme measure of such postindustrial exclusion.4 Less dramatically, but perhaps more pervasively, fortified enclaves such as gated communities, shopping malls, and business centers have multiplied exponentially over the past decade and seem to be as prevalent in "developing" as in "developed" countries.5 Additionally, privatized streets, parks, and security services effectively sacrifice civic accountability and civil rights while increasing affordances for the monitoring of public life.6 Finally, telecommunications and other infrastructures unevenly distribute access to the goods and services necessary for modern life while facilitating data collection on and control of the public.7 Against this backdrop, the embedding of technological surveillance into spaces and infrastructures serves to augment not only existing social control functions but also capital accumulation imperatives, which are readily seen with the sharing of surveillance operations and data between public and private sectors.8 Through a range of interventions into the logic and institutions of global capitalism, countersurveillance tacticians seek to disrupt these trends in the privatization, sanitation, and elimination of public spaces, resources, and rights. While the ideologies and intentions of those engaging in countersurveillance are manifold and disparate, they are unified in the mission of safeguarding— or creating—the necessary spaces for meaningful participation in

determining the social, environmental, and economic conditions of life. Because of this orientation, the term countersurveillance will be used here to indicate intentional, tactical uses or disruptions of surveillance technologies to challenge power asymmetries. In this chapter I review several countersurveillance practices and analyze the power relations simultaneously revealed and reproduced by resistance to institutionalized surveillance. The emphasis here is upon the framing of surveillance problems and responses by activists, or on points of symbolic conflict rather than physical confrontation. Thus, it is assumed that while countersurveillance practitioners may have immediate practical goals, such as circumventing or destroying video cameras, that they are foremost engaged in acts of symbolic resistance with the intention of raising public awareness about modern surveillance regimes. I analyze two categories of countersurveillance efforts—interventions into the technical and social faces of public surveillance—and then theorize the efficacy and implications of countersurveillance more generally. The data are drawn primarily from Web sites, video productions, and publications, but I conducted several interviews with activists in the United States to corroborate the critical readings offered here. The main argument is that activists tend to individualize both surveillance problems and methods of resistance, **leaving the institutions, policies, and cultural assumptions that support public surveillance relatively insulated from attack**. Furthermore, while the oppositional framing presented by activists (that is, countersurveillance versus surveillance) may challenge the status quo and raise public awareness, it also introduces the danger of unintentionally reinforcing the systems of social control that activists seek to undermine.

Individual Reflection Bad

Institutional change is key – abstract post-modernism ignores the reality of everyday people

Monahan 10 (Torin, Professor of Communication Studies at The University of North Carolina at Chapel Hill, "Surveillance in the time of Insecurity," 2010, Chapter 9)//ghs-VA

This <u>countersurveillance intervention is explicitly conceived of as an art project</u> that appropriates surveillance technologies to challenge their dominant meanings and uses. <u>Mann mobilizes a tactic he calls "reflectionism," or reflecting experiences of being surveilled back on the surveillers, with the goal of destabilizing</u> store <u>employees to make them realize that they are merely "totalitarianist officials" involved in acts of blind obedience</u> and conformity. 21 Mann writes: "It is my hope that the department store attendant/ representative sees himself/herself in the bureaucratic "mirror" that I have created . . . [and that this helps them] to realize or admit for a brief instant that they are puppets and to confront the reality of what their blind obedience leads to."22 Beyond this somewhat dubious educational goal, the Shooting Back project further aspires to explode the rhetoric behind systematic public surveillance in places of commerce. For example, the project raises the question: if surveillance is intended for public safety, then would not more cameras increase the potential for such safety? The answer is an obvious no, because the primary intended function of cameras in stores is theft prevention, and they are as often trained on employees as on customers.23 Shooting Back is a provocative project because it calls attention to the embodied experiences of watching and being watched, of recording and being recorded. Usual uses of video surveillance, in contradistinction, tend to erase all sense of embodied action and interaction through their ambiguity (you do not know who is watching or when), through their integration into infrastructure (they become the taken-for-granted backdrop to social life), and through their mediation of experience (camera operators may feel a disconnect from those they are watching, and vice versa). Shooting Back disrupts the illusion of detached, objective, impersonal, disembodied monitoring—a camera in one's face personalizes the experience of being recorded in a very direct and uncomfortable way. One can speculate that the project is especially destabilizing and annoying for employees, because for them store surveillance systems and monitoring practices are institutional projections that they are relatively powerless to alter. <u>Mann's</u> rather unforgiving <u>denouncement of individuals working in stores</u>, however, <u>reveals certain assumptions about the problems of modern surveillance</u>. First, by criticizing employees as being "puppets" who blindly accept their companies' explanations for surveillance and comply with company policies, Mann implies that all individuals are rational actors with equal social and economic footing. Thus, if low-income employees elect not to fight the system as he does, then they must be either ignorant or weakwilled, or both. Second, <u>by calling store clerks and security guards representatives of totalitarian surveillance regimes, Mann conflates individuals with the institutions they are a part of,</u> effectively **sidestepping the important but more difficult problem** of <u>changing institutional relations, structures, or logics</u>. Both these assumptions lead to the conclusion that one can contend with the problem of rampant surveillance by intervening on the level of the individual and by educating people about their complicity with the systems. Unfortunately, <u>the fact that people have very real dependencies upon their jobs or that vast power differentials separate workers from the systems they work within</u> (and perhaps from activists and academics as well) <u>become unimportant issues once the critique of surveillance is abstracted and individualized in this way</u>. Surveillance Camera Players The Surveillance Camera Players (SCP) is a New York–based ad hoc acting troupe that stages performances in front of surveillance cameras in public places.24 Founded in 1996 with a performance of Alfred Jarry's Ubu Roi in front of a subway station, it has since performed numerous play adaptations of famous (and not-so-famous) works of cautionary fiction or troubling nonfiction, ranging from George Orwell's 1984 to Wilhelm Reich's The Mass Psychology of Fascism.25 Because most surveillance cameras are not soundequipped, the troupe members narrate their performances with large white placard signs, which they hold up for remotely located camera operators to read. A performance of 1984, for instance, uses placards describing scene locations (for example, "ROOM 101") or key lines from the book (for example, "WE ARE THE DEAD").26 When possible, fellow troupe members document the plays with video cameras and distribute information brochures to curious spectators. The players are routinely confronted by security guards or New York City police and asked to disperse, often before the conclusion of their performances. Up close, it appears as if SCP is directing its messages at camera operators, police, or security guards. The troupe's determination to notice and respond to video surveillance, rather than let it fade uninterrogated into the urban landscape, places it in confrontation with institutional representatives. By speaking to cameras (and their representatives), the actors become perceived as threats to the political and economic systems that support and indeed demand public surveillance, so institutional agents move in to contend with the perceived threat. <u>As with Steve Mann's concentration on individuals, SCP performances force interactions with others, and, because of this, they draw attention to the always present embodiment of surveillance</u>

technologies and the social relations they engender. If one takes a step back, however, the Surveillance Camera Players are **really performing for the public**: they enroll the unwitting police and security personnel into their play so that the public can witness the spectacle and perhaps the absurdity of modern surveillant relations. The troupe acknowledges this staging explicitly: "The SCP no longer consider their primary audience to be the police officers and security guards who monitor the surveillance cameras installed in public places. Today, the SCP concentrate on the people who happen to walk by and see one of their performances."27 In a mode true to its "situationist" theoretical orientation, SCP affirms that the revolutionary potential of art thoroughly infuses everyday life because everyday life is a complex artistic performance. In this vein, SCP seeks to repoliticize the everyday by inviting the public to participate in its performances, by inviting all of us to recognize that we are already enmeshed in political performances and that we are required to act—and act well. The primary adversary for SCP is the state. SCP is concerned about the erosion of public space and personal privacy brought about by the state's support of police surveillance and its permissive non-regulation of private surveillance. Its members write: The SCP is firmly convinced that the use of video surveillance in public places for the purposes of law enforcement is unconstitutional, and that each image captured by police surveillance cameras is an unreasonable search. We also believe that it is irresponsible of the government to allow unlicensed private companies to install as many surveillance cameras as they please, and to install them wherever they please.28 The implication is that the state is not living up to its responsibility to safeguard civil liberties through improved regulation of public surveillance. Thus, SCP performances confront individual agents of public and private sector security, but the troupe's primary audience is the general public, whom it hopes to cast as transformative actors who can collectively agitate for social change, **especially on the level of public policy**. Both Steve Mann's Shooting Back project and the Surveillance Camera Players' performances intervene on an overtly social level by challenging institutional agents of surveillance. Mann draws upon relatively sophisticated technical apparatuses to place store representatives in uncomfortable positions. By doing so, he aims to reflect back to them the hypocritical logics and empty rhetoric that they impose upon others and to raise their awareness about their complicity with the surveillance society. SCP, on the other hand, employs decidedly low-tech countersurveillance props such as signs and costumes to address police and security guards with the aim of creating a public spectacle—and to raise public awareness about the everyday surveillance spectacle of which we are all already a part. These two interventions share in common their focus on individual representatives of institutionalized surveillance. By engaging with store employees or speaking to those behind the cameras, Mann and SCP seek to reveal and challenge the larger structures and rationalities that those individuals represent. A key difference is that SCP overtly enrolls members of the public in activist performances, whereas Mann's project invites public involvement only through the technical mediation of Web sites. Because of this difference, SCP seems more successful at moving beyond its initial site of intervention (the individual) to critique institutions for their dominance over the public, which is a relationship betrayed by the ironic juxtaposition of police removing SCP performers from public streets while private companies remain free to monitor the public at will. While each of the four countersurveillance interventions discussed in this chapter so far seeks to raise public awareness and to mobilize for social change, none is completely successful at moving its critique from the individual to the institutional plane. SCP comes closest to doing this, but so far its plays remain too isolated and discrete to effect long-term change. This deficiency may be in part because activists construct surveillance problems in **individualized and abstracted terms in order to make them somewhat tractable and receptive to intervention**. The challenge lies in ratcheting up the unit of analysis to the **institutional level so that lasting change can be achieved**. The desired outcomes might take the form of better regulation and oversight of surveillance and/or meaningful democratic participation in the process of setting surveillance policies, for instance. In the long run, as I will argue in the next section, the oppositional framing of surveillance versus countersurveillance may be counterproductive for meeting these goals.

AT: Rejection Solves

Individual approaches reify neoliberalism and can't solve

Monahan 10 (Torin, Professor of Communication Studies at The University of North Carolina at Chapel Hill, "Surveillance in the time of Insecurity," 2010, Chapter 9)//ghs-VA

Countersurveillance and Global Systems of Control When viewed from a distance, <u>surveillance and countersurveillance appear to be engaged in a complicated dance</u>, with the larger, cumbersome partner pushing and pulling while the smaller, defter dancer negotiates her- or himself—and others—out of harm's way. <u>The oafish leader is</u>, of course, <u>the state</u> and corporate apparatus surveilling the public, <u>and the partner is the collective of activist adversaries circumventing or destabilizing surveillance systems</u>. Drawing upon Michel Foucault's insights about the disciplinary potential of modern bureaucratic regimes, one could read surveillance societies as bringing about disciplinary or panoptic relationships.29 But <u>Foucault was</u> also <u>insistent upon the productive capacity of power to generate and sustain social relations apart from any property of control that might be possessed by individuals</u>. As Gilles Deleuze expresses it: "Power has no essence; it is simply operational. It is not an attribute but a relation: the power-relation is the set of possible relations between forces, which passes through the dominated forces no less than through the dominating."30 Therefore, <u>the metaphor of the panopticon is not a static or transcendent statement of disciplinary power but is instead a **contingent and situated articulation of modernity** in a fluid field of production regimes</u>.31 In specific response to Foucault's work, Michel de Certeau's book The Practice of Everyday Life provides a point of departure for thinking about the agency of individuals and groups within disciplinary power structures.32 For de Certeau, <u>the practices of the dominant dancer clearly would be strategic ones of building control structures to regulate the activities of those in the field of power, whereas the practices of the defter dancer would be much more tactical, **poaching off the existing structures** to create new meanings and possibilities</u>. <u>The two dancers may be in opposition, but that does not change the fact that they are engaged in a reciprocal relationship and collective activity</u>—although without comparable degrees of influence or control. It is this tense connection that is worth probing, even if there is never an embrace or a union, because after all the exchanges of strategic structuring and tactical appropriation, the dance has moved somewhere across the floor and created a pattern, or a logic, or a world that was not there before.33 Examples of this problematic, if not dialectical, relationship between surveillance and countersurveillance practitioners abound. The capture on videotape of the beating of Rodney King in Los Angeles in 1991 did not necessarily catalyze correctives to actions of police brutality, nor did it motivate greater police engagement with urban communities. Instead, police have seemingly used this event to further distance themselves from and maintain antagonistic relationships with communities,34 while learning from the blowup that they must exert greater control over the conditions where brutality occurs. This enhanced and learned control can be seen in the torture case of Haitian immigrant Abner Louima by the New York City police in 1997. Louima was beaten in a vehicle on the way to the 70th Precinct stationhouse and was then sodomized with the stick from a toilet plunger in the police restrooms. 35 Regardless of the fact that the story did finally emerge, the police officers obviously exercised extreme caution in regulating the places of abuse (a police vehicle and a police restroom), and one can speculate that this level of control was a response to their fear of being surveilled and thus held accountable for their actions. Another example of the dance of surveillance and countersurveillance can be witnessed in the confrontations occurring at antiglobalization protests throughout the world. <u>Activists have been quite savvy in videotaping and photographing police and security forces as a technique not only for deterring abuse but also for documenting and disseminating any instances of excessive force</u>. According to accounts by protesters of the World Trade Organization (WTO), the police, in turn, now zero in on individuals with video recorders and arrest them or confiscate their equipment as a first line of defense in what has become a war over the control of media representations.36 Similarly, vibrant Independent Media Centers (IMCs) are now routinely set up at protest locations, allowing activists to produce and edit video, audio, photographic, and textual news stories and then disseminate them over the Internet, which serves as an outlet for alternative interpretations of the issues under protest.37 As was witnessed in the beating of independent media personnel and destruction of an Indymedia center by police during the 2001 G8 protests in Genoa, Italy,38 those with institutional interests and power are learning to infiltrate "subversive" countersurveillance collectives and vitiate their potential for destabilizing the dominant system. A final telling example of the learning potential of institutions was the subsequent 2002 G8 meeting held in Kananaskis, which is a remote and difficult-to-access mountain resort in Alberta, Canada. Rather than contend with widespread public protests and a potential repeat of the police violence in Genoa (marked by the close-range shooting and death of a protester), the organizers of the mountain meeting exerted the most extreme control over the limited avenues available for public participation: both reporters and members of the public were excluded, and a no-fly-zone was enforced around the resort. It could be that <u>grassroots publicizing of protests</u> (through Indymedia, for example) <u>is</u>

ultimately more effective than individualized countersurveillance because such protests are collective activities geared toward **institutional change**. While the removal of the 2002 G8 meetings to a publicly inaccessible location was a response to previous experiences with protesters and their publicity machines, this choice of location served a symbolic function of revealing the exclusionary elitism of these organizations, thereby calling into question their legitimacy. So, whereas mainstream news outlets seldom lend any sympathetic ink or air time to antiglobalization movements, many of them did comment on the overt mechanisms of public exclusion displayed by the 2002 G8 meeting.39 Michael Hardt and Antonio Negri would describe these ongoing exchanges between dominant and subordinate groups as a mutual and perhaps unwitting advancement of Empire—the larger system of global capitalism and its colonization of lifeworlds.40 They note, for instance, how humanitarian efforts by Western countries first establish discursive universal orders—such as "human rights"—as justification for intervention, and how these universals are then capitalized upon by military and economic institutions as rationales for imperialistic invasions. Similarly, activist struggles appear to teach the system of global capitalism, or those manning its operations, how to increase strategic efficiency by controlling spaces available for political opposition. From this perspective, the flexible ideologies of the 1960s counterculture movements may have disturbed the capitalist system, but in doing so they also described a new territory (the self) and a new mode of operation for the growth of capitalism: Capital did not need to invent a new paradigm (even if it were capable of doing so) because the truly creative moment had already taken place. Capital's problem was rather to dominate a new composition that had already been produced autonomously and defined within a new relationship to nature and labor, a relationship of autonomous production.41 The postindustrial colonizations of public spaces and resources today are outgrowths of an earlier colonization of "flexibility" as a viable and successful challenge to the rigidities of technocratic bureaucracies. I would build upon these observations to say that the conflicts between surveillance and countersurveillance practices today represent a larger struggle over the control of spaces and bodies. It is doubtful that most police or security forces are manipulating spaces and bodies with surveillance and other strategies because they intentionally wish to neutralize democratic opportunities; in fact, they probably believe that their actions of social control are preserving democracy by protecting the public and safeguarding the status quo. Be that as it may, such activities advance neoliberal agendas by eliminating spaces for political action and debate, spaces where effective alternatives to economic globalization could emerge and gain legitimacy if they were not disciplined by police and corporate actions. Therefore, it should not be seen as a coincidence that the demise of public spaces is occurring at the same time that spatial and temporal boundaries are being erased to facilitate the expansion of global capital. The two go hand in hand. Whereas one can readily critique Hardt and Negri for their attribution of agency to capitalism or to the amorphous force of Empire, their **systemic** viewpoint is worth preserving in what has become a contemporary landscape of social fragmentation, polarization, and privatization. Dominant and subordinate groups serve as asymmetrical refractions of each other in emerging global regimes. Surveillance and countersurveillance are two sets of overlapping practices selectively mobilized by many parties in this conflict, but the overall effect is unknown. Perhaps non-governmental organizations are the best place to look for effective countersurveillance movements on the institutional level. There are a host of remarkable groups tackling surveillance abuses in societies and lobbying for accountability and policy reform. Some of the best-known organizations are the American Civil Liberties Union, Privacy International, Electronic Privacy Information Center, Statewatch, and the Electronic Frontier Foundation. Other organizations represent niche issues of concern to specific audiences, such as Katherine Albrecht's fundamentalist Christian organization Caspian, which opposes RFID technologies on the grounds that they are the "mark of the beast" (see chapter 5). According to surveillance studies scholar Colin Bennett,42 who has done extensive research on civil society groups, their narrow focus on particular issues, especially on privacy, hinders coalition building for widespread policy changes or lasting social movements. In fact, focusing on privacy alone may hamstring such organizations at the outset because privacy is a highly individualized rather than collective concept, and it cannot meaningfully account for issues of power or domination.43 This does not mean that such groups or similar ones do not attempt to challenge surveillance from a collective standpoint, but in an individualistic political, legal, and cultural climate, such an approach meets with serious difficulties in generating support, especially financial support, for their efforts.

AT: Aff = State Good

A curtailment especially in context of surveillance calls into question the legitimacy of the state and doesn't affirm it

Newman 10 (Saul Newman, Reader in Political Theory at Goldsmiths, U of London, Theory & Event Volume 13, Issue 2)//ghs-VA

There are two aspects that I would like to address here. Firstly, the notion of demand: making certain demands on the state – say for higher wages, equal rights for excluded groups, to not go to war, or an end to draconian policing – is one of the **basic strategies of social movements** and radical groups. Making such demands does not necessarily mean working within the state or reaffirming its legitimacy. On the contrary, demands are made from a position outside the political order, and they often exceed the question of the implementation of this or that specific measure. **They implicitly call into question the legitimacy and even the sovereignty of the state** by highlighting fundamental inconsistencies between, for instance, a formal constitutional order which guarantees certain rights and equalities, and state practices which in reality violate and deny them.

AT: Identity

Reform has to be methodologically based around structural reform -- not a purely identity based response

Wills 12 (David Barnard, Research Fellow in the Department of Informatics and Sensors at Cranfield University, "Surveillance and Identity: Discourse, Subjectivity, and the State," 2012, pg. 24-28)//ghs-VA

<u>Resistance to Surveillance</u> There is a rich emerging literature on resistance to surveillance, which Lyon positions as an important corrective to the dystopian trends in surveillance research (2007:160). Much of this research necessarily involves paying attention to subjects of surveillance, their experience and activities. Lyon identifies a number of caveats when considering resistance to surveillance: firstly that <u>surveillance is ambiguous, it is not a purely negative phenomenon</u>, secondly that <u>surveillance is complex, with different institutions or perspectives playing a large part in the specific politics of surveillance</u>. Thirdly, that surveillance technology is not infallible (Lyon 2007:162). In analyzing surveillance, we should be wary of taking the claims of those designing or promoting surveillance technologies and practices as social fact, although intentions of technologists are important. Marx suggests that the existence of a potential for surveillance does not mean that this surveillance occurs, and that much of the reason for this is resistance of various types (Marx 2003:294). These three factors affect the way that surveillance is complied with, negotiated, and resisted. As the converse of resistance, surveillance is frequently complied with for reasons of: the widespread presence of surveillance practices, that many practices are taken for granted, that we are unaware of many surveillance practices, and that many systems are accepted as legitimate and necessary (Lyon 2007:164). Resistance can range from ad hoc and individual, (avoiding CCTV cameras by walking a different route) to organized and collective (joining a group to campaign against the introduction of identity cards), instrumental or non-instrumental, direct or strategic. Marx presents a typology of eleven forms of resistance to surveillance These include discovery, avoidance, piggy-backing, switching, distorting, blocking, masking (identification), breaking, refusal, cooperative and counter-surveillance moves (Marx 2003). These moves can be contrasted with explicitly political strategies to remove surveillance systems and practices through democratic political process or direct action. Work in political theory on resistance to surveillance often tends to take the form of analyses of privacy and practices of the regulation of personal data, emphasizing the individual, owned nature of privacy rather than collective or social resistance. Sociology has also contributed research into the experiences of the subject under surveillance. Insights have been drawn from the work of Goffman on the presentation of self (Goffman 1990). including the social work done by individuals to present an appropriate public face to other members of their social group. Additionally there are accounts drawing upon phenomenological and psychological approaches focusing on differing degrees of scopophobia and scopophillia (the fear and love of being watched) (Jay 1994). Many analyses of resistance to surveillance emerge from this level of analysis, focusing on the experience of the individual under surveillance (Ball & Wilson 2000; Koskela 2006; Matheson 2009). as do many of the artistic contributions to a cultural understanding of surveillance practices (Levin et al. 2002; MeGrath 2004). Lyon argues an important part of understanding resistance to surveillance is the subjectivities of those resisting surveillance, especially the alternate identities which can be mobilized against imposed and attributed surveillant representations (Lyon 2007:67). There is a politics of resistance associated with (he subject's own understanding of their identity or identities and interaction with the data double. <u>Another important question involves the connection between</u> **<u>individual and collective responses</u>** - understanding the ways in which individual resistance acts become taken up in collective and organized ways (Marx 2003:304). Monahan is concerned that <mark>current</mark> modes of <mark>activism</mark> tend to **leave institutions, policies and cultural assumptions** <mark>supportive of surveillance in place</mark> because of their focus upon <u>individualistic resistance to specific instances of surveillance</u> (Monahan 2006a: 1). Sieve Mann (Mann 2002) has popularised the practice and concept of sous-veillance, watching 'from below" in which surveillance technologies are turned upon those in power. Mann has built and advocated wearable cameras to facilitate this. This approach suffers from simple binary models of power, in which 'the powerful" do surveillance, and the less powerful are surveilled. Surveillance is not automatically effective in supporting the ends to which it is put. <u>Sousveillance is</u> therefore best understood as <u>surveillance that is being used to draw attention to power relations</u> (of surveillance) <u>and as a type of consciousness raising activity</u>. There is nothing wrong with this, but to assume the automatic success (or subversiveness) of sousveillance is to perpetuate some of the myths about the automatic functioning of surveillance and visual power. Photojournalists have long realised that <u>simply documenting or creating an image of some immoral or harmful practice is</u> **not sufficient** <u>to bring about its end</u>. Mann argues that photographing low level clerks in department stores1 is an effective way of getting to speak with the manager. This misses that the clerk is already likely under surveillance by in-store CCTV system. Surveillance, as we have seen is not simply an up/down binary Mann's form of resistance is also not available to all, being based upon technological literacy, but also on social capital. <mark>Rose identifies a problem with identity based responses to surveillance</mark>. He argues <u>experience of the actuarial processes of contemporary surveillance practices</u> **does not produce collective identities** <u>in the same way as the collective experience of</u> workplace <u>exploitation or</u>

racism (Rose 1999:236). Anticipating the same impediments, Ogura provides a potential solution to this problem. He suggests that "identity politics" should be drastically transformed. Rather than attempting to 'establish the collective identity of social minority groups against cultural, ideological or political integration or affiliation by social groups' he points in the direction of a "de-convergent politics' able to resist methodological individualism and biological determinism he sees as present in information technology identity systems. Whilst he acknowledges that we have not yet seen such a social movement or politics based on identity, he identifies "criminal* identity activity, such as fake ID cards and identity theft as manifestations of a surveillance orientated society's focus on methodological individualism and biological determinants of identity (such as biometrics). He predicts the possibility of a politics based around self-determination of identity, potentially associated with the (non-criminal) use of multiple identities, collaborative identities or anonymity (Ogura 2006). If the exploitation of identity expands and deepens, resistance against it to achieve self determination rights of who 'is' will also follow. In the very near future, we may grab hold of an alternative identity politics based on an identity of identities that is against identity exploitation. (Ogura 2006:292) Brian Martin suggests that a sense of unfairness is not inherent in the act of surveillance, but rather people's sense of unfairness is subject to a continual struggle between interests. He places privacy campaigners on one side, trying to increase a sense of concern about surveillance, with surveillance purveyors on the other side. This suggests that motivations for resistance come from understanding and evaluation of the practice of surveillance, as well as the meaning of fairness, the possibility of resistance, subject positions and political alternatives, all of which are contested discursively. One of the key elements of interpretative struggles is language (Martin 2010) Aaron Martin, Rosamunde Van Brakel and Daniel Bernhard conducted an insightful review of the literature on resistance in international relations, social psychology, information systems and education, to counter a tendency in surveillance studies accounts to focus exclusively on the resistance relationship between the surveyor and the surveilled. They address an assumption that the resisting actor, is an autonomous agent capable of interaction with technology and observers, resistance emerging because surveillance is recognised and rejected. They also find this binary in the sousveillance literature. They find instead that resistance is multiple and rhizomatic, and that many actors beyond the surveillance subject are capable of resistance. This includes powerful actors seeking to prevent other resistance, and. drawing upon information systems perspectives, technologies themselves. They find that resistance is not an unavoidable consequence of surveillance, but the result of interpreting surveillance as overbearing, and that this representation is dependent upon specific relational histories of the actors involved, including the content of previous interactions. The ability of an actor to resist, the ways they resist and the actors at whom their resistance is directed are determined in large part by the power relations of the resisting actor to others as well as by the context. (Martin et al. 2009:226) From education contexts they draw the insight that not all authority is resisted, and that authority can be allowed if it is perceived as legitimate and just. On the other hand, resistance is problematic if there is no clearly identifiable figure of dominance. They also identify the way that structural roles affect resistance, showing how different actors are likely to resist at different stages of a technology development and introduction lifecycle. For Martin et al, understanding resistance to surveillance requires understanding the context, roles and relationships of various actors. We can expand this account by suggesting these shared histories and contexts also depend upon conventional representations of the world, and of the structures of legitimate and illegitimate power. Roles are not just structural but are subjective.

Role Playing/Simulation Good

Rice – USFG Key

Public resistance to surveillance starting at the USFG is critical – creates the most effective advocates and change

Rice 15 (Rebecca, University of Montana, "Resisting NSA Surveillance: Glenn Greenwald and the public sphere debate about privacy," pg online @ http://scholarworks.umt.edu/cgi/viewcontent.cgi?article=5439&context=etd)//ghs-VA

Public Sphere Resistance Based on these critiques, Greenwald identifies several actors who can change US surveillance policies: the public, the government, and journalists. As discussed above, the first group Greenwald calls on is the public, which he encourages to **deliberate to resist surveillance**. Greenwald reminds his audience that "it is human beings **collectively**, not a small number of elites working in secret, who can decide what kind of world we want to live in" (2014, p. 253). However, aside from average citizens, who can come together to discuss surveillance, Greenwald also names special actors within the public sphere. In the epilogue of NPTH, Greenwald says that Snowden's leaks triggered the first global debate about the value of individual privacy in the digital age and prompted challenges to America's hegemonic control over the Internet. It changed the way people around the world viewed the reliability of any statements made by US officials and transformed relations between countries. It radically altered views about the proper role of journalism in relation to government power. And within the United States, it gave rise to an ideologically diverse, trans-partisan coalition pushing for meaningful reform of the surveillance state (p. 248). These changes stem from the public sphere, and occurred through public discussion. Greenwald's "trans-partisan coalition" can be conceived of as a public, which he calls into being as he addresses this group in NPTH. Greenwald's created public. Warner (2002) encourages scholars to frame publics discursively, saying they exist "by virtue of being addressed" (p. 413). Greenwald calls a concerned public into being throughout NPTH, often by discussing his readers as a collective "we." Greenwald's created audience is concerned about surveillance, and **willing to take public action to advocate for reform**. Greenwald emphasizes the choice readers can make with Snowden's leaked NSA documents. He says that Snowden's leaks can create a new discussion about surveillance, or they can fade due to public apathy. In the introduction to NPTH, he writes That's what makes Snowden's revelations so stunning and so vitally important. By daring to expose the NSA's astonishing surveillance capabilities and its even more astounding ambitions, he has made it clear, with these disclosures, that we stand at a historic crossroads. Will the digital age usher in the individual liberation and political freedoms that the Internet is uniquely capable of unleashing? Or will it bring about a system of omnipresent monitoring and control, beyond the dreams of even the greatest tyrants of the past? Right now, either path is possible. Our actions will determine where we end up. (2014, p. 6). Greenwald gives the audience two choices and links their actions to the two potential paths. In this way, he begins the process of public deliberation, which Goodnight (2012a) describes as a momentary pause in which we examine political paths, both taken and untaken. "As deliberation raises expectations that are feared or hoped for, public argument is a way to share in the construction of the future," he says (Goodnight, 2012a, p. 198). Greenwald shares his interpretation of the choice the public must make with this information. He projects two alternative futures based on the public's deliberation about privacy. This shared future is emphasized through his use of the words "our," "everyone," and "we," which link readers together as the American public. Greenwald's projected paths put the decision into the readers' hand, emphasizing the public's ability to act and intervene in technical surveillance. Through invitations to deliberate, Greenwald addresses his readers as part of a public sphere. Greenwald also argues that deliberation is an effective way to resist surveillance and curb surveillance abuses. Greenwald offers an example from his own life. He says he first learned of the power of deliberation when he heard from Laura Poitras, another journalist who accompanied him on the trip to Hong Kong. She said that she had been detained in airports dozens of times as a result of her writing and filmmaking. Greenwald covered the interrogations of Poitras in a Salon article, which received substantial attention. In the months afterward, Poitras was not detained again. In NPTH, Greenwald writes "The lesson for me was clear: **national security officials do not like the light**. They act abusively and thuggishly only when they believe they are safe, in the dark. Secrecy is the linchpin of abuse of power, we discovered, its enabling force. Transparency is the only real antidote" (2014, p. 12). Greenwald generalizes this example to other abuses of power. He says that power **without deliberation** is "the ultimate imbalance, permitting the most dangerous of all human conditions: the exercise of limitless power with no transparency or accountability" (2014, p. 169). Greenwald presents public

deliberation as the solution and antithesis to surveillance, which he calls for the public to undertake. After addressing readers as members of this public, Greenwald names special actors within the public sphere who can also help to effect change. Government reform. First, Greenwald says the government must make changes in order to curb abuses from the NSA, and that readers should pressure the government to do so. Greenwald says that public branches of the government do not have enough control over the NSA. Giving examples of reform that occurred after his reporting, Greenwald says that he and Snowden were pleased by a bipartisan bill introduced to US Congress. This bill proposed defunding the NSA, which was "by far the most aggressive challenge to the national security state to emerge from Congress since the 9/11 attacks" (2014, p. 249). The bill did not pass, but only by a small margin, which Greenwald portrays as a hopeful sign of reform. Additionally, Greenwald suggests "converting the FISA court into a real judicial system, rather than the onesided current setup in which only the government gets to state its case, would be a positive reform" (2014, p. 251). Greenwald's suggestions for change go beyond individual acts to put pressure on government policy reform. By reforming the FISA court, the secrets of the NSA would be public knowledge. Though Greenwald writes about power from a Foucauldian perspective, he proposes large acts of resistance to the public problems created by surveillance in addition to small acts to resist the discipline of individual bodies. These ideas are compatible with Foucault's (1997) idea of critique, however, which he defines as "the art of not being governed quite so much" (p. 45). Greenwald asks the audience to resist through public sphere discussion in order to negotiate the way they are governed. He argues that discussion through the public sphere can alter power relations between citizens and the US surveillance state. Though the government is considered completely separate from the public sphere by many scholars (Habermas, 1974), others push back on this idea (e.g. Asen & Brouwer, 2001). In the case of the NSA, other government branches are considered members of the public by Greenwald. Greenwald notes that many congressional members were unaware of the tactics used by the NSA, including spying on Congress itself (2014). For these reasons, Greenwald specifically calls on Congress to be part of the solution. This should occur through legislative reform spurred by public pressure. Greenwald's summoned public addresses politicians as well as average citizens.

Mimoso – NSA

Debates over meta-data and the NSA and <u>uniquely key now</u> – outweighs your education claims.

Mimoso 14 (Michael, award-winning journalist and former Editor of Information Security magazine, a two-time finalist for national magazine of the year. He has been writing for business-to-business IT websites and magazines for over 10 years, with a primary focus on information security, "NSA Reforms Demonstrate Value of Public Debate," March 26, 2014, https://threatpost.com/nsa-reforms-demonstrate-value-of-public-debate/105052)//ghs-VA

<u>The president's proposal would end the NSA's collection</u> and storage <u>of phone data</u>; those <u>records would remain with the providers and the NSA would require judicial permission</u> <u>under a new court order</u> to access those records. The House bill, however, requires no prior judicial approval; a judge would rule on the request after the FBI submits it to the telecommunications company. "**It's absolutely crucial to understand the details of how these things will work**," the ACLU's Kaufman said <u>in reference to the "new court order</u>" mentioned in the New York Times report. "<u>There is no substitute for robust</u> Democratic **debate** in the court of public opinion and in the courts. **The system** of oversight **is broke and issues like these need to be debated in public**." <u>Phone metadata</u> and dragnet collection of digital data from Internet providers and other technology companies <u>is supposed to be used to map connections between foreigners suspected of terrorism and threatening the national security of the U.S. The NSA's dragnet</u>, however, <u>also swept up communication involving Americans</u> that is supposed to be collected and accessed only with a court order. The NSA stood by claims that the program was effective in stopping hundreds of terror plots against U.S. interests domestic and foreign. Those numbers, however, quickly were lowered as they were challenged by Congressional committees and public scrutiny. "<u>The president said the effectiveness of this program was one of the reasons it was in place</u>," Kaufman said. "<u>But</u> <u>as soon as these claims were made</u> public, journalists, **advocates** and the courts **pushed back** <u>and it could not withstand</u> <u>the scrutiny</u>. It's remarkable how quickly [the number of] plots turned into small numbers. The NSA was telling FISC the program was absolutely necessary to national security, but <u>the government would not go nearly that far in defending the program</u>. <u>That shows **the value of public debate and an adversarial process**</u> in courts."

State Education – Giroux

Political engagement is necessary – your ethical education absent concrete political reform is the exact reason the lefts progressivism fails.

Giroux 15 (Henry, currently holds the McMaster University Chair for Scholarship in the Public Interest in the English and Cultural Studies Department and the Paulo Freire Chair in Critical Pedagogy at The McMaster Institute for Innovation & Excellence, "Orwell, Huxley and the Scourge of the Surveillance State," 30 June 2015, http://www.truth-out.org/news/item/31639-orwell-huxley-and-the-scourge-of-the-surveillance-state)//ghs-VA

In this instance, the surveillance state is one that not only listens, watches and gathers massive amounts of information through data mining, allegedly for the purpose of identifying "security threats." It also acculturates the public into accepting the intrusion of commercial surveillance technologies - and, perhaps more vitally, the acceptance of privatized, commodified values - into all aspects of their lives. In other words, the most dangerous repercussions of a near total loss of privacy involve more than the unwarranted collecting of information by the government: We must also be attentive to the ways in which being spied on has become not only normalized, but even enticing, as corporations up the pleasure quotient for consumers who use new digital technologies and social networks - not least of all by and for simulating experiences of community. Many individuals, especially young people now run from privacy and increasingly demand services in which they can share every personal facet of their lives. While Orwell's vision touches upon this type of control, there is a notable difference that he did not foresee. According to Pete Cashmore, while Orwell's "Thought Police tracked you without permission, some consumers are now comfortable with sharing their every move online." (17) The state and corporate cultural apparatuses now collude to socialize everyone - especially young people - into a regime of security and commodification in which their identities, values and desires are inextricably tied to a culture of commodified addictions, self-help, therapy and social indifference. Intelligence networks now inhabit the world of major corporations such as Disney and Bank of America as well as the secret domains of the NSA, FBI and 15 other intelligence agencies. As Edward Snowden's revelations about the PRISM program revealed, the NSA has also collected personal data from many of the world's largest internet companies, including Apple, Google, Yahoo and Facebook. According to a senior lawyer for the NSA, the internet companies "were fully aware of the surveillance agency's widespread collection of data." (18) The fact is that Orwell's and Huxley's ironic representations of the modern totalitarian state - along with their implied defense of a democratic ideal rooted in the right to privacy and the right to be educated in the capacity to be autonomous and critical thinkers - have been transformed and mutilated almost beyond recognition by the material and ideological registers of a worldwide neoliberal order. Just as we can envision Orwell's and Huxley's dystopian fables morphing over time from "realistic novels" into a "real life documentary," and now into a form of "reality TV," privacy and freedom have been radically altered in an age of permanent, nonstop global exchange and circulation. That is, in the current moment, the right to privacy and freedom has been usurped by the seductions of a narcissistic culture and casino capitalism's unending desire to turn every relationship into an act of commerce and to make all aspects of daily life subject to market forces under watchful eyes of both government and corporate regimes of surveillance In a world devoid of care, compassion and protection, personal privacy and freedom are no longer connected and resuscitated through their connection to public life, the common good or a vulnerability born of the recognition of the frailty of human life. Culture loses its power as the bearer of public memory, civic literacy and the lessons of history in a social order in which the worst excesses of capitalism are left unchecked and a consumerist ethic "makes impossible any shared recognition of common interests or goals." (19) With the rise of the punishing state along with a kind of willful amnesia taking hold of the larger culture, we see little more than a paralyzing fear and apathy in response to the increasing exposure of formerly private spheres to data mining and manipulation, while the concept of privacy itself has all but expired under a "broad set of panoptic practices." (20) With individuals more or less succumbing to this insidious cultural shift in their daily lives, there is nothing to prevent widespread collective indifference to the growth of a surveillance culture, let alone an authoritarian state. The worst fears of Huxley and Orwell merge into a dead zone of historical amnesia as more and more people embrace any and every new electronic device regardless of the risks it might pose in terms of granting corporations and governments increased access to and power over their choices and movements. Detailed personal information flows from the sphere of entertainment to the deadly serious and integrated spheres of capital accumulation and policing as they are collected and sold to business and government agencies that track the populace for either commercial purposes or for fear of a possible threat to the social order and its established institutions of power. Power now imprisons not only bodies under a regime of surveillance and a mass incarceration state but also subjectivity itself, as the threat of state control is now coupled with the seductions of the new forms of passivity-inducing soma: electronic technologies, a pervasive commodified landscape and a mind-numbing celebrity culture. The Growing Role of Private Security Companies Underlying these everyday conveniences of modern life, as Boghosian documents in great detail, is the growing Orwellian partnership between the militarized state and private security companies in the United States. Each day, new evidence surfaces pointing to the emergence of a police state that has produced ever more sophisticated methods for surveillance in order to enforce a mass suppression of the most essential tools for democratic dissent: "the press, political activists, civil rights advocates and conscientious insiders who blow the whistle on corporate malfeasance and government abuse." (21) As Boghosian points out, "By claiming that anyone who questions authority or engages in undesired political speech is a potential terrorist threat, this government-corporate partnership makes a mockery of civil liberties." (22) Nowhere is this more evident than in US public schools where young people are being taught that they are a generation of suspects, subject to the presence of armed police and security guards, drug-sniffing dogs and an array of surveillance apparatuses that chart their every move, not to mention in some cases how they respond emotionally to certain pedagogical practices. Whistleblowers are not only punished by the government; their lives are also turned upside down in the process by private surveillance agencies and major corporations that now work in tandem. For instance, Bank of America assembled 15 to 20 bank officials and retained the law firm of Hunton & Williams in order to devise "various schemes to attack WikiLeaks and [journalist Glenn] Greenwald whom they thought were about to release damaging information about the bank." (23) It is worth repeating that Orwell's vision of surveillance and the totalitarian state look mild next to the emergence of a corporate-state surveillance system that wants to tap into every conceivable mode of communication, collect endless amounts of metadata to be stored in vast intelligence storage sites around the country and potentially use that data to repress any vestige of dissent. (24) As Huxley anticipated, any critical analysis must move beyond documenting abuses of power to how addressing contemporary neoliberal modernity has created a social order in which individuals become complicit with authoritarianism. That is, how is unfreedom internalized? What and how do state- and corporate-controlled institutions, cultural apparatuses, social relations and policies contribute to making a society's plunge into dark times self-generating as Huxley predicted? Put differently, what is the educative nature of a repressive politics and how does it function to secure the consent of the US public? And, most importantly, how can it be challenged and under what circumstances? The nature of repression has become more porous, employing not only brute force, but also dominant modes of education, persuasion and authority. Aided by a public pedagogy, produced and circulated through a machinery of consumption and public relations tactics, a growing regime of repression works through the homogenizing forces of the market to support the widespread embrace of an authoritarian culture and police state. Relentlessly entertained by spectacles, people become not only numb to violence and cruelty but begin to identify with an authoritarian worldview. As David Graeber suggests, the police "become the almost obsessive objects of imaginative identification in popular culture ... watching movies, or viewing TV shows that invite them to look at the world from a police point of view." (25) But it is not just the spectacle of violence that ushers individuals into a world in which brutality becomes a primary force for mediating relations as well as the ultimate source of pleasure; there is also the production of an unchecked notion of individualism that both dissolves social bonds and removes any viable notion of agency from the landscape of social responsibility and ethical consideration. Absorbed in privatized orbits of consumption, commodification and display, Americans vicariously participate in the toxic pleasures of the authoritarian state. Violence has become the organizing force of a society driven by a noxious notion of privatization in which it becomes difficult for ideas to be lifted into the public realm. Under such circumstances, politics is eviscerated because it now supports a market-driven view of society that has turned its back on the idea that social values, public trust and communal relations are fundamental to a democratic society. This violence against the bonds of sociality undermines and dissolves the nature of social obligations as freedom becomes an exercise in self-development rather than social responsibility. This upending of the social and critical modes of agency mimics not just the death of the radical imagination, but also a notion of banality made famous by Hannah Arendt who argued that at the root of totalitarianism was a kind of thoughtlessness, an inability to think, and a type of outrageous indifference in which, "There's simply the reluctance ever to imagine what the other person is experiencing." (26) Confronting the Threat of Authoritarianism By integrating insights drawn from both Huxley and Orwell, it becomes necessary for any viable critical analysis to take a long view, contextualizing the contemporary moment as a new historical conjuncture in which political rule has been replaced by corporate sovereignty, consumerism becomes the only obligation of citizenship, and the only value that matters is exchange value. Precarity has replaced social protections provided by the state, just as the state cares more about building prisons and infantilizing the US public than

it does about providing all of its citizens with quality educational institutions and health care. The United States is not just dancing into oblivion as Huxley suggested; it is also being pushed into the dark recesses of an authoritarian state. Orwell wrote dystopian novels but he believed that the sheer goodness of human nature would in the end be enough for individuals to develop modes of collective resistance that he could only imagine in the midst of the haunting specter of totalitarianism. Huxley was more indebted to Kafka's notion of destabilization, despair and hopelessness. For Huxley, the subject had lost his or her sense of agency and had become the product of a scientifically manufactured form of idiocy and conformity. Progress had been transformed into its opposite, and science needed to be liberated from itself. As Theodor Adorno has pointed out, where Huxley fails is that he has no sense of resistance. According to Adorno, "The weakness of Huxley's entire conception is that it makes all its concepts relentlessly dynamic but nevertheless arms them against the tendency to turn into their own opposites." (27) Hence, the forces of resistance are not simply underestimated but rendered impotent. The authoritarian nature of the corporate-state surveillance apparatus and security system with its "urge to surveil, eavesdrop on, spy on, monitor, record, and save every communication of any sort on the planet" (28) can only be fully understood when its ubiquitous tentacles are connected to wider cultures of control and punishment, including security-patrolled corridors of public schools, the rise in supermax prisons, the hypermilitarization of local police forces, the justification of secret prisons and state-sanctioned torture abroad, and the increasing labeling of dissent as an act of terrorism in the United States. (29) This is part of Orwell's narrative, but it does not go far enough. The new authoritarian, corporate-driven state deploys more subtle tactics to depoliticize public memory and promote the militarization of everyday life. Alongside efforts to defund public and higher education and to attack the welfare state, a wide-ranging assault is being waged across the culture on all spheres that encourage the public to hold power accountable. If these public institutions are destroyed, there will be few sites left in which to nurture the critical formative cultures capable of educating people to challenge the range of injustices plaguing the United States and the forces that reproduce them. One particular challenge comes from the success of neoliberal tyranny to dissolve those social bonds that entail a sense of responsibility toward others and form the basis for political consciousness. Under the new authoritarian state, perhaps the gravest threat one faces is not simply being subject to the dictates of what Quentin Skinner calls "arbitrary power," but failing to respond with outrage when "my liberty is also being violated, and not merely by the fact that someone is reading my emails but also by the fact that someone has the power to do so should they choose." (30) The situation is dire when people no longer seem interested in contesting such power. It is precisely the poisonous spread of a broad culture of political indifference that puts at risk the fundamental principles of justice and freedom, which lie at the heart of a robust democracy. The democratic imagination has been transformed into a data machine that marshals its inhabitants into the neoliberal dream world of babbling consumers and armies of exploitative labor whose ultimate goal is to accumulate capital and initiate individuals into the brave new surveillance-punishing state that merges Orwell's Big Brother with Huxley's mind-altering soma. Nothing will change unless people begin to take seriously the subjective underpinnings of oppression in the United States and what it might require to make such issues meaningful in order to make them critical and transformative. As Charles Derber has explained, knowing "how to express possibilities and convey them authentically and persuasively seems crucially important". (31) if any viable notion of resistance is to take place. The current regime of authoritarianism is reinforced through a new and pervasive sensibility in which people surrender themselves to both the capitalist system and a general belief in its call for security. It does not simply repress independent thought, but constitutes new modes of thinking through a diverse set of cultural apparatuses ranging from the schools and media to the internet. The fundamental question in resisting the transformation of the United States into a 21st century authoritarian society must concern the educative nature of politics - that is, what people believe and how their individual and collective dispositions and capacities to be either willing or resistant agents are shaped. I want to conclude by recommending five initiatives, though incomplete, that might help young people and others challenge the current oppressive historical conjuncture in which they along with other oppressed groups now find themselves. My focus is on higher education because that is the one institution that is under intense assault at the moment because it has not completely surrendered to the Orwellian state.

(32) A Resource for Resistance: Reviving the Radical Imagination First, there is a need for what can be called a revival of the radical imagination. This call would be part of a larger project "to reinvent democracy in the wake of the evidence that, at the national level, there is no democracy - if by 'democracy' we mean effective popular participation in the crucial decisions affecting the community." (33) Democracy entails a challenge to the power of those individuals, financial elites, ruling groups and large-scale enterprises that have hijacked democracy. At the very least, this means refusing to accept minimalist notions of democracy in which elections become the measure of democratic participation. Far more crucial is the struggle for the development of public spaces and spheres that produce a formative culture in which the US public can imagine forms of democratic self-management of what can be called "key economic, political, and social institutions." (34) One step in this direction would be for young people, intellectuals, scholars and others to go on the offensive in defending higher education as a public good, resisting as much as possible the ongoing attempt by financial elites to view its mission in instrumental terms as a workstation for capital. This means fighting back against a conservative-led campaign to end tenure, define students as consumers, defund higher education and destroy any possibility of faculty governance by transforming most faculty into adjuncts. Higher education should be harnessed neither to the demands of the warfare state nor to the instrumental needs of corporations. In fact, it should be viewed as a right rather than as an entitlement. Nowhere is this assault on higher education more evident than in the efforts of billionaires such as Charles and David Koch to finance academic fields and departments, and to shape academic policy in the interest of indoctrinating the young into the alleged neoliberal, free market mentality. It is also evident in the repressive policies being enacted at the state level by right-wing politicians. For instance, in Florida, Gov. Rick Scott's task force on education has introduced legislation that would lower tuition for degrees friendly to corporate interests in order to "steer students toward majors that are in demand in the job market." (35) In Wisconsin, Gov. Scott Walker drew up a proposal to remove the public service philosophy focus from the university's mission statement, which says that the university's purpose is to solve problems and improve people's lives. He also scratched out the phrase "the search for truth" and substituted both ideas with a vocabulary stating that the university's goal is to meet "the state's work force needs." (36) But Walker's disdain for higher education as a public good can be more readily understood given his hatred of unions, particularly those organized for educators. How else to explain his egregious comparison of union protesters to the brutal terrorists and thugs that make up ISIS and his ongoing attempts to eliminate tenure at Wisconsin's public universities as well as to eviscerate any vestige of shared governance. (37) Another egregious example of neoliberalism's Orwellian assault on higher education can be found in the policies promoted by the Republican Party members who control the North Carolina Board of Governors. Just recently it has decimated higher education in that state by voting to cut 46 academic degree programs. One member defended such cuts with the comment: "We're capitalists, and we have to look at what the demand is, and we have to respond to the demand." (38) The ideology that drives this kind of market-driven assault on higher education was made clear by the state's Republican governor, Pat McCrory, who said in a radio interview, "If you want to take gender studies, that's fine, go to a private school and take it. But I don't want to subsidize that if that's not going to get someone a job." (39) This is more than an example of crude economic instrumentalism; it is also a recipe for instituting an academic culture of thoughtlessness and a kind of stupidity receptive to what Hannah Arendt once called totalitarianism. Crafting Educational Counternarratives Second, young people and progressives need to create the institutions and public spaces in which education becomes central as a counternarrative that serves to both reveal, interrogate and overcome the common sense assumptions that provide the ideological and affective webs that tie many people to forms of oppression. Domination is not just structural and its subjective roots and pedagogical mechanisms need to be viewed as central to any politics that aims to educate, change individual and collective consciousness, and contribute to broad-based social formations. Relatedly, a coalition of diverse social movements, from unions to associations of artists, educators and youth groups, needs to develop a range of alternative public spheres in which young people and others can become cultural producers capable of writing themselves back into the discourse of democracy while bearing witness to a range of ongoing injustices from police violence to the violence of the financial elite. Rejecting Criminalization Third, the United States has become a society in which the power at the state and national levels has become punitive for most Americans and beneficial for the financial and corporate elite. Punishment creep now reaches into almost every commanding institution that holds sway over the US public and its effects are especially felt by poor people, Black people, young people and the elderly. Millions of young men are held in prisons and jails across the United States, and most of them for nonviolent crimes. Working people are punished after a lifetime of work by having their pensions either reduced or taken away. Poor people are denied Medicaid because right-wing politicians believe the poor should be financially responsible for their health care. And so it goes. The United States is one of the few countries that allows teenagers to be tried as adults, even though there are endless stories of such youth being abused, beaten and in some cases committing suicide as a result of such savage treatment. Everywhere we look in US society, routine behavior is being criminalized. If you owe a parking ticket, you may end up in jail. If you violate a dress code as a student, you may be handcuffed by the police and charged with a criminal offense. A kind of mad infatuation with violence is matched by an increase in state lawlessness. In particular, young people have been left out of the discourse of democracy. They are the new disposables who lack jobs, a decent education, hope and any semblance of a future better than the one their parents inherited. In addition, an increasing number of youth suffer mental anguish and overt distress, even, perhaps especially, among the college-bound, debt-ridden and unemployed whose numbers are growing exponentially. Many reports claim that "young Americans are suffering from rising levels of anxiety, stress, depression and even suicide." For example, "One out of every five young people and one out of every four college students ... suffers from some form of diagnosable mental illness." (40) According to one survey, "44 percent of young aged 18 to 24 say they are excessively stressed." (41) One factor may be that there are so few jobs for young people. In fact the jobless rate for Americans aged 15 to 24 stands at 15.8 percent, more than double the unemployment rate of 6.9 percent for all ages, according to the World Bank. (42) Facing what Richard Sennett calls the "specter of uselessness," the war on youth serves as a reminder of how finance capital has abandoned any viable vision of democracy, including one that would support future generations. The war on youth has to be seen as a central element of state terrorism and crucial to critically engaging the current regime of neoliberalism. Reclaiming Emancipatory Morality Fourth, as the claims and

promises of a neoliberal utopia have been transformed into an Orwellian and Dickensian nightmare, the United States continues to succumb to the pathologies of political corruption, the redistribution of wealth upward into the hands of the 1%, the rise of the surveillance state and the use of the criminal legal system as a way of dealing with social problems. At the same time, Orwell's dark fantasy of an authoritarian future continues without enough massive opposition as students and low-income and poor youth of color are exposed to a low-intensity war in which they are held hostage to a neoliberal discourse that translates systemic issues into problems of individual responsibility. **This individualization of the social is one of the most powerful ideological weapons used by the current authoritarian regime and must be challenged**. Under the star of Orwell, morality loses its emancipatory possibilities and degenerates into a pathology in which misery is denounced as a moral failing. Under the neo-Darwinian ethos of survival of the fittest, the ultimate form of entertainment becomes the pain and humiliation of others, especially those considered disposable and powerless, who are no longer an object of compassion, but of ridicule and amusement. This becomes clear in the endless stories we are now hearing from US politicians disdaining the poor as moochers who don't need welfare but stronger morals. This narrative can also be heard from conservative pundits, such as New York Times columnist David Brooks, who epitomize this view. According to Brooks, poverty is a matter of the poor lacking virtue, middle-class norms and decent moral codes. (43) For Brooks, the problems of the poor and disadvantaged can be solved "through moral education and self-reliance … high-quality relationships and strong familial ties." (44) In this discourse, soaring inequality in wealth and income, high levels of unemployment, stagnant economic growth and low wages for millions of working Americans are ignored. What Brooks and other conservatives conveniently disregard are the racist nature of the drug wars, the strangle hold of the criminal legal system on poor Black communities, police violence, mass unemployment for Black youth, poor quality education in low-income neighborhoods, and the egregious effect of mass incarceration on communities of color. Paul Krugman gets it right in rebutting the argument that all the poor need are the virtues of middle-class morality and a good dose of resilience. (45) He writes: So it is … disheartening still to see commentators suggesting that the poor are causing their own poverty, and could easily escape if only they acted like members of the upper middle class…. Shrugging your shoulders as you attribute it all to values is an act of malign neglect. The poor don't need lectures on morality, they need more resources - which we can afford to provide - and better economic opportunities, which we can also afford to provide through everything from training and subsidies to higher minimum wages. (46) Developing a Language of Critique and Possibility Lastly, any attempt to make clear the massive misery, exploitation, corruption and suffering produced under casino capitalism must develop both a language of critique and possibility. It is not enough to simply register what is wrong with US society; it is also crucial to do so in a way that enables people to recognize themselves in such discourses in a way that both inspires them to be more critical and energizes them to do something about it. In part, this suggests a politics that is capable of developing a comprehensive vision of analysis and struggle that "does not rely on single issues." (47) It is only through an understanding of the wider relations and connections of power that the US public can overcome uninformed practice, isolated struggles and modes of singular politics that become insular and self-sabotaging. This means developing modes of analyses capable of connecting isolated and individualized issues to more generalized notions of freedom, and developing theoretical frameworks in which it becomes possible to translate private troubles into broader more systemic conditions. In short, this suggests developing modes of analyses that connect the dots historically and relationally. It also means developing a more comprehensive vision of politics and change. The key here is the notion of translation, that is, the need to translate private troubles into broader public issues and understand how systemic modes of analyses can be helpful in connecting a range of issues so as to be able to build a united front in the call for a radical democracy. This is a particularly important goal given that the fragmentation of the left has been partly responsible for its inability to develop a wide political and ideological umbrella to address a range of problems extending from extreme poverty, the assault on the environment, the emergence of the permanent warfare state, the rollback of voting rights, the assault on public servants, women's rights and social provisions, and a range of other issues that erode the possibilities for a radical democracy. The dominating mechanisms of casino capitalism in both their symbolic and material registers reach deep into every aspect of US society. Any successful movement for a radical democracy will have to wage a struggle against the totality of this new mode of authoritarianism rather than isolating and attacking specific elements of its anti-democratic ethos.

Policy Capacity

Policy capacity is key to effective surveillance change

Kraft and Furlong 15 (Michael E, Department of Public & Environmental Affairs - University of Wisconsin-Green Bay, Scott R, Political Science - University of Wisconsin-Green Bay, "Public Policy: Politics, Analysis, and Alternatives," 2015, pg. 477-479)//ghs-VA

Improving Policy Capacity Policy analysis also can help improve the performance of government and its responsiveness to citizen concerns. Policy capacity refers to the ability of government to identify and act on public problems within a reasonable period of time. One element of such a capacity is public trust and confidence in government because such trust affects the ability of policymakers to work together on policy solutions. Yet public trust in governmental institutions fell almost steadily from the 1960s to the late 1990s, with a small upward trend only in the fall of 2001, following the terrorist attacks on the United States and the U.S. response to them (Mackenzie and Labiner 2002). After the financial crisis of 200S and 2009, and growing public frustration over government's seeming ineptitude in figuring out what to do, it would be remarkable if trust and confidence in government returned to its former levels anytime soon. On the campaign trail in 2008, then-candidate Obama pledged to "make government cool again." In support of such a goal, some policymakers and on/i'ii activists supported a new civilian service academy, analogous to the military academics but devoted to training a new generation of public servants. The United States Public Service Academy would have offered a free four-year college education if individuals who attend arc prepared to commit to five years of government service. In early 2009, the idea was attracting support, and legislation was pending in Congress to create such a program, but it was not approved." By 2014, many public opinion polls pointed to a continuing decline in public confidence in government and particularly in the U.S. Congress. Indeed, public assessments of Congress reached historic lows, and the public clearly disapproved of the performance of both major political parties. The congressionally forced government shutdown in the fall of 2013 further reduced the public's confidence in government and its capacity to act. Much the same was true in many state governments that faced similar partisan divisions, a rising level of political incivility, and policy stalemate." Despite the many criticisms of government performance, the evidence on how well government programs have done is clearly mixed. Some programs have indeed fallen short of expectations, but others, as we have shown in previous chapters, have produced significant benefits to the public, from public education and environmental protection to health care services delivered through Medicare, Medicaid, and the veterans' health care system. A 2007 article in the National journal on ten notable successes in public policy put it this way: "Not every problem is intractable. Progress is possible."" In a similar vein, in 2000, the Brookings Institution released a study of government's greatest achievements of the past half-century. Among the most notable were rebuilding Europe after World War II; expanding the right to vote; promoting equal access to public accommodations, such as hotels and restaurants; reducing disease; ensuring safe food and drinking water; increasing older Americans' access to health care; enhancing workplace safety; increasing access to higher education; and reducing hunger and improving nutrition. The study's point was simple; it is easy to ignore some of the most important public policy actions because they are not very visible as they become routine parts of American life; yet examining such a list confirms the important role that government and public policy can play in improving everyday life.1" Still, there is little doubt from public commentary and political rhetoric over the past decade that many people believe to the contrary, that government is not working well (Bok 2001). In response to this skeptical public mood, policymakers at all levels of government have struggled with how to improve public policies and programs and better meet citizens* needs. Various efforts to "reinvent" government and to improve its efficiency were tried during the 1990s, and they continue today. As indicated earlier. President Obama began his administration determined not only to operate with openness and transparency but also to ensure that all programs would be as effective and efficient as possible. Yet, as noted, the public remains distrustful of government, and partisan divisions in the nation continue over what role government should play in our lives, from health care and food safety to environmental protection and energy policy. To some extent, the rise of the Tea Party movement reflects this broad discontent, which is fueled by increasingly partisan news shows and talk radio.' It is clear that any meaningful change in the public's view of government and public policy will require more than a determined White I louse. It will mean **developing a broader policy capacity** to define and respond effectively to public problems, both present and future, and ensuring that government agencies, from the military to Social Security, arc as well managed as they can be. How can policy analysis contribute to improving the policy capacity of government? One way is through the analysis of proposed institutional reforms, such as changes in the electoral process, campaign finance reform, and opportunities for citizens to participate in decision making. This is a task at which political scientists excel (Levi ct al. 2008). Yet too often their analyses fail to reach the public or even policymakers, who then must act without benefit of what the analysis has uncovered. The box "Steps to Analysis: Money in Politics" illustrates these needs. Other chapters have suggested that policy capacity can also be improved through better evaluation of the agencies charged with implementing policies and programs. Thanks to the Government Performance and Results Act of 1993, the federal government is likely to conduct more evaluations of this kind than in the past, though probably of varying quality (Radin 2006). For many reasons, think tanks and

other independent bodies carrying out external evaluations may be better able to identify institutional strengths and weaknesses and to suggest meaningful paths to reform. For example, chapter 11 noted that a series of studies by the National Academy of Public Administration (1995, 2000) identified many elements of the U.S. environmental protection system that could be changed to improve the effectiveness and efficiency of the Environmental Protection Agency (EPA) and other agencies. Studies by Resources for the Future have reached similar conclusions (Davics and Mazurck 1998). Chapter 12 highlighted a number of studies by the Government Accountability Office and the Congressional Research Service on foreign economic assistance, domestic electronic surveillance, the risks of terrorism, and military weapons acquisition and spending.

Policy Education Key

Circumvention contributes to the cycle of civic ignorance- that causes authoritarianism in the name of national security

Glennon 14 (Michael J, professor of international law at Tufts University's Fletcher School of Law and Diplomacy, Legal Counsel to the Senate Foreign Relations Committee (1977-1980), Fulbright Distinguished Professor of International and Constitutional Law, Vytautus Magnus University School of Law, Kaunas, Lithuania (1998); a Fellow at the Woodrow Wilson International Center for Scholars in Washington D.C. (2001-2002); Thomas Hawkins Johnson Visiting Scholar at the United States Military Academy, West Point (2005); Director of Studies at the Hague Academy of International Law (2006); and professeur invité at the University of Paris II (Panthéon-Assas) from 2006 to 2012., consultant to congressional committees, the U.S. State Department, and the International Atomic Energy Agency, member of the American Law Institute, the Council on Foreign Relations, and the Board of Editors of the American Journal of International Law, Michael J., "Torturing the Rule of Law", http://nationalinterest.org/files/digital-edition/%5Buser-last-login-raw%5D/134%20Digital%20Edition.pdf, EC)

That root cause is difficult to discuss in a democracy, for it lies in the electorate's own deficiencies. This is the second great obstacle the reform proposals confront; on this point Bagehot's and Madison's theories converge. Bagehot argued that when the public becomes too sophisticated to be misled any longer about who holds governmental power but not informed enough to play a genuine role in governance, the whole structure will "fall to the earth," in his phrase. Madison, contrary to popular belief, did not suggest that the system that he and his colleagues designed was self-correcting. The Framers did not believe that merely setting "ambition against ambition" within the government would by itself save the people from autocracy. They believed that this competition for power would not occur absent an **informed** and **engaged** public— what Robert Dahl has called the "adequate citizen," the citizen able and willing to undertake the responsibilities required to make democracy work. Thomas Jefferson spoke for many of the Framers. He said: "If a nation expects to be ignorant and free, in a state of civilization, it expects what never was and never will be." Competition between institutions was thus written into the constitutional architecture not as a substitute for civic virtue— there is none— but as a backstop, as an additional safeguard to forestall the rise of autocracy. But that backstop was not freestanding: it, too, depended upon an electorate possessed of civic virtue. If anything, the essentiality of civic virtue has grown over the years. In the early days of the Republic, public-policy issues were less intricate, and the franchise was de jure or de facto more restricted. A smaller electorate was more capable of mastering the more straightforward issues it faced. As Louis Henkin pointed out, however, the United States has since changed gradually from a republic to a democracy—an "ultra-democracy," Bagehot believed. The problems government has faced over the years have become more complex, and a greater base of civic knowledge has thus become **indispensable** for responsible participation in the process of governance. Yet a cursory glance at consistent survey results confirms what former Supreme Court justice David Souter has described today as the public's "**pervasive** civic **ignorance**." The numbers are sobering. A 2011 Newsweek survey showed that 80 percent of Americans did not know who was president during World War I; 40 percent did not know whom the United States fought in World War II; and 29 percent could not identify the current vice president of the United States. Far more Americans can name the Three Stooges than any member of the Supreme Court. One poll has found that 71 percent of Americans believe that Iran already has nuclear weapons. In 2006, at the height of U.S. military involvement in the region, 88 percent of Americans aged eighteen to twenty-four could not find Afghanistan on a map of Asia, and 63 percent could not find Iraq or Saudi Arabia on a map of the Middle East. Ilya Somin's fine book Democracy and Political Ignorance analyzes the problem in depth. The great conundrum is that the public's ignorance does not derive from "stupidity"—average raw iq scores

actually have increased in recent decades—so much as it derives from simple rationality: Why spend time and energy learning about national-security policies that cannot be changed? That is the **nub** of the negative feedback loop in which the United States is now locked. Resuscitating the Madisonian institutions requires an informed, engaged electorate, but voters have little incentive to be informed or engaged if they believe that their efforts would be for naught— and as they become more uninformed and unengaged, they have all the more reason to continue on that path. The Madisonian institutions thus continue to atrophy, the power of the Trumanite network continues to grow and the public **continues** to **disengage**. Should this trend continue, and there is scant reason to believe it will not, it takes no great prescience to see what lies ahead: outward symbols and rituals of national security governance that appear largely the same, concealing a Trumanite network that takes on the role of a silent directorate, and Madisonian institutions that, like the British monarchy and House of Lords, quietly and gradually are transformed into museum pieces.

Plans Key

Role playing is key – developing these skills in less high risk scenarios like debate is net better than throwing people into the policy making process absent training
Steve 7 (Anonymous member of Black Bloc and Active Transformation, "Anarchist! Get Organized! A discussion of A16, the blackblock, and beyond!," 2007, https://www.nadir.org/nadir/initiativ/agp/free/global/a16dcdiscussion.htm)//ghs-VA

What follows is not an attempt to discredit our efforts. It was a powerful and inspiring couple of days. I feel <u>it is important to always analyze our actions and be self-critical</u>, and try to move forward, advancing our movement. The State has used Seattle as an excuse to beef up police forces all over the country. In many ways Seattle caught us off-guard, and we will pay the price for it if we don't become better organized. <u>The main weakness</u> of the Black Block <u>in DC was that clear goals were not elaborated in a strategic way and tactical leadership was not developed to coordinate</u> our <u>actions. By leadership I don't mean</u> any sort of <u>authority, but</u> some <u>coordination</u> beside the call of the mob. We were being led around DC by any and everybody. All someone would do is make a call loud enough, and the Black Block would be in motion. We were often lead around by Direct Action Network (DAN - organizers of the civil disobedience) tactical people, for lack of our own. We were therefore used to assist in their strategy, which was doomed from the get go, because we had none of our own. The DAN strategy was the same as it was in Seattle, which the DC police learned how to police. Our only chance at disrupting the IMF/WB meetings was with drawing the police out of their security perimeter, therefore weakening it and allowing civil disobedience people to break through the barriers. This needs to be kept in mind as we approach the party conventions this summer. Philadelphia is especially ripe for this new strategy, since the convention is not happening in the business center. Demonstrations should be planned all over the city to draw police all over the place. On Monday the event culminated in the ultimate anti-climax, an arranged civil disobedience. The civil disobedience folks arranged with police to allow a few people to protest for a couple minutes closer to where the meetings were happening, where they would then be arrested. The CD strategy needed arrests. Our movement should try to avoid this kind of stuff as often as possible. While this is pretty critical of the DAN/CD strategy, it is so in hindsight. This is the same strategy that succeeded in shutting down the WTO ministerial in Seattle. And, while we didn't shut down the IMF/WB meetings, we did shut down 90 blocks of the American government on tax day - so we should be empowered by their fear of us! <u>The root of the lack of strategy problem is a general problem within the North American anarchist movement</u>. <u>We get caught up in tactical thinking **without establishing clear goals**</u>. <u>We need to elaborate how our actions today fit into a plan that leads to the destruction of the state and capitalism, white supremacy and patriarchy</u>. <u>Moving away from strictly tactical thinking **toward political goals** and long term strategy needs to be a priority</u> for the anarchist movement. <u>No longer can we justify a **moralistic** approach</u> to the latest outrage - <u>running around like chickens with their heads cut off</u>. We need to prioritize developing the political unity of our affinity groups and collectives, as well as developing regional federations and starting the process of developing the political principles that they will be based around (which will be easier if we have made some headway in our local groups). The NorthEastern Federation of Anarchist Communists (NEFAC) is a good example of doing this. They have prioritized developing the political principles they are federated around. <u>The strategies that we develop in our collectives</u> and networks will never be blueprints set in stone. They <u>will be documents in motion, constantly being **challenged and adapted**</u>. But <u>without a specific elaboration of what we are working toward and how we plan to get there, we will always end up making bad decisions</u>. If we just assume everyone is on the same page, we will find out otherwise really quick when shit gets critical. Developing regional anarchist federations and networks is a great step for our movement. We should start getting these things going all over the continent. We should also prioritize developing these across national borders, which NEFAC has also done with northeastern Canada. Some of the errors of Love and Rage were that it tried to cover too much space too soon, and that it was based too much on individual membership, instead of collective membership. We need to keep these in mind as we start to develop these projects. One of the benefits of Love and Rage was that it provided a forum among a lot of people to have a lot of political discussion and try to develop strategy in a collective way. This, along with mutual aid and security, could be the priorities of the regional anarchist federations. These regional federations could also form the basis for tactical leadership at demonstrations. Let me first give one example why we need tactical teams at large demos. In DC the Black Block amorphously made the decision to try to drive a dumpster through one of the police lines. The people in front with the dumpster ended up getting abandoned by the other half of the Black Block who were persuaded by the voice of the moment to move elsewhere. The people up front were in a critical confrontation with police when they were abandoned. This could be avoided if the Black Block had a decision making system that slowed down decision making long enough for the block to stay together. With this in mind we must remember that the chaotic, decentralized nature of our organization is what makes us hard to police. We must maximize the benefits of decentralized leadership, without establishing permanent leaders and targets. Here is a proposal to

consider for developing tactical teams for demos. Delegates from each collective in the regional federation where the action is happening would form the tactical team. Delegates from other regional federations could also be a part of the tactical team. Communications between the tactical team and collectives, affinity groups, runners, etc. could be established via radio. The delegates would be recallable by their collectives if problems arose, and as long as clear goals are elaborated ahead of time with broader participation, the tactical team should be able to make informed decisions. An effort should be made to rotate delegates so that everyone develops the ability. People with less experience should be given the chance to represent their collectives in less critical situations, where they can become more comfortable with it. The reality is that liberal politics will not lead to an end to economic exploitation, racism, and sexism. Anarchism offers a truly radical alternative. Only a radical critique that links the oppressive nature of global capitalism to the police state at home has a chance of diversifying the movement against global capitalism. In order for the most oppressed people here to get involved the movement must offer the possibility of changing their lives for the better. A vision of what "winning" would look like must be elaborated if people are going to take the risk with tremendous social upheaval, which is what we are calling for. We cannot afford to give the old anarchist excuse that "the people will decide after the revolution" how this or that will work. We must have **plans** and ideas for things as diverse as transportation, schooling, crime prevention, and criminal justice. People don't want to hear simple solutions to complex questions, that only enforces people's opinions of us as naive. We need practical examples of what we are fighting for. People can respond to examples better than unusual theory. While we understand that we will not determine the shape of things to come, when the system critically fails someone needs to be there with anti-authoritarian suggestions for how to run all sorts of things. If we are not prepared for that we can assume others will be prepared to build up the state or a new state.

Galles

Policy details are key – abstract rhetoric devices ensure failure

Galles 9 (Gary M, Professor of economics @ Pepperdine University, "The Orange Grove: Obama health plan; we need details," March 3, 2009, http://www.ocregister.com/articles/details-25757-proposals-obama.html)//ghs-VA

The problem with such vagueness is that any informed public policy decision **has to be based on specific proposals**. Absent concrete details, which is where the devil lurks, no one--including those proposing a "reform"--can judge how it would fare or falter in the real world. So when the President wants approval for a proposal which offers too few details for evaluation, we must ask why. Like private sector salesmen, politicians strive to present their wares as attractively as possible. Unlike them, however, a politician's product line consists of claimed consequences of proposals not yet enacted. Further, politicians are unconstrained by truth in advertising laws, which would require that claims be more than misleading half-truths; they have fewer competitors keeping them honest; and they face "customers"--voters-- far more ignorant about the merchandise involved than those spending their own money. These differences from the private sector explain why politicians' "sales pitches" for their proposals are so vague. However, if vague proposals are the best politicians can offer, they are inadequate. **If rhetoric is unmatched by specifics**, there is no reason to believe a policy change will be an improvement, because no reliable way exists to determine whether it will actually accomplish what is promised. Only the **details** will determine the actual incentives facing the decision-makers involved, which is the only way to forecast the results, including the myriad of unintended consequences from unnoticed aspects. We must remember that, however laudable, goals and promises and claims of cost-effectiveness that are inconsistent with the incentives created will go unmet. It may be that President Obama knows too little of his "solution" to provide specific plans. If so, he knows too little to deliver on his promises. Achieving intended goals then necessarily depends on blind faith that Obama and a panoply of bureaucrats, legislators, overseers and commissions will somehow adequately grasp the entire situation, know precisely what to do about it, and do it right (and that the result will not be too painful, however serious the problem)--a prospect that, due to the painful lessons of history, attracts few real believers. Alternatively, President Obama may know the details of what he intends, but is not providing them to the public. But if it is necessary to conceal a plan's details to put the best possible public face on it, those details must be adverse. If they made a more persuasive sales pitch, a politician would not hide actual details. They would be trumpeted at every opportunity, proving to a skeptical public he really had the answers, since concealing rather than revealing pays only when better informed citizens would be more inclined to reject a plan. Claiming adherence to elevated principles, but keeping detailed proposals from sight, also has a strategic advantage. It defuses critics. Absent details, any criticism can be parried by saying "that was not in our proposal" or "we have no plans to do that" or other rhetorical devices. It also allows a candidate to incorporate alternatives proposed as part of his evolving reform, as if it was his idea all along. The new administration has already put vague proposals on prominent display. However, adequate analysis cannot rest upon such flimsy foundations. That requires the nuts and bolts so glaringly absent. In the private sector, people don't spend their own money on such vague promises of unseen products. It is foolhardy to act any differently when political salesmen withhold specifics, because political incentives guarantee that people would object to what is kept hidden. So while vagueness may be good political strategy, **it virtually ensures bad policy**, if Americans' welfare is the criterion.

Concrete Plans Good

Simulation is key to good decision making -- abstractions promote bad outcomes

Lantis et al 8 (Jeffrey S. Lantis , Professor in the Department of Political Science and Chair of the International Relations Program at The College of Wooster, Kent J. Kille, Associate Professor in the Department of Political Science at The College of Wooster, Matthew Krain is Associate Professor and Chair of the Department of Political Science at The College of Wooster, "The State of the Active Teaching and Learning Literature," 2008, http://www.isacompss.com/info/samples/thestateoftheactiveteachingandlearningliterature_sample.pdf)//ghs-VA

Simulations, games, and role-play represent a third important set of active teaching and learning approaches. Educational objectives include deepening conceptual understandings of a particular phenomenon, sets of interactions, or socio-political processes by using student interaction to bring abstract concepts to life. They provide students with a real or imaginary environment within which to act out a given situation (Crookall 1995; Kaarbo and Lantis 1997; Kaufman 1998; Jefferson 1999; Flynn 2000; Newmann and Twigg 2000; Thomas 2002; Shellman and Turan 2003; Hobbs and Moreno 2004; Wheeler 2006; Kanner 2007; Raymond and Sorensen 2008). The aim is to enable students to actively experience, rather than read or hear about, the "constraints and motivations for action (or inaction) experienced by real players" (Smith and Boyer 1996:691), or to think about what they might do in a particular situation that the instructor has dramatized for them. As Sutcliffe (2002:3) emphasizes, "Remote theoretical concepts can be given life by placing them in a situation with which students are familiar." Such exercises capitalize on the strengths of active learning techniques: creating memorable experiential learning events that tap into multiple senses and emotions by utilizing visual and verbal stimuli. Early examples of simulations scholarship include works by Harold Guetzkow and colleagues, who created the Inter-Nation Simulation (INS) in the 1950s. This work sparked wider interest in political simulations as teaching and research tools. By the 1980s, scholars had accumulated a number of sophisticated simulations of international politics, with names like "Crisis," "Grand Strategy," "ICONS," and "SALT III." More recent literature on simulations stresses opportunities to reflect dynamics faced in the real world by individual decision makers, by small groups like the US National Security Council, or even global summits organized around international issues, and provides for a focus on contemporary global problems (Lantis et al. 2000; Boyer 2000). Some of the most popular simulations involve modeling international organizations, in particular United Nations and European Union simulations (Van Dyke et al. 2000; McIntosh 2001; Dunn 2002; Zeff 2003; Switky 2004; Chasek 2005). Simulations may be employed in one class meeting, through one week, or even over an entire semester. Alternatively, they may be designed to take place outside of the classroom in local, national, or international competitions. The scholarship on the use of games in international studies sets these approaches apart slightly from simulations. For example, Van Ments (1989:14) argues that games are structured systems of competitive play with specific defined endpoints or solutions that incorporate the material to be learnt. They are similar to simulations, but contain specific structures or rules that dictate what it means to "win" the simulated interactions. Games place the participants in positions to make choices that affect outcomes, but do not require that they take on the persona of a real world actor. Examples range from interactive prisoner dilemma exercises to the use of board games in international studies classes (Hart and Simon 1988; Marks 1998; Brauer and Delemeester 2001; Ender 2004; Asal 2005; Ehrhardt 2008). A final subset of this type of approach is the role-play. Like simulations, roleplay places students within a structured environment and asks them to take on a specific role. Role-plays differ from simulations in that rather than having their actions prescribed by a set of well-defined preferences or objectives, role-plays provide more leeway for students to think about how they might act when placed in the position of their slightly less well-defined persona (Sutcliffe 2002). Role-play allows students to create their own interpretation of the roles because of role-play's less "goal oriented" focus. The primary aim of the role-play is to dramatize for the students the relative positions of the actors involved and/or the challenges facing them (Andrianoff and Levine 2002). This dramatization can be very simple (such as roleplaying a two-person conversation) or complex (such as role-playing numerous actors interconnected within a network). The reality of the scenario and its proximity to a student's personal experience is also flexible. While few examples of effective roleplay that are clearly distinguished from simulations or games have been published, some recent work has laid out some very useful role-play exercises with clear procedures for use in the international studies classroom (Syler et al. 1997; Alden 1999; Johnston 2003; Krain and Shadle 2006; Williams 2006; Belloni 2008). Taken as a whole, the applications and procedures for simulations, games,

and role-play are well detailed in the active teaching and learning literature. Experts recommend a set of core considerations that should be taken into account when designing effective simulations (Winham 1991; Smith and Boyer 1996; Lantis 1998; Shaw 2004; 2006; Asal and Blake 2006; Ellington et al. 2006). These include building the simulation design around specific educational objectives, carefully selecting the situation or topic to be addressed, establishing the needed roles to be played by both students and instructor, providing clear rules, specific instructions and background material, and having debriefing and assessment plans in place in advance. There are also an increasing number of simulation designs published and disseminated in the discipline, whose procedures can be adopted (or adapted for use) depending upon an instructor's educational objectives (Beriker and Druckman 1996; Lantis 1996; 1998; Lowry 1999; Boyer 2000; Kille 2002; Shaw 2004; Switky and Aviles 2007; Tessman 2007; Kelle 2008). Finally, there is growing attention in this literature to assessment. Scholars have found that these methods are particularly effective in bridging the gap between academic knowledge and everyday life. Such exercises also lead to enhanced student interest in the topic, the development of empathy, and acquisition and retention of knowledge.

Student Role Playing

Debating within institutions in role playing bridges the gap between knowledge and real life – simple consciousness isn't sufficient

O'Reilly 13 (Patricia, Department of Politics and Public Administration, Ryerson University, "Implementing and Assessing Student Performance Skills and Learning: A Policy Role-Playing Exercise," February 27, 2013, http://www.macrothink.org/journal/index.php/ije/article/viewFile/3137/2875)//ghs-VA

1. Introduction Instructors constantly strive to accurately assess students' learning, that is, the knowledge students have gained in a subject. At the post-secondary level, their memory and ability to reason are tested and examined repeatedly. However, the performance component of knowledge is often not emphasized and only weakly assessed. Performance is here referred to as the ability to orally present and/or argue or debate your ideas to or in a group. Performance skills are important in all public institutions such as the university or workplace, and they play an important role in social engagement. Acquiring the skills for public speaking and presentations is a useful and practical part of learning, but the lack of attention in the teaching and learning literature to the development and assessment of performance skills in post-secondary social science education means we are undervaluing an important element of learning – one that post-secondary students themselves value (Cavanagh, 2011). A scan of the teaching and learning literature shows very little reference to performance skills of students - as performance rather than as knowledge acquisition (Lai, 2011). Learning through performance ought to be encouraged, assisted and rewarded. It is a reality for both the student and the graduate. In the classroom or tutorial there is always both informal and formal evaluation of students' performances. In the public sphere, students and instructors share in the fact that all adults need to "perform" in regular public engagement. There are performance skills sets that are useful to this social and political interaction. Educational institutions need to teach these skills to prepare their graduates for the workplace - especially when many full-time jobs begin as short-term contract jobs and those who "perform" best are more likely to be offered the full-time jobs. The ability to perform effectively and intelligently requires individual skills such as personal presentation and professional comportment, clear articulation, systematic revelation of one's ideas, and ease of intellectual exchange. These are the kinds of skills that tend to improve with practice and guidance, as well as help develop influence and leadership (Rackaway & Goertzen, 2008, p. 330). As instructors we sometimes forget that despite all their education, even graduate students may not have developed basic professional skills. We at the post-secondary level could learn from the training of earlier-level education teachers where classroom performance is proven to be enhanced by such non-academic factors as recognition of the role of emotions in learning (Timostsuk & Ugaste, 2012) and face-to-face performance feedback from instructors (Thurlings, Vermeulen, Kreijns, Bastianens & Stijnen, 2012). Another level at which performance is important to the education of the student is that of improved understanding of the nature of our social and political environment. That is, while learning through performance is important; learning about performance is also important. In order to better understand social and political interaction, students would do well to understand the use of performance in the institutions and discourse of the public sphere. Although the latter is being studied more and more in the social sciences - in for example, discourse analysis - the former is relatively understudied; and the importance of performance per se is not often considered in the social sciences. In Political Science/Studies in North American, for example, there are many textbooks that document and discuss the institutions, actors and processes of politics, but there are few studies that show the underlying informal human relations and emotions that drive interactions in the formal systems of governance, despite their importance to politics (Johns, O'Reilly & Inwood, 2007). Politicians, like any public actors, relate to each other and to their public. That is, they perform. When students themselves experience the limits of process and subjectivity through performance, they understand it better. In one of my policy courses, an undergraduate student reporting on our classroom performance exercises, had this to say I always knew that the political system and policy-making were complex, but my understanding of these processes was largely academic...In essence, I have a good understanding of how the system works and who the major and minor players in it are, but I really had no concept of how it feels to be a part of it. The policy exercises (we did in class) really helped open my eyes as to why a policy often ends up radically different from when it was first envisioned. Through the use of more structured forums for performance learning, students can both enhance their own professional performance skills and gain a better understanding of the complex messy nature of public social engagement - as it is practiced. With this in mind, this paper looks at some of the means by which we might organize, monitor and evaluate our students' performances in political exercises in order to encourage knowledge and development of performance skills and performance learning. First, it looks at the importance of encouraging performance skills in students and provides simple assessment techniques for evaluating student presentations and classroom or tutorial debates. Second, it provides a three-part policy exercise which could be used either individually or in a progressive developmental process to enable students to enhance their interactive performance skills and to better understand the limitations encountered by policy makers. Third, it discusses some means for instructor assessment of students' performance throughout the policy exercise, as well as students' understanding of the role of performance in politics. And fourth, this paper presents some early finding and conclusions from the author's use of the policy exercises in various political studies courses over several years. 2. Encouraging Student Performance Skills and Performance Learning Whether or not we make much note of it, performance is an important aspect of any post-secondary educational classroom and tutorial experience. Social studies and humanities courses have a considerable amount of informal discussion and debate. Classroom lectures often include Socratic exchange between the instructor and those students who choose to engage with questions or ideas in the classroom; and informal debates among the students are also encouraged by some instructors. However, the lecture format tends to ensure that these classroom exchanges are ad hoc and limited in nature. Tutorials attached to lectures are set up as a means to allow for more elaborate and continuous discussion and debate among the students, but, this format is generally not very structured and it is left up to the (often inexperienced) tutorial leader to run a fairly informal session that may vary considerably from tutor to tutor. Students are asked to speak, discuss, debate and present; but although it is often encouraged, it is not so often systematically organized, monitored and evaluated with feedback to encourage student improvement and development in this skill. Where participation is graded it is often done so more for content than performance per se. Even when performance skills are directly assessed and graded such as in mandatory slide presentations, they are rarely taught or weighted heavily in the final grade. This signal from the instructor means the students themselves are not always encouraged to perform well - many participate reluctantly. In a large classroom setting students are often nervous about how they are perceived by their peers as well as the instructor, and need encouragement to learn performance skills such as how to speak and present in front of groups. Adding an element of performance assessment provides the instructor with both the excuse to decrease the volume of input from the overly enthusiastic student and increase the input of the more reserved student. There are two things to keep in mind here: one, both individual and collective student performance already affects the quality of student learning whether or not we focus on it; and two, when students come together and undergo the pressures of the institutional learning environment, they are under both hierarchical student-to-instructor pressure and student-to-student peer pressure. At the most obvious level, the classroom or tutorial environment is altered by student engagement, either positively or negatively. As any instructor or student knows, the discussion and debate can be elevated by the performance skills of a few good students, or it can be lowered by weaker but highly vocal students. In either case the environment may discourage the more timid students from speaking.

If the instructor maintains a degree of control over student participation, this can improve both quality and fairness. At a more hidden level, there are subtle pressures related to performance in the classroom or tutorial. Instructors are making conscious and unconscious judgements about a student's intellectual and social abilities when listening to student responses and engagements during the most simple classroom exchanges. Students are right to be concerned that classroom performance is noticed by the person who will be evaluating their course learning. There is a hierarchy here. There is also considerable peer pressure among students in any classroom or discussion group, just as there is among academics themselves. It is better, I would argue, to recognize this rather than ignore it. In this way teaching exercises and techniques can be used to counter these pressures while downplaying the disadvantages and enhancing the advantages of the oral exchange and debate in student-to-instructor and student-to-student exchange. It would also enhance fairness since students who are uncomfortable with performance skills are those who suffer most from the open, ungraded discussion. There are various simple means by which an instructor can allow for active performance in the classroom and these can be monitored with instructor feedback and grading. For example, simple classroom presentations and debates can be set up with performance in mind. But in order to teach students more fully about the nature of their own and broader institutional performance skills an instructor needs to set up a more formal means of playing out and monitoring these skills as well as and providing feedback for improvement - not unlike those advocated by professionals-in-training through some sort of service learning (Gleason & Violette, 2012, p. 280) or those used for training teachers by utilizing keywords to prevent learner overload during instructor feedback (Coninx, Kreijns & Jochems, 2012, p. 11). A useful method of active performance in the classroom which is used throughout the social sciences is that of role playing – which has the added advantage of including and coaching the more reserved students, such as those who are reluctant participators for cultural reasons (Chunlei & Han, 2010, p. 81; Micari & Drane, 2011). The education literature on role playing and simulations, although weighted toward the positive, is somewhat ambiguous on its benefits (Chad, 2012, p. 23). Analysis suggests they increase student interest, enthusiasm, sense of control over learning, and **development of empathy** (Dougherty, 2003). Some say they increase political knowledge (Baranowski, 2006; Kahn & Perez, 2007), develop critical thinking and logical reasoning (Hayati, 2006; Smith & Boyer, 1996), increase retention of knowledge (Cherney, 2008; Smith & Boyer, 1996), and decrease levels of cynicism (Lay & Smarick, 2006). Others note that they improve students' public speaking abilities and negotiation skills, as well as their capacity to critically analyze their own positions on issues (Fliter, 2009) or ethical dilemmas (Rackaway & Goertzen, 2008). Conversely, some analysts have shown little difference of increased learning or knowledge of the subject taught through the use of simulations and experiential learning (Krain & Lantis, 2006; Powner & Allendoerfer, 2008). (Although this is countered by methodologists such as Chad who suggests that these results may be more attributable to poor technique on the part of the simulation designers than to student efforts (Chad, 2012).) It is also, I would argue, important to note that this literature tends to focus on the measurement or evaluation of student learning with the use of these exercises. It is then compared to learning in standard teaching forums, generally through comparative test results of total acquired knowledge. While this may be a useful exercise to prove a point, it is to some degree missing the point. An alternative approach to teaching that only supplements a strongly traditional education for students need not be "better than" standard academic teaching methods currently used in the field to merit use. Even if it were "less than" in terms of rote knowledge taken away from a social science course that will in all likelihood be outdated before long-certainly in political knowledge-the fact that it might alter the traditional routine of exams and essay writing for students and generate such benefits as enthusiasm, empathy, a focus on ethics and decreased cynicism would make it worthy of pursuit. Essays are a good tool for the development of critical thinking skills, but as others have also noted, there are other means and other tools to develop "higher order thinking skills" in students (Cherney, 2008; Rackaway & Goertze, 2008), especially where understanding of multi-dimensional and complex relations is required (Grove, 2005). It is notable that the most extensive use of role playing and simulations in political science is in International Relations where negotiations and diplomacy play such a key role in political outcomes (Chasek, 2004). It is easier to teach this sort of dynamic to young adults through role playing. I would argue there is value-added by experiential learning even if it is only as good as the standard teaching formats measured by standard learning measurements. These **debates** over the measured outcomes **are missing a significant point about** the importance of **performance learning** by students. While standard learning outcomes are clearly important to teaching, verbal engagement or the performance aspects of educational exercises are also important, and as I argue here, the two are linked in the real world of social and political engagement. Policy and legislative output, for example, is **not the product of knowledge alone**; it is developed through one-on-one interpersonal interaction during set processes within institutions and among actors engaged in ongoing rhetorical and power relations. The educated student would do well to better understand these dynamics. 3. Three-Stage Policy Exercise For anyone interested in teaching about public performance and the role it plays in our social and political processes and outcomes through experiential learning, a series of graduated participation forums that highlight both process and content is useful. Here the students learn more than in a standard lecture or tutorial about the structuring of group discourse and what this does to political or policy content. Over the course of three weeks a series of expanding forums may be used: starting out as one-on-one and then getting larger and more complex in both process and content. This exercise may be used to illustrate different social or political interactions such as structural, administrative or policy dynamics (redesigning institutional processes, enhancing institutional/group accountability and ethics, or producing policy and/or policy analysis). Here the example of a public policy debate and some of its common forums will be used. Preparation for the policy exercise includes an assigned or student-chosen jurisdiction and policy issue, e.g., a nation-state dealing with climate change, plus an assigned political role for each student, e.g., the national leader, various party members, members of a policy network, etc. (Hereafter, the example of political parties will be used.) Research guidance is given, and preferably illustrated, in class. Media presentations of legislative debates, journalist scrums or political or policy issue debates that feature cross-party discussions of political or policy issues are good tools for this type of classroom learning. This allows for a better understanding by the students of the actors and institutions involved, as well as the policy debates common to the chosen policy field. It also allows for illustration of the use of rhetoric and argument, as well as the use of content avoidance as a political tool. These are strategies the students may wish to employ in their own discussions and debates. The first week of the Three-Stage exercise is called the Triage Stage. Here each student comes to class with a personal triage list that moves from the most to least important issues in the selected policy area. Students are told explicitly to use their own personal policy preferences here, but to also research their political role so that they understand how the person they will later represent would think about the policy. When the exercise begins the students are put into groups of two, then four, then eight, and so on, respectively, depending on class size. Each student must begin by explaining and defending her or his original triage list to the discussion group (of two) and then come to an agreement on a new list to take to the next level (of four), and so on until the full group has one triage list. This entails considerable discussion, debate and retreat. Power dynamics, persuasion and knowledge differentials among the students begin to show up here, since they are forced to agree on one list in the end. The second part of the Triage stage, then, asks the students to repeat the first exercise, this time acting out their assigned political role within their own political party, and again producing one triage list – to be used in the next stage of the exercise. By representing a political actor, they are forced to move beyond their personal perspective to look at the likely output of the political actors involved. It provides the opportunity to see how process and hierarchy affects output since the party members range in power. It also provides an illustration of how ideas, relations and emotions can shape or even subvert a seemingly straightforward process. In these exercises both the interpersonal and institutional world is brought in to demonstrate the effects they can have on politics and policy making. Once a final single triage list is produced by each party in the class, they are ready to enter the Negotiation Stage held the following week, preferably in an informal setting. The time lapse allows the students to assimilate the triage experience, record their impressions (more below in Assessment section), and engage in further research with the members of their own party. At the negotiations, each party has a central table where the party leader coordinates activities, sending out sets of students to negotiate with the other parties. Blank tables with headings are provided for students to keep track of the negotiations. In the role playing, the governing party group is looking for backers for the triage they will be pushing during the final policy debate stage. Other groups are deciding whether or not to back those in power as well as which groups or individuals they might be able to bring on board in order to oppose the governing party during the policy meeting. The students then report back, and at the end of the session each party leader meets individually with each of the other party leaders to debate and negotiate positions. The results of these negotiations are known only within each party and will be used to build its strategy for the more formal debate the following week. The negotiation exercise helps reveal the dynamics of political communication, debate and negotiation. It also illustrates to the students the "back room" strategies and deal making of the real pre-meeting political dynamics that occur prior to major policy meetings/debates in, for example, the legislature, committee system, executive caucuses, or institutions of federalism. The final stage of the learning exercise, the Debate Stage, is where a full class debate is held and a vote taken on a final policy "to do" list. If using political parties, this can be a legislative debate and vote of the full legislature or house. The students' task here is further develop performance skills, and to

demonstrate political and policy knowledge. Each student brings his or her research summary notes, party triage list and negotiation tables, and another blank table with headings is provided to make quick notations during the debate. Prior to the debate, each party also prepares a brief opening statement of their policy position. After the opening statements, the floor is open to debate and it is up to the individual students and their group to put forth their best arguments and counter-arguments to the policy choices proposed. The competitive environment means it moves along at a good pace, since the students are eager to demonstrate all the policy research they have in front of them. As one student put it, "When the debate occurred, I learned that you really had to stay on your toes and think quickly in order to rebut." At the end of the session either consensus is reached on a number of issues or a vote is held and the majority wins. The results of the vote are recorded in the session and can then be used in the student's final journal entry. The debate exercise advances the students' understanding of communication, debate, and negotiation, only this time it is in a formal institutional setting where there are rules of procedure, time limits, and hierarchies of authority. Performance skills play a role here as well. This is enhanced if the simulated institutional process is one which is open to the public, such as a House Question Period, where the dynamics of political language and rhetoric aimed at the public through the media can be demonstrated. Of course, the debate also offers students the opportunity to demonstrate their policy and political knowledge – or content knowledge rather than process or performance knowledge. Any of these three stages could be used independently, but there is an advantage to using all three and to using them in succession. Education experiments have shown that although some students start out with trepidation about new modes of learning, this is often overcome as the exercise progresses (Frederking, 2005, p. 391). The staged approach allows the student to build up gradually toward the more pressured performance forum of the full debate. They begin in the less formal communications and debate sessions without too much pressure, since the instructor is not focused solely on them, and the group dynamics are still small. But as the role playing exercises progress, they are under increasing hierarchical pressure and peer pressure to perform. The staged approach also takes the students from their original personal policy preferences through a simulated institutional process: from the internal informal process of the triage, to the external informal process of the negotiations, to the external formal process of the policy making debate. Students learn: how this process alters their personal policy list; what the informal sphere does to policy content; and what the formal rules of an institution allow in the development of public policy. These things rarely discussed or not fully understood out of textbooks.

Simulation Model Good

Simulation models like debate are key to effective policy – simply reading isn't sufficient, an adversarial process is key

Levy et al 1 (David Levy, Pacific Institute for Research and Evaluation, FRANK CHALOUPKA, University of Illinois, Chicago, IL, USA, JOSEPH GITCHELL Pinney Associates DAVID MENDEZ and KENNETH E. WARNER University of Michigan, MI, USA, "The Use of Simulation Models for the Surveillance, Justification and Understanding of Tobacco Control Policies," 2002)//ghs-VA

Simulation models can be useful tools in informing policy makers who are trying to develop an appropriate mix of policies to reduce tobacco use and its consequences, **and**, more generally, in helping to understand the effects of tobacco policies. They can serve to predict future tobacco use and the effect of policies on that use, justify the implementation of particular policies, and help to **better understand the impact** of these policies. Simulation models generally start with a status-quo scenario, which projects smoking rates and health outcomes from some date forward in the absence of any specific policy addressing tobacco use. This type of information enables policy makers to understand and plan for likely future trends. Status quo scenarios generally reflect current policies, which is generally the base most relevant to policy makers. The models predict the effect of new policies on current levels and trends in smoking rates. The level of socio-demographic detail may vary from model to model, but, at a minimum, variation in smoking levels across different age cohorts is needed. Simulation models can allow policy makers to conduct experiments to determine the effects of well-defined programs and/or policies on smoking rates and specific tobacco-related problems in their communities before the actual expenditure of funds. Policies may be considered individually and then compared. For example, policy makers can use models as a tool to estimate the long-term impact of a tax increase on smoking rates or deaths, and to compare these effects to those of youth access policies. The effects of policies may be gauged in terms of the level and timing of their effect on smoking-related harms as well on smoking rates. Different policies may be also considered together or implemented in some sequence. The effect of newly implemented policies in a state or community is likely to depend on the policies already in effect, as well as on the intensity of their implementation and enforcement, and on policies being considered. For example, mass media-related policies may be more effective if they are accompanied by attempts to pass clean air laws or raise taxes. The effects of policies on different socio-demographic groups may also be considered. Many policies are likely to affect those of different ages, genders, racial/ethnic groups, or income/ education levels in different ways. Consequently, **knowledge of the effects of policies on these different groups will be helpful in targeting policies to particular populations where the need is greatest**, and in coordinating the effects of different policies. For example, treatment-oriented policies aimed at adult smokers may be an important adjunct to youth oriented policies, not only because they affect a different population but also because adults serve as a role model for youth and as a potential source of cigarettes. The results of simulation models may be used to justify specific tobacco policies or tobacco policies in general. The effect of one tobacco control policy may be considered relative to another policy in order to determine which is more effective. Alternatively, tobacco control policies may be compared to other public health policies, such as treatment for alcohol abuse. The effects of other policies may be considered in the model or may be derived from other models or literature. In comparing different policies, **cost-effectiveness analyses** are often useful. When combined with information on the costs of the policies, their effect may be gauged relative to the expenditure of scarce resources. The choice between tobacco policies may also be justified. Part of justifying tobacco control policies is a **"heuristic" role of explaining the effects of policies** to those less familiar with the public health literature. Simulation models demonstrate what is known from the scientific literature concerning the relative effectiveness of various policy approaches on the prevention of smoking and its consequences. They provide a useful method for helping to understand the basic effects of policies. Besides being used as a teaching device, simulation models may help to provide guidance on research needs in the field of public health and help define priorities and new directions for this research. In developing equations in simulation models, decisions must be made to explain how policies affect smoking outcomes. Policies may be transmitted through the population in various ways. They may affect the physical or financial availability of tobacco products, norms regarding use, or the ability to get successful treatment. They may affect initiation, quit or relapse rates, may have effects of

different magnitude and duration, and may affect different socio-demographic groups in different ways. Policies may have interactive effects. In other words, simulation models force the developers to think in a system wide fashion that provides a basis for a more complete understanding of the policies. In developing the linkages, the limitations of our knowledge on the effects of different policies are also made more explicit. In addition to examining how policies affect the population, simulation models may be used to examine the form that policies may take. For example, youth access policies generally involve some combination of compliance checks, penalties on those who violate the law, and attempts to educate and mobilize the community. The model may consider how different uses of these components may affect outcomes of the policy. Thereby, models can help policy makers to more effectively implement policy. In addition, simulation models may provide a structure for those studying public health to better understand and explore the effects of a policy

Real Life Application

Traditional pedagogical techniques fail – simulation is key to breaking out of current models of passive learning – adversarial model is key

Silvia 10 (Chris, Assistant Professor in the Romney Institute of Public Management at Brigham Young University, PhD in Public Affairs from the School of Public and Environmental Affairs at Indiana University, "The Impact of Simulations on Higher-Level Learning," 2010, http://www.naspaa.org/jpaemessenger/article/vol18-2/10_silva.pdf)//ghs-VA

Often, political science, <u>public policy</u>, and public administration <u>course objectives include statements regarding increasing responsible citizenship</u>, developing a continued interest in public affairs and policy, building the capacity to integrate the course material to develop policy arguments, <u>and fostering the ability to apply the theoretical concepts to "real life" situations</u>. These objectives are beyond simple recall and comprehension and are often referred to as higher-level learning. However, the **traditional pedagogical techniques** of assigned readings, lectures, tests, and papers often <u>fail to replicate the "real world."</u> As a result, some have turned to **role-playing simulations** to <u>help achieve</u> their <u>course objectives</u>. While the benefits of role-playing simulations are often touted, there is a dearth of empirical evidence to support this assertion. A survey of nearly 200 students in four sections of an entry-level course in urban policy is used to examine this gap in the teaching and learning literature and attempts to uncover the impact of multisession classroom role-playing simulations on higher-level student learning. The results of this study suggest that <u>role-playing simulations are an effective means to give students the opportunity to engage in higher-level learning</u>. "One must learn by doing the thing, for though you think you know it—you have no certainty until you try." — Sophocles (495–406 BCE) Over the past few years, many college campuses around the country have moved toward the use of innovative teaching techniques to improve student learning. One of the most commonly used techniques has been active learning, which has been defined as "anything that involves students in doing things and thinking about the things they are doing" (Bonwell & Eison, 1991, p. 2). This movement has been spurred on by the thought that <u>"genuine learning" is the result of the student's active engagement in the learning process and not merely their passive absorption of what is being taught</u> (Alder, 1982). Proponents argue that the incorporation of active learning activities (e.g. hands-on activities, <u>role plays</u>, group projects, peer-led learning, <u>and simulations</u>) <u>better</u> help an instructor "create a lesson plan that <u>maximizes student learning, encourages critical thinking</u>, aids information retention, <u>and allows students to apply key concepts and knowledge gained through readings and lecture to real</u> (or realistic) <u>problems</u>" (Raines, 2003, p. 432). Further, it has been argued that active learning techniques help bridge the lecturer-listener divide. In a traditional lecture, the students passively listen while the professor actively lectures (Bonwell, 1996). This approach places more focus on the teacher's teaching than on the students' learning (O'Leary, 2002). Since individual students "process information, learn concepts, and solve problems in different ways" (Brock & Cameron, 1999, p. 251), all of the students in the classroom may not be able to grasp the material through merely hearing a lecture. The standard lecture format may in fact only help those students to learn the intended material who "learn auditorially, have a high working memory capacity, have all the required prior knowledge, have good note-taking skills, and are not susceptible to information-processing overload" (Johnson, Johnson, & Smith, 1991, p. 89). Further, some contend that lectures are "not suited for teaching higher orders of thinking such as application, analysis, synthesis or evaluation" (Bonwell, 1996, p. 32). Thus, using active learning activities in the classroom has become a popular teaching technique because such activities are designed to engage students actively in their own learning (Campbell & McCabe, 2002) and are more effective alternatives to the traditional lecture/ discussion approach whereby students take a passive role in their own learning process (Poling & Hupp, 2009). While much of the literature on the scholarship of teaching and learning suggests that students will comprehend better, retain longer, and become more interested in the material when active learning techniques are used (Bonwell, 1996; Fink, 2003; Poling & Hupp, 2009), a healthy debate continues over whether active learning techniques are of value. Some are skeptical that the juice is worth the squeeze, for they see too many barriers to usage to justify its incorporation. Such barriers include concerns that the preparation time required to conduct these activities is too onerous (Crawford & Machemer, 2008; Faria & Wellington, 2004; Killian &Brandon, 2009), that active learning activities make it harder to cover the required course material (Killian &Brandon, 2009; Michaelsen, Knight, & Fink, 2004), that the amount of class time taken up by active learning activities is too great (Faria & Wellington, 2004), and, finally, that these activities simply do not work as they were intended to work (Powner & Allendoerfer, 2008). However, perhaps the largest point of contention raised by those who question the utility of active learning activities is the lack of empirical evidence that these techniques really work (Gosen & Washbush, 2004; Krain & Lantis, 2006; Rochester, 2003). The answer to this question is difficult to assess because of the difficulty in determining what works means. As Rochester counsels, "Rather than offering ringing endorsements of the latest innovations and sweeping indictments of old-fashioned techniques, we should engage in research that specifies what learning outcomes are maximized under what circumstances for what clienteles" (2003, p. 434). In other words,

instead of flocking blindly toward an approach that is an unproven panacea, professors need to apply the research skills that we hone in our individual disciplines to our teaching to see if what many think works really does work. ROLE-PLAYING SIMULATIONS AS AN ACTIVE LEARNING TECHNIQUE Experiential learning activities have been a commonly employed pedagogical tool for centuries. The physical sciences have had laboratory sessions, language classes have included role-playing exercises, and the health sciences have held mock-ups, all of which were designed to allow the student to use and apply what was read or presented in class. With the lectures and/or readings as a foundation, many of these experiences were intended to crystallize the students' understanding of the material. For example, since the relationship between force, mass, and acceleration is often not intuitive, many physics courses include a lab session where students manipulate these three parameters and prove to themselves that force is equal to mass times acceleration. Whereas classes in the physical sciences reinforce and build upon the concepts and theories taught in lecture with opportunities to experiment in a laboratory setting, courses in the social sciences often do not include similar, hands-on learning opportunities. This lack of an active learning experience may be particularly problematic in the political science, public policy, and public administration classrooms, for students in these disciplines must often grapple with the conflicting facts and values that are common in public policy debates and throughout the policy process in the real world. Since pure laboratory experiments in many disciplines are not possible or ethical, instructors in these fields have turned to simulations as ways to allow students a laboratory-like experience. Simulations vary widely in their length—some last only 5 to 10 minutes (Davis, 2009), and others are held over multiple class sessions (Woodworth, Gump, & Forrester, 2005). Additionally, the format of simulations ranges from computerized games to elaborate, role-playing scenarios (Moore, 2009). While not all simulations involve role playing, for the purposes of this paper, the terms role playing, role-playing simulation, and simulations are used synonymously to refer to active learning techniques in which students try to "become another individual and, by assuming the role, to gain a better understanding of the person, as well as the actions and motivations that prompt certain behaviors… [and] explore their [own] feelings" (Moore, 2009, p. 209). "Simulations give students the chance to apply theory, develop critical skills, and provide a welcome relief from the everyday tasks of reading and preparing for classes" (Kanner, 2007). An additional benefit of many of these simulations is the introduction of an aspect of realism into the students' experience. Such simulations are historically seen in the medical fields, where mock-up patients take on the signs and symptoms of a certain disease or injury and the student is asked to assess, diagnose, and/or treat the "patient." Here the students must apply what they have learned to a reasonably realistic scenario. Further, there is evidence that the experiential learning that occurs in role-playing simulations promotes long-term retention of course material (Bernstein & Meizlish, 2003; Brookfield, 1990). Increasingly, public administration, public policy, and political science courses are turning toward simulations and role playing to help their students both better understand and apply the material. Simulations have been used in courses such as international relations (e.g., Shellman & Turan, 2006), negotiations (e.g., Kanner, 2007), constitutional law (e.g., Fliter, 2009), comparative politics (e.g., Shellman, 2001), professional development (e.g., Wechsler & Baker, 2004), economics (e.g., Campbell & McCabe, 2002), human resource management (e.g., Dede, 2002; Yaghi, 2008), leadership (e.g., Crosby & Bryson, 2007), and American government (e.g., Caruson, 2005). Frequently, the learning objectives in these courses include statements regarding increasing responsible citizenship, developing a continued interest in public affairs and policy, building the capacity to integrate the course material to develop policy arguments, and fostering the ability to apply theoretical concepts to real-life situations. Many professors want their students to be able to apply the "book knowledge" to the real world, to see how the abstract concepts and theories play out in the real world, to be able to experience real-world processes, and to become motivated to become involved in the real-world processes that are discussed in class. Scholars have claimed that simulations achieve all four objectives (see Brock & Cameron, 1999; Campbell & McCabe, 2002; Shellman, 2001; Smith & Boyer, 1996, respectively) because they place the students in roles where they are asked to apply what they have learned previously in order to "exercise judgment,…enlarge their analytical capacity"(Moreno, 2007, p. 85), "make decisions, solve problems, and react to the results of their decision" (McKeachie & Marilla, 2006, p. 226). The aforementioned objectives are beyond simple recall and comprehension and are what Bloom (1956) referred to as higher levels of student learning. However, the traditional pedagogical techniques of assigned readings, lectures, tests, and papers often fail to replicate the real world in that these traditional learning experiences frequently do not require the students to integrate, synthesize, and apply the course material in realistic situations. Simulations, on the other hand, put students in realistic situations that allow them to participate affectively, behaviorally, and cognitively (Blanchard & Donahue, 2007) and, in so doing, may assist students in engaging in higher-level learning.

Util

Extinction First

High risk of extinction - doomsday argument

Nick **Bostrom, 2012** ("A Primer on the Doomsday Argument" http://www.anthropic-principle.com/?q=anthropic_principle/doomsday_argument)

Here is the doomsday argument. I will explain it in three steps:¶ Step I¶ Imagine a universe that consists of one hundred cubicles. In each cubicle, there is one person. Ninety of the cubicles are painted blue on the outside and the other ten are painted red. Each person is asked to guess whether she is in a blue or a red cubicle. (And everybody knows all this.)¶ Now, suppose you find yourself in one of these cubicles. What color should you think it has? Since 90% of all people are in blue cubicles, and since you don't have any other relevant information, it seems you should think that with 90% probability you are in a blue cubicle. Let's call this idea, that you should reason as if you were a random sample from the set of all observers, the self-sampling assumption.¶ Suppose everyone accepts the self-sampling assumption and everyone has to bet on whether they are in a blue or red cubicle. Then 90% of all persons will win their bets and 10% will lose. Suppose, on the other hand, that the self-sampling assumption is rejected and people think that one is no more likely to be in a blue cubicle; so they bet by flipping a coin. Then, on average, 50% of the people will win and 50% will lose. – The rational thing to do seems to be to accept the self-sampling assumption, at least in this case.¶ Step II¶ Now we modify the thought experiment a bit. We still have the hundred cubicles but this time they are not painted blue or red. Instead they are numbered from 1 to 100. The numbers are painted on the outside. Then a fair coin is tossed (by God perhaps). If the coin falls heads, one person is created in each cubicle. If the coin falls tails, then persons are only created in cubicles 1 through 10.¶ You find yourself in one of the cubicles and are asked to guess whether there are ten or one hundred people? Since the number was determined by the flip of a fair coin, and since you haven't seen how the coin fell and you don't have any other relevant information, it seems you should believe with 50% probability that it fell heads (and thus that there are a hundred people).¶ Moreover, you can use the self-sampling assumption to assess the conditional probability of a number between 1 and 10 being painted on your cubicle given how the coin fell. For example, conditional on heads, the probability that the number on your cubicle is between 1 and 10 is 1/10, since one out of ten people will then find themselves there. Conditional on tails, the probability that you are in number 1 through 10 is one; for you then know that everybody is in one of those cubicles.¶ Suppose that you open the door and discover that you are in cubicle number 7. Again you are asked, how did the coin fall? But now the probability is greater than 50% that it fell tails. For what you are observing is given a higher probability on that hypothesis than on the hypothesis that it fell heads. The precise new probability of tails can be calculated using Bayes' theorem. It is approximately 91%. So after finding that you are in cubicle number 7, you should think that with 91% probability there are only ten people.¶ Step III¶ The last step is to transpose these results to our actual situation here on Earth. Let's <u>formulate the following</u> two rival <u>hypotheses. Doom Early</u>: humankind goes extinct in the next century and <u>the total number of humans that will have existed is,</u> say<u>, 200 billion</u>. <u>Doom Late: humankind survives</u> the next century and goes on to colonize the galaxy; the <u>total number of humans is</u>, say, <u>200 trillion</u>. To simplify the exposition we will consider only these hypotheses. (Using <u>a more fine-grained partition</u> of the hypothesis space <u>doesn't change the principle</u> although it would give more exact numerical values.)¶ Doom Early corresponds to there only being ten people in the thought experiment of Step II. Doom Late corresponds to there being one hundred people. Corresponding the numbers on the cubicles, we now have the "birth ranks" of human beings – their positions in the human race. Corresponding to the prior probability (50%) of the coin falling heads or tails, we now have some prior probability of Doom Soon or Doom Late. This will be based on our ordinary empirical estimates of potential threats to human survival, such as nuclear or biological warfare, a meteorite destroying the plant, runaway greenhouse effect, self-replicating nanomachines running amok, a breakdown of a metastable vacuum state due to high-energy particle experiments and so on (presumably there are dangers that we haven't yet thought of). <u>Let's say</u> that based on such considerations, <u>you think that there is a 5% probability of Doom Soon</u>. The <u>exact number doesn't matter</u> for the structure of the argument.¶ Finally, corresponding to finding you are in cubicle number 7 we have the fact that you find that <u>your birth rank is</u> about <u>60 billion</u> (that's approximately how many humans have lived before you). Just as finding you are in cubicle 7 increased the probability of the coin having fallen tails, so <u>finding you are human number 60 billion gives you reason to think that Doom Soon is more probable</u> than you previously thought. Exactly how much more probable will depend on the precise numbers you use. In the present example, the <u>posterior probability of Doom Soon will be very close to one</u>. You can with near certainty rule out Doom Late.¶ *¶ That is the Doomsday argument in a nutshell. After hearing about it, many people think they know what is wrong with it. But these objections tend to be mutually incompatible, and often they hinge on some simple misunderstanding. Be sure to read the literature before feeling too confident that you have a refutation.¶ If the Doomsday argument is correct, what precisely does it show? It doesn't show that there is no point trying to reduce threats to human survival "because we're doomed anyway". On the contrary, the <u>Doomsday argument could make such efforts seem even more urgent. Working to reduce the risk that nanotechnology will be abused to destroy intelligent life, for example, would decrease the prior probability of Doom Soon</u>, and this would reduce its posterior probability after taking the Doomsday argument into account; humankind's life expectancy would go up.

Existential risk education good

http://pcast.ideascale.com/a/dtd/Catalyze-Education-and-Industry-in-Existential-Risk-and-Global-Catastrophic-Risk-Reduction/72299-8319

There is no agenda for innovation more important for humanity to undertake than the identification and reduction of "existential risks" (human extinction risks). Following that are global catastrophic risks our civilization could survive.¶ The effort to reduce existential and global catastrophic risks involves information technology (rogue artificial intelligence, infrastructure threats), biotechnology (bioweapons, virulent contagious diseases), and nanotechnology (nanoweapons, nanorobots). These "golden triangle" technologies also are of great interest economically, and young people can become inspired to work in them based on the need to reduce existential risk and global catastrophic risk. Like the anti-terrorism agenda, a focus on risk reduction also has the potential to unite the U.S. with other nations in applying science, technology, and innovation to cooperative efforts¶ Expansion of industry to meet demands of such risk reduction - in the near term as well as the longer term through education - could generate many white and blue collar jobs, and provide a boost to the economy that will not disappear over time, since the demand will be self-perpetuating (new risks will be determined and risk reduction can always be improved) as well as in everyone's rational self-interest. Improving analysis of potential interactions between risks and proactively developing solutions and contingency plans (including how risks may impact the economy) would seem to be an especially promising area for commercial development. In turn, commercial development would spur more innovative solutions for risk reduction.¶ There may be tens of thousands of people working on specific risks including arms control, severe climate scenarios, mega-scale natural disasters, asteroids, technological weaponization and many other particular risks. However, instead of viewing these risks as fundamentally dissimilar, they can all be classified as "existential risks" or "global catastrophic risks." Popularizing these classifications, with objective weightings for things such as the significance of impact, the likelihood of occurrence, and the time horizon to avert, would facilitate wiser allocations of (inter)governmental resources and contribute to synergies between various risk reduction institutes and companies (e.g. via shared conferences, publications, web tools, business solutions, etc.). This could be especially beneficial to those working on reduction of existential risks, which receive much less attention than some global catastrophic risks, e.g. some forms of large-scale terrorism.¶ Ideally, a government panel would be formed as soon as possible to explore how to highlight and reward the study of existential and global catastrophic risks in education and catalyze industry quickly around the reduction of such risks, both to serve that primary aim and secondarily to create valuable jobs that help boost the economy, many of which will relate to information technology, biotechnology, and nanotechnology.

Future generations

Bostrom and Andersen 2012 (The Atlantic, "We're underestimating the Risk of Human Extinction" http://www.theatlantic.com/technology/archive/2012/03/were-underestimating-the-risk-of-human-extinction/253821/)

Well suppose you have a moral view that counts future people as being worth as much as present people. You might say that fundamentally it doesn't matter whether someone exists at the current time or at some future time, just as many people think that from a fundamental moral point of view, it doesn't matter where somebody is spatially---somebody isn't automatically worth less because you move them to the moon or to Africa or something. A human life is a human life. If you have that moral point of view that future generations matter in proportion to their population numbers, then you get this very stark implication that existential risk mitigation has a much higher utility than pretty much anything else that you could do. There are so many people that could come into existence in the future if humanity survives this critical period of time---we might live for billions of years, our descendants might colonize billions of solar systems, and there could be billions and billions times more people than exist currently. Therefore, even a very small reduction in the

probability of realizing this enormous good will tend to outweigh even immense benefits like eliminating poverty or curing malaria, which would be tremendous under ordinary standards.

High risk - new technologies and observer selection effect

Bostrom and Andersen 2012 (The Atlantic, "We're underestimating the Risk of Human Extinction" http://www.theatlantic.com/technology/archive/2012/03/were-underestimating-the-risk-of-human-extinction/253821/)Bostrom: Well, there's another line of thinking that's very similar to what you're describing that speaks to how much weight we should give to our track record of survival. Human beings have been around for roughly a hundred thousand years on this planet, so how much should that count in determining whether we're going to be around another hundred thousand years? Now there are a number of different factors that come into that discussion, the most important of which is whether there are going to be new kinds of risks that haven't existed to this point in human history---in particular risks of our own making, new technologies that we might develop this century, those that might give us the means to create new kinds of weapons or new kinds of accidents. The fact that we've been around for a hundred thousand years wouldn't give us much confidence with respect to those risks. ¶ But, to the extent that one were focusing on risks from nature, from asteroid attacks or risks from say vacuum decay in space itself, or something like that, one might ask what we can infer from this long track record of survival. And one might think that any species anywhere will think of themselves as having survived up to the current time because of this observation selection effect. You don't observe yourself after you've gone extinct, and so that complicates the analysis for certain kinds of risks.¶ A few years ago I wrote a paper together with a physicist at MIT named Max Tegmark, where we looked at particular risks like vacuum decay, which is this hypothetical phenomena where space decays into a lower energy state, which would then cause this bubble propagating at the speed of light that would destroy all structures in its path, and would cause a catastrophe that no observer could ever see because it would come at you at the speed of light, without warning. We were noting that it's somewhat problematic to apply our observations to develop a probability for something like that, given this observation selection effect. But we found an indirect way of looking at evidence having to do with the formation date of our planet, and comparing it to the formation date of other earthlike planets and then using that as a kind of indirect way of putting a bound on that kind of risk. So that's another way in which observation selection effects become important when you're trying to estimate the odds of humanity having a long future.

Predictions are inevitable and good - the idea that we can either have perfect information or none is absurd and makes action impossible

Nick **Bostrom 2007** ("The Future of Humanity", http://www.nickbostrom.com/papers/future.html)

We need realistic pictures of what the future might bring in order to make sound decisions. Increasingly, we need realistic pictures not only of our personal or local near-term futures, but also of remoter global futures. Because of our expanded technological powers, some human activities now have significant global impacts. The scale of human social organization has also grown, creating new opportunities for coordination and action, and there are many institutions and individuals who either do consider, or claim to consider, or ought to consider, possible long-term global impacts of their actions. Climate change, national and international security, economic development, nuclear waste disposal, biodiversity, natural resource conservation, population policy, and scientific and technological research funding are examples of policy areas that involve long time-horizons.

Arguments in these areas often rely on implicit assumptions about the future of humanity. By making these assumptions explicit, and subjecting them to critical analysis, it might be possible to address some of the big challenges for humanity in a more well-considered and thoughtful manner.¶ The fact that we "need" realistic pictures of the future does not entail that we can have them. Predictions about future technical and social developments are notoriously unreliable – to an extent that have lead some to propose that we do away with prediction altogether in our planning and preparation for the future. Yet while the methodological problems of such forecasting are certainly very significant, the extreme view that we can or should do away with prediction altogether is misguided. That view is expressed, to take one example, in a recent paper on the societal implications of nanotechnology by Michael Crow and Daniel Sarewitz, in which they argue that the issue of predictability is "irrelevant":¶ ¶ preparation for the future obviously does not require accurate prediction; rather, it requires a foundation of knowledge upon which to base action, a capacity to learn from experience, close attention to what is going on in the present, and healthy and resilient institutions that can effectively respond or adapt to change in a timely manner.2¶ ¶ Note that each of the elements Crow and Sarewitz mention as required for the preparation for the future relies in some way on accurate prediction. A capacity to learn from experience is not useful for preparing for the future unless we can correctly assume (predict) that the lessons we derive from the past will be applicable to future situations. Close attention to what is going on in the present is likewise futile unless we can assume that what is going on in the present will reveal stable trends or otherwise shed light on what is likely to happen next. It also requires non-trivial prediction to figure out what kind of institution will prove healthy, resilient, and effective in responding or adapting to future changes.¶ The reality is that predictability is a matter of degree, and different aspects of the future are predictable with varying degrees of reliability and precision.3 It may often be a good idea to develop plans that are flexible and to pursue policies that are robust under a wide range of contingencies. In some cases, it also makes sense to adopt a reactive approach that relies on adapting quickly to changing circumstances rather than pursuing any detailed long-term plan or explicit agenda. Yet these coping strategies are only one part of the solution. Another part is to work to improve the accuracy of our beliefs about the future (including the accuracy of conditional predictions of the form "if x is done, y will result"). There might be traps that we are walking towards that we could only avoid falling into by means of foresight. There are also opportunities that we could reach much sooner if we could see them farther in advance. And in a strict sense, prediction is always necessary for meaningful decision-making.4¶ Predictability does not necessarily fall off with temporal distance. It may be highly unpredictable where a traveler will be one hour after the start of her journey, yet predictable that after five hours she will be at her destination. The very long-term future of humanity may be relatively easy to predict, being a matter amenable to study by the natural sciences, particularly cosmology (physical eschatology). And for there to be a degree of predictability, it is not necessary that it be possible to identify one specific scenario as what will definitely happen. If there is at least some scenario that can be ruled out, that is also a degree of predictability. Even short of this, if there is some basis for assigning different probabilities (in the sense of credences, degrees of belief) to different propositions about logically possible future events, or some basis for criticizing some such probability distributions as less rationally defensible or reasonable than others, then again there is a degree of predictability. And this is surely the case with regard to many aspects of the future of humanity. While our knowledge is insufficient to narrow down the space of possibilities to one broadly outlined future for humanity, we do know of many relevant arguments and considerations which in combination impose significant constraints on what a plausible view of the future could look like. The future of humanity need not be a topic on which all assumptions are entirely arbitrary and anything goes. There is a vast gulf between knowing exactly what will happen and having absolutely no clue about what will happen. Our actual epistemic location is some offshore place in that gulf.5¶

Magnitude first - we can recover from anything short of extinction and there's consensus that it's a real risk

Nick **Bostrom 2007** ("The Future of Humanity", http://www.nickbostrom.com/papers/future.html)

Human extinction risks have received less scholarly attention than they deserve. In recent years, there have been approximately three serious books and one major paper on this topic. John Leslie, a Canadian philosopher, puts the probability of humanity failing to survive the next five centuries to 30% in his book End of the World.19 His estimate is partly based on the controversial "Doomsday argument" and on his own views about the limitations of this argument.20 Sir Martin Rees, Britain's Astronomer Royal, is even more pessimistic, putting the odds that humanity will survive the 21st century to no better than 50% in Our Final Hour.21 Richard Posner, an eminent American legal scholar, offers no numerical estimate but rates the risk of extinction "significant" in Catastrophe.22 And I published a paper in 2002 in which I suggested that assigning a probability of less than 25% to existentialdisaster (no time limit) would be misguided. 23 The concept of existential risk is distinct from that of extinction risk. As I introduced the term, an existential disaster is one that causes either the annihilation of Earth-originating intelligent life or the permanent and drastic curtailment of its potential for future desirable development.24¶ It is possible that a publication bias is responsible for the alarming picture presented by these opinions. Scholars who believe that the threats to human survival are severe might be more likely to write books on the topic, making the threat of extinction seem greater than it really is. Nevertheless, it is noteworthy that there seems to be a consensus among those researchers who have seriously looked into the matter that there is a serious risk that humanity's journey will come to a premature end.25¶ The greatest extinction risks (and existential risks more generally) arise from human activity. Our species has survived volcanic eruptions, meteoric impacts, and other natural hazards for tens of thousands of years. It seems unlikely that any of these old risks should exterminate us in the near future. By contrast, human civilization is introducing many novel phenomena into the world, ranging from nuclear weapons to designer pathogens to high-energy particle colliders. The most severe existential risks of this century derive from expected technological developments. Advances in biotechnology might make it possible to design new viruses that combine the easy contagion and mutability of the influenza virus with the lethality of HIV. Molecular nanotechnology might make it possible to create weapons systems with a destructive power dwarfing that of both thermonuclear bombs and biowarfare agents.26 Superintelligent machines might be built and their actions could determine the future of humanity – and whether there will be one.27 Considering that many of the existential risks that now seem to be among the most significant were conceptualized only in recent decades, it seems likely that further ones still remain to be discovered.¶ The same technologies that will pose these risks will also help us to mitigate some risks. Biotechnology can help us develop better diagnostics, vaccines, and anti-viral drugs. Molecular nanotechnology could offer even stronger prophylactics.28 Superintelligent machines may be the last invention that human beings ever need to make, since a superintelligence, by definition, would be far more effective than a human brain in practically all intellectual endeavors, including strategic thinking, scientific analysis, and technological creativity.29 In addition to creating and mitigating risks, these powerful technological capabilities would also affect the human condition in many other ways.¶ Extinction risks constitute an especially severe subset of what could go badly wrong for humanity. There are many possible global catastrophes that would cause immense worldwide damage, maybe even the collapse of modern civilization, yet fall short of terminating the human species. An all-out nuclear war between Russia and the United States might be an example of a global catastrophe that would be unlikely to result in extinction. A terrible pandemic with high virulence and 100% mortality rate among infected individuals might be another example: if some groups of humans could successfully quarantine themselves before being exposed, human extinction could be avoided even if, say, 95% or more of the world's population succumbed. What distinguishes extinction and other existential catastrophes is that a comeback is impossible. A non-existential disaster causing the breakdown of global civilization is, from the perspective of humanity as a whole, a potentially recoverable setback: a giant massacre for man, a small misstep for mankind.¶ An existential catastrophe is therefore qualitatively distinct from a "mere" collapse of global civilization, although in terms of our moral and prudential attitudes perhaps we should simply view both as unimaginably bad outcomes.30 One way that civilization collapse could be a significant feature in the larger picture for humanity, however, is if it formed part of a repeating pattern. This takes us to the second family of scenarios: recurrent collapse.

AT: ethics

Constant surveillance is morally fantastic

James Stacy **Taylor, 2005** (In Praise of Big Brother: Why We Should Learn to Stop Worrying and Love Government Surveillance; Public Affairs Quarterly 19(3))

If the above pro-surveillance argument is sound, then it is morally permissible¶ for a State to subject its citizens to constant surveillance. Given the horror with¶ which the current proliferation of surveillance devices is usually greeted this¶ conclusion is not likely to be a popular one. However, before turning to rebut the¶ objections that it will be faced with, some of its advantages should be outlined.¶ The most obvious advantages to the State's installing such a surveillance system¶ would result from the fact that witnesses would no longer be needed in either¶ criminal or civil cases, for their testimony would be supplanted by information¶ supplied by surveillance devices. Unlike witness testimony, this information would¶ be accurate. It would, for example, be unaffected by any biases (whether conscious¶ or unconscious) that human witnesses might be subject to and which could taint¶ their testimony. It would also be free from distortions, whether deliberate (e.g.,¶ the witness is lying, or omitting parts of the truth), or accidental (e.g., the witness¶ has a faulty memory). Moreover, the juries and judges to whom the information¶ taken from surveillance devices would be presented in a court could take it at its¶ face value, rather than having subjectively to assess its accuracy in the light of¶ the perceived reliability of the witness from whom it was taken. Furthermore, that¶ witnesses would no longer be needed under a system of constant and universal¶ State surveillance would also benefithose who would otherwise have served in¶ this capacity. Most obviously, they would no longer be burdened with the task of¶ testifying, which might have required them to travel, or to take time off work. They¶ would also be relieved from any threats that they might have faced from persons¶ who would be adversely affected either by their testimony (e.g., the defendants¶ or their associates), or by its lack (e.g., the prosecutors).¶ A system of constant State surveillance would have other advantages, too.¶ Under the current criminal justice system a wealthy defendant who is innocent¶ of the charges that she is faced with can use her wealth to hire private investigators¶ to demonstrate her innocence, either by finding persons who witnessed the¶ crime of which she is accused, or by finding persons who can provide her with a¶ legitimate alibi. This option is not open to poorer defendants who are similarly¶ innocent, but who cannot afford to hire private investigators. Since this is so,¶ innocent, poor defendants are more likely than innocent, wealthy defendants to¶ accept plea bargains, or to be convicted of crimes that they did not commit. If,¶ however, a poor person were to be accused of a crime in a State that subjected its¶ citizens to constant surveillance, the judge in her case would be morally justified¶ (indeed, would be morally required) in enabling the defense to secure information¶ that would prove her innocence, and that would have been gathered by the State's¶ surveillance devices. A State's use of constant surveillance could thus reduce the¶ number of persons who are wrongfully convicted. This would not only be good in¶ itself, but it would also lead to a more equitable justice system, for the disparity¶ in wrongful conviction rates between the wealthy (who could use their wealth to¶ prove their innocence) and the poor could be eliminated.¶ In addition to these advantages constant State surveillance would also benefit¶ the State's citizenry at large, by serving as a deterrent to crime. This would not be¶ because the citizens who lived under State surveillance would never know when¶ they were being watched, and so would refrain from committing crimes for fear¶ of being caught in the act, as would persons in both 1984 and Jeremy Bentham's¶ Panopticon.11 As is clear from the second clarification of this pro-surveillance¶ argument, above, this argument does not justify the State watching its citizens,¶ for in doing so it would acquire more information about them than it is morally¶ permitted to acquire. However, if the State were to subject its citizens to the degree¶ of surveillance that would be justified on the above argument, its citizens would¶ know that whenever acrime was committed its performance would be recorded,¶ and so its perpetrator would be likely to be apprehended. This knowledge would¶ deter many potential criminals from committing crimes.18 (It would also deter¶ law enforcement officers from extending the limits of their authority.19) To be¶ sure, the knowledge that one's criminal act would be recorded would not deter¶ all potential criminals from committing crimes. Some persons would still commit¶ crimes of passion, and of anger; others would succumb to the temptation to¶ commit an opportunistic theft, act under the influence of drugs or alcohol, or act¶ on the belief that they would not be caught. But most persons would simply judge¶ the commission of crime not to be worthwhile, once they realized that they were¶ subject to constant State surveillance, and so such surveillance would serve as¶ an effective deterrent to most criminal activity.

Deontology implies that you can't evaluate the potential for abuse

James Stacy **Taylor, 2005** (In Praise of Big Brother: Why We Should Learn to Stop Worrying and Love Government Surveillance; Public Affairs Quarterly 19(3))

It must be admitted that, in practice, a system of constant State surveillance¶ is likely to be abused to some extent.[20] However, <u>if one adopts a rights-based¶ understanding of claim (ii)</u> above (i.e., if one holds that such a system of State¶ <u>surveillance is permissible as long as it does not in itself violate persons' moral¶ rights</u>), this objection can be readily rebutted. On such an understanding of claim¶ (ii) <u>one could first note that this abuse-based objection gets its force from the¶ view that such abuse would violate persons' moral rights</u>. The proponent of a¶ rights-based understanding of claim (ii) would certainly agree with this underlying¶ view, and would join with its advocates in condemning such abuse. However, the¶ rights theorist who was in favor of such a system of State surveillance would also¶ note that <u>the condemnation of the abuse of State surveillance is not to condemn¶ State surveillance itself</u>. To condemn the use of x for the purposes of v, where y¶ violates persons' rights (e.g., to privacy or autonomy) is not also to condemn the¶ use of x for the purposes of z, where z does not violate persons' rights. <u>Thus</u>, a¶ rights theorist who was a proponent of State surveillance could argue, <u>to offer the¶ possibility of abuse as an objection to constant State surveillance is to confuse the¶ moral status of different possible uses of such surveillance</u>. For such proponents¶ of State surveillance, then, this first objection can be readily dismissed¶

And, either the benefits outweigh or state corruption is inevitable

James Stacy **Taylor, 2005** (In Praise of Big Brother: Why We Should Learn to Stop Worrying and Love Government Surveillance; Public Affairs Quarterly 19(3))

To show why there is good reason to believe that little harm would accrue

from such a system of State surveillance its consequentialist <u>proponents should¶</u> first <u>distinguish between major abuses of such a system and minor abuses of it</u>.¶ A major abuse of such a system would be one in which the State used its power¶ together with its improved surveillance capabilities to persecute or oppress its¶ citizens, either individually or as a whole. A minor abuse of the system would be¶ one in which some of the agents of the State secured access to the information¶ gathered by its surveillance devices for their own nefarious purposes, such as¶ voyeurism or the mockery of the persons whose recorded actions they are viewing.¶ <u>The consequentialist proponent of constant and universal State surveillance need not be unduly concerned about the possibility of major abuses of the State surveillance system</u>. If the State were prone to abuse its citizens in this way <u>prior</u>¶ <u>to the installation of such a system</u>, this would provide good consequentialist¶ grounds for resisting its introduction. <u>The consequentialist proponent of constant</u>¶ State <u>surveillance is thus only concerned with defending the introduction of such a surveillance system in those cases where the State was not prone to abusing its citizens in this way</u>. This is not to say, however, that a State (or the agents of a¶ State) that was not prone to persecuting or oppressing its citizens might not occasionally¶ persecute individual citizens. In response to this the consequentialist¶ proponent of constant State surveillance should note that given its power <u>were¶ the State (or its agents) to decide to persecute some of its citizens in this way it¶ would not need a system of surveillance to do this effectively</u>. Thus, although such¶ a surveillance system might make it easier for the State (or its agents) to engage¶ in the persecution that it had decided upon, this would not make things any worse¶ for the person or persons thus persecuted. <u>As such</u>, then, <u>the possibility of the¶ major abuse of a system of</u> constant and universal <u>State surveillance</u> by a State¶ that was not prone to persecuting its citizens <u>would not</u>, for a conseqentialist, <u>be¶ a significant objection to the introduction of such a system</u>.¶ What, then, of the concern that such a system of constant State surveillance¶ would be subject to minor abuses? The most obvious response to this concern is to¶ argue that if such a system of surveillance is introduced then it must be accompanied¶ by a series of safeguards that would reduce the possibility that the information that¶ it gathers would be abused in this way. It might, for example, be that such a system¶ should be accompanied by the requirement that only a very few persons have access¶ to the information that it gathers, that such persons be screened carefully and¶

supervised closely, and that they are subject to draconian penalties for any abuses¶ that they might perpetrate. If they were severe enough such safeguards would be¶ likely to reduce the possibility of the minor abuse of such a system of surveillance¶ to a level whereby the harm that its abusers might cause would be outweighed by¶ the advantages that it would provide to the State's citizens as a whole.¶ However, the consequentialist proponent of State surveillance also has a¶ second - and more philosophically interesting - response to the concern that¶ such surveillance would be subject to minor abuse: that such abuse would not¶ be harmful, and so would not detract from the advantages outlined above. This¶ response is based on observing that given the penalties for abuse by which such¶ a system would be accompanied (as outlined above) any such abuse would be¶ perpetrated covertly. As such, its victims (e.g., persons subjected to the voyeuristic gaze of some of the agents of the State) would not know that they were victims.¶ Yet even though this is so, the proponents of this second response to the above¶ abuse-based objection do not use this observation to argue that, since such persons¶ did not know that they were being watched, this watching did not harm them.21¶ This is because, as Joel Feinberg has persuasively argued, the mere fact that a¶ person is ignorant of the frustration of her interests (e.g., her interest not to be¶ the unwilling subject of voyeurism) does not mean that she has not thereby been¶ harmed.22 Rather, this second consequentialist response to the above abuse-based¶ objection conjoins this observation with the claim that for a person to be harmed¶ her life must have been adversely affected in some way, whether she knew of¶ this or not. To support this latter claim it will be useful to examine more closely¶ Feinberg's argument against the view that a person can be harmed only if she¶ knows that she has been harmed. This examination will serve two purposes. First,¶ it will show why the consequentialist proponent of constant State surveillance¶ should not claim that the unwitting victim of (e.g.) State voyeurism failed to be¶ harmed by it owing to her ignorance of it. Second, it will support the claim that¶ a person's life must be adversely affected for her to be considered harmed - the¶ claim on which this second response rests.¶ To show that a person can be harmed even though she is ignorant of it,¶ Feinberg¶ provides an example of a woman who devotes thirty years of her life "to the¶ furtherance of certain ideals and ambitions in the form of one vast undertaking."¶ Unfortunately, one month before this woman dies "the empire of her hopes" collapses¶ and she is disgraced. However, this woman's friends conceal this from her¶ and she dies contented. Feinberg writes "it would not be very controversial to say¶ that the woman . . . has suffered grievous harm to her interests although she never¶ learned the bad news."23 Feinberg is correct here; this woman has been harmed¶ even though she does not know this. As such, that the victim of (e.g.) voyeurism¶ does not know that she is being watched, and so does not experience harm as a¶ result, does not show that such voyeurism does not harm her. Thus, one should¶ not claim that owing to their ignorance of their being watched such voyeurism¶ would not harm the potential victims of such minor abuse of State surveillance.¶ Close examination of Feinberg's example, however, also shows that we consider¶ this woman to have been harmed even though she did not experience harm¶ because her life was adversely affected as a result of the collapse of the empire of the empire¶ of her hopes.24 Feinberg is right to claim that the woman in this case is harmed¶ because her interests are thwarted, whether she realizes this or not. However, the¶ success of this woman's enterprise and her enjoyment of a good reputation are¶ not the only interests that she has. She also has an interest in not being deceived¶ and an interest in the effective exercise of her autonomy - and these interests are¶ thwarted when her friends deceive her. Through controlling the information that¶ she has this woman's friends usurp her autonomy, acting so as to ensure that it¶ is they, and not she, who controls what type of actions she performs. That is, it is they who control whether she performs actions that she considers appropriate¶ to perform if her enterprise is flourishing and her reputation is intact, or whether¶ she performs actions that she considers appropriate for a situation where her¶ enterprise has collapsed and her reputation is ruined. This woman is thus harmed¶ by the collapse of the empire of her hopes because this leads to her deception by¶ her friends and the consequent compromise of her autonomy. And this compromise¶ of her autonomy has an adverse effect on her life, insofar as it results in the¶ thwarting of her interest to exercise her autonomy.25 Given this, then, although the¶ consequentialist proponent of constant State surveillance should not argue that if¶ a person did not know that she was the object of voyeurism then she would not¶ be harmed by this, he should argue that if such abuse of the State surveillance¶ system did not affect this person's life then she would not be harmed by it. And¶ it is plausible that such minor abuse would indeed fail to affect the lives of those subject to it. Given the draconian penalties that would be imposed upon those who¶ engaged in such minor abuse of the system it is unlikely that its victims would¶ come to learn of their victimization, and so it is unlikely that they would come to¶ be upset by it as a result of gaining such knowledge. Moreover, the perpetrators¶ of such abuse would not be deceiving their victims as the friends of the woman¶ in Feinberg's example deceived her. The system of State surveillance that would¶ be justified by the above pro-surveillance argument would not be one in which¶ the State's citizens were constantly watched, but just one in which their actions¶ were recorded. As such, the perpetrators of such minor abuses as voyeurism would¶ have no direct contact with their victims. They would thus be unable to influence¶ the type of actions that they performed, as the woman's friends were able¶ to influence the type of actions that she performed. This is because they would¶ be unable to control the

information that their victims had about their situations¶ in the same way as the woman's friends were able to control her informational¶ environment. Since the victims of such minor abuse would thus be immune to¶ being deceived by its perpetrators they would not suffer, as did the woman in¶ Feinberg's example, from the usurpation of their autonomy. Thus, since such¶ minor abuses of the State surveillance system as voyeurism would neither upset¶ their unwitting victims, nor compromise their autonomy through subjecting them¶ to deception, they would not harm them in any way.26¶ Through instituting safeguards, then, one could ensure that the minor abuse of¶ the type of State surveillance system that was argued for above could be reduced¶ to a minimum - or, perhaps, even eliminated altogether. Yet even if such abuse¶ did occur it would not necessarily harm its victims, for it would not necessarily¶ adversely affectheir lives. As such, then, even though the consequentialist proponents¶ of such a system of constant State surveillance must take into account¶ the possibility of the harm that its abuse might cause, they still have good reason¶ to believe that, all things considered, the State should be morally permitted to¶ subject its citizens to it.

No autonomy impact

James Stacy **Taylor, 2005** (In Praise of Big Brother: Why We Should Learn to Stop Worrying and Love Government Surveillance; Public Affairs Quarterly 19(3))

Fortunately, however, the citizens of a State that utilized the type of constant¶ surveillance that would be justified on the above pro-surveillance argument¶ would not similarly suffer from compromised autonomy. As noted earlier such a¶ surveillance system would not utilize the type of in-person surveillance that was¶ used by Big Brother's Party in 1984. Instead, it would merely record the actions¶ of the citizens and the events that they participated in. Since this is so, most of¶ the citizens subject to this form of State surveillance would not believe that they¶ needed to alter their behavior to conform to the State's view of how they should¶ act (were the State even to hold such a view) for they would recognize that the¶ State would not actually be watching them. Moreover, if they were law-abiding,¶ then they would also recognize that the chances of the State having just cause to access information about their actions would be very slim indeed. Free from the¶ pressure to conform of the sort that was imposed upon the citizens of Oceania,¶ then, most citizens whose State subjected them to constant and universal surveillance¶ of the type outlined above would not cede control over their acts to the¶ State. The citizens of such a State would thus not become heteronomous with¶ respect to their behavior, as did the citizens of Oceania. Instead, they would retain¶ their autonomy with respect to it. Moreover, the claim that most citizens placed¶ under constant State surveillance would not suffer from any diminution in their¶ autonomy is not merely a speculative one. Persons subjected to surveillance are¶ unlikely to alter their behavior once they become used to being "on tape" (unless¶ they previously performed acts that they believed they should not have been performing)¶ when they realize that there is little chance that the information that the¶ surveillance devices record would ever be required, and so there is little chance¶ of their actions ever being observed.35¶ Of course, not all the citizens of a State that utilized the type of surveillance¶ advocated above would retain full autonomy with respect to all of their actions.¶ The exceptions would be those who are criminally inclined, and who, as a result¶ of being placed under State surveillance, would alter their behavior by refraining¶ from committing crimes. Such persons would suffer from compromised autonomy¶ with respect to their deliberate omission of criminal activity, insofar as they alter¶ their behavior solely to avoid incurring criminal penalties. Yet, given that the actions¶ that these persons refrain from performing are criminal ones, the diminution¶ in autonomy that these persons would experience as a result of being placed under¶ State surveillance is one that it is morally legitimate to inflict upon them.36

AT: CDA

The subjectivity inherent to CDA makes politics arbitrary

Ruth **Breeze, 2011** (Articles in pragmatics, "Critical Discourse Analysis and its Critics")

As we have seen, those working within the field of CDA have rarely been slow to defend their own political standpoint, their own belief that research must be "critical" in all the senses outlined above. It is also evident that the heterogeneous nature of CDA's intellectual inheritance sets a complex task for the researcher trying to trace exactly what the justification for a particular stance or interpretation might be. This has led some critics to accuse CDA of operating somewhat randomly, moved by personal whim rather than well-grounded scholarly principle, while others have made attempts to uncover and explicate the precise philosophical and sociological basis, concluding that its foundations are by no means as sound as its practitioners appear to believe.¶ Hammersley (1997: 237-248) attacks the founding assumptions of CDA, accusing Fairclough and others of asserting the need for a critical approach as though this were quite obvious and unproblematic. First of all, Hammersley argues, orthodox Marxist theory is now discredited: It has been discarded by philosophers, historians and economists, who have rejected most of Marx's ideas as mechanistic, unfounded and irrelevant to an understanding of society today. He then takes the arguments back to an analysis of the Frankfurt school, which, as we have seen, is generally claimed to provide immediate antecedents for CDA. He insists that the Frankfurt school in no sense constitutes a solid basis for CDA's critical enterprise, because the changes wrought on Marxist theory by Adorno and Hochheimer were extremely radical, reaching far beyond economic factors to issues related to alienation, rationality and human nature. They believed alienation to be "a product of the distortion of Western rationality, in particular the latter's pursuit of control over nature, including human nature" (Hammersley 1997: 242), which begs a large number of unresolved questions about the essentially rational nature of scientific enquiry. Moreover, the type of critique proposed by Adorno, for example, would seem to undercut the ground for privileging one agent over another, and casts doubt on the possibilities of attaining emancipation. The Frankfurt school may have been interested in explaining social change, and may have offered a thorough critique of orthodox Marxism, Hammersley argues, but it certainly does not provide an effective philosophical basis for "critical" research of the type carried out by critical discourse analysts. None the less, although Hammersley's main contention that CDA's philosophical foundations are "simply taken for granted, as if they were unproblematic" (1997: 244) is borne out in many studies associated with CDA, this does not necessarily mean that a more throughly grounded approach can be ruled out; nor does the intrinsic difficulty of an approach built on a critique of Western rationality mean that such analysis is not possible. In the last analysis, perhaps Hammersley's most telling criticism is that levelled at the ambitious claims made by CDA practitioners to offer a comprehensive understanding of society as a whole and how it functions, which is "superior" to other positions precisely because it is conducted in a spirit of self-reflexive critique (1997: 244-5). Since a large part of its claim to legitimacy rests on this¶ assertion, CDA specialists need to pay special attention to this aspect of the epistemological underpinning of their work, and to its methodological implications.¶ At this point, it is interesting to note that the term "critical" itself has a special role in the history of the Frankfurt school. The word itself is thought to have been adopted when members of the Frankfurt school were exiled in the USA, where the original descriptor "Marxist" was deemed unacceptable (Scholem 1982: 210). As we saw above, in this first sense, "critical" means the capacity to evaluate society from a specific standpoint, in this case, Marxism. There is actually a long history of use of the term "critical" that extends back to Kant, who used it to signify that his analysis was based on rational a priori principles "without the aid of experience" rather than the uncritical dogmatism of his predecessors (Kant 1781: 3; Bilig 2002: 37). In its post- Frankfurt after-life, the word "critical" has been adopted by a range of approaches in the social sciences, most notably by critical psychology, which also claims intellectual descent from the Frankfurt school (even though many of its approaches appear to have little in common with the work of these theorists), and which also operates on the premise that academic research should criticise the existing conditions of social life with the aim of improving those conditions (Gergen 1994: 11-20). In the field of education, the word "critical" is associated with Paulo Freire's "critical pedagogy", which again states the aim of challenging domination and empowering the oppressed by encouraging the development of critical consciousness. The term "critical" is thus employed across a range of disciplines, used loosely to mean "critical of the status quo" or "critical of liberal humanist perspectives", usually with a view to highlighting commitment to social change.¶ To complicate matters, however, there are at least another two potential meanings of the word "critical". On the one hand, the Frankfurt school theorists themselves recognised that their work was

"critical" in another sense, that is, it provided a critique on what they perceived as the authoritarian positivism of orthodox Marxism (Shaw 1985: 165). In other words, they felt that they should be critical of received ideas, and hoped to develop new, deeper and broader understandings of developments in capitalism that would extend far beyond straightforward Marxism. In doing this, they should also be self-critical, and should aim to subject their own work to rigorous intellectual standards. This aspect of the "critical" heritage from the Frankfurt school does not figure largely in most approaches associated with CDA, which tend rather to assume their own left-wing political standpoint uncritically. One notable exception to this general trend is found in the discourse historical approach (Wodak 2001; Reisigl and Wodak 2001: 32-35, 2009: 86-89), which distinguishes three dimensions of critique, namely textual, socio-diagnostic, and prospective/retrospective, and advocates critical self-reflection at multiple stages along the analytical route. Another is that advocated by Gloy (1998) and the so-called Oldenburg school (Bredehöft 1994: 4; Bluhme 2000: 10-13), who acknowledge that analysts participate in the discourses which form their object of study, and insist that scholars must therefore always reveal their own perspectives and show how they are grounded, in order to give their views validity on an intersubjective level.¶ On the other hand, to the multiple connotations of the term "critical" in this context, we also have to add a further sense: In the classic liberal education in most English-speaking countries, students are encouraged to "be critical", that is, to think for themselves rather than to take what they read at face value – an intellectual skill that does not presuppose any particular ideological affiliation. One senses intuitively that the¶ Critical discourse analysis and its critics 499¶ 500 Ruth Breeze¶ polysemy of the term "critical" may have led to certain confusions regarding what the role of the discourse analyst is, and what if any political stance she ought to take. Many scholars feel that they are generally "critical" because that is what their education has encouraged them to be; others define "critical" as meaning critical of society from a neo-Marxist standpoint; while still others see themselves as "critical" because they adopt a critical stance to some neo-Marxist positions. The outcome is a merging of meanings, with the consequent loss of clarity and intellectual precision. It is scarcely surprising, given the problems of definition that lie at the very basis of CDA, that the enterprise may sometimes seem to lack coherence.¶ At the same time, there is a major contradiction, alluded to above, between the Marxist and post-structuralist strands in CDA's intellectual antecedents. While Marxists rely on a normative theory of history and society, authors within the post-structuralist or post-modern movement see all such totalising meta-narratives as invalid and potentially manipulative. Moreover, on the level of individual political decisions, in the post- modern philosophical landscape it is hard to justify adopting a particular meta-narrative to interpret the phenomena one has observed. Foucault, for example, at one time notoriously refused to commit himself to value judgements about the discourses that he studied (Foucault 1969). Instead, in a post-modern framework, it has been suggested that one simply "chooses" particular values or stances, in a process of existential self- definition which is sometimes referred to as decisionism (Habermas 1976; Macintyre 1981). In this perspective, although we may try to form our commitments by following "rational" procedures, the fragmentation of the moral and intellectual order is such that it is hard to find consistent grounds for a rational politics, or for reasoned political discourse, and there is little real hope of furthering human emancipation.¶ Faced with these seemingly contradictory scenarios, Hammersley asks whether it would perhaps be more appropriate to situate CDA researchers on the post- structuralist side of the fence, as people who have chosen a particular standpoint by an act of will, rather than as a result of extended deliberation based on examination of the facts and issues. If this is the case, he argues (1997: 242-245), then there is no particular reason why readers should accept CDA's political stance rather than any other, and CDA's claim to "interpretive power" and "emancipatory force" can be regarded as mere assertions that one can accept if one chooses to share their point of view, or not, as the case may be.¶ The consequences that this would have for CDA's status as an approach are far-reaching. As Hammersley points out, if the political stance on which CDA is founded turns out not to be well founded, but merely a product of decisionism, this fits ill with the strong claims made by CDA for itself and its own activities. If a central tenet of critical research is that research should be explicitly designed to fulfil political functions (exposure of inequality, dominance, injustice), rather than what would be the more conventional purpose of research (to observe and interpret phenomena), then there has to be a sound justification for this. If, in the end, the justification is only a matter of individual choice, then there is little incentive for the reader to take this type of research seriously.¶ CDA researchers are usually careful to make their own political commitments quite explicit before they embark on the interpretation and explanation of social phenomena. Fairclough, for example, tends to stress his old-Left leanings, even though in principle he agrees that critical research need not be left-wing, and that right-wing forms of CDA are perfectly conceivable (Fairclough 1996: 52). Two points should be¶ made here. One is that, if this is so, then Fairclough's and others' interpretations must be quite open to argument, because any left-wing interpretation might equally be challenged from the right, or from any other political dimension that might exist. Thus the whole scholarly project of CDA can be seen as heavily

conditioned by political choice, rather than scientific criteria, which might be thought to take on a secondary role. Secondly, the fact that CDA's adherents regularly bow in the direction of transparency and truthfulness by stating their political affiliations does not somehow mean that they are absolved from the need for objectivity in their research. Bourdieu has alluded to the perfunctory nature of many declarations of this kind, and to the role that self-definitions play in academic power struggles (1984b: 308). Indeed, in various types of post-modern framework, it is common for writers to try to circumvent serious epistemological difficulties by taking an explicit stance from the outset. This is particularly common in areas such as post-modern approaches to feminism (Harding 11-12), where the usual justification given is that a feminist perspective is needed redress the balance in a system that has been dominated by patriarchy. However, whether or not the epistemological problems of post-modernism are resolved by this, such gambits do not free the author to misrepresent the data, or to interpret the data in any way he or she chooses for some particular political purpose.¶ Given the striking heterogeneity of CDA's intellectual sources, it is at least surprising that there is little debate within CDA circles about their relevance or, indeed, their compatibility. As Slembrouck points out (2001: 40-41), "CDA continues to be unclear about its exact preferences for a particular social theory." Indeed, trends over the years seem to have broadened rather than narrowed its intellectual base. So while Fairclough (1989) is largely informed by neo-Marxism with a Gramscian view of hegemony, in which naturalised "common sense" is the vehicle of ideology and text is a site of struggle, ten years later, Chouliaraki and Fairclough (1999) construct a research agenda that is engaged in ongoing dialogue between late modernity, feminism and post- modernism. CDA is thus able to draw on a vast and somewhat contradictory panorama of ideas about society, encompassing thinkers from Marx, through Gramsci and Horkheimer to Giddens, and an enormous diversity of approaches to language and communication, which take in Bakhtin, Foucault, Habermas and Halliday, seemingly without ever perceiving the need to justify this eclecticism, or to systematise its intellectual base, other than by linking these notions vaguely to the phenomena associated with late modernity (consumer capitalism, marketisation, achievement and consolidation of hegemony through ideological manipulation). Indeed, Weiss and Wodak (2002) go one step further, to declare that the theories or constructs gleaned from different philosophical or sociological thinkers are simply tools, just as linguistic approaches are also seen to be instruments, to be used by the analyst as appropriate in any given situation: "one can speak of a theoretical synthesis of conceptual tools (...). Tools of this kind are, for example, Foucault's discursive formations, Bourdieu's habitus, or register and code as defined by Halliday and Bernstein" (2002: 7). On the strength of statements such as this, critics have noted that CDA habitually operates in the interface between an array of ideas and the world of discourse, using the one to explain the other, without addressing either of these on its own terms (Slembrouck 2001). In effect, this could lead to a situation in which the arguments from philosophy, politics and sociology are not fully worked out in terms that would be satisfactory to specialists in these disciplines, nor are the bases for language analysis firmly established in a way that is recognised by linguists.

You fail basic rigor
Ruth **Breeze, 2011** (Articles in pragmatics, "Critical Discourse Analysis and its Critics")

The main problem here appears not to be a lack of awareness of the need for rigour. In a review of 20 articles published in Discourse and Society, Fairclough (1992)¶ argues that their analyses would have been more convincing had closer attention been paid to textual and intertextual properties. However, his review is symptomatic in that rather than decrying this lack of rigour, he merely regrets that an opportunity to support specific conclusions was lost, to the extent that "the entire exercise (...) looks like a community-building effort rather than a search for enhanced understanding" (Verschueren 2001: 67). A similar lack of scholarly rigour in applying linguistic methodology has been detected in many publications that purport to apply critical discourse analysis. For example, in a review of 40 articles using CDA in the field of education published up to 2003, Rogers et al. (2005: 385) noted that one quarter of the articles included no discussion of language theory, while the others made reference to CDA, SFL and discourse theory, many in rather general terms, and few included detailed discussion of the linguistic evidence. Other scholars have pointed out that critical analysts often

state that they are using methodology proper to the ethnography of communication, but fail to present the description of situations or the ways in which such information was obtained in a manner that would be acceptable to ethnographers (Blommaert 2001: 14-17).¶ These methodological shortcomings are generally recognised as existing on the level of how the data are actually obtained, and how they are subsequently interpreted. I shall focus here on the way CDA researchers obtain their data. In the section which follows this, I shall turn my attention to the issue of interpretation and the related question of reader response.¶ One of the most outspoken critics of CDA in this area has been Widdowson (1998, 2005). In a review of three representative studies published in the 1990s, Widdowson homes in on what he feels to be the unsystematic nature of some CDA research. He quotes Fowler (1996: 8) as stating that "critical linguists get a very high mileage out of a small selection of linguistic concepts such as transitivity and nominalisation", which he interprets as meaning that "analysis is not the systematic application of a theoretical model, but a rather less rigorous operation, in effect a kind of ad hoc bricolage which takes from theory whatever concept comes usefully to hand" (Widdowson 1998: 136). Widdowson goes on to cite Fowler as stating that other analytical approaches (CA, schema theory, etc.) could equally well be put to use, provided they were brought into the "critical" model. Any method will do, he implies, as long as the results are the right ones.¶ Widdowson revisits CDA's analyses of various key texts at length in order to illustrate what he feels to be the lack of impartiality in the way that method is applied. By focusing on particular lexical items, or by focusing on certain grammatical features (passives, nominalisations), it is possible to reach certain conclusions about ideology in the text. But, he asks, is this legitimate? Given that these features have been chosen, he feels, more or less randomly, because the researcher feels intuitively that they will provide results that have ideological meaning, it is possible that the rest of the text, which may contain contradictory data, is ignored. Widdowson does not reject the possibility that there might really be certain grammatical features (such as passives, for example) that genuinely have a "greater ideological valency" (1998: 148). But in his view, critical discourse analysts have so far not succeeded in proving that this is the case, or even addressed the issue as to how this could be proven. He proposes that corpus methodology might go some way towards resolving the problem, since its samples are larger and its methods more systematic. The results of such studies would be less likely to suffer from the "randomness" and openness to bias that Widdowson¶ Critical discourse analysis and its critics 503¶ 504 Ruth Breeze¶ perceives in studies by Fowler (1996), Fairclough (1996) and van Dijk (1996). It should be noted at this point that Widdowson himself is unable to show scientifically that such "randomness" exists in the selection of data, which somewhat undermines his point. However, the basic idea that discourse analysts should strive to implement objective standards and apply thoroughly scientific methods (for example, by engaging with larger samples of text or using corpus tools) is one which has informed much of the more recent work by CDA scholars (see below). Widdowson's critique is much more pertinent when applied to the early days of CDA, and particularly to British authors such as Fowler and Fairclough.¶ This problem of potential analytical bias is addressed by other authors, such as Toolan (1997) and Stubbs (1997), who centre their arguments on the idea that CDA, at least in its early stages, often failed to approach texts systematically. Stubbs argues for a comparative approach based on large, representative samples. In this, he addresses the issue of method by tackling what many discourse analysts call the level of "description". In Fairclough's classic definition (1989), description means ascertaining what experiential, relational or expressive values the words or grammatical structures in the text have, and what textual structures or interactional conventions can be observed. In practice, many discourse analysts choose to focus on just one of these features, or one aspect of one of the features, such as the use of passives or nominalisation (Fowler et al. 1979; Fowler 1991; Fairclough 1992a, 1992b). In Stubbs's view, the claims being made by discourse analysts on the basis of such analyses are not tenable, because the method is often simply impressionistic, or because the sample of texts is small and obtained unsystematically. Stubbs cites a study by Fairclough (1995), who claims that public language (academic writing, political debate) is becoming less formal. The essence of Stubbs's criticism is that Fairclough provides no quantitative evidence for this, and particularly, no quantitative diachronic evidence that the degree of informality is increasing. In fact, although Fairclough's claims would seem plausible, the methods he uses to obtain his evidence are not explained, and his findings are not set out in such a way that anyone else could challenge them. In fact, when some CDA studies are examined closely, it turns out that much of the argument hinges on just a few words (such as the example of the word "enterprise" in Fairclough 1995). Yet, as Stubbs reminds us, "registers are very rarely defined by individual features, but consist of clusters of associated features which have a greater than chance tendency to co-occur" (1997: 3).¶ Although it is impossible to generalise about the methods used in CDA, the main force of Stubbs's argument holds, because some critical analysts, particularly in the 1980s and 1990s, paid scant regard to

issues of methodological consistency, and provided little if any justification of their own methods. Although their work may contain genuine intuitions, it lacks the kind of rigour expected in academic research. Stubbs points out that "there is very little discussion of whether it is adequate to restrict analysis to short fragments of data, how data should be sampled, and whether the sample is representative" (1997: 7). What is more, there is a danger that fragments can be presented as representative, without any explanation as to how this representativeness has been established.¶ Stubbs is not intrisically hostile to CDA, but the main brunt of his argument is that the methods used are not sound enough to justify the results that are supposedly obtained, with the consequence that the interpretations and explanations must be regarded as suspect. His manifesto for a methodologically-sound version of discourse¶ Critical discourse analysis and its critics 505 analysis is doubtless coloured by his background in corpus linguistics, but is none the¶ less useful:¶ "the text analyses must quite simply be much more detailed. Analyses must be comparative: individual texts must be compared with each other and with data from corpora. Analyses must not be restricted to isolated data fragments: a much wider range of data must be sampled before generalisations are made about typical language use. And a much wider range of linguistic features must be studied, since varieties of language use are defined, not by individual features, but by clusters of co-occurring features: this entails the use of quantitative and probabilistic methods of text and corpus analysis" (Stubbs 1997: 10)¶ In fact, by the time that Stubbs was writing, many discourse analysts had already become sensitive to the need for a more systematic approach applied across larger, more representative samples of discourse (cf. Wodak et al. 1990; van Dijk 1993; Hoey 1996: 154; Wodak 1996). In fact, there has been a growing trend to draw on corpus methodology to provide a more solid methodological framework for use in CDA (Mautner 2001: 122; Partington 2003: 12; Partington 2006: 267; Baker et al. 2008: 277- 283). Fairclough himself, who formed the butt of much of the original criticism regarding methods in CDA, subsequently published a study of the language of "new Labour" based on large quantities of empirical data and incorporating the use of corpus linguistic tools in order to obtain a more representative picture (Fairclough 2000: 17).¶ In fairness to Fairclough and CDA in general, it must be said that Stubbs's background in corpus linguistics would tend to bias him in favour of studies based on large samples of text, particularly contrastive studies that are designed to bring out the distinctive features of different genres or registers, using statistical methods to establish significance. However, this is far from being the only way to study language data. It would certainly be wrong to rule out qualitative approaches to textual analysis, since it is clear that these offer a viable alternative to quantitative methodology, which also has many flaws and inconsistencies. Similarly, it would be wrong to discard the findings of CDA simply because they have not been obtained in this way. Close, qualitative analysis of a small sample of text might be the only way of analysing certain types of discourse, for example, the discourse of a particular politician or party.¶ A slightly different angle is adopted by Verschueren (2001: 60), who points to the lack of detailed analysis of language and interaction in some CDA analysis (for example, Verschueren provides a critique of textual analysis from Chouliaraki and Fairclough 1999). Verschueren homes in specifically on the tendency to leave out important aspects of the text that do not fit with the interpretive framework. A review of various instances of this selective tendency leads Verschueren to conclude that many of the supposed findings are "the product of conviction rather than the result of a careful step-by-step analysis that reflexively questions its own observations and conclusions" (2001: 65).¶ Verschueren accepts the validity of Fairclough's three-stage approach to analysis (description, interpretation and explanation, see above), but takes issue with the way in which the analyst moves from the first level (description) to the second (interpretation, that is, situating the text as discourse). To make this transition, Fairclough relies on what he terms "members' resources" (1989: 167):¶ At this stage of the procedure, it is only really self-consciousness that distinguishes¶ 506 Ruth Breeze¶ the analyst from the participants she is analysing. The analyst is doing the same as the participant interpreter, but unlike the participant interpreter the analyst is concerned to explicate what she is doing.¶ Verschueren suggests that by introducing the notion of "members' resources", Fairclough is essentially giving up on the issue of empirical evidence. The analyst's interpretation is only as valid as any other interpretation (that of the participants themselves, for example, or an onlooker), since it is grounded in the same kind of working knowledge of how language is used and what society is like. Moreover, as Slembrouck has pointed out, members' resources are also conceptually affected and distorted by social power relations, and so there is no guarantee that they are free from reproduction or ideological manipulation (2001: 39).¶ According to Fairclough, from the point of interpretation, the analyst can quickly go on to the final stage of explanation. But since interpretation relies on members' resources, then even at the level of explanation, the only difference between a participant, say, and the analyst is that the

analyst can draw on social theory to interpret what he or she has observed. It is at this point that Verschueren believes that CDA's claims to interpretive insights fall down. In his words "the only real requirement for explanation is a good social theory. Nothing is said about the empirical dimension that is required to link data and theory" (Verschueren 2001: 69). In the view of some critics (Slembrouck 2001), the heart of the matter is that it is not legitimate to maintain a difference between researcher and researched solely on the grounds of access to social theory.¶

Verschueren provides a detailed analysis of how, in his estimation, Fairclough (1989) fails to cope satisfactorily with the empirical dimension – that is, fails to provide sufficiently rigorous systematic analysis of the text. The essence of his critique is that Fairclough isolates single texts for analysis, without placing them in the kind of social and intertextual context within which they would usually be read. For example, Fairclough takes a linguistic feature such as nominalisation in news reports, and interprets it as as being used to obfuscate issues of agency and avoid attribution of responsibility. However, in the context of the particular story or situation, and the ongoing reporting about a particular topic across many issues of the same newspaper, it may well be very clear to readers where responsibility lies. Verschueren's main point is that Fairclough fails to anchor the text in a communicative situation, taking it out of context and ignoring aspects of the text that do not conform to expectations, which leads to distorted results.¶ Verschueren (2001: 60-79) also analyses a similar phenomenon that occurs when Fairclough attempts to analyse conversational interaction. Taking the case study by Fairclough (1992: 50-52) contrasting two doctor-patient interactions, one "traditional" and the other "alternative", Verschueren applies systematic techniques of conversation analysis and pragmatic interpretation to show that Fairclough's conclusions are ungrounded (Verschueren 2001: 70-71). He argues that Fairclough imposes a contrastive framework from the outset, which leads to a distortion of the data and disregard for features that do not fit the predetermined scheme. In the methodology, Verschueren identifies two major flaws: First, general aspects of context are simply ignored (such as whether the patient has a specific problem or not, whether or not the doctor and patient know each other); and second, form-function relations are treated as stable, which is not acceptable in pragmatic terms (for example, Fairclough assumes¶ that the first doctor exerts control over the interaction by asking questions, but does not address the possibility that the second doctor may be exercising control more subtly by giving minimal responses and waiting for the patient to continue – or that the second doctor might simply be uninterested in the patient, or wish to seem non-committal).¶ Verschueren argues cogently for a more systematic, objective, disciplined approach to qualitative analysis of ideology in texts, based on a set of specific principles concerning the nature of the samples used, the need for horizontal and vertical exploration of the text, sensitivity to pragmatic issues in the relationship between form and function, and concern that the meanings should emerge coherently from the data rather than be imposed by the researcher (see Verschueren 2011). In fact, the past history of CDA reveals that practitioners have sometimes made few concessions to methodological exigencies, and do not always present their own research procedures with transparency (Rogers et al. 2005). The major failing of approaches such as that used by Fairclough (1989) is that it accords a pivotal role to the researcher and his/her interpretive and explanatory skills, and, as Verschueren (2001: 60-77) indicates, provides no account of exactly how or why particular aspects of the text are deemed to have one meaning or another – the researcher's judgement is enough, a questionable assumption that is sometimes justified, rather weakly, by using the rather nebulous concept of "members' resources" (Fairclough 1989: 167; Verschueren 2001: 68). In particular, Fairclough's assumption (1989: 167) that "it is only really self-consciousness that distinguished the analyst from the participants she is analysing" is singled out for criticism, because many readings are possible, and the purpose of analysis is to provide something more solid than a subjective impression, by applying a rigorous method that is theoretically grounded. As Verschueren points out (2001: 68-69), the problem of method and interpretation is a serious one which is not satisfactorily resolved in Fairclough's later studies. For example, Chouliaraki and Fairclough (1999: 67) state that CDA does not "advocate a particular understanding of a text, though it may advocate a particular explanation". In Verschueren's view, by saying this they shrug off any claims that the analyst has a privileged understanding, and thereby eliminate the need for methodological rigour at the stage of reading and "understanding" the text (Verschueren 2001: 69). Their lack of interest in the epistemological and hermeneutic dimensions of textual analysis is matched by a corresponding over-emphasis on the theoretical dimension of explanation.

After quoting Fairclough's distinction (1989: 167) between the analyst as reader (with the same "member's resources" as any other reader) and the analyst as explainer (the analyst is superior to other readers because he/she can draw on social theory), Verschueren concludes that:¶ In other words, the only real requirement for explanation is a good social theory. Nothing is said about the empirical dimension that is required to link data and theory. The theory being preconceived, it is not surprising, therefore, that 'findings' tend to be predictable and that a gap emerges between textual analysis and conclusions – even for many of those who, like myself, share large portions of the theory – as soon as the question of evidence is asked. Texts are simply made into carriers, as it were, of what one already assumes to be the case. Rather than proceeding from description via explanation to positioning, with interpretation at the core of all stages of the investigation, positioning comes first and interpretation is marginalized. (Verschueren 2001: 69).¶ This issue inevitably leads into the question of interpretation, which is again linked intimately to the issue of reader response. For the question as to how discourse analysts¶ Critical discourse analysis and its critics 507¶ 508 Ruth Breeze¶ can or should interpret text overlaps with the question as to how readers understand text. Although these questions also arise when quantitative language data are being interpreted, the problem tends to be more acute when the analysis is exclusively qualitative. These issues will be tackled together in the next section.

Circular logic
Ruth **Breeze, 2011** (Articles in pragmatics, "Critical Discourse Analysis and its Critics")

It is perhaps on the level of textual interpretation that the CDA enterprise has come in for the greatest amount of criticism. At the most extreme end of the spectrum, critical discourse analysts have been accused of what might be called a kind of naive linguistic determinism. Widdowson (1998: 136) draws attention to an explanation offered by Kress (1996: 25):¶ "this set of semiotic features, of representational resources, suggests and implies, and I would wish to say, over the longer period produces a particular disposition, a particular habitus, and in so doing, plays its part in the production of a certain kind of subjectivity"¶ Widdowson likens the analysts' approach to "the interpretive ingenuity one associates with literary criticism" (1998: 136). In his view, discourse analysts have unwittingly fallen back into "a transmission view of meaning, whereby significance is always and only the reflex of linguistic signification" (1998: 142).¶ On this basis, several critics have targeted CDA's understanding of the relationship between texts and readers. Some authors have identified what they call "the familiar Whorfian notion of linguistic determinism" (Widdowson 1998: 139), not in its original form whereby the possibilities of a particular language code determine the habitual thought processes of the language users, but in an extended form in which discourses similarly produce, condition and restrict the thought processes of the recipient/user. It is uncontroversial to assume the existence of a significant relationship between discourse and people's view of reality. However, it is equally obvious that in a globalised world people are exposed to many different discourses, and that they learn to navigate them, ignoring many, accepting some, rejecting others. Despite the evident truth of this, much CDA research proceeds on the basis that there is a simple, one-to- one relationship between the text and its reader, or the discourse and its recipient. It would be at once more subtle and more realistic to acknowledge from the outset that some discourses are more powerful or influential than others, and to focus attention on those that are particularly likely to have an impact on a large audience, or to attempt to determine what factors make such an impact probable.¶ One of the major problems with this approach is the circularity of the argumentation. It is possible to maintain that language use determines cognition, but this claim is weakened if the only evidence we have of cognition is language use. It would be truer to say that language both represents and influences cognitive processes, and so we must be very careful when trying to draw conclusions about thought from language and vice versa. In Stubbs's view (1997), if researchers want to make claims about what people think

on the basis of what they read or hear, they really ought to obtain non-linguistic evidence about their beliefs, or examine their behaviour. As he says (1997: 6), "if we have no independent evidence, but infer beliefs from language use, then the theory is circular". Stubbs's proposal presents many difficulties, because it¶ is not clear how exactly one would infer people's thoughts and beliefs without using language, and it is by no means straightforward to relate discourses to non-linguistic evidence such as observable behaviour. None the less, his criticism stands, because it is unreasonable to assume a one-way influence from discourse to thought, and methodologically unsound to operate as though the existence of such an influence were unproblematic.¶ Taking a rather different line of attack, some CDA researchers have devoted considerable space to discussing the means by which they think texts influence people, in order to validate their own hermeneutic practices. Kress (1992: 91-117) develops a theory of representation and transformation which he proposes as the means by which discourses function to modify or change people's views of reality. His theory is initially based on Halliday's notion of representation, the process by which reality is ideationally encoded. The notion of transformation is not borrowed from Halliday, and appears to be distantly conceptually related to the Chomskian notion of transformation. The main point is an insistence on the way in which representations are changed, possibly as a result of ideological manipulation.¶ As Widdowson points out (1998: 138), there is a certain circularity in this, too, because representations are by definition an encoded version of reality, and so it is hard to know exactly how we are to know which representations are purely representations, and which are transformations. It appears that this is a theory of language change, or discourse change, but it is not entirely clear how it is possible to ascertain what has changed from what. There is a curious parallel here with the problem of classifying poetic language as a deviation ("Abweichung") from normal language, discussed by Coseriu (1980: 51). Deviation is a relational concept, one must deviate from something, but who is to say what is deviating from what? Moreover, it may be possible to "deviate" in a wealth of different ways. Similarly, the concept of transformation is set up as a dichotomy, but there is no real way of knowing which side is which or whether, indeed, there is a dichotomy at all, or a range of different possibilities. In a further explanation of transformation offered in Hodge and Kress (1993), the authors propose that some types of grammatical construction are neutral or "non-transformed", and that these, though representational, lack any particular representational significance – they are innocent reflections of reality. Others, however, are transformed, and transformed sentences "always involve suppression and/or distortion" (Hodge and Kress 1993: 35). In practice, especially in much research carried out in the 1990s, transformation appears to be involved when grammatically "less simple" structures, such as the passive, are used to convey information. However, the question as to whether use of the passive is always ideological, or indeed, whether the passive is actually "less simple" than the equivalent active form, is not fully addressed by these researchers.¶ Widdowson takes issue with Kress's notion of transformation in various ways. First, he reminds us that in a Chomskian model, all strings of words are transformed and potentially transformable, so there are no neutral, innocent, non-transformed sentences. This model offers no method for telling transformed and non-transformed sentences apart. Secondly, Widdowson relates Kress's notion that transformed sentences are more complex to the derivational theory of complexity, a theory prominent in the 1960s, based on the idea that structural complexity was mirrored by psychological complexity and the consequent difficulty in processing. Thus passive sentences, it was proposed, required more effort to process, because a passive sentence is intrinsically more complex than an active sentence. This theory, again, presupposes that some structures¶ Critical discourse analysis and its critics 509¶ 510 Ruth Breeze¶ are actually more complex than others, and that this has a knock-on effect on the reader/receptor. However, this assumption goes against the evidence that is available from the area of language processing. When experiments were actually carried out to determine the processing speed or ease of different linguistic structures, it proved impossible for the subjects to separate their understanding of the language itself from contextual factors. For example, Olson and Filby (1972) compared comprehension time in processing active and passive propositions, and found that when events or questions were coded in terms of the actor, active statements were more swiftly processed, whereas when they were coded in terms of the receiver of the action, passives were processed more quickly. In their view, "the comprehension of a passive sentence does not necessarily involve the recovery of the base structure equivalent of the passive to the active sentence, or the base S-V-O structure usually assumed to underlie (...) sentence meaning" (1972: 379). In other experiments (Wales and Grieve 1969: 327-332), subjects found it surprisingly easy to understand complex structures within a particular context, in other words, they tended

to come up with pragmatic interpretations, rather than engage in linguistic analysis.¶ In more recent CDA publications, the notion of transformation is less prominent. None the less, the underlying concept is often used (Schroder 2002; Kuo and Nakamura 2005; Stenvall 2007; and see also Billig (2008: 35-46) for a detailed discussion of possible ways in which passives and nominalisation have been thought to be "mystificatory") so that passives are often suspect of depriving certain groups of agency, or of concealing agency, for example, without full discussion as to the pragmatic functions of the passive in language in general, or the impact, or lack of it, on the reader. Finally, as Widdowson (pp. 138-141) astutely points out, the whole notion of representation versus transformation, innocent language versus ideologised manipulation, appears to contradict another of the tenets of CDA, which is that all language is ideological, and nothing can be neutral. This further undermines the dichotomy between representation and transformation, and leaves little firm ground for the analyst to stand on.¶ How, then, can the analyst interpret texts, and how can the analyst establish what effect the text has on the reader? Critical discourse analysts are not unaware of the problems that arise here, and are quick to assert that ideological meanings cannot be read off from textual features, and that textual analysis should be combined with analysis of production and consumption practices (Fairclough 1995). Yet they provide little evidence of such practices, and tend to fall back on a transmission model of hermeneutics whereby linguistic forms "convey" or "construct" meaning, which is presumably imbibed by the reader in undiluted form.¶ This model itself contains an underlying contradiction, because even CDA specialists admit that the ideological meanings are often opaque and have to be prised out with difficulty by the discourse analyst, and yet they appear to be communicated with ease to the reader and be capable of subtly exerting an ideological influence on him or her. Thus meaning is contained in text in a deeply embedded form, subtly imbricated in the syntactic structures and lexical choices, but that same meaning, opaque to the analyst, is conveyed to readers, exerting an ideological influence on them. Moreover, the problem of understanding reader response is further compounded by issues of access to context, discussed elsewhere in this paper, because poor consideration of context tends to render opaque the way that the actual participants in any situation understand and interpret it themselves. Thus if, as we have seen, the researcher privileges his own¶ position because his/her "members' resources" include access to social theory, then he or she "runs the risk of losing sight of whatever spontaneously productive 'hermeneutics' there already are in the lifeworlds" (Slembrouck 2001: 42), that is, what the participants actually think is happening.¶ The issue of reader response, analytical stance and hermeneutic possibilities has been addressed in considerable length in literary studies. When critics such as Widdowson accuse CDA of subordinating analysis to interpretation, of finding in the text what they set out to find (Widdowson 1998: 149), they frequently refer back to literary criticism for a parallel problem: CDA is "a kind of political poetics, and over and over again the same issues arise about the textual warrant for interpretation". It is therefore useful to make a brief examination of the way this issue has been tackled in literary studies, in order to draw fruitful comparisons with CDA.¶ Both Stubbs and Widdowson recognise that the problem of hermeneutics in CDA somehow mirrors the problem of literary criticism and reader response that was the object of heated debate in the 1960s and 1970s. However, their claim that the problem is similar enough to be solved in the same way is open to criticism. To summarise briefly, the arguments in the field of literature about reader response arose in implicit contradiction to previous theories of literature that had foregrounded the writer or the content and form of the literary work, and in explicit opposition to the New Criticism and to formalist theories, which consigned the reader to oblivion. The proponents of reader-response approaches centred on the idea of the reader as an active agent who completes the meaning of a literary work through interpretation – a notion which some detractors felt would lead to relativism or even chaos. Stubbs cites Fish (1980: 341, 347) who endeavours to solve the problem of the heterogenous nature of readers' responses by taking the line that a text does not have meaning outside a set of cultural assumptions about what it means and how it should be interpreted. These assumptions are embodied in the "interpretive community", which establishes the criteria for reading a particular text in a particular way, and sets norms as to what is possible and what is not.¶ Although the main question addressed by reader response theory is similar to the issue of interpretation in CDA, it is important to highlight some major differences. First, the responses to a literary work are essentially different, more complex or more multi- layered than responses to everyday texts of an informative or instrumental nature. Rather than reader response theory, which is more usually applied to works of art, the approaches to audience reception that form the staple of media studies would

provide a useful tool for gauging what people understand from a particular text, or detecting the deviant readings that are generated within particular social settings. Second, if we are to accept CDA's claims that obscure patterns and hidden meanings in discourse ultimately exert an ideological influence, then the notion that an "interpretive community" would provide useful in determining the meaning of discourse is obviously suspect: the community itself might be positioned in support of the hegemony, or various different interpretive communities might exist, offering a variety of interpretations. Moreover, when we are dealing with the type of text often studied by CDA, we are not simply thinking of the way a text is "interpreted", which is the case in literary studies, but of the way in which it is accepted, used, acted upon, changed, parodied or perhaps ignored. In this, the notion more familiar to applied linguists of the "discourse community", or the educationalists' notion of the "community of practice", offer more useful tools for gaining an understanding of how discourse works in specific social settings (Kent 1991:¶ Critical discourse analysis and its critics 511¶ 512 Ruth Breeze¶ 425-445; Lave and Wenger 1991: 22-23). As Bhatia has remarked (2002: 6), thick descriptions of the communicative practices within a particular group "may unravel many of the mysteries of the way members of various discourse communities function to achieve their institutional and disciplinary goals and to justify their discursive practices". Recent studies (Sarangi and Roberts 1999; Candlin and Hyland 1999; Arminen 2005) have brought out the complexity of the workings of power and language in academic and professional settings. There is also a substantial body of research in media studies that suggests that the influence of texts and broadcast material on subjects is much less one-way and much more complex than might be supposed (Abercrombie 1996; Nightingale 1996; Reese et al. 2003), because people bring a wide range of previous knowledge and interpretive techniques that enable them to generate a broad spectrum of divergent readings. Ideally, studies of this kind should be borne in mind or carried out in combination with discourse analytical research, in order to establish how media, institutional and other texts "work" in their natural settings.¶ Despite the foregoing, the problem of obtaining evidence about the effects of the text on the reader or listener is one that is rarely even raised in CDA research. The bodies of research that exist in media studies or ethnography of communication are rarely even alluded to by CDA practitioners, and in general it can be stated that CDA lacks a cogent theory of audience effects and audience response that would provide support for its assertions about the influence of discourses on human subjects.

CDA fails - infinite contexts and arbitrary selection

Ruth **Breeze, 2011** (Articles in pragmatics, "Critical Discourse Analysis and its Critics")

One of the fundamental tenets of CDA is that discourse is socially embedded: It is at once socially constructed, and also plays a role in constructing and perpetuating ("reproducing") social structures and relations. CDA also declares itself to be socially committed (Fairclough and Wodak 1997), with an explicit purpose of raising its readers' consciousness "of how language contributes to the domination of some people by others, because consciousness is the first step to emancipation" (Fairclough 1989: 1). Language viewed in a social framework is a highly complex phenomenon, since it both constitutes and challenges social relations, and different linguistic media are intermeshed with each other and with non-language media, generating an intricate web of intertextuality and multimodality. It is therefore striking that one criticism levelled at CDA is that the most specifically social aspects of discourse, namely the social contexts in which discourse is embedded, have often been ignored.¶ The critiques that question CDA's claims to offering an interpretation of the social world have originated in the areas of conversation analysis, on the one hand, and the ethnography of communication and pragmatics, on the other. In essence, these approaches tend to differ from CDA in their emphasis on the need to follow a bottom- up approach (Peace 2003: 164). Both conversation analysis and ethnography require meticulous data-gathering techniques involving the use of recordings and detailed transcripts, and both disciplines are committed to the notion that interpretations should emerge from the data. Pragmatics is concerned with the functions fulfilled by language in real contexts, and with the complex relationships between form and social function, and also focuses on the detailed study of specific instances of language

use. Although CDA practitioners frequently call for "triangulation" in the sense of obtaining multiple perspectives on the phenomenon under observation (Reisigl and Wodak 2001: 33ff;¶ Rogers et al. 2005: 382; van Dijk 2006: 359ff; Wodak 2007: 203), or at least for "constant movement back and forth between theory and data" (Meyer 2001: 27), there is an observable trend for work carried out in CDA to operate in a top-down manner, in that it presupposes a particular theory of social relations, and looks at language data from that perspective, or singles out interesting aspects of language that tie in with a particular theoretical view, rather than embarking on an all-round, in-depth study covering the multiple dimensions of a text to determine how language works in a particular setting.¶ Conversation analysis and CDA share an interest in naturally-occurring talk, interaction and text, and agree that discourse has a two-way relationship with context and social structures. However, the discipline of conversation analysis emerged from a different intellectual background, partly as a reaction to mainstream sociological trends. Although generalisations entail some risk of over-simplification, in broad terms it is usually accepted that conversation analysts mainly focus their analysis on close study of the interaction itself, and are unwilling to include what might have come before or after the interaction within their field of focus. It has sometimes been called the study of "micro interactions" (Rogers 2005: 378). By contrast, CDA's field of focus tends to widen out to encompass the macro context, the role that interaction plays in social relations, institutional power structures, and so on.¶ From the area of pragmatics, some critics have argued that CDA does not always look closely at the linguistic features of interactions, but that there is a tendency to jump too quickly to the macro context, making assertions as to how macro relations might be mapped onto micro interactions (Widdowson 1998). The immediate context, which determines the type of interaction in social settings, is often ignored completely (cf. Verschueren 2011). In the words of Verschueren (2001: 60), the lack of methodological rigour and, particularly, the way that context may be left out of the equation, means that CDA, particularly in its early days, was responsible for "subjecting the media, as well as other institutions, to a circus trial, playing fast and loose with the observable facts in order to support preconceived claims."¶ Contact with CDA researchers who were using some of the techniques of conversation analysis sparked a heated debate in the late 1990s. To summarise the main arguments, in Schegloff's view, context should only be taken into account insofar as it features in the interaction as a concern for the participants. Since there may be an almost infinite number of contextual factors that might possibly influence a given interaction, how is it possible to select just one that is analytically relevant? For example, an interaction between a man and a woman might be influenced by gender issues, but then again, this might not be the case, and it is conceivable that gender issues are unimportant for the participants on this particular occasion. In such a case, would it be legitimate for a researcher interested in gender to impose an analytical framework on this interaction?¶ In Schegloff's opinion, conversation analysis should be driven by a desire to understand how everyday interaction works, how identities are negotiated, how people do things through language in different settings. To this end, the appropriate analytical approach is to discover the orientations provided by the participants themselves, and the role these play in the interaction. Moreover, even when it has been established that certain aspects of the context are important, the analyst has to take care to discern exactly what these might mean in the particular situation at hand, rather than jumping to conclusions in terms of meta-categories such as "gender" or "power". In Potter's words¶ Critical discourse analysis and its critics 513¶ 514 Ruth Breeze¶ (1998: 31), "context is treated as something that is constructed, dealt with, and oriented to by participants. Features of participants such as their ethnicity, features of the setting, and other 'ethnographic' particulars are not treated as separable factors". As Potter points out, this tends to dissolve the classic distinction between micro- and macroanalysis, because researchers in this tradition do not view social structures as something in which interaction happens, but rather look at social interactions as evidence of the way social phenomena are shaped or constituted.¶ Although it is obvious that in the real world, the researcher cannot approach the data without preconceived notions, Schegloff's recommendation is that scholars should try to ground their analysis in the interaction itself, focusing on what is relevant to the participants. In his words (1997: 165), "this is a useful constraint on analysis in disciplining work to the indigenous preoccupations of the everyday world being grasped, and serving as a buffer against the potential for academic and theoretical imperialism which imposes intellectuals' preoccupations on a world without respect to their indigenous resonance."

CDA can't produce positive solutions

Ruth **Breeze, 2011** (Articles in pragmatics, "Critical Discourse Analysis and its Critics")

CDA practititioners repeatedly emphasise that their enterprise is essentially aimed at creating a better world, effecting transformation and empowering the oppressed: "CDA is essentially political in intent with its practitioners acting upon the world in order to transform it and thereby help create a world where people are not discriminated against because of sex, colour, creed, age or social class" (Caldas-Coulthard and Coulthard 1996: ix). However, they also admit that this objective is rarely met:¶ Critical language projects have remained just that: critiques of texts and of the social practices implied by or realised in those texts, uncovering, revealing, inequitable, dehumanising and deleterious states of affairs [...] if critical language projects were to develop apt, plausible theories of this domain, they would be able to move from critical reading, from analysis, from deconstructive activity, to productive activity [...] CL or CDA have not offered (productive) accounts of alternative forms of social organisation, nor of social subjects, other than by implication. (Kress 1996: 15-16)¶ Given the assumptions made in CDA about the nature of society, and the overwhelming interest in exposing ideological manipulation that shapes and perpetuates power imbalances through discourse, it is hardly surprising that language scholars of this school find it easier to deconstruct than to construct. In an article calling for more positive work in discourse analysis, Martin draws particular attention to the negative facets of CDA, locating CDA among "a pathological disjunction in 20th century social sciences and humanities research which systematically elides the study of social processes which make the world a better place in favour of critique of processes which disempower and oppress" (2004: 186) and calls for a serious attempt to be made to re- configure CDA in a more positive sense. He identifies this type of negative deconstruction as the dominant face of CDA, which he terms "CDA realis", which is¶ largely concerned with "exposing language and attendant semiosis in the service of power" (2004: 179). However, he also notes that CDA has a secondary aspect oriented to constructive social action, which he names "CDA irrealis", which has rarely been put into practice. In Martin's view, "we need a complementary focus on community, taking into account how people get together and make room for themselves in the world – in ways that redistribute power without necessarily struggling against it" (2004: 186). This "Positive Discourse Analysis" would focus on how change happens for the better, looking at how indigenous peoples overcome their colonial heritage, for example, or how sexism is eroded and new gender relationships are established. By studying such phenomena, we will learn more about how positive developments take place, and we will thus be in a better position to support change in the future.¶ By way of example, Martin documents the Australian government enquiry on the forced adoption of indigenous children, which is truly innovative within the genre of the bureaucratic report in that it foregrounds the voice of the victims. He similarly charts the roles of narrative and of biographical literature in raising people's awareness of injustice and changing public opinion. Martin's own frustration with the orthodoxies of CDA is plain when he states that he supposes "it would be going too far to propose a 10 year moratorium on deconstructive CDA, in order to get some constructive PDA off the ground" (2004: 199).¶ In a similar vein, Luke (2002: 98) argues that if CDA is to develop its full potential, it needs to move beyond ideological critique, and to explore what he calls "the productive use of power" and, in Freirean terms, "emancipatory discourse". Like Martin, he asserts that "if CDA is a normative form of social science and political action, it must be able to demonstrate what 'should be' as well as what is problematic" (2002: 105). If not, he argues, CDA will remain entrenched in a deterministic negative paradigm in which all media are forms of central ideological control, and CDA practitioners have the "enlightening" role of the Gramscian intellectual, to raise awareness and mobilise the people against the hegemony. Since this would be reductive (and, we might add, assumes certain premises about the nature of the audience and the workings of the media that are highly questionable), Luke proposes that a new, positively-oriented CDA should focus on minority discourses and diasporic voices, emergent counter-discourses, reinterpretations of mainstream discourses by different groups of subjects, and strategies of resistance. In the face of globalisation, for CDA to remain locked in dialectical analyses of economic disparity and political oppression would be to miss an opportunity, and ultimately to fail to come to terms with new cultural configurations, new ways of negotiating identity, new counter-discourses and voices of resistance. To meet this challenge, from a theoretical point of view, it will be necessary to stop thinking in terms of outdated dichotomies, while in methodological terms, it will be important to seek out

evidence and develop appropriate methods for investigating the new discourses and new media that characterise life in the 21st century.

You get coopted

Ruth **Breeze, 2011** (Articles in pragmatics, "Critical Discourse Analysis and its Critics")

However, as is inevitable in the case of successful new movements of any kind, in the twenty years or so in which CDA has gathered momentum there has been a gradual move towards establishment and respectability. Some authors even claim that CDA scholars are actively engaged in an attempt to establish CDA as an approach or school in itself (Verschueren 2001: 67). Billig (2002) documents this change and sketches out what this may mean for a "revolutionary" discipline, calling for greater self-awareness and self-criticism on the part of CDA practitioners.¶ In his account, Billig (2002) draws attention to the use of the acronym "CDA", which he feels has gained the status of an academic "brand". In his view, one rhetorical strategy available to academics is to package their products as part of a range which is accredited or in some way guaranteed by a particular theoretical perspective. The "branding" of this theory is often accomplished by the use of abbreviations (Billig cites the example of SIT, Social Identity Theory, in sociology, but one might equally think of SFL, in linguistics). In Billig's view, this type of labelling makes it possible for academics to "market" their ideas "as branded and identifiable intellectual products in today's academic world" (2002: 42), and this phenomenon is becoming common in a fiercely competitive academic world that is increasingly dominated by the rules of the market place. Now that CDA has a firm foothold in universities, with its own journals and large numbers of academics who assent to its main tenets, it is part of the academic power structure, and aspiring scholars can choose to join its ranks by accepting its principles and methodological assumptions. In terms of academic power (to publish books or articles, to make appointments, to achieve promotion), CDA is now at least equal to other fields of language study. It is even possible to maintain that, in intellectual terms, a critical paradigm has been established – a critical orthodoxy which may, in its way, be as inflexible, dogmatic and exclusive as other orthodoxies of the past.¶ Moreover, Billig draws special attention to the role played by the term "critical" in the self-understanding and self-marketing of CDA. He points to the history of the way the word "critical" has been used from Kant through to Piaget and Popper, not to mention the Frankfurt school (see above), and suggests that the main force of the term has usually been to insist on the objectivity or intellectual credibility of one's own enterprise and undermine the "uncritical", "non-critical" or "acritical" approaches adopted by other scholars. In particular, CDA's insistence that academic work should be addressed to the critique of power in society, added to the difference it establishes between itself and disciplines or paradigms whose theoretical and methodological assumptions exclude direct political analysis, tends to set up a dichotomy in which CDA is constructed as positive, while non-critical approaches are positioned as potentially defective or worse. Non-critical approaches are not simply another option: By not taking a critical stance, they are taking side with the existing hegemonies, guilty of precluding the necessary social critique, and thereby of collusion or of furthering the reproduction of an unjust social order. If we appraise CDA critically, we should therefore be aware that the use of the term "critical" is itself significant as what has been termed "a rhetoric of self-praise" (Billig 2002: 37). This aspect of CDA could indeed be¶ seen as a form of ideological manipulation, a way of disqualifying the competition. As Potter (1996) indicates, CDA treats criticism as if it were intrinsic to the enterprise. Although this does not necessarily follow, the implication often seems to be that discourse analysis which is not critical is in some sense lacking. As Potter says (1996), there is scope for types of discourse analysis which might or might not lead to social criticism, depending on what emerges from the data. There is no particular need for discourse analysis to be critical in order to be valid, useful or interesting. Moreover, other discourse analysts have argued forcefully that discourse analysis ought set its own particular rules as a discipline of language study, particularly relating to rigorous and impartial standards of analysis and interpretation, and that external

concerns such as ideological issues are not necessarily germane to the enterprise (Antaki et al. 2003). However, to those working within CDA, critique is not something that may or may not emerge from the analysis of text: Critique is the raison d'être for analysis in the first place.¶ In Billig's evaluation of this situation, several points stand out as being relevant to our present discussion. First, there is the issue of the critical canon. As we have seen, the intellectual basis for CDA is a subject of discussion even within the area itself. Beginning from a fairly straightforward neo-Marxist critique of society in the 1980s, CDA has expanded its intellectual horizons to take in a range of sociological thinking of a very diverse nature. What is special about this, if CDA is considered as a "school" or "approach" within language study, is the heavy emphasis on sociology, and on figures with a particular "critical" position towards late modernity, blended with the use of notions more generally associated with post-modern paradigms. Whatever the merits of this eclectic background, the result is that CDA seems to have established its own "critical canon" consisting of "radical works of social analysis that were never considered by conventional linguists to be part of linguistics" (Billig 2002: 44), which have now been fixed as set texts for the upcoming generation. There is some danger that this "canon" will be accepted uncritically, which is a matter for concern, particularly if it contains an imbalance between social theory and works concerned with language and linguistic methodology.¶ A second, related theme is the lack of reflexivity and internal dialogue, which tends to consolidate CDA from the outside, as an intellectual paradigm with its own hierarchy and systems of control, but which may detract from the seriousness of its intellectual enterprise. Billig (2002) feels that what self-critique there is tends to omit key factors, and is concerned that the growth in respectability will entail a loss of intellectual creativity. He recommends that academics should draw back from treating CDA as if it were a reified product, or a brand name for labelling one's work so that it will be published. He asks scholars to "unpick the rhetoric that has led from 'critical approaches' to the abbreviated and capitalised 'CDA'" (Billig 2002: 44), and calls for a return to the critical analysis of discourse (without capital letters) in such a way that new approaches can arise. In his words:¶ "Above all, there is a need to encourage young academics, especially those without established positions, to criticise the language and rhetoric of the established critical writers – even to expose the self-interest and political economy of the sign 'critical'. The results would not be comfortable for the critical experts; nor should they be if the activity of social critique is to continue into the future" (Billig 2002: 45).

AT: epistemology

Focus on epistemology relies on anthropocentric and modernist notions that prevent engagement with the object itself - makes political engagement impossible (this might be two cards)
Levi R **Bryant 2011** (The Democracy of Objects)

Yet in all of the heated debates surrounding epistemology that have cast nearly every discipline in turmoil, we nonetheless seem to miss the point that the question of the object is not an epistemological question, not a question of how we know the object, but a question of what objects are. The being of objects is an issue distinct from the question of our knowledge of objects. Here, of course, it seems obvious that in order to discuss the being of objects we must first know objects. And if this is the case, it follows as a matter of course that epistemology or questions of knowledge must precede ontology. However, I hope to show in what follows that questions of ontology are both irreducible to questions of epistemology and that questions of ontology must precede questions of epistemology or questions of our access to objects.What an object is cannot be reduced to our access to objects. And as we will see in what follows, that access is highly limited. Nonetheless, while our access to objects is highly limited, we can still say a great deal about the being of objects.¶ However, despite the limitations of access, we must avoid, at all costs, the thesis that objects are what our access to objects gives us. As Graham Harman has argued, objects are not the given. Not at all. As such, this¶ book defends a robust realism.Yet, and this is crucial to everything that follows, the realism defended here is not an epistemological realism, but an ontological realism. Epistemological realism argues that our representations and language are accurate mirrors of the world as it actually is, regardless of whether or not we exist. It seeks to distinguish between true representations and phantasms. Ontological realism, by contrast, is not a thesis about our knowledge of objects, but about the being of objects themselves, whether or not we exist to represent them. It is the thesis that the world is composed¶ of objects, that these objects are varied and include entities as diverse as mind, language, cultural and social entities, and objects independent of humans such as galaxies, stones, quarks, tardigrades and so on. Above all, ontological realisms refuse to treat objects as constructions of humans. While it is true, I will argue, that all objects translate one another, the objects that are translated are irreducible to their translations. As we will see, ontological realism thoroughly refutes epistemological realism or¶ Introduction: Towards a Finally Subjectless Object 19¶ what ordinarily goes by the pejorative title of "naïve realism". Initially it might sound as if the distinction between ontological and epistemological realism is a difference that makes no difference but, as I hope to show, this distinction has far ranging consequences for how we pose a number of questions and theorize a variety of phenomena.¶ One of the problematic consequences that follows from the hegemony that epistemology currently enjoys in philosophy is that it condemns philosophy to a thoroughly anthropocentric reference. Because the ontological question of substance is elided into the epistemological question of our knowledge of substance, all discussions of substance necessarily contain a human reference.The subtext or fine print surrounding our discussions of substance always contain reference to an implicit "for- us".This is true even of the anti-humanist structuralists and post- structuralists who purport to dispense with the subject in favor of various impersonal and anonymous social forces like language and structure that exceed the intentions of individuals. Here we still remain in the orbit of¶ an anthropocentric universe insofar as society and culture are human phenomena, and all of being is subordinated to these forces. Being is thereby reduced to what being is for us.¶ By contrast, this book strives to think a subjectless object, or an object that is for-itself rather than an object that is an opposing pole before or in front of a subject. Put differently, this essay attempts to think an object for-itself that isn't an object for the gaze of a subject, representation, or a cultural discourse.This, in short, is what the democracy of objects means. The democracy of objects is not a political thesis to the effect that all objects ought to be treated equally or that all objects ought to participate in human affairs. The democracy of objects is the

ontological thesis that all objects, as Ian Bogost has so nicely put it, equally exist while they do not exist equally. The claim that all objects equally exist is the claim that no object can be treated as constructed by another object. The claim that objects do not exist equally is the claim that objects contribute to collectives or assemblages to a greater and lesser degree. In short, no object such as the subject or culture is the ground of all others. As such, The Democracy of Objects attempts to think the being of objects unshackled from the gaze of humans in their being for-themselves.¶ 20 Levi R. Bryant¶ Such a democracy, however, does not entail the exclusion of the human. Rather, what we get is a redrawing of distinctions and a decentering of the human. The point is not that we should think objects rather than humans. Such a formulation is based on the premise that humans constitute some special category that is other than objects, that objects are a pole opposed to humans, and therefore the formulation is based on the premise that objects are correlates or poles opposing or standing-before humans. No, within the framework of onticology—my name for the ontology that follows—there¶ is only one type of being: objects. As a consequence, humans are not excluded, but are rather objects among the various types of objects that exist or populate the world, each with their own specific powers and capacities.¶ It is here that we encounter the redrawing of distinctions proposed by object-oriented philosophy and onticology. In his Laws of Form, George Spencer-Brown argued that in order to indicate anything we must first¶ draw a distinction. Distinction, as it were, precedes indication. To indicate something is to interact with, represent, or point at something in the world (indication takes a variety of forms). Thus, for example, when I say the sun is shining, I have indicated a state-of-affairs, yet this indication is based on a prior distinction between, perhaps, darkness and light, gray days and sunny days, and so on. According to Spencer-Brown, every distinction contains a marked and an unmarked space.¶ marked unmarked¶ The right-angle is what Spencer-Brown refers to as the mark of distinction. The marked space opens what can be indicated, whereas the unmarked space is everything else that is excluded. Thus, for example, I can draw a circle on a piece of paper (distinction), and can now indicate what is in that circle. Two key points follow from Spencer-Brown's calculus of distinctions. First, the unmarked space of a distinction is invisible to the person employing the distinction. While it is true that, in many instances, the boundary of a distinction can be crossed and the unmarked space¶ can be indicated, in the use of a distinction the unmarked space of the¶ ⌗¶ Introduction: Towards a Finally Subjectless Object 21¶ distinction becomes a blind-spot for the system deploying the distinction. That which exists in the unmarked space of the distinction might as well not exist for the system using the distinction.¶ However, the unmarked space of the distinction is not the only blind- spot generated by the distinction. In addition to the unmarked space of a distinction, the distinction itself is a blind-spot. In the use of a distinction, the distinction itself becomes invisible insofar as one passes "through" the distinction to make indications. The situation here is analogous to watching a bright red cardinal on a tree through one's window. Here the window becomes invisible and all our attention is drawn to the cardinal. One can either use their distinctions or observe their distinctions, but never use their distinctions and observe their distinctions. By virtue of the withdrawal of distinctions from view in the course of using them, distinctions thus create a reality effect where properties of the indicated seem to belong¶ to the indicated itself rather than being effects of the distinction. As a consequence, we do not realize that other distinctions are possible. The result is thus that we end up surreptitiously unifying the world under a particular set of distinctions, failing to recognize that very different sorts of indications are possible.¶ Within the marked space of its distinctions, much contemporary philosophy and theory places the subject or culture. As a consequence, objects fall into the unmarked space and come to be treated as what is other than the subject.¶ ⌗content: signs/signifiers/representations¶ subject/culture Here one need only think of Fichte for a formalization of this logic. Within any distinction there can also be sub-distinctions that render their own indications possible. In the case of the culturalist schema, the subject/ culture distinction contains a sub-distinction marking content. The catch is that in treating the object as what is opposed to the subject or what is other than the subject, this frame of thought treats the object in terms of¶ 22 Levi R. Bryant¶ the subject. The object is here not an object, not an autonomous substance that exists in its own right, but rather a representation. As a consequence¶ of this, all other entities in the world are treated only as vehicles for human contents, meanings, signs, or projections. By analogy, we can compare the culturalist structure of distinction with cinema. Here the object would be the smooth cinema screen, the projector would be the subject or culture, and the images would be contents or representations. Within this schema, the screen is treated as contributing little or nothing and all inquiry is focused

on representations or contents. To be sure, the screen exists, but it is merely a vehicle for human and cultural representations.¶ Onticology and object-oriented philosophy, by contrast, propose to place objects in the marked space of distinction.¶ subject/culture/nonhumans object¶ It will be noted that when objects are placed in the marked space of distinction, the sub-distinction does not contract what can be indicated, but rather expands what can be indicated. Here subjects and culture are not excluded, but rather are treated as particular types of objects. Additionally, it now becomes possible to indicate nonhuman objects without treating them as vehicles for human contents. As a consequence, this operation is not a simple inversion of the culturalist schema. It is not a call to pay attention¶ to objects rather than subjects or to treat subjects as what are opposed to objects, rather than treating objects as being opposed to subjects. Rather, just as objects were reduced to representations when the subject or culture occupied the marked space of distinction, just as objects were effectively transformed into the subject and content, the placement of objects in the marked space of distinction within the framework of ontology transforms the subject into one object among many others, undermining its privileged, central, or foundational place within philosophy and ontology. Subjects are objects among objects, rather than constant points of reference related to all other objects. As a consequence, we get the beginnings of what anti-¶ 🕮¶ Introduction: Towards a Finally Subjectless Object 23¶ humanism and post-humanism ought to be, insofar as these theoretical orientations are no longer the thesis that the world is constructed through anonymous and impersonal social forces as opposed to an individual subject. Rather, we get a variety of nonhuman actors unleashed in the world as autonomous actors in their own right, irreducible to representations and freed from any constant reference to the human where they are reduced to our representations.¶ Thus, rather than thinking being in terms of two incommensurable worlds, nature and culture, we instead get various collectives of objects.¶ As Latour has compellingly argued, within the Modernist schema that drives both epistemological realism and epistemological anti-realism,¶ the world is bifurcated into two distinct domains: culture and nature.3¶ The domain of the subject and culture is treated as the world of freedom, meaning, signs, representations, language, power, and so on. The domain¶ of nature is treated as being composed of matter governed by mechanistic causality. Implicit within forms of theory and philosophy that work with this bifurcated model is the axiom that the two worlds are to be kept entirely separate, such that there is to be no inmixing of their distinct properties. Thus, for example, a good deal of cultural theory only refers to objects¶ as vehicles for signs or representations, ignoring any non-semiotic or non-representational differences nonhuman objects might contribute to collectives. Society is only to have social properties, and never any sorts of qualities that pertain to the nonhuman world.¶ It is my view that the culturalist and modernist form of distinction is disastrous for social and political analysis and sound epistemology. Insofar as the form of distinction implicit in the culturalist mode of distinction indicates content and relegates nonhuman objects to the unmarked space of the distinction, all sorts of factors become invisible that are pertinent¶ to why collectives involving humans take the form they do. Signifiers, meanings, signs, discourses, norms, and narratives are made to do all the heavy lifting to explain why social organization takes the form it does. While there can be no doubt that all of these agencies play a significant role in¶ the formation of collectives involving humans, this mode of distinction leads us to ignore the role of the nonhuman and asignifying in the form¶ of technologies, weather patterns, resources, diseases, animals, natural¶ 24 Levi R. Bryant¶ disasters, the presence or absence of roads, the availability of water, animals, microbes, the presence or absence of electricity and high speed internet connections, modes of transportation, and so on. All of these things and many more besides play a crucial role in bringing humans together in particular ways and do so through contributing differences that while coming to be imbricated with signifying agencies, nonetheless are asignifying. An activist political theory that places all its apples in the basket of content is doomed to frustration insofar as it will continuously wonder why its critiques of ideology fail to produce their desired or intended social change. Moreover, in an age where we are faced with the looming threat of monumental climate change, it is irresponsible to draw our distinctions in such a way as to exclude nonhuman actors.¶ On the epistemological front, the subject/object distinction has the curious effect of leading the epistemologist to focus on propositions¶ and representations alone, largely ignoring

the role that practices and nonhuman actors play in knowledge-production. As a consequence, the central question becomes that of how and whether propositions correspond to reality. In the meantime, we ignore the laboratory setting, engagement with matters and instruments, and so on. It is as if experiment and the entities that populate the laboratory are treated as mere means to the end of knowledge such that they can be safely ignored as contributing nothing to propositional content, thereby playing no crucial role in the production of knowledge.Yet by ignoring the site, practices, and procedures by which knowledge is produced, the question of how propositions represent reality becomes thoroughly obscure because we are left without the means of discerning the birth of propositions and the common place where the world of the human and nonhuman meets.

AT: grassroots

Grassroots activism statistically useless

NBS 2012 http://nbs.net/knowledge/when-shareholders-are-scarier-than-green-peace/

Shareholders unhappy with your environmental track record hurt your company's financial performance far more than a Greenpeace boycott.¶ This according to researchers Ion Bogdan Vasi of Columbia University and Brayden King of Northwestern University. Vasi and King found that a single resolution from a concerned shareholder makes analysts believe your firm is environmentally risky. And that belief translates to lower stock price valuation. The same cannot be said, however, of environmental activists outside your company.¶ "It's surprising activist groups don't influence analysts' risk assessments," said John Peloza, a management professor at Florida State University and NBS Editor on Valuing Sustainability. "Intuitively, you might assume lawsuits or boycotts attacking companies' poor environmental record would down-grade a company's stock price. But that's apparently not the case."¶ "Extracting fossil fuels is becoming increasingly risky and that is a financial risk."¶ The researchers came to the conclusion after studying the 700 highest-revenue companies in the United States from 2004 to 2008. They tracked financial analysts' perceptions of "environmental risk," studied who influenced those perceptions and compared the assessments to companies' financial performance.¶ As one analyst observed: "Extracting fossil fuels is becoming increasingly risky and that is a financial risk. The latest spate of environmental crises is pushing investors to become more interested in how environmental risk translates into financial risk."¶ Primary Versus Secondary Activists¶ Armed with risk assessments for the 700 companies, the researchers studied the influence of primary versus secondary activists on analyst assessments. Primary activists are people whose financial situation correlates directly with firm performance: shareholders, employees, suppliers and creditors.¶ Secondary activists include community groups, religious groups and non-governmental organizations (NGOs) like Greenpeace, WWF or the David Suzuki Foundation in Canada – organizations outside the firm. These external activists may use boycotts, protests, lawsuits, demonstrations, petitions or sit-ins to raise awareness about a company's poor environmental practices. Their actions are sometimes effective at prompting companies to adopt sustainable practices – or at least the appearance of improved environmental performance. From an analyst's perspective, though, environmental groups are often dismissed as radical or marginal.¶ One Unhappy Shareholder Rocks the Boat¶ Shareholders share companies' goals of making money and remaining financially viable over the long term. So their concerns about environmental policies raise red flags for potential investors. And unlike people outside the firm, shareholder activists are in a unique position to "observe corporate activities and to report what they perceive as environmental misdeeds," according to the researchers.¶ Shareholders take action against corporate environmental performance through resolutions: "Although shareholder resolutions rarely receive enough support to force a change in corporate policies," the researchers write, "they present evidence that investors [should] be concerned with firms' environmental practices."¶ Shareholder activism has its roots in the corporate raiders of the 1980s. Corporate raiders would buy an equity stake in a company and force the firm to make changes internally – or buy them out at a premium. Famous corporate raiders include Carl Icahn, T. Boone Pickens and, most recently, Bill Ackman.¶ Examples of Shareholder Resolutions¶ 2004: Brothers of Holy Cross, Dominican Sisters of Hope, Sisters of Mercy of the Americas and other religious groups ask GE to disclose the cost of PCB clean-up. Received support from 12.7 per cent of shareholders.¶ 2007: Trillium Asset Management asks Dow Chemical Company to publish a report on the extent to which its products cause or exacerbate asthma. Received support from 6.7 per cent of shareholders.¶ Comparing Risk Perception to Stock Price¶ Once they knew which companies were targeted by primary and secondary activists, the researchers examined financial performance. They studied the difference between each company's book value – the value of its assets on paper – and market value – how much analysts thought it was worth.¶ The researchers found the firms with high levels of environmental risk performed worse financially than those with low levels of risk. And the firms with the highest levels of perceived risk were the ones with shareholder resolutions – not the ones targeted by environmental groups or activists outside the company.¶ The Takeaway for CEOs¶ While you shouldn't dismiss third-party organizations' concerns about your environmental record, recognize that their public campaigns won't necessarily affect your market performance. Beware, however, the disgruntled shareholder.¶

Deliberation Good

Decolonization Impact

Deliberation key to solve colonization and social inequality

Leung 10 (Cheuk-Hang, Institute of Education, London, "Decolonization through Deliberation Teaching Democratic Citizenship in a Quasi-LiberalDemocratic Society," November 2010, https://www.ioe.ac.uk/about/documents/About_Overview/Cheuk-Hang_L.pdf)//ghs-VA

Introduction: Civic Education, Decolonization, and Quasi-Liberal-Democracy Issues on decolonization and democratization always provoke heated debates across different classes, races, religions, political camps, and cultural groups in postcolonial societies. Social struggle for democratic citizenship could be a tough and long process for the post-colonial society, as those domestic elites and conservative groups with vested interests who succeed the colonial authority do not easily concede power. Furthermore, It is not uncommon to see a re-legitimization of authoritarian rule in some post-colonial states (Grugel, 2002). This paper aims to present a philosophical analysis of democracy teaching in a post-colonial society. My focus will be on approaches to teaching civic and political education in such a contested socio-political environment, given that the transition to full-scale democracy normally takes a fairly long period of time. In the meantime, transitional politics always creates some forms of injustice, and post-colonial governments may seem resistant to promote the kind of citizenship education that favors democratic reform. Thus, civic education may be confined to, for example national identity building, instead of teaching democratic values. This paper addresses the key question of how to and who should teach citizens about the project of democratization and decolonization, given the apparent retreat of the state from the teaching of democratic citizenship in some postcolonial situations. The main theme of this paper is to argue that the concept of deliberative democracy represents a **cooperative learning process** for the public sphere; and that this could be essential for the development of democratic culture. Deliberative democracy should therefore, serve as an educational ideal for democratic citizenship education, whereas deliberation per se should be embraced as a means of civic education for the transformation to a democratic and **decolonized** citizenship. My focus on deliberation will highlight the moral salience of teaching „controversial" history through public deliberation. Therefore, as an illustration of the educative function of deliberation, in the later part of this paper, I will consider the moral implications of informal democratic education through the commemoration of a traumatic historic event in a postcolonial society, especially during the period of transitional politics towards the ultimate goal of decolonization. The progress of the decolonization project in part lies in the maturity and intensity of the democratic civic discourse within a given society, though constitutional reform still ought to be recognized as the necessary indicator. A full-scale democracy not only rests with democratic transformation of political institutions, but also requires the citizenry to take up a set of (liberal) values that can facilitate democratic operation and consolidate an open minded democratic life. The classical Marxist critique of colonialism, such as writers like Lenin and Hilfreding, that focuses on the imperialism of international trade and the coercive ruling of the colonizers seem to neglect the colonial impacts on the cultural dimensions of the colonized (Law, 2009). One of the key features of postcolonial studies is to reveal the underlying fabrics of colonial impacts on various epistemological, psychological, behavioral, and imaginary perspectives that still linger in the absence of colonial forces under the post-colonial period of time (Law, 2009). The project of decolonization thus should be conceived as both the reflection of and the rehabilitation from the colonial past. In this sense, the teaching of democratic citizenship is a top priority of the project with a view to developing a robust political culture for democratic public life. After all, democratic institutions cannot work without a robust democratic culture that efficiently conducts a specific liberal version of political morality for the interaction among people in a democratic public sphere. It is, therefore, conceivable to imagine that the teaching of democratic civic values in a postcolonial state, especially given the resistance of the government, is a necessarily contested task. It is not only because of its educational salience and controversy of teaching-learning approaches (one of which, as I will suggest below, is through public deliberation), but also due to the nature that it somehow touches on a sensitive political issue --- a highly reflective citizenry in the postcolonial condition may not always be welcome by domestic elitists, big businessmen, conservative groups, and even the government. In this context, one might note that the research of postcolonial education needs to be context-sensitive so as to grasp the accurate colonial experience for reflection. The pedagogy of civic values education, by the same token, is constrained by the social and cultural circumstances of individual postcolonial society. In this paper I propose the term quasi-liberal-democracy, which is used exclusively to depict merely some post-colonial societies that well suit the approach of teaching democracy through public deliberation. It portrays a society with semi- or fragile democratic institutions that, for example, were inherited from the colonial master in the later period of governance. The quasi-nature infers to the unfinished constitutional reforms of governmental settings. It also lies in the relative lack of a thriving political culture in favor of the consolidation of institutional democracy. On the other hand, the term „quasi-liberal" implies a critical point of view on the potentially rich liberal resources for these

postcolonial societies to further cultivate a desirable political culture and to nurture a robust democratic society. I would suggest that these quasi-liberal-democracies are mainly situated in Southeast Asian societies such as Hong Kong, Taiwan, and Singapore. Of course, this classification is subject to empirical challenge, but the basic observation here draws on the relatively „civilized" colonial history and the rapid economic development in recent decades of these post-colonial societies, both of which contribute to their acceptance of liberal values and material foundation for democratization. Nevertheless, the term quasi-liberal-democracy is only a conceptual tool to represent the readiness for becoming democratic and to differentiate some post-colonial societies from many others. It does not aim at constructing any epistemological distinction on different postcolonial conditions. Indeed, those post-colonial societies out of the focus of this paper – African and Latin American – can largely fall into the category of quasiliberal-democracy at some level, despite the national variations in democratic constitutional settings and political culture. The term quasi-liberal-democracy, as a conceptual tool, depicts a particular societal configuration in order to illustrate a case for teaching democratic civic values through public deliberation. This is because the main purpose of this paper is to articulate and defend deliberative democracy as an ideal for civic teaching and to illustrate the normative endowment of public deliberation in the setting of informal education. In respect of this chosen context, the case for illustration is selective, though the educational implication of deliberative democracy it carries is thought to be universally applicable to all democratic societies. Therefore, in the following discussion on postcolonial society I will mainly focus on the case of Hong Kong as an example for illustrating a complex and contested political environment in teaching civic values via informal settings. Before that a working conception of deliberative democracy is needed in order to grasp its philosophical essence. <u>Deliberative Democracy</u> as Ideal for Civic Education Citizenship education in a liberal pluralist society concerns the relevant knowledge of a democratic community and aims at fostering civic virtues of commitment to a democratic polity. In other words, it <u>emphasizes the civic participation of citizens and their required education</u>. The deliberative turn in democratic theory that emerged mostly in the 1990s can be seen as a response to the increasing demand for the political participation of citizens. <u>Deliberative democracy addresses the legitimacy issue of lawmaking through the **public deliberation of citizens**</u>. It also presents an ideal of political autonomy based on practical reasoning of participatory citizens seen as a way to attain rational legislation, participatory politics, self-governance, and even accommodation of moral differences (Bohman & Rehg, 1997; Gutmann & Thompson, 2004). Deliberation here means a social process that is distinguished from other forms of communication. During the process of deliberation, people can propose ideas and listen to each other"s opinions. It is also an interaction that allows for changes in judgments and preferences throughout the whole process. In this sense, deliberative democracy is a model, which objects to seeing democracy as consisting merely in voting or the aggregation of citizens" preferences; it also rejects the definition that confines democracy to simply constitutionalism. Instead, <u>deliberative democracy encourages the political participation of citizens and proclaims „the authenticity of democracy" --- a substantive democratic control by „competent citizens</u>" (Dryzek, 2000). Nowadays, in real politics, some political institutions have been developed in the name of deliberative democracy, such as deliberative polls, citizens" juries, consensus conferences, and national issues forums (Goodin, 2008). Deliberative democracy is not only an ideal proposal by political philosophers; it has been gradually implemented in some of our ordinary political practices. As citizenship education aims at promoting active civic participation, deliberative democracy should become its ideal form of democratic citizenship that educational theorists apply. It carries robust moral salience for educating democratic citizen. Deliberative democracy in its ideal form can foster democratic life in at least three ways. First, the reason-giving character of deliberative democracy can enhance citizens" understanding of public debates through information sharing and public deliberation. <u>Reasoning and arguments are appreciated during the process of deliberation</u> (Cohen, 2009). In an ideal speech situation, public deliberation is free from coercion, distortion, deception, and manipulation; that is, to use another Habermasian term, a „lifeworld" would be formed where free and equal citizens can take part in public affairs with a sense of communicative rationality. <u>An ideal formulation of deliberative democracy resembles the lifeworld, in which democracy would be enriched with communicative actions through the public deliberation of reasonable citizens</u> (Habermas, 1996). In this sense, <u>democracy cannot be simply reduced to voting</u>; and voting itself is not merely a means for aggregating private interests, as we can, ideally, see the reasons behind each preference. The reason giving character and the communicative features embedded in deliberative democracy promote an educative environment for citizens to respect reasons and practices acting as politically autonomous participants. Secondly, <u>deliberative democracy can help to promote **social justice**</u>. Public deliberation can efficiently expose how certain preferences are potentially linked to <u>sectional interests</u>, as <u>public deliberation is **more capable of comprehending complex problems** than individual contemplation</u>. Citizens can figure out those partial interests underlying specific preferences and seek those that represent the interests of many (Held, 2006: 237-8). As <u>deliberation</u> enhances better understanding of arguments and reasoning (see above), it <u>could</u> help to <u>build up a more open, fair and dynamic platform for collective reasoning</u>. Public reasons prevailing through public deliberation are those could pass the scrutiny of common goods and public interests. In this regard, the requirement of transparency generates a sense of impartiality among deliberative participants. Public deliberation thus helps transcend the language of interest to the language of reason (Elster, 1998: 101-5). In deliberative context, the outcome can sometimes be shaped independently of the motives of participants, since there are powerful norms to oppose the appeal to interest or prejudice (Elster, 1998: 104). <u>Citizens and politicians are required to justify their proposals by public interest</u>. Deliberation is not only a form of information exchange, but also a process of justification and presentation of reasoning on various public proposals and opinions in order to maintain a just

society. Third, deliberative democracy requires a communal setting for a realization of fair public interaction among free and equal citizens. In this particular public setting for deliberation, given under fair conditions, citizens are encouraged to develop a sense of justice, by which they can take part in deliberation in accordance with public reasons that all are expected to follow. The effect of this communal setting of public deliberation is also, it is argued, to cultivate citizens with a sense of belonging and caring about other fellow citizens. The more they practise discussion, debate, negotiation, and interaction in public deliberation, the more citizens will come to acknowledge the virtues of accommodation of differences. Deliberative democracy, as both the ideal of democratic citizenship and the method of collective decision-making, requires individuals to always be responsive to other"s interests and needs. Talking cannot always settle disputes, but it helps us to clarify things and to put ourselves into others shoes. By knowing more about each other"s positions, we can develop codes of mutual respect in public forum. The essentiality of reciprocity is a top priority of democratic civility in deliberative political settings; and the sense of justice and of belonging and caring all help consolidate the reciprocal mindset of citizens. Deliberative democracy, apart from legitimizing collective decision and promoting social justice, cultivates reciprocal citizens who acquire liberal civility and duty that enhance their willingness to accommodate moral differences (Gutmann & Thompson, 1996). In a nutshell, deliberative democracy aims at strengthening the legitimacy of democratic decision-making procedures by the input of deliberative elements in the life of public participation. Citizens thus cannot simply state their preferences in public dialogues; they have to be prepared to provide reasons and arguments in supporting their points of view. Political deliberation is an ideal, that is, it is a circumstance where citizens are free from distortion, manipulation, coercion, strategizing or bargaining in motivating rationality and arguments (Cohen, 1989: 22-26). Deliberative democracy therefore offers free and equal citizens a way of dealing with moral disagreement about public affairs. It prescribes a set of principles on fair terms of cooperation that could enhance the accountability and legitimacy of decision-making for public affairs (Gutmann & Thompson, 2004). A new paradigm of citizenship education should, I argue, follow this shift of democratic theory to fit in with the account and the requirement of implementing deliberative democracy.

Surveillance Deliberation

Deliberation is critical to resolving pressing issues of the status quo

Rask and Worthington 15 (Mikko Rask, Senior Researcher, National Consumer Reserch Centre in Finland, Richard Worthington, Professor of Politics at Pomona College, "Governing Biodiversity through Democratic Deliberation," 2015)//ghs-VA

'Deliberation' is a term used extensively in democratic theory and environmental governance, referring to the style and nature of problem-solving through communication and collective consideration of relevant issues.6 Deliberation welcomes different types of argumentation and communication such as exchanging observations, weighing and balancing arguments, providing reflections and associations and setting facts into a contextual perspective (Renn 2008: 285). Due to its emphasis on **argumentation** and public dialogue, deliberation is often characterized as a 'talk-centric' rather than 'vote-centric' approach to decision making (Chambers. 2003). Increased public deliberation on political matters is also seen as a way to complement and deepen practices of representative and direct democracy, which are minimalist in the sense that they tend to offer a role for the average citizens merely as a voter, who influences public policy issues rarely, perhaps once in two or four years, when parliamentary or congressional elections take place. As for 'deliberative democracy', it can be understood as a political orientation that aims at deepening democracy by enhancing the discursive quality and effectiveness of collective decision making. Supporters of deliberative democracy perceive severe problems in the established institutions of representative and direct democracy, such as the superficiality of political discussion, non-transparency of decision making and selfishness in the definition of political interests (Held, 2006). Celebrity politics, disclosure of mass surveillance and government secrecy by whistleblowers such as Edward Snowden or Julien Assange, and widespread political corruption are examples of these problems. To remedy them, the supporters of **deliberative democracy call for more informed dialogue, public reasoning, and objective weighing of political matters** (Held, 2006).

Civic Education Impact

Deliberation is key to revitalizing democracy

Kavanaugh et al 6 (Andrea L. Kavanaugh, Philip L. Isenhour Matthew Cooper, John M. Carroll, Mary Beth Rosson, Joseph Schmitz, Virginia Tech, USA, Pennsylvania State University, USA, Western Illinois University, "Information Technology in Support of Public Deliberation," 2006, http://www.sozioinformatik.org/fileadmin/IISI/upload/C_T/2005/Paper1C_T2005.pdf)//ghs-VA

Civic Participation and Social Ties Civic participation encompasses a broad range of basic rights, duties and responsibilities (e.g., Davis and Fernlund, 1991). Duties of citizens are not voluntary and include attending school, obeying laws and paying taxes. In contrast, basic rights and responsibilities are voluntary and include voting, holding elected office, influencing government, practicing one's own religion, expressing what one thinks in speech and in writing, attending public meetings, serving the community, and contributing to the common good (e.g., helping neighbors and fellow citizens). It is crucial that citizens read, write, and **evaluate political arguments** if they are to participate in democratic decision-making processes. The aspiration for an informed, engaged populace is one of the most constant elements of democracy in America (Dahl, 1989, and others). The requirements and consequences of public education with an attendant freeing of minds underlie the protections of free speech (Meikeljohn, 1948). Democratic theory typically envisions a system of government designed to foster deliberation just as much as it is to enhance participation (Schudson, 1992). **Deliberation differs from participation** in that it involves more public discussion, negotiation, prioritizing, consensus building, and agenda setting (Barber, 1984; Coleman and Gotze, 2002; Coleman, 2003). It is a multifaceted group process, one that typically occurs in public spaces, such as voluntary associations and public meetings that transpire in what Oldenburg (1991) characterizes as "Great Good Places." For most people, citizenship is not this multifaceted and active (Pateman, 1970; Verba and Nie, 1972; Milbraith and Goel, 1982; White, 2001). Few citizens participate actively in political processes, as indicated by low voter turn out and other civic engagement indicators such as those itemized by Putnam (2000), and others. Classical political theory posits that our democratic system of government works despite ill-informed and inactive citizens. According to elite theories of democracy, this successful functioning derives from the active, well informed, participation of a minority of citizens - often referred to as political 'elites' (Lasswell, 1948; Fishkin, 1991; Bottomore; 1965; Bachrach and Baratz, 1962). People who belong to multiple groups act as bridging ties across groups (Simmel [1908]; Wolf, 1950; Wellman, 1988) and contribute towards 'bridging' types of social capital (Putnam, 2000) - or what Granovetter (1973) calls weak social ties. Bridging (or weak) ties increase the pace and flow of information and ideas throughout a community. Citizen engagement tends to be higher in communities that have dense social networks, high levels of trust and both 'bridging' (across groups) and 'bonding' (within groups) types of social capital (or what Fischer (2001) and others refer to as 'in-bound social networks'. When people with bridging ties use communication media, such as the Internet, they enhance their capability to educate community members and organize for collective action. Communities with a rich organizational life (i.e., numerous voluntary associations) provide many opportunities for bridging social capital to develop and grow. Nie, Powell, and Prewitt (1969) found that along with social class (high SES), rich organizational life represents the economic development component that most strongly affects mass political participation. Groups educate members, both cognitively and experientially, and generate satisfaction (or spur opposition) to political action, especially in local politics (Newton, 1997). Presently, the capability of Internet technology to facilitate deliberation is much less clear than its capability to facilitate participation - more private, passive, and individual activities. Keeping informed and participating take time, a scarce resource for the better educated, political elites and for the general populace. Much evidence suggests that the Internet can alleviate constraints of time by providing anytime/anywhere information and discussion. For these and other reasons, the Internet may serve as a medium with great potential to revive civic participation (Milbraith and Goel, 1977; Barber et al., 1997; Davis and Owen, 1998; Wilhelm, 2000; Norris, 2001; Horrigan, Garrett and Resnick, 2004).

Neolib Good

Enviornment

Neoliberalism is inevitable

Smith 12 "Candace, writer for the sociology lens"A Brief explanation of neoliberalism and its consequences", http://thesocietypages.org/sociologylens/2012/10/02/a-brief-examination-of-neoliberalism-and-its-consequences/".CC

Starting in the second half of the 20th century, neoliberalism became increasingly prominent as a form of governance in countries around the world (Peters 2001). Originally, the roots of neoliberalism were planted by a classical political economy theory which advocated for markets (and thus people) to be completely liberated from any type of governmental interference (Smith 2009). "**Free" competition and "free" enterprise were promoted as manners in which economies should be allowed to grow**. Martinez and García (2000) contend that this "liberal" type of economic theory began to be adopted in the West throughout the 1800s and into the early part of the 1900s. The Great Depression of the 1930s and the development of Keynesian economics, though, temporarily slowed down the advancement of liberal economics. In recent decades, however, there has been a revival of economic liberalism (or, neoliberalism) on a truly global level as countries around the world now either choose or are forced to engage in neoliberal governance. As a result of the growing hegemonic prominence of neoliberalism, there have been vast changes at the national-level, the international-level, and the individual-level. At the national-level, neoliberal ideas have drastically changed how states operate. By heavily promoting market-based economies that highly value competition and efficiency, neoliberalism has moved countries closer to adopting social Darwinism. Under Thatcher and Reagan, for instance, Peters (2001) argues that neoliberalism directly led to the economic liberalization/rationalization of the state, the restructuring of state sectors, and the dismantling of the welfare state. As a consequence of these changes, the U.S. and the U.K. have seen things like the abolishment of subsidies and tariffs, the corporatization and privatization of state trading departments, a sustained attack on unions, and the individualization of health, welfare, and education. Although the idea that markets should fully dictate governments would have seemed ludicrous in prior decades (George 1999), Bourdieu (1999b) contends that neoliberalism as a form of national governance has become a doxa, or an unquestioned and simply accepted worldview. Harvey (2005) is thus not surprised that the ideas of capitalism have been infused into political, social, and cultural institutions at the state-level. By placing a mathematical quality on social life (Bourdieu 1999a), neoliberalism has encouraged formerly autonomous states to regress into penal states that value production, competition, and profit above all else, including social issues. At the international-level, George (1999) argues that neoliberals have focused on three primary points: free trade in goods and services, free circulation of capital, and freedom of investments. Thus, neoliberal globalization means that there has been an emphasis placed on exchanges across national borders, financialization, and the development of international organizations as well as a transnational civil society (Bandelj, Shorette, and Sowers 2011). With the help of the International Monetary Fund and the World Trade Organization, George contends that advocates of neoliberalism have essentially forced many countries to accept this framework. Such acceptance means that more states are now tacitly agreeing to promote the rule of the market, severely cut public expenditures, reduce governmental regulation, and embrace the concept of individuality even if this means casting millions (if not billions) of people aside and regarding them as "losers" in a zero-sum game (Martinez and García 2000). By adopting such an economic worldview, George warns that it is likely that the North-South gap and global inequality are likely to become more exaggerated in the years to come. Because neoliberalism leads to the globalization of financial markets (Bourdieu 1999a), it can further be expected that economic crises—built on the backs of short-sided neoliberal policies—will become more common and catastrophic. At the individual-level, neoliberalism insists that rationality, individuality, and self-interest guide all actions (Peters 2001). In fact, neoliberalism often views itself as a global social science capable of explaining all human behavior since all behavior is thought to be directed by logical, individualistic, and selfish goals. Neoliberalism's focus on the individual means that ideas related to things such as "the public good" and "the community" are now being discarded as unnecessary components of a welfare state (Martinez and García 2000). Unsurprisingly, then, unemployment, inequality, and poverty have become increasingly blamed on individuals rather than on structural constraints (Passas 2000). Because we are turning away from the role of the community and instead focusing solely on individuals, Bourdieu (1999a) contends that social problems like suicide, alcoholism, depression, and domestic violence will consequently become increasingly prominent. Still, the outward attractiveness of individual freedom, prosperity, and growth makes it challenging for the public to realize that neoliberalism is designed to benefit only a very small class of people (Harvey 2005). Such a worldview also makes it easier to justify the thought that some people are deserving of much more than others because, after all, it is a common refrain that we are all responsible for our own destinies. Source: Stefan Kühn As can be seen from this brief description of neoliberalism and its repercussions, this ideology has led to many changes at the state-level, the international-level, and the individual-level. Such changes include the dismantling of the welfare state, the growing reality of global inequality, and the individualization of all actions. In spite of such negative outcomes, George (1999) argues that **the hegemonic nature of neoliberalism makes it seem like the only possible economic and social order available. As a true doxa, neoliberalism has become an unquestioned reality as it now seems almost logical that the markets should be the allocators of resources, that competition should be the primary driver of innovation, and that societies should be composed of individuals primarily motivated by economic conditions (Coburn 2000). Against the onslaught of neoliberal ideals, some scholars such as Bourdieu and Harvey have argued that the**

populace must rise up and resist this ideology. With the effectiveness with which neoliberals have pushed forward their ideas, though, such an uprising seems unlikely at least in the near future.

Neoliberalism solves for poverty and income inequality, neoliberalism manifests itself in different forms Europe proves

Summer 10' " Scott, Scott Sumner is a professor of economics at Bentley University in Waltham, Massachusetts. He earned his Ph.D. in economics at the University of Chicago in 1985, "The unacknowledged success of neoliberalism, http://www.econlib.org/library/Columns/y2010/Sumnerneoliberalism.html".CC

The neoliberal policy revolution that began in the late 1970s might be the most important recent event in world history. But it remains a curiously elusive and underreported phenomenon. Many on the left question the motives behind the reforms, as well as their efficacy, while some on the right talk as if the neoliberal revolution never happened. Yet, **the neoliberal revolution has been widespread and highly successful. And the motives of neoliberal reforms are much purer than one would imagine** after reading left-wing criticisms of free-market reforms. First, to understand what neoliberalism it, we need to start with the term "liberal." The best way to make sense of liberalism, in all its permutations, is to assume that liberals are people with constantly evolving policy views but relatively stable utilitarian values. In the late 18th and early 19th centuries, idealistic utilitarian reformers, aka "classical liberals," believed that free-market capitalism was the best way to improve human welfare. Views shifted over the course of the 19th century, as capitalism was increasingly associated, whether accurately or not, with overly-powerful corporations and increasing inequality. After the Great Depression, many liberals saw laissez-faire not just as unfair, but also as dysfunctional. In the United States, self-described "liberals" moved toward somewhat more socialist policy views. Modern liberalism (or social democracy outside the United States) reached its peak between the 1930s and 1970s. The policy mix included a great deal of statism (barriers to trade, price controls, high marginal tax rates (MTRs) and government ownership of industry), as well as greatly increased government spending, especially in government transfer programs. Then, beginning in the late 1970s, there was a sudden and dramatic shift away from one aspect of socialism—statist policies were discarded and free markets came back into vogue. However, there was no significant reduction in government spending: In most countries, the government's share of GDP has been fairly stable in recent decades. The neoliberal revolution combines the free markets of classical liberalism with the income transfers of modern liberalism. Although this somewhat oversimplifies a complex reality, it broadly describes the policy changes that have transformed the world economy since 1975. **Markets in almost every country are much freer than in 1980; the government owns a smaller share of industry**; and the top MTRs on personal and corporate income are sharply lower. The United States, starting from a less-socialist position, has been affected less than some other countries. But even in the United States there have been neoliberal reforms in four major areas: deregulation of prices and market access, sharply lower MTRs on high-income people, freer trade, and welfare reform. Many other countries saw even greater neoliberal policy reforms, as once-numerous state-owned enterprises were mostly privatized. **There is an unfortunate tendency to associate the term "neoliberal" with right-wing political views. In fact, the quite liberal social democracies of northern Europe have been among the most aggressive neoliberal reformers**. Indeed, according to the Heritage Foundation's Index of Economic Freedom**, Denmark** is the freest economy in the world in the average of the eight categories unrelated to size of government.1 **The Nordic countries2** have begun to privatize many activities that government still performs in the United States. These include passenger rail, airports, air-traffic control, highways, postal services, fire departments, water systems, and public schools, among many others. These countries do have much larger and more comprehensive income-transfer programs than the United States has, but are not otherwise particularly socialist. So why is the left so skeptical of the neoliberal revolution? And why does the right tend to overlook it, except for the obvious cases, such as the collapse of communism? Many on the left are skeptical about how much freer markets have actually achieved. Part of this skepticism reflects the slowdown in worldwide growth since 1973. Because almost all countries instituted at least some reforms, and yet growth slowed in most countries, there is a tendency to assume that the reforms failed. Others point to well-publicized fiascos in electricity and banking deregulation and assume that these represent the broader reality. On the right, many American economists focus on the failure of Reaganomics to reduce the size of government, as well as on increased regulation in areas such as health, safety, and the environment, while the so-called "economic regulations" were trimmed back. Paul Krugman, one of the most forceful advocates of the view that neoliberal reforms in the United States caused economic growth to slow, wrote: Basically, US postwar economic history falls into two parts: an era of high taxes on the rich and extensive regulation, during which living standards experienced extraordinary growth; and an era of low taxes on the rich and deregulation, during which living standards for most Americans rose fitfully at best.3 Because economic growth slowed almost everywhere after 1973, however, we need to look at relative economic performance in order to identify the effect of neoliberal policy reforms. The following data show per capita income in terms of purchasing power parity [PPP].4 All data are from the World Bank and are expressed as a ratio to U.S. per capita income: Note that four countries gained significantly on the United States, two were roughly stable (Australia and Japan) and the rest regressed. The four that gained were Chile, Britain, Hong Kong and Singapore. Of course, many poor countries also gained on the United States, but that's to be expected. As we will see, the relative performance of each of these economies is consistent with the view that neoliberal policies promote economic growth. Britain: At the time Margaret Thatcher became Prime Minister in 1979, decades of statist policies had turned Britain into the sick man of Europe. The government owned the big manufacturing firms in industries such as autos and steel. The top individual MTRs on income were 83 percent on "earned income" and an eye-popping 98 percent on income from capital. Frequent labor strikes paralyzed transportation and led to garbage piling up in the streets of London. Much of the housing stock was government-owned. Britain had

lagged other European economies for decades, growing far more slowly than most economies on the continent. Thatcher's reforms were among the most comprehensive in the world, and by the mid-1980s, Britain was growing faster than the other major European economies. By 2008, it had a higher per capita income than Germany, France, and Italy. United States: The United States was doing better than Britain in 1980, but not particularly well. We had also been growing much more slowly than Europe and Japan. Unlike Britain, we were still richer than most other developed countries, and so many people viewed this convergence as partly inevitable (the catch-up from World War II) and partly reflective of the superior economic model of the Germans and Japanese. It was widely expected that Japan and Germany would eventually surpass the United States in per capita GDP. Paul Samuelson claimed in 1973 that Soviet GDP might surpass U.S. GDP as soon as 1990.5 Obviously none of this happened, and **by the 1990s, the United States was growing faster than most major European economies**. Australia: A traditionally rich country whose commodity export model started to sputter in the 1970s, Australia began free-market reforms in the 1980s (under a left-wing government) and accelerated the reforms after the conservatives took power in 1996. After 1994, Australia's relative decline reversed. Japan: Japan is just the opposite of Australia. Its free-market export model did very well in the post-war years and didn't hit a wall until about 1990. After that, domestic growth sputtered as Japan's dysfunctional government refused to reform its statist domestic economy. Hong Kong and Singapore: These two countries top most surveys of "economic freedom" (which include size of government.) Both are in the process of becoming much richer than the United States. Some of that is due to their status as city-states. But even in larger developed economies, the population is mainly urban, and so Hong Kong's and Singapore's success is due to more than just demographics. Canada: Canada is similar to Australia, except that it was not as statist as Australia in the earlier period, and its reforms occurred in the 1990s, when Canada began shrinking the size of government as a share of GDP, after having, in 1988, adopted free trade with the United States. These reforms were successful, as its decline relative to the United States was reversed, and Canada started catching up after 1994. France and Germany: Both passed some reforms, but much less than Britain. They suffered a decline relative to both Britain and the United States. Note that the German data for the whole time period include the East, so their relative decline cannot be explained by the 1990 absorption of that less-productive region. Italy: Italy instituted a few reforms, but has a significantly more statist model than most of Western Europe. Italy fell far behind Britain. Sweden: Sweden had a bad recession in the early 1990s after having suffered decades of relative decline. It made major cuts in MTRs, privatized, and deregulated during the 1990s, and its relative performance improved after those reforms. Switzerland: Switzerland has always been regarded as one of the most capitalist countries in Western Europe, but has also been among the least aggressive countries in terms of neoliberal reforms. That pattern would predict high levels of GDP/person, but relative decline vis-à-vis the United States And that is exactly what has occurred. What about in the developing world? Even most progressives concede that India has benefited by moving away from the "License Raj," the term used to describe the morass of controls and regulations facing anyone who wanted to start or run a business. There's even less controversy about China's abandonment of Maoism after 1979. But there is controversy about the impact of neoliberalism in middle-income regions such as Latin America. Once again, here's Paul Krugman: Latin Americans are the most disillusioned. Through much of the 1990's, they bought into the "Washington consensus"—which we should note came from Clinton administration officials as well as from Wall Street economists and conservative think tanks—which said that privatization, deregulation and free trade would lead to economic takeoff. Instead, growth remained sluggish, inequality increased, and the region was struck by a series of economic crises.6 It's certainly true that neoliberal reforms have not worked miracles in Latin America. But a major part of the reason is that despite reforms such as trade liberalization, most economies in that region remain strikingly statist. Among Latin American nations, Chile has by far the best record of neoliberal reforms. It ranks tenth on the Heritage Index of Economic Freedom and is the only Latin American country, other than St. Lucia, to make the top 30. In contrast, Argentina ranks 135th. Chilean incomes were barely half those of Argentineans in 1980, but by 2008, Chile had actually become slightly richer. Argentina did some neoliberal reforms in the early 1990s and grew rapidly between 1991 and 1998. But Argentina slipped into a highly deflationary monetary policy in the late 1990s. The resulting depression led to a backlash against neoliberalism, and a more left-wing government moved Argentina back toward statism after 2002. One lesson of both Argentina after 1998 and the United States after 1929 is that even a fairly efficient free-market economy cannot easily adapt to deflationary monetary policies. Other critics of neoliberalism point to the discouraging economic situation in the former Soviet bloc. While the performance has been disappointing, the critics often overlook two important considerations. First, the entire Soviet bloc experienced a severe depression in the late 1980s and early 1990s**, even before economic reforms had begun in most areas. (The reforms began in 1992 in Russia.) Second, economic growth tended to be higher in areas that reformed most rapidly and lowest in areas that remained unreformed.** Estonia did better than Russia, which did better than the Ukraine. The one communist country that adopted no reforms (North Korea) saw an almost-complete collapse of its economy during the 1990s. The preceding examples suggest one aspect of the neoliberal revolution that is often overlooked. By the 1970s, growth was slowing sharply almost everywhere, which led Margaret Thatcher to proclaim: "There is no alternative." Britain did not grow significantly faster after the Thatcher reforms, but did overtake Western European countries that reformed their economies less aggressively. Interestingly, academics were often the last to understand what was going on. In 1981, 364 British economists signed a petition7 warning that Thatcher's polices would fail. But, by the 1990s, there was a sort of tacit understanding8 among policy-oriented economists that **when countries get into trouble, market reforms are the only real option.** Indeed, the term "economic reform" became almost synonymous with "market reforms." **Although the dispute over neoliberalism is often characterized in left/right terms, that characterization is misleading. Neoliberal reforms occurred in nearly every country during the 1980s and 1990s, regardless** of whether a left- or right-wing **government** was in office. A few years ago, I researched9 the relationship between cultural attitudes and neoliberal reforms among the developed countries. It turns out that, between 1980 and 2005, those countries with more idealistic or civic-minded cultures (as indicated by surveys on attitudes toward the common good and by indices of corruption10) tended to reform their economies much more rapidly than

countries with less civic-minded attitudes.11 Interestingly, Denmark has by far the most civic-minded culture in the group of 32 developed countries, and, as noted above, ended up with the least statist economic system in the Heritage's 2008 rankings (excluding the two size-of-government categories). Greece has the least civic-minded attitudes and ended up with the most statist economy in 2008. Far from being a right-wing plot to enrich corporations, the neoliberal revolution was liberal in the truest sense of the term: a rational response by idealistic policymakers to the increasingly obvious failure of statist economic models in the 1970s and 1980s. So far, I have focused on the move away from statism and haven't addressed the long-term viability of the welfare state. Here, the evidence is mixed. It is true that governments in rich countries tend to spend a higher share of GDP than governments of poorer countries. On the one hand, fans of the welfare state point to the relatively high living standards **in places like Sweden and Denmark,** which **have extensive income transfers and low income inequality. On the other hand, both of those countries have been aggressive neoliberal reformers, and so part of their success is despite their high tax burdens.** Figure 1. Economic Freedom Figure 1. Economic FreedomZOOM There is some evidence that the high-tax European model may eventually lose out to the low-tax/high-saving economy, the kind one observes in Singapore. The graph in Figure 1 shows the relationship between per capita GDP and the Heritage Index of Economic Freedom, including size of government. I included all sizable countries with GDPs exceeding $23,000/person (PPP), except for a few small Middle Eastern oil producers and Luxembourg (which was literally off the charts). There are two obvious outliers. Norway, the highest-income country, is much richer than other countries with similar levels of economic freedom, and New Zealand, at 80 on the economic freedom scale and only $27,260 in per capita income (US PPP dollars), is somewhat poorer than expected. Norway's position is almost certainly attributable to its vast oil wealth. Perhaps New Zealand's disappointing performance is due to its remote location and its comparative advantage in agriculture holding it back in an increasingly globalized economy in which many governments subsidize farming. But other than those two exceptions, there is a close relationship between economic freedom and income per capita. Although developed countries tend to have large governments, the very richest have smaller governments than the next tier. The lowest tier consists of relatively statist economies such as Greece. And the wealth gaps are set to widen over time. Countries with relatively small government sectors, such as the United States, Australia and Canada, are expected12 to modestly outgrow Western Europe and Japan over the next few years, even in per-capita terms. And extremely low-tax Singapore and Hong Kong are likely to dramatically outperform Western Europe and Japan. For a podcast with Scott Sumner on neoliberalism, see Sumner on Growth and Economic Policy. EconTalk, June 21, 2010. Singapore is able to combine universal health care with extremely low taxes and large budget surpluses. The government does this by requiring workers to self-insure for retirement, unemployment and non-catastrophic medical expenses. **This economic model provides much greater incentives for wealth creation a**nd may explain why Singapore leads the world in millionaires per capita (roughly 11 percent of the population and rising fast13). As Europe struggles with its enormous public-debt challenges, this sort of small government/high-saving model will look increasingly attractive.

The Free market is the best way to solve for climate change EU exchange proves

Pandit et al 13' "Gbenga Ibikunle, Andros Gregoriou, Naresh R. Pandit.University of Edinburgh. "Free market is best way to combat climate change, study suggests." ScienceDaily. ScienceDaily, 15 July 2013. www.sciencedaily.com/releases/2013/07/130715105429.htm.CC

Researchers who monitored the effectiveness of the European Climate Exchange (ECX) -- the world's biggest carbon trading platform -- found it to be as efficient as Europe's two biggest exchanges, the London Stock Exchange and the Euronext Paris. Using free market platforms like the ECX to combat climate change could provide the basis for the introduction of a mandatory emissions cap and trade scheme worldwide. The report found that the value of the trades on the ECX were higher after the market closed, a sign of growing sophistication within platforms. It means that trades were made with greater confidence based upon increasingly detailed information. Researchers said there are also signs of maturity based on increased liquidity -- the immediate availability of a party to trade with -- and price efficiency, which means all available information is incorporated into prices so they are traded in a relatively transparent manner. The ECX was created by the EU Emissions Trading Scheme (EU-ETS) in 2005 to help the European Union (EU) achieve its obligations under the Kyoto Protocol to reduce carbon emissions. **The EU set limits and issued permits for how much carbon firms could emit into the atmosphere. If companies exceed their limit, they incur regulatory penalties. To avoid this, the EU-ETS allows firms with high emissions to buy the permits of other companies on platforms such as the ECX. By creating a market, it gave firms a financial incentive to reduce their carbon emissions. Researchers said that changes are needed to ensure the EU-ETS survives Europe's economic downturn. Since the study appears to confirm the ECX's effectiveness, researchers say the EU-ETS should be allowed to self-adjust emission caps in reaction to changes in the Eurozone's fortunes and industrial production.** Gbenga Ibikunle, from the University of Edinburgh Business School, said: "While individual responsibility for combating climate change is important, much needs to be done to incentivise companies -- especially those who emit most of the world's carbon -- to cut back too. **This study shows that free market mechanisms such as the EU-ETS can be effective in doing that. Several other schemes around the world are already learning from this and adopting it as a model."**

Market based incentives solve for the environment by commodifying nature it allows for better cost benefit analysis

Plastow 10 "Robert, Neoliberalism in environmental governance: a paradoxical double Movement, Working for the Centre for Ecology and Conservation at the University of Exeter, file:///C:/Users/Conner/Downloads/Neoliberalism_in_environmental_goverance_-_Plastow_2010.pdf".CC

For proponents of neoliberalism**, the market is seen not only as the governing mechanism for allocating all goods and services but also as a way of understanding the organisation and evaluation of institutional performance, necessitating the commodification of everything,** (McCarthy and Prudham, 2004). However, Benton sees a clash between economic and ecological rationalities in that it makes good commercial sense for firms to externalise production costs, which is ecologically irrational, (Benton, 1991; Castree, 2008). The externalities created by production, pass the environmental costs onto society and the biophysical world, creating an ecological contradiction that sees neoliberal capitalism gnawing away at the resource base that supports it, (O'Connor, 1998; Pepper, 1993). Hence, it is argued, that without sufficient self-regulation by firms or states, capitalist societies will continue to create ecological crises, (Castree, 2008; O'Connor, 1998**). However, by making firms internalise externalities, in other words making the polluter pay, marketbased instruments provide an incentive for innovation of new technologies and are therefore more cost-effective than traditional regulation**, (Jordan et al, 2003). It is hoped that "through efficiency gains and better management, private companies will be able to lower prices, improve performance, and increase cost recovery, enabling systems to be upgraded and expanded", (Bakker, 2007: 437). **By encoding the natural world as a form of the economic world, cost-benefit analysis and market criteria can be applied to decision-making processes**, (Lemke, 2001), within the dominant, hegemonic discourse of neoliberal capitalism. This commodification of nature, or its neoliberalisation (Castree, 2008), requires the creation of new marketable property rights, "employing markets as allocation mechanisms, and incorporating environmental externalities through pricing", **then, as a result of the economic-rationality of neoliberalism: "environmental goods will be more efficiently allocated if treated as economic goods—thereby simultaneously addressing concerns over environmental degradation and inefficient use of resources**", (Bakker, 2007: 434).

Neolib will on become more entrenched in the immediate future the perm solves because we must engage in neoliberal logic in order to further the goals of the alternative

Plastow 10 "Robert, Neoliberalism in environmental governance: a paradoxical double Movement, Working for the Centre for Ecology and Conservation at the University of Exeter, file:///C:/Users/Conner/Downloads/Neoliberalism_in_environmental_goverance_-_Plastow_2010.pdf".CC

Through its commodification, nature under neoliberalism is also subject to a restructuring of social relations, much in the same way as classical liberalism led to the enclosing of the commons to "facilitate the development of increasingly capitalist, export oriented farming operations", (McCarthy and Prudham, 2004: 277). Lockeian perspectives on the (neo)liberalisation of nature therefore look at the way it imagines and legitimates particular social orders, (McCarthy and Prudham, 2004: 277). Just as the enclosures created struggle in which a new class structure was formed largely by access to land, so too may the commodification of nature and the private property rights that ensue, have similar effects. **This change in social relations with nature is a result of the ideological power of neoliberal capitalism which "drives the politics, economics and culture of the world system**, providing the context and direction for how humans affect and interact with non-human nature and with one another.", (Heynen and Robbins, 2005: 5). This ideology has pervaded throughout modern Western living and its power is evident, paradoxically, in its seeming elusiveness as neoliberal capitalist projects have "successfully masqueraded as a set of objective, natural, and technocratic truisms", (McCarthy and Prudham, 2004: 276). Despite the objection of many in the environmental movement over the last thirty years to the effects of the change in social relations to nature – criticism being mainly born out of a more eco-centric perspective - the neoliberalisation of nature as a means to conserve it can be seen as a turn in thinking towards a more anthropocentric environmentalism

perhaps because of the force which Noel Castree describes as **"what economic sociologists are wont to call `path dependency', in simple terms, the sheer inertia of existing arrangements, [which] means that, in many situations, specific modalities of neoliberalism will not only cling on but, possibly, become further entrenched in the immediate future",** (Castree, 2009: 1788-1789). **Ultimately, neoliberalism is the most powerful ideological and political project in global governance today**, (McCarthy and Prudham, 2004). **It is therefore important to engage with it as it permeates different scales and dimensions, often setting the conditions for discussion itself as "contemporary politics revolve around axes the very essences of which have been neoliberalized...[neoliberal rule systems] have the capacity to constrain, condition, and constitute political change and institutional reform in far-reaching and multifaceted ways**" (Peck and Tickell, 2002: 400-401).

Neoliberalism is the best system for solving for the pollution and carbon levels in the developing world it creates the most innovative and sustainable technologies

Plastow 10 "Robert, Neoliberalism in environmental governance: a paradoxical double Movement, Working for the Centre for Ecology and Conservation at the University of Exeter, file:///C:/Users/Conner/Downloads/Neoliberalism_in_environmental_goverance_-_Plastow_2010.pdf".CC

Government is also seen to benefit and make political gains by using such new environmental policy instruments, as they cut public expenditure for environmental management and open up trade and investment, (Jordan et al, 2003), which encourages the eternal quest for the political holy grail of economic growth. This is also politically attractive to Third Way governments of the rollout period as the state does not have to interfere in all aspects of society unless justifiable and less politically contentious, such as in cases of taxing environmental 'bads' to provide social 'goods', (Jordan et al, 2003: 14**). In addition, voluntary agreements encourage industry to adopt a more proactive attitude to environmental protection, spurred on by cost efficiency and the potentially quicker achievement of policy goals**, (Jordan et al, 2003: 13**). Such agreements are used to reduce the expense and political difficulty of domestic emission reductions, (Bumpus and Liverman, 2008). As a result offsetting purportedly leads to an expansion of the market that provides cheaper alternatives in the developing world where faster and larger reductions in carbon dioxide levels in the atmosphere are possible as well as the potential sustainable development implications and technology transfer of projects to poor communities** (Bumpus and Liverman, 2008: 148). However, the political economy of offsetting produces inequality across geographies and raises ethical issues of responsibility around the producer company or country and their behaviour in the first place, (Bumpus and Liverman, 2008: 147-148). Not just in offsetting but in criticism of neoliberalism as a whole, environmentalists note the importance social justice has to impede the neoliberal conquest of nature, which is based on rising tides lifting all boats and the indefinite growth of the economy, (McCarthy and Prudham, 2004). This is because neoliberalisation necessitates an act of dispossession with negative distributive consequences, (Bakker, 2007: 437), often favouring ruling elites, (Wolford, 2005). This happens locally and internationally, as neoliberal reform has shown in, for example, Latin America, where there has been an internationalisation as part of the process of engaging in global economics. This is rooted in the formation of trans-national class alliances among elites whose shared interest is the maximization of international investment, regardless of where they come from, (Glassman, 1999).

Deregulation of the market and the decentralization of government increases democracy and opens authoritarian regimes to more governance and creates different forms of how and where regulation comes

Plastow 10 "Robert, Neoliberalism in environmental governance: a paradoxical double Movement, Working for the Centre for Ecology and Conservation at the University of Exeter, file:///C:/Users/Conner/Downloads/Neoliberalism_in_environmental_goverance_-_Plastow_2010.pdf".CC

Extending from this perspective, **neoliberalism offers up the market as an alternative to the state's regulatory function. This view denies** Karl **Polanyi's contention that markets are not self-regulating,** (1944), and is of serious concern in light of the recent banking crisis, which has seen massive state intervention supportive of the Keynesian welfarism that neoliberalism has spent the last thirty years dismantling. Castree argues that the main threat to neoliberalism is the potential inadequate management of the economic-environmental relationship when left to firms and civil society groups, (Castree, 2008: 149). Furthermore, **although the deregulation proposed in the neoliberal model strips away state regulation to provide a freer market, market-oriented approaches are still subject to regulation albeit in different terms as the state does not withdraw but changes its interaction with citizens and corporations,** (Bakker, 2003: Mansfield, 2007). The state then takes on a role within which it steps in now and then to help facilitate the market and provide an international, legalistic administrative role by negotiating free-trade agreements and so forth. Therefore, fr**om a legal point of view markets cannot exist without the external intervention of the state, (**Brenner and Theodore, 2002a; Peck and Tickell, 2002). This arrangement is aptly termed reregulation as opposed to the purported deregulation, as markets still operate subject to rules (Mansfield, 2007). In practice, however, **the ideal state behaviour is not as clear cut as the neoliberal philosophy would suggest; the state still retains responsibility to mediate the relationship between the economy, civil society and the natural environment**, (Castree, 2008**). Neoliberalism instead emphasises decentralisation of government, which in many cases can improve governance and promote democratisation in countries where such notions have been weak; at the same time it also opens up "economically competitive subnational spaces ripe for transnational investment"**, (Perrault, 2005). In terms of development it is understandable why such an approach is appealing for encouraging economic growth, especially in developing countries, and the resulting favour the model carries in capitalist democracies. However, as has been shown in the Bolivian example it is vulnerable to the double movement of greater localisation and resulting potential for organising resistance mentioned above. This decentralisation has been referred to as the 'hollowing out' of the nation-state, (Jessop, 1994), and has led to the development of notions of 'governance' rather than 'government', (Jordan, 2003). This helps to fuel the shift we see today in policy making, wherein market-based instruments and other neoliberal policy tools are arguably new forms of biopower and expressions of Foucault's 'governmentality', showing the reconfiguration of power in the neoliberal era, wherein hegemony is secured by regulating ecological relations in a way that reinforces the stability of capitalist relations of power and accumulation, (Foucault, XXXX; McCarthy and Prudham, 2004; Robertson, 2004). **Such control has worked well in governing people so as an extension, governing the environment and human relations towards it is arguably just as powerful,** limited only by the potential friction of conserving and profiting at the same time as well as the contradiction of creating and destroying nature in order to perpetuate the current conditions of production sustainably**. Where nature is a commodity under capitalism that can be banked and offset, ecological restoration can be a euphemism for 'constructed nature', (Robertson, 2004; 2006) and fundamentally change human-nature relations forever, as biodiversity cannot be offset – once a species is gone it is gone forever.**

Neoliberalism is resilient the commodification of nature is a great example neolib will necessitate a cost effect solution and not a rush to find the most immediate and radical solutions
Plastow 10 "Robert, Neoliberalism in environmental governance: a paradoxical double Movement, Working for the Centre for Ecology and Conservation at the University of Exeter, file:///C:/Users/Conner/Downloads/Neoliberalism_in_environmental_goverance_-_Plastow_2010.pdf".CC

At the heart of the debate around neoliberalism in environmental governance is the balance between the state and the market and the rise of the market in the last few decades shows just how powerful it has become through the processes of deregulation and globalisation. This has happened not without its inequalities as well as wealth generation. **Neoliberal capitalism is a system of booms and busts and despite its creation of crises, it has an astounding capacity to turn around and profit from them, (Klein, XXXX). With regards to the environmental crisis and climate change, this is still to be seen but is argued, as above, that the commodification of nature will again be an example of neoliberalism's dynamic capacity to manage crisis.** It is not necessarily a case of market or state, but a nuanced balance between the two – societies are more than their political leaders and their markets and the environment plays an integral role in everyone's lives, as well as making all life possible at

all. It therefore must be valued above its destruction and attributing monetary value can stop it from being taken for granted. However, there are limits to scientific rationality and measurement, (Robertson, 2004; 2006), and nature has value beyond its potential use but intrinsic value is hard to measure, if not impossible outside of the close approximations to beauty within the arts. Due to the overwhelming threat of potential loss of nature posed by business-as-usual development, eco-centric views have paradoxically disappeared, subsumed by the vast ideological power tied to control, identity and culture of the Western capitalist system that has dominated global politics and whose discourse is anthropocentric and calculable in monetary terms. **This anthropocentric translation of nature is purportedly more efficient, encouraging of innovation and more costeffective than traditional regulation, (Jordan et al, 2003). As decision-making within all other areas of governance are also heavily weighted by economics,** commodifying nature allows for levelpegging within that deliberation and has already proved valuable in the Stern Review with regards to the climate change debate. Pricing also opens up opportunities for new trade and investment. **Therefore, going green will succeed - as with all things in the market** (unless given vast bail-outs from the public) **- if it is profitable.** Yet one must ask if turning crisis into profit is enough, as perhaps there are crises that are best averted, such as tipping points that cannot be undone regardless of any monetary value potential produced by them.

The perm solves the harms of neoliberalism, neolib is the only system in which the entire world can cooperate, while it is nice to imagine an ideal world and solution it is not the most reasonable nor is it feasible on its own

Schecht 14' "Spencer, "Working With Neoliberalism to Solve Climate Change", Spencer is a climate policy and communication practitioner with broad international experience. Building on his studies in the biological experiences, his interests branched into climate and energy studies Spencer is completing his Masters degree at American University, School of International Service, http://sisgep.org/2014/11/18/spencer-schecht-working-with-neoliberalism-to-solve-climate-change/".CC

"Whether from an anthropocentric or a biocentric perspective, **more adequate environmental values need to be formulated and linked to areas of public policy** (Tucker and Grim, 2009)." Consulting the literature surrounding environment and development, a clear pattern of environmental destruction and climate change vis-à-vis neoliberal capitalism arises (Daly, 1998; Durham, 1995; Hansen, 2013; Hopwood, 2005; McAfee, 2012). Modern civilization has not found a way to decouple development from pollution, deforestation, and carbon emissions (Ramesh, 2014). Concurrent to these development challenges, **we have not found a 21st Century development model that is not, at a fundamental level, neoliberal. Correlation can be drawn from neoliberalism to environmental damage and climate change. The first choice to reverse this trend would be to completely transform**, as Hopwood explains (2006, p. 49), "Given the need for fundamental change, a deep connection between human life and the environment and a common linkage of power structures that exploit both people and planet, we would argue that transformation is essential**." Indeed, to address climate change with the haste and industriousness necessary to avoid global ecosystem collapse, rapid transformation is ideal.** Rapid redistribution of responsibilities internationally as well as within sovereign states can align industry and science to output with maximum efficiency the knowledge and hardware required to rapidly decarbonize the world economy by 2050 (Kammen, 2013). An all hands on deck approach that throws away neoclassical economics in favor of global environmental necessities on the basis of realistic industrial potential as well as global and intergenerational equity is ideal**. Realistically, however, the structures that perpetuate neoliberal principles are not going to be radically transformed within the time frame needed to address climate change with sufficient ambition. Neoliberalism is baked in, so to speak, to the global institutions responsible for creating the standards of sustainable development. The global governance structures now developing modes of incentivizing action and creating accountability are neoliberal at heart**. Castree explains, "The first United Nations Conference on Environment and Development (informally, the Earth Summit), held in 1992, was a key event… because the now famous Framework Convention on Climate Change and the Convention on Biological Diversity both embodied neoliberal principles— and they did so at a global level. (2010, p. 15**)." In order to act on the timescales necessary to adequately respond to climate change, we as a global society would best benefit from leveraging the socio-economic inertia of neoliberalism rather than trying to slow it down. Already, international carbon markets are staged to play a critical role in the conservation side of the climate change equation**. Despite their shortcomings as poverty alleviation mechanisms, efforts to 'sell nature to save it' are succeeding in preventing deforestation (McAfee,

2012). Sustainable development in the 21st Century will be defined by humanity's response to climate change. There is much change guaranteed within the climate system, and much more if actions do not change soon. All human and natural systems will come under increasing threat as the manifestations of climate change create a new definition of normal on planet Earth. Humanity is entering uncharted territory with the amount of climate change already guaranteed by the current alterations to the composition of the atmosphere. Ceasing further jeopardy to modern society by drastically cutting down greenhouse gas emissions from burning fossil fuels is of the utmost importance to avoid the worst impacts of climate change. **However, the neoliberal principles that created this dilemma will not be going anywhere anytime soon. Yet even considering these misgivings, the benefits of globalized neoliberalism can be leveraged to remedy environmental destruction and climate change. The modern advancements in communication, representation, and elevation of our global consciousness created within the neoliberal capitalist system have fostered a 21st Century form of cooperation.** Never before has the human species been so interdependent**. Never before has their existed so much potential for solidarity to combat the environmental challenges we face as a global civilization**. We live in a transnational age with transnational problems. The globalization of neoliberalism may be the disease but it must also be the remedy. **To address our environmental problems and our challenges in international development with appropriate technology and a level headed progressiveness, we need to work within existing systems**, the mixed bag that they are, to forge a path of cohesive global cooperation into this daunting new century.

War

Neoliberalism has prevented war it creates alliances and balances power through economic incentives

Mooney 14' "Loren, writes for the Stanford business school and is writing on Matthew O. Jackson is the William D. Eberle Professor of Economics at Stanford, and earned his PhD in economics from Stanford GSB in 1988, "Matthew O Jackson can trade prevent war", https://www.gsb.stanford.edu/insights/matthew-o-jackson-can-trade-prevent-war".CC

How can humans stop war? Obviously there's no simple answer, but a new network model analysis of international alliances suggests that trade may be at least part of the answer. The model, developed by Stanford economist Matthew O. Jackson and economics Ph.D. candidate Stephen Nei, suggests that **military alliances alone aren't enough to stop nations from attacking one other, and also that the addition of multilateral economic trade creates a more stable, peaceful world.** While there is considerable existing research on the effects of trade and war, much of it has looked at bilateral relationships. **This model focuses on multilateral interactions and considers various incentives for countries to attack, form alliances with, and trade with one another**. In an attempt to understand what's necessary to achieve a stable network with no incentive for war, Jackson and Nei first explored an alliance scenario based solely on military defense considerations, excluding trade. "The fundamental difficulty we find is that alliances are costly to maintain if there's no economic incentive," says Jackson. So networks remain relatively sparse, a condition in which even a few shifting allegiances leaves some countries vulnerable to attack. "**Stability is not just a little bit elusive; it's very elusive." Economic trade, however, makes a significant difference. "Once you bring in trade, you see network structures densify,"** he says. **Nations form a web of trading alliances, which creates financial incentive not only to keep peace with trading partners, but also to protect them from being attacked so as not to disrupt trade.** "In the context of the alliances we have analyzed, trade motives are essential to avoiding wars and sustaining stable networks," the authors wrote in their paper, Networks of Military Alliances, Wars, and International Trade. Euro statue **The Eurozone has promoted peace and trade** | Associated Press Photo by Bernd Kammerer Their findings coincide with two major global trends since World War II: From 1950 to 2000, the incidence of interstate war has decreased nearly tenfold compared with the period from 1850 to 1949. At the same time, since 1950 international trade networks have increased nearly fourfold, becoming significantly more dense. **"In the period before World War II, it was hard to find a stable set of alliances," says Jackson. The probability of a lasting alliance was about 60%.** "You have almost a coin-flip chance that the alliance won't still be there in five years," he says. In Europe in the 1870s, for example, German chancellor Otto von Bismarck sought peace with "balance of power" diplomacy, which crumbled leading up to World War I. "**Then in the past 50 years or so, there's been a surprising global stability." The impact of economic interdependence is especially apparent in Europe,** Jackson says, where the Eurozone has promoted not only peace and increased trade among nations, but also labor mobility. Very costly wars still occur, of course, but Jackson notes that the most war-torn places in recent history have tended to be those with fewer global trade alliances. For example, the Second Congo War from 1998 to 2003 and beyond, which killed more than four million people and is the deadliest war since World War II, involved eight African nations with relatively few trade ties. "Then look at the Kuwait situation," says Jackson, referring to U.S. intervention in the first Gulf War to protect oil supplies. "Economic interest drives a lot of what goes on in terms of where nations are willing to exercise military strength." There are other real-world factors that have no doubt influenced war and trade trends since World War II, among them the proliferation of nuclear weapons — "Changing military technology can help maintain stable arrangements," says Jackson — the Cold War, an increase in worldwide wealth levels, and the introduction of container shipping in the 1960s, which has helped facilitate low-cost, long-range trade. Still, Jackson and Nei's theoretical model suggests that trade alliances play a critical role. **And in fact economic allies may be the most worth striving for in developing areas. "Maybe wars like the Second Congo War won't be occurring in the future if there's more trade with African nations,"** says Jackson. **"Economic interests can really help us have a more peaceful world than we already have."**

Free market capitalism and trade can prevent war better than every other system comparatively and with a lesser cost in lives and material

Nyquist 13' "JR, "The free market's path to peace", J.R. Nyquist, a WorldNetDaily contributing editor and a renowned expert in geopolitics and international relations, http://www.financialsense.com/contributors/jr-nyquist/free-market-path-peace".CC

It is the season of "Peace on earth, good will to men," though wars continue to occur and peace is far from established. While mankind should prefer peace we have nonetheless chosen war again and again. Excepting the Pax Romana from 27 BC to 180 AD, ancient history presents us with one war after another. If we read the Roman historian Tacitus, even the Pax Romana appears to have been a series of military operations. All the tribes of the earth make war, or prepare for war. It is therefore of special interest when a scholar shows that the free market may have already reduced the number of wars that otherwise would have been fought. Professor Patrick J. McDonald has offered exactly such a thesis in a book titled The Invisible Hand of Peace: Capitalism, the War Machine, and International Relations Theory. **Under the rule of law, with private property and "competitive market structures," modernity has arguably found a greater incentive to peace than to war**. As McDonald explains in his book, "states that possess liberal political and economic institutions do not go to war with each other…." What does liberalism signify in this context? According to Austrian economist Ludwig von Mises, "**The essential teaching of liberalism is that social cooperation and the division of labor can be achieved only in a system of private ownership of the means of production, i.e., within a market society, or capitalism**." Mises and McDonald would both argue that economic freedom, **and the institutions which make this freedom possible, tend to promote peace.** McDonald offers a caveat, however. He warns that democracy is not the guarantor of peace some have asserted it to be. The free market and free trade are much stronger guarantors of peace. In the case of China today, McDonald argues that an autocratic Chinese regime has adopted a policy of peace for the sake of economic development. "Because conflict or even the threat of it tends to disrupt normal trading patterns, potentially large economic costs will deter dependent states from using military force to solve their political conflicts." McDonald also noted: **"As commerce grows, the incentives for plunder or conquest decrease simply because it is a more costly means of generating economic growth." Not only does free market cooperation bring wealth to all the parties involved, it displaces national loyalties and state rivalries.** Of course, McDonald is well aware that free trade and free markets can be overridden by democratic ideological imperatives. Simply put, if economic liberalism signifies the disutility of war, democratic liberalism does no such thing. According to McDonald, "Even democratic leaders can exploit domestic institutional instability and public fears of insecurity to construct broad swaths of public support for war." **It is not the ballot box that assures peace**, says McDonald. **It is private property and free trade which binds nations and peoples to the cause of peace, despite cultural and political differences.** The controversial German revisionist, Udo Walendy, summed up democracy's readiness to start a global war when he wrote, "On September 3, 1939, England and France declared war on Germany. In so doing they transformed a limited territorial dispute between Poland and Germany into a world war over the city of Danzig, a matter that could easily have been resolved through negotiation." Patrick Buchanan offered a similar judgment in his book Churchill, Hitler, and the Unnecessary War: How Britain Lost Its Empire and the West Lost the World. Arguably, in both world wars the democracies fought when they didn't have to. About this idea George Kennan wrote: "When you total up the score of two [world] wars, in terms of their ostensible objective, you find that if there has been any gain at all, it is pretty hard to discern**." Imagine if the politicians of 1914 and 1939 had consulted market priorities instead of ideology? What argument, in the end, is more likely to transform tyranny into freedom? Starting a world war to advance the cause of democracy is not practical** as the Allies learned when Josef Stalin got hold of Eastern Europe in 1945 (hardly a democratic outcome). Hitler was gone, it is true, but he was replaced with somebody equally bad – or worse. Imagine if the win-win formula of the free market had displaced the "everyone loses" syndrome of world war. Sixty million lives might have been saved and material progress might have advanced at a faster pace. Who on earth would've been worse off in this case? **Since the bloodiest dictatorship in history, located in Communist China, has come to grasp the advantages of respecting private property, is not the victory of the free market inevitable** in the teeth of the most recalcitrant despot? McDonald seems to suggest something of the kind. The truth of the proposition is not proven, of course. Men are not the "rational actors" of political economy. They do not live "by bread alone." And yet, having an economic incentive for embracing peace on earth must count for something.

Neoliberalism is the most important thing in nation building it represses conflict by taking away the benefits of conflict and can create cooperation across different forms of government in a way that democracy cannot

Dowd 14' "Alan, "Capitalizing on capitalist peace", https://www.aei.org/publication/capitalizing-on-the-capitalist-peace/, Alan W. Dowd is an award-winning writer with experience in opinion journalism, public-policy research and communications consultancy. He is nationally recognized for his commentaries on issues ranging from faith to foreign policy.".CC

The next time the United States is compelled to try to rescue and rehabilitate a broken nation, **Washington needs to pay as much attention to building free markets as to holding free elections**. If Americans have learned anything from their well-intentioned, costly efforts in the unforgiving lands of Iraq and Afghanistan**, it's that democratic elections do not ensure freedom. Nor do democratic elections necessarily promote stability,** as the post-Arab Spring chaos reminds us. But a new Fraser Institute study helps quantify how building up free-market institutions and promoting economic freedom can strengthen societies by increasing social trust and reducing the risk of war. Starting from the premise that "**adequate finance is a key ingredient for organizing violence against a state,"** Indra de Soysa and Krishna Chaitanya Vadlamannati argue that **"economic repression and market distortions create conditions that make armed conflict feasible.**" These factors "supply the means, motive and opportunity for groups to challenge states because economic distortions spawn underground economies that form the organizational bases of insurgency." **The expansion of free markets and free economic exchange, on the other hand, "marginalizes violence because it binds people meaningfully in a way suited to addressing the collective dilemmas stemming from violence." "With economic freedom, people gain when they produce goods and services others desire in mutually beneficial exchange**," the report concludes. "**People from other groups become customers, employees, employers, suppliers." Together, they lay the building blocks for social trust and become essential ingredients in economic expansion — rather than enemies in a zero-sum struggle over scarce resources**. In other words, economic freedom raises the costs of violence — and helps remove the incentives and benefits of civil disorder. Economic freedom raises the costs of violence — and helps remove the incentives and benefits of civil disorder. Of course, others have pointed out the limitations of democracy in promoting stability and prosperity — and even the dangers of prematurely opening up a society to democratic governance. For instance, Robert Kaplan observed in his 2000 book The Coming Anarchy that "Democracies do not always make societies more civil — but they do always mercilessly expose the health of the societies in which they operate … If a society is not in reasonable health, democracy can be not only risky but disastrous." He wrote those words two years before America began its nation-building project in Afghanistan, four years before Iraq's postwar war, and more than a decade before Egypt descended into its spiral of re-revolution. "Democracy," Kaplan noted, "emerges only as a capstone to other social and economic achievements." These include the rule of law, stable institutions, economic freedom, and a civil society that protects minority rights as much as it respects majority rule. There is also an application here for international relations. Just as the spread of economic freedom creates incentives for cooperation within nation-states and disincentives for conflict between sub-state groups, it lessens the likelihood of war between nation-states by raising the costs of war. As political scientist Erik Gartzke noted in 2005, **"For six decades, developed nations have not fought each other." This "capitalist peace" is historically unusual given that "powerful nations are the most war prone."** However, nations that embrace economic freedom — **even those with different approaches to governance, politics, and religion — are learning to "capitalize on the capitalist peace … through expanding markets, development, and a common sense of international purpose." Thus, the likelihood of conflict between the United States and China would seem to be lower than it was between the United States and the Soviet Union.** After all, China needs the U.S. market, and the United States needs China's cash — and wants China's goods. Beijing owns $1.3 trillion in U.S. government debt. Annual U.S.-China trade is $562 billion. There was no such connective tissue between the United States and the USSR. Of course, there is no is failsafe inoculation against conflict. Nation-states, like individuals, are unpredictable and sometimes irrational. Miscalculations and misunderstandings can touch off unexpected, unintended conflict. Even strong commercial ties cannot always overcome this — something we should keep in mind 100 years after the cascade of calamities that triggered World War I. It pays to recall that European nations enjoyed deep commercial connections before the war. Britain accounted for more than 14 percent of Germany's exports in 1913 — then came the summer of 1914. "The United States and China," the Brookings Institution's Robert Kagan cautions, "are no more dependent on each other's economies today than were Great Britain and Germany before World War I." Beijing owns $1.3 trillion in U.S. government debt. Even so, the vast economic and commercial ties between China and the United States do help to mitigate the possibility of war. **If such economic linkages are something less than an inoculation against conflict, perhaps we can think of them — along with transparent (rather than**

secret) treaty commitments and credible expressions of deterrence — as preventive medicine. The solution to the problems posed by the rise of strong states like China and the instability of failing states like Iraq, Afghanistan, and Pakistan is not to shrink U.S. foreign policy back to some 19th-century version of itself, or to have "less soldiers stationed overseas" (from Germany, Japan, and Jordan to Korea, Kuwait, and Kosovo, the presence of U.S. troops solves far more problems than it creates) or "to focus on nation-building here at home" (a phrase devoid of much meaning, aside from trying to repackage isolationism). Americans may like the sound of those applause lines, but they don't like the consequences. Perhaps that's because we feel compelled to do more than simply defend narrow self-interest. This is not a new phenomenon. As Kagan observes in Dangerous Nation, by the end of the 19th century, "The fact that many [Americans] believed they could do something to aid the Cubans helped convince them they should do something, that intervention was the only honorable course." **At least part of the solution to these new/old problems is to spend more time and energy nurturing free-market institutions that encourage commerce between nations** and planting free-market institutions that address the root cause of conflict within nations. So, the next time the United States is compelled to try to rescue and rehabilitate a broken nation — and it seems likely there will be a next time — Washington needs to pay as much attention to building free markets as to holding free elections.

It is proven that free trade decreases war and protectionism, it demystifies and humanizes potential adversaries the last 40 years is indicative

Adorney 13' "Julian, Julian Adorney is Director of Marketing at Peacekeeper, a free app that offers an alternative to 911. He's also an economic historian, focusing on Austrian economics. He has written for the Ludwig von Mises Institute, Townhall, and The Hill, "Want peace promote free trade".CC

Frédéric Bastiat famously claimed that **"if goods don't cross borders, soldiers will."** Bastiat argued that **free trade between countries could reduce international conflict because trade forges connections between nations and gives each country an incentive to avoid war with its trading partners**. If every nation were an economic island, the lack of positive interaction created by trade could leave more room for conflict. Two hundred years after Bastiat, libertarians take this idea as gospel. Unfortunately, not everyone does. But as recent research shows, the historical evidence confirms Bastiat's famous claim. To Trade or to Raid In "Peace through Trade or Free Trade?" professor Patrick J. McDonald, from the University of Texas at Austin, **empirically tested whether greater levels of protectionism in a country** (tariffs, quotas, etc.) would increase the probability of international conflict in that nation. He used a tool called dyads to analyze every country's international relations from 1960 until 2000. A dyad is the interaction between one country and another country: German and French relations would be one dyad, German and Russian relations would be a second, French and Australian relations would be a third. He further broke this down into dyad-years; the relations between Germany and France in 1965 would be one dyad-year, the relations between France and Australia in 1973 would be a second, and so on. Using these dyad-years, McDonald **analyzed the behavior of every country in the world for the past 40 years.** His **analysis showed a negative correlation between free trade and conflict: The more freely a country trades, the fewer wars it engages in. Countries that engage in free trade are less likely to invade and less likely to be invaded.** The Causal Arrow Of course, this finding might be a matter of confusing correlation for causation. Maybe countries engaging in free trade fight less often for some other reason, like the fact that they tend also to be more democratic. Democratic countries make war less often than empires do. But McDonald controls for these variables. **Controlling for a state's political structure is important, because democracies and republics tend to fight less than authoritarian regimes.** McDonald also controlled for a country's economic growth, because countries in a recession are more likely to go to war than those in a boom, often in order to distract their people from their economic woes. McDonald even controlled for factors like geographic proximity: It's easier for Germany and France to fight each other than it is for the United States and China, because troops in the former group only have to cross a shared border. The takeaway from McDonald's analysis is that **protectionism can actually lead to conflict.** McDonald found that **a country in the bottom 10 percent for protectionism** (meaning it is less protectionist than 90 percent of other countries) **is 70 percent less likely to engage in a new conflict** (either as invader or as target) than one in the top 10 percent for protectionism. Protectionism and War Why does protectionism lead to conflict, and why does free trade help to prevent it? The answers, though well-known to classical liberals, are worth mentioning. **First, trade creates international goodwill.** If Chinese and American businessmen trade on a regular basis, both sides benefit. And mutual benefit disposes people to look for the good in each other. **Exchange of goods also promotes an exchange of cultures**. **For decades, Americans saw China as a mysterious country with strange, even hostile values. But in the 21st century**, **trade between our nations has increased markedly, and both countries know each other a little better now**. iPod-wielding

Chinese teenagers are like American teenagers, for example. They're not terribly mysterious. Likewise, the Chinese understand democracy and American consumerism more than they once did. The countries may not find overlap in all of each other's values, but trade has helped us to at least understand each other. **Trade helps to humanize the people that you trade with. And it's tougher to want to go to war with your human trading partners than with a country you see only as lines on a map.** Second, trade gives nations an economic incentive to avoid war. If Nation X sells its best steel to Nation Y, and its businessmen reap plenty of profits in exchange, then businessmen on both sides are going to oppose war. This was actually the case with Germany and France right before World War I. Germany sold steel to France, and German businessmen were firmly opposed to war. They only grudgingly came to support it when German ministers told them that the war would only last a few short months. German steel had a strong incentive to oppose war, and if the situation had progressed a little differently—or if the German government had been a little more realistic about the timeline of the war— that incentive might have kept Germany out of World War I**. Third, protectionism promotes hostility. This is why free trade, not just aggregate trade** (which could be accompanied by high tariffs and quotas), **leads to peace**. **If the United States imposes a tariff on Japanese automobile**s, that tariff hurts Japanese businesses. **It creates hostility in Japan toward the United States. Japan might even retaliate with a tariff** on U.S. steel, hurting U.S. steel makers and angering our government, which would retaliate with another tariff. **Both countries now have an excuse to leverage nationalist feelings to gain support at home; that makes outright war with the other country an easier sell, should it come to that**. In socioeconomic academic circles, this is called the Richardson process of reciprocal and increasing hostilities; the United States harms Japan, which retaliates, causing the United States to retaliate again. History shows that the Richardson process can easily be applied to protectionism. For instance, in the 1930s, industrialized nations raised tariffs and trade barriers; countries eschewed multilateralism and turned inward. These decisions led to rising hostilities, which helped set World War II in motion. These factors help explain why free trade leads to peace, and protectionism leads to more conflict. Free Trade and Peace One final note: McDonald's analysis shows that taking a country from the top 10 percent for protectionism to the bottom 10 percent will reduce the probability of future conflict by 70 percent. He performed the same analysis for the democracy of a country and showed that taking a country from the top 10 percent (very democratic) to the bottom 10 percent (not democratic) would only reduce conflict by 30 percent. Democracy is a well-documented deterrent: The more democratic a country becomes, the less likely it is to resort to international conflict. **But reducing protectionism**, according to McDonald**, is more than twice as effective at reducing conflict than becoming more democratic**. Here in the United States, we talk a lot about spreading democracy. We invaded Iraq partly to "spread democracy." A New York Times op-ed by Professor Dov Ronen of Harvard University claimed that "the United States has been waging an ideological campaign to spread democracy around the world" since 1989. One of the justifications for our international crusade is to make the world a safer place. **Perhaps we should spend a little more time spreading free trade instead. That might really lead to a more peaceful world.**

Neoliberalism necessitates peace it lessens the cost of empire and it solves for international agreements one country cannot stifle emerging powers inevitably but can incorporate them into a larger system ensuring peace

Gady 10' "Franz Stefan, " Should the United States continue as a champion of free trade", Franz-Stefan Gady is a senior fellow at the EastWest Institute, where he was a program associate and founding member of the Worldwide Cybersecurity Initiative, http://www.unc.edu/depts/diplomat/item/2010/0912/comm/gady_freetrade.html".CC

Ever since the end of the Second World War and the introduction of the Bretton Woods system, the United States has been seen as a champion of free trade. In part due to its industrial supremacy and the onset of the Cold War, the U.S. government was one of the most consistent proponents of reduced tariff barriers and free trade in the last sixty years and helped to establish the General Agreement on Tariffs and Trade (GATT) and later, the World Trade Organization. Today, with its economic power in relative decline and neo-mercantilist powers such as China on the rise, the question arises whether the US will remain a champion of free trade. This paper will argue that **the United States should continue to be a champion of free trade for two reasons. First, free trade promotes peace and hence, makes it easier for the single hegemonic power to manage the international system. It lessens the cost of the "empire," so to speak. Second, the argument that the United States will deviate from free trade due its relative decline in relation to neo-mercantilist powers such as China is unsubstantiated. The truth is that a hegemon1, despite the arguments of the hegemonic stability theory, can do very little to influence states' behavior in the international system. Hegemony is based**

on tacit consensus among the members of the international system. Hence, the professed inability of the hegemon to deal with a new emerging power should not be seen as a decline but merely as a natural exposition of the limitations of any state trying to influence the domestic policy of another state in the international arena. The first part of the paper will attempt to show that free trade indeed promotes peace. The second part will take the historical case study of the British Empire and how it tried unsuccessfully to influence continental economic policy with little consequence for the overall promotion of free trade in the later part of the 19th century. CREATOR: gd-jpeg v1.0 (using IJG JPEG v62), quality = 100 Peace through Free Trade The old liberal idea that trade promotes peace is based on four assumptions or models. The first has been labeled the "opportunity cost" or "deterrence model**". Armed conflict or even the threat of confrontation tends to disrupt normal trade pattern and out of that the resulting large economic costs will deter dependent states** from using military force to solve political conflict. A case in point would be the large Chinese trade surplus that the Chinese government uses to invest in U.S. treasury notes. Economists have referred to the growing Chinese dollar reserve as a "balance of terror" since both economies would substantially be hurt if China decided to sell U.S. treasury notes as a retaliatory measure, for such instances as U.S. intervention in the Strait of Taiwan on behalf of the island, resulting in a devaluation of the U.S. currency. **The second assumption is an "efficiency argument" in that it compares the relative costs of acquiring productive resources. As trade increases it will become progressively less productive to acquire resources through plunder or conquest in order to promote economic growth**. A good illustration for this is that the Soviet Union delivered more raw materials and wheat to Germany in one year prior to 1941 than Germany was able to extrapolate during four years of its occupation of the western parts of the Soviet Union from 1941 to 1944. The third assumption is a sociological hypothesis and focuses on how trade helps to increase contact and communication across societies. **Through those contacts national loyalties and competitive behavior are displaced and hence lead to a more stable international environment.** Italy during the Renaissance provides a good example for this hypothesis. Wars were not uncommon during this period of time, but they were relatively bloodless and short mostly due to the economic interests of the parties involved such as the Medici family of Florence. Fourth and lastly, international commerce, international trade and the resulting human interaction can provide important signaling mechanism that can help a state to achieve a negotiated compromise short of war. Yet, is trade alone sufficient to explain state behavior? The simple answer is no. A mercantilist trading system, such as that of 18th century Europe, did actually promote conflict. Most of the mercantilist policies were the outgrowth of the relationship between the governments of the nation-states and their mercantile classes. In exchange for paying levies and taxes to support the armies of the nation-states, the mercantile classes induced governments to enact policies that would protect their business interests against foreign competition, which often meant through either the force of arms or trade barriers, i.e. tariffs. Both conflict and tariffs have the effect of reducing foreign competition. CREATOR: gd-jpeg v1.0 (using IJG JPEG v62), quality = 100 Also, trade based on David Ricardo's idea of comparative advantage leads to a redistribution of income within a domestic society as shown by the Heckscher-Ohlin model. Hence, by definition it can create opposition to further transnational economic integration. It follows as a corollary that groups that see their income decline form international trade namely import-competing sectors (the mercantile class) are unlikely to lobby the state for a pacific foreign policy that promotes expanding transnational ties. Indeed, **conflict may create income gains for these sectors by enlarging a protected domestic market through conquest and the integration of another economy** as was the case for the French manufacturing industry during the Napoleonic wars. **This is precisely the reason why free trade rather than any other form of trade promotes stability and peace in the international system. Free trade removes an important foundation of domestic privilege- protective barriers to trade- that enhances the domestic power of societal groups** likely to support war and thus, is the reason why the United States will continue to support trade liberalization. The First World War is often cited as the main example to counter the free trade peace hypothesis. Scholars such as Kenneth Waltz and John Mearsheimer have characterized the global economy prior as an open trading system fostering the independence among states. In fact, starting in 1879, the great European powers became increasingly more protective. Next to wide-ranging tariffs, both France and Germany possessed capital controls that allowed them to funnel domestic savings toward their political allies and away from potential enemies. CREATOR: gd-jpeg v1.0 (using IJG JPEG v62), quality = 100 Industries that rely on protection to remain profitable are in many senses "captured" by the state and more likely to support its entire range of domestic and foreign policies. For example, the French government used its influence on the private sector to build coalitions in support of a more aggressive foreign policy before World War I. In France, the need for the approval from the foreign and finance ministries before floating the loans of foreign governments in the Paris money market allowed the government to use the economy's financial reserves to shape balance-of-power diplomacy in Europe. It pressured the Russian government into building strategic railways in 1913 in Poland for it was hoped that a quicker Russian mobilization would slow a German offensive into France. The imposition of agricultural tariffs in Germany created an opportunity for the state to wed agricultural and industrial interests behind Weltpolitik. Those tariffs, however, produced a strong anti-German within Russia pressuring the government for a more aggressive foreign policy against German interests. Thus, the pre- World War I global economy can hardly be described as an archetypical liberal economic order and one can easily see the possibilities of conflicts arising out of the various protective measures.

While hegemony alone has its limitations the neoliberal order makes great power tacit in the international system that is spurred by free trade

Gady 10' "Franz Stefan, " Should the United States continue as a champion of free trade", Franz-Stefan Gady is a senior fellow at the EastWest Institute, where he was a program associate and founding member of the Worldwide Cybersecurity Initiative, http://www.unc.edu/depts/diplomat/item/2010/0912/comm/gady_freetrade.html".CC

For the United States in the 21st century, **a return to a system such as the pre-World War I global economy would be detrimental to economic growth and the stability of the international system. Free trade rather than any other form of trade is the key ingredient to promoting peace. This fact can be easily proven by the relative absence of conflict between countries engaging in free trade in the last sixty years. Free trade also makes the management of the international system less costly since it promotes economic efficiency and reduces the cost of policing the international system due the decrease of international tensions. Consequently, the United States has no alternative but to promote free trade.** CREATOR: gd-jpeg v1.0 (using IJG JPEG v62), quality = 100 The Limitation of Hegemony Scholars from the realist tradition such as Robert Gilpin have identified the distribution of power among states as a central factor in explaining the openness and stability of the international economy. The "Hegemonic Stability Theory" first coined by Charles Kindleberger in the 1970s focuses on the role of leading states- for example, Great Britain in the 19th century- and how changes in the distribution of power affect the world economy. The theory argued that the preponderance of power of one state was the precondition for an open and stable world economy. Such a hegemon served to coordinate and discipline other countries so that each feels secure enough to open its markets and to avoid beggar-thy-neighbor policies. In the 19th century, Britain enjoyed this role as a global economic hegemon over most of the world. After the end of the Napoleonic Wars in 1815, the British Empire was by far the wealthiest and strongest power in the world. The British Royal Navy ruled the waves, guaranteed the free flow of capital, the globalization of markets and enforced the openness of international trade. In the 20th century the United States of America took on the role of economic hegemon and it was the U.S. Navy that guaranteed international commerce and the integration of world markets. Just like the British Empire at the end of the French Revolutionary Wars, the U.S., after the end of the Second World War, assumed the leadership role and moved forward to create an open international trade system based on the General Agreement on Tariffs and Trade (GATT) and a stable monetary system founded on the Bretton Woods system. The United States also actively promoted the completion of various multilateral trade negotiations, such as the Tokyo, Uruguay and Doha rounds, aimed at reducing barriers to trade and reducing tariffs. In the 21st century, the U.S. is by far still the most economically powerful country in the world and continues to be the main proponent of free trade. Free trade, despite the U.S.'s long history of opposition, is intrinsically connected to the spirit of enlightenment of which the country's political institutions are a direct product. Various scholars and commentators, however, have assessed that this is changing and that the U.S. is rapidly declining in relative terms to neo-mercantilist powers such as China with its gigantic trade surplus and its market entry barriers. CREATOR: gd-jpeg v1.0 (using IJG JPEG v62), quality = 100 **According to the hegemonic stability theory, the hegemonic state is able to offer both bribes and threats in exerting its influence. The unprecedented U.S. current account deficit and U.S. consumption behavior financed by abroad** (mostly China), however, **has substantially limited the United States' policy options in that regard**. It just cannot threaten to, for example, cut off China's access to the U.S. domestic market. It is increasingly argued that the United States cannot manage the rise of a new economic superpower and that according to the hegemonic stability theory this decline will result in reduced economic activity and reduced trade flows among states. In short, the emergence of a new power that only on paper abides to the rules of free trade will result in an abandonment of free trade and loss of U.S. influence on the international economic system. A case in point for some observers is the impossibility to force the Chinese to revalue their currency although the U.S. Congress drafted legislation in 2007 to "boost pressure on China to let its currency rise in value." Beijing's currency manipulation imposes severe economic costs on the United States, Europe and many developing countries that compete with China. The U.S. threatened various retaliatory measures such as trade sanction, yet so far to no avail. In reality, there is very little a hegemon can do when it comes to promoting free trade in the international system or influencing other powers to comply when they are not willing. A state that opposes an open system of trade, such as Japan in the 1980s, faced very little consequences from the hegemonic power, i.e. the Unites States. The reason is that the capabilities of a hegemon required to maintain an open system are much bigger (often too big for the hegemon to cope with) if members are opposed to the open system, i.e. free trade, rather than when they are willing to tacitly comply with the existing order. **Thus, hegemony is only possible with the tacit cooperation of most of the states in the international system. It follows that if one or two countries oppose policies of the hegemon, it does not necessarily mean a decline of hegemonic power, but the overall limitations of hegemony in the international system.** This can be illustrated with the following case study of the British Empire in the 19th century. The pax Britannica was at its height in the period 1849 to 1880; thereafter, other states began to challenge British naval superiority, colonization became widespread and British economic superiority began to fall as well. Thus, one can hypothesize that during the period from 1849 to 1880, British hegemony translated into firm British control of the international economic and financial system. The truth was far from that. For example, the series of treaties that began with the Anglo-French treaty of commerce in 1860 are generally recognized as supplying the building blocks of a low-tariff regime that persisted until the late

1870s and hence, should be seen a sign of British hegemonic influence on the European continent. Nevertheless, three points should be noted. First, the British government did not initiate the negotiations. They were essentially triggered by the transnational collusion of Richard Cobden and Michel Chevalier two businessmen. Second, British Prime minister Palmerston, had rebuffed an earlier French overture on commercial negotiations because he was unwilling to tolerate the possible loss of customs revenue from the wine duty, which the French wanted to get rid off in order to have access to the British domestic market. Third, in 1860 a primary British motivation for seeking a treaty was not to gain lower tariffs and a greater market for exports, but rather to head off a serious deterioration in Anglo-French relations. The British were simply worried about the possibility of a French invasion. At the end, Britain did not succeed in gaining substantial concessions from the French despite its hegemonic position in the world. The British experience with most of the other states of Europe during the period 1848-1880 roughly corresponds to their experience with the French—scattered British successes, but no clear evidence that Britain was making a major impact on the tariff policies of the European states. Another case in point would be Prussia. After 1848, it was not Britain but Austria that dominated Prussian calculations on tariffs. The Prussians were ready to use a low tariff policy to block Austrian entry into the Zollverein. The Prussians desired low Zollverein tariffs in order to maximize the economic and domestic political costs to the Austrian government of joining the organization. Although the Austrians mounted two serious challenges to Prussian dominance in the Zollverein in 1852-3 and 1862-4, the British played no active role in either case. Thus, although Britain was assessed to be most powerful country in the world at that time it still could not influence the behavior of a second rate power such as Prussia. Yet, when Queen Victoria opened the Great World Exhibition in 1851, her country was the world's leading industrial power producing more than half its iron, coal and cotton cloth. Britain was called the "workshop of the world". The Royal Navy was the biggest fleet of its time and soon the British Empire would rule a quarter of the world. London became the leading financial center. This pax Britannica would last until 1914 and the beginning of the First World War. Throughout that time Britain continued to advocate free trade**. As with China in the 21st century, the fear that the rise of a new economic power and the decline of U.S. preponderance may inhibit free trade due to the impossibility of the hegemon to influence the economic policy of other countries is unsubstantiated. As illustrated with the example of Great Britain, the hegemon can rarely influence economic policies when a state's government or electorate is opposed to the policy since hegemony is built on some form of tacit consensus and economic interdependence between nations**. Conclusion T**he United States was and will continue to remain the champions of free trade.** First, this paper tried to illustrate that it is in the United States' interest to promote free trade because it leads to a more stable international system by promoting peace. Second, the argument that the United States will not alter from its free trade policy despite the emergence of neo-mercantilists power challenging U.S. hegemony has been put forward. Although observers might detect a decline in U.S. hegemony due to the U.S.'s impossibility to enforce its will on China in reality, this is just an exposition of the natural limitation of hegemony that is always dependent on some form of consensus among states. It will not, as the hegemonic stability theory suggests, lead to a decline in trade openness of states. Consequently, as illustrated with the British example of the 19th century, the lack of influence on other states behavior will not alter the U.S.'s policy on free trade.bluestar

Poverty

Globalization and free trade decrease poverty it decreases export and import taxes which allows for access for new tech and it increases the poor's buying power and real income

Bannister et al 01' "Geoffrey, "International trade and poverty alleviation", a Senior Economist in the Trade Policy Division of the IMF's Policy Development and Review Department, http://www.imf.org/external/pubs/ft/fandd/2001/12/banniste.htm#author".CC

Liberalization's effects Trade liberalization can affect the welfare of the poor by changing the prices of tradable goods and improving access to new products; changing the relative wages of skilled and unskilled labor and the cost of capital, thereby affecting the employment of the poor; affecting government revenue from trade taxes and thus the government's ability to finance programs for the poor; changing incentives for investment and innovation and affecting economic growth; and affecting the vulnerability of an economy to negative external shocks. Prices and availability of products. T**rade liberalization helps the poor in the same way it helps most others, by lowering prices of imports and keeping prices of substitutes for imported goods low, thus increasing people's real incomes.** Imported products that might be especially important for the poor include basic foods, pharmaceuticals and other medical or basic health products, and used clothing**. The poor may also benefit significantly from removal of export taxes or prohibitions, to the extent that the poor are net producers of exports** (as is often true in agriculture). **An open trade regime also permits imports of technologies and processes that can help the poor—for example, packaging for perishable foods** that is light and does not require refrigeration, chemicals for sterilizing water, and improved seeds and fertilizers. **An example of trade liberalization resulting in tangible and immediate benefits for the poor is the African Summit to Roll Back Malaria, held in April 2000, at which the continent's heads of state pledged to reduce or waive taxes and tariffs for mosquito nets, insecticides, antimalarial drugs, and other goods and services needed for malaria control.** There is also some evidence that liberalizing imports of used clothing can improve the welfare of the poor. Wages and employment. Trade theory predicts how trade liberalization will affect wages and employment under very specific conditions. In practice, these conditions do not often hold, and for a more general analysis, we have to rely on empirical studies. **These suggest at least two factors that will directly affect the way trade liberalization can change the wages and employment of the poor. First, how flexible labor markets are will determine whether the effects of trade reform translate into changes in employment or wages. If firms are constrained by labor regulations from reducing their workforces, most of the adjustment to changes in relative prices of outputs will be reflected in changes in real wages.** If minimum wage legislation prohibits downward adjustments in wages but labor mobility is high, however, adjustment will take place through changes in employment. In the rural and informal urban sectors (the informal sector is the part of an economy where businesses are not incorporated or otherwise registered with governments) of developing countries where the poor live, labor markets usually are highly flexible (being generally unregulated) and are characterized by a high elasticity of supply for labor. Wages will generally be determined by the requirements of urban and rural subsistence or the next-best employment opportunities that are available. Thus, we can expect that adjustment to trade shocks will take place predominantly through changes in employment. In this case, the costs of trade reform for the poor may be large, and government assistance may be required to mitigate their impact.

Neoliberalism increases trade flows and government revenue and it decreases tariffs which take away incentives for corruption and loopholes and after the intial stages the increased government revenue creates benefits for the poor

Bannister et al 01' "Geoffrey, "International trade and poverty alleviation", a Senior Economist in the Trade Policy Division of the IMF's Policy Development and Review Department, http://www.imf.org/external/pubs/ft/fandd/2001/12/banniste.htm#author" .CC

Second, the initial pattern of protection will have an important bearing on who wins and who loses when that protection is removed. **If the pattern favors unskilled workers in agriculture and light manufacturing, as was true for Mexico in the**

early 1980s, then the removal of protection could be expected to lower the relative wages of these segments of the labor force. Government revenues and programs for the poor. There is a general concern that trade reform may lead to lower government revenues as trade taxes are reduced and that, in an effort to maintain macroeconomic stability, **governments may cut social expenditures or implement new taxes that could disproportionately affect the poor. At the initial stages of trade liberalization, however, replacing nontariff barriers with tariffs and eliminating tariff exemptions will generally increase government revenues. Similarly, if initial tariffs are prohibitively high, reducing them can result in higher trade flows, which will increase revenues. Lowering high tariffs also reduces incentives for smuggling and corruption, which, in turn, can increase the volume of goods recorded at customs and boost revenues**. Finally, simplifying the tariff regime to create a more uniform structure, with just a few tariff rates, could increase fiscal revenue by increasing transparency and simplifying tax administration. In the latter stages of reform, however, lowering tariffs may lead to lower government revenues. In this instance, domestic tax reform (particularly the introduction of broader-based and less distortionary taxes) or expenditure restraint that may be required to maintain macroeconomic stability should be designed to minimize their adverse effects on the poor. Investment, innovation, and growth. An important consideration in sustained poverty reduction is whether the country is experiencing robust economic growth in which the poor can participate. One of the main channels through which trade reform affects growth is by reducing the anti-export bias of trade policy and leading to a more efficient allocation of resources. However, this is a onetime gain in allocative efficiency and need not affect the economy's long-term growth rate. In the long term, trade liberalization can affect the economy's rate of growth by creating incentives for investment**. In addition, trade reform usually encourages foreign direct investment, with attendant spillovers of advanced technologies and new business practices that increase overall productivity and growth in domestic firms**. Recent empirical research (for example, Rodriguez and Rodrik, 1999) suggests that the relationship between trade liberalization and growth is not straightforward. In particular, the effects of trade reform on growth depend upon the existence of other, complementary macroeconomic and structural policies and the creation of appropriate institutions. For example, in cross-country research, one variable that is consistently related to the rate of growth is the parallel-market premium on the exchange rate, indicating that exchange rate overvaluation may be an important inhibitor of growth. The implication is that undertaking trade reform without implementing appropriate macroeconomic and exchange rate policies (to improve competitiveness) will be less effective in promoting growth. Thus, a consistent overall economic package is essential if trade reform and other structural measures are to succeed in fostering adjustment and growth. Even when liberalization leads to growth, one concern often raised is that open trade policies may lead to a pattern of growth that disproportionately benefits the rich, thus worsening the country's distribution of income. Recent evidence (see, for example, Dollar and Kraay, 2001), however, casts doubt on this assessment. Vulnerability to negative external shocks. Trade liberalization will make an economy more open and deepen its economic integration with the rest of the world. In many cases, this will help an economy to diversify its exports in line with its comparative advantages and to become less dependent on single export markets or products. In addition, integration with foreign markets helps an economy become less dependent on the domestic market, so that domestic economic downturns are offset by growth in the international economy. Openness may, however, also make an economy more vulnerable to external shocks, such as abrupt changes in the terms of trade, that can significantly reduce growth. If the shocks directly affect certain sectors, such as agriculture or informal production, they can have significant effects on the poor.

Neoliberalism decreases poverty it changes economies from being sole buyers to economies which are competitive and produce manufactured products, and studies to the contrary ignore these benefits and complementary polices along with this growth that help the poor, Zimbabwe proves

Bannister et al 01' "Geoffrey, "International trade and poverty alleviation", a Senior Economist in the Trade Policy Division of the IMF's Policy Development and Review Department, http://www.imf.org/external/pubs/ft/fandd/2001/12/banniste.htm#author" .CC

Findings of empirical **studies Because of the complexity of the linkages between trade reform and poverty, the empirical evidence on trade liberalization and poverty is limited largely to case studies**. Some studies use computable-general-equilibrium (CGE) models to trace the effects of trade reform on the poor. Winters (2000) reports on a joint Oxfam-Institute of Development Studies study of liberalization of the cotton market **in Zimbabwe** during the late 1980s and 1990s that illustrates the potential effects of liberalization on the poor. **Before liberalization, the government was a monopsony buyer** (a sole buyer facing many sellers**) of cotton from farmers and used low producer prices to subsidize inputs into the textile industry, thereby reducing the incomes of small, poor farmers. Liberalization included elimination of price controls and privatization of the marketing board. The results were higher prices**

and greater competition among three principal buyers, not only on price but also in providing extension and input services to small landholders. In Zambia, liberalization of the maize market had the opposite result. Before liberalization, maize producers enjoyed cross-subsidies, financed by the mining sector, that considerably lowered the cost of inputs. In addition, small producers in remote areas were implicitly subsidized by prices, set by a parastatal firm (one funded by the government without formally being a part of it) serving as monopsony buyer, that were uniform for all seasons and throughout the country. When the subsidies were removed and the parastatal was privatized, larger farmers close to national markets saw no effective change in market conditions while small farmers, and especially those in remote areas, were severely affected by price fluctuations. In addition, owing to a sharp deterioration in transportation infrastructure, remote rural markets for corn completely disappeared, leaving poor farmers without formal incomes. These episodes provide examples of the effects of different types of liberalization. In Zimbabwe, initial restrictions were analogous to a tax on exports that kept producer prices low and inhibited competition. The removal of these "taxes" resulted in benefits to net suppliers of exports. In Zambia, however, the restrictions were analogous to a tariff on imports that results in a subsidy being provided to domestic producers (and a tax on consumers) of import-competing products. The removal of the tariff/subsidy resulted in a decline in revenue for producers of the import-competing products and, at the extreme, the disappearance of uncompetitive domestic production. A more important distinction between these two cases, as Winters points out, is that in Zimbabwe liberalization resulted in the creation of markets in which the poor could participate and an improvement in market performance, while in Zambia it resulted in the disappearance of functioning markets for the poor's produce**.** **In general, this study and others have found that, in most cases, trade reform increases the income of the poor as a group and that the transition costs are generally small relative to the overall benefits**. Nevertheless, there are cases where the short-run effects of liberalization on the poor and others are negative and significant. Although these negative results cannot be discounted, it is important to realize that in many cases they have been affected by the initial patterns of protection. It is also important to note that most studies assume a short-term perspective in which no changes in investment or the growth path of the economy can occur. But **the more important gains from liberalization come from dynamic gains, such as more efficient patterns of investment and technological diffusion. Further, they do not include the effects of complementary policies that facilitate adjustment to the new free-trade equilibrium. For all these reasons, the studies are likely to significantly overstate liberalization's costs and understate its benefits, even for the poor**. Over the medium term, changes in investment and economic growth can significantly exceed the negative distributional effects of changes in prices that result from trade liberalization.

Broad based liberalization and neoliberal reforms create benefits for the poor like better infrastructure and labor mobility training in order to facilitate their participation in the market and the broad based liberalization of the country incentives government to help the poor in the transition

Bannister et al 01' "Geoffrey, "International trade and poverty alleviation", a Senior Economist in the Trade Policy Division of the IMF's Policy Development and Review Department, http://www.imf.org/external/pubs/ft/fandd/2001/12/banniste.htm#author" .CC

Lessons for design of trade reform A natural question to ask is whether there are ways of liberalizing trade restrictions that might be more friendly to the poor. One first and obvious suggestion is to pay attention to the way liberalization might affect the most vulnerable members of society. In practical terms, this means developing diagnostic tools that can help policymakers identify who the losers from trade liberalization might be. Based on this analysis, compensatory policies can be designed to help the poor to deal with the transition costs of adjustment and to benefit from the new, open trade regime. In addition, trade reform and complementary economic policies can be implemented so as to ease the plight of the poor. **Broad-based liberalization. The importance of broad-based liberalization** (that is, of lowering trade barriers across the board) **follows from the economy-wide adjustment to trade liberalization. The wider the domain of trade that is being liberalized, the more individual sectors or groups (including the poor) will be able to perceive the benefits of liberalization (not only from cheaper inputs or consumption goods but also from economy-wide effects such as lower transportation costs). In addition, if liberalization is broad-based, the costs of adjustment will be spread more widely among different sectors. Exchange rate flexibility. Exchange rate flexibility will not only reduce the output costs of terms of trade shocks but also help a country adjust to trade liberalization.** The classic policy prescription for substantial trade liberalization under a fixed exchange rate regime is for a onetime devaluation just before, or in conjunction with, reform. If there is nominal wage rigidity (that is, if wages tend not to decrease when the demand for labor decreases), having some exchange rate flexibility, which will dissipate the shock of trade reform throughout the economy, will be better than requiring adjustment to

take place entirely through increased unemployment in the most affected industries. This is especially important if the poor depend on these industries. Complementary reforms. **Trade reform cannot succeed in promoting growth in isolation from other reforms. Complementary reforms enhance the flexibility of markets (which reduces the costs of adjustment) and facilitate the creation of markets that will benefit the poor**. Some of the more important complementary reforms are discussed below (see Winters, 2000). **Infrastructure development**. Better **roads and cheaper transportation will give the poor better access to the principal markets for their products and let them benefit from opportunities that might develop as a result of trade liberalization.** Development of markets. Encouraging the development of markets involves their deregulation and the removal of monopolies (such as state trading monopolies) that could adversely affect the poor or prevent them from receiving the benefits of trade liberalization. But perhaps more important for the poor are the technical assistance, extension services in agriculture, and training in up-to-date business practices. that they may need to receive if they are to take advantage of new market opportunities. Developing credit markets is also an important way of facilitating the provision of important inputs to encourage market activities. **Labor mobility and training. Rigidities in the labor market can also make it difficult for the poor to move into other occupations and take advantage of new market opportunities and to minimize the costs of trade liberalization. Worker training and other forms of assistance can also help the poor who lose jobs in sectors that suffer from trade liberalization to find jobs in sectors that benefit from it**. Sequencing and credibility. Although the broad-based liberalization advocated above can bring considerable benefits, it may be necessary to sequence liberalization at different speeds across sectors to ameliorate the costs of adjustment. This may be true for sectors or markets where liberalization has a very large effect on prices or where adjustment is likely to be very difficult and to take a long time. In addition, trade reform may be phased in gradually if people need more time to adjust to the new policy environment. For example, under the North American Free Trade Agreement (NAFTA), the maize sector was liberalized over a much longer period than other sectors because of the importance of maize farming for Mexico's rural poor. An important condition for implementing long adjustment periods for liberalizing sensitive sectors, however, is the credible commitment of the government to trade reform, often enhanced by its entering into international agreements (either regional or multilateral). Social safety nets. Even the best-designed trade reform will create winners and losers. In order to mitigate the possible adverse effects of transitory, short-term adjustment costs on the poor, developing countries need to have well-functioning social safety nets to ease the tension between implementing trade reforms and alleviating poverty. They also need to quantify the budgetary costs of offsetting some of these adverse effects—this can be done in the context of the participatory process of the poverty reduction strategy papers for countries that have IMF- and World Bank-supported programs. Given the substantial long-term benefits of trade reforms, the absence of appropriate safety-net policies should not unduly delay trade liberalization, because the sequencing and phasing of reforms can be designed to mitigate the transitional costs for the poor.

Neoliberalism does not necessitate poverty and it is inevitable only a neoliberal development effort combined with poverty reducing government policies can be effective, an outright rejection cannot reduce poverty

Rahim et al 14' "Hardy Loh, "Globalization and its effect of world poverty and inequality", Lecturer of Entrepreneurship, University Teknologi Mara, file:///C:/Users/Conner/Downloads/globalization%20and%20its%20effect%20on%20world%20poverty%20and%20inequality.pdf".CC

Different claims have been heard within the development community about how just much progress has been made against poverty (Ravallion, 2003). Research has presented conflicting arguments and estimations, with few claiming that overall poverty is on the decline, while others claim the opposite. While Aminat (2002) and Harrison and McMillan (2007) concluded in their studies that **globalization has boosted incomes and helped raised living standards and that the poor are more likely to share in the gains from globalization**, there are pro-poor growth advocates who find the idea that globalization produces losers more that what can be called 'winners.' For Stiglitz (2002), globalization fails in promoting development and hence continue to create poverty and instability. This finding is shared by Klasen (2005) in his study in which he concluded that globalization does not necessarily result in poverty reduction. Fortunately, the debate over the impact of globalization and growth on poverty and income inequality has not been entirely contradictory. For instance, between the extreme views insisting that

growth through globalization, have increased world's wealth and reduced poverty, and the opposing extreme view fault globalization for escalating poverty and perpetuating economic reliance of poor countries. **Globalization is not in itself a folly** (Sen, 2001**); it can be a force for good and has the potential to benefit all, including the poor** (Stiglitz, 2002). **Globalization seems to be irreversible. It produces both winners and losers among the poor. Thus, the question that needs to be addressed is how we can better govern this process to make it more inclusive and fairer than the current conditions. That is, it is not globalization ought to be abandoned, but rather it is poor governance of globalization is what needs to be challenged. If managed correctly and fairly for the benefit of all, globalization could be a positive force.** International community should act together in an effort to make available the resources necessary to wage a war against poverty and inequality (Akoum, 2008). Naturally, this requires fundamental adjustment of the global status quo, starting with a true political pledge of the developing and developed countries to conceive an enhanced global financial and economic landscape. **Generally, it has been found that the poor are more likely to share in the gains from globalization when there are complementary policies in place, such as access to credit, technical know-how, and other complementary inputs.** This can range from countries implementing minimum wage policies to protect unskilled workers who are most likely to be poor to encouraging export and incoming foreign investment, which has been linked to reduction in poverty levels in many countries (Harrison and McMillan, 2007). There is also a need for a Global Collective Action to sustain a steady global economic expansion and reduce the likelihood of and contain the effects of global volatility as it is the poor countries that are known for its volatility. This international policy coordination should mobilize adequate and more effective aid for poverty reduction in order to eliminate debt of poor countries. It should provide for information and knowledge sharing, removes barriers to trade, provide preferential access to the poorest countries, provide increased international support in protecting global commons and combating global diseases. **Whatever the methods and measurements used, it is important that poverty reduction via economic growth becomes the ultimate aim of development endeavors towards a more peaceful, prosperous, and accountable economic world. It cannot be said that poverty can only be reduced if globalization effort is halted or vice-versa.**

Globalization has reduced poverty in developed and developing nations it reduces poverty ensuring that growth is sustainable it requires low inequalities

Rahim et al 14' "Hardy Loh, "Globalization and its effect of world poverty and inequality", Lecturer of Entrepreneurship, University Teknologi Mara, file:///C:/Users/Conner/Downloads/globalization%20and%20its%20effect%20on%20world%20poverty%20and%20inequality.pdf".CC

Conversely, proponents of pro-poor, while recognizing the mandatory role played by openness and growth, contends that it does not represent sufficient conditions for poverty reduction. **The United Nations (2005) stated that though some parts of the world have experienced unprecedented growth and improvement in living standards in recent years,** poverty remains unshakable and much of the world is trapped in an inequality situation. This report also focuses on the chasm between the widening gap between skilled and unskilled workers, the formal and informal economies, the growing disparities in education, health and opportunities for economic, social as well as political participation. Many view the empirical evidence in favor of globalization skeptically because they see globalization as a process through which power is concentrated upward and away from the poor. In particular, they see transnational firms as gaining a lopsided amount of both political and market power. Critics of globalization are also steadfastly of the opinion that firms will use their increased power in ways that profit themselves and harm the poor. To determine the impact of globalization on poverty over the period 1980 to 2005, Salvatore and Campano (2012) adopted the macroeconomic perspective to examine the income distributions of the people living in developing countries, as one group, and the people living in the developed countries as another group. **They also further subdivided the developing countries into two groups: those that globalized and those that did not globalize, as**

not all developing countries have globalized during this period of study. Their study found that real personal incomes grew and flourished in both developed and developing countries, but more rapidly in the developing countries, such as in China and India. However, when looking at the estimates of real personal income in terms of the three major measures of central tendency, **they found that the ratios between developed and developing have been substantially reduced in the period, especially at the mode where the most severe poverty lies.** Akoum (2008) attempted to present empirical evidence on whether countries registering high growth rates do necessarily succeed in reducing the incidence of poverty. In his study, he recognized that there are various data and methodological problems in examining the relationship between growth, globalization, and poverty. Using simple statistical methods, he concluded that higher economic growth rates are not necessarily translated into lower poverty rates. Bergh and Nilsson (2011) used panel data from more than 100 countries around the world starting from 1988 through 2007, to examine the relationship between economic and social globalization and absolute income poverty (Table I). **They found that there is no evidence that globalization is associated with higher poverty levels in developing countries. They concurred that less trade restrictions and larger information flows are robustly associated with lower poverty levels thus indicating that globalization decreases poverty more when the informal and the rural sectors are relatively bigger.** They also found clear evidence that the main part of the poverty-decreasing effect is not mediated via the growth channel. Finally, they stated that although the fact that many low-income countries embarked on programs of external economic liberalization in recent decades has been intensely debated, their analysis suggests that the underlying premises of current and previous poverty reduction strategies are correct: poverty reduction can be achieved by means of closer economic integration and higher levels of globalization. The evidence from reading criticisms of globalization is that people are more interested in the optimal policy mix to maximize the benefits to the poor while minimizing the negative impacts on any subgroup of the poor that is made worse off by such policies. **They are also interested in ensuring that growth is socially, economically, and environmentally sustainable. Social sustainability, it is assumed, requires that inequality be kept under a certain limit.**

Globalization reduces poverty it incentives creating a manufacturing base in undeveloped countries and reduces the effects of only trading commodities an example of this is the rapid growth and reduction of poverty in China

Rodrik 12' "Dani, "Global poverty amid global plenty getting globalization right", an economist and Ford Foundation Professor of International Political Economy at the John F. Kennedy School of Government at Harvard University, http://www.americasquarterly.org/rodrik".CC

Marching to its Own Beat: China and Globalization **China's experience offers compelling evidence that globalization can be a great boon for poor nations.** Yet it also presents the strongest argument against the reigning orthodoxy in globalization, which emphasizes financial globalization and deep integration through the World Trade Organization (WTO). China's ability to shield itself from the global economy proved critical to its efforts to build a modern industrial base, which would in turn be leveraged through world markets. Since 1978, income per capita in China has grown at an average rate of 8.3 percent per annum—a rate that implies a doubling of incomes every nine years. **Thanks to this rapid economic growth, between 1981 and 2008 the poverty rate in China (the percent of the population below the $1.25-a-day poverty line) fell from 84 percent to 13 percent, much of it from reducing rural poverty.5 This meant a whopping 662 million fewer Chinese in extreme poverty, a number that accounts for virtually the entire drop in global poverty over the same period. During the same period, China transformed itself from near autarky to the most feared competitor on world markets.** That this happened in a country with a complete lack of private property rights (until recently) and run by the Communist Party only deepens the mystery. China's big break came when Deng Xiaoping and other post-Mao leaders decided to trust markets instead of central planning. But their real genius lay in their recognition that the market-supporting institutions they built, most of which were sorely lacking at the time, would have to possess distinctly Chinese characteristics. China's economy was predominantly rural in 1978. A Western-trained economist would have recommended abolishing central planning and removing all price controls. Yet without a central plan urban workers would have been deprived of their cheap rations and the government of an important source of revenue, resulting in masses of disgruntled workers in the cities and the risk of hyperinflation. The Chinese solution to this conundrum was to graft a market system on top of the plan. Communes were abolished and family farming restored, but land remained state property. Obligatory grain deliveries at controlled prices were kept in place, but once farmers had fulfilled their state quota they were now free to sell their surplus at market-determined prices. **This dual-track regime gave farmers market-based incentives and yet did not deprive the state of revenue nor deprive urban workers of cheap food.**6 Agricultural productivity rose sharply, setting off the first phase of China's post-1978 growth. Another challenge was how to provide a semblance of property rights when the

state remained the ultimate owner of all property. Privatization would have been the conventional route, but it was ruled out by the Chinese Communist Party's ideology. Once again, an innovation came to the rescue. Township and village enterprises (TVEs) proved remarkably adept at stimulating domestic private investment. They were owned not by private entities or the central government, but by local governments (townships or villages). TVEs produced virtually the full gamut of products, everything from consumer goods to capital goods, and spearheaded Chinese economic growth from the mid-1980s until the mid-1990s. The key to the success of TVEs was the self-interest of local governments, which would reap substantial income from their equity stake in the enterprises. China's strategy to open its economy to the world also diverged from received theory. The Chinese leadership resisted the conventional advice to remove trade barriers. Such an action would have forced many state enterprises to close without doing much to stimulate new investments in industrial activities. Employment and economic growth would have suffered, threatening social stability. The Chinese decided to experiment with alternative mechanisms that would not create too much pressure on existing industrial structures. While state trading monopolies were dismantled relatively early (starting in the late 1970s), what took their place was a complex and highly restrictive set of tariffs, nontariff barriers and licenses restricting imports. These were not substantially relaxed until the early 1990s. In particular, China relied on Special Economic Zones (SEZs) to generate exports and attract foreign investment. Enterprises in these zones operated under different rules than those that applied in the rest of the country; they had access to better infrastructure and could import inputs duty free. The SEZs generated incentives for export-oriented investments without pulling the rug out from under state enterprises. What fueled China's growth, along with these institutional innovations, was a dramatic productive transformation. The Chinese economy latched on to advanced, high-productivity products that no one would expect a poor, labor-abundant country to produce, let alone export. By the end of the 1990s, China's export portfolio resembled that of a country with an income-per-capita level at least three times higher than China's.7 Foreign investors played a key role in the evolution of China's industries. They created the most productive firms, introduced new technology to the economy, and became the drivers of the export boom. The SEZs, where foreign producers could operate with good infrastructure and with a minimum of hassles, deserve considerable credit. But if China welcomed foreign companies, it always did so with the objective of fostering domestic capabilities. It used a number of policies to ensure that technology transfer would take place and that strong domestic players would emerge. Early on, they relied predominantly on state-owned national champions. Later, the government used a variety of incentives and disincentives to foster joint ventures with domestic firms (as in mobile phones and computers) and expand local content (as in autos). Cities and provinces were given substantial freedoms to fashion their own policies of stimulation and support, which led to the creation of industrial clusters in Shanghai, Shenzhen, Hangzhou, and elsewhere.8 Many of these early policies would have run afoul of WTO rules that ban export subsidies and prohibit discrimination in favor of domestic firms—if China had been a member of the organization. Chinese policy makers were not constrained by any external rules in their conduct of trade and industrial policies and could act freely to promote industrialization. By the time China did join the WTO, in 2001, it had created a strong industrial base, much of which did not need protection or nurturing. China substantially reduced its tariffs in preparation for WTO membership, bringing them down from the high levels of the early 1990s (averaging around 40 percent) to single digits in 2001. Many other industrial policies were also phased out. However, China was not yet ready to let the push and pull of global markets determine the fate of its industries. It began to rely increasingly on a competitive exchange rate to effectively subsidize these industries. By intervening in currency markets and keeping short-term capital flows out, the government prevented its currency (renminbi) from appreciating, which would have been the natural consequence of China's rapid economic growth. Explicit industrial policies gave way to an implicit industrial policy conducted by way of currency policy. Asia's economic experience violates stereotypes and yet offers something for everyone. In effect, it acts as a reflecting pool for the biases of the observer. If you think unleashing markets is the best way to foster economic development, you will find plenty of evidence for that. If you think markets need the firm, commanding hand of the government, well, there is much evidence for that too. Globalization as an engine for growth? East Asian countries are a case in point. Globalization needs to be tamed? Ditto. **However, if you leave aside these stale arguments and listen to the real message that emanates from the success of the region, you find that what works is a combination of states and markets. Globalization is a tremendously positive force, but only if you are able to domesticate it to work for you rather than against you.** The Diversification Imperative You become what you produce. That is the inevitable fate of nations. Specialize in commodities and raw materials, and you will get stuck in the periphery of the world economy. You will remain hostage to fluctuations in world prices and suffer under the rule of a small group of domestic elites. **If you can push your way into manufactured and other modern tradable products, you may pave a path toward convergence with the world's rich countries. You will have greater ability to withstand swings in world markets, and you will acquire the broad based, representative institutions that a growing middle class demands, instead of the repressive ones that elites need to hide behind**. Globalization accentuates the dilemma because it makes it easier for countries to fall into the commodities trap. The international division of labor makes it possible for you to produce little else besides commodities, if that is what you choose to do. At the same time, globalization greatly increases the rewards of the alternative strategy, as the experiences of Japan, South Korea, Taiwan, and China amply show**. Sustained poverty reduction requires economic growth. A government committed to economic diversification and capable of energizing its private sector can spur growth rates that would have been unthinkable in a world untouched by globalization. The trick is to leverage globalization through a domestic process of productive transformation and capacity-building.**

Rapid industrialization and the access to global markets through neoliberalism ends a reliance a commodities based economy and helps solve unending poverty

Rodrik 12' "Dani, "Global poverty amid global plenty getting globalization right", an economist and Ford Foundation Professor of International Political Economy at the John F. Kennedy School of Government at Harvard University, http://www.americasquarterly.org/rodrik".CC

The proximate cause of poverty is low productivity. Poor people are poor because their labor produces too little to adequately feed and house them, let alone provide adequately for other needs such as health care and education. Low productivity, in turn, has diverse and multiple causes. It may be the result of lack of credit, lack of access to new and better technologies, or lack of skills, knowledge or job opportunities. It may be the consequence of small market size—or exploitative elites, in cahoots with the government, who block any improvement in economic conditions that would threaten their power. **Globalization promises to give everyone access to markets, capital and technology, and to foster good governance. In other words, globalization has the potential to remove all of the deficiencies that create and sustain poverty. As such, globalization ought to be a powerful engine for economic catch-up in the lagging regions of the world**. **And yet, the past two centuries of globalization have witnessed massive economic divergence on a global scale. How is that possible?** This question has preoccupied economists and policy makers for a long time. The answers they have produced coalesce around two opposing narratives. **One says the problem is "too little globalization," while the other blames "too much globalization."** The debate on globalization and development ultimately always comes back to the conundrum framed by these competing narratives: if we want to increase our economic growth in order to lift people out of poverty, should we throw ourselves open to the world economy or protect ourselves from it? Unfortunately, **neither narrative offers much help in explaining why some countries have done better than others, and therefore neither is a very good guide for policy.** The truth lies in an uncomfortable place: the middle. It's a point best illustrated by the country that has contributed the most—given its overall size—to the reduction of poverty globally: China. China, in turn, learned from Japan's example, as did other successful Asian countries. The Japanese Exception In the aftermath of the Industrial Revolution, globalization enabled new technologies to disseminate in areas with the right preconditions, but also entrenched and accentuated a long-term division between the core and the periphery. Once the lines were drawn between industrializing and commodity-producing countries, strong economic dynamics reinforced the division. **Commodity-based economies faced little incentive or opportunity to diversify.** This was very good for the small number of people who reaped the windfall from the mines and plantations that produced commodities, but not very good for manufacturing industries that were squeezed as a result.1 The countries of the periphery not only failed to industrialize; they actually lost whatever industry they had. They deindustrialized. Geography and natural endowments largely determined nations' economic fates under the first era of globalization, until 1914. One major exception to this rule would ultimately become an inspiration to all commodity-dependent countries intent on breaking the "curse." T**he exception was Japan, the only non-Western society to industrialize prior to 1914. Japan** had many of the features of the economies of the periphery. It exported primarily raw materials—raw silk, yarn, tea, fish—in exchange for manufactures, and this trade had boomed in the aftermath of the opening to free trade imposed by Commodore Matthew Perry in 1854. Left to its own devices, the economy would have likely followed the same path as so many others in the periphery. But Japan had a local group of well-educated, patriotic businessmen and merchants, and even more important, a government—following the Meiji Restoration of 1868—that was single-mindedly focused on economic (and political) modernization. That government was little moved by the laissez-faire ideas prevailing among Western policy elites at the time. Japanese officials made clear that the state had a significant role to play in developing the economy, even though its actions "might interfere with individual freedom and with the gains of speculators."2 Many of the reforms introduced by the Meiji bureaucrats were aimed at creating the infrastructure of a modern national economy: a unified currency, railroads, public education, banking laws, and other legislation. **Considerable effort also went into what today would be called industrial policy—state initiatives targeted at promoting new industries. The Japanese government built and ran state-owned plants in a wide range of industries, including cotton textiles and shipbuilding**. Even though many of these enterprises failed, they produced important demonstration effects. They also trained many skilled artisans and managers who would subsequently ply their trade in private establishments. Eventually privatized, these enterprises enabled the private sector to build on the foundations established by the state. The government also paid to employ foreign technicians and technology in manufacturing industries and financed training abroad for Japanese students. In addition, as Japan regained tariff autonomy from international treaties, the government raised import tariffs on many industrial products to encourage domestic production. These efforts paid off most remarkably in cotton textiles. By 1914, Japan had established a world-class textile industry that was able to displace British exports not just from the Japanese markets, but from neighboring Asian markets as well.3 While Japan's militarist and expansionist policies in the run up to the Second World War tarred these accomplishments, its achievements on the economic front demonstrated it was possible to steer an economy away from its natural specialization in raw materials. Economic growth was achievable, even if a country started at the wrong end of the international division of labor, if you combined the efforts of a determined government with the energies of a vibrant private sector. The Global Rise of East Asia The experience of Asian tigers after the Second World War—**South Korea, Taiwan, Hong Kong, Singapore, Malaysia, Thailand, and Indonesia—reinforced the lesson. All of these countries benefited enormously from exports, and hence from globalization.** But none, with the exception of British colony Hong Kong, came even close to being free-market economies. The state played an important guiding and coordinating role in all of them. Consider two of the most successful countries of the region: South Korea and Taiwan. In the late 1950s, neither of these economies was much richer than the

countries of Sub-Saharan Africa. South Korea was mired in political instability and had virtually no industry, having lost whatever it had to the more developed North Korea. Taiwan, too, was a predominantly agricultural economy, with sugar and rice as its main exports. The transformation that the two economies began to experience in the early 1960s placed them on a path that would turn them into major industrial powers. In many ways, their strategies mirrored Japan's. They required, first, a government that was single-mindedly focused on economic growth. Prior land reform in both countries had established some space for governments to act independently from landed elites. Both countries also possessed an overarching geo-political motive. South Korea needed to grow so it could counter any possible threats from North Korea. Taiwan, having given up on the idea of reconquest of mainland China, wanted to forestall any possible challenge from the Communists. The governments in South Korea and Taiwan understood that achieving their political and military goals required rapid economic growth. Developing industrial capabilities and a strong manufactured exports base became their predominant objective. This objective was accomplished by unleashing the energies of private business. Even though both governments invested heavily in public enterprises during the 1960s, the investment was designed to facilitate private enterprise—by providing cheap intermediate inputs, for example—and not to supplant it. One plank of the strategy called for removing the obstacles to private investment that stifled other low-income countries: excessive taxation, red tape and bureaucratic corruption, inadequate infrastructure, and high inflation. These were improvements in what today would be called the "investment climate." **Equally important were interventionist policies—government incentives designed to stimulate investments in modern manufactures.** Both governments designated such industries as "priority sectors" and provided businesses with generous subsidies. In South Korea, these largely took the form of subsidized loans administered through the banking sector. In Taiwan, they came in the form of tax incentives for investments in designated sectors. In both countries, bureaucrats often played the role of midwife to new industries: they coordinated private firms' investments, supplied the inputs, twisted arms when needed, and provided sweeteners when necessary. Even though they removed some of the most egregious import restrictions, neither country exposed its nascent industries to much import competition until well into the 1980s. While they enjoyed protection from international competition, these infant industries were goaded to export almost from day one. This was achieved by a combination of explicit export subsidies and intense pressure from bureaucrats to ensure that export targets were met. **In effect, private businesses were offered a quid pro quo: they would be the beneficiaries of state largesse, but only as long as they exported, and did so in increasing amounts**. If gaining a beachhead in international markets required loss-making prices early on, these could be recouped by the subsidies and profits on the home market. **But importantly, these policies gave private firms a strong incentive to improve their productivity so they could hold their own against established competitors abroad**.4

Globalization helps the poor although it creates winners and losers it must be compared with the countries pre-globalization which shows no trend that neoliberalism made poverty worse than it was before

Pavcnik 09' " Nina, "How has globalization benefited the poor", Professor of Economics Niehaus Family Professorship in International Studies at Dartmouth University, http://insights.som.yale.edu/insights/how-has-globalization-benefited-poor".CC

The lives of people in distant countries are increasingly being linked, through commerce, communications technology, or culture. Researchers are trying to parse out how the gains from globalization are touching the lives of the poorest citizens in developing countries. Q: Is there a way to describe, in a broad sense, what impact globalization has had on the poorest people in underdeveloped countries? I first want to clarify what I mean by "globalization." It's an all-encompassing concept, and the aspect of globalization that I focus on in my work is international trade**. If you look back over the past 30 years, developing countries had very high levels of trade protection** — so they had high barriers on imports in terms of taxes, and they restricted imports quantitatively, by quotas or licenses. During the 1980s and 1990s, many countries decided to abandon these protectionist policies and implemented large-scale trade reforms. For example, India implemented trade reforms in 1991, and its average tax on imports dropped from over 80% to an average of 30% in the late 1990s. Colombia went from 50% to around 13%. We observed big increases in trade flows as a result. **Economic growth is the main channel through which globalization can affect poverty. What researchers have found is that, in general, when countries open up to trade, they tend to grow faster and living standards tend to increase.** The usual argument goes that the benefits of this higher growth trickle down to the poor. It has been a bit trickier, especially with aggregate data, to pinpoint how exactly the poor have been benefited. One challenge is that when trade or globalization happens, many other factors are changing, such as technology and macroeconomic conditions. Another challenge is that high-quality data on the well-being of the poor is often not available. It is thus really hard to tease out the effects of globalization on poverty in a broad sense. But, that said, **it is virtually**

impossible to find cases of poor countries that were able to grow over long periods of time without opening up to trade. And we have no evidence that trade leads to increases in poverty and declines in growth. Q: When you look at particular countries, how much variation are you finding in the effect of increased trade? It's very country-specific, and it depends on where countries started off and on the nature of trade reform. Oftentimes, when we try to look at what globalization has done for the poor, we focus on workers in developing countries: what types of factories they work in, and what wages they earn. We often find that wages are lower than similar workers would be making in a country like the United States and working conditions are worse. But another way of looking at the consequences of globalization for poor countries is to actually look at how workers in these countries were doing prior to globalization and compare that to how they are doing now. Recent research has focused on how trade can affect inequality and poverty by affecting relative prices of goods and wages of individuals. And what that literature has found in India and in many Latin American countries is that inequality between the more educated and less educated has increased. The extent of the increase varies somewhat from country to country, but the evidence suggests that the more educated are benefiting more from the trade reforms than the less educated. But **greater inequality doesn't necessar-ily mean greater poverty.** The effect that trade has on less educated laborers in these developing countries depends in part on where they are employed and how mobile they are across sectors. **Workers, both educated and less educated, in export-oriented sectors tend to benefit.** However, workers who were employed in sectors that were initially shielded by higher tariffs experienced a drop in relative wages as tariffs were eliminated. Many countries, such as Mexico and Colombia, had shielded industries that employed a high share of less educated workers. When the tariffs were eliminated, these unskilled workers were disproportionately affected by declines in industry wages. These are short-term costs of globalization, and over time you would hope that these workers would be able to move toward the exporting sectors and share in the benefits of globalization. But that is not occurring as fast as we would like because worker mobility in many of these countries is quite constrained. Q: What factors keep people from moving? Moving is costly. Oftentimes, it goes beyond the financial cost of moving. For example, the poor in these countries often don't have access to formal insurance and a social safety net, so they rely on family networks for these services. This might impede mobility across regions. Q: Could you describe who the poorest people are in these countries? Many studies focus on the consequences of globalization for less educated workers in manufacturing. But there are other parts of the population in developing countries who are even poorer: individuals who live on less than a dollar a day — often small-scale rural farmers. These households spend a large share of their budget on food and other essential items. They are less likely to send their children to school. They are more prone to health risks. Q: How do they end up being reached by globalization? For the rural areas, it really depends on how much globalization involves agriculture and that varies country to country. One example where the poor who were in agriculture benefited substantially was Vietnam. In the mid-1990s, Vietnam liberalized its trade. Prior to that, Vietnam limited the amount of rice that farmers were able to export abroad. When the government eliminated that quota, demand for Vietnamese rice increased and prices of rice in Vietnam increased. This led to higher standards of living for Vietnamese rice farmers. Globalization helped lift many of them out of poverty. Conversely, if you are a country that imports a majority of the food stock, farmers might be made worse off by trade liberalization because prices of agricultural products will fall. You can see how the result depends on the underlying structure of the economy prior to trade liberalization. Q: Why have some regions, such as parts of Africa, not benefited as much from globalization? In some countries in Africa, there are so many factors that work against trade. One of the reasons why many companies don't go into some of those countries is lack of political and economic stability. The risks of doing business are much higher. That precludes them from benefiting from globalization. Trade, alone, won't lift those countries. Many other changes need to occur. Q: Another issue associated with glob-alization is child labor. Does buying a sweatshirt in the United States encourage child labor in the country where that was manufactured? The usual concern that we have about glob-alization leading to child labor focuses on the fact that globalization might generate employment opportunities in poor countries. In particular, consumers in developed coun-tries tend to import a lot of products, such as t-shirts, sweatshirts, and toys, that are made with low-skilled labor. By increasing the demand for these products, we are increasing employment opportunities for children in poor countries and this discourages them from going to school. But to understand the link between child labor and international trade, we really need to think about why children work. And one reason why children might work is the story I just told. But another reason children work is because their families can't survive without the help of child work. Studies suggest that the main reason why children are working is the poverty of their household and the main channels through which trade is affecting whether children work is the effect of trade on household poverty. In circumstances where trade increases living standards of poor households, as was the case in Vietnam, households pulled their children away from work and children started going to school. The liberalization in Vietnam also created greater earning opportunities for children, but because of improved economic conditions these families no longer had to rely on children to work. Q: This suggests that the knee-jerk response of banning children from working in any factory may not be the most effective way to improve their welfare. When you look at the images of children working in not-very-safe factories, that is the knee-jerk reaction. What we need to be asking is, if we banned child labor, if we shut down these factories, what would these children be doing? We would like to see them attend school, but that might not be the alternative for these children. They might take a job that is even more hazardous, like prostitution or stone quarrying, or work in parts of the economy that are even more informal than sweatshops. Q: Are there gender differences in which kids are sent to work or school? Yes. Boys are more likely to work in market work, that is, work for wages, work for a family farm, or work for a household business. Girls are more likely to participate in domestic work, such as fetching firewood, taking care of younger siblings, cooking, sewing. Trade affects boys and girls differentially because it affects these types of work differently. That's one difference. The other thing that we found, in India, is that families on the losing end of globalization were more likely to take girls out of school than boys in response to this economic hardship. Q: How do you think about the long-term implications of whether children forgo school for work? Better-educated individuals tend to do better in life on many dimensions. We also know that countries that have higher human capital accumulation tend to do better. Another factor is that children who are working can be vulnerable to injury and occupational hazards for a longer period of time. Child labor has longer-term implications for these countries in its effects on health and human capital accumulation. But we also have to keep asking ourselves, if children

are not doing this particular job, what is their alternative? Q: For a consumer in the developed world, what actions are actually effective in trying to bring the benefits of globalization to some of the people who are getting left out? Many of us, as we benefit from cheaper goods made in China or Vietnam, or goods that have been made by child labor, worry about what we are doing. But perhaps the best way to help the poor in poor countries is for them to have the employment opportunities that arise when there is demand in rich countries for products that they produce. However, globalization generates winners and losers. For those people who are made worse off, those are real costs, and we have to help them deal with those costs. Even in a country like the United States, it's pretty tricky to compensate the losers from this process, and it's even trickier in the developing countries, where government assistance is not as readily available. **There are a lot of benefits for all of us that can be had by promoting globalization, but government policy needs to make sure that those left behind share in these gains.** Q: Are poverty and inequality threats to globalization? If you look at polls that ask people for their opinions of globalization, there is less opposition in poorer countries than there has recently been in the United States. But I think the threat can grow if more people feel as if they are left out of this process or hurt by this process.

Security Good

Realism

Defensive realism is good wars empirically have only happened in an international system when the balance of power is reached because power and politics are inevitable

Kiseleva 08' "Yulia, "The relevance of realims in international reslations toady", a phd canadidate from kings college London, https://www.academia.edu/1632931/The_Relevance_of_Realism_in_International_Relations_Theory".CC **Firstly, the balance of power derived from the concept of power as the central element of realism seems valid and workable to the present day**. It is not hard to retrace this chain of events taking Europe as a starting point. The Treaty of Westphalia after the Thirty Years' War, the Congress of Vienna after the Napoleonic Wars, the world order established after the Franco-Prussian War leading to a strong, unified Germany, the Versailles-Washington world order after World War Iand the Yalta-Potsdam world order after World War II are those milestones that enable one to discern a certain logic in the historical process (Carr) and some continuity in world politics (Buzan) . **There have always been great powers, coalitions, the struggle for power, balancing, equilibrium, and wars served as punctuation marks dividing different epochs and bringing into existence new ones. The actors** (states, great powers on the international scene) **changed but the script and decorations did not. This is what Morgenthau called an "astounding continuity" in foreign policy** (Morgenthau) . Besides, war has contributed to shaping the nature of the modern state, "the state makes war and war makes the state" (Rotberg & Rubb) . 2Now that the Cold War is long over, many of today's theorists and policy-makers are welcoming the advent of a new era which will never witness war again. This may prove true but on one condition – that the balance of power is maintained. After the end of the Cold War no new balanced world order was established or, to be precise, there was one world order – with the United States at the helm, with the tacit approval of all others. That, however, does not mean that such an order is capable of generating a truly peaceful environment for all nations. There is still much tension worldwide, not least because of discontent with US foreign policy. According to Waltz, there is now a grave imbalance of power in the world (Waltz) . It seems reasonable to argue that 9/11 has contributed to or even become a pretext for extending American power and military capabilities all across the globe, which in turn continues to contribute to instability indifferent parts of the world as a whole. In this context intensified terrorist activity can be viewed as a consequence of rather than a reason for America's current foreign policy (Waltz) . Even looking at the composition of the United Nations' Security Council, one can say that the world is not represented proportionately. New centers of power have emerged and it is not indicated in the UNSC in any way. **Some may object that the balance of power implicitly means resorting to war, conflict, calamity because power politics is only about violence, the use of force and bringing misery** (Dougherty& Pfaltzgraff) . **But the question is not about banishing power politics from reality and denying its existence but rather bringing about a genuine balance of power that would maintain the easily-broken peace, stability and satisfy many who would in turn help the rest cope with their problems** (e.g. Third World countries). **This line of argument is in agreement with so-called defensive realism, which postulates that it is in a state's interest to preserve the existing balance of power rather than trying to shift it in its favor thus creating instability and conflict (**Waltz) **.That is what guarantees security**

Realism is a good starting point to any specific theory on international relations it tempers wishful think and can be combined with a more open IR framework

Kiseleva 08' "Yulia, "The relevance of realims in international reslations toady", a phd canadidate from kings college London, https://www.academia.edu/1632931/The_Relevance_of_Realism_in_International_Relations_Theory".CC

Thus, **realism seems to be still alive in present-day international relations** since such everyday aspects of political life as the national state, sovereignty, legitimacy, power, national interests, security, conflict, war have not sunk into oblivion. **While it is obvious that realism can be easily challenged by other, more optimistic and humane, theories, it has the right to existence, at least because it can complement other perspectives** and produce interesting results in combination with them. As Donnelly contends, there is nothing wrong with theory being too abstract. **The questions that need to be asked are how often, in what instances and for what purposes does realism help understand the**

world (Donnelly) . In this respect, Aron argues **that realism serves as a "good starting point" for understanding the world since at least it can prove a good hindrance to "wishful thinking**" (*Dougherty & Pfaltzgraff*) . Moreover, Buzan believes that**, although realism is instrumental in revealing the fundamentals of political and international life, the narrowness and primitiveness of the realist paradigm can be overcome (**Buzan) . Kegley speaks 5about a possibility of **cooperation between realism and liberalism, particularly a likely merger of the concept of the national interest with the necessity of cooperation among state**s (*Kegley*) .**There is another side to realism – its "normative attraction" (Buzan) . Realism can be viewed as favoring different values such as ideological, cultural, political diversity, political independence, self-reliance. It is, therefore, evident that realism has something to offer to the world it attempts to describe and there are some things that one can either accept or disagree with.** At present, the world seems to be entering a profoundly new stage in its development. The current economic crisis, which affects almost everyone across the globe, is certain to have a tremendous impact on all aspects of human life, from very inconsequential to genuinely important. States are trying to protect the interests of their people in the face of the impending disaster, which may lead to serious consequences on a larger scale. Now nationalism is on the rise. It can stir up a lot of negative feeling across many nations and roll over national boundaries causing conflict and strife. In such circumstances, it may be useful to turn to realism to find some answers and learn its lessons. Realism may be making a huge comeback. Nevertheless, it is its basic tenets that we need in order to never let this comeback happen

Reps Defense

Reps not first

Need to start with policy action

Rigakos and Law 9 (George, Assistant Professor of Law at Carleton University, and Alexandra, Carleton University, "Risk, Realism and the Politics of Resistance", Critical Sociology 35(1) 79-103)

McCann and March (1996: 244) next set out the 'justification for treating everyday practices as significant' suggested by the above literature. First, the works studied are concerned with proving people are not 'duped' by their surroundings. At the level of consciousness, subjects 'are ironic, critical, realistic, even sophisticated' (1996: 225). But McCann and March remind us that earlier radical or Left theorists have made similar arguments without resorting to stories of everyday resistance in order to do so. Second, everyday resistance on a discursive level is said to reaffirm the subject's dignity. But this too causes a problem for the authors because they: query why subversive 'assertions of self' should bring dignity and psychological empowerment when they produce no greater material benefits or changes in relational power ... By standards of 'realism', ... subjects given to avoidance and 'lumping it' may be the most sophisticated of all. (1996: 227) Thus, their criticism boils down to two main points. First, everyday resistance fails to tell us any more about so-called false consciousness than was already known among earlier Left theorists; and second, that a focus on discursive resistance ignores the role of material conditions in helping to shape identity. Indeed, absent a broader political struggle or chance at effective resistance it would seem to the authors that 'powerlessness is learned out of the accumulated experiences of futility and entrapment' (1996: 228). A lamentable prospect, but nonetheless a source of closure for the governmentality theorist. In his own meta-analysis of studies on resistance, Rubin (1996: 242) finds that 'discursive practices that neither alter material conditions nor directly challenge broad structures are nevertheless' considered by the authors he examined 'the stuff out of which power is made and remade'. If this sounds familiar, it is because the authors studied by McCann, March and Rubin found their claims about everyday resistance on the same understanding of power and government employed by postmodern theorists of risk. Arguing against celebrating forms of resistance that fail to alter broader power relations or material conditions is, in part, recognizing the continued 'real' existence of identifiable, powerful groups (classes). In downplaying the worth of everyday forms of resistance (arguing that these acts are not as worthy of the label as those acts which bring about lasting social change), Rubin appears to be taking issue with a locally focused vision of power and identity that denies the possibility of opposing domination at the level of 'constructs' such as class. Rubin (1996: 242) makes another argument about celebratory accounts of everyday resistance that bears consideration: [T]hese authors generally do not differentiate between practices that reproduce power and those that alter power. [The former] might involve pressing that power to become more adept at domination or to dominate differently, or it might mean precluding alternative acts that would more successfully challenge power. ... [I]t is necessary to do more than show that such discursive acts speak to, or engage with, power. It must also be demonstrated that such acts add up to or engender broader changes. In other words, some of the acts of everyday resistance may in the real world, through their absorption into mechanisms of power, reinforce the localized domination that they supposedly oppose. The implications of this argument can be further clarified when we study the way 'resistance' is dealt with in a risk society.

Reps focus kills ptx

Bryant 2014 (Levi R. Bryant, "Thoughts on the Social and Political Implications of Correlationism" https://larvalsubjects.wordpress.com/2014/01/20/thoughts-on-the-social-and-political-implications-of-correlationism/)

...the political problem of contemporary philosophy identified by the 'new realists' is, in fact, the product of a more fundamental epistemic problem. In his book After Finitude, Quentin Meillassoux calls this problem 'correlationism' and identifies it as an essentially post-Kantian legacy, which continues to dominate and limit philosophy. As a matter of fact, correlationism lies at the heart of postmodern theory and consists in the premise that thought can only 'think itself,' that the real is inaccessible to

knowledge and human subjectivity, and that there is nothing but discursive constructs that fully determine thinking and that are meth0dologically accounted for all the way down. (1 – 2)¶Thought thinking only itself. Thought only encountering itself. In the jargon of postmodern and poststructuralist lingo, this would be the thesis of infinite semiosis, where signs ("thoughts") only ever relate to other signs. Within ths framework, discursivity comes to be the hegemonic framework defining all of being. At the level of politics and social theory more generally, if the correlationist thesis is true the consequences are clear: all social phenomena are discursive and all solutions to social and political problems will be discursive. The sole sphere of the political will be the discursive and all questions of politics will be questions of speech-acts and interpretation.¶The problem here is not that many theorists recognize that the discursive and semiotic plays an important role in the social and the political. It does and I've repeated this tirelessly. The problem is with what happens when thought or the semiotic becomes a hegemon, an "all", foreclosing our ability to recognize other forms of power. What I've wanted to say is that not all power functions discursively. In my last post and elsewhere I spoke of some other forms of politics:¶Thermopolitics: The politics surrounding energy in the form of calories and fuels such as gasoline and coal, and how our life and our very bodies are structured by energy dependencies and by being trapped in particular distributive networks that render these forms of energy available. I'm being quite literal when I speak of energy, talking about the effects, for example, of the absence of food in certain educational environments on cognition, for example; and am generally hostile to metaphorical extensions of the concept of energy which I see as erasing the dimension of real materiality.¶Geopolitics: The role that features of natural and built geography such as mountain ranges, rivers, oceans, soil conditions, roads, housing design, etc., play in the form that social relations take and how they impact individual bodies.¶Chronopolitics: The way in which the structuration of time organize what is possible for us. For example, the structuration of the working day, how much we can say and comprehend at any given time, the impact of things like the invention of the clock, etc.¶Oikopolitics: This would be the domain of political economy described so well by Marxists.¶So five different types of politics: Semiopolitics (or what currently dominates critical theory), thermopolitics, geopolitics, chronopolitics, and oikopolitics. No doubt there are other sites of the political or political struggle that we could speak of, but this is a good start. Also, it should be obvious that these aren't exclusive domains, but are entangled in all sorts of important ways. For example, something might take place at the level of semiopolitics (speech, law, rhetoric, norms, communication) that has all sorts of impact at the level of thermopolitics. Congress might decide to cut programs that fund school meal programs. This, in turn, will have a thermodynamic impact on those students that go without the calories they need developmentally and cognitively to function in a particular way. There is an entanglement here of semiopolitical and thermopolitical domains. The young student here has been constrained both at the level of semiotic phenomena and thermodynamic structures.¶The point is that if true, semiotic intervention (speech-acts, protests, interpretations, deconstructions, etc) will not be an appropriate response to all political problems because social formations are not entirely structured by the semiotic. The child in that school does not suffer from a lack of the right signs, but from a lack of calories needed to run the engine of his thought and body. Certainly semiotic interventions might be needed to render that energy available, but it is the energy itself that is at issue and the absence of that energy that forms the spider web entangling him in his position. A correlationist perspective tends to erase this as even being a site of the political.

Anthropocene means reps focus uniquely fails now

Clive **Hamilton** 01-24-**2013** ("Climate Change Signals the End of the Social Sciences" http://theconversation.com/climate-change-signals-the-end-of-the-social-sciences-11722)

In response to the heatwave that set a new Australia-wide record on 7 January, when the national average maximum reached 40.33°C, the Bureau of Meteorology issued a statement that, on reflection, sounds the death knell for all of the social sciences taught in our universities.¶ "Everything that happens in the climate system now", the manager of climate monitoring at the Bureau said, "is taking place on a planet which is a degree hotter than it used to be."¶ Eminent US climate scientist, Kevin Trenberth, made the same point more fully last year:¶ The answer to the oft-asked question of whether an event is caused by climate change is that it is the wrong question. <u>All weather events are affected by climate change because the environment in which they occur is warmer and moister than it used to be</u>.¶ Trenberth's commentary calls on us to reframe how we think about human-induced climate change. <u>We can no longer place some events into the box marked "Nature" and some into the box marked "Human</u>".¶ The invention of these <u>two boxes was the defining feature of modernity, an idea founded on Cartesian and Kantian philosophies of the subject</u>. Its emergence has also been tracked by science studies in the contradiction between purified science and the messy process of knowledge creation, leading to Bruno Latour's troubling claim that <u>the separation of Human and Nature was an illusion</u>, and that "we have never been modern".¶ Climate science is now telling us that such a separation can no longer be sustained, that the natural and the human are mixed up, and their influences cannot be neatly distinguished.¶ This <u>human-nature hybrid is true</u> not just of the climate system, but <u>of the planet as a whole</u>, although it would be enough for it to be true of the climate system. We know from the new discipline of Earth system science that changes in the atmosphere affect not just the weather but the Earth's hydrosphere (the watery parts), the biosphere (living creatures) and even the lithosphere (the Earth's crust). They are all linked by the great natural cycles and processes that make the planet so dynamic. In short, everything is in play.¶ Apart from climatic change, <u>it is apparent that human activity has transformed the Earth in profound ways</u>. Every cubic metre of air and water, every hectare of land now has a human imprint, from hormones in the seas, to fluorocarbons in the atmosphere and radioactivity from nuclear weapons tests in the soil.¶ Each year <u>humans shift ten times more rock and soil around the Earth than the great natural processes of erosion and weathering</u>. Half of the land surface has been modified by humans. Dam-building since the 1930s has held back enough water to keep the oceans three centimetres lower than otherwise. Extinctions are now occurring at a rate 100 times faster than the natural one.¶ So profound has been the influence of humans that Earth scientists such as Will Steffen have recently declared that <u>the Earth has entered a new geological epoch</u>, an epoch defined by the fact that the "human imprint on the global environment has now become so large and active that it rivals some of the great forces of Nature in its impact on the functioning of the Earth system". <u>Known as the Anthropocene</u>, the Age of Humans, it marks the end of the Holocene, the 10,000-year period of remarkable climatic stability and clemency that allowed civilisation to flourish.¶ The <u>modern social sciences</u> — sociology, psychology, political science, economics, history and, we may add, philosophy — <u>rest on the assumption that the grand and the humdrum events of human life take place against a backdrop of an inert nature</u>. Only humans have agency. Everything worthy of analysis occurs in the sealed world of "the social", and where nature does make itself felt – in environmental history, sociology or politics – "the environment" is the Umwelt, the natural world "over there" that surrounds us and sometimes intrudes on our plans, but always remains separate.¶ What was distinctive of the "social sciences" that emerged in 18th-century Europe was not so much their aspiration to science but their "social-only" domain of concern.¶ <u>So the advent of the Anthropocene shatters the self-contained world of social analysis</u> that is the terrain of modern social science, <u>and explains why those intellectuals who remain within it find it impossible to "analyze" the politics, sociology or philosophy of climate change in a way that is true to the science</u>. They end up floundering in the old categories, unable to see that something epochal has occurred, a rupture on the scale of the Industrial Revolution or the emergence of civilization itself.¶ A few are trying to peer through the fog of modernism. In an epoch-marking intervention, Chicago historian Dipesh Chakrabarty has argued that <u>the distinction we have drawn between natural history and human history has now collapsed</u>. With the arrival of the Anthropocene, <u>humans have become a geological force</u> so that the two kinds of history have converged and <u>it is no longer true that "all history properly so called is the history of human affairs</u>".¶ E.H. Carr's famous definition of history must now be discarded:¶ History begins when men begin to think of the passage of time in terms not of natural processes — the cycle of the seasons, the human life-span — but of a series of specific events in which men are consciously involved and which they can consciously influence.¶ From hereon our history will increasingly be dominated by "natural processes", influenced by us but largely beyond our control. Our future has become entangled with that of the Earth's geological evolution. As I argue in a forthcoming book, contrary to the modernist faith, it can no longer be maintained that humans make their own history, for the stage on which we make it has now entered into the play as a dynamic and

capricious force.¶ And the actors too must be scrutinised afresh. If on the Anthropocene's hybrid Earth it is no longer tenable to characterise humans as the rational animal, God's chosen creatures or just another species, what kind of being are we?¶ The social sciences taught in our universities must now be classed as "pre-Anthropocene". The process of reinventing them — so that what is taught in our arts faculties is true to what has emerged in our science faculties — will be a sustained and arduous intellectual enterprise. After all, it was not just the landscape that was scorched by 40.33°C, but modernism itself.

China method defense

Discourse of co-operation shapes better sino – U.S policies

Mawdsley 07 (Emma Department of Geography, prof @ 04/2007 Cambridge University China and Africa: Emerging Challenges to the Geographies of Power http://www.researchgate.net/profile/Emma_Mawdsley/publication/229577767_China_and_Africa_Emerging_Challenges_to_the_Geographies_of_Power/links/54f6e0770cf27d8ed71f6287.pdf)(AC)

Deepening Sino–African relations are one indicator of a changing world order. The West's diplomatic, political and economic hegemony, while far from seriously threatened, is subject to an increasingly visible challenge. China is seeking increasing trade, investment, diplomatic missions and geopolitical alliances across the world. The outcomes will be socially, politically, economically and environmentally profound. As important as the actual material shape and impacts of China's rise (such as decreasing prices for consumer goods, competition for oil, the environmental impacts of its growing economy, or its programme of military development) will be the way in which Western governments, and most obviously the USA, perceive, construct and respond to the fact of China's growth (Arrighi 2005a, b; Johnston 2003; C. Pan 2006). There is a strong tendency to simplify and even demonise China, demonstrated in the growing number of popular alarmist accounts (e.g. Gertz 2002; Menges 2005; Mosher 2000;Timperlake and Triplett 2002), but also present within some foreign policy circles (see Johnston 2003). Africa is one arena in which economic and diplomatic competition is being played out. There are, of course, very real concerns, whether from a progressive standpoint (e.g. in terms of human rights and dignity, environmental futures, or participation and democracy), or, at the opposite end of what is a complex spectrum, from a realist international relations position (e.g. China as an aggressive competitor for resources, and potentially a future military threat, eventually seeking hegemonic power). But as this very brief review of Sino–African relations shows, any understanding of these emerging geographies are aided by a fuller 416 . China and Africa: emerging challenges to the geographies of power © 2007 The Author Geography Compass 1/3 (2007): 405–421, 10.1111/j.1749-8198.2007.00019.x Journal Compilation © 2007 Blackwell Publishing Ltd appreciation of historical underpinnings; of multi-dimensional relations (not just oil or authoritarian regimes); of complex actors (noting the divisions and tensions within the Chinese and African states, people and companies); of the agency of African actors; and, not least, through considerably more humility regarding the West's past and present relations with Africa. For different Africans and African countries, China brings a range of benefits as well as problems, and China will undoubtedly become an ever more important factor in the continent's future. For the rest of the world, Sino–African relations, and how the West responds to them, may act as a very important marker of the changing geographies of power – and how these will be resisted or embraced.

Distribution of power controls challenges to American primacy – the aff is a unique form of solvency

Chan 06 (STEVE CHAN a a Chair and professor of Political Science at the University of Colorado , Boulder Published online: 07 Aug 2006. http://www.tandfonline.com/doi/pdf/10.1080/09636410490914077)(AC)

Contrary to a general inclination by colleagues engaging in this discourse to focus on how fast China is growing (whether economically or militarily), the arguments presented here suggest that one should be more concerned about whether this growth will slow down. A rising power, as long as it expects further rapid growth, is more inclined to accept minor concessions in the hope of making further gains in future rounds of bargaining. When its growth tapers off or even stops, it will demand larger concessions because it is no longer restrained by the incentive of deferred gratification. A declining hegemon will be called upon to make a large, lump-sum concession for the distribution of benefits to be adjusted fully in accordance with the actual distribution of power. Previous discussions of preventive war have focused on the motivation of the preventer,69 particularly its concern that waiting may mean a less favorable outcome for it later on. This emphasis naturally draws one's attention to the speed of the ascending state's growth. How fast is this prospective challenger closing the gap between it and the leading state? It is supposed that the more rapid the power shift to its relative disadvantage, the more urgency there is for the preventer to act. Conversely,

the slower this change and/or the more limited the challenger's growth potential is perceived to be, the weaker should be the declining hegemon's preventive motivation.Powell's research suggests that one needs to recognize a crosscutting current from the challenger's perspective.70 From this state's viewpoint, waiting is preferable to waging war as long as it can expect further improvements in its bargaining position. When it realizes that its growth is waning and that it is in danger of falling behind other, faster-growing states, it has less incentive to accept deferred gratification. **It is more inclined to demand full adjustment in benefits when its bargaining position is as strong as it will ever be. In short, the implications of power shifts tend to be quite different for declining and rising states. We need to be cognizant of both their motivations because, after all, the outbreak of war reflects a joint decision (that is, both must believe that they will be better off by fighting than by living in peace**). The analytic logic and historical evidence presented in this article lead to a very different interpretation than the current predominant characterization of Sino-American relations—and not just compared to that presented by those emphasizing the "China threat." My proposition accords instead with Copeland's argument that "since rising states wish to avoid conflict, [his] theory would expect China to continue to be relatively peaceful (especially since economic engagement is helping to fuel its growth). If destabilizing policies are to be initiated, the perpetrator will likely be a declining United States."71 At the same time, Copeland emphasized the caveat that unless a dominant but declining power believes its downward mobility will be deep and inevitable, it will not launch a preventive war, as there are other, more acceptable means to maintain its status.72 Clearly, the United States is predominant today and will remain so in the foreseeable future in tangible military and economic power, intangible soft power, and potential to realize both kinds of power with respect to not only China, but also every other country in the world. As will be seen shortly, suggestions that there is or will soon be a power transition in Sino-American relations are very misleading. There is debate in the United States about the relative merits of a policy to engage or contain China.73 Advocates of engagement argue in favor of integrating China in the existing international institutions and global conventions. They see widening and deepening economic interdependence as another way to restrain Beijing's bellicosity in its foreign relations and to encourage its domestic political and economic liberalization. Either implicitly or explicitly, they hope to "reform" China by influencing its values and practices through regular interactions and positive exchanges designed to influence the formation of its policy agenda and the political standing and perceived self-interests of its various stakeholders in pursuing this agenda. Proponents of a containment policy are pessimistic about these hoped-for changes and prefer instead to take actions that would block or at least curtail Beijing's power ascent. They would rather accept the risks of provoking and even exacerbating strains in current bilateral relations than the risks of a stronger China in the future. Whether the hard-line policies being advocated would have an effect in abetting or reinforcing Beijing's suspicions and even hostility is less consequential for the proponents of containment than the likely future distribution of power if nothing is done now to hamper Beijing's rising capability trajectory. What about China's likely policies toward the United States? Notwithstanding occasional belligerent verbal posturing,74 one would not expect China as a rising power to seek or provoke a confrontation with the United States. If anything, one would expect it to signal its limited goals and good intentions. It will have much to lose and little to gain by doing or saying anything that would strengthen the arguments of those in the United States favoring a hard-line policy. Beijing would make its security position worse rather than better if its actions or words were to induce Washington to enhance its armament and therefore to put China at a serious disadvantage (due to its economic and potential power in Copeland's terms) in an arms race with the United States. Indeed, despite all its bluster, Beijing's policy has sought to avoid a confrontation with Washington. Its preferred ways to influence Washington, especially in light of the George W. Bush administration's declared intention to wage preventive war (against Iraq), have been to emphasize the role of international organizations (for example, the United Nations, the Association of Southeast Asian Nations Plus Three), interlocking interests in international commerce and investment, and various lobby groups (for example, business firms, trade associations) within the United States that have a stake in continuing and expanding Sino-American ties.75 Readers familiar with the arguments of those who favor engaging China and, more broadly, those who believe in the proposition of liberal peace, whether that advanced originally by Immanuel Kant (1795) or more recently articulated by scholars such as Bruce Russett and John Oneal, will surely notice the irony. Beijing is applying the very tools advocated by U.S. liberals to transform China in its effort to restrain assertive and even bellicose unilateralism by the United States. An exclusive concern with the distribution of power misses half the picture. Some take the view that states pursue power as an end in itself. This article adopts the opposite perspective: that power is a means to achieve other ends. States do not go to war unless they believe that they can improve upon their current benefits. This reasoning draws attention to the arguments advanced by the theory of status inconsistency. Do the benefits being received by a state

correspond to its relative power? A rising state will not go to war if it can attain gains in benefits peacefully. Nor will a declining state go to war if it can continue to claim a surplus of benefits (that is, more benefits than it is objectively entitled to by its relative power). As Powell put it succinctly, "if the distribution of benefits mirrors the distribution of power, no state can credibly threaten to use force to change the status quo and the risk of war is smallest. If, however, there is a sufficiently large disparity between the distribution of power and benefits, the status quo may be threatened regardless of what the underlying distribution of power is."[77] This formulation calls attention to not just changes in relative power as a possible determinant of international instability, but also the role played by any possible institutional, political, and psychological rigidity that resists altering the existing distribution of benefits to reflect more accurately recent and ongoing changes in relative power.

Rising power

Friedberg 11 (Aaron L. Friedberg served from 2003 to 2005 in the office of the Vice President of the United States as deputy assistant for national-security affairs and director of policy planningpeer reviewed The Future of U.S.-China Relations: Is Conflict Inevitable? http://www3.nccu.edu.tw/~lorenzo/Friedberg%20US%20China%20Relations.pdf)(AC)

For realist pessimists, the single most important feature of the PRC today is its rising power. Everything else, including the likely character of the U.S.-China relationship, follows from this fact. Taking aggregate economic capacity as a rough surrogate for overall national power, it is apparent that China's growth has been extraordinarily rapid. Since the start of economic reforms in 1978, the PRC's gross national product (GNP) is thought to have increased by a factor of four and, according to some estimates, it could double again by the middle of the second decade of the twenty-first century.[26] What is especially impressive about the Chinese economy is not only the speed with which it appears to be expanding but its growing mass and enormous potential. Given the sheer size of its population and the rising productivity of its workers, China may one day regain its historic position as the world's largest economy. Although such projections are fraught with difficulties and uncertainties, some experts have calculated that China's economy could overtake that of the United States as early as 2015.[27] The combination of the speed and the magnitude of China's growth in recent decades appears to be unprecedented. The closest analogy is proba- bly the emergence of the United States as the world's preponderant economy over the course of the nineteenth century. As was true of the United States in the late nineteenth and early twentieth centuries, so too is China's rapidly growing economy bringing expanding military capabilities in its train. A fast-growing GNP has made it comparatively easy for the PRC to sustain a large and expanding military effort and, in recent years, China's spending on arms and military equipment has grown at an impressive pace.[28] The rising levels of productivity, per capita incomes, and technological competence that accompany economic growth should also translate into an increasing ability both to absorb sophisticated weapons imported from foreign suppliers and eventually to develop such systems indigenously.[29] Although the picture is mixed, and the PRC continues to lag in many areas, these expectations too are borne out by the general pattern of Chinese military development over the last several decades. There are good reasons to expect that China will be able to build and deploy more increasingly capable military systems in the years ahead.[31]

Expansion – SOI

Friedberg 11 (Aaron L. Friedberg served from 2003 to 2005 in the office of the Vice President of the United States as deputy assistant for national-security affairs and director of policy planningpeer reviewed The Future of U.S.-China Relations: Is Conflict Inevitable? http://www3.nccu.edu.tw/~lorenzo/Friedberg%20US%20China%20Relations.pdf)(AC)

Realist pessimists note that, throughout history, rising powers have tended to be troublemakers, at least insofar as their more established counterparts in the international system are concerned. This is the case, in the realists' view, regardless of regime type; it was as true of a rising, democratic United States as it was of a rising, autocratic Germany. As Samuel Huntington has pointed out, "The external expansion of the UK and France, Germany and Japan, the Soviet Union and the United States coincided with phases of intense industrialization and economic development."[31] There appear to be a

number of reasons for this pattern. As a state's capabilities grow, its leaders tend to define their interests more expansively and to seek a greater degree of influence over what is going on around them. Rising powers seek not only to secure their frontiers but to reach out beyond them, taking steps to ensure access to markets, materials, and transportation routes; to protect their citizens far from home, defend their foreign friends and allies, and promulgate their values; and, in general, to have what they consider to be their legitimate say in the affairs of their region and of the wider world. This correlation between growing power and expanding interests has been succinctly summarized by Robert Gilpin: "A more wealthy and more powerful state ... will select a larger bundle of security and welfare goals than a less wealthy and less powerful state."32 As they seek to assert themselves, rising powers are often drawn to challenge territorial boundaries, international institutional arrangements, and hierarchies of prestige that were put in place when they were relatively weak. Their leaders and people often feel that they were unfairly left out when the pie was divided up, and may even believe that, because of their prior weakness, they were robbed of what was rightfully theirs. Like Germany at the turn of the twentieth century, rising powers tend to want their "place in the sun," and this often brings them into conflict with more established great powers, which are typically the architects and principal beneficiaries of the existing international system.33 The collision between the expanding interests of a rising power and those of its more established counterparts can be dealt with in a number of ways, but the resulting disputes are seldom resolved peacefully. Recognizing the growing threat to its position, a dominant power (or coalition of status quo powers) may attempt to use force preventively to destroy a rising state before it can achieve its full potential. Less bellicose, established powers have also at times sought to appease emerging states, looking for ways to satisfy their demands and ambitions without conflict and to engage them and incorporate them peacefully into an existing international order. However sincere and well intentioned these efforts may be, they have usually failed. Sometimes the reason is clearly the character of the demands of the rising state. As was true of Adolf Hitler's Germany, for example, a rising power may have ambitions that are so extensive as to be impossible for the status quo powers to satisfy without effectively committing suicide. Even when the demands being made of them are less extensive, the status quo powers may be too reluctant to make reasonable concessions, thereby fueling the frustrations and resentments of the rising power, or too eager to do so, feeding its ambitions and leading to escalating demands. Successful policies of engagement/appeasement are certainly possible in theory, but in practice they have proven to be difficult to implement.34 Looking at the raw facts of its expanding economy and growing military capabilities, most realist pessimists would be content to conclude that China is a rising power and that, as such, it is unlikely to behave differently than have others of its type throughout history. Thus Huntington, after describing the correlation in past cases between rapid internal growth and external expansion, predicts that China too will "undoubtedly be moving into such a phase in the coming decades."" Similarly, according to John Mearsheimer, so long as China's power continues to grow, "China, like all previous potential hegemons, [will] be strongly inclined to become a real hegemon."36 Some analysts go a step further, arguing that China is especially likely to behave assertively, even at the risk of coming into conflict with others. Recent Chinese history, the "century of humiliation" that began with the Opium Wars of the 1840s and ended only with the final expulsion of foreign powers from the mainland after World War II, appears to have left China's leaders and its people acutely sensitive to perceived slights to national honor and prestige and especially alert to threats around their periphery.37 As a result of the painful experiences of the nineteenth and twentieth centuries, contemporary Chinese strategists may be even more eager than they might otherwise be to establish a sphere of influence or zone of control that would prevent such threats from reemerging in the future.38 Reaching even further back into the past, other observers point to the fact that, before its decline and domination by outside powers, China was for many centuries the preponderant force in Asia and the hub of a Sinocentric Asian international system. As they adapt to the reality of their growing power and look for models to guide their behavior under increasingly favorable conditions, the leadership in Beijing could hearken back to this earlier era of glory and seek to reestablish China as East Asia's preponderant power.39 Some U.S. government agencies have concluded that China's current leaders aim to "maximize [China's] influence within East Asia relative to the U.S." or, more bluntly, to become "the preeminent power in Asia."4"' If this is true, and assuming that the United States continues to adhere to its century-old policy of opposing the dominance of either half of Eurasia by a hostile power or coalition, the stage will be set for an intense and possibly protracted strategic competition between the two Pacific giants.41

Historical analogies can provide a useful basis for understanding. Some have suggested that those in charge of contemporary Sino-American relations can benefit from studying the dynamics of Anglo-German rivalry a century ago.5 Others have tried to synthesize a larger number of historical episodes in order to formulate a more generalizable statement. Among such formulations, the theory of power transition has offered a leading analytic perspective and a robust research program.6 The respect and popularity accorded to this theory follow from a substantial number of studies seeking to validate its empirical derivations.7 Thus, it seems natural that Sinologists as well as others with different field specializations are drawn to this theory. This attraction extends not just to Americans but also to their Chinese colleagues, therefore suggesting a common framework of reference for their dialogue.8 This book focuses on this discourse pertaining to power transition, and seeks to develop and clarify further the relevant analytic logic and conceptual basis in the hope of understanding better the policy and theoretical implications of China's recent ascendance in the international system. What is the central claim of the power-transition theory? It contends that when a revisionist latecomer overtakes an erstwhile leader of the international system, war looms. War is likely to be precipitated by the faster-growing upstart in its attempt to displace the declining hegemon. The Anglo-German rivalry is supposed to exemplify this dynamic that eventually ended in the outbreak of World Wars I and II. Similarly, France's decline relative to Prussia is taken to have set the stage for their war of 1870.9 Contrary to the view that a balance of power between the major states provides a basis for peace and stability, the theory of power transition argues that the approach to a more symmetric relationship and especially the occurrence of a positional reversal between the two top states augur increased bilateral tension which in turn has the potential of engulfing other countries in a system-wide conflict. The logic of the power-transition theory naturally raises the concern that China's recent rapid growth portends more turmoil for the international system and the danger of heightened discord, even military collision, between Beijing and Washington.10 The brief stylized account given above presumes a shared understanding about what makes a state powerful. It would of course be difficult to assess relative changes in national power absent an agreement about the nature of this power. Therefore, when people speak about an ongoing or impending power transition, it is pertinent to inquire about the empirical indicators they are using. That is, what is the nature of their evidence? Although territorial or demographic size may be a factor, it would surely not be a decisive one because, according to these measures, Russia and China would remain the most powerful countries throughout the contemporary era. If one chooses to emphasize military power, for example by focusing on the number of a country's military personnel or the size of its defense budget, the U.K. has never been the world's premier power according to these criteria. Moreover, the entire notion of any ongoing or pending power transition involving the U.S. becomes far-fetched, as this country has been spending more on the military than the rest of the world combined. One could perhaps turn to economic size or productivity as another way to track changing national status. It is worth noting, however, that the U.S. had overtaken the U.K. as the world's largest economy before World War I. According to this criterion, prior to 1914 a power transition had occurred between the U.S. and the U.K. and not between the U.K. and Germany, if one is to focus on the displacement of a previously dominant state by a latecomer. Moreover, the Anglo-American transition was peaceful, even though it was not entirely without acrimony. Measured by their respective economic size, Germany prior to World War II and the USSR since that conflict never came close to challenging the U.S. lead. It also does not appear that the U.S. economy is in any imminent danger of being overtaken by the Chinese economy (certainly not in terms of per capita income which may be used as an approximation of a citizenry's productivity), even though the latter's size has recently grown rapidly from a relatively low base. Finally, if one emphasizes a state's pioneering and dominant status in developing leading economic sectors, one would again be hard

pressed to argue that China is capable currently or in the foreseeable future of competing with the U.S. in fostering scientific discovery and technological innovation.11 These issues naturally require those concerned about power transitions to be more specific about the capability attribute(s) they have in mind when speaking about power shifts among the world's leading states. Without a clear specification of these attributes, one can hardly begin to assess when power transitions have occurred historically and whether any is currently taking place in Sino-American relations. Vague and/or shifting empirical referents cause confusing and even arbitrary arguments about when power transitions occur and what consequences they entail. Although people can have reasonable disagreements about which indicators give the most valid or reliable information about national power, it is necessary for them to be clear and consistent about the ones they do use to reach their judgments. In Chapter 2, I explore different measures of national power for any evidence of an ongoing or impending power transition involving China. This analysis shows that the U.S. has a vast lead in those capabilities that are critical in determining future economic growth and productivity. It is also militarily much stronger than China or, for that matter, any other country or conceivable combination of countries.

Social science proves hegemony

Wohlforth 09 ("http://muse.jhu.edu/journals/world_politics/v061/61.1.wohlforth.html" \l "back"William C. Wohlforth, Professor of government @ Dartmouth College, "Unipolarity, Status Competition, and Great Power War," World Politics, Volume 61, Number 1, January 2009, Pg. 33-35)(AC)

The literature on bargaining failure in the context of power shifts remains inconclusive, and it is premature to take any empirical pattern as necessarily probative. Indeed, Robert Powell has recently proposed that indivisibility is not a rationalistic explanation for war after all: fully rational leaders with perfect information should prefer to settle a dispute over an indivisible issue by resorting to a lottery rather than a war certain to destroy some of the goods in dispute. What might prevent such bargaining solutions is not indivisibility itself, he argues, but rather the parties' inability to commit to abide by any agreement in the future if they expect their relative capabilities to continue to shift. HYPERLINK " The larger point is that positional concerns for status may help account for the puzzle of bargaining failure. In the rational choice bargaining literature, war is puzzling because it destroys some of the benefits or flows of benefits in dispute between the bargainers, who would be better off dividing the spoils without war. Yet what happens to these models if what matters for states is less the flows of material benefits themselves than their implications for relative status? The salience of this question depends on the relative importance of positional concern for status among states. Do Great Powers Care about Status? Mainstream theories generally posit that states come to blows over an international status quo only when it has implications for their security or material well-being. The guiding assumption is that a state's satisfaction [End Page 34] with its place in the existing order is a function of the material costs and benefits implied by that status.24 By that assumption, once a state's status in an international order ceases to affect its material wellbeing, its relative standing will have no bearing on decisions for war or peace. But the assumption is undermined by cumulative research in disciplines ranging from neuroscience and evolutionary biology to economics, anthropology, sociology, and psychology that human beings are powerfully motivated by the desire for favorable social status comparisons. This research suggests that the preference for status is a basic disposition rather than merely a strategy for attaining other goals.25 People often seek tangibles not so much because of the welfare or security they bring but because of the social status they confer. Under certain conditions, the search for status will cause people to behave in ways that directly contradict their material interest in security and/or prosperity. Much of this research concerns individuals, but international politics takes place between groups. Is there reason to expect individuals who act in the name of states to be motivated by status concerns? Compelling findings in social psychology suggest a positive answer. SOCIAL IDENTITY THEORY (SIT) has entered international relations research as a psychological explanation for competitive interstate behavior.26 According to the theory's originator, Henri Tajfel, social identity is "that part of an individual's self-concept which derives from his knowledge of his membership of a social group (or groups) together with the value and emotional significance attached to that membership."27 Tajfel and his followers argue that deep-seated human motivations of self-definition and self-esteem induce people to define their identity in relation to their in-group, to compare and contrast that in-group with out-groups, and to **want that comparison to reflect favorably** on themselves. In a [End Page 35] remarkable set of experiments that has since been replicated dozens of times, Tajfel and his collaborators found that simply assigning subjects to trivially defined "minimal" in-groups led them to discriminate in favor of their in-group at the expense of an out-group, even when nothing else about the setting implied a competitive relationship. Although SIT appears to provide a plausible candidate explanation for interstate conflict, moving beyond its robust but general implication about the ubiquitous potential for status seeking to specific hypotheses about state behavior has proved challenging. In particular, experimental findings concerning which groups individuals will select as relevant comparisons and which of many possible identity-maintenance strategies they will choose have proved highly sensitive to the assumptions made about the social context. The results of experimental research seeking to predict responses to status anxiety—whether people will choose social mobility (identifying with a higher status group), social creativity (seeking to redefine the relevant status-conferring dimensions to favor those in which one's group excels), social conflict (contesting the status-superior group's claim to higher rank), or some other strategy—are similarly highly context dependent.28 For international relations the key unanswered question remains: under what circumstances might the constant underlying motivation for a positive self-image and high status translate into violent conflict? While sit research is suggestive, standard concerns about the validity of experimental findings are exacerbated by the fact that the extensive empirical sit literature is generally not framed in a way that captures salient features of international relations. The social system in which states operate is dramatically simpler than the domestic social settings much of the research seeks to capture. Decision makers' identification with the state is generally a given, group boundaries are practically impermeable, and there are very few great powers and very limited mobility. For states, comparison choice and the selection of status- maintenance strategies are constrained by exogenous endowments and geographical location. Natural and historical endowments—size and power potential—vary much more among states than among individuals [End Page 36] and so play a much larger role in determining hierarchies and influencing the selection of identity maintenance strategies. Assumptions built into most sit research to date generally do not capture these realities of interstate life. In particular, standard sit research designs beg the question of the expected costs of competing for status. Experiments do not generally posit situations in which some groups are endowed with demonstrably superior means with which to discriminate in favor of their own group at the expense of out-groups. Indeed, built in to most experimental setups is an implied assumption of material equality among groups. Yet international politics is notable as a social realm with especially large disparities in material capabilities, and decision makers are unlikely to follow identity-maintenance strategies that are demonstrably beyond their means. Nevertheless, there is no reason to doubt the relevance for states of sit's core finding that individual preferences for higher status will affect intergroup interactions. Individuals who identify with a group transfer the individual's status preference to the group's relations with other groups. If those who act on behalf of a state

(or those who select them) identify with that state, then they can be expected to derive utility from its status in international society. In addition, there are no evident reasons to reject the theory's applicability to interstate settings that mimic the standard sit experimental setup—namely, in an ambiguous hierarchy of states that are comparable in material terms. As Jacques Hymans notes: "In the design of most sit experiments there is an implicit assumption of rough status and power parity. Moreover, the logic of sit theory suggests that its findings of in group bias may in fact be dependent on this assumption."29Status conflict is thus more likely in flat, ambiguous hierarchies than in clearly stratified ones. And there are no obvious grounds for rejecting the basic finding that comparison choice will tend to be "similar but upward" (that is, people will compare and contrast their group with similar but higher status groups).30 In most settings outside the laboratory this leaves a lot of room for consequential choices, but in the context of great power relations, the set of feasible comparison choices is constrained in highly consequential ways. [End Page 37]How Polarity Affects Status Competition SIT is often seen in a scholarly context that contrasts power-based and identity-based explanations.31 It is thus put forward as a psychological explanation for competitive behavior that is completely divorced from distributions of material resources. But there is no theoretical justification for this separation. On the contrary, a long-standing research tradition in sociology, economics, and political science finds that actors seek to translate material resources into status. Sociologists from Weber and Veblen onward have postulated a link between material conditions and the stability of status hierarchies. When social actors acquire resources, they try to convert them into something that can have more value to them than the mere possession of material things: social status. As Weber put it: "Property as such is not always recognized as a status qualification, but in the long run it is, and with extraordinary regularity." 32 This link continues to find support in the contemporary economics literature on income distribution and status competition.33 Status is a social, psychological, and cultural phenomenon. Its expression appears endlessly varied; it is thus little wonder that the few international relations scholars who have focused on it are more struck by its variability and diversity than by its susceptibility to generalization. 34 Yet if SIT captures important dynamics of human behavior, and if people seek to translate resources into status, then the distribution of capabilities will affect the likelihood of status competition in **predictable ways**. Recall that theory, research, and experimental results suggest that relative status concerns will come to the fore when status hierarchy is ambiguous and that people will tend to compare the states with which they identify to similar but higher-ranked states.35 Dissatisfaction arises not from dominance itself but from a dominance that [End Page 38] appears to rest on ambiguous foundations.

Distribution of resources and dissatisfied contenders prove the need for hegemony

Bussman and Oneal 07 (Margit Department of Politics and Management University of Konstanz, Germany and John Political Science Department University of Alabama, Tuscaloosa "Do Hegemons distribute private goods" https://kops.uni-konstanz.de/bitstream/handle/123456789/4147/Do_hegemons_distribute_privat_goods_Bussmann_Oneal_JCR_2007_51_88.pdf?sequence=1&isAllowed=y)(AC)

Power-transition theory is constructed on three fundamental claims (Kugler and Lemke 2000): the internal growth of nations influences international politics, world politics is characterized by hierarchy rather than anarchy, and relative power and evaluations of the international status quo are important determinants of interstate wars. From its earliest formulation, Organski (1968) emphasized the implications of national economic and political development for interstate relations in the modern era. Industrialization and the growing effectiveness of the state increase a nation's power and change its behavior internationally. The countries that industrialized first came to dominate the international system in the eighteenth and nineteenth centuries, but later modernizers periodically challenged the status quo. This emphasis on the international implications of domestic development sets power-transition theory apart from most realist writings, which typically take a more static view of nations' power. An even more striking difference with conventional realism is the emphasis power-transition theory places on the hierarchical—rather than anarchic—character of world politics. Organski (1968) likened the international system to a pyramid with the most powerful state at the apex and major, middle, and minor powers arrayed below. Relations among these states are anarchic in the literal sense that there is no world government, but the international system is not chaotic. The international system is hierarchical because the dominant state established and maintains it, creating patterns in states' political, military, and economic relations and in "the distribution of value" (Kugler and Lemke 2000, 131). The leading state "orders, adjusts, and allocates" (Siverson and Miller 1996, 59), and it "always benefits disproportionately from any enterprises involving less powerful states, be they friends or foes" (Organski 1968, 358). Thus, power-transition theorists adopt the traditional view of the powerful: they use their power to promote their interests. The dominant state maintains a stable international order because it is the principal beneficiary of peace. 90 Journal of Conflict Resolution © 2007 SAGE Publications. All rights reserved. Not for commercial use or unauthorized distribution. Downloaded from http://jcr.sagepub.com at Universitat Konstanz on March 16, 2007 Bussmann, Oneal / Do Hegemons Distribute Private Goods? 91 To serve its interests, the hegemon enlists the support of other powerful states.1 Despite its

great capabilities, it cannot control potential rivals by itself or cannot control them as efficiently, so the leading state constructs a defensive security system— a status quo alliance system (Tammen et al. 2000, 33) designed to maintain the advantageous global order it created after the last great war (Organski 1968; Gilpin 1981). To be successful, a number of great and middle powers must be attracted to the hegemon's side. Powerful states are courted because they can provide valuable support. The dominant state maintains the status quo by "managing the international system under rules that benefit its allies and satisfy their national aspirations" (Tammen et al. 2000, 6). A few states at the top, more in the middle, and most at the bottom of the hierarchy are excluded from the hegemon's alliance system and are consequently dissatisfied with the existing distribution of value.2 Power-transition theory argues that alliances tend to be fixed while traditional realism sees shifting commitments as a crucial mechanism for maintaining the balance of power. The danger of a major war does not come from small states—whether dissatisfied or not—or from powerful, satisfied ones. Small states cannot effectively challenge the status quo, and the dominant state's powerful allies have limited incentive to do so. "These nations are satisfied with the present international order and its working rules, for they feel that the present order offers them the best chance of obtaining the goals they have in mind"; they have "their rightful share of benefits" (Organski 1968, 366). It is a powerful, dissatisfied state that threatens the peace, for it has both the opportunity and the willingness to initiate conflict (Starr 1978). Usually such states have come to power after the current order was established and the distribution of benefits determined. They seek to restructure the system to receive benefits commensurate with their newly acquired power. Consequently, the prospect of a great war grows as a powerful dissatisfied challenger overtakes the hegemon. The dominant nation can anticipate such a challenge and will use its power over the international distribution of value in an attempt to preserve its privileged position. It can, for example, delay the rival's growth by imposing trade barriers and embargoes, refusing to provide aid, and supporting discriminatory action in international organizations (Lemke 2002, 22-27; Lemke 2004). The leading state directs sanctions toward and benefits away from threatening states. Control over the distribution of private goods is, according to power-transition theory, important in supplementing deterrence in the hegemon's efforts to maintain the status quo.

Econ cards

Our form of predictions are good

Mincer 69 (Jacob Economic forecast and lead analyst at the National Bureau of Economic Research "ECONOMIC FORECASTS AND EXPECTATIONS" http://www.nber.org/chapters/c1214.pdf)(AC)

An economic forecast may be called "scientific" if it is formulated as a verifiable prediction by means of an explicitly stated method which can be reproduced and checked.1 Comparisons of such predictions and the realizations to which they pertain provide tests of the validity and predictive power of the economic model which produced the forecasts. Such empirical tests are an indispensable basis for further scientific progress. Conversely, as knowledge accumulates and the models improve, the reliability of forecasts, viewed as information about the future, is likely to improve. Forecasts of future economic magnitudes, unaccompanied by an explicit specification of a forecasting method, are not scientific in the above sense. The analysis of such forecasts, which we shall call "business forecasts," is nevertheless of interest.2 There are a number of reasons for this interest in business forecasts: 1. To the extent that the predictions are accurate, they provide information about the future. 2. Business forecasts are relatively informative if their accuracy is not inferior to the accuracy of forecasts arrived at scientifically, particularly if the latter are more costly to obtain. 3. Conversely, the margin of inferiority (or superiority) of business forecasts relative to scientific forecasts serves as a yardstick of progress in the scientific area. 4. Regardless of the predictive performance ascertainable in the future, business forecasts represent a sample of the currently prevailing climate of opinion. They are, therefore, a datum of some importance in understanding current economic behavior. 5. Even though the methods which produce the forecasts are not specified by the forecasters, it is possible to gain some understanding of the genesis of forecasts by relating the predictions to other available data. In this paper we are concerned with the analysis of business forecasts for some of these purposes. Specifically, we are interested in methods of assessing the degree of accuracy of business forecasts both in an absolute and in a relative sense. In the Absolute Accuracy Analysis (Section I) we measure the closeness with which predictions approximate their realizations. In the Relative Accuracy Analysis (Section II) we assess the net contributions, if any, of business forecasts to the information about the future available from alternative, relatively quick and cheap methods. The particular alternative or benchmark method singled out here for analysis is extrapolation of the past history of the series which is being predicted. The motivation for this choice of benchmark is spelled out in Section II. It will be apparent, however, that our relative accuracy analysis is suitable for compariSons of any two forecast methods. The treatment of extrapolations as benchmarks against which the predictive power of business forecasts is measured does not imply that business forecasts and extrapolations constitute mutually exclusive methods of prediction. It is rather plausible to assume that most forecasts rely to some degree on extrapolation. If so, forecast errors are partly due to extrapolation errors. Hence, an analysis of the predictive performance of extrapolations can contribute to the understanding and assessment of the quality of business forecasts. Accordingly, we proceed in Section III to inquire into the relative importance of extrapolations in generating business forecasts, and to study the effects of extrapolation error on forecasting error.3

Perm

Perm solves best—allows for best policymaking through critique of discourse and its understanding its historical effects

Puar and Rai 2 [Jasbir Puar, Associate Professor of Women's & Gender Studies at Rutgers University; Amit Rai, Senior Lecturer in New Media and Communication @ Queen Mary University of London; "Monster, Terrorist, Fag: The War on Terrorism and the Production of Docile Patriots", pg 121-122; Social Text; Vol 20 No 3; Fall 2002; accessed 7/20/2015; MUSE.] We do not endorse gendered language

Today, we find the two figures of the monster and the person to be corrected in some ways converging in the discourse of the terrorist-monster. Which is to say that the terrorist has become both a monster to be quarantined and an individual to be corrected. It is in the strategic analyses of terrorism that these two figures come together. For the past thirty years, since 1968, the Western academy has been involved in the production and implementation of a body of knowledge that took the psyche of the terrorist as its object and target: "terrorism studies." The strategic analysis of what in the intelligence community is known as "violent substate activism" is at the moment a highly sought-after form of knowledge production. And it has direct policy relevance; hence its uneven integration into the broader field of what Edward Said once named as the disciplinary home of Orientalism: "policy studies."9 Our own analysis has been usefully informed by the pioneering work of scholars and activists such as Said, Cynthia Enloe, Ann Tickner, Noam Chomsky, Shirin M. Rai, Edward Herman, Helen Caldicott, Philip Agee, Talal Asad, and others.10 These writers have opened a space of critique that brings the **epistemological and ethical claims** of terrorism studies to crisis; their rigorous and impassioned interrogation of U.S. foreign policy has not only enabled subsequent writers to make connections to ongoing domestic wars against people of color and the working poor but crucially, their critiques have enabled the countermemory of other genealogies, histories, and modes of power: for example, sexuality, colonialism, and normalization. So, for instance, in the discourse of counterterrorism the shared modernity of the monster and the delinquent comes together in the knowledge of cultures, nations, and races. As one editorial in the magazine Foreign Policy put it, "The Global Positioning System, unmanned drones, unrivaled databases, and handheld computers—much has been made of the technological resources available to the U.S. military and diplomatic establishments. But what do you do if you're trying to wage war in or against a country where you don't know the locals, can't speak the language, and can't find any reliable maps? Welcome to the front lines of the war against terrorism, likely to be waged primarily in 'swamp states' about which the United States knows little."11 The writer ends the piece by drawing a particular lesson from Sun Tzu's The Art of War: "'If you know yourself but not the enemy, for every victory gained you will also suffer a defeat.' If any war on terrorism is to succeed, the United States has some serious learning to do."

Terrorism studies is at the forefront of this knowledge production. In an article in the Rand Corporation–funded journal, Studies in Conflict and Terrorism, Richard Falkenrath notes:

The literature on terrorism is vast. Most of this work focuses on the practi- tioners of terrorism, that is, on the terrorists themselves. Different strands within terrorism studies consider, for example, the motivations or belief sys- tems of individual terrorists; the external strategies or . . . internal dynamics of particular terrorist organizations; or the interaction of terrorist move- ments with other entities, such as governments, the media, or social sub- groups. . . . Terrorism studies aspires not just to scholastic respectability but to policy relevance. . . . It has helped organize and inform governmental counter-terrorism practices.12

Perm is the only way to solve the alt—avoids cooption of squo

Richard **Jackson**, Marie Breen **Smyth**, **and** Jeroen **Gunning 09**, Jackson is a Senior Researcher at the Centre for the Study of Radicalization and Contemporary Political Violence (CSRV), Smyth is Director of the CSRV, and Gunning is a Lecturer in International Politics at Aberystwyth University, 2009, "Critical Terrorism Studies: A new research agenda," pg 226, https://books.google.com/books?hl=en&lr=&id=NZEMLpmDK6IC&oi=fnd&pg=PP1&dq=critical+terror+studies+terrorism+studies&ots=BM1YDK-ij4&sig=Z182J5jqiDUgTsk2WkXvr9_R7_k#v=onepage&q&f=false

Another important methodological commitment that flows from our position is a permanent adherence to a set of responsible research ethics which take account of the various end-users of **terrorism research**, including informants, the "suspect communities* from which terrorists often emerge, and the populations who bear the brunt of terrorist campaigns and counterterrorism policies - as well as the wider public, other academics, and policymakers. More concretely, this means 'recognising the human behind the [terrorist] label' (Booth, 2008: 73), identifying marginalised and silenced voices, the adoption of a 'do no harm' approach to research, operating transparently as a researcher, recognising the vulnerability of those we research, honouring undertakings of confidentiality and protecting our interviewees, utilising principles of informed consent, and taking responsibility for the anticipated impact of our research and the ways in which it may be utilised. Adopting research paradigms, such as participative action research which aims to establish partnerships with researched populations, particularly when working with 'suspect communities', is a method of attempting to give away or share one's power as a researcher and an academic. As critical researchers, these are all principles, paradigms, and strategies that we ought to explore.

If a critically-informed research praxis is distinguished by its explicit commitment to human emancipation, an important component of CTS research is to try to **influence policy.** As we have argued both in this volume and elsewhere, **not being concerned with policy relevance is not an option** for scholars **committed to human emancipation** (Gunning, 2007b; Toros and Gunning, this volume). However, this does not mean that one should limit oneself to being relevant to state elites. Critical scholars should engage both policymakers and policy-takers, if their primary commitment is to humanity, rather than the state. Engaging policy-takers, furthermore, serves to lessen the risk of co-option by the status quo, particularly if those thus engaged include members of communities labelled "suspect' by the state, those designated 'terrorists', and so on. However, to be effective, and to work towards realising the potential for immanent change within the status quo, critical scholars must simultaneously strive to engage those who are embedded in the state, members of the 'counterterrorist' forces, the political elite, and so on.

Perm works within their framework—a responsible educator will attempt to change the system, not just criticize it

Lee **Jarvis 09**, Lecturer in the Department of Politics and International Relations at Swansea University, February 2009, "The Spaces and Faces of Critical Terrorism Studies," Security Dialogue 40-1, http://sdi.sagepub.com/content/40/1/5.full.pdf+html

It is, perhaps, too early to know whether the critical terrorism studies enterprise will replicate the achievements of the earlier critical security studies project(s). As one contribution to that enterprise, this article set out to expose the normative and meta-theoretical assumptions underpinning more orthodox works in this area. This exploration opened space for a sustained investigation into two competing analytical strategies for countering these problematic assumptions. By reflecting on the very different practices of resistance or critique embodied by these faces, the article sought to unpack the implications that accompany either broadening or reversing the gaze in the context of terrorism. As argued above, such an exercise not only adds specificity and detail to a burgeoning, and vital, research agenda; it also creates opportunities for discussion between critically oriented scholars engaging with political violence and other issues beyond.

If the two faces of critical terrorism studies discussed above depart from each other largely through their different conceptions and practices of critique, greater reflection on this issue is likely to be crucial in furthering this enterprise. At the risk of homogenizing several bodies of literature, the first, broadening, face offers a form of juxtapositional critique in substituting one conception of terrorism for an alternative – more accurate – account. Although an appealing normative call to detachment and distance in scholarship, this approach ultimately **reinforces the analytical questions and paradigms structuring the mainstream debates**. Trading truths about terrorism, I argued, is critical only up to a point.

The second, interpretivist, face of critical terrorism studies, by contrast, offers an alternative approach to critique as a practice of destabilization or discursive intervention (see, for example, Campbell, 1998: 4–8). Although variants of this style of enquiry may be found in strategies of immanent critique and deconstruction (Roffe, 2004: 44; Wyn Jones, 2005: 228), Foucault's (1988: 154–155) famous synopsis remains useful here:

A critique is not a matter of saying that things are not right as they are. It is a matter of pointing out on what kinds of assumptions, what kinds of familiar, unchallenged, unconsidered modes of thought the practices that we accept rest. . . . Criticism is a matter of flushing out that thought and **trying to change it**: to show that things are not as selfevident as one believed, to see that what is accepted as self-evident will no longer be accepted as such. Practicing criticism is a matter of making facile gestures difficult.

As Foucault's remarks suggest, by encouraging us to expose and contest constructions of (counter)terrorism, along with their political functions and outcomes, this second face offers the responsible scholar of terror a far more active and analytically sound strategy for **practising criticism** than its alternatives.

Perm solves—policy must be influenced by critical theory to truly reject the orthodoxy
Richard **Jackson**, Marie Breen **Smyth**, **and** Jeroen **Gunning 09**, Jackson is a Senior Researcher at the Centre for the Study of Radicalization and Contemporary Political Violence (CSRV), Smyth is Director of the CSRV, and Gunning is a Lecturer in International Politics at Aberystwyth University, 2009, "Critical Terrorism Studies: A new research agenda," pg 213, https://books.google.com/books?hl=en&lr=&id=NZEMLpmDK6IC&oi=fnd&pg=PP1&dq=critical+terror+st udies+terrorism+studies&ots=BM1YDK-ij4&sig=Z182J5jqiDUgTsk2WkXvr9_R7_k#v=onepage&q&f=false

Although critical scholars may wish to distance themselves from certain aspects of government policy, it is crucial that they remain engaged with policymakers, **so that policy is informed by** a diverse range of views, not merely the orthodoxy. Critical scholars cannot complain about government policy on terrorism if they have not attempted to inform thai policy. Even though critical voices may be disregarded or not taken seriously, critical scholars should not let this prevent them from talking to policymakers and government, and speaking "truth to power', even though 'power' may not listen.

Some worry about accepting government funding, and the case study presented here illustrates how the design of research programmes and the involvement of certain agencies may preclude scholars' participation. However, this does not mean that all government funding is problematic or that it is not

possible to accept funding from government and retain one's integrity - and one's safety. Such decisions are made on a case-by-case basis: after all, both governments and research fields change over time.

Critical theorizing can't solve—utopian

David Martin **Jones** and M. L. R. **Smith 09**, Jones is an Associate Professor of Political Theory at the University of Queensland and Smith is a Professor of Strategic Theory at King's College in London, March 28, 2009, "We're All Terrorists Now: Critical—or Hypocritical—Studies "on" Terrorism?," Studies in Conflict and Terrorism 32-4,
http://www.tandfonline.com/doi/abs/10.1080/10576100902744128#.VbuPGipViko

In the end, un-coerced norm projection is not concerned with the world as it is, but how it ought to be. This not only compounds the logical errors that permeate critical theory, it advances an ultimately utopian agenda under the guise of soi-disant cosmopolitanism where one somewhat vaguely recognizes the "human interconnection and mutual vulnerability to nature, the cosmos and each other" (p. 47) and no doubt bursts into spontaneous chanting of Kumbaya.

In analogous visionary terms, Booth defines real security as emancipation in a way that denies any definitional rigor to either term. The struggle against terrorism is, then, a struggle for emancipation from the oppression of political violence everywhere.

Consequently, in this Manichean struggle for global emancipation against the real terror of Western democracy, Booth further maintains that universities have a crucial role to play. This also is something of a concern for those who do not share the critical vision, as university international relations departments are not now, it would seem, in business to pursue dispassionate analysis but instead are to serve as cheerleaders for this critically inspired vision

Perm solves—we must appreciate critical perspectives

Nathan **Roger 10**, Professor of International Relations and Critical Security Studies, 2010, Book Review on "Security and the war on terror," International Affairs 86

In the conclusion, Sara E. Davies and Richard Devetak draw together the diverse arguments presented in this volume, reiterating that the return to realism in the aftermath of the September 11 attacks was misguided, and that to engage fully with contemporary security issues there should be 'a greater appreciation of critical approaches that questioned why insecurity existed, who was most insecure, how those insecurities might be ameliorated and how best to understand and explain security and insecurity' (p. 190). My only criticism is that this volume does not deal with the important relationship between media studies, visual culture and security in the war on terror. After all, we live in an information age where new media and images progressively dominate our lives. We are also increasingly made aware of contemporary security issues through these media and images— rather than through speech alone— hence Bleiker's announcement of an aesthetic turn in the study of IR (Millennium 30: 3, 2001, pp. 509–33). Unfortunately, in this volume the editors have themselves sidelined this important area of critical security studies.

Alt

Acknowledgement fails without connecting queer spaces to other forms of oppression

Natalie **Oswin 08**, Associate Professor in the Department of Geography, "Critical geographies and the uses of sexuality: deconstructing queer space," Progress in Human Geography 32(1)

The experiences of non-heterosexuals are no longer excluded within critical geographical work. This important change is undoubtedly the result of various disciplinary engagements with queer theory. And for as long as non-heterosexuals are discriminated against, queer spaces will remain something that, to borrow Spivak's phrase, queers cannot not want. So there is certainly a need for the recent geographical readings of queer spaces that help us understand queer cultural politics as contested sites in which racializations, genderings and classed processes take place. There are also other geographical uses for queer theory. Much of the work that I have highlighted adopts a queer approach to such issues as transnational labour flows, diaspora, immigration, public health, globalization, domesticity, geopolitics and poverty. It demonstrates the use of queer theory to these central concerns of critical geography far beyond analysis of their relationship to gay, lesbian, bisexual or transgendered lives. Once we dismiss the presumption that queer theory offers only a focus on 'queer' lives and an abstract critique of the heterosexualization of space, we can utilize it to deconstruct the hetero/homo binary and examine sexuality's deployments in concert with racialized, classed and gendered processes. Queering our analysis thus helps us to position sexuality within multifaceted constellations of power. As critical geographers seek to understand these constellations, the advancement of a queer approach alongside postcolonial, feminist, critical race and materialist approaches will most certainly help to ask new questions and illuminate a broader range of critical possibilities.

"Terrorist"

Turn—definition destroys advocacy skills, leads to worse representations, and fuels political opportunism

Christopher J. **Finlay 1/8**, reader in political theory at the University of Birmingham, January 8, 2015, "How to do things with the word 'terrorist'," Review of International Studies, Vol. 35, No. 4 (October 2009)

First of all, I agree that the application of the term 'terrorist' mainly to non-state entities is arbitrary from a purely moral point of view. There is therefore a good philosophical reason for arguing that the word should be available to direct against actions of a certain kind by states too. Moreover, there is a rhetorical argument for challenging the exclusion of states. Theorists and activists rightly voice concern that restricting 'terrorist' to the discussion of non-state actions unfairly biases public-critical discourse and policy in favour of states whose actions may be no different morally from those who try to resist them (they are often much worse, as Held rightly emphasises).81 There is therefore both a rhetorical and a philosophical rationale for rebalancing debate by broadening the scope of 'terrorist' to include some actions by states, thus permitting a more direct commensuration of state and non-state violence.

A rhetorical approach, however, suggests some further considerations that theorists ought to bear in mind around the question of redescriptive strategies. None of these are strong enough to eliminate absolutely the possibility of revisionary redescription, but I think they do suggest that theorists should approach the question with caution. First of all, while ordinary usages might be changed through redescriptive rhetorics, it would be difficult, to say the least, for theorists to achieve this comprehensively, that is, to bring about a wider shift in public discourse. Moreover, where change does occur, it is likely to be just as hard to control the direction it takes and its consequences. Changes in definition are therefore likely to have two detrimental effects: first, where proposals for redefinition aren't accepted widely or quickly enough in public discourse, they are likely to cause confusion amongst interlocutors who have to negotiate meanings using a variety of conflicting older and newer linguistic norms. This will diminish the ability of conscientious participants in public debate to argue effectively and hence diminish persuasiveness. In the short term, therefore, redefinition could decrease rather than increase the clarity of moral-political debate and make it harder for speakers to make distinctions of the kind we want to achieve. These considerations suggest that one should be hesitant about semantic innovation. Having said that, if the philosophical or rhetorical rationale for change were sufficiently compelling, theorists should then do their best to publicise their arguments and penetrate public consciousness. But for reasons to which I'll return below, I'm not sure the case for change is as compelling in this case as is sometimes suggested.

Secondly, redefinition may increase the chance of political opportunism and unscrupulous, ad hoc revisionary redescriptions. The most obvious recent example is the foreign policy rhetoric in the US and Britain after 2001 where the idea of 'terror' was adapted to include a range of states that could potentially be made subject to aggression, notably Iraq, North Korea, and Iran. Noam Chomsky charted similar strategies against 'state-directed international terrorism' pursued by the Reagan administration in the 1980s.82 Similarly, if theorists worry that the application of 'terrorist' of non-state groups unduly prejudices rhetoric against resistance, say in the occupied territories of Palestine, and in favour of aggressive actions, say by an Israeli state against civilians, they might also pause to consider the

permissiveness in foreign policy opened up by helping the Israeli government to denominate not only Fatah and Hamas but also its neighbouring states as 'terrorist'. Expansionary redefinition could thus sometimes help states rather than non-state groups.

AT Security K

AT Impact/Alternative

There's no root cause of conflict and threat construction is inevitable – even if security is socially constructed, states use balance of power and deterrence to make foreign policy calculations
Moore '04

Dir. Center for Security Law @ University of Virginia, 7-time Presidential appointee, & Honorary Editor of the American Journal of International Law, Solving the War Puzzle: Beyond the Democratic Peace, John Norton Moore, page 27-31.

As so broadly conceived, <u>there is strong evidence that deterrence</u>, that is, <u>the effect of external factors on the decision to go to war, is the missing link in the war/peace equation</u>. In my War/Peace Seminar, I have undertaken to examine the level of deterrence before the <u>principal wars of the twentieth century.</u>10 This examination has led me to believe that <u>in every case the</u> potential <u>aggressor made a rational calculation that the war would be won,</u> and won promptly.11 In fact, the longest period of time calculated for victory through conventional attack seems to be the roughly six reeks predicted by the German General Staff as the time necessary) prevail on the Western front in World War I under the Schlieffen Plan. <u>Hitler believed</u> in his attack on Poland that <u>Britain and France could not</u> take the occasion to <u>go to war with him</u>. And he believed his 1941 Operation Barbarossa against the Soviet Union that "[w]e have only to kick in the door and the whole rotten structure will come crashing down."12 In contrast, following Hermann Goering's failure to obtain air superiority in the Battle of Britain, Hitler called off the invasion of Britain and shifted strategy to the nighttime bombing of population centers, which became known as the Blitz, in a mistaken effort to compel Britain to sue for peace. <u>Calculations in the North Korean attack</u> on South Korea <u>and Hussein's attack on Kuwait were that the operations would be completed in a matter of days</u>. Indeed, <u>virtually all principal wars in the twentieth century,</u> at least those involving conventional invasion, <u>were preceded by</u> what I refer to as a "<u>double deterrence absence</u>." That is, <u>the</u> potential <u>aggressor believed that they had the military force</u> in place <u>to prevail promptly</u> and that nations that might have the military or diplomatic power to prevent this were not dined to intervene. This analysis has also shown that many of the perceptions we have about the origins of particular wars are flatly wrong. Anyone who seriously believes that World War I was begun by competing alliances drawing tighter should examine the al historical record of British unwillingness to enter a clear military alliance with the French or to so inform the Kaiser! Indeed, this pre-World War I absence of effective alliance and resultant war contrasts sharply with the laterrobust NATO alliance and absence of World War III.14 Considerable other evidence seems to support this historical analysis as to the importance of deterrence. Of particular note, Yale Professor Donald Kagan, a preeminent United States historian who has long taught a seminar on war, published in 1995 a superb book On the Origins of War and the Preservation of Peace.15 In this book heconducts a detailed examination of the <u>Peloponnesian War, World War I, Hannibal's War, and World War II,</u> among other case studies. A careful reading of these studies suggests that <u>each war could have been prevented by achievable deterrence</u> and that <u>each occurred in the absence of such deterrence</u>.16 <u>Game theory seems to offer yet further support</u> for the proposition that appropriate deterrence can prevent war. For example, Robert Axelrod's famous 1980s experiment in an iterated prisoner's dilemma, which is a reasonably close proxy for many conflict settings in international relations, repeatedly showed the effectiveness of a simple tit for tat strategy.17<u>Such a strategy is at core simply a basic deterrent strategy of influencing behavior through incentives</u>. Similarly, much of <u>the game-theoretic work on crisis bargaining</u> (and danger of asymmetric information) in <u>relation to war and the democratic peace assumes the importance of deterrence</u> through communication of incentives.18 The well-known correlation between war and territorial contiguity seems also to underscore the importance of deterrence and is likely principally a proxy for levels of perceived profit and military achievability of aggression in many such settings. It should further be noted that the democratic peace is not the only significant correlation with respect to war and peace, although it seems to be the most robust. Professors Russett and Oneal, in recently exploring the other elements of the Kantian proposal for "Perpetual Peace," have also shown a strong and statistically significant correlation between economically important bilateral trade between two nations and a reduction in the risk of war between them. Contrary to the arguments of "dependency theorists," such economically

important trade seems to reduce the risk of war regardless of the size relationship or asymmetry in the trade balance between the two states. In addition, there is a statistically significant association between economic openness generally and reduction in the risk of war, although this association is not as strong as the effect of an economically important bilateral trade relationship.° Russett and Oneal also show a modest independent correlation between reduction in the risk of war and higher levels of common membership in international organizations.[20] And they show that a large imbalance of power between two states significantly lessens the risk of major war between them.[21] All of these empirical findings about war also seem to directly reflect incentives; that is, a higher level of trade would, if foregone in war, impose higher costs in the aggregate than without such trade,[22] though we know that not all wars terminate trade. Moreover, with respect to trade, a, classic study, Economic Interdependence and War, suggests that the historic record shows that it is not simply aggregate levels of bilateral trade that matters, but expectations as to the level of trade into the future.[23] This directly implicates expectations of the war decision maker as does incentive theory, and it importantly adds to the general finding about trade and war that even with existing high levels of bilateral trade, changing expectations from trade sanctions or other factors affecting the flow of trade can directly affect incentives and influence for or against war. A large imbalance of power in a relationship rather obviously impacts deterrence and incentives. Similarly, one might incur higher costs with high levels of common membership in international organizations through foregoing some of the heightened benefits of such participation or otherwise being presented with different options through the actions or effects of such organizations. These external deterrence elements may also be yet another reason why democracies have a lower risk of war with one another. For their freer markets, trade, commerce, and international engagement may place them in a position where their generally higher level of interaction means that aggression will incur substantial opportunity costs. Thus, the "mechanism" of the democratic peace may be an aggregate of factors affecting incentives, both external as well as internal factors. Because of the underlying truth in the relationship between higher levels of trade and lower levels of war, it is not surprising that theorists throughout human history, including Baron de Montesquieu in 1748, Thomas Paine in 1792, John Stuart Mill in 1848, and, most recently, the founders of the European Union, have argued that increasing commerce and interactions among nations would end war. Though by themselves these arguments have been overoptimistic, it may well be that some level of "globalization" may make the costs of war and the gains of peace so high as to powerfully predispose to peace. Indeed, a 1989 book by John Mueller, Retreat From Doomsday,[24] postulates the obsolescence of major war between developed nations (at least those nations within the "first and second worlds") as they become increasingly conscious of the rising costs of war and the rising gains of peace. In assessing levels of democracy, there are indexes readily available, for example, the Polity III[25] and Freedom House [26] indexes. I am unaware of any comparable index with respect to levels of deterrence that might be used to test the importance of deterrence in war avoidance?' Absent such an accepted index, discussion about the importance of deterrence is subject to the skeptical observation that one simply defines effective deterrence by whether a war did or did not occur. In order to begin to deal with this objection and encourage a more objective methodology for assessing deterrence, I encouraged a project to seek to develop a rough but objective measure of deterrence with a scale from minus ten to plus ten based on a large variety of contextual features that would be given relative weighting in a complex deterrence equation before applying the scaling to different war and nonwar settings.[28] On the disincentive side of the scale, the methodology used a weighted calculation of local deterrence, including the chance to prevent a short- and intermediate-term military victory, and economic and political disincentives; extended deterrence with these same elements; and contextual communication and credibility multipliers. On the incentive side of the scale, the methodology also used a weighted calculation of perceived military, economic, and political benefits. The scales were then combined into an overall deterrence score, including, an estimate for any effect of prospect theory where applicable.[2] This innovative first effort uniformly showed high deterrence scores in settings where war did not, in fact, occur. Deterring a Soviet first strike in the Cuban Missile Crisis produced a score of +8.5 and preventing a Soviet attack against NATO produced a score of +6. War settings, however, produced scores ranging from -2.29 (Saddam Hussein's decision to invade Kuwait in the Gulf War), -2.18 (North Korea's decision to invade South Korea in the Korean War), -1.85 (Hitler's decision to invade Poland in World War II), -1.54 (North Vietnam's decision to invade South Vietnam following the Paris Accords), -0.65 (Milosevic's decision to defy NATO in Kosovo), +0.5 (the Japanese decision to attack Pearl Harbor), +1.25 (the Austrian decision, egged on by Germany, to attack Serbia, which was the real beginning of World War I), to +1.75 (the German decision to invade Belgium and France in World War I). As a further effort at scaling and as a point of comparison, I undertook to simply provide an impressionistic rating based on my study of each pre-crisis setting. That produced high positive scores of +9 for both deterring a Soviet first strike during the Cuban Missile Crisis and NATO's deterrence of a Warsaw Pact attack and even lower scores than the more objective effort in settings where wars had occurred. Thus, I scored North Vietnam's decision to invade South Vietnam following the Paris Accords and the German decision to invade Poland at the beginning of World War II as -6; the North Korean/Stalin decision to invade South Korea in the Korean War as -5; the Iraqi decision to invade the State of Kuwait as -4; Milosevic's decision to defy NATO in Kosovo and the German decision to invade Belgium and France in World War I as -2; and the Austrian decision to attack Serbia and the Japanese decision to attack Pearl Harbor as -1. Certainly even knowledgeable experts would be likely to differ in their impressionistic scores on such pre-crisis settings, and the effort at a more objective methodology for scoring deterrence leaves much to be desired. Nevertheless, both exercises did seem to suggest that deterrence matters and that high levels of deterrence can prevent future war. Following up on this initial effort to produce a more objective measure of deterrence, two years later I encouraged another project to undertake the same effort, building on what had been learned in the first iteration. The result was a second project that developed a modified scoring system, also incorporating local deterrence, extended deterrence, and communication of intent and credibility multipliers on one side of a scale, and weighing these factors against a potential aggressor's overall subjective incentives for action on the other side of the scale.[3]° The result, with a potential range of -5.5 to +10, produced no score higher than +2.5 for eighteen major wars studied between

1939 and the 1990 Gulf War.[31] Twelve of the eighteen wars produced a score of zero or below, with the 1950-53 Korean War at -3.94, the 1965-75 Vietnam War at -0.25, the 1980-88 Iran-Iraq War at -1.53, and the 1990-91 Gulf War at -3.83. The study concluded that in more than fifty years of conflict there was "no situation in which a regime elite/decision making body subjectively faced substantial disincentives to aggressive military action and yet attacked."[32] Yet another piece of the puzzle, which may clarify the extent of deterrence necessary in certain settings, may also assist in building a broader hypothesis about war. In fact, it has been incorporated into the just-discussed efforts at scoring deterrence. That is, newer studies of human behavior from cognitive psychology are increasingly showing that certain perceptions of decision makers can influence the level of risk they may be willing to undertake, or otherwise affect their decisions.[33] It now seems likely that a number of such insights about human behavior in decision making may be

useful in considering and fashioning deterrence strategies. Perhaps of greatest relevance is the insight of "prospect theory," which posits that individuals evaluate outcomes with respect to deviations from a reference point and that they may be more risk averse in settings posing potential gain than in settings posing potential loss.[34] The evidence of this "cognitive bias," whether in gambling, trading, or, as is increasingly being argued, foreign policy decisions generally, is significant. Because of the newness of efforts to apply a laboratory based "prospect theory" to the complex foreign policy process generally, and particularly ambiguities and uncertainties in framing such complex events, our consideration of it in the war/peace process should certainly be cautious. It does, however, seem to elucidate some of the case studies. In the war/peace setting, "prospect theory" suggests that deterrence may not need to be as strong to prevent aggressive action leading to perceived gain. For example, there is credible evidence that even an informal warning to Kaiser Wilhelm II from British Foreign Secretary Sir Edward Grey, if it had come early in the crisis before events had moved too far, might have averted World War I. And even a modicum of deterrence in Kuwait, as was provided by a small British contingent where Kuwait was earlier threatened by an irredentist Iraqi government in 1961, might have been sufficient to deter Saddam Hussein from his 1990 attack on Kuwait. Similarly, even a clear United States pledge for the defense of South Korea before the attack might have prevented the Korean War. Conversely, following the July 28 Austrian mobilization and declaration of war against Serbia in World War I, the issue for Austria may have begun to be perceived as loss avoidance, thus requiring much higher levels of deterrence to avoid the resulting war. Similarly, the Rambouillet Agreement may have been perceived by Milosevic as risking loss of Kosovo and his continued rule of Serbia and, as a result, may have required higher levels of NA-TO deterrence to have prevented Milosevic's actions in defiance. Certainly NATO's previous hesitant responses in 1995 against Milosevic in the Bosnia phase of the Yugoslav crisis and in 1998-99 in early attempts to deal with Kosovo did not create a high level of deterrence.[35] One can only surmise whether the killing in Kosovo could have been avoided had NATO taken a different tack, both structuring the issue less as loss avoidance for Milosevic and considerably enhancing deterrence. Suppose, for example, NATO had emphasized that it had no interest in intervening in Serbia's civil conflict with the KLA but that it would emphatically take action to punish massive "ethnic cleansing" and other humanitarian outrages, as had been practiced in Bosnia. And on the deterrence side, it made clear in advance the severity of any NATO bombardment, the potential for introduction of ground troops if necessary, that in any assault it would pursue a "Leadership Strategy" focused on targets of importance to Milosevic and his principal henchmen (including their hold on power), and that it would immediately, unlike as earlier in Bosnia, seek to generate war crime indictments of all top Serbian leaders implicated in any atrocities. The point here is not to second-guess NATO's actions in Kosovo but to suggest that taking into account potential "cognitive bias," such as "prospect theory," may be useful in fashioning effective deterrence. "Prospect theory" may also have relevance in predicting that it may be easier to deter (that is, lower levels are necessary) an aggression than to undo that aggression. Thus, much higher levels of deterrence were probably required to compel Saddam Hussein to leave Kuwait than to prevent him initially from invading that state. In fact, not even the presence of a powerful Desert Storm military force and a Security Council Resolution directing him to leave caused Hussein to voluntarily withdraw. As this real-world example illustrates, there is considerable experimental evidence in "prospect theory" of an almost instant renormalization of reference point after a

gain; that is, relatively quickly after Saddam Hussein took Kuwait, a withdrawal was framed as a loss setting, which he would take high risk to avoid. Indeed, we tend to think of such settings as settings of compellance, requiring higher levels of incentive to achieve compulsion producing an action, rather than deterrence needed for prevention. One should also be careful not to overstate the effect of "prospect theory" or to fail to assess a threat in its complete context. We should remember that a belated pledge of Great Britain to defend Poland before the Nazi attack did not deter Hitler, who believed under the circumstances that the British pledge would not be honored. It is also possible that the greater relative wealth of democracies, which have less to gain in all out war, is yet another internal factor contributing to the "democratic peace."36 In turn, this also supports the extraordinary tenacity and general record of success of democracies fighting in defensive settings as they may also have more to lose. In assessing adequacy of deterrence to prevent war, we might also want to consider whether extreme ideology, strongly at odds with reality, may be a factor requiring higher levels of deterrence for effectiveness. One example may be the extreme ideology of Pol Pot leading him to falsely believe that his Khmer Rouge forces could defeat Vietnam.37 He apparently acted on that belief in a series of border incursions against Vietnam that ultimately produced a losing war for him. Similarly, Osama bin Laden's 9/11 attack against America, hopelessly at odds with the reality of his defeating the Western World and producing for him a strategic disaster, seems to have been prompted by his extreme ideology rooted in a distorted concept of Islam at war with the enlightenment. The continuing suicide bombings against Israel, encouraged by radical rejectionists and leading to less and less for the Palestinians, may be another example. If extreme ideology is a factor to be considered in assessing levels of deterrence, it does not mean that deterrence is doomed to fail in such settings but only that it must be at higher levels (and properly targeted on the relevant decision elites behind the specific attacks) to be effective, as is also true in perceived loss or compellance settings.38 Even if major war in the modern world is predominantly a result of aggression by nondemocratic regimes, it does not mean that all nondemocracies pose a risk of war all, or even some, of the time. Salazar's Portugal did not commit aggression. Nor today do Singapore or Bahrain or countless other nondemocracies pose a threat. That is, today nondemocracy comes close to a necessary condition in generating the high risk behavior leading to major interstate war. But it is, by itself, not a sufficient condition for war. The many reasons for this, of course, include a plethora of internal factors, such as differences in leadership perspectives and values, size of military, and relative degree of the rule of law, as well as levels of external deterrence.39 But where an aggressive nondemocraticregime is present and poses a credible military threat, then it is the totality of external factors, that is, deterrence, that become crucial.

Alternative Fails

Rejection of current IR paradigm magnifies hierarchy – emancipation rhetoric gives powerful states a basis for intervention and robs the Third World of agency – traditional security models solve their impacts better
McCormack 10 – Lecturer in International Politics

Tara McCormack, is Lecturer in International Politics at the University of Leicester and has a PhD in International Relations from the University of Westminster. 2010, Critique, Security and Power: The political limits to emancipatory approaches, pg. 127-129

The following section will briefly raise some questions about the rejection of the old security framework as it has been taken up by the most powerful institutions and states. Here we can begin to see the political limits to critical and emancipatory frameworks. In an international system which is marked by great power inequalities between states, the rejection of the old narrow national interest-based security framework by major international institutions, and the adoption of ostensibly emancipatory policies and policy rhetoric, has the consequence of problematising weak or unstable states and allowing international institutions or major states a more interventionary role, yet without establishing mechanisms by which the citizens of states being intervened in might have any control over the agents or agencies of their emancipation. Whatever the problems associated with the pluralist security framework there were at least formal and clear demarcations. This has the consequence of entrenching international power inequalities and allowing for a shift towards a hierarchical international order in which the citizens in weak or unstable states may arguably have even less freedom or power than before. Radical critics of contemporary security policies, such as human security and humanitarian intervention, argue that we see an assertion of Western power and the creation of liberal subjectivities in the developing world. For example, see Mark Duffield's important and insightful contribution to the ongoing debates about contemporary international security and development. Duffield attempts to provide a coherent empirical engagement with, and theoretical explanation of, these shifts. Whilst these shifts, away from a focus on state security, and the so-called merging of security and development are often portrayed as positive and progressive shifts that have come about because of the end of the Cold War, Duffield argues convincingly that these shifts are highly problematic and unprogressive. For example, the rejection of sovereignty as formal international equality and a presumption of nonintervention has eroded the division between the international and domestic spheres and led to an international environment in which Western NGOs and powerful states have a major role in the governance of third world states. Whilst for supporters of humanitarian intervention this is a good development, Duffield points out the depoliticising implications, drawing on examples in Mozambique and Afghanistan. Duffield also draws out the problems of the retreat from modernisation that is represented by sustainable development. The Western world has moved away from the development policies of the Cold War, which aimed to develop third world states industrially. Duffield describes this in terms of a new division of human life into uninsured and insured life. Whilst we in the West are 'insured' – that is we no longer have to be entirely self-reliant, we have welfare systems, a modern division of labour and so on – sustainable development aims to teach populations in poor states how to survive in the absence of any of this. Third world populations must be taught to be self-reliant, they will remain uninsured. Self-reliance of course means the condemnation of millions to a barbarous life of inhuman bare survival. Ironically, although sustainable development is celebrated by many on the left today, by leaving people to fend for themselves rather than developing a society wide system which can support people, sustainable development actually leads to a less human and humane system than that developed in modern capitalist states. Duffield also describes how many of these problematic shifts are embodied in the contemporary concept of human security. For Duffield, we can understand these shifts in terms of Foucauldian biopolitical framework, which can be understood as a regulatory power that seeks to support life through intervening in the biological, social and economic processes that constitute a human population (2007: 16). Sustainable development and human security are for Duffield technologies of security which aim to create self-managing and self-reliant subjectivities in the third world, which can then survive in a situation of serious underdevelopment (or being uninsured as Duffield terms it) without causing security problems for the developed world. For Duffield this is all driven by a neoliberal project which seeks to control and manage uninsured populations globally. Radical critic Costas Douzinas (2007) also criticises new forms of cosmopolitanism such as human rights and interventions for human rights as a triumph of American hegemony. Whilst we are in agreement with critics such as Douzinas and Duffield that these new security frameworks cannot be empowering, and ultimately lead to more power for powerful states, we need to understand why these frameworks have the effect that they do. We can understand that these frameworks have political limitations without having to look for a specific plan on the part of current powerful states. In new security frameworks such as human security we can see the political limits of the framework proposed by critical and emancipatory theoretical approaches.

Transition Wars DA

Transition to the alternative guarantees war – radical changes in existing security architecture collapse threat perception

Yoon 03 – Professor of International Relations at Seoul National University; former Foreign Minister of South Korea (Young-Kwan, "Introduction: Power Cycle Theory and the Practice of International Relations", International Political Science Review 2003; vol. 24; p. 7-8)

In history, the effort to balance power quite often tended to start too late to protect the security of some of the individual states. If the balancing process begins too late, the resulting amount of force necessary to stop an aggressor is often much larger than if the process had been started much earlier. For example, the fate of Czechoslovakia and Poland showed how non-intervention or waiting for the "automatic" working through of the process turned out to be problematic. Power cycle theory could also supplement the structure-oriented nature of the traditional balance of power theory by incorporating an agent-oriented explanation. This was possible through its focus on the relationship between power and the role of a state in the international system. It especially highlighted the fact that a discrepancy between the relative power of a state and its role in the system would result in a greater possibility for systemic instability. In order to prevent this instability from developing into a war, practitioners of international relations were to become aware of the dynamics of changing power and role, adjusting role to power. A statesperson here was not simply regarded as a prisoner of structure and therefore as an outsider to the process but as an agent capable of influencing the operation of equilibrium. Thus power cycle theory could overcome the weakness of theoretical determinism associated with the traditional balance of power. The question is often raised whether government decision-makers could possibly know or respond to such relative power shifts in the real world. According to Doran, when the "tides of history" shift against the state, the push and shove of world politics reveals these matters to the policy-maker, in that state and among its competitors, with abundant urgency. (2) The Issue of Systemic Stability Power cycle theory is built on the conception of changing relative capabilities of a state, and as such it shares the realist assumption emphasizing the importance of power in explaining international relations. But its main focus is on the longitudinal dimension of power relations, the rise and decline of relative state power and role, and not on the static power distribution at a particular time. As a result, power cycle theory provides a significantly different explanation for stability and order within the international system. First of all, power cycle theory argues that what matters most in explaining the stability of the international system or war and peace is not the type of particular international system (Rosecrance, 1963) but the transformation from one system to another. For example, in the 1960s there was a debate on the stability of the international system between the defenders of bipolarity such as Waltz (1964) and the defenders of multi-polarity such as Rosecrance (1966), and Deutsch and Singer (1964). After analyzing five historical occasions since the origin of the modern state system, Doran concluded that what has been responsible for major war was not whether one type of system is more or less conducive to war but that instead systems transformation itself led to war (Doran, 1971). A non-linear type of structural change that is massive, unpredicted, devastating to foreign policy expectation, and destructive of security is the trigger for major war, not the nature of a particular type of international system.

Institutions 1st FW

Governments' obey institutional logics that exist independently of individuals and constrain decisionmaking – that's true regardless of this debate
Wight – Professor of IR @ University of Sydney – 6

(Colin, Agents, Structures and International Relations: Politics as Ontology, pgs. 48-50

One important aspect of this relational ontology is that these relations constitute our identity as social actors. According to this relational model of societies, one is what one is, by virtue of the relations within which one is embedded. A worker is only a worker by virtue of his/her relationship to his/her employer and vice versa. 'Our social being is constituted by relations and our social acts presuppose them.' At any particular moment in time an individual may be implicated in all manner of relations, each exerting its own peculiar causal effects. This 'lattice-work' of relations constitutes the structure of particular societies and endures **despite changes in the individuals occupying them**. Thus, the relations, the structures, are ontologically distinct from the individuals who enter into them. At a minimum, the social sciences are concerned with two distinct, although mutually interdependent, strata. There is an ontological difference between people and structures: 'people are not relations, societies are not conscious agents'. Any attempt to explain one in terms of the other should be rejected. If there is an ontological difference between society and people, however, we need to elaborate on the relationship between them. Bhaskar argues that we need a system of mediating concepts, encompassing both aspects of the duality of praxis into which active subjects must fit in order to reproduce it: that is, a system of concepts designating the 'point of contact' between human agency and social structures. This is known as a 'positioned practice' system. In many respects, the idea of 'positioned practice' is very similar to Pierre Bourdieu's notion of *habitus*. Bourdieu is primarily concerned with what individuals do in their daily lives. He is keen to refute the idea that social activity can be understood **solely in terms of individual decision-making**, or as determined by surpa-individual objective structures. Bourdieu's notion of the *habitus* can be viewed as a bridge-building exercise across the explanatory gap between two extremes. Importantly, the notion of a habitus can only be understood in relation to the concept of a 'social field'. According to Bourdieu, a social field is 'a network, or a configuration, of objective relations between positions objectively defined'. A social field, then, refers to a structured system of social positions occupied by individuals and/or institutions – the nature of which defines the situation for their occupants. This is a social field whose form is constituted in terms of the relations which define it as a field of a certain type. A *habitus* (positioned practices) is a mediating link between individuals' subjective worlds and the socio-cultural world into which they are born and which they share with others. The power of the habitus derives from the thoughtlessness of habit and habituation, rather than consciously learned rules. The habitus is imprinted and encoded in a socializing process that commences during early childhood. It is inculcated more by experience than by explicit teaching. Socially competent performances are produced as a matter of routine, without explicit reference to a body of codified knowledge, and without the actors necessarily knowing what they are doing (in the sense of being able adequately to explain what they are doing). As such, the *habitus* can be seen as the site of 'internalization of reality and the externalization of internality.' Thus social practices are produced in, and by, the encounter between: (1) the *habitus* and its dispositions; (2) the constraints and demands of

the socio-cultural field to which the habitus is appropriate or within; and (3) the dispositions of the individual agents located within both the socio-cultural field and the *habitus*. When placed within Bhaskar's stratified complex social ontology the model we have is as depicted in Figure 1. The explanation of practices will require all three levels. Society, as field of relations, exists prior to, and is independent of, individual and collective understandings at any particular moment in time; that is, social action requires the conditions for action. Likewise, given that behavior is seemingly recurrent, patterned, ordered, institutionalised, and displays a degree of stability over time, there must be sets of relations and rules that govern it. Contrary to individualist theory, these relations, rules and roles are not dependent upon either knowledge of them by particular individuals, or the existence of actions by particular individuals; that is, **their explanation cannot be reduced to consciousness** or to the attributes **of individuals**. These emergent social forms must possess emergent powers. This leads on to arguments for the reality of society based on a causal criterion. Society, as opposed to the individuals that constitute it, is, as Foucault has put it, 'a complex and independent reality that has its own laws and mechanisms of reaction, its regulations as well as its possibility of disturbance. This new reality is society…It becomes necessary to reflect upon it, upon its specific characteristics, its constants and its variables'.

AT Ontology 1st

Ontology not come first - questions of ethics are contingent and political, not ontological - their attempt to ground ethics in ontology leads to epistemic closure and prevents democratic challenges to existing relationships of violence
Beasley & Bacchi 7

(Chris, Prof. of Politics @ University of Adelaide, Carol, Prof. Emeritus @ University of Adelaide, "Envisaging a new politics for an ethical future: Beyond trust, care and generosity -- towards an ethic of `social flesh'", *Feminist Theory*, 2007 8: 279)

How does our concept of 'social flesh' draw on, yet differ from, existing vocabularies? Following on from the second generation care ethicists we suggest that the ethico-political ideal of 'social flesh' is not so much to be understood as a moral quality, usually perceived in relation to individuals, but rather as a political ethic concerning existing and future practices, a political challenge specifically to the neo-liberal ethos of atomistic individualism. We do not stress ontology in this account of interconnection. Diprose argues – in keeping with Levinas – that embodied interconnection between self and other makes 'being' possible, is a fixed universal, and hence precedes history and politics. Ethical responsibility for the other, connectedness, becomes unquestionable and inescapable. We feel that this reliance on ontology to do the work of social responsibility may be **overly hopeful** and may also **relegate important political debates to the sidelines**, while framing embodied interconnection in strongly prescriptive and normative terms. While we agree, along with care ethicists, that sociality is embodied (and consequently involves care), this is a very preliminary and thin ontological foundation which **does not presume in advance that forms of recognition which flow from it are necessarily laudable** or predictable, **let alone self-evidently altruistic**. While embodied interconnection is the preexisting condition of 'being' human and therefore of sociality,2 in concert with Borgerson we are inclined to assert that **what human beings do with this ontological state of connection is not ontological**. In other words, **the ontological starting point** of embodied interconnection does get us very far. It **does not entail a particular ethics**. Rather ethics – a relation of responsibility – remains firmly in the realm of the political possibilities and political will within particular forms of sociality, a matter of history.3 Hence, **the question remains, what is to be done**? Like Borgerson, we think that an overemphasis on the ontological leads to an **'epistemic closure'** (Gordon, 2000: 145–7 in Borgerson, 2001: 183) and to an **essentializing as fundamental and inevitable**. This is importantly contingent and a matter of political debate. Thus, at least at the level of the political imaginary, **such an overemphasis blocks the necessary and fruitful contestation required in order to undertake the democratic project of overhauling neo-liberalism**.

Extinction 1st

Extinction 1st – pre-requisite to formation of value
Wapner '3

Paul, Associate professor and director of the Global Environmental Policy Program at American University, DISSENT, Winter, http://www.dissentmgazine.org/menutest/artiles/wi03/wapner.htm

The third response to eco-criticism would require critics to acknowledge the ways in which they themselves silence nature and then to respect the sheer otherness of the nonhuman world. Postmodernism prides itself on criticizing the urge toward mastery that characterizes modernity. But isn't mastery exactly what postmodernism is exerting as it captures the nonhuman world within its own conceptual domain? Doesn't postmodern cultural criticism deepen the modernist urge toward mastery by eliminating the ontological weight of the nonhuman world? What else could it mean to assert that there is no such thing as nature? I have already suggested the postmodernist response: yes, recognizing the social construction of "nature" does deny the self-expression of the nonhuman world, hut how would we know what such self-expression means? Indeed, nature doesn't speak; rather, some person always speaks on nature's behalf, and whatever that person says is, as we all know, a social construction. All attempts to listen to nature are social constructions-except one. Even the most radical postmodernist must acknowledge the distinction between physical existence and non-existence. As I have said, postmodernists accept that there is a physical substratum to the phenomenal world even if they argue about the different meanings wc ascribe to it. This acknowledgment of physical existence is crucial. We can't ascribe meaning to that which doesn't appear What doesn't exist can manifest no character. Put differently, yes, the postmodernist should rightly worry about interpreting nature's expressions. And all of us should be wary of those who claim to speak on nature's behalf (including environmentalists who do that). But we need not doubt the simple idea that a prerequisite of expression is existence. This in turn suggests that preserving the nonhuman world-in all its diverse embodiments-must be seen by eco-critics as a fundamental good. Eco-critics must be supporters, in some fashion, of environmental preservation.

Elevating Human extinction to a real possibility encourages a new social ethic to solve conflicts and create meaning to life.
Epstein and Zhao 9 [Richard J. Epstein and Y. Zhao, Laboratory of Computational Oncology,Department of Medicine,University of Hong Kong, Professorial Block, Queen Mary Hospital, Hong Kong. "The Threat That Dare Not Speak Its Name: Human Extinction". Perspectives in Biology and Medicine, volume 52, number 1 (winter 2009):116–25. Project Muse.-

Final ends for all species are the same, but the journeys will be different. If we cannot influence the end of our species, can we influence the journey? To do so—even in a small way—would be a crowning achievement for human evolution and give new meaning to the term civilization. Only by elevating the topic of human extinction to the level of serious professional discourse can we begin to prepare ourselves for the challenges that lie ahead. The difficulty of the required transition should not be underestimated. This is depicted in Table 3 as a painful multistep progression from the 20th-century philosophical norm of Ego-Think—defined therein as a short-term state of mind valuing individual material self-interest above all other considerations—to Eco-Think, in which humans come to adopt a broader Gaia-like outlook on themselves as but one part of an infinitely larger reality. Making this change must involve communicating the non-sensationalist message to all global citizens that "things are serious" and "we are in this together"—or, in blunter language, that the road to extinction and its related agonies does indeed lie ahead. Consistent with this prospect, the risks of human extinction—and the cost-benefit of attempting to reduce these risks— have been quantified in a recent sobering analysis (Matheny 2007). Once complacency has been shaken off and a sense of collective purpose created, the battle against self-seeking anthropocentric human instincts will have only just begun. It is often said that human beings suffer from the ability to appreciate their own mortality—an existential agony that has given rise to the great religions— but in the present age of religious decline, we must begin to bear the added burden of anticipating the demise of our species. Indeed, as argued here, there are compelling reasons for encouraging this collective mind-shift. For in the best of all possible worlds,

the realization that our species has long-term survival criteria distinct from our short-term tribal priorities **could spark a new social ethic to upgrade** what we now all too often dismiss as "human nature" (Tudge 1989).

Consequentialism Good

Moral absolutism creates tunnel vision and error replication – focus on consequences is a pre-requisite to ethical decisionmaking
Isaac '2

As writers such as Niccolo Machiavelli, Max Weber, Reinhold Niebuhr, and Hannah Arendt have taught, <u>an unyielding concern with moral goodness undercuts political responsibility. The concern may be morally laudable, reflecting a kind of personal integrity, but it</u> suffers from three fatal flaws: (1) It <u>fails to see that the purity of one's intention does not ensure the achievement of what one intends. Abjuring violence or refusing to make common cause with morally compromised parties may seem like the right thing; but if such tactics entail impotence, then it is hard to view them as serving any moral good beyond the clean conscience of their supporters</u>; (2) it fails to see that <u>in a world of real violence and injustice, moral purity is not simply a form of powerlessness; it is often a form of complicity in injustice. This is why, from the standpoint of politics</u>--as opposed to religion--<u>pacifism is always a potentially immoral stand.</u> In categorically repudiating violence, it refuses in principle to oppose certain violent injustices with any effect; and (3) <u>it fails to see that politics is as much about unintended consequences as it is about intentions; it is the effects of action, rather than the motives of action, that is most significant.</u> Just as the alignment with "good" may engender impotence, <u>it is often</u> the <u>pursuit of "good" that generates evil</u>. This is the lesson of communism in the twentieth century: it is not enough that one's goals be sincere or idealistic; it is equally important, always, to ask about the effects of pursuing these goals and to judge these effects in pragmatic and historically contextualized ways. Moral absolutism inhibits this judgment. It alienates those who are not true believers. It promotes arrogance. And it undermines political effectiveness.

AT Impact/Alternative

There's no root cause of conflict and threat construction is inevitable – even if security is socially constructed, states use balance of power and deterrence to make foreign policy calculations

Moore '04

Dir. Center for Security Law @ University of Virginia, 7-time Presidential appointee, & Honorary Editor of the American Journal of International Law, Solving the War Puzzle: Beyond the Democratic Peace, John Norton Moore, page 27-31.

As so broadly conceived, <u>there is strong evidence that deterrence</u>, that is, <u>the effect of external factors on the decision to go to war, is the missing link in the war/peace equation</u>. In my War/Peace Seminar, I have undertaken to examine the level of deterrence before the <u>principal wars of the twentieth century.</u>10 This examination has led me to believe that <u>in every case the</u> potential <u>aggressor made a rational calculation that the war would be won,</u> and won promptly.11 In fact, the longest period of time calculated for victory through conventional attack seems to be the roughly six reeks predicted by the German General Staff as the time necessary) prevail on the Western front in World War I under the Schlieffen Plan. <u>Hitler believed</u> in his attack on Poland that <u>Britain and France could not</u> take the occasion to <u>go to war with him</u>. And he believed his 1941 Operation Barbarossa against the Soviet Union that "[w]e have only to kick in the door and the whole rotten structure will come crashing down."12 In contrast, following Hermann Goering's failure to obtain air superiority in the Battle of Britain, Hitler called off the invasion of Britain and shifted strategy to the nighttime bombing of population centers, which became known as the Blitz, in a mistaken effort to compel Britain to sue for peace. <u>Calculations in the North Korean attack</u> on South Korea <u>and Hussein's attack on Kuwait were that the operations would be completed in a matter of days</u>. Indeed, <u>virtually all principal wars in the twentieth century,</u> at least those involving conventional invasion, <u>were preceded by</u> what I refer to as a "<u>double deterrence absence</u>." That is, <u>the</u> potential <u>aggressor believed that they had the military force</u> in place <u>to prevail promptly</u> and that nations that might have the military or diplomatic power to prevent this were not dined to intervene. This analysis has also shown that many of the perceptions we have about the origins of particular wars are flatly wrong. Anyone who seriously believes that World War I was begun by competing alliances drawing tighter should examine the al historical record of British unwillingness to enter a clear military alliance with the French or to so inform the Kaiser! Indeed, this pre-World War I absence of effective alliance and resultant war contrasts sharply with the laterrobust NATO alliance and absence of World War III.14 Considerable other evidence seems to support this historical analysis as to the importance of deterrence. Of particular note, Yale Professor Donald Kagan, a preeminent United States historian who has long taught a seminar on war, published in 1995 a superb book On the Origins of War and the Preservation of Peace.15 In this book heconducts a detailed examination of the <u>Peloponnesian War, World War I, Hannibal's War, and World War II,</u> among other case studies. A careful reading of these studies suggests that <u>each war could have been prevented by achievable deterrence</u> and that <u>each occurred in the absence of such deterrence</u>.16 <u>Game theory seems to offer yet further support</u> for the proposition that appropriate deterrence can prevent war. For example, Robert Axelrod's famous 1980s experiment in an iterated prisoner's dilemma, which is a reasonably close proxy for many conflict settings in international relations, repeatedly showed the effectiveness of a simple tit for tat strategy.17<u>Such a strategy is at core simply a basic deterrent strategy of influencing behavior through incentives</u>. Similarly, much of <u>the game-theoretic work on crisis bargaining</u> (and danger of asymmetric information) in <u>relation to war and the democratic peace assumes the importance of deterrence</u> through communication of incentives.18 The well-known correlation between war

and territorial contiguity seems also to underscore the importance of deterrence and is likely principally a proxy for levels of perceived profit and military achievability of aggression in many such settings. It should further be noted that the democratic peace is not the only significant correlation with respect to war and peace, although it seems to be the most robust. Professors Russett and Oneal, in recently exploring the other elements of the Kantian proposal for "Perpetual Peace," have also shown a strong and statistically significant correlation between economically important bilateral trade between two nations and a reduction in the risk of war between them. Contrary to the arguments of "dependency theorists," such economically important trade seems to reduce the risk of war regardless of the size relationship or asymmetry in the trade balance between the two states. In addition, there is a statistically significant association between economic openness generally and reduction in the risk of war, although this association is not as strong as the effect of an economically important bilateral trade relationship.° Russett and Oneal also show a modest independent correlation between reduction in the risk of war and higher levels of common membership in international organizations.[20] And they show that a large imbalance of power between two states significantly lessens the risk of major war between them.[21] All of these empirical findings about war also seem to directly reflect incentives; that is, a higher level of trade would, if foregone in war, impose higher costs in the aggregate than without such trade,[22] though we know that not all wars terminate trade. Moreover, with respect to trade, a, classic study, Economic Interdependence and War, suggests that the historic record shows that it is not simply aggregate levels of bilateral trade that matters, but expectations as to the level of trade into the future.[23] This directly implicates expectations of the war decision maker as does incentive theory, and it importantly adds to the general finding about trade and war that even with existing high levels of bilateral trade, changing expectations from trade sanctions or other factors affecting the flow of trade can directly affect incentives and influence for or against war. A large imbalance of power in a relationship rather obviously impacts deterrence and incentives. Similarly, one might incur higher costs with high levels of common membership in international organizations through foregoing some of the heightened benefits of such participation or otherwise being presented with different options through the actions or effects of such organizations. These external deterrence elements may also be yet another reason why democracies have a lower risk of war with one another. For their freer markets, trade, commerce, and international engagement may place them in a position where their generally higher level of interaction means that aggression will incur substantial opportunity costs. Thus, the "mechanism" of the democratic peace may be an aggregate of factors affecting incentives, both external as well as internal factors. Because of the underlying truth in the relationship between higher levels of trade and lower levels of war, it is not surprising that theorists throughout human history, including Baron de Montesquieu in 1748, Thomas Paine in 1792, John Stuart Mill in 1848, and, most recently, the founders of the European Union, have argued that increasing commerce and interactions among nations would end war. Though by themselves these arguments have been overoptimistic, it may well be that some level of "globalization" may make the costs of war and the gains of peace so high as to powerfully predispose to peace. Indeed, a 1989 book by John Mueller, Retreat From Doomsday,[24] postulates the obsolescence of major war between developed nations (at least those nations within the "first and second worlds") as they become increasingly conscious of the rising costs of war and the rising gains of peace. In assessing levels of democracy, there are indexes readily available, for example, the Polity III[25] and Freedom House [26] indexes. I am unaware of any comparable index with respect to levels of deterrence that might be used to test the importance of deterrence in war avoidance?' Absent such an accepted index, discussion about the importance of deterrence is subject to the skeptical observation that one simply defines effective deterrence by whether a war did or did not occur. In order to begin to deal with this objection and encourage a more objective methodology for assessing deterrence, I encouraged a project to seek to develop a rough but objective measure of deterrence with a scale from minus ten to plus ten based on a large variety of contextual features that would be given relative weighting in a complex deterrence equation before applying the scaling to different war and nonwar settings.[28] On the disincentive side of the scale, the methodology used a weighted calculation of local deterrence, including the chance to prevent a short- and intermediate-term military victory, and economic and political disincentives; extended deterrence with these same elements; and contextual communication and credibility multipliers. On the incentive side of the scale, the methodology also used a weighted calculation of perceived military, economic, and political benefits. The scales were then combined into an overall deterrence score, including, an estimate for any effect of prospect theory where applicable.[2] This innovative first effort uniformly showed high deterrence scores in settings where war did not, in fact, occur. Deterring a Soviet first strike in the Cuban Missile Crisis produced a score of +8.5 and preventing a Soviet attack against NATO produced a score of +6. War settings, however, produced scores ranging from -2.29 (Saddam Hussein's decision to invade Kuwait in the Gulf War), -2.18 (North Korea's decision to invade South Korea in the Korean War), -1.85 (Hitler's decision to invade Poland in World War II), -1.54 (North Vietnam's decision to invade South Vietnam following the Paris Accords), -0.65 (Milosevic's decision to defy NATO in Kosovo), +0.5 (the Japanese decision to attack Pearl Harbor), +1.25 (the Austrian decision, egged on by Germany, to attack Serbia, which was the real beginning of World War I), to +1.75 (the German decision to invade Belgium and France in World War I). As a further effort at scaling and as a point of comparison, I undertook to simply provide an impressionistic rating based on my study of each pre-crisis setting. That produced high positive scores of +9 for both deterring a Soviet first strike during the Cuban Missile Crisis and NATO's deterrence of a Warsaw Pact attack and even lower scores than the more objective effort in settings where wars had occurred. Thus, I scored North Vietnam's decision to invade South Vietnam following the Paris Accords and the German decision to invade Poland at the beginning of World War II as -6; the North Korean/Stalin decision to invade South Korea in the Korean War as -5; the Iraqi decision to invade the State of Kuwait as -4; Milosevic's decision to defy NATO in Kosovo and the German decision to invade Belgium and France in World War I as -2; and the Austrian decision to attack Serbia and the Japanese decision to attack Pearl Harbor as -1. Certainly even knowledgeable experts would be likely to differ in their impressionistic scores on such pre-crisis settings, and the effort at a more objective methodology for scoring deterrence leaves much to be desired. Nevertheless, both exercises did seem to suggest that deterrence matters and that high levels of deterrence can prevent future war. Following up on this initial effort to produce a more objective measure of deterrence, two years later I encouraged another project to undertake the same effort, building on what had been learned in the first iteration. The result was a second project that developed a modified scoring system, also incorporating local deterrence, extended deterrence, and communication of intent and credibility multipliers on one side of a scale, and weighing these factors against a potential aggressor's overall subjective incentives for action on the other side of the scale.[3]° The result, with a potential range of -5.5 to +10, produced no score higher than +2.5 for eighteen major wars studied between

1939 and the 1990 Gulf War.[31] Twelve of the eighteen wars produced a score of zero or below, with the 1950-53 Korean War at -3.94, the 1965-75 Vietnam War at -0.25, the 1980-88 Iran-Iraq War at -1.53, and the 1990-91 Gulf War at -3.83. The study concluded that in more than fifty years of conflict there was "no situation in which a regime elite/decision making body subjectively faced substantial disincentives to aggressive military action and yet attacked."[32] Yet another piece of the puzzle, which may clarify the extent of deterrence necessary in certain settings, may also assist in building a broader hypothesis about war. In fact, it has been incorporated into the just-discussed efforts at scoring deterrence. That is, newer studies of human behavior from cognitive psychology are increasingly showing that certain perceptions of decision makers can influence the level of risk they may be willing to undertake, or otherwise affect their decisions.[33] It now seems likely that a number of such insights about human behavior in decision making may be useful in considering and fashioning deterrence strategies. Perhaps of greatest relevance is the insight of "prospect theory," which posits that individuals evaluate outcomes with respect to deviations from a reference point and that they may be more risk averse in settings posing potential gain than in settings posing potential loss.[34] The evidence of this "cognitive bias," whether in gambling, trading, or, as is increasingly being argued, foreign policy decisions generally, is significant. Because of the newness of efforts to apply a laboratory based "prospect theory" to the complex foreign policy process generally, and particularly ambiguities and uncertainties in framing such complex events, our consideration of it in the war/peace process should certainly be cautious. It does, however, seem to elucidate some of the case studies. In the war/peace setting, "prospect theory" suggests that deterrence may not need to be as strong to prevent aggressive action leading to perceived gain. For example, there is credible evidence that even an informal warning to Kaiser Wilhelm II from British Foreign Secretary Sir Edward Grey, if it had come early in the crisis before events had moved too far, might have averted World War I. And even a modicum of deterrence in Kuwait, as was provided by a small British contingent when Kuwait was earlier threatened by an irredentist Iraqi government in 1961, might have been sufficient to deter Saddam Hussein from his 1990 attack on Kuwait. Similarly, even a clear United States pledge for the defense of South Korea before the attack might have prevented the Korean War. Conversely, following the July 28 Austrian mobilization and declaration of war against Serbia in World War I, the issue for Austria may have begun to be perceived as loss avoidance, thus requiring much higher levels of deterrence to avoid the resulting war. Similarly, the Rambouillet Agreement may have been perceived by Milosevic as risking loss of Kosovo and his continued rule of Serbia and, as a result, may have required higher levels of NA-TO deterrence to have prevented Milosevic's actions in defiance. Certainly NATO's previous hesitant responses in 1995 against Milosevic in the Bosnia phase of the Yugoslav crisis and in 1998-99 in early attempts to deal with Kosovo did not create a high level of deterrence.[35] One can only surmise whether the killing in Kosovo could have been avoided had NATO taken a different tack, both structuring the issue less as loss avoidance for Milosevic and considerably enhancing deterrence. Suppose, for example, NATO had emphasized that it had no interest in intervening in Serbia's civil conflict with the KLA but that it would emphatically take action to punish massive "ethnic cleansing" and other humanitarian outrages, as had been practiced in Bosnia. And on the deterrence side, it made clear in advance the severity of any NATO bombardment, the potential for introduction of ground troops if necessary, that in any assault it would pursue a "Leadership Strategy" focused on targets of importance to Milosevic and his principal henchmen (including their hold on power), and that it would immediately, unlike as earlier in Bosnia, seek to generate war crime indictments of all top Serbian leaders implicated in any atrocities. The point here is not to second-guess NATO's actions in Kosovo but to suggest that taking into account potential

"cognitive bias," such as "prospect theory," may be useful in fashioning effective deterrence. "Prospect theory" may also have relevance in predicting that it may be easier to deter (that is, lower levels are necessary) an aggression than to undo that aggression. Thus, much higher levels of deterrence were probably required to compel Saddam Hussein to leave Kuwait than to prevent him initially from invading that state. In fact, not even the presence of a powerful Desert Storm military force and a Security Council Resolution directing him to leave caused Hussein to voluntarily withdraw. As this real-world example illustrates, there is considerable experimental evidence in "prospect theory" of an almost instant renormalization of reference point after a gain; that is, relatively quickly after Saddam Hussein took Kuwait, a withdrawal was framed as a loss setting, which he would take high risk to avoid. Indeed, we tend to think of such settings as settings of compellance, requiring higher levels of incentive to achieve compulsion producing an action, rather than deterrence needed for prevention. One should also be careful not to overstate the effect of "prospect theory" or to fail to assess a threat in its complete context. We should remember that a belated pledge of Great Britain to defend Poland before the Nazi attack did not deter Hitler, who believed under the circumstances that the British pledge would not be honored. It is also possible that the greater relative wealth of democracies, which have less to gain in all out war, is yet another internal factor contributing to the "democratic peace."36 In turn, this also supports the extraordinary tenacity and general record of success of democracies fighting in defensive settings as they may also have more to lose. In assessing adequacy of deterrence to prevent war, we might also want to consider whether extreme ideology, strongly at odds with reality, may be a factor requiring higher levels of deterrence for effectiveness. One example may be the extreme ideology of Pol Pot leading him to falsely believe that his Khmer Rouge forces could defeat Vietnam.37 He apparently acted on that belief in a series of border incursions against Vietnam that ultimately produced a losing war for him. Similarly, Osama bin Laden's 9/11 attack against America, hopelessly at odds with the reality of his defeating the Western World and producing for him a strategic disaster, seems to have been prompted by his extreme ideology rooted in a distorted concept of Islam at war with the enlightenment. The continuing suicide bombings against Israel, encouraged by radical rejectionists and leading to less and less for the Palestinians, may be another example. If extreme ideology is a factor to be considered in assessing levels of deterrence, it does not mean that deterrence is doomed to fail in such settings but only that it must be at higher levels (and properly targeted on the relevant decision elites behind the specific attacks) to be effective, as is also true in perceived loss or compellance settings.38 Even if major war in the modern world is predominantly a result of aggression by nondemocratic regimes, it does not mean that all nondemocracies pose a risk of war all, or even some, of the time. Salazar's Portugal did not commit aggression. Nor today do Singapore or Bahrain or countless other nondemocracies pose a threat. That is, today nondemocracy comes close to a necessary condition in generating the high risk behavior leading to major interstate war. But it is, by itself, not a sufficient condition for war. The many reasons for this, of course, include a plethora of internal factors, such as differences in leadership perspectives and values, size of military, and relative degree of the rule of law, as well as levels of external deterrence.39 But where an aggressive nondemocraticregime is present and poses a credible military threat, then it is the totality of external factors, that is, deterrence, that become crucial.

Alternative Fails

Rejection of current IR paradigm magnifies hierarchy – emancipation rhetoric gives powerful states a basis for intervention and robs the Third World of agency – traditional security models solve their impacts better
McCormack 10 – Lecturer in International Politics

Tara McCormack, is Lecturer in International Politics at the University of Leicester and has a PhD in International Relations from the University of Westminster. 2010, Critique, Security and Power: The political limits to emancipatory approaches, pg. 127-129

The following section will briefly raise some questions about the rejection of the old security framework as it has been taken up by the most powerful institutions and states. Here we can begin to see the political limits to critical and emancipatory frameworks. In an international system which is marked by great power inequalities between states, the rejection of the old narrow national interest-based security framework by major international institutions, and the adoption of ostensibly emancipatory policies and policy rhetoric, has the consequence of problematising weak or unstable states and allowing international institutions or major states a more interventionary role, yet without establishing mechanisms by which the citizens of states being intervened in might have any control over the agents or agencies of their emancipation. Whatever the problems associated with the pluralist security framework there were at least formal and clear demarcations. This has the consequence of entrenching international power inequalities and allowing for a shift towards a hierarchical international order in which the citizens in weak or unstable states may arguably have even less freedom or power than before. Radical critics of contemporary security policies, such as human security and humanitarian intervention, argue that we see an assertion of Western power and the creation of liberal subjectivities in the developing world. For example, see Mark Duffield's important and insightful contribution to the ongoing debates about contemporary international security and development. Duffield attempts to provide a coherent empirical engagement with, and theoretical explanation of, these shifts. Whilst these shifts, away from a focus on state security, and the so-called merging of security and development are often portrayed as positive and progressive shifts that have come about because of the end of the Cold War, Duffield argues convincingly that these shifts are highly problematic and unprogressive. For example, the rejection of sovereignty as formal international equality and a presumption of nonintervention has eroded the division between the international and domestic spheres and led to an international environment in which Western NGOs and powerful states have a major role in the governance of third world states. Whilst for supporters of humanitarian intervention this is a good development, Duffield points out the depoliticising implications, drawing on examples in Mozambique and Afghanistan. Duffield also draws out the problems of the retreat from modernisation that is represented by sustainable development. The Western world has moved away from the development policies of the Cold War, which aimed to develop third world states industrially. Duffield describes this in terms of a new division of human life into uninsured and insured life. Whilst we in the West are 'insured' – that is we no longer have to be entirely self-reliant, we have welfare systems, a modern division of labour and so on – sustainable development aims to teach populations in poor states how to survive in the absence of any of this. Third world populations must be taught to be self-reliant, they will remain uninsured. Self-reliance of course means the condemnation of millions to a barbarous life of inhuman bare survival. Ironically, although sustainable development is celebrated by many on the left today, by leaving people to fend for themselves rather than developing a society wide system which can support people, sustainable development actually leads to a less human and humane system than that developed in modern capitalist states. Duffield also describes how many of these problematic shifts are embodied in the contemporary concept of human security. For Duffield, we can understand these shifts in terms of Foucauldian biopolitical framework, which can be understood as a regulatory power that seeks to support life through intervening in the biological, social and economic processes that constitute a human population (2007: 16). Sustainable development and human security are for Duffield technologies of security which aim to create self-managing and self-reliant subjectivities in the third world, which can then survive in a situation of serious underdevelopment (or being uninsured as Duffield terms it) without causing security problems for the developed world. For Duffield this is all driven by a neoliberal project which seeks to control and manage uninsured populations globally. Radical critic Costas Douzinas (2007) also criticises new forms of cosmopolitanism such as human rights and interventions for human rights as a triumph of American hegemony. Whilst we are in agreement with critics such as Douzinas and Duffield that these new security frameworks cannot be empowering, and ultimately lead to more power for powerful states, we need to understand why these frameworks have the effect that they do. We can understand that these frameworks have political limitations without having to look for a specific plan on the part of current powerful states. In new security frameworks such as human security we can see the political limits of the framework proposed by critical and emancipatory theoretical approaches.

Transition Wars DA

Transition to the alternative guarantees war – radical changes in existing security architecture collapse threat perception

Yoon 03 – Professor of International Relations at Seoul National University; former Foreign Minister of South Korea (Young-Kwan, "Introduction: Power Cycle Theory and the Practice of International Relations", International Political Science Review 2003; vol. 24; p. 7-8)

In history, the effort to balance power quite often tended to start too late to protect the security of some of the individual states. If the balancing process begins too late, the resulting amount of force necessary to stop an aggressor is often much larger than if the process had been started much earlier. For example, the fate of Czechoslovakia and Poland showed how non-intervention or waiting for the "automatic" working through of the process turned out to be problematic. Power cycle theory could also supplement the structure-oriented nature of the traditional balance of power theory by incorporating an agent-oriented explanation. This was possible through its focus on the relationship between power and the role of a state in the international system. It especially highlighted the fact that a discrepancy between the relative power of a state and its role in the system would result in a greater possibility for systemic instability. In order to prevent this instability from developing into a war, practitioners of international relations were to become aware of the dynamics of changing power and role, adjusting role to power. A statesperson here was not simply regarded as a prisoner of structure and therefore as an outsider to the process but as an agent capable of influencing the operation of equilibrium. Thus power cycle theory could overcome the weakness of theoretical determinism associated with the traditional balance of power. The question is often raised whether government decision-makers could possibly know or respond to such relative power shifts in the real world. According to Doran, when the "tides of history" shift against the state, the push and shove of world politics reveals these matters to the policy-maker, in that state and among its competitors, with abundant urgency. (2) The Issue of Systemic Stability Power cycle theory is built on the conception of changing relative capabilities of a state, and as such it shares the realist assumption emphasizing the importance of power in explaining international relations. But its main focus is on the longitudinal dimension of power relations, the rise and decline of relative state power and role, and not on the static power distribution at a particular time. As a result, power cycle theory provides a significantly different explanation for stability and order within the international system. First of all, power cycle theory argues that what matters most in explaining the stability of the international system or war and peace is not the type of particular international system (Rosecrance, 1963) but the transformation from one system to another. For example, in the 1960s there was a debate on the stability of the international system between the defenders of bipolarity such as Waltz (1964) and the defenders of multi-polarity such as Rosecrance (1966), and Deutsch and Singer (1964). After analyzing five historical occasions since the origin of the modern state system, Doran concluded that what has been responsible for major war was not whether one type of system is more or less conducive to war but that instead systems transformation itself led to war (Doran, 1971). A non-linear type of structural change that is massive, unpredicted, devastating to foreign policy expectation, and destructive of security is the trigger for major war, not the nature of a particular type of international system.

Institutions 1st FW

Governments' obey institutional logics that exist independently of individuals and constrain decisionmaking – that's true regardless of this debate
Wight – Professor of IR @ University of Sydney – 6

(Colin, <u>Agents, Structures and International Relations: Politics as Ontology</u>, pgs. 48-50

One important aspect of this relational ontology is that these <u>relations constitute our identity as social actors</u>. <u>According to this</u> relational <u>model</u> of societies, <u>one is what one is, by virtue of the relations within which one is embedded</u>. A worker is only a worker by virtue of his/her relationship to his/her employer and vice versa. 'Our social being is constituted by relations and our social acts presuppose them.' <u>At any particular moment in time an individual may be implicated in all manner of relations, each exerting its own peculiar causal effects</u>. <u>This</u> 'lattice-work' of relations <u>constitutes the structure of particular societies and endures</u> **despite changes in the individuals occupying them**. Thus, the <u>relations</u>, the structures, <u>are ontologically distinct from the individuals who enter into them</u>. At a minimum, the social sciences are concerned with two distinct, although mutually interdependent, strata. There is an ontological difference between people and structures: '<u>people are not relations, societies are not conscious agents</u>'. Any attempt to explain one in terms of the other should be rejected. <u>If there is an ontological difference between society and people</u>, however, we need to elaborate on the relationship between them. Bhaskar argues that <u>we need</u> a system of mediating concepts, encompassing both aspects of the duality of praxis into which active subjects must fit in order to reproduce it: that is, <u>a system of concepts designating the 'point of contact' between human agency and social structures. This is known as a 'positioned practice' system</u>. In many respects, the idea of 'positioned practice' is very similar to Pierre Bourdieu's notion of *habitus*. <u>Bourdieu</u> is primarily concerned with what individuals do in their daily lives. He <u>is keen to refute the idea that social activity can be understood</u> **solely in terms of individual decision-making**, or as determined by surpa-individual objective structures. Bourdieu's notion of the *habitus* can be viewed as a bridge-building exercise across the explanatory gap between two extremes. Importantly, <u>the notion of a habitus can only be understood in relation to</u> the concept of <u>a 'social field'</u>. According to Bourdieu, <u>a social field is 'a network</u>, or a configuration, <u>of objective relations between positions objectively defined'</u>. <u>A social field</u>, then, <u>refers to a structured system of social positions occupied by individuals and/or institutions – the nature of which defines the situation for their occupants</u>. This is a social field whose form is constituted in terms of the relations which define it as a field of a certain type. A *habitus* (positioned practices) is a mediating link between individuals' subjective worlds and the socio-cultural world into which they are born and which they share with others. <u>The power of the habitus derives from the thoughtlessness of habit</u> and habituation, <u>rather than consciously learned rules. The habitus is imprinted</u> and encoded <u>in a socializing process that commences during early childhood. It is inculcated more by experience than by explicit teaching. Socially competent performances are produced as a matter of routine, without explicit reference to a body of codified knowledge</u>, and without the actors necessarily knowing what they are doing (in the sense of being able adequately to explain what they are doing). As such, the *habitus* can be seen as the site of 'internalization of reality and the externalization of internality.' <u>Thus social practices are produced</u> in, and <u>by, the encounter between</u>: (1) the *habitus* and its dispositions; (2) <u>the constraints and demands of</u>

the socio-cultural field to which the habitus is appropriate or within; and (3) the dispositions of the individual agents located within both the socio-cultural field and the *habitus*. When placed within Bhaskar's stratified complex social ontology the model we have is as depicted in Figure 1. The explanation of practices will require all three levels. Society, as field of relations, exists prior to, and is independent of, individual and collective understandings at any particular moment in time; that is, social action requires the conditions for action. Likewise, given that behavior is seemingly recurrent, patterned, ordered, institutionalised, and displays a degree of stability over time, there must be sets of relations and rules that govern it. Contrary to individualist theory, these relations, rules and roles are not dependent upon either knowledge of them by particular individuals, or the existence of actions by particular individuals; that is, **their explanation cannot be reduced to consciousness** or to the attributes **of individuals**. These emergent social forms must possess emergent powers. This leads on to arguments for the reality of society based on a causal criterion. Society, as opposed to the individuals that constitute it, is, as Foucault has put it, 'a complex and independent reality that has its own laws and mechanisms of reaction, its regulations as well as its possibility of disturbance. This new reality is society…It becomes necessary to reflect upon it, upon its specific characteristics, its constants and its variables'.

AT Ontology 1ˢᵗ

Ontology not come first - questions of ethics are contingent and political, not ontological - their attempt to ground ethics in ontology leads to epistemic closure and prevents democratic challenges to existing relationships of violence
Beasley & Bacchi 7

(Chris, Prof. of Politics @ University of Adelaide, Carol, Prof. Emeritus @ University of Adelaide, "Envisaging a new politics for an ethical future: Beyond trust, care and generosity -- towards an ethic of `social flesh'", *Feminist Theory*, 2007 8: 279)

How does our concept of 'social flesh' draw on, yet differ from, existing vocabularies? Following on from the second generation care ethicists we suggest that the ethico-political ideal of 'social flesh' is not so much to be understood as a moral quality, usually perceived in relation to individuals, but rather as a political ethic concerning existing and future practices, a political challenge specifically to the neo-liberal ethos of atomistic individualism. We do not stress ontology in this account of interconnection. Diprose argues – in keeping with Levinas – that embodied interconnection between self and other makes 'being' possible, is a fixed universal, and hence precedes history and politics. Ethical responsibility for the other, connectedness, becomes unquestionable and inescapable. We feel that this reliance on ontology to do the work of social responsibility may be **overly hopeful** and may also **relegate important political debates to the sidelines**, while framing embodied interconnection in strongly prescriptive and normative terms. While we agree, along with care ethicists, that sociality is embodied (and consequently involves care), this is a very preliminary and thin ontological foundation which **does not presume in advance that forms of recognition which flow from it are necessarily laudable** or predictable, **let alone self-evidently altruistic**. While embodied interconnection is the preexisting condition of 'being' human and therefore of sociality,2 in concert with Borgerson we are inclined to assert that **what human beings do with this ontological state of connection is not ontological**. In other words, **the ontological starting point** of embodied interconnection does get us very far. It **does not entail a particular ethics**. Rather ethics – a relation of responsibility – remains firmly in the realm of the political possibilities and political will within particular forms of sociality, a matter of history.3 Hence, **the question remains, what is to be done**? Like Borgerson, we think that an overemphasis on the ontological leads to an **'epistemic closure'** (Gordon, 2000: 145–7 in Borgerson, 2001: 183) and to an **essentializing as fundamental and inevitable**. This is importantly contingent and a matter of political debate. Thus, at least at the level of the political imaginary, **such an overemphasis blocks the necessary and fruitful contestation required in order to undertake the democratic project of overhauling neo-liberalism**.

Ableism K – NDI 2015

a bunch of cards that can be used to construct a language PIC, an offensive reason to vote against the other team, a kritik if you're really ambitious, etc. applies spec. to metaphors used for disability in their cards. check at the end of cites in small text to see if there's anything particular about the card that's useful/important to know

what even is ableism? and why does it matter? Leibowitz 14 = what ableism is; Brown 14 A2 Censorship=why it matters

but wait! why do so many of these cards have ableist slurs in them??? 1. most of the cards were written by people with disabilities (Jean, Leibowitz, Brown, FWD) who have the choice to reclaim slurs which apply to them 2. using slurs in their context to analyze them isn't offensive in that they're not directed and used to study the words themselves 3. example usages in the card are offensive, but are then deconstructed and critiqued, unlike the evidence read by the other team, which uncritically uses ableist language. control+f "potential for offensive language" for questionable contexts.

Critical Biometrics Consciousness K

1NC

Strategies of critical consciousness are exclusionary – posits those with cognitive disabilities as aligned with the moral failing of racism

Clifford 11 [Stacy Clifford, Hegarty Fellow in the MSU-DOCTRID program, educational background in political science and disability studies; "Indispensable Idiocy: Cognitive Disability and The Social Contract" pg 120-122; Dissertation for 2012 PhD of Philosophy in Political Science @ Vanderbilt; 12/2011; accessed 07/31/2015; <http://etd.library.vanderbilt.edu/available/etd-12022011-135421/unrestricted/Clifford_Dissertation113011.pdf>.] You can read this as a PIC/Counter-advocacy and instead advocate for an epistemology of disavowal of biometrics

Conversely, Charles Mills describes the racial contract as promoting an epistemology of ignorance amongst (most) whites in which white people are ignorant of their own complicity with racism. In many ways, the racial and disabled contracts promote similar epistemic faults: both require the "cultivation of patterns of affect and empathy that are only weakly, if at all, influenced by nonwhite [disabled] suffering" (1997, 95); "[e]vasion and self-deception thus become the epistemic norm" (97); both instill a "cult of forgetfulness" (97) as certain [nonwhite/disabled] "realities were made invisible" (92). Although Mills employs the language of ignorance, it is often abutted by descriptions of invisibility and "structured blindness"—and so these epistemologies are not entirely dissimilar. But there are important reasons to avoid the language of ignorance, especially for a project on cognitive disability, most important of which is the way in which the familiar Enlightenment category of ignorant/cognizant maps onto morally wrong/right. Mills often emphasizes the ways in which racism causes "cognitive dysfunctions" leaving whites "unable to understand" because they live in a "cognitive model that precludes self-transparency (1997, 18). If the problem is ignorance, then the answer is to become more cognizant, both for whites and nonwhites. If whites live in a "racial fairyland" (18), nonwhites' must launch a cognitive voyage to overturn racism. Mills answer to racism requires a series of cognitive feats: One has to learn to trust one's own cognitive powers, to develop one's own concepts, insights, modes of explanation, overarching theories, and to oppose the epistemic hegemony of conceptual frameworks designed in part to thwart and suppress the exploration of such matters; one has to think against the grain. (119) Mills is not the first to propose **cognitive self-consciousness raising as a first step to emancipatory politics**, but **judged from the lens of cognitive disability**, this familiar route to empowerment **is troublesome**. In this epistemic model, the ignorant are always in the role of morally wrong and inferior while the cognitively superior are also morally superior. Better politics mutates into smarter people. An **epistemology of disavowal, however, can rely on other tools to dismantle oppression and it doesn't require individuals to pursue an intellectual** mystic **journey** before they can effectively politically advocate for themselves. Understanding a model of advocacy detached from cognition is more than this present chapter can handle, but it will be the subject of chapter five. For now, let me just say that—if ignorance presupposes cognizance as a political answer— then disavowal requires confrontation and affirmation of disabled lives.

Turns the aff's claims about the unmarked nature of whiteness by replicating the unmarked ablebodiedness of their politics

Ferri and May 5 (Beth, Assoc Prof Disability Studies, Syracuse Univ; Vivian, Asst Prof Women's Studies, Syracuse Univ; , "Fixated on Ability: Ableist metaphors in feminist theories of resistance," Prose Studies, v27, http://syr.academia.edu/BethFerri/Papers/160692/Fixated_on_Ability_Questioning_Ableist_Metaphors_in_Feminist_Theories_of_Resistance]

Just as whiteness frequently operates as an unstated/unmarked racial norm (in, for example, analogies between homophobia and racism (Carbado 291**)), able-bodiedness continues to operate as the unstated/unnoticed bodily norm both in analogies to disability and in metaphors for freedom and agency. This dynamic obscures the fact that able-bodied people are, in fact, embodied and that disabled persons are disenabled by systems of power. Additionally, it denies the myriad forms of unearned able-bodied privilege accorded to non-disabled persons.**

Vote negative to refuse this replication of oppression, obligation as judge and educator

Ben-Moshe 5 (Liat, Ph.D. student in Sociology, Disability Studies and Women Studies at Syracuse University. ""Lame Idea": Disabling Language in the Classroom," in Building Pedagogical Curb Cuts: Incorporating Disability into the University Classroom and Curriculum, http://www.syr.edu/gradschool/pdf/resourcebooksvideos/Pedagogical%20Curb%20Cuts.pdf)

When we use terms like "retarded," "lame" or "blind"— even if we are referring to acts or ideas and not to people at all— we perpetuate the stigma associated with disability. By using a label which is commonly associated with disabled people to denote a deficiency, a lack or an ill-conceived notion, we reproduce the oppression of people with disabilities. As educators, we must be aware of the oppressive power of "everyday" language and try to change it. False Beliefs Contained in Disabling Phrases We learn about disability through everyday use of language. In the same way that racist or sexist attitudes, whether implicit or explicit, are acquired through the "normal" learning process, so too are negative assumptions about disabilities and the people who are labeled as having them. Our notions of people who are blind, deaf or labeled as mentally retarded come into play when we use disabling phrases, and these notions are usually far from accurate. They do not convey the complexity of living in a society that regards people with disabilities as the Other on the basis of perceived mentally or bodily difference. The use of disability as a metaphor perpetuates false beliefs about the nature of impairment and disability. People who are blind, for example, do not lack in knowledge; they simply have different ways of obtaining it. Paralysis does not necessarily imply lack of mobility, stagnancy or dependence since there are augmentative instruments, such as wheelchairs and personal aids, that secure independence and mobility. The continued use of disabling language in the classroom perpetuates ignorance and misconceptions in regards to the lived experience of people with disabilities. Power Relations in the Classroom As Marxists, feminists and anti-racist activists and scholars have claimed for decades, the world is viewed mostly from the perspective of the rulers, and language is created in their image as well. Therefore, we must not be surprised that the use of disabling language not only persists, but is neither contested nor acknowledged. Disabling language is language that accepts the assumption that disabilities are bad, unfortunate or denote lack/deficiency; that they are invisible and insignificant to society as a whole; and that disabilities belong to the Other and are distinct from what we would term as normal. What this language hides is that there is a power struggle of definitions, that normalcy is culturally determined and ever-changing, and that there are more people who are defined as having disabilities than we acknowledge. The question that disability activists and scholars are asking is not who is disabled, but who gets to be defined as blind, mentally retarded or crippled and under what power relations? Using an oppressive abelist language to denote deficiency reproduces the same hierarchy and power relations in the classroom, and renders these phrases unproblematic. Disability is not a metaphor. It is an identity. Using disability as a metaphor to represent only negative aspects of a situation is problematic. It is made worse by the fact that blindness, deafness, paralysis, etc., are not floating signifiers, but have real referents behind them—people with disabilities. When using disabling language, we do not only de-value the lived experience of people with disabilities, but we also appropriate these lived experiences for our own use.

2NC

The affirmative's appeal to rationality exclude people with cognitive disabilities – the urge toward consciousness requires ablenormative ideas of competency and self-awareness

Clifford 11 [Stacy Clifford, Hegarty Fellow in the MSU-DOCTRID program, educational background in political science and disability studies; "Indispensable Idiocy: Cognitive Disability and The Social Contract" pg 121; Dissertation for 2012 PhD of Philosophy in Political Science @ Vanderbilt; 12/2011; accessed 07/31/2015; <http://etd.library.vanderbilt.edu/available/etd-12022011-135421/unrestricted/Clifford_Dissertation113011.pdf>.] Potential for offensive language: glang

The shock that Briggs-Wall described is attributed entirely to the injustice of situating women alongside these other stigmatized groups. Here we can see how dehumanization of the feebleminded is used to as an appeal to certain classes of women and similarly is used to build cross-class solidarity among women. Even within the disability rights movement, **appeals to rationality are difficult to resist**. Mitchell and Snyder argue that physically disabled activists have been complicit with using cognitive disability as the "true" insufficiency (2006). James Charlton's Nothing About Us Without Us: Disability Oppression Empowerment is a foundational text analyzing ableist oppression and the disability rights movement (1998). Charlton laments the absence of people with cognitive disabilities from his analysis, but fails to see how his reliance on a Marxist understanding of oppression enforces exclusion. Under this logic, each individual must undergo a profound change in consciousness to understand their own oppression, but **this assumes that an individual can conceptualize himself as disabled**. Likewise, Justin Dart, a disability activist proclaims, "Empowerment is the issue of the age…. Nobody is going to give it to us. We have to empower ourselves" (quoted in Fleischer and Zames 2001, 109). R.R. Anspach similarly insists that the first step of a successful disabilities movement is to convince others by their actions that they are "independent, rational beings, capable of self-determination and political action" (1996, find page number). Charlton, Anspach, Dart and Anspach endorse the logic of exclusion when they argue that full inclusion necessitates competency, independence, and self-awareness—all of which pose real problems for the severely cognitively disabled. Researchers point out that establishing these kinds of self-concepts may prove especially difficult for people with cognitive disabilities, who thus remain ostracized within their own movement (Finlay and Lyons 1998).

And, their focus on mobility and border crossing reinforces ablenoremative notions of the relationship between mobility and politics

Ferri and May 5 (Beth and Vivian, "Fixated on Ability: Questioning Ableist Metaphors in Feminist Theories of Resistance", Prose Studies, 27 (1&2)

In addition to the use of explicitly ableist metaphors, it is equally important to think about how ableism plays out in more implicit ways. In this vein, **we wonder about many of the metaphors of movement being used in contemporary discourse**. Consider this query posed to incite innovative action toward a more positive future: "What... if we were to tap into the lifeforce that confers upon us the right to live and work toward possibility as opposed to remaining paralyzed and dissatisfied.. .*V* (Cervenak et al. 354). A life of possibility, and even the lifeforce itself, is constructed here in opposition to "paralysis" and dissatisfaction: in other words, being moved to act and live in fulfilling ways requires a form of *movement* that is understood in ableist terms. Iliis example is not unique, however. **References to roving subjects, boundary crossers, and migrating subjects abound: is the movement invoked to signal freedom conceptualized in ways that account for or include disability? Our suspicion is that it is not**. Are **contemporary theorists imagining rolling down the road to freedom or is there an assumption of marching as the authoritative sign of collective group action? What notions of motility are at use in the idea of crossing borders, leaving home, or exile?** What of the ideas of unrestrained movement at work in the many references to untethered subjectivities or "figures of hybridity and excess jsuch as the cvborgj" (Thomson, *Inicfitaiinn* 9)?
Just as whiteness frequently operates as an unstated/unmarked racial norm (in, for example, analogies between homophobia and racism (Carbado 291)), **able-bodiedness continues to operate as the unstated/unnoticed bodily norm both in analogies to disability and in metaphors for freedom and agency. This dynamic obscures the fact that able-bodied people are, in fact, embodied and that disabled persons are disenabled by systems of power.** Additionally, it denies the myriad forms of unearned able-bodied privilege accorded to non-disabled persons. *l*he **able-bodied or "ambulist"** (Keith) **notions of mobility and movement used to define and imagine liberation, resistance,**

and transformation require an unstated, but understood, notion of stasis as their figurative, disabled doppelganger. Here, we turn again to our own writing to further illustrate our point. In our discussion of the character Nichole in Atom Kgoyan's film adaption of the novel, *The Sweet Hereafter,* we analyze Nichole's newfound agency, which rests on her astute uses of ableism to refuse sexual exploitation by her father. Yet in our article, we problematically celebrate the scene at the close of the film when she wheels herself away from the deposition table. Ironically, in analyzing the interdependent nature of ableism and sexism, we privileged autonomy and a narrow notion of motility as signifiers of freedom and agency (May and rerri, 145). The *motility* that is imagined, in our example and in many others, as signaling freedom, political action or movement, or agency often (directly or indirectly) constructs disability as a state of being that is dependent, relational, "stuck," broken, and/or in need of a cure in contrast, of course, to the critical or postmodern subject who seems unfettered, on the move, independent, and whole. Such a framework replicates a troubling figure/ground dichotomy and stymies our ability to rethink diverse modes of motility, movement, agency, freedom, and subjectivity.

Any permutation that calls for an attempt to engage in consciousness is compulsory rationality – the argument that people with cognitive impairments are pitiful or nonexistent unless they work toward abledness – political discourse must be reshaped around accessibility

Clifford 11 [Stacy Clifford, Hegarty Fellow in the MSU-DOCTRID program, educational background in political science and disability studies; "Indispensable Idiocy: Cognitive Disability and The Social Contract" pg 128-130; Dissertation for 2012 PhD of Philosophy in Political Science @ Vanderbilt; 12/2011; accessed 07/31/2015; <http://etd.library.vanderbilt.edu/available/etd-12022011-135421/unrestricted/Clifford_Dissertation113011.pdf>.] You can read this as a PIC/Counter-advocacy and instead advocate for an epistemology of disavowal of biometrics

Dominant conceptions of personhood hinge political membership on a cluster of cognitive capacities. In this dissertation, I have argued that this conception of personhood is an inheritance from Locke's disabled contract, the terms of which deny the political and human equality of people with cognitive disabilities. Prior chapters examined the disabled contract in liberal political thought and in the historical practices surrounding people with cognitive disabilities. In this chapter, I turn to contemporary self-advocacy groups dedicated to the political empowerment of people with cognitive disabilities. Given the disabled contract's troubled legacy in theory and history, how do contemporary self-advocates with disabilities and their allies frame political claims for inclusion? Do they demand political membership based on the traditional norm of cognitive competence established within social contract theory? Or do they contest the legitimacy of cognitive competence as a marker of political equality and thus aim to transform the foundation of political equality more broadly? In fact, self-advocates and their allies pursue both strategies. They demand recognition as cognitively competent persons in order to gain political standing while simultaneously contesting narrow norms of personhood that enforce their exclusion. Self-advocacy efforts thus straddle an uncomfortable paradox of personhood at the heart of social contract theory: the promise of human and political equality amid profound differences in cognitive disability. More specifically, I argue that the paradox of personhood enforces a threshold measure of cognitive capacity even when self-advocates' aim to displace cognitive competence as a marker for political and human membership. I explore this tension between equality and disability through my observations of People First, a state-wide self-advocacy organization run by and for people with disabilities, and SABE, Self Advocates Becoming Empowered, a national organization largely made-up of People First chapters. Just one of many self-advocacy organizations found in the United States, People First operates through a network of local chapters that serve as political outlets for members to address concerns around employment, transportation, healthcare, and housing. Like the broader disability rights movement, People First directly challenges the idea that people with cognitive disabilities are personally and politically incompetent. This adamant denial of incompetence, however, threatens to intensify the normative commitment to the disabled contract and, in addition, evades the hard question prompted by people with profound cognitive disabilities whose impairment precludes conformity with cognitive competence. Importantly, my analysis of self-advocates with disabilities is driven by a feminist research ethic and feminist theory. My analysis builds on prior feminist scholarship that relies on the empirical experiences of women, women activists, and noncitizens engaged in political struggle to inform the development of normative theory (Beltrán 2009; Ackerly 2000; Mahmood 2004). Methodologically, incorporating disabled voices is congruent with the disability rights movement's motto of "nothing about us, without us" and rectifies scholarship about disability that excludes the involvement or insight of disabled persons. Relying on advocates' voices also momentarily suspends the epistemological

authority of the researcher with the intent to allow the experiences of those most marginalized to guide the development of theoretical claims. In addition, my understanding of key concepts—including compulsory rationality and the paradox of personhood—is derived from feminist theory. I use these concepts to describe in more detail the ways in which the disabled contract enforces conformity. Compulsory rationality builds on feminist and queer theorists' understanding of compulsory heterosexuality in which "lesbian experience is perceived on a scale ranging from deviant to abhorrent, or simply rendered invisible" (Rich 1980, 632). Within disability studies, Robert McRuer similarly argues that the "problem" of disability is not situated in disabled bodies but rather the "inevitable impossibility, even as it is made compulsory, of an able-bodied identity" (2006, 10 emphasis added). I argue in this chapter that a similar dilemma undergirds the lives of people with cognitive disabilities and, insofar as they are unable to cultivate a rational identity, their lives are marked as pitiful, repulsive, or nonexistent. My understanding of the paradox of personhood is also informed by feminist theory and is specifically indebted to Wendy Brown's work on the paradox of rights (2000). For Brown, "Women both require access to the existence of this fictional subject and are systematically excluded from it by the gendered terms of liberalism, thereby making our deployment of rights paradoxical" (239). Brown describes the paradox accordingly, even as invocations of rights for a particular subject (e.g. women) on a particular issue (e.g. sexuality) in a particular domain (e.g. marriage), all of which have been historically excluded from the purview of rights, may work to politicize the standing of those subjects, issues, or domains, rights in liberalism also tend to depoliticize the conditions they articulate. Rights function to articulate a need, a condition of lack or injury, that cannot be fully redressed or transformed by rights, yet can be signified in no other way within existing political discourse. (239)

Call for Consciousness=Root Cause

Their underlying engagement with the social contract of personhood gatekeeps with the ability to think and reason – excludes people with cognitive impairments as deformed, inhuman monsters

Clifford 11 [Stacy Clifford, Hegarty Fellow in the MSU-DOCTRID program, educational background in political science and disability studies; "Indispensable Idiocy: Cognitive Disability and The Social Contract" pg 56-; Dissertation for 2012 PhD of Philosophy in Political Science @ Vanderbilt; 12/2011; accessed 07/31/2015; <http://etd.library.vanderbilt.edu/available/etd-12022011-135421/unrestricted/Clifford_Dissertation113011.pdf>.] You can read this as a PIC/Counter-advocacy and instead advocate for an epistemology of disavowal of biometrics

According to Locke, <u>human parents and birth does not bestow species membership</u>. Instead, <u>a species is distinctive because of its essence</u> and the possession of this essence confers membership. "<u>To be a man, or of the species man, and have the essence of a man, is the same thing</u>" (298). Locke argues that <u>the faculty of thinking separates the meaning of man from person. Man</u>, according to Locke, <u>is "nothing but a participation of the same continued life</u>…united to the same organized body" (215). <u>A person, however, "is a thinking intelligent being, that has reason and reflection, and can consider it self as it self"</u> (217). In contrast, <u>a man cannot be considered a person without the ability to reason</u>. Locke is adamant on this point, <u>repeatedly stressing the dependence of personhood on consciousness</u>. Accordingly, "<u>without consciousness, there is no Person</u>" (344), and again, "<u>Self is that conscious thinking thing</u>" (341, see also 335). C.F. Goodey articulates Locke's argument that to belong to the species of man in Locke's Essay, "<u>each single member must conform with our idea of man and thus with our idea of what it is to be rational</u>" (1996, 93). By using man instead of person, Goodey's own analysis of Locke reiterates <u>the slippery conceptual demarcations between categories</u>. The bodily difference of idiocy—<u>lodged in the faculty of thinking</u>—is directly situated on the border between man and person. Locke does not evade the questionable personhood status of idiots, but faces it directly in his discussion of changelings. In the seventeenth century, a changeling was defined as a "halfwitted person, idiot, [and] imbecile," as well as a "child (usually stupid or ugly) supposed to have been left by fairies in exchange for one stolen child" (Oxford 2007). Locke himself describes changelings as "drivelling, unintelligent, [and] intractable," "half Beast, and half Man," and "ill-formed and mis-shaped productions" (571-2). Changelings are used by Locke to debunk two misplaced assumptions: "That all Things that have the outward Shape and Appearance of a Man, must necessarily be designed to an immortal future Being, after this Life. Or, secondly, that whatever is of humane Birth must be so" (570). For Locke, <u>being born of two rational humans is not enough to bestow human membership</u>. <u>When Locke conjoins the driveling intelligence of idiots with the misshapen form of beasts, **the result is hardly human, but rather monstrous.**</u>

Monstrous projections of disability are cultural wounds that engender replication and fear-mongering – means no solvency as the label of disability is projected onto other marginalized groups

Cohen 96 [Jeffrey Jerome Cohen, Professor of English, Director of Institute for Medieval & Early Modern Studies at Columbian College of Arts and Sciences; "Monster Culture" pg 4; University of Minnesota Press; 1996; accessed 06/29/2015; < http://ptfaculty.gordonstate.edu/rscoggins/Cohen,%20Monster%20Culture%20(Seven%20Theses),%203-20.pdf>.]

Thesis I: <u>The Monster's Body Is a Cultural Body</u> Vampires, burial, death: inter the corpse where the road forks, so that when it springs from the grave, it will not know which path to follow. Drive a stake through its heart: it will be stuck to the ground at the fork, it will haunt that place that leads to many other places, that point of in- decision. Behead the corpse, so that, acephalic, <u>it will not know itself as subject, only as pure body</u>. <u>The monster is born only at</u> this me<u>taphoric Crossroads, as an embodiment of a certain cultural moment-of a time, a feeling, and -a place</u>.1 <u>The monster's body</u> quite literally <u>incorporates fear, desire, anxiety, and fantasy (ataractic or incendiary), giving</u> them <u>life and an uncanny independence. The monstrous body is pure culture. A construct and a projection, the monster exists only to be read</u>: the monstrum is <u>etymologically "that which reveals," "that which warns,"</u> a glyph that seeks a

hierophant. Like a letter on the page, **the monster signifies** something other than itself: it is always **a displacement**, always inhabits the gap between the time of upheaval that created it and the moment into which it is received, to be born again. These epistemological spaces between the monster's bones are Derrida's familiar chasm of différance: a genetic uncertainty principle, the essence of the monster's vitality, the reason it always rises from the dissection table as its secrets are about to be revealed and vanishes into the night.

Their fear of the dangerous, deviant, impaired body justifies human rights abuses, murder, and devalued lives – discrimination against people of color, women, and immigrants has always been through their alignment with disability

Siebers 10 [Tobin Siebers, Department of English Language and Literature at the University of Michigan; "The Aesthetics of Human Disqualification"; University of Michigan Press; 10/28/2010; accessed 07/31/2015; <http://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=1&ved=0CCoQFjAA&url=http%3A%2F%2Fdisabilities.temple.edu%2Fmedia%2Fds%2Flecture20091028siebersAesthetics_FULL.doc&ei=LWz4T6jyN8bHqAHLkY2LCQ&usg=AFQjCNGdkDuSJkRXMHgbXqvuyyeDpldVcQ&sig2=UCGDC4tHbeh2j7-Yce9lsA>.]

Surprisingly little thought and energy have been given to disputing the belief that nonquality human beings do exist. This belief is so robust that it supports the most serious and characteristic injustices of our day. Disqualification at this moment in time justifies discrimination, servitude, imprisonment, involuntary institutionalization, euthanasia, human and civil rights violations, military intervention, compulsory sterilization, police actions, assisted suicide, capital punishment, and murder. It is my contention that disqualification finds support in the way that bodies appear and in their specific appearances—that is, **disqualification is justified through the accusation of mental or physical inferiority** based on aesthetic principles. Disqualification is produced by naturalizing inferiority as the justification for unequal treatment, violence, and oppression. According to Snyder and Mitchell, disability serves in the modern period as "the master trope of human disqualification." They argue that disability represents a marker of otherness that establishes differences between human beings **not as acceptable or valuable variations but as dangerous deviations**. Douglas Baynton provides compelling examples from the modern era, explaining that during the late nineteenth and early twentieth centuries in the United States **disability identity disqualified other identities defined by gender, race, class, and nationality.** Women were deemed inferior because they were said to have mental and physical disabilities. People of color had fewer rights than other persons based on accusations of biological inferiority. Immigrants were excluded from entry into the United States when they were poor, sick, or failed standardized tests, even though the populations already living there were poor, sick, and failed standardized tests. In every case, disability identity served to justify oppression by amplifying ideas about inferiority already attached to other minority identities. Disability is the trope by which the assumed inferiority of these other minority identities achieved expression. The appearance of lesser mental and physical abilities disqualifies people as inferior and justifies their oppression. It is now possible to recognize disability as a trope used to posit the inferiority of certain minority populations, but it remains extremely difficult to understand that mental and physical markers of inferiority are also tropes placed in the service of disability oppression. Before disability can be used as a disqualifier, disability, too, has to be disqualified. Beneath the troping of blackness as inbuilt inferiority, for example, lies the troping of disability as inferior. Beneath the troping of femininity as biological deficiency lies the troping of disability as deficiency. The mental and physical properties of bodies become the natural symbols of inferiority via a process of disqualification that seems biological, not cultural—which is why disability discrimination seems to be a medical rather than a social problem. If we consider how difficult it is at this moment to disqualify people as inferior on the basis of their racial, sexual, gender, or class characteristics, **we may come to recognize the ground that we must cover in the future before we experience the same difficulty disqualifying people as inferior on the basis of disability**. We might also recognize the work that disability performs at present in situations where race, sexuality, gender, and class are used to disqualify people as physically or mentally inferior.

Cyborg K

1NC

The essentializing claim "we are all cyborgs" ignores the visceral hatred of the use of technology in disability – that Othered people with disabilities must only be <u>as</u> good as, or striving for, the abled body, but their cyborgization must not extend beyond that. Even if "we" are all cyborgs, the abled body cannot challenge these categories

Wanenchak 12 [Sarah Wanenchak, contributor to cyborgology, fifth year doctorate candidate, MA in gender and sexuality studies, their work focuses on exploring social movements from the perspective of analysis of events, and the way movement dynamics work in the context of a world augmented by digital technology; "Disabled Bodies and Ableist Acceptance"; Sociological Images; 01/16/2012; accessed 07/26/2015; <http://thesocietypages.org/socimages/2012/01/16/disabled-bodies-and-ableist-acceptance/>.]

My angle was to begin with the idea of <u>able-bodied society's instinctive, gut-level sense of discomfort and fear regarding disabled bodies</u>, which is outlined in disability studies scholar Fiona Kumari Campbell's book Contours of Ableism. Briefly, Campbell distinguishes between disableism, which are the set of discriminatory ideas and practices that construct the world in such a way that it favors the able-bodied and marginalizes the disabled, and ableism, which <u>is the set of constructed meanings that set disabled bodies themselves apart as objects of distaste and discomfort</u>. In this sense, <u>disabled bodies are imbued with a kind of queerness – they are Other</u> in the most physical sense, outside and beyond accepted norms, <u>unknown and unknowable, uncontrollable</u>, disturbing in how difficult they are to pin down. Campbell identifies <u>this quality of unknowability and uncontainability as especially, viscerally horrifying</u>. Campbell connects more directly to <u>Haraway's cyborgs</u> when she opens a discussion of biotechnology and disabled bodies: The fortunes of techno-science continue to <u>disrupt the fixity of defining disability and normalcy especially within the arenas of law and bioethics</u>. Whilst anomalous bodies are undecidable in being open to endless and differing interpretations, <u>an essentialised disabled body is subjected to constant deferral</u> – standing in reserve, awaiting and escaping able(edness) <u>through morphing technologies and as such exists in an ontologically tentative or provisional state</u>. Anomalous and <u>disabled bodies are</u> both <u>unsettling to the able-bodied</u>, therefore, because they implicitly lay open to question our assumptions about essential definitions of embodied humanity. <u>Throw technology into the mix and the questions become even more explicit. What is human?</u> What does human mean? And where is the line between organic human and machine – if there even is one? <u>Haraway's position is</u>, of course, <u>that there is no meaningful line, and that we are all</u>, in some sense, <u>cyborgs</u> — that <u>the relationship between the organic and the machine is so complex that it is no longer sensible to attempt to untangle it</u>. And thanks to <u>advances in prostheses and other biotechnologies, the boundary between "disabled" and "augmented" is becoming increasingly problematic</u>, despite the essentializing power that the label of <u>"disabled" contains</u>. In order to introduce my students to the ideas behind the relationship of different kinds of organic bodies to different kinds of technology, and how we culturally process those embodied relationships, I invited them to consider the cases of two <u>amputee athletes</u>, Aimee Mullins and Oscar Pistorius. These are the pictures I used: Mullins and Pistorius present interesting examples. They are both known for being both accomplished athletes and for being physically attractive – Mullins has done modeling work. They <u>present inspiring stories</u> that have generated a fair amount of sports media coverage. And <u>yet</u> things have not been altogether smooth – <u>there has been</u> some <u>controversy regarding the degree to which the carbon fiber prostheses they use</u> for running <u>confer</u> any form of <u>advantage</u> on the runners who use them. <u>Questions over the effect of the prostheses have threatened Pistorius's bids</u> to compete <u>in the Olympics alongside able-bodied athletes</u>. I think <u>the combination of positive and negative reactions is worth noting</u>, in light of Campbell's writing on culture and disability. Mullins and Pistorius are <u>admired for "overcoming" a perceived disability, and this admiration feels especially safe for people embedded in able-bodied culture</u> because they are conventionally attractive in every other respect. But <u>this is a story with which we only feel comfortable provided that it doesn't present any kind of threat to our conventional categories of abled and disabled bodies. It is unacceptable for a disabled body to be better at what it does than an abled body. It is even slightly uncomfortable when a disabled body manages to be "just as good".</u> After the images of Mullins and Pistorius, I also showed my students an image of speed skater

<u>Apollo Ohno</u>: Like the images of Mullins and Pistorius, Ohno's body is explicitly being presented here as an attractive object. By most standards, Ohno is as able-bodied as one can get. But as I pointed out to my students, he <u>manages</u> this <u>on the back of technology</u> – on specially designed skates, in special aerodynamic suits, with the help of carefully balanced exercise and nutrition plans; almost no athlete is really "natural" anymore. <u>But</u> at least in part <u>because of the closeness of his body to an able-bodied ideal, this presents no explicit threat to our categories. Ohno fits the accepted model of "human".</u> Who would look at him and doubt it? And if Mullins and Pistorius are perhaps not as close to that ideal, they at least fall into line with it, by virtue of the fact that they don't explicitly question its legitimacy as an ideal – unless they seek to transcend it. My point, in short, is this: we <u>are uncomfortable with disabled bodies that question or trouble our accepted, hierarchical categories of abled and disabled</u>, of human and non-human, of organic and machine. <u>We are far more comfortable with them when they perform in such a way that they reinforce the supremacy of those categories</u>. They become acceptable to us.

To be seen as a cyborg is not a radical choice for people with disabilities and the elderly – the ability to choose obscures the psycho-emotional effects of perception of cyborgism, and ignores the economic and survival struggles of those perceived as cyborgs

Reeve 12 [Donna Reeve, Department of Applied Social Science at Lancaster University, specializing in Feminist Disability Studies; "Cyborgs, cripples and iCrip: Reflections on the contribution of Haraway to disability studies" pg 96-98; Disability and Social Theory: New Developments and Directions; 2012; accessed 07/26/2015; <http://donnareeve.co.uk/wp-content/uploads/2014/03/ReeveChapter2012c.pdf>.]

As part of her critique of the poststructural disabled subject Erevelles (2001) argues strongly that <u>there is danger in viewing disabled subjects as being able to seek</u> a <u>pleasurable survival as a border-crosser in the ironic political myth of a cyborgean materiality</u>. (Erevelles, 2001: 97) Whilst many disabled people do have intimate relationships with technology, guide dogs and ventilators which are necessary to everyday survival, this <u>playful transgressing of boundaries so favoured by Haraway</u> and subsequent theorists <u>neglects the materiality of disablism</u>, in other words, the social practices and cultural beliefs that underpin the disadvantage and exclusion experienced by people with impairments (Thomas, 2007: 13). <u>The ease with which cyborg politics offers a new language and possibilities</u> for marginalised groups <u>risks **erasing the actual struggles that many disabled people face for economic survival**</u>, especially in the majority world. Here the extreme poverty in some countries is exacerbated by the high numbers of people who become amputees as a result of war and landmines (Yeo and Moore, 2003) - <u>cyborg politics would appear to have little relevance to these disabled people struggling simply to survive</u>. Reality of living as a cyborg Another criticism which has been made by scholars in disability studies is that <u>the cyborg imagined by Haraway fails to take account of the reality of living with a body which is hybridised with technology</u>. As Siebers (2008) puts it so well: <u>Haraway's cyborgs are spunky, irreverent, and sexy; they accept with glee the ability to transgress old boundaries</u> between machine and animal, male and female, and mind and body. … [However] <u>Haraway is so preoccupied with power and ability that **she forgets what disability is**</u>. <u>Prostheses</u> always increase the cyborg's abilities; they <u>are a source only of new powers, never of problems. The cyborg is always more than human</u> – <u>and never risks</u> to be seen as <u>subhuman</u>. To put it simply, **the cyborg is not disabled**. (Siebers, 2008: 63) Siebers describes how his plastic leg brace helps ease the pain in his lower back, but in summer it chafes his calf causing pain and soreness. Long-term wheelchair users can develop painful shoulder problems in later life and implanted devices such as nerve cord stimulators can have wires break and batteries that need replacing; these are examples of 'impairment effects' (Thomas, 2007: 136), restrictions of activity due to bodily variation and ways of managing that difference, rather than from externally imposed disablism. In addition to these physical problems that prosthetics can cause, there are also potential psycho-emotional barriers. For example, whilst using a wheelchair can be enabling, allowing the user to move more freely in space, that person then becomes subject to the prejudices that exist in society about the perceived inabilities of wheelchair users (Cromby and Standen, 1999). This example of <u>psycho-emotional disablism</u> (Reeve, 2006; Reeve, 2008; Thomas, 2007) <u>is a form of social oppression that undermines emotional well-being, self-esteem and ontological security, impacting on 'being' rather than 'doing' as seen in examples of</u>

structural disablism such as inaccessible buildings. This experience of psycho-emotional disablism may make someone decide to abandon their prosthetic because they don't want to be marked out as different and subject to stigma; this has implications for professionals such as physiotherapists who need to rework their notion of 'non-compliance' through the lens of psycho-emotional disablism. Another form of psycho-emotional disablism can emerge when people feel 'forced' to use a prosthetic or assistive device because of the reactions of others. For example, there is social pressure on women to wear a prosthetic or have breast reconstruction surgery following breast cancer (Herndl, 2002); not only does this retain the cultural image of women as feminine but it also hides the unspeakable spectre of cancer from public view. People using prosthetic devices can be stared at by strangers which is another example of psycho-emotional disablism. Alongside questions about how someone lost their hand for example, there are also questions about how the mechanical hand works (Garland-Thomson, 2009). Some people choose to wear an 'aesthetic prosthetic' which has no function, but helps reduce this experience of psycho-emotional disablism. It is not just impaired bodies that have been seen as potential cyborgs – increasingly the ageing body can also be seen as a cyborg if one considers the use of stents, pacemakers, artificial hips and so on, that are offered to shore up worn out joints and other body parts near their sell-by date. Ihde (2008) who self-identifies as a 'partial cyborg' has written an excellent paper describing how these prosthetics do not work as well as the original body part and so they are 'quasi-transparent'. Although implants such as replacement hip and knee joints are common operations in the UK at least, they have a limited lifespan in practice and so people delay surgery as long as possible, aiming for 'late life, rather than mid-life cyborg parts!' (Ihde, 2008: 400). Although prosthetics 'fall far short of the bionic technofantasies so often projected in popular culture' (Ihde, 2008: 403), adopting cyborg options is one common way of attempting to counteract the processes of ageing.

We must reject ableism in the context of the 1AC – creates trauma, normalizes and perpetuates systemic violence and abuse, and is rooted in the same linguistic and representational connotations as misogyny, heteronormativity, racism, and binarist

Brown 14 [Lydia Brown, activist, public speaker, and writer focused on violence against multiply-marginalized disabled people, such as LGBTQ+ (queer and trans), poor, undocumented, and people of color groups within the disability community, Board of Directors for TASH New England, Project Assistant at the Autistic Self Advocacy Network, and previously involved in writing disability policy; "Violence in Language: Circling Back to Linguistic Ableism"; Autistic Hoya; 02/11/2014; accessed 07/27/2015; < http://www.autistichoya.com/2014/02/violence-linguistic-ableism.html>.] this card is on fire!!!!!! please, pull a fire alarm like asap

One of the most common (inaccurate and mischaracterizing) criticisms, however, both from inside and outside the disability community, is the accusation that the list is a tool for policing language or censoring words. So what's the purpose of the list? Why compile it at all? Because linguistic ableism is part of the total system of ableism, and it is critical to understand how it works, how it is deployed, and how we can unlearn our social conditioning that linguistic ableism is normal and just how things are or should be. As important as it is to recognize and uncover the violence of linguistic ableism (how ableism is specifically embedded into our language), it is also critical to understand why this is important. (And this is where those who jump the gun and leap to accusations of pedantic, holier-than-thou, smug language-policing or censorship **have not yet come to understand why this** page, and those like it, **need to exist**.) Linguistic ableism: a) is part of an entire system of ableism, and doesn't exist simply by itself, b) signifies how deeply ableist our societies and cultures by how common and accepted ableism is in language, c) reinforces and perpetuates ableist social norms that **normalize violence and abuse against disabled people**, d) actively creates less safe spaces by **re-traumatizing disabled people**, and e) **uses ableism to perpetuate other forms of oppression**. Language is not the be all end all. This isn't about policing language or censoring words, but about critically examining how language is part of total ableist hegemony. This is about being accountable when we learn about linguistic ableism, but it is also about being compassionate to ourselves and recognizing that to varying extents, we have all participated in ablesupremacy and ablenormativity. **This is about understanding** the connections between linguistic ableism and other forms of ableism, such as medical ableism, scientific ableism, legal ableism, and cultural ableism. Language reflects and influences society and culture. That's why students of any foreign language often study the cultures where that language is dominant. (And that's not to dimiss the many valid

criticisms of the ethnocentrism and colonialism in much area and language studies programs.) Language isn't important for silly semantic reasons, but because it cannot be separated from the culture in which it is deployed. Feminist theory, queer theory, and race theory have all analyzed how **sexism, heterosexism, cissexism, binarism, and racism are embedded in language. This is the same** process. Using the language of disability (either directly or through metaphor) as a way to insult other people, dismiss other people, express your vehement loathing for them/their viewpoints, or invalidate their viewpoints is actually extremely ableist (and often sanist, neurotypicalist, audist, or vidist). For example, I am talking about using the language of mental illness ("crazy," "insane," "psycho," or "wacko," for example), cognitive disability ("retarded," "slow," or "moron," for example), or physical disability ("crippled" or "completely blind/deaf," for example). In another example, I am also talking about using disability as metaphor. Using the language of disability to denigrate or insult in our conversations and organizing presumes that a.) people who hold undesirable or harmful viewpoints must hold them because they are mentally ill/have psych disabilities/are mentally disabled/are disabled in some way, b.) having mental illness/psych disability/mental disability/any disability is actually so undesirable and horrible that you can insult someone that way (the same underlying reason why socially embedded linguistic heterosexism lets people use "gay" as an insult), c.) it's acceptable to use ableism against one disability group while decrying ableism against another disability group (creating horizontal or intra-disability oppression) or another form of oppression against another marginalized group (creating horizontal oppression), and d.) and that no one who is disabled in any way might actually share your opinion or be on your side, thus actually actively excluding and marginalizing this part of our community, and making our spaces less safe and less inclusive.

2NC

Cyborgism eschews people with disabilities as already cyborgs in need of no further consideration – using people with disabilities as cyborgs ignores their poverty and inherent capitalist slant of prosthetics while managing to disregard their experiences

Reeve 12 [Donna Reeve, Department of Applied Social Science at Lancaster University, specializing in Feminist Disability Studies; "Cyborgs, cripples and iCrip: Reflections on the contribution of Haraway to disability studies" pg 93-95; Disability and Social Theory: New Developments and Directions; 2012; accessed 07/26/2015; <http://donnareeve.co.uk/wp-content/uploads/2014/03/ReeveChapter2012c.pdf>.]

In addition, <u>the cyborg</u> is an individual and the whole, <u>representing 'transgressed boundaries</u>, potent fusions, <u>and dangerous possibilities'</u> (Haraway, 1991: 154). The hybrid figure of the cyborg bl<u>urs categorical distinctions such as human/machine, human/animal and nature/culture and moves beyond the dualisms which contribute to the domination of those marked as Other. Cyborgs can unsettle the existing order</u> by creating new modes of 'resistance and recoupling' (Haraway, 1991: 154) which undermine the implicit hierarchies within these dualisms. <u>This</u> theoretical approach <u>raises new ethical and epistemological questions; for example, how does the cyborg</u> (often seen as posthuman) <u>question what it means to be human?</u> I have briefly identified some of the key points about the cyborg figure described by Haraway in A Cyborg Manifesto. <u>Whilst [Haraway]</u> she <u>engages with issues of difference such as gender, ethnicity and class, her discussion about disability is restricted to a passing comment</u> that many disabled people are already cyborg. Perhaps <u>paraplegics and other severely handicapped people can (and</u> sometimes <u>do) have the most intense experiences of complex hybridization</u> with other communication devices. (Haraway, 1991: 178) <u>This omission is particularly striking when one takes into account the fact that Haraway's father was disabled from childhood</u> which meant he used under-arm crutches to walk (Haraway, 2008). Whilst Haraway talks about the cyborg relationship her father had with his crutches and various wheelchairs, <u>there is no discussion of disability per se</u>; this seems odd given that it is likely she grew up with a father who would probably have experienced environmental barriers of some kind during his life as a crutch user before the disability rights movement started in the US in the 1970s. <u>Whilst there is potential value in exploring disability</u> within the larger 'bodies' of cyberculture, the internet and telecommunications technologies, such as disability activists working together across the world via internet technology (Goodley, 2010), **that has been set aside for another day**. This chapter sets out to revisit the figure of the individual cyborg and to consider its relevance for disability studies in the 21st century. <u>The impaired body as contemporary cyborg</u> For people with impairments, the <u>hybridisation of machine/human or animal/human is often synonymous with lived experience</u>, particularly for those with physical or sensory impairments (which will form the focus for this chapter). Potential cyborg figures can be seen in the wheelchair user, the person with a cochlear implant, artificial leg or pacemaker, someone who uses an assistance dog. In this section I want to look at the issues which are raised <u>if the impaired body is viewed as a potential contemporary cyborg</u>. Access to cyborg technology There <u>have been various criticisms within disability studies about the cavalier use of impaired bodies within mainstream theorising about cyborgs</u>. For example Mitchell and Snyder describe how <u>A Cyborg Manifesto provides an example of how disabled people exemplify</u>, in a footnote, the <u>self-evident cyborgs of modernity</u> – transhuman subjects who rework the nature/culture divide. (Mitchell and Snyder, 1997: 28-29, my emphasis) This <u>footnoting is common; discussion of prosthetics and impaired bodies is often limited to consideration of how technology either restores functionality or normalises the person</u> with little discussion of the cultural/social implications of prosthetics, or of the lived experience of body and prosthetic. <u>Discussions of the connections between 'cyborg' and 'disabled' are rarely made</u> (Campbell, 2009). Mitchell and Snyder (1997) also point out the insensitivity that many <u>social theorists and philosophers display when using impaired bodies and technology to illustrate cyborg thinking</u>. It is all very well to fantasise about the couplings of human and technology which have developed over time to include prosthetics, implants, artificial organs and technological aids - human trials will start by 2012 on a prosthetic arm which is directly controlled by micro arrays which have been implanted into the brain (Drummond, 2010). This is close to the stuff of science fiction. But at the same time, <u>disabled people are amongst the poorest group in society and so access to adequate prosthetics or technology so that they can participate in society as an 'active citizen' is seriously</u>

<u>curtailed</u> (Mitchell and Snyder, 1997). Therefore improvements in technology do not always relate to improvements in the quality of life of disabled people because <u>[t]echnology is always already social – which in our culture means it is shaped and informed by market forces</u> and the requirements of powerful vested interests. (Cromby and Standen, 1999)

Recognizing and stopping use of ableist language is only the first step in addressing the larger problem it symptomizes – they need to accept critiques through the lens of disability

FWD 10 [Anna, writer for the now defunct Feminists with Disabilities;"Why Talking About Language Isn't Enough"; FREEDOM: Feminists with Disabilities; 05/25/2010; accessed 07/27/2015; <http://disabledfeminists.com/2010/05/25/awp-why-writing-about-language-isnt-enough/>.] Also explains why indicts of blogs are bad in the case of disability studies

In social justice blogging circles, especially feminist-focused ones, <u>it's not unusual to have conversations about language, and why language matters</u>. Those conversations can vary from explaining why it's problematic to call women & girls "females", why using "he" and "mankind" to be a generic non-gendered term is sexist, reclaiming – or not – of words like "bitch", and what it means to refer to "undocumented immigrants" rather than "illegals". These conversations often focus on how sexist or racist language is a symptom of a problem that needs to be addressed. <u>We can talk about how calling women bitches is a sign of sexism, or referring to people as "illegals" is dehumanizing to immigrants</u>. And <u>yet</u>, when trying to have <u>discussions about ableist language</u>, we're back to the silo of disability. Instead of talking about ableist language <u>as part of the manifestation of the disdain and abuse of people with disabilities, it's treated as isolated – the problem, instead of a symptom of the problem. Ableism is not simply a language problem</u>. Ableism manifests in the social justice blogosphere in so many different ways. They can vary from just not thinking about disability at all when writing about social justice issues to <u>shrugging off critiques from disability-focus</u>ed bloggers <u>as being "too sensitive".</u> It can be <u>ignoring posts about disability-focused issues or only linking to non-disabled people writing about disability-issues instead of to disabled</u> bloggers. It can be as apparent as declining to acknowledge disability exists to as "subtle" (to some) as declining to make your blog template accessible to screen readers. <u>There are also choices</u> that social justice bloggers make <u>about how we educate ourselves, and whose voices we highlight, who we approach about their writing, and who we ask to be mediators</u>. <u>If we're not reading disability-focus</u>ed blogs, then <u>we're not learning about disability-focus</u>ed issues – and, in turn, <u>we're not highlighting those voices, bringing attention to those issues, or thinking about that analysis</u> when writing our own posts. Thirdly, <u>ableism manifests in whose voices we trust</u>. For all that I'm very happy to provide people with book lists, I'm a bit suspicious of people who decline lists of disability-focused bloggers they could be reading as well. <u>Why does someone's voice have to go through the publishing-sphere (and usually through academia</u> for the books you're going to get from me) **before it counts as worth-reading?** I get why people talk about language, and I agree that <u>language is important. But I'm not giving cookies out for publicly declaring</u> your ally-status by saying <u>you won't (or will try not to) use ableist language anymore. That's a great first step. Now move on.</u>

Feminism K

1NC

<Link – specific metaphor>

Ableist language in feminist scholarship positions disability as oppositional to feminism, hurts political potential, and limits intersectional participation

Schalk 13 [Sami Schalk, assistant professor at Albany Arts, PhD in Gender Studies at Indiana University, research focuses on the representation of disability in contemporary African American literature; "Metaphorically Speaking: Ableist Metaphors in Feminist Writing"; Disability Studies Quarterly Vol 33 No 4; 2013; accessed 07/28/2015; <http://dsq-sds.org/article/view/3874/3410>.]

The two interactions that I describe above offer important lessons about <u>the relationship between language and ableism</u>. In fact, these interactions motivated me to seriously <u>reflect upon the ways that our ability to recognize diverse embodiment is limited by figurative language that conceptually distances us from the reality of impairment</u>. In particular, I began to question the function and impact of <u>disability metaphors</u> and the role that such figures of speech play <u>in feminist scholarship</u>. In this article, I consider how disability is used as metaphor in two feminist texts: bell hooks's The Will to Change: Men, Masculinity and Love (2004) and Tania Modleski's Feminism without Women: Culture and Criticism in a "Postfeminist" Age (1991). Beginning with a broad understanding of feminism as a movement <u>to end sex and gender oppression in the lives of all people</u>, a movement aligned with anti-racist, anti-homophobic, anti-classist, and (most importantly for this piece) anti-ableist movements, I make connections between <u>sexist and ableist rhetoric</u> in order to ex<u>pose the political and intellectual repercussions of the use of disability as metaphor</u> in these feminist texts in particular and in feminist theory more generally. I argue, for instance, that <u>when feminists use metaphors of disability to represent the negative effects of patriarchy, they conceptually and theoretically position feminism and disability in opposition to each other and</u> thereby <u>imply that the goals of feminism are two-fold: to end patriarchy and to erase disability</u>. I insist, furthermore, that <u>this theoretical and conceptual strategy runs counter to the goals of contemporary, intersectional feminist politics</u>, activism, and scholarship. Insofar as I make these connections, I may seem to enter into a broader <u>discussion</u> about what is often <u>derisively referred to as "political correctness."</u> Such discussions 1 tend to <u>devolve into accusations of censorship</u> and battles over what is, or is not, offensive, <u>and who does, or does not, have the "right" to be offended in the first place</u>. 2 In some mainstream and feminist philosophical contexts, these discussions have tended to revolve around the use of ocular metaphors to represent a lack of knowledge and information (as in "blind review") or to refer to forms of moral negligence (for example, "blindly followed"). Although this article will address negative metaphoric uses of disability, my aim is not to argue that certain words and phrases are inherently offensive, nor do I assert that politically-engaged feminist scholars should act as arbiters or censors of each other's linguistic practices; rather, I aim to show the impact that such language-use has on feminist scholarship and for feminist politics at the structural, as opposed to the individual, level. In short, I contend that <u>feminist scholars should recognize that these negative metaphorical uses of disability variously impact, limit, and contradict the aims of their arguments</u>, in addition to <u>compromising their professed political goals</u>, <u>regardless of whether or not everyone</u> in a targeted disabled group <u>is offended by any given disability metaphor</u>. To advance my argument, I draw on the insights about metaphor that disability scholars such as Vivian M. May and Beth A. Ferri have made.

Must reject ableism in the context of the 1AC – creates trauma, normalizes and perpetuates systemic violence and abuse, and is rooted in the same linguistic and representational connotations as misogyny, heteronormativity, racism, and binarist

Brown 14 [Lydia Brown, activist, public speaker, and writer focused on violence against multiply-marginalized disabled people, such as LGBTQ+ (queer and trans), poor, undocumented, and people of color groups within the disability community, Board of Directors for TASH New England, Project Assistant at the Autistic Self Advocacy Network, and previously involved in writing disability policy; "Violence in Language: Circling Back to Linguistic Ableism"; Autistic Hoya; 02/11/2014; accessed 07/27/2015; < http://www.autistichoya.com/2014/02/violence-linguistic-ableism.html>.] this card is on fire!!!!!! please, pull a fire alarm like asap

<u>One of the most</u> common (<u>inaccurate and mischaracterizing) criticisms</u>, however, both from inside and outside the disability community, <u>is the accusation</u> that the list is a tool <u>for policing language or censoring words.</u> So what's the

purpose of the list? Why compile it at all? Because linguistic ableism is part of the total system of ableism, and it is critical to understand how it works, how it is deployed, and how we can unlearn our social conditioning that linguistic ableism is normal and just how things are or should be. As important as it is to recognize and uncover the violence of linguistic ableism (how ableism is specifically embedded into our language), it is also critical to understand why this is important. (And this is where those who jump the gun and leap to accusations of pedantic, holier-than-thou, smug language-policing or censorship have not yet come to understand why this page, and those like it, need to exist.) Linguistic ableism: a) is part of an entire system of ableism, and doesn't exist simply by itself, b) signifies how deeply ableist our societies and cultures by how common and accepted ableism is in language, c) reinforces and perpetuates ableist social norms that normalize violence and abuse against disabled people, d) actively creates less safe spaces by re-traumatizing disabled people, and e) uses ableism to perpetuate other forms of oppression. Language is not the be all end all. This isn't about policing language or censoring words, but about critically examining how language is part of total ableist hegemony. This is about being accountable when we learn about linguistic ableism, but it is also about being compassionate to ourselves and recognizing that to varying extents, we have all participated in ablesupremacy and ablenormativity. This is about understanding the connections between linguistic ableism and other forms of ableism, such as medical ableism, scientific ableism, legal ableism, and cultural ableism. Language reflects and influences society and culture. That's why students of any foreign language often study the cultures where that language is dominant. (And that's not to dimiss the many valid criticisms of the ethnocentrism and colonialism in much area and language studies programs.) Language isn't important for silly semantic reasons, but because it cannot be separated from the culture in which it is deployed. Feminist theory, queer theory, and race theory have all analyzed how sexism, heterosexism, cissexism, binarism, and racism are embedded in language. This is the same process. Using the language of disability (either directly or through metaphor) as a way to insult other people, dismiss other people, express your vehement loathing for them/their viewpoints, or invalidate their viewpoints is actually extremely ableist (and often sanist, neurotypicalist, audist, or vidist). For example, I am talking about using the language of mental illness ("crazy," "insane," "psycho," or "wacko," for example), cognitive disability ("retarded," "slow," or "moron," for example), or physical disability ("crippled" or "completely blind/deaf," for example). In another example, I am also talking about using disability as metaphor. Using the language of disability to denigrate or insult in our conversations and organizing presumes that a.) people who hold undesirable or harmful viewpoints must hold them because they are mentally ill/have psych disabilities/are mentally disabled/are disabled in some way, b.) having mental illness/psych disability/mental disability/any disability is actually so undesirable and horrible that you can insult someone that way (the same underlying reason why socially embedded linguistic heterosexism lets people use "gay" as an insult), c.) it's acceptable to use ableism against one disability group while decrying ableism against another disability group (creating horizontal or intra-disability oppression) or another form of oppression against another marginalized group (creating horizontal oppression), and d.) and that no one who is disabled in any way might actually share your opinion or be on your side, thus actually actively excluding and marginalizing this part of our community, and making our spaces less safe and less inclusive.

2NC

The academic sphere is the best place to interrogate ableism and deconstruct it, specifically in the context of feminism. Our methodology of tolerance of what is often considered too sensitive solves rolelessness and the intersection of sexism and ableism

Garland-Thomson 1 [Rosemarie Garland-Thomson, Professor of English at Emory University, where her fields of study are disability studies, American literature and culture, feminist theory, and bioethics; "Re-shaping, Re-thinking, Re-defining: Feminist Disability Studies" pg 18-20; Center for Women Policy Studies; Barbara Waxman Fiduccia Papers on Women and Girls with Disabilities; 2001; accessed 07/28/2015; <http://www.centerwomenpolicy.org/pdfs/DIS2.pdf>.]

Activism: Feminist Disability Studies also focuses on <u>activism for change</u>, which <u>augments and remedies the accompanying focus on negative representations of women and disabled people</u>, the pathologizing of their bodies, and the politics of appearance. <u>Important activist strands</u> have <u>developed</u> in both feminism and Disability Studies <u>that shift</u> them <u>from</u> the constant task of <u>exposing just how relentless and pervasive oppression</u> has been – and <u>is</u>. <u>This is a different kind of activism from demonstrations and marches</u>. While less theatrical, the <u>activism focused on integrating education, in the very broadest sense of that term, is no less ardent</u>. And higher education is <u>the grass roots of the educational enterprise</u>. College and university teachers shape the communal knowledge base that is disseminated from kindergarten through the university. A<u>ctivist academic practices include exposing the workings of oppression, constructing a tradition of disability culture, historical and textual retrieval</u>, canon reformation, finding and being role models, mentoring, curriculum reform, course and program development, and integrating disability into existing syllabi. Part of the <u>activism inherent in Feminist Disability Studies emerges in its commitment to study</u> the lives and artistic products of women with disabilities. To analyze who disabled women are and what they create expands our understanding of human variation and enriches our collective knowledge of humankind, especially the ways that gender operates. <u>For example, the judgment that the disabled woman's body is asexual and unfeminine creates</u> what Michelle Fine and Adrienne Asch term <u>"rolelessness," a social invisibility and cancellation of femininity that can prompt disabled women to claim the female identity that the culture denies them</u>. Cheryl Marie Wade insists upon a harmony between her disability and her womanly sexuality in a poem characterizing herself as "The Woman With Juice."37 As Mairs' exploration of <u>selfnaming and</u> Wade's <u>assertion of sexuality suggest, a feminist disability politics would uphold the right of women to define their physical differences and their femininity for themselves</u> rather than conforming to received interpretations of their bodies. Wade's poem of self-definition echoes Mairs by maintaining firmly that she is "not one of the physically challenged." Rather, she claims, "I'm the Gimp/I'm the Cripple/I'm the Crazy Lady." Affirming her body as at once sexual and different, she asserts, "I'm a French kiss with cleft tongue." Resisting the cultural tendency not only to erase her sexuality but to deprecate and objectify her body, she characterizes herself as "a sock in the eye with gnarled fist." <u>This image of the disabled body as a visual assault, a shocking spectacle to the nondisabled eye, captures a defining aspect of disabled experience.</u> Whereas <u>feminists claim that women are objects of the evaluative male gaze</u>, Wade's image of her body as "a sock in the eye" subtly reminds us that <u>the disabled body is the object of the stare. If the male gaze makes the normative female a sexual spectacle, then the stare sculpts the disabled subject into a grotesque spectacle.</u> The stare is the gaze intensified, <u>framing her body as an icon of deviance</u>. Indeed, as Wade's poem suggests, the stare is the gesture that creates disability as an oppressive social relationship. And as every person with a visible disability knows intimately, managing, deflecting, resisting, or renouncing that stare is part of the daily business of life. One example of <u>academic activism</u> that is exemplary in Feminist Disability Studies is what m<u>ight be called a methodology of intellectual tolerance. This is not tolerance in the more usual sense of tolerating each other – although that would be useful</u> as well. Rather, <u>it is the intellectual position of tolerating what has previously been thought of as incoherence.</u>

Disability rhetoric promotes exclusion from feminism and ultimate ineffectiveness of the feminist movement – they need to take responsibility for what they said and seek a new dialogue

Schalk 13 [Sami Schalk, assistant professor at Albany Arts, PhD in Gender Studies at Indiana University, research focuses on the representation of disability in contemporary African American literature; "Metaphorically Speaking: Ableist Metaphors in Feminist Writing"; Disability Studies Quarterly Vol 33 No 4; 2013; accessed 07/28/2015; <http://dsq-sds.org/article/view/3874/3410>.] Explains why they can't kick their reps/language

Reacting to characterizations of being weak or inferior as slander, feminists deflected such portrayals by distancing themselves from these categories, and denying association of feminine gender with disability. Using an ableist line of thinking still in place today, nineteenth-century women agreed that there was a category of hopelessly, inherently dependent defectives that should be subjected to social control, but they argued against women being included in this defective class simply by virtue of their sex. …The move by feminists to separate themselves from the devalued group of defectives without challenging the hierarchical value-system that produced it served to make disability central to feminism as a negative marker. (emphasis in Lamp) Notable historical examples of this feminist "distancing" from disability include Charlotte Perkins-Gilman and Margaret Sanger, both of whom used disability rhetoric and metaphor in the context of the widely-popular late nineteenth- and early twentieth-century eugenics movement as a way to promote women's rights (Lamp 2006, 14; Lamp and Cleigh 2011, 176-182; Seitler 2003). Both women, that is, used "positive" eugenic rhetoric and rhetoric about women's roles as breeders in order to encourage better education and treatment of white, middle-class, able-bodied women who would give birth to the next generation of eugenically-sound, rather than "weak" or "feeble-minded," children. This sort of ableist rhetoric within feminist political organizations and movements has historically distanced (nondisabled) feminists from disability, making alliances between disabled feminists and nondisabled feminists hard to establish. Though this history does not explain away or excuse the use of ableist disability metaphors today, it provides a context within which to situate the habitual positioning of feminist women against disability and the conceptualization of patriarchal power as disabling. The issue at hand now is how to resist this historical usage without losing the important purpose of previous feminist work. What does the lesson of this discussion mean for feminists in the present (and future) who want to align themselves with disability rights scholars and activists and resist the use of negative and monolithic representations of disability? Does my argument in this article entail that one should never use disability metaphorically? Not exactly. Rather, the problem is the use of disability as a negative source domain to represent inability, loss, and lack in a simplistic and uncritical way. As I have shown, this use of disability as metaphor creates problems for understanding lived embodiment and ultimately limits or contradicts the feminist arguments that are proffered. Despite the problems in most past and current uses of disability metaphors, I nonetheless encourage creativity, nuance, and experimentation in feminist writing because innovative, politically-accountable uses of metaphor could make people think more deeply and alternatively about embodiment than conventional metaphors currently allow. For example, Vidali (2010) suggests that we alter the sensory experiences that have traditionally been used in a metaphor by (for instance) asking "students to find the 'scents' of previous course" concepts rather than asking if they can "see" connections (49). She writes that this sort of "creative engagement with disability metaphors can further complicate, or 'denaturalize,' ideas of how bodies and metaphors interact" (ibid.). Furthermore, Moya Bailey (2011, 142), in "'The Illest': Disability as Metaphor in Hip Hop Music," writes that in "the liminal spaces of hip hop, the reappropriation of ableist language can mark a new way of using words that departs from generally accepted disparaging connotations." It is indeed possible and even desirable to use disability metaphorically in ways that are empowering and that acknowledge the complexity of disabled minds and bodies. To do so, feminist scholars could take cues from disabled creative writers such as Eli Clare (2007) who describes tremors as a bodily experience that prevents playing the piano, provokes stares and taunts, and also causes a lover to rise up in pleasure and beg for more (34, 79, 82). How, we might ask, would a creative metaphor of tremors attend to the multiplicity of that experience? Attempts to use metaphor creatively do not release anyone from responsibility. The growing corpus of work on disability and rhetoric will clearly be useful to feminists (nondisabled and disabled alike) who aim to use metaphor more responsibly in their work. As Titchkosky points out, however, "Texts never just get it right or get it wrong insofar as they are also a 'doing'—right or wrong, texts are always oriented social action, producing meaning" that involves both the writer and the reader (Titchkosky 2007, 21; emphasis in Titchkosky). We can never fully predict the way in which our metaphors will be read or used once our words are out in the world. Although I never contacted hooks to ask about her use of "emotional cripples" (as so many folks at the conference wanted me to do), nor did I point out to the pilot that he had misunderstood the woman's use of "Deaf," my experience of these two events and my further research into the topic of disability as metaphor have made clear to

me that better incorporation of disability issues into feminist work is not simply a matter of using more inclusive, politically-correct language; rather, **we must be willing to engage in difficult dialogues**, to acknowledge the open-endedness of our inherently metaphoric language and communicate with one another across differences—in whatever ways and with whatever modes we use to do so. I contend, therefore, that a feminist philosophy of language—that is, language conveyed in any format or mode of communication, not just scholarly writing alone—ought to incorporate insights from disability studies and be premised on the following general concepts. Note that this feminist philosophy of language is a process, not a product, "an art, not a science" (Hall 2012, 31). First, do no harm. Do not use language that aligns negative concepts or connotations with another marginalized group, even if that language is what seems most powerful, evocative, and effective. Many of us have taught our students and our peers to consider the meanings that are embedded in phrases such as "throwing like a girl" and "acting like a pussy." We have likely shunned the use of the term gay to refer to something as silly and discouraged use of the term retard in order to insult; yet, some of us cling to the terms blind, deaf, dumb in order to insult, invalidate, and demean. Therefore, second: **be responsible. Language is never neutral. We make choices about the words we use and we have a responsibility to understand both the denotation and connotation of the words we choose**. We must interrogate metaphors and other forms of speech in the same rigorous way and to the same extent that we would investigate and understand any theory or concept before we use it in our work. Metaphors have political content and effect; they are not merely the creative, stylistic delivery of the "real" meaning of a given phrase or argument. On the contrary, the content and style of delivery of these rhetorical practices are inseparable: they inform and inflect one another. Third, and finally: be accountable and open to criticism. Despite our best feminist intentions, we cannot always get it right. Nevertheless, we must be willing to let go of words or concepts that do damage to others and develop new words, new metaphors, and new ideas that better serve and further our feminist goals. This feminist philosophy of language allows for us to enact an affective politics that embraces the linguistic utility of metaphor, yet remains intellectually rigorous and committed to the social justice mission of the feminist movement.

"Able-Bodied"

Able-bodied doesn't mean non-disabled – this use denies cognitive disabilities and the experience of people who have them

Clark and Marsh 2 [Laurence Clark, internationally-acclaimed comedian, presenter, writer and actor who has cerebral palsy; Stephen Marsh, inventor and entrepreneur writing on disability; "Patriarchy in the UK: The Language of Disability" 2nd Draft; 2002; accessed 07/31/2015; <http://disability-studies.leeds.ac.uk/files/library/Clark-Laurence-language.pdf>.]

Able-bodied: This term is also often incorrectly used, in this case to refer to people who are not disabled. This ignores the fact some disabled people, for example people with learning difficulties may also be 'able-bodied'. Morris (1993, page x) explains: "the term non-disabled people is used rather than able-bodied people because the point is that people who do not experience physical, sensory or intellectual impairments are not disabled by the prejudice and discrimination which denies opportunities to people who do experience such impairments." Similarly the British movement rejected American terms that revolve around ability, such as 'differently-abled' and 'temporarily able-bodied' (Rae, 1989).

Agamben

Agamben's state of exception resecures political authority – but this same idea creates the state as opposed to a disabled body excepted from participation in the work of the state

Baker 13 [Bernadette M. Baker, Curriculum and Instruction Professor @ University of Wisconsin-Madison, research areas of philosophy, history, and post-foundationalist curriculum studies; "William James, Sciences of Mind, and Anti-Imperial Discourse" pg 233; Cambridge University Press; 09/30/2013; accessed 07/30/2013; Google Books.]

Two Innovations: Distributive Causality and the Bottom-line Lunatic The problems that the state of exception poses for constitutional law in Agamben's account can only arise as such under the belief that one is operating within a humanist notion of the rational decision-making and volitional perceiver. What James elaborates in the Lowell lectures goes far beyond that, and then returns to it, and what nonetheless indirectly results is a rationale for political philosophy and expectation for governance that maintains the aporia at the heart of democratic traditions. This occurs in the very midst of - even via - the sensitivity to or empathy for the suffering of "the insane" and the talents of "the psychic." Taylor's cautious insights regarding the bigger picture of disciplinary formations, the Iamesian oeuvre, and the relative bypassing of some of Iames' work since its publication can be coupled, then, to how "internalist" debates within emergent scientific disciplines had implication for strategies of nation- building, social diagnosis, and criticism. If, as Agamben suggests, claiming a state of exception has become a way of resecuring and enlarging political authority in contemporary Western democracies and is in turn transforming the very nature of governance into more totalitarian forms, then it proves interesting to examine what happens when the state is considered mental rather than geopolitical and the exceptionalism could disqualify one from actively participating in any form of political authority, totalitarian or otherwise."5 As alluded to earlier, the subject at the heart of political philosophies such as Agamben's usually carries "ableist" and "adultist" presumptions indicative of a historically and implicitly masculinized public sphere, with contemporary borders between nations, races, religions, or languages operating as "the context," nuancing the frame of reference - for example, the differences between German and Italian constitutions. Through James' Exceptional Mental States, the dependencies of discourse that inextricably intertwine political philosophy's obsession with governance and the requirement for the "normal" subject become more thoroughly exposed. At the same time, the philosophical stakes in the trajectories that Taylor fruitfully lays out become understandable in regard, not to the political authority of elected officials, but the condition of being "able to" be worked upon on earth." As noted earlier, James' introduction of Myers' version of "the subliminal consciousness" was his reference to the unconscious and a crucial turn in the objectification of mind - he proffered it as the most likely explanation for multiplicity - an explanation that if fully indebted to Myers had to rely on apparently mystical themes that loosely resonated both with reincarnation theses and/or with spiritism. As Taylor notes, James in the end could not…(page ends)

"Autistic"

Using "autistic" to mark difficult communication equates developmental disabilities to be pathetic, less-than, and an insult – only becoming sensitized to the words can lead to the end of their usage

BBC 9 [Tamsyn Kent for BBC News Magazine, a section of BBC news online not related to particular categories; "Has 'autism' become a term of abuse?"; BBC; 11/06/2009; accessed 07/27/2015; <http://news.bbc.co.uk/2/hi/uk_news/magazine/8345282.stm>.]

It is not the first time a politician has caused a furore by using the word autism. Three years ago the shadow chancellor, George Osborne, appeared to suggest Prime Minister Gordon Brown could be "faintly autistic". Now, France's Minister for Europe, Pierre Lellouche, has accused David Cameron of "castrating" Britain's position in Europe, adding that his approach was "pathetic". He has since said his use of the word "pathetique" has been misunderstood and can mean sad or unfortunate in French. But it was his use of the word "autism" which caused most offence. He says he did not realise the word "autism" could been seen as offensive in English and has retracted his remark. Whatever way he meant it, "autistic" is often used as an insult and it's insensitive to use a term that describes a disability or a condition in this way, says the National Autistic Society. "I thought we'd got over that from the 1970s when people used to use the term 'spastic' in the playground," says Benet Middleton from the society. "To have senior politicians doing that is thereby signalling that it's ok and that is deeply worrying." 'Vogue' term For many the complex nature of autism makes the pejorative use of the term even more misguided and unhelpful. Alexis Miller was diagnosed with Asperger syndrome, a form of autism, 14 years ago. "I want him to apologise and take it back. I think it's wrong. Even if someone is autistic, it should not be used in an insulting way because he is basically calling us pathetic autistics. I'm not pathetic, I'm a person." More than half a million people in the UK have the condition which affects the way they communicate and relate to those around them. People with the condition often have difficulties with everyday social interaction. Relatively unheard of or even recognised years ago, autism is now firmly in the public domain, partly due to films like Rain Man in 1988. And, some lexicographers argue its slang usage is down to it becoming a "vogue" term. It has become part of people's vocabulary following the same route slang often does. It is very often originated by teenagers at street or playground level. "There aren't many constraints on youngsters, especially when they're talking to each other," says Tony Thorne, Language and Innovation Consultant at King's College London. "What they say is meant to be traded among themselves and therefore anything goes. They use a lot of racist, sexist and ageist language." He explains it could also have originated from media slang which comes mainly from the United States and is a mixture of showbiz and therapy terms. But what accounts for the use of the term by people in power, those, who it is deemed, should know better? Offensive slang "The minister hasn't picked it up from street slang, he's picked it up from the media and the current vogue-ish language for the purpose of rhetoric, for effect. You could say for cheap effect, both on behalf of George Osbourne and this French minister," says Mr Thorne. Lexicographers argue it is a powerful tool used to dramatise the idea of impaired communications, to taunt those deemed not able to articulate or understand a range of ideas. "People have very limited knowledge or awareness of autism and they think it's something to do with the way people communicate and so they use that sometimes as a way to insult people if they think they're communicating in a way that's different," says Mr Middleton. And, once slang enters the public's vocabulary it is difficult to eradicate. Some argue that it is only when whole societies undergo a process of sensitisation - what some might call political correctness - that certain terms are outlawed. Much of the power of slang derives, undoubtedly, from its novelty. Experts say most terms have a shelf life of around three or four years. It eventually seeps into everyday language and then the people at the cutting edge, the inventors, abandon it and move on to something else. "People think that slang kind of disappears. It doesn't completely go away, it relapses into the slang underworld," says Mr Thorne.

"Crazy"

In political terms, "crazy" is a cheap shot that dismisses uncommon policies to the margins, replicating its use against people with disabilities to silence and other them

Jean 10 [Abby Jean, writer for Feminists with Disabilities since its founding, speaking on the intersection of the welfare state, feminism, capitalism, and disability; "Ableist Word Profile: Crazy to Describe Political Viewpoints or Positions"; FREEDOM: Feminists with Disabilities; 05/28/2010; accessed 07/27/2015; <http://disabledfeminists.com/2010/05/28/ableist-word-profile-crazy-to-describe-political-viewpoints-or-positions/>.]

Crazy Aunt, Unleashed – about Sarah Palin Mainstreaming the Crazy – lamenting the Right's reaction to Obama speaking to schoolchildren about health reform, and implying that the fringe "crazy" element of the party had infected the mainstream Meet the Crazy Caucus – a listing of Republican congresspeople who espouse "crazy" views and are implied to have a caucus, equivalent to existing formalized congressional caucus groups Postcards From the Crazy – about Frank Gaffney Crazy Arizona – about the recent immigration law and other racial laws passed in the state Crazy 101 – about the Texas revisions to history textbooks This is just a sampling of the posts with headlines including the term "crazy" and is not at all comprehensive. Even within this sample, we can see that the term is used to describe viewpoints with which TPM does not agree (like revising history textbooks or arguing, like Gaffney, that the Pentagon logo indicates a secret plan to subject the United States to Shariah law) and thinks are biased, bigoted, racist, or otherwise offensive (such as the protests about Obama speaking to schoolchildren or the racial laws in Arizona). None of the posts, though, engage or critique those viewpoints or speakers in a substantive way – simply describing them as "crazy" is seen as self-evident and no further discussion is needed to demonstrate these views or people should be excluded from reasonable political discussion. There's been an even more recent explosion of use of the term to describe Rand Paul and Paul's views, after he won a Republican congressional primary in Kentucky.1 Paul favors the free market and freedom of private business, to the extent that he seems to believe that anti-discrimination laws are an unreasonable restriction on businesses. Now I am no fan of Mr. Paul – and wrote about my problems with him previously on FWD – but that doesn't mean I approve of political cartoons like this: To my mind, characterizing Rand as "mad" or "crazy" and not saying anything further is a lazy way to dismiss him and his ideology without actually having to engage with it. There is a lot to say about Rand's ideas: how prioritizing private business over human rights preserves existing institutional structures that will continue to perpetuate racism, sexism, ableism, and other oppression if not checked by a larger force like the government; how the line between private and public realms is a lot fuzzier and less distinct than Paul implies it to be; that the Gulf of Mexico oil spill and BP's seemingly inadequate safety protections and near complete inability to effectively respond are strong indications that business will prioritize profits over public goods like environmental safety; how an attitude of business before anything else will influence Rand's views on everything from the minimum wage to immigration policy to climate control to internet neutrality. Those are all important discussions to have, discussions where we can't assume that everyone in the audience will come down on the same side, but calling him "crazy" or "mad" and leaving it at that elides all of those complicated issues. Even more strongly, it implies that those discussions are not even worth having because it is so evident that the views or person being dismissed are wrong and absurd and laughable. In Newsweek, Conor Friesdorf made an interesting observation about the policies and people who are dismissed as "crazy": Forced to name the "craziest" policy favored by American politicians, I'd say the multibillion-dollar war on drugs, which no one thinks is winnable. Asked about the most "extreme," I'd cite the invasion of Iraq, a war of choice that has cost many billions of dollars and countless innocent lives. The "kookiest" policy is arguably farm subsidies for corn, sugar, and tobacco—products that people ought to consume less, not more. These are contentious judgments. I hardly expect the news media to denigrate the policies I've named, nor do I expect their Republican and Democratic supporters to be labeled crazy, kooky, or extreme. These disparaging descriptors are never applied to America's policy establishment, even when it is proved ruinously wrong, whereas politicians who don't fit the mainstream Democratic or Republican mode, such as libertarians, are mocked almost reflexively in these terms, if they are covered at all. What I conclude from that is that the media doesn't consistently use "crazy" and other ableist terms to refer to absurd policies or those that lack rational support, but instead reserves those terms for people outside of mainstream politics. Which in turn implies that the term is used primarily to further marginalize and dismiss people who don't fit expectations of what a politician is or what are common or popular political arguments. To me, this is even more evidence that the implicit subtext of terming a person or policy "crazy" is **"shut up and go away, or start blending in better."** Which, again, is exactly the message leveled at people with mental illness when they're called "crazy" or "loony" or "unhinged" or any number of synonyms. This selective usage is even more reason the term "crazy" shouldn't be used in the

political context – partly because it's a lazy out for commentators who refuse to engage with the actual policy issues or political ideas being proposed on a substantive level, and partly because it fiercely underlines and reinforces marginalization and dismissal of people with mental illness. It reminds me that when people call me "crazy," what they really mean is "**stop existing in my consciousness – either disappear or become normal.**" To see progressive writers and organizations rely on the marginalization of people with mental illness to score easy points against unpopular politicians is upsetting not only because of their perpetuation of ableism, but also because it puts me in the extremely uncomfortable position of defending people like Palin and Paul against this kind of criticism.

"Cripple"

Cripple has been used to mean both powerless and able only to creep – it's undesirable, and only reclamation of 'crip' by disabled people is acceptable

Clark and Marsh 2 [Laurence Clark, internationally-acclaimed comedian, presenter, writer and actor who has cerebral palsy; Stephen Marsh, inventor and entrepreneur writing on disability; "Patriarchy in the UK: The Language of Disability" 2nd Draft; 2002; accessed 07/31/2015; <http://disability-studies.leeds.ac.uk/files/library/Clark-Laurence-language.pdf>.]

3.6 'Cripple' Reiser (2001) credits the derivation of the word 'cripple' to the Middle German word 'Kripple' meaning: "to be without power". Whilst this may be currently true in the political sense, the inference is a lack of physical or intellectual power. On the other hand, Crowley and Crowley (2000) date its usage back to before 950 AD, the earliest form being the Old English 'crypel' which is a form of 'creep'. Therefore a 'cripple' would be one who can only creep. The word is only used once in the King James bible: "and there sat a certain man at Lystra, impotent in his feet, being a cripple his mother's womb, who never had walked" (Acts 14:8). However it is used a number of times by Shakespeare: "And chide the cripple tardy-gaited night Who, like a foul and ugly witch, doth limp So tediously away." (Henry V, act IV chorus) The word is still commonly used as an adjective: e.g. "crippling pain", "crippling debts" and "the health service is crippled"; or as an undesirable fate: "to end up a cripple". More recently the abbreviated form 'crip' has been reclaimed and used by disabled people in the United Kingdom in the same positive way that 'queer' was adopted by lesbians and gay men, however it could not be used in that same way by non-disabled people.

Discourse

The politics of language reflect and shape ableist world views and must be first brought to the forefront to combat microaggressions and ableism

Brown 13 [Lydia Brown, activist, public speaker, and writer focused on violence against multiply-marginalized disabled people, such as LGBTQ+ (queer and trans), poor, undocumented, and people of color groups within the disability community, Board of Directors for TASH New England, Project Assistant at the Autistic Self Advocacy Network, and previously involved in writing disability policy; "Ableism/Language"; Autistic Hoya; 13 06/13/2013; accessed 07/27/2015; <http://www.autistichoya.com/p/ableist-words-and-terms-to-avoid.html>.] Always point to specifically what portion of their argument was ableist

Language is inherently political. Both as individuals and as larger social and cultural groups, it is self-evident that the language we use to express all sorts of ideas, opinions, and emotions, as well as to describe ourselves and others, is simultaneously reflective of existing attitudes and influential to developing attitudes. The terms that are listed below are part of an expanding English-language glossary of ableist words and terms. I have chosen to include words or phrases that I know of or that are brought to my attention that meet two criteria: 1) Their literal or historical definition derives from a description of disability, either in general or pertaining to a specific category of disability, and 2) They have been historically and or currently used to marginalize, other, and oppress disabled people. The rationale for including some of these words may be readily apparent to many visitors as meriting inclusion on this list, such as for "retarded" and "invalid." For others, however, there may be the lingering suspicion that I have opted to be overinclusive and thus, extremely hypersensitive and obsessed with being politically correct. The reason that I have listed words that may not readily come to mind when asked to consider "insults and slurs targeting disability" is precisely because so much of this ableist language is utterly pervasive both in everyday colloquy and formal idiom with hardly any notice or acknowledgement, even by fellow disabled people not using the language as part of any reclamation project. On that note, the list is not intended to condemn or scold disabled people who use any of the words included in the spirit of reclamation or as self-descriptors. Its primary purpose is to serve as a reference for anyone interested in learning about linguistic microaggressions and everyday, casual ableism. And to the observation that some of the terms offered as alternatives carry analogous meanings, I have stated that the reason some words are included while others are not is because some words have oppressive histories and others do not. For example, the word "dumb" has a disability-specific history (referring to people who cannot speak, and often used to refer to Deaf people), whereas the word "obtuse" does not (deriving from a meaning of "beating against something to make it blunt or dull").

The rhetoric of disability allows ableism to be learned and promote a culture of discrimination, only challenging that which seems innocuous can change the widespread, unwitting acceptance of ableist thinking

Cherney 11 [James L Cherney, former college debater, PhD in Communication and Culture @ Westminster, and undergraduates in Public Speaking, Body Rhetoric, and the Disability Rights Movement; "The Rhetoric of Ableism"; Disability Studies Quarterly, Vol 31 No 3; 2011; accessed 07/31/2015; <http://dsq-sds.org/article/view/1665/1606>.]

As Disability Studies continues its exploration of disability in society, scholars have paid growing attention to the rhetoric of disability. This scholarship approaches the subject from different angles, but it generally works with similar premises including the position that rhetoric can shape the way disability is understood and (in)forms its political implications. These studies range from considering how rhetoric crafts disability to examining how ideas of disability impact theories of rhetoric. Brenda Jo Brueggemann explores how rhetoric constructs the disability of deafness, revealing how Hearing culture oppresses Deaf culture.1 Jay Dolmage shows how contemporary histories have "imported [exclusion] into the classical world" and oversimplified the complex views of disability that informed that era's influential theories of rhetoric.2 James C. Wilson and Cynthia Lewiecki-Wilson's Embodied Rhetorics collects several works covering the terrain between these studies.3 I seek to build upon these authors' valuable work by continuing to examine rhetoric but turning to a related yet different focus: I analyze ableism instead of disability. While disability and ableism clearly relate, I consider attending to the latter to be similar to studying racism

instead of race. Neither project makes sense without the other, and arguably studying disability has greater potential for promoting awareness and emancipatory politics, but studying ableism promises unique results such as identifying the identical mechanisms that propagate different types of discrimination. In this essay I analyze ableism as a rhetorical problem for three reasons. First, ableist culture sustains and perpetuates itself via rhetoric; the ways of interpreting disability and assumptions about bodies that produce ableism are learned. The previous generation teaches it to the next and cultures spread it to each other through modes of intercultural exchange. Adopting a rhetorical perspective to the problem of ableism thus exposes the social systems that keep it alive. This informs my second reason for viewing ableism as rhetoric, as revealing how it thrives suggests ways of curtailing its growth and promoting its demise. Many of the strategies already adopted by disability rights activists to confront ableism explicitly or implicitly address it as rhetoric. Public demonstrations, countercultural performances, autobiography, transformative histories of disability and disabling practices, and critiques of ableist films and novels all apply rhetorical solutions to the problem. Identifying ableism as rhetoric and exploring its systems dynamic reveals how these corrective practices work. We can use such information to refine the successful techniques, reinvent those that fail, and realize new tactics. Third, I contend that any means of challenging ableism must eventually encounter its rhetorical power. As I explain below, ableism is that most insidious form of rhetoric that has become reified and so widely accepted as common sense that it denies its own rhetoricity—it "goes without saying." To fully address it we must name its presence, for cultural assumptions accepted uncritically adopt the mantle of "simple truth" and become extremely difficult to rebut. As the neologism "ableism" itself testifies, we need new words to reveal the places it resides and new language to describe how it feeds. Without doing so, ableist ways of thinking and interpreting will operate as the context for making sense of any acts challenging discrimination, which undermines their impact, reduces their symbolic potential, and can even transform them into superficial measures that give the appearance of change yet elide a recalcitrant ableist system.

Foucault

Engaging fully with disability studies at the forefront allows a breaking down of binaries – identity politics fail as they necessarily rely on boundaries

Anders 13 [Abram Anders, Assistant Professor of Business Communication, English PhD @ Penn State; "Foucault and "the Right to Life": From Technologies of Normalization to Societies of Control"; Disability Studies Quarterly; Vol 33 No 2; 2013; accessed 07/29/2015; <http://dsq-sds.org/article/view/3340/3268>.]

Considered from the genealogical perspective such claims and protest are of a piece with the landscape of biopower rather than an effective challenge to it. In the following study, my aim is to reevaluate disability studies in terms of the configuration of social relations that have produced disability as identity and motivated claims for social protection. Technologies of normalization are not solely or primarily about the exclusionary, prohibitive functions of social neglect, stigmatization, and institutional paternalism. Rather, the primary danger we face today is the continued intensification of power relations through increasingly invasive and privatized mechanisms of rehabilitation. As Jeffrey Nealon writes in Foucault Beyond Foucault: Power and Its Intensifications since 1984 (2008), "societies of control extend and intensify the tactics of discipline and biopower (by linking training and surveillance to ever-more-minute realms of everyday life), they also give birth to a whole new form" (68). Ultimately, I argue that we have already moved past a point where rights discourse is the primary front in the battle against disablism. As reform efforts have begun to focus on quality of life issues and empowering "consumers" of health services, we have entered into a new era of grappling with problems unique to societies of control. The Failure of Rights Discourse It is commonplace in disability studies to assert that we are all only "temporarily-abled." On the one hand, the statement points to the likelihood that most of us will experience some form or period of disablement during our lifetimes. On the other, as Eva Kittay points out, even those of us who lead full and healthy lives will experience dependency at least twice, "when we are infants and when we are very old" (qtd. in Squier 24). At times, this invocation almost seems to suggest that if only the mythical "normal subject" would accept that it too will be disabled someday, then a primary obstacle to the social acceptance and accommodation of disability would disappear. 5 In this formulation, we might recognize a version of what Nealon characterizes as the theoretical success of identity politics. Namely, the linguistic turn of identity politics arrives at the recognition that "any state of sameness actually requires difference in order to structure itself" (4). Yet, the realization of a common intersubjective ground to social and linguistic identity formation does not entail a political success. As Nealon goes on to argue: …because intersubjective theories argue that we need each other for recognition and happiness, such theories continue to harbor a regulatory ideal of complete subjective freedom, which is actually freedom from recognition, freedom from difference itself. It is not necessarily surprising, then, that needing the other often shows itself as resenting the other. (Alterity Politics 7) Insofar as identity politics are thematized through reference to a lack, a failure of wholeness, and the instability of identity in the same, it tends to reinscribe as an object of desire the very privileges it seeks to deconstruct. Thus, identity politics have often been haunted by the unacknowledged goal of **attaining the privileges from which certain categories of people are excluded** and thereby maintains as ideal the configuration of power relations that produce these politicized identities as effects (Brown 7). As an example, we might consider Lennard Davis's "dismodernist" approach to identity politics, an approach that is founded on the radical version of "lack" discovered in disability. Davis sees the disability movement as having a unique potential to **destabilize the "normal subject" insofar as it presents a "real," physical** (i.e., not merely discursive) **lack** that not only problematizes identity, but materially challenges the illusion of independence: In a dismodernist mode, the ideal is not a hypostatization of the normal (that is, dominant) subject, but aims to create a new category based on the partial, incomplete subject whose realization is not autonomy and independence but dependency and interdependence. This is a very different notion from subjectivity organized around wounded identities; rather, all humans are seen as wounded. Wounds are not the result of oppression, but rather the other way around. Protections are not inherent, endowed by the creator, but created by society at large and administered to all. The idea of a protected class in law now becomes less necessary since the protections offered to that class are offered to all. (Bending Over Backwards 30) Whereas, Davis wants to **unsettle the privilege of the "normal subject," his invocation of the lack or "wound" creates a platform for extending this very privilege** (elided as "protections" in the passage) to the disabled. Precisely because

everyone is recognized as lacking, the goal remains to achieve wholeness through dependence on each other: "The dismodernist subject is in fact disabled, only completed by technology and interventions" (Davis 30). Davis's argument for a "right to be ill" ends up becoming an argument for a right to be protected from illness or even a "right to be normal" for all. Of course, it is not particularly the commitment or goal that is problematic, but the appeal to rights discourse itself. The essential and unavoidable problem with rights discourse is that it appeals to a liberal notion of equality that " insofar as it neither constitutes political community nor achieves substantive equality, guarantees only that all individuals will be treated as if they were sovereign and isolated individuals" (Brown 110). As Brown argues, the formal equality of liberalism abandons the individual to the social forces that produce her or him as a politicized identity. Thus, the problem with rights discourse and the desire to seek melioration within its institutions is that "[it] continuously recolonizes political identity as political interest—a conversion that recasts politicized identity's substantive (and often deconstructive) cultural claims and critiques as generic claims of particularism endemic to universalist political culture" (Brown 59). Along these lines, we might consider Brown's example of the way in which an identity such as the "welfare subject" is produced and regulated through categories of "motherhood, disability, race, age, and so forth" (59). While such subjects seek the intervention of the state, that is, a political solution for social inequity, the response is further reform and administration by the institutions that produced these subjects as effects. In other words, the entire system becomes a closed circuit: "Thus, disciplinary power politically neutralizes entitlement claims generated by liberal individuation, while liberalism politically neutralizes rights claims generated by disciplinary identities" (Brown 59).

Janelle Monae

Janelle Monáe's use of abelist metaphors for freedom obscures the experience of disability and props up ableism, despite intentions

Bailey 12 [Moya Bailey, Graduate student at Emory's Women's, Gender, and Sexuality Studies program with a focus on African-American Studies, Digital Humanities, Disability Studies, History of Medicine, Media Studies & Popular Culture, Queer Theory/Sexuality Studies, Women's & Gender Studies; "Vampires and Cyborgs: Transhuman Ability and Ableism in the work of Octavia Butler and Janelle Monáe"; Social Text Journal; 01/04/2012; accessed 07/28/2015; <http://socialtextjournal.org/periscope_article/vampires_and_cyborgs_transhuman_ability_and_ableism_in_the_work_of_octavia_butler_and_janelle_monae/>.] Janelle Monae's work is used in a lot of fugitivity affs.

Like Butler, Janelle Monáe is interested in the transhuman possibilities of the body. Her alter ego, Cindi Mayweather, is an android from the distant future who does the impossible: falls in love with a human. This taboo animates a droid army to hunt and destroy her. Monáe's album The ArchAndroid is the rock opera of Mayweather's life on the run. As she attempts to remain true to her feelings, she struggles with the perceptions of the power structure who see her as wild, unstable, and crazy as she flouts the conventions of an ableist and human-centered world. Her body, like Shori's is a threat to the conventions of her community, troubling the meticulously maintained division of man and machine. The ArchAndroid provides a window into Cindi Mayweather's experience. The track "Faster" highlights her escape from the Droid Army. The invocation of the ableist slur "schizo" is supposed to be liberatory. She is talking about running for freedom, and schizophrenia is representative of the liberation she hopes to achieve. She sings: "I'm running, I'm running, running, running. I'm shaking like, shaking like a schizo." Similarly, in the track "Alive" Monáe makes schizophrenia a metaphor for heightened consciousness. In reference to dance, she sings "That's when I come alive, like a schizo running wild, that's when I come alive, now let's go wild!" If you've seen a Monáe live show, she does, as the kids say, "go off," with dance moves that rival James Brown in their explosiveness. It is when Cindi feels most alive that society, in the form of medication, the droid army and institutional pressure, tries to squelch her boundary-breaking expression by forcing her to conform to an unanimated norm. **Monáe's critique is powerful but the sting of words that support ableism remains**. Janelle Monae Feat. Big Boi – Tightrope from Fred Romano on Vimeo. The video for "Tightrope" portrays Monáe and fellow institutionalized patients trying to break free of the repressive watchful eye of the powers that be through dance and song. She goes through walls and into the woods to escape those who would limit her expression. The video provides a visual critique of the ways in which disability is policed through showing the nurse's attempts to medicate and thwart the revolutionary dance party of the patients. The audience is privy to the soul-crushing nature of the institution and we delight in the patients' stolen moments of freedom of expression in dance, their powerful and uncontrollable hidden magic exposed. For Butler and Monáe, transhuman disabled bodies offer possibility and freedom that simple humanity forecloses. Monáe's use of disability as metaphor supports her alter ego's search for a freedom in a world much like our own. However, **by reducing disability to metaphor and by using ableist language, the real lives of disabled people are obscured**. Butler's depiction of Shori's hybrid body serves as a flash point for eugenic impulse, allowing an investigation of the deep seated racial prejudices of our time. However, punishing characters through impairment makes disability into retribution, a just sentence for wrongdoing in an ableist world that doesn't make accommodations for people who need them. Butler and Monáe open up conversations about disability that are messy and fraught, but they do so in arenas that traditional disabilities studies scholarship neglects.

"People with Disabilities"

The term "people with disabilities" conflates disability and impairment, and refuses to recognize that disability is the fault of the social sphere

Clark and Marsh 2 [Laurence Clark, internationally-acclaimed comedian, presenter, writer and actor who has cerebral palsy; Stephen Marsh, inventor and entrepreneur writing on disability; "Patriarchy in the UK: The Language of Disability" 2nd Draft; 2002; accessed 07/31/2015; <http://disability-studies.leeds.ac.uk/files/library/Clark-Laurence-language.pdf>.]

The British civil rights movement has rejected the term 'people with disabilities', as it implies that the disabling effect rests within the individual person rather than from society. The term 'disabilities' when used in this context refers to a person's medical condition and thus confuses disability with impairment. In addition it denies the political or 'disability identity' which emerges from the disabled people's civil rights movement in a similar way to the Black and Gay political identities (Barnes, 1992, page 43; Oliver and Barnes, 1998, page 18). Indeed some are now going further and writing Disabled with a capital 'D', in order to emphasise the word's political connotations. The Deaf people's movement largely does not identify with the term 'disabled people', instead adopting a cultural model and defining themselves as a linguistic minority. Corker (2002) defines Deaf people as "that group of people with hearing impairments who are excluded from the dominant areas of social and cultural reproduction by the perpetuation of a phonocentric world-view." Deaf people too have adopted a capital 'D' in order to politicise the word. None of the rest of the terms discussed here come from disabled people themselves and portray the social construction of disability.

Performativity (Gender/Queerness)

The performativity of gender is based on the ability to move and present oneself – this expression is especially pervasive in queer communities

Ndopu and Moore 12 [Edward Ndopu, Top 200 Young South African, public speaker, graduate of the African Leadership Academy, founder of Global Strategy for Inclusive Education, advocate for CWD in developing countries, consultant with the World Economic Forum, administrative coordinator of the GLBTG Center @ Carleton university, board member for Insitute of Research, Education, Accessibility, and Design; Darnell Moore, Senior Editor for Mic, Visiting Scholar @ Yale Divinity, previous Women and Gender Studies professor @ Rutgers, 2012 Humanitarian Award Winner for developing the Queer Newark Oral History Project; "On Ableism within Queer Spaces, or, Queering the "Normal""; Pretty Queer Activism; 12/07/2012; accessed 07/30/2015; <http://prettyqueer.com/2012/12/07/on-ableism-within-queer-spaces-or-queering-the-normal/>.]

Our daily existence as two black queer men—one a (dis)abled queer femme man and the other an able-bodied (sometimes) masculine queer man—informs our belief that our quest for liberation from oppressions based on sexuality and gender expression must also account for the ways that ableism also often subjugates some queer people. Ableism shapes attitudes, policies and systems that ultimately dehumanize, pathologize and criminalize people whose bodies do not fit into socially constructed notions of what constitutes a "normal" human being. Indeed, ableism shapes our understandings of gender expression. As Eli Clare brilliantly puts it, "the mannerisms that help define gender—the way in which people walk, swing their hips, gesture with their hands, move their mouths and eyes when they talk, take up space—are all based upon how non disabled people move…The construct of gender depends not only upon the male body and female body, but also on the non disabled body." Ableism renders invisible those bodies not privileged by dominant definitions of ability, those bodies that do not fit the conceptions of gender that we often imagine. We "read" the movement of bodies, the ways people walk, hair styles, and the ways our bodies interact with other bodies in social spaces without ever realizing that all of the aforementioned performances are gendered expressions that center on the privilege of physical movement. We tend to place a lot of emphasis on the body, and one's use of the body, without attending to the fact that for some the use of the body is an impossibility. Indeed, for one of us, a queer who relies on attendants for personal care and grooming, such understanding wholly ignores the ways he exists in the world. As a result, it is time to fully acknowledge ableism as a pervasive form of oppression within our queer communities. Take, for example, Pride Parades, which are visual representations of queer and trans* communities. Pride Parades are organized around the notion of marching and, therefore, requires that people are able to physically move to showcase their belonging. This does not account for the experiences of those who are not able to walk or who have to use special equipment to move. And so when we rely on our physical abilities to express ourselves, we inadvertently reproduce disability oppression. In addition, consider the ways that ablesim functions in queer dating spaces, virtual or otherwise. Pervasive in many queer and trans* dating spaces is a type of self-expression that centers on the body and the need to make ourselves desirable to others. Queer and trans* folks of different abilities, who live with chronic illnesses, or battle with addictions are left out of so many of the spaces that purport to be designed for "us." The "party culture" that is ubiquitous within many of our communities alienates those who are not able to feel safe, validated, and affirmed within these contexts. Our lack of access to such spaces has an impact on our ability to claim our identifications and belonging within these communities.

Posthumanism

Posthumanist scholars' refusal to examine disability which is situated in the center of their research proves an implicit bias

That <u>posthuman scholars have not closely examined the cultural implications of the American eugenics movement</u> is puzzling for a few reasons. First of all, <u>scholars of posthumanism often concern themselves with the margins of humanity: animals, others, monsters, and similar figures</u>. In both medical and sociological discourse, <u>people with physical and mental disabilities—referred to in this essay as victims of eugenics—have been described as others, animals, retards, monsters and anomalies, among other pejoratives</u>. Writing for a 1950 edition of the American Journal of Mental Deficiency, <u>eugenicist Leonard le Vann states that Indeed the picture of comparison between the normal child and the idiot might almost be a comparison between two separate species</u>. On the one hand, <u>the graceful, intelligently curious, active young homo sapiens, and</u> on the other <u>the gross, retarded, animalistic, early primate type individual.</u> (470) <u>Since victims of eugenics are identified as animals or as a different species, we would think that scholars of posthumanism would draw a precise connection between their area of expertise and the specifics of eugenics: the historical context, the propagandistic practices, the formal medical tests and procedures. Unfortunately, such scholarship is scarce.</u>

Science Fiction

Science fiction is solely an outlet for social fears – their construction of a binary implicit hearkens back to eugenics and the elimination of people with disabilities

Pottle 13 [Adam Pottle, author, pursuing a doctoral degree in English Literature; "Segregating the Chickenheads: Philip Dick's Do Androids Dream of Electric Sheep? and the Post/humanism of the American Eugenics Movement"; Disability Studies Quarterly; Vol 33 No 3; 2013; accessed 07/29/2015; <http://dsq-sds.org/article/view/3229/3262>.]

Ever since science fiction emerged as a bonafide genre, its writers have consistently allegorized social fears. As Istvan Csicsery-Ronay argues, "'[t]he boundary between science fiction and social reality is an optical illusion'" ("The Science Fiction of Theory: Baudrillard and Haraway," conference paper). Both film and literature have tackled subjects ranging from nuclear anxiety (1954's Godzilla, 1954's Them!) to scientific exploration (Mary Shelley's Frankenstein, Jules Verne's Journey to the Centre of the Earth, H.G. Wells's At the Mountains of Madness), and the western eugenics movement is no different. Writers such as Robert Sawyer and Mikhail Bulgakov have allegorized the difficulties and pitfalls of attempting to improve human beings through (often extreme) scientific measures. In Do Androids Dream of Electric Sheep?, Dick situates his discussion of eugenics in a specifically American context. As shown here in the novel's opening chapter, when bounty hunter Rick Deckard considers the precariousness of his current situation, the novel quickly establishes a discourse of normalcy, a common theme during the heyday of the eugenics movement: So far, medical checkups taken monthly confirmed him as a regular: a man who could reproduce within the tolerances set by law. Any month, however, the exam by the San Francisco Police Department doctors could reveal otherwise….The saying currently blabbed by posters, TV ads, and government junk mail, ran: "Emigrate or degenerate! The choice is yours!" (Dick 439) Four key American eugenics associations arise within this passage. First of all, the word "regular" indirectly establishes a dichotomy, on the other side of which is "irregular," or, as we see later in the novel, "special." Using similar language, **eugenicists sought to separate "normal" and "abnormal" people**: after World War I, American eugenic scientists undertook extensive studies to establish mental and physical norms for men and women, emerging with a "hypothetical" average American (Christina Cogdell 193). The "average" American man and woman were later represented in statues called Normman and Norma, sculpted by Abram Belskie and based on research by Dr. R.L. Dickinson (197). The dichotomy is emphasized by the phrase "'Emigrate or degenerate! The choice is yours!'" yet complicated when we consider the novel's characters. The choices of emigrate or degenerate speak to the normal and abnormal portions of the novel's population; ironically, however, the entire novel takes place on Earth, from which most of the "regular" population has emigrated. Deckard remains on Earth because of his job, choosing to subsist in the radioactive dust-choked city of San Francisco so he can hunt and kill renegade androids (439). Deckard is one character who blurs the lines of the regular/special dichotomy. Although he is physically and mentally a regular, his choice to remain on Earth suggests otherwise; continued residence on Earth is the telltale sign of a special, meaning someone who is too poor to emigrate or who chooses not to emigrate. 3 Even though he is not officially declared a special, Deckard fulfills the criteria. Another special, John Isidore, also blurs the lines between regular and special, as demonstrated below. A second point about the above passage concerns the prevalence of the law. The phrase "the tolerances set by law" underscores the judicial reach of American and especially Californian eugenicists. Scientists, politicians, judges and the general public frequently discussed the legal boundaries of reproduction, seeking to promote strong unions between fertile, regular people and limit—if not totally prevent—the feebleminded, the insane and the criminal from reproducing. In California, such legal handcuffing arose in a variety of measures: in addition to establishing the sterilization law in 1909, a law which "granted the medical superintendents of asylums and prisons the authority to 'asexualize' a patient or inmate if such action would improve his or her 'physical, mental, or moral condition'" (Stern 99), the California government created several commissions and departments that gave eugenicists an imposing legal presence. Such commissions and departments included the State Commission in Lunacy (52), the Department of Institutions (87) and the Board of Charities and Corrections (87). Each of these organizations had their own agenda for controlling or manipulating victims of eugenics. The Department of Institutions was especially influential, as Alexandra Stern points out: the implementation of eugenic programs would not have reached such extremes in California without the active involvement of the Department of Institutions, which led the country in the expulsion of foreigners and undesirables, the development of large-scale intelligence testing, and the sterilization of those deemed unfit. (113) The government of California undertook these initiatives under the guise of improving life for victims of eugenics; in reality, eugenicists wanted to prevent the victims from reproducing in order to promote racial purity and avoid the financial and moral burdens these people supposedly placed on the state (88). All told, the eugenics program had a pervasive legal reach, a fact of which Dick seems keenly aware. Thirdly, the passage reveals the anxiety that the novel's regulars endure: the anxiety that at any moment they may become sterile, and therefore useless. This anxiety arose in reality as well. Victims of eugenics faced

derision precisely because they reflected the discomfort of the general population: "eugenicists tended to group together all allegedly 'undesirable' traits. So, for example, **criminals, the poor, and people with disabilities might be mentioned in the same breath**" (Davis 35). Because the victims were sterilized, they took on the additional association of impotence; as a result, they were often mistreated: "Psychologists persecuted their patients. Teachers stigmatized their students. Charitable associations clamored to send those in need of help to lethal chambers they hoped would be constructed" (Black xvi). Later in the novel, John Isidore takes on the stigma of impotence, adding to his stigma of being a "chickenhead."

"Special"

The multiple meanings of "special" complicate its meaning, and requires an evaluation of it before proceeding

Pottle 13 [Adam Pottle, author, pursuing a doctoral degree in English Literature; "Segregating the Chickenheads: Philip Dick's Do Androids Dream of Electric Sheep? and the Post/humanism of the American Eugenics Movement"; Disability Studies Quarterly; Vol 33 No 3; 2013; accessed 07/29/2015; <http://dsq-sds.org/article/view/3229/3262>.]

Even though "special" and "chickenhead" are separate things, the terms are often used interchangeably in the novel: And there existed chickenheads infinitely stupider than Isidore, who could hold no jobs at all, who remained in custodial institutions quaintly called "Institute of Special Trade Skills of America," the word 'special' having to get in there somehow, as always. (447) The word "special" carries a number of contradictory associations. Being called "special" can be either a compliment, meaning someone who is precious or unique, or it can be an insult; both meanings arise in the novel, complicating how we must read the character of John Isidore. Is he an inferior, animalistic human, or a superior, empathetic human? As I mentioned earlier, Isidore, like Deckard, blurs the lines between regular and special, allowing us to question the validity of such categories. While Deckard is a physical and mental regular who chooses to stay on Earth, Isidore is a mental special/chickenhead who has more empathy than any other character in the novel. Like animals, the quality of empathy is highly prized; the Voigt-Kampff test separates humans from androids based on their ability to empathize. When Isidore vows to protect the three androids Pris, Irmgard and Roy, the trio, desperate for shelter, lauds him:

"The Disabled"

The totalizing phrase creates a burden of "The Disabled" ignores individual experiences

Anna 10 [Anna, permanent contributor to FWD; "AWP: The Disabled"; FREEDOM: Feminists with Disabilities; 06/18/2010; accessed 07/31/2015; <http://disabledfeminists.com/2010/06/18/awp-the-disabled/>.] Potential for offensive language: damned. Read this version if the aff also says 'people with disabilities'.

The short form of why this is a problem: <u>People with disabilities/the disabled are not a collective group that all agree on anything</u>. <u>Asking what</u> "the disabled" want or <u>"the disabled" are doing is exactly like asking</u> what "women" want and <u>what "women" are doing. Women are individuals. Some of them are women with disabilities! We don't all want the same things, but grouping everyone</u> under the same umbrella, <u>as though we are a Collective</u> rather than Individuals With Opinions and Needs <u>is</u>… well, it's <u>pretty</u> damned <u>ableist</u>, as well as being arrogant, ignorant, and irritating. Long Version: <u>We're</u> still <u>living in a society that makes a lot of casual assumptions about people with disabilities</u> and their experiences. <u>When people start talking about "the disabled" they are generally about to launch into some sort of stereotype</u> – "the disabled are the pawns of the religious right", for example. <u>This boils down a lot of complicated people</u> – people <u>who have a wide variety of needs, wants, opinions, thoughts, and experiences – into one homogeneous group</u>. <u>This contributes to the de-humanization of disabled people. "The disabled" aren't people, they're a big collective noun who</u> can't be reasoned with, <u>can't be talked to, can't be considered – they're just to be placated, and dealt with</u>, and put out of our minds as quickly as possible in case they sue us.

Choosing to say "The Disabled" is a totalizing phrase which ignores individual experience of people with disabilities

Anna 10 [Anna, permanent contributor to FWD; "AWP: The Disabled"; FREEDOM: Feminists with Disabilities; 06/18/2010; accessed 07/31/2015; <http://disabledfeminists.com/2010/06/18/awp-the-disabled/>.] Potential for offensive language: damned. Read this if the aff only says 'The Disabled' and you want to PIC out to say people with disabilities instead. Be aware of DAs to 'people first' wording, like Fiona Kumari Campbell's work.

The short form of why this is a problem: <u>People with disabilities/the disabled are not a collective group that all agree on anything</u>. <u>Asking what</u> "the disabled" want or <u>"the disabled" are doing is exactly like asking</u> what "women" want and <u>what "women" are doing. Women are individuals. Some of them are women with disabilities! We don't all want the same things, but grouping everyone</u> under the same umbrella, <u>as though we are a Collective</u> rather than Individuals With Opinions and Needs <u>is</u>… well, it's <u>pretty</u> damned <u>ableist</u>, as well as being arrogant, ignorant, and irritating. Long Version: <u>We're</u> still <u>living in a society that makes a lot of casual assumptions about people with disabilities</u> and their experiences. <u>When people start talking about "the disabled" they are generally about to launch into some sort of stereotype</u> – "the disabled are the pawns of the religious right", for example. <u>This boils down a lot of complicated people</u> – people <u>who have a wide variety of needs, wants, opinions, thoughts, and experiences – into one homogeneous group</u>. <u>This contributes to the de-humanization of disabled people. "The disabled" aren't people, they're a big collective noun who</u> can't be reasoned with, <u>can't be talked to, can't be considered – they're just to be placated, and dealt with</u>, and put out of our minds as quickly as possible in case they sue us. <u>Saying "people with disabilities" or "disabled people" may seem like a pretty minor thing</u>. It is, so <u>it shouldn't be that difficult</u>. The reason for it, <u>though</u>, is that <u>it can be that small reminder: that people with disabilities are people</u>. <u>That disabled people have opinions and thoughts and experiences and needs that are not universal</u> to all people with disabilities. That <u>we are, in fact, people, and it would be nice if we could be treated as such</u>. <u>Language doesn't change everything</u>. It isn't an end in and of itself. <u>But it can be the first step in</u>

combating the sort of ableism that makes it okay for many people – including editors and writers for major and minor news sources – to dismiss us as pawns without thought.

Blocks

A2 Censorship

The language of disability isn't censorship – it's an educative project that seeks to disrupt the ableist hegemony of the status quo

Brown 14 [Lydia Brown, activist, public speaker, and writer focused on violence against multiply-marginalized disabled people, such as LGBTQ+ (queer and trans), poor, undocumented, and people of color groups within the disability community, Board of Directors for TASH New England, Project Assistant at the Autistic Self Advocacy Network, and previously involved in writing disability policy; "Violence in Language: Circling Back to Linguistic Ableism"; Autistic Hoya; 02/11/2014; accessed 07/27/2015; < http://www.autistichoya.com/2014/02/violence-linguistic-ableism.html>.] this card is on fire!!!!!! please, pull a fire alarm like asap

One of the most common (inaccurate and mischaracterizing) criticisms, however, both from inside and outside the disability community, is the accusation that the list is a tool for policing language or censoring words. So what's the purpose of the list? Why compile it at all? Because linguistic ableism is part of the total system of ableism, and it is critical to understand how it works, how it is deployed, and how we can unlearn our social conditioning that linguistic ableism is normal and just how things are or should be. As important as it is to recognize and uncover the violence of linguistic ableism (how ableism is specifically embedded into our language), it is also critical to understand why this is important. (And this is where those who jump the gun and leap to accusations of pedantic, holier-than-thou, smug language-policing or censorship **have not yet come to understand why this** page, and those like it, **need to exist**.) Linguistic ableism: a) is part of an entire system of ableism, and doesn't exist simply by itself, b) signifies how deeply ableist our societies and cultures by how common and accepted ableism is in language, c) reinforces and perpetuates ableist social norms that **normalize violence and abuse against disabled people**, d) actively creates less safe spaces by **re-traumatizing disabled people**, and e) **uses ableism to perpetuate other forms of oppression**. Language is not the be all end all. This isn't about policing language or censoring words, but about critically examining how language is part of total ableist hegemony. This is about being accountable when we learn about linguistic ableism, but it is also about being compassionate to ourselves and recognizing that to varying extents, we have all participated in ablesupremacy and ablenormativity. **This is about understanding** the connections between linguistic ableism and other forms of ableism, such as medical ableism, scientific ableism, legal ableism, and cultural ableism. Language reflects and influences society and culture. That's why students of any foreign language often study the cultures where that language is dominant. (And that's not to dimiss the many valid criticisms of the ethnocentrism and colonialism in much area and language studies programs.) Language isn't important for silly semantic reasons, but because it cannot be separated from the culture in which it is deployed. Feminist theory, queer theory, and race theory have all analyzed how **sexism, heterosexism, cissexism, binarism, and racism are embedded in language. This is the same** process. Using the language of disability (either directly or through metaphor) as a way to insult other people, dismiss other people, express your vehement loathing for them/their viewpoints, or invalidate their viewpoints is actually extremely ableist (and often sanist, neurotypicalist, audist, or vidist). For example, I am talking about using the language of mental illness ("crazy," "insane," "psycho," or "wacko," for example), cognitive disability ("retarded," "slow," or "moron," for example), or physical disability ("crippled" or "completely blind/deaf," for example). In another example, I am also talking about using disability as metaphor. Using the language of disability to denigrate or insult in our conversations and organizing presumes that a.) people who hold undesirable or harmful viewpoints must hold them because they are mentally ill/have psych disabilities/are mentally disabled/are disabled in some way, b.) having mental illness/psych disability/mental disability/any disability is actually so undesirable and horrible that you can insult someone that way (the same underlying reason why socially embedded linguistic heterosexism lets people use "gay" as an insult), c.) it's acceptable to use ableism against one disability group while decrying ableism against another disability group (creating horizontal or intra-disability oppression) or another form of oppression against another marginalized group (creating horizontal oppression), and d.) and that no one who is disabled in any way might actually share your opinion or be on your side, thus actually actively excluding and marginalizing this part of our community, and making our spaces less safe and less inclusive.

A2 Intent/Didn't Mean It

Unconscious ableism is worse – uses language while ignoring its history, otherization, and the violence behind it. Their defensive response proves their need to learn a lesson

Leibowitz 14 [Cara Leibowitz, disability activist in several campus and off-campus organizations, studying for a Master's Degree in Disability Studies at the CUNY School of Professional Studies; "Just because it's ableist, doesn't mean it's bad."; 01/03/2014; accessed 07/27/2015; <http://thatcrazycrippledchick.blogspot.com/2012/03/just-because-its-ableist-doesnt-mean.html>.]

Ableism doesn't mean you hate disabled people. It doesn't mean you're an evil person. It doesn't even mean you think disabled people aren't capable of anything, although all of those qualifiers can certainly fall under ableism. Ableism is the system of oppression that faces disabled people in our society, a system that marks disabled people as inferior and most importantly, other. It doesn't have to be done with malice to be ableism. It doesn't even have to be done with conscious intent. Ableism is separating society into us and them, sequestering disabled people into this category of not-entirely-human, mythical type people that are: a) so sad and tragic and/or b) sooo inspiring!! Ableism is dictating that there is a right, a "normal" way to be, and disabled people aren't it. Ableism is merely "tolerating" us instead of accepting us for who we are and embracing the differences that make us unique. Ableism is preaching that diversity makes us stronger, and then conveniently leaving disability out of that equation. Ableism is believing that we have a lesser life, that we suffer, because we are disabled. Ableism is "otherizing" us. Ableism is using language that really has been used over generations to attack disabled people, to tell us that we are not normal and as such, we are less than human. And ableism is using that language without any idea what it has done, how many people it's hurt, because society doesn't want us to know how, in a society that's supposed to have conquered discrimination the way we conquered countries, millions and millions of people were systematically threatened, bullied, and slaughtered. Ableism is never speaking about disability history, never even knowing that there is a history, because our history is not considered history. At best, our struggle for rights is largely viewed as a cute little adolescent rebellion, complete with whining protests and stomping of feet. At worst, it is completely wiped from the collective consciousness, because the world doesn't want to see us, hear us, acknowledge our existence beyond using us, our stories, as a tool to make the privileged feel better about themselves. Ableism is using us as scare tactics, as examples of what you don't want to be. Ableism is assuming that our lives are inherently less worth living than yours. Ableism is having only one definition of disability, and only viewing a disabled person as one way. Ableism is calling the rest of us fakers and benefit scroungers, because we don't fit your definition of disability. Ableism is cutting the services that we need to survive. Ableism is putting disabled people in a box, a box that is never opened and has very clear edges. Ableism is never recognizing that you or someone you know may be disabled, because they have a productive life. Ableism is thinking that it is okay, even commendable, for disabled people to want to die, because our lives are not worth living. Ableism is killing us before we have the chance to live, all because of a pre-conceived notion of what our lives will be like. Ableism is warping the public notion of an entire group of people as "so smiley and happy all the time!" Ableism is reducing us to a caricature of human beings, painting us all as one shade of a color, when in fact we are as diverse as any other group of people. Ableism is dividing a diverse community into "high functioning" and "low functioning" and deciding that only those who fit your idea of "high functioning" can possibly have anything to say. Ableism is defining disability as solely an unfortunate happening, and not recognizing the social and cultural factors that oppress us. Ableism is denying that you have privilege, that you can feel safe, because you are nondisabled. Ableism is a world that is centered on the nondisabled, instead of being welcoming for everyone. And truth be told? Ableism is claiming that there is no ableism. You don't have to know that ableism exists to be an ableist. Nor does being an ableist mean that you are a horrible, soulless person. Being an ableist just means that you have privilege you need to acknowledge, and patterns of thought that you need to change. So what should you do if someone calls you out on your ableism? Take a step back. Reflect on your privilege and what you said or did. Recognize why someone may take offense at that. If you don't understand why it's ableist, don't start pointing fingers at the other person, claiming that they are oversensitive. Ask politely, and think on their answer. Apologize, and

<u>learn a lesson</u>. You are not evil because you are an ableist. You are simply an ableist. So take the opportunity to learn about your own privilege. Hopefully, you'll come away knowing more than you did before.

A2 Just Words

Recognizing and stopping use of ableist language is only the first step in addressing the larger problem it symptomizes – they need to accept critiques through the lens of disability

FWD 10 [Anna, writer for the now defunct Feminists with Disabilities;"Why Talking About Language Isn't Enough"; FREEDOM: Feminists with Disabilities; 05/25/2010; accessed 07/27/2015; <http://disabledfeminists.com/2010/05/25/awp-why-writing-about-language-isnt-enough/>.] Also explains why indicts of blogs are bad in the case of disability studies

In social justice blogging circles, especially feminist-focused ones, <u>it's not unusual to have conversations about language, and why language matters</u>. Those conversations can vary from explaining why it's problematic to call women & girls "females", why using "he" and "mankind" to be a generic non-gendered term is sexist, reclaiming – or not – of words like "bitch", and what it means to refer to "undocumented immigrants" rather than "illegals". These conversations often focus on how sexist or racist language is a symptom of a problem that needs to be addressed. <u>We can talk about how calling women bitches is a sign of sexism, or referring to people as "illegals" is dehumanizing to immigrants</u>. And <u>yet</u>, when trying to have <u>discussions about ableist language</u>, we're back to the silo of disability. Instead of talking about ableist language <u>as part of the manifestation of the disdain and abuse of people with disabilities, it's treated as isolated – the problem, instead of a symptom of the problem. Ableism is not simply a language problem</u>. Ableism manifests in the social justice blogosphere in so many different ways. They can vary from just not thinking about disability at all when writing about social justice issues to <u>shrugging off critiques from disability-focus</u>ed bloggers <u>as being "too sensitive".</u> It can be <u>ignoring posts about disability-focused issues or only linking to non-disabled people writing about disability-issues instead of to disabled</u> bloggers. It can be as apparent as declining to acknowledge disability exists to as "subtle" (to some) as declining to make your blog template accessible to screen readers. <u>There are also choices</u> that social justice bloggers make <u>about how we educate ourselves, and whose voices we highlight, who we approach about their writing, and who we ask to be mediators</u>. <u>If we're not reading disability-focus</u>ed blogs, then <u>we're not learning about disability-focus</u>ed issues – and, in turn, <u>we're not highlighting those voices, bringing attention to those issues, or thinking about that analysis</u> when writing our own posts. Thirdly, <u>ableism manifests in whose voices we trust</u>. For all that I'm very happy to provide people with book lists, I'm a bit suspicious of people who decline lists of disability-focused bloggers they could be reading as well. <u>Why does someone's voice have to go through the publishing-sphere (and usually through academia</u> for the books you're going to get from me) **before it counts as worth-reading?** I get why people talk about language, and I agree that <u>language is important. But I'm not giving cookies out for publicly declaring</u> your ally-status by saying <u>you won't (or will try not to) use ableist language anymore. That's a great first step. Now move on.</u>

Use of metaphor is a commitment to a speech act – based in universal presupposition of experience

Schalk 13 [Sami Schalk, assistant professor at Albany Arts, PhD in Gender Studies at Indiana University, research focuses on the representation of disability in contemporary African American literature; "Metaphorically Speaking: Ableist Metaphors in Feminist Writing"; Disability Studies Quarterly Vol 33 No 4; 2013; accessed 07/28/2015; <http://dsq-sds.org/article/view/3874/3410>.] Explains why they can't kick their reps/language

Much <u>contemporary scholarship on metaphor</u> is based upon the work of George Lakoff and his colleagues, most notably a book that he co-authored with Mark Johnson in 1980: Metaphors We Live By. In this text, Lakoff and Johnson <u>establish cognitive metaphor theory which argues that metaphors are not merely creative or literary devices, but rather are **essential speech acts**</u>. 3 They contend that <u>the way in which we understand and use metaphor is informed by our **(presumed to be universal) experiences of embodiment**</u> as <u>evidenced by</u> the preponderance of <u>concrete bodily and experience-based conceptual metaphors</u>. 4 Though I do not accept these philosophical assumptions nor the conclusions that Lakoff and Johnson derive from them, I use some of their analytical terminology in my argument below. That is, I use Lakoff

and Johnson's term source domain (also referred to as the vehicle) in order to refer to the main concrete concept—namely, disability—that is used to explain another, usually abstract, idea. As Elena Semino explains it, typically, under Lakoff and Johnson's cognitive metaphor theory, source domains are (what they regard as) "concrete, simple, familiar, physical and well-delineated experiences, such as motions, bodily phenomena, physical objects and so on" (Semino 2008, 6). Alternatively, I use their term target domain to refer to the abstract concept (in this case, the bad, deficient, or painful effect of patriarchy) that is assumed to be represented through the invocation of the source domain (disability). I should point out that the metaphors I discuss in this context do not fit within the category of conventional or dead metaphors, which have become "lexicalized" or officially incorporated into dictionary meanings. Rather, the two metaphors I examine (hooks's "emotional cripples" and Modleski's "mute body") should be considered as novel metaphors, to use Semino's term: ones which are "likely to be conscious and deliberate on the part of its user, and recognized and/or processed as such by its receivers" (19). In the terms of scholarship on metaphor in language, they could also be referred to as creative metaphors: "those which a writer/speaker constructs to express a particular idea or feeling in a particular context, and which a reader/hearer needs to deconstruct or 'unpack' in order to understand what is meant. They are typically new…although they may be based on pre-existing ideas or images" (Knowles and Moon 2006, 5). Though the terms novel metaphors and creative metaphors signify similar figures of speech, for the sake of parsimony, in this argument, I refer only to the term creative metaphors.

A2 Not Accountable

Indirectly ableist language doesn't take responsibility for itself – removed from its origin yet retaining its negative connotations, we must commit to an alternative understanding of disability metaphor

Schalk 13 [Sami Schalk, assistant professor at Albany Arts, PhD in Gender Studies at Indiana University, research focuses on the representation of disability in contemporary African American literature; "Metaphorically Speaking: Ableist Metaphors in Feminist Writing"; Disability Studies Quarterly Vol 33 No 4; 2013; accessed 07/28/2015; <http://dsq-sds.org/article/view/3874/3410>.] Explains why they can't kick their reps/language

I've had the craziest day. The snowstorm completely paralyzed the city. That's such a lame excuse. What are you blind? What are you deaf? Idiot! Moron! Retard! Disability too has become part of everyday language, and not positively so. In order to demonstrate this negative state of affairs, disability activists and rhetoricians have drawn lessons from feminist philosophy/theory of language scholarship, utilizing some of the same language-reform techniques in response to overt ableism that feminists have employed to resist overt sexism, including the introduction of alternative terms and phrases (such as the replacement of handicap with disability and the use of person-first language 6) and the revaluation of pejorative words (for example, the reclaiming of the terms crip and gimp). Although Mills (2008, 73), for instance, is concerned to make connections between overt sexism and overt racism, homophobia, and ableism, I am concerned to show the connections between indirect sexism and indirect ableism in language-use, in addition to the overt connections that can made between these axes of power. Indeed, by interrogating metaphors of disability and their underlying presuppositions about bodies, disability theorists can challenge indirect ableism in feminist writing just as third-wave feminists have challenged indirect sexism in mainstream (and alternative) popular culture, academia, the mainstream media, and public policy. Disability rhetoricians have brought attention to the fact that "when Americans think, talk, and write disability, they usually consider it as a tragedy, illness, or defect that an individual body 'has,'... as personal and accidental, before or without sociopolitical significance" (Wilson and Lewiecki-Wilson 2001, 2). In other words, when disability is used in figurative and metaphorical ways, it is primarily understood in terms of inability, loss, lack, problems, and other forms of negation (Titchkosky 2007, 8). Although, unlike gender, disability is not centrally implicated in the basic grammatical system, the use of disability as a metaphorical construct is nonetheless prevalent and implicit in our language. Just as a word such as seminal has lost its original etymological connection (in this case, to male ejaculation) in our contemporary connotations, so too many words that refer to disability have transitioned from medical discourse into common speech and slang and have lost their linguistic connection to the original referent. In this regard, Jay Dolmage (2005, 113) gives as examples the words crippled, retarded, and handicapped, to which I would add idiot (once a medical category of cognitive disability), dumb (once used to refer to lack of oral speech communication, as in the phrase "deaf and dumb"), lame, crazy, and insane. Though most of these disparaging words are no longer generally recognized as connected to, or associated with, specific impairments, they have nevertheless retained connotations of insult, inability, and lack due to more widespread negative conceptions of disability. This, then, is indirect ableism. Vidali, May and Ferri, and Dolmage are among the disability studies scholars who have explored disability metaphors, that is, the way that metaphors of disability are used as a source domain that confers negativity upon things not themselves directly associated with disability due to the retention of broader negative cultural connotations of disability itself. As I indicate above, the work of these scholars has tended to deal primarily with conventional, rather than creative, metaphors by citing a variety of brief examples, rather than considering the role that these metaphors play within the wider context of the original text's argument. By analyzing the creative disability metaphors of "emotional cripples" and "the mute body" in the feminist texts of hooks and Modleski, I expand on the work of these scholars, modeling a process of transgressive reading that reveals how extended disability metaphors impact the overall argument of the texts. Knowles and Moon (2006, 12) note that metaphors allow an open-endedness that is less precise than literal language, which gives metaphor its creative, emotional, and intellectual potential. A transgressive reading of disability metaphors mines these creative, emotional, and intellectual potentialities with a "commitment to retelling the stories of disability in such a way that resists the illusion that disability is a limit without possibility" (Titchkosky 2007, 131).

A2 Oversensitive

Dismissal of disability studies as oversensitive or a fad reifies the idea that disability is worthless, flawed, and inferior – yet ableism is used to promote insidious discrimination against people with impairments

Siebers 10 [Tobin Siebers, Department of English Language and Literature at the University of Michigan; "The Aesthetics of Human Disqualification"; University of Michigan Press; 10/28/2010; accessed 07/31/2015; <http://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=1&ved=0CCoQFjAA&url=http%3A%2F%2Fdisabilities.temple.edu%2Fmedia%2Fds%2Flecture20091028siebersAesthetics_FULL.doc&ei=LWz4T6jyN8bHqAHLkY2LCQ&usg=AFQjCNGdkDuSJkRXMHgbXqvuyyeDpldVcQ&sig2=UCGDC4tHbeh2j7-Yce9lsA>.]

Many beholders choose to reject disability, but what would the other choice involve? "If the Venus de Milo had arms," Quinn observes, "it would most probably be a very boring statue" (4). Quinn's work trades in the bewildering idea that the same properties that strengthen works of art disqualify the actual people who possess them—the same bewildering idea on which modern art establishes itself. Modern art discovers in the eye drawn to the difference of disabiliity one of its defining aesthetic principles. The interviews included in the catalogue of The Complete Marbles insist again and again on this idea. Quinn repeatedly asks the subjects of his sculptures what they think about fragmentary classical statuary, whether it is beautiful and, if yes, whether their bodies are therefore beautiful as well. Lapper poses the same question: "Why shouldn't my body be considered art?" (Freeman). The crucial point here is to recognize that Lapper's body, once turned into an aesthetic representation, has a better chance of being accepted as art than a nondisabled body, despite the fact that disabled bodies, outside of aesthetic contexts, are still dismissed as repulsive and ugly. Disability is not merely unwanted content, political or otherwise, introduced into art but a mode of appearance that grows increasingly identifiable over time as the aesthetic itself. In February 1998 New York Press published an essay by Norah Vincent that attacks the emerging discipline of disability studies as "yet another academic fad" (40). Nevertheless, disability studies apparently fails as a discipline not because it is too chic but because it attracts incompetent, weak, and dishonest people. Camille Paglia calls disability studies "the last refuge for pc scoundrels" (40), but if we believe Vincent, disability studies is also a refuge for ordinary scoundrels, not to mention scholars and students of poor quality. Disability studies supposedly attracts people of questionable moral character— "academic careerists" and "ambulance-chasing publishers" who want to profit from the newest fad—as well as mediocre and flawed minds—the "victim-obsessed," the "second-rate," and the psychologically dependent (40). Vincent seems especially keen to discredit disability studies by associating it with intellectually inferior and psychologically damaged scholars, and when she interviews various leading lights in the field, she is more intent on exposing their psychological weak spots than on capturing what is original about their contribution to disability studies. Lennard Davis, Vincent tells us, melts into "self-righteous goodspeak" at the mere mention of disability, while Michael Bérubé speaks in a voice that is "silky and kind" when he argues that disability is an idea necessary to understand human rights (40). Disability studies deserves no place in the university, it seems, and no self-respecting scholar should have anything to do with it. If there is any doubt that Vincent wants to disqualify disabled people as physically defective, morally degenerate, or psychologically damaged, the cartoon accompanying the essay should make her purpose obvious. The cartoon, drawn by Gary Leib, pictures a man in a wheelchair being pushed by a woman in a nurse's uniform (fig. 16). Leib overlays the drawing with a variety of disqualifying aesthetic markers: some associate the disabled with physical ugliness and lack of intelligence, while others attempt to promote the idea, despite all evidence to the contrary, that the disabled enjoy a privileged, exclusive, and wealthy life style. For example, as beads of sweat run down his face, the disabled man in the wheelchair grips a cigarette holder in his mangled teeth and toasts his public with a martini. Behind him and pushing the wheelchair is his nurse attendant. Her eyes are vapid, and her breasts are bursting out of her tight-fitting uniform. Most hateful, however, is the fact that Leib draws the cartoon in a way that re-envisions people with disabilities as Nazi soldiers. The disabled man in the wheelchair wears a monocle, summoning the image of an SS officer. The message of the cartoon is shocking and direct in its attack on disabled people; it manages to represent the disabled as poor, inferior, and undeserving creatures who have managed somehow to attain a position of wealth and power superior to other people. The cartoon asks its beholders to believe that the disabled as a group belong to the privileged few, to a dominant class, and to an infamous story of genocide and military expansionism, deserving comparison with the Nazis, some of the greatest criminals in human history.

A2 Perm Do Both

The permutation's ableism casts disability as non-human, and fails to account for the societal oppression that comes with disability before rushing to a political solution

Campbell 9 [Dr Fiona Kumari Campbell, long time Covener of Disability Studies, boardmember of the International Advisory Board of the Socio-Legal Review, Italian Journal of Disability Studies, Journal of Literary and Cultural Disability Studies, and Ethnographica: Journal of Disability and Culture; "Disability Advocacy & Ableism:Towards a re-discovery of the disability Imagination" pg 1-4; Keynote Address @ 2nd Strengthening Advocacy Conference; 11/17-18/2009; accessed 07/31/2015;<http://griffith.academia.edu/FionaKumariCampbell/Papers/118483/Disability_Advocacy_and_Ableism_Towards_a_re-discovery_of_the_disability_Imagination>.]

Working models (often called conceptual frameworks) are very important as they help us work out which questions to ask, help us interpret and process things and events. We all have conceptual frameworks that shape our beliefs as to why thing happen – even if we do not use that language. In a keynote speech I made at a DPI conference in Adelaide 1984 I said it was important for disabled people to understand the nature of social change "so that we will not be fooled by any token one off gestures or initiatives handed out by government and disability agencies" (1984, 91). I still hold to that idea and add that we always need to test new ideas by asking "what is this proposal or idea saying about disability, does it assume that disability is terrible, or that diversity and difference are terrible or is the idea on about celebrating and bringing out difference"? **From the perspective of political activism, the necessity to have a theory of disability before deciding strategies** of political action was well understood as early as 1975 by the Union of Physically Impaired Against Segregation UPAIS in the UK whose minutes of a debate between 2 advocacy groups produced a document called The Fundamental Principles of Disability. They decided that disability should not be understood medically as a broken down body, mind or heart, rather society and the way that it is organized had something to do with us becoming disabled …. Disability is something imposed on top of our impairments by the way we are unnecessarily isolated and excluded from full participation in society. … To understand this it is necessary to grasp the distinction between the physical impairment and the social situation, called "disability", of people with such impairment. Thus we define … disability as the disadvantage or restriction of activity caused by a contemporary social organization which takes no or little account of people who have physical impairments and thus excludes them from participation in the mainstream of social activities. …**Disability is therefore a particular form of social oppression**.(UPAIS, quoted in Oliver 1995: 16 – 17).I have not so much rejected this model as extended it through my work in Studies in Ableism and adoption of a model out of Europe called the Relational model of Disability. First to the relational model… the French concept of disability ('situation de handicap ') defines… disability as a confrontation between the ability of a person and situations she encounters in life" 'macro-situations', such as work or schooling, or 'micro-situations' such as cutting meat or using the keyboard of a computer. The disabling situations are not only structural and material, they are also(especially) cultural (Hamonet, 2006, 1, cited in Campbell,2009). The model moves beyond abilities and limitations and embraces our sense of Self acknowledging our own perception of difference in our bodies, thinking or emotions. This notion of disability as a relational concept says that disability is made through our faulty interaction with differences in mentalities and bodies. The choice of language is no accident – what we have in that description is a process ripe with tension, a pushing through of impairment in its encounter with the environment. The environment includes the spiritual & emotional life of the disabled person as we try to negotiate our sense of self in a world that is uncomfortable and negative about disability. It is hard to be positive about oneself (and disabled people as a group) when disability is seen as a form of harm or is harmful! This understanding is similar to the framework contained in the Convention on the Rights of Persons with Disabilities. The Preamble[Opening section] of the Convention describes: disability [a]s an evolving concept and that disability results from the interaction between persons with impairments and attitudinal and environmental barriers that hinders their full and effective participation in society on an equal basis with others (emphasis added).Whilst many of the barriers to inclusion are external to the disabled person (laws, resources, environmental and educational barriers) –barriers also exist that are internal to the person (self-image, internalization of negative views of disability, learned helplessness, and the legacies of institutionalisation).Now to a definition of ableism, by ableism I refer to... a network of beliefs, processes and practices that produces a particular kind of self and body (the …[bodily] standard) that is projected as the perfect, species-typical and therefore essential and fully human. Disability then, is cast as a diminished state of being human (Campbell, 2001: 44).Ableism tells us what a healthy body

means – a normal mind, how quickly we should think and the kinds of emotions that are okay to express. Of course these characteristics then are put out as an ideal. These beliefs do not take account of differences in the ways we express our emotions, use our thinking and bodies in different cultures and in different situations. There is pressure in modern societies for us to show we are always productive (doing sometime useful) and contributing. Ableist belief values certain things as useful and particular kinds of contributions. Disabled people are often seen as a burden, a problem, a drain of the system, making no contribution – or a Hitler said 'useless eaters'. According to our understanding of Ableism, 'disability' refers to people who do not make the grade, are unfit in someway – and therefore are not properly human. Central to a system of ableism are two elements, namely the notion of the normative (and normal individual) and the enforcement of a divide between perfect humanity (how humans are supposedly meant to be) and the aberrant, the unthinkable, and therefore not really-human. Studies in Ableism instead of looking directly at disability focuses more on how the able, ablebodied, non-disabled identity is maintained – we look at elements of what it is to be normal. According to ableism, while in a democracy we should treat (most)disabled people fairly through a belief in toleration. this does NOT mean that we think disability is okay – that disability is an acceptable form of diversity, that disability can be celebrated. • [All] Disability (irrespective of type & degree) is assumed to be unacceptable and negative. Disability is harmful and a form of harm. In my work I refer to this view as disability being provisional and tentative – it is always subject to being erased if a solution comes along (cure, correction, elimination). Disabled people have not yet established their entitlement to fully exist as disabled people as part of human diversity. There are many people in the disability services field and working in universities who if pushed hold this view. It is assumed that disability always equals suffering. If disabled people suffer, people think it is always because of the impairment and not others issues like lack of support and belongingness. So it is not surprising that we get mixed messages about disability – "be kind and nice to the disabled!" … "but there is no real right to exist, and how dare you be happy because of your disability and not in spite of it" …. [Paragraph ends with ellipses]

A2 Policy Affs About Disability

Disability movements, no matter where they start from, become coopted into legalistic solutions which only reify surveillance and victimhood

Anders 13 [Abram Anders, Assistant Professor of Business Communication, English PhD @ Penn State; "Foucault and "the Right to Life": From Technologies of Normalization to Societies of Control"; Disability Studies Quarterly; Vol 33 No 2; 2013; accessed 07/29/2015; <http://dsq-sds.org/article/view/3340/3268>.]

For another example, <u>political efforts to address racism culminate in</u> affirmative action legislation, which in turn becomes a mean of <u>regulating ethnic identities through institutional and legal procedures</u>. <u>This effectively shifts debates and conflicts over racism from a political issue to one addressed in the educational system</u> and through workplace litigation. At the same time, <u>conservatives characterize such programs as reverse discrimination that unfairly provides "rewards" based on characteristics</u> (i.e. race) <u>which the government should disregard</u>. Brown describes a two-stage process whereby <u>political claims against social inequalities are depoliticized and privatized through disciplinary administration and the logic of formal justice</u>. This pattern holds equally true for the disability movement. Though <u>intended to politically contest social inequalities pertaining both to the allocation of resources and the self determination of the disabled, measures such as the ADA ultimately depoliticize and privatize these claims</u> by reinserting them into the purview of judicial institutions: "It converts social problems into matters of individualized, dehistoricized injury and entitlement, into matters in which there is no harm if there is no agent and not tangibly violated subject" (Brown 124). Furthermore, such measures <u>not only neutralize political claims as private interest, but through bureaucratic codification reify the subject categories that are meant to protect</u> and serve as a means of further disciplinary regulation. In consideration of the latter claim, it is important to recognize the way in forms of disciplinary discourses imply and reinforce one another. Historically, this has been particularly true of the relationship between medical and judicial discourse. In his lecture series on this very topic, <u>Foucault reiterates the fundamental thesis of much of his work, that power is productive, that it "multiplies itself on the basis of its own effects" and operates primarily through the "formation of knowledge"</u> (Abnormal 48). Disability scholars have pointed out that a <u>primary aspect of court decisions pertaining to disability has been the reliance on medical knowledge</u>. As Hahn points out, "courts have viewed medical evidence of a functional impairment as an essential pre-condition for legal findings about disability" (185). <u>Even legislation designed specifically to aid and accommodate the disabled is often administered in ways that undermine its positive impact</u>. For example, in her critique of the <u>questionnaire that determines eligibility for the Disability Living Allowance</u> (DLA), Shildrick characterizes the way in which <u>state administered aid becomes an opportunity for **oppressive surveillance**</u>: "<u>No area of bodily functioning **escapes the requirement of total visibility, and further the ever more detailed subdivision of bodily behavior into a set of discontinuous functions speaks to a fetishistic fragmentation**</u> of the embodied person" (qtd. in Hughes 69). In this way, <u>disabled people are made subject to the invasive examinations, surveillance, and objectification that are the hallmark and most obviously oppressive aspect of technologies of normalization</u>. Fiona Campbell argues that, more insidiously, legal proceedings depend on an "inherently negative" conception of disability that frames all disabled people as abject victims of a "personal tragedy" (109). Following Wendy Brown, Campbell argues <u>legal proceedings reify and codify the interrelation of disability, dependency, and victimhood</u>. Most profoundly, <u>they require "disabled people to trade in trade in, negotiate, and maintain" an identity of "social injury"</u> (115). Rights discourse unavoidably appeals to legal processes and procedures that subjugate disabled people in the dual sense already cited from Foucault: they are made "subject to … control and dependence, and tied to … identity by a conscience or self-knowledge" ("The Subject and Power" 130). A primary goal of disability activism is to contest the traditional view of disability as a private problem that should be fixed by adapting disabled bodies to a normalized society. It is thus ironic and tragic that the discourse of rights through which such claims have been advanced is, when viewed in light of Brown's analysis, a further mechanism of depoliticizing difference as private; appeals to rights and their codification may actually deepen the social injuries they to address. However, as I will argue further, <u>it is important to recognize that these injuries are not simply injuries of exclusion</u>. Though in one sense political claims for a "right to life" are rejected by disciplinary justice, in another sense these <u>claims for a "right to life" are channeled, redirected, and quarantined within the productive apparatus of juridical</u>

and medical institutions. A collective, political protest is referred and deferred to the site of the individual's confrontation with technologies of normalization.

Ableism = Prior Question

The question of (dis)ability must be at the forefront of debate over what is dehumanizing and what makes life worth living – it shapes our perceptions

Taylor 13 [Ashley Taylor, PhD in Cultural Foundations of Education @ Syracuse, specialization in Disability Studies; ""Lives Worth Living:" Theorizing Moral Status and Expressions of Human Life"; Disability Studies Quarterly Vol 33 No 4; 2013; accessed 07/30/2015; <http://dsq-sds.org/article/view/3875/3404>.] read this card against k affs

Despite the increasing social visibility of people labelled with intellectual disabilities 1 and the gains made to include them in all of the major institutions of society, popular rhetoric and political discourses continue to call into question the worth of a life lived with intellectual disability. Over the last decade, policy-makers, popular media, and diverse advocacy groups have publicly debated about the rights to bodily integrity, the reproductive capacities and self-determination of people with intellectual disabilities, their access to adequate education, and their right to community-based living (rather than confinement in institutions). In contemporary moral, political, and bioethical philosophy, there has been growing discussion of the relationship between individual humans and their moral status, raising questions that bear significantly on the lives of people with intellectual disabilities: To whom shall the rights and duties of political or civic membership be accorded? Who qualifies as a person in considerations of ethical treatment and care? Who, or what, is a subject of justice and to whom is justice owed? At the center of these inquiries is the question of the social, moral, and political place of individuals with intellectual disabilities and, in particular, the extent to which individuals so labelled or defined can be said to have moral personhood. Such efforts to clarify the moral status of individuals with intellectual disabilities have, for the most part, been intended to produce more just and equitable social arrangements and ensure individual welfare, though, at times, they respond to concerns over scarce resources. As public debates continue over what counts as a life worth living, a life of human dignity, and even what constitutes life itself, disability studies scholars—especially those working at the intersections of gender, race, sexuality, and disability—have linked this preoccupation with definitions of human life and lives worth living to the **prevailing social regard of the disabled body as questionably human**, as aberrant, abhorrent, as an unfortunate existence (for instance, Garland Thomson 1997; Garland-Thomson 2006; Johnson 2003; Linton 1998; Schweik 2009; Siebers 2009). In her description of the disabled body as the representation of "contradiction, ambiguity, and partiality incarnate," Garland-Thomson considers what she calls "the will to normalize" as the prevailing will to expunge human differences, to ignore the messiness and non-uniformity of nature, and to control, shape, and regulate bodies (Garland-Thomson 2006, 262). This well-documented new eugenics of the contemporary world consists in what disability scholars have called the "ideology of ability" (Siebers, 2009), "compulsory able-bodiedness" (McRuer, 2006), or simply "ableism:" the persistent perception—both conscious and unconscious—that disability precludes human well-being and agency and is the quintessential representation of the precariousness of the human condition (Siebers 2009, 5; see also Bogdan and Biklen 1977). Feminist disability theorists and feminist philosophers of disability argue that prevailing ideas about which lives are worth living have real and sometimes deadly material consequences, insofar as they inform policies on genetic testing, euthanasia, selective abortion, and rights to bodily integrity, as well as political attitudes towards war and its material repercussions, including loss of life, physical, mental, and emotional disablement, extreme poverty, and more (See Asch 1999; Erevelles 2011; Tremain 2006; Garland-Thomson 2006; Johnson 2003; Lamp and Cleigh 2011; Shapiro 1993). The theoretical basis of these arguments is especially apparent in the wealth of literature that analyzes disability from a Foucauldian perspective, showing that the social and political forces that individualize and categorize people according to particular social norms effectively produce subjects as particular kinds of people, kinds which are taken to be natural and have pre-discursive existence (see Allen 2005; Tremain, 2002, 2005; Carlson, 2010). Furthermore, feminist philosophers of disability and other philosophers of disability have waded into these debates in order to comment on the gendered and racialized assumptions of rationality, independence, and normalcy that uphold dominant philosophical views of personhood (see Carlson 2010; Kittay 2002, 2010; Wong 2010; Stubblefield 2007, 2010). For example, Kittay (2002) describes how liberal definitions of personhood rely on beliefs about normal human ability that are grounded in masculinist ideas about the capacities—

including the capacities for rationality and self-sufficiency—and behavior of the white independent adult male (see also Lanoix 2007). To take another example, Stubblefield (2007, 2010) traces the construction of the contemporary Western understanding of "intellect" to historical intersections between gender and race ideology and the label of mental retardation, arguing that the concept of cognitive disability cannot be abstracted from the social and political forces that shape the meaning of intellect. In addition to exposing the ways that deep-seated cultural biases and prejudices against disability steer these public and academic debates, many of the aforementioned authors issue a call to philosophers, bioethicists, and feminist philosophers and theorists to recognize how their own approaches to these fundamental ethical questions can themselves reproduce wrongful and harmful views of disability and the humanity of disabled lives. I propose that in order to attend to these important insights and philosophical claims about disability and human life and the dehumanizing discourse that surrounds people with intellectual disabilities in particular, we should consider a **prior question** in regard to normative theories about the moral status and humanity of people with intellectual disabilities, noting the question's significant import and impact on policy and law: Do these philosophical questions about human life and moral status, politically and practically necessary though they may be, also function to obscure or distort emerging and alternative conceptions of competency, intellect, human behavior, ability, and well-being? Indeed, I maintain that philosophy in general and feminist philosophy in particular **would benefit from asking this question in advance of other questions about human life and moral status**. To understand the deep discomfort that people with disabilities, 2 parents of children with disabilities, 3 as well as advocates and theorists of disability have about normative theories of moral status, we should reframe the question of moral personhood to address the social conditions under which the qualifying conditions for moral status and human belonging arise, in addition to asking what the qualifying conditions for moral status or human belonging are. Kim Q. Hall (2011) has suggested that the question of a life worth living is not foremost "a question about whether disability impoverishes or enhances quality of life. Rather the question is, following [Judith] Butler, what makes possible a life that can be lived" (6). In her recent work, Butler has explored what she calls "normative violence" and its relationship to social recognition and physical violence (Butler 2004, 2005, 2009). As Butler explains it, normative violence makes one intelligible through cultural and social norms of gender, race, sexuality, ability, and so on in ways that render one vulnerable to erasure and exclusion from social, political, and cultural recognition and potentially exposed to physical harm. I aim to consider how the above philosophical debates about human life and moral personhood perform a normative violence of their own. Where these approaches measure political recognition and moral status in terms of individuals' intelligibility through norms, they involve a potentially violent exclusion of possible alternative ways of expressing human life, capability, and well-being. For Butler, social justice requires not the delineation of what counts as human in the service of politics, but rather the creation of the conditions under which moral and political recognition is always fluid and what counts as human is always subject to social contestation. I will argue that Butler's view of normative violence offers us a way to consider how the identification of moral status, though possibly unavoidable within the scope of political theorizing, is ultimately a precarious method for creating the conditions of social justice.

Alt=Aesthetics

Disqualification on the basis of perceived disability is the root of sexism, racism, and classism – only learning about the aesthetic discrimination against non-normative bodies solves widespread oppression

Of course, when bodies produce feelings of pleasure or pain, they also invite judgments about whether they should be accepted or rejected in the human community. People thought to experience more pleasure or pain than others or to produce unusual levels of pleasure and pain in other bodies are among the bodies most discriminated against, actively excluded, and violated on the current scene, be they disabled, sexed, gendered, or racialized bodies. Disabled people, but also sex workers, gay, lesbian, bisexual, and transgendered people, and people of color, are tortured and killed because of beliefs about their relationship to pain and pleasure (Siebers 2009). This is why aesthetic disqualification is not merely a matter for art critics or museum directors but a political process of concern to us all. An understanding of aesthetics is crucial because it reveals the operative principles of disqualification used in minority oppression. Oppression is the systematic victimization of one group by another. It is a form of intergroup violence. That oppression involves "groups," and not "individuals," means that it concerns identities, and this means, furthermore, that oppression always focuses on how the body appears, both on how it appears as a public and physical presence and on its specific and various appearances. Oppression is justified most often by the attribution of natural inferiority—what some call "in-built" or "biological" inferiority. Natural inferiority is always somatic, focusing on the mental and physical features of the group, and it figures as disability. The prototype of biological inferiority is disability. The representation of inferiority always comes back to the appearance of the body and the way the body makes other bodies feel. This is why the study of oppression requires an understanding of aesthetics—not only because oppression uses aesthetic judgments for its violence but also because the signposts of how oppression works are visible in the history of art, where aesthetic judgments about the creation and appreciation of bodies are openly discussed. One additional thought must be noted before I treat some analytic examples from the historical record. First, despite my statement that disability now serves as the master trope of human disqualification, it is not a matter of reducing other minority identities to disability identity. Rather, it is a matter of understanding the work done by disability in oppressive systems. In disability oppression, the physical and mental properties of the body are socially constructed as disqualifying defects, but this specific type of social construction happens to be integral at the present moment to the symbolic requirements of oppression in general. In every oppressive system of our day, I want to claim, the oppressed identity is represented in some way as disabled, and although it is hard to understand, the same process obtains when disability is the oppressed identity. "Racism" disqualifies on the basis of race, providing justification for the inferiority of certain skin colors, bloodlines, and physical features. "Sexism" disqualifies on the basis of sex/gender as a direct representation of mental and physical inferiority. "Classism" disqualifies on the basis of family lineage and socioeconomic power as proof of inferior genealogical status. "Ableism" disqualifies on the basis of mental and physical differences, first selecting and then stigmatizing them as disabilities. The oppressive system occults in each case the fact that the disqualified identity is socially constructed, a mere convention, representing signs of incompetence, weakness, or inferiority as undeniable facts of nature. As racism, sexism, and classism fall away slowly as justifications for human inferiority—and the critiques of these prejudices prove powerful examples of how to fight oppression—the prejudice against disability remains in full force, providing seemingly credible reasons for the belief in human inferiority and the oppressive systems built upon it.

This usage will continue, I expect, until we reach a historical moment when we know as much about the social construction of disability as we now know about the social construction of race, class, gender, and sexuality. Disability represents at this moment in time the final frontier of justifiable human inferiority.

Alt=Imagination

note: it's not necessary to win, or even read, an alt – or the alt can simply be to refuse ableist language, and have the judge vote on discourse.

The alternative is an imagination centering around disability – it rehumanizes but does not assimilate, and makes room for alternate perceptions of the world

Campbell 9 [Dr Fiona Kumari Campbell, long time Covener of Disability Studies, boardmember of the International Advisory Board of the Socio-Legal Review, Italian Journal of Disability Studies, Journal of Literary and Cultural Disability Studies, and Ethnographica: Journal of Disability and Culture; "Disability Advocacy & Ableism:Towards a re-discovery of the disability Imagination" pg 5-6; Keynote Address @ 2nd Strengthening Advocacy Conference; 11/17-18/2009; accessed 07/31/2015;<http://griffith.academia.edu/FionaKumariCampbell/Papers/118483/Disability_Advocacy_and_Ableism_Towards_a_re-discovery_of_the_disability_Imagination>.]

I am mindful of the time, so want to move onto my final topic, that of imagination – creating a positive imagination about disability, developing a Crip Horizon. Since 1981, the International Year of Disabled Persons, legal & policy discourses of disability have gravitated towards an equality as sameness model declaring that disabled people should be integrated into mainstream society and be able to claim the entitlements of citizenship. What has become clear is that the project of inclusion has become conditional. The working model of inclusion is really only successful to the extent that people with disabilities are able to 'opt in', or be assimilated (normalized). A drive towards self-independence may mean that it is not possible for some disabled people to be truly 'free' within the confines of liberal society. These people may lose person status because they fail to meet certain criterion. The conditions of disability acceptability are about the capacity of disabled people to mimic abledness, be seen to be productive and accept the reality of the provisionality of their impairment until an obliterating remedy comes along. We might want to imagine how life might be different if instead of trying to change our unacceptability that we instead embrace it – to explore the richness of the disability experience whilst at the same time fighting for the entitlements of citizenship but on a new basis – not sameness but recognition ,recognition of our difference. In the same way that some of our indigenous brothers and sisters have said 'no' to assimilation and 'yes' to self-determination and difference. What would it mean for us to acknowledge and explore our ways of moving differently in the world …. Crippin' the human(putting disability back into human) involves a different gaze (way of viewing & sensing the world) – where sometimes signs and gestures predominate, where there is a different mind style such as Tourette's or autism, or a centring on visuality or tactility. Groundedness to earthiness can be 'different' through echolocation, waist heightness and shadows. I suggest maybe the way we use and live time can be different. Cripped time can be staggered, frenzied, coded, meandering and be the distance between two events. Some of our time is shaped according to another's doing – service time –the segmenting and waiting on assistive agencies. Aside from service time, there is a transient time whereby our cripped selves rub up against biology, environmental barriers and relationality.

Alt="Step Outside Language"

note: it's not necessary to win, or even read, an alt – or the alt can simply be to refuse ableist language, and have the judge vote on discourse.

Ableist rhetoric promotes interpretations which construct understanding of disability – we have a responsibility to step outside this rhetoric to recognize the impacts of ableist speech

Cherney 11 [James L Cherney, former college debater, PhD in Communication and Culture @ Westminster, and undergraduates in Public Speaking, Body Rhetoric, and the Disability Rights Movement; "The Rhetoric of Ableism"; Disability Studies Quarterly, Vol 31 No 3; 2011; accessed 07/31/2015; <http://dsq-sds.org/article/view/1665/1606>.]

Every orientation, perspective, and ideology has its basis somewhere; we are taught to understand the world as we do. In other words, we learn meaning—it does not arise naturally from objects or relationships. In Hall's words, "there is no one, final, absolute meaning—no ultimate signified, only the endlessly sliding chain of signification."6 Earlier, Kenneth Burke argued similarly that "Stimuli do not possess an absolute meaning" and pointed out that "Even a set of signs indicating the likelihood of death by torture has another meaning in the orientation of a comfort-loving skeptic than it would for the ascetic whose world-view promised eternal reward for martyrdom." Burke concludes: "Any given situation derives its character from the entire framework of interpretation by which we judge it."7 From the perspective of ableism as a framework of interpretation, we identify its dimensions by examining the linguistic codes and rhetorical assumptions that govern sense making. As Burke put it, "We discern situational patterns by means of the particular vocabulary of the cultural group into which we are born. Our minds, as linguistic products, are composed of concepts (verbally molded) which select certain relationships as meaningful." In other words, meaning exists primarily as a function of language rather than a natural or necessary consequent of material objects or bodies. Our comprehension of reality itself arises from our perspective, so "different frameworks of interpretation will lead to different conclusions as to what reality is."8 Complicating the simple materiality of things does not necessarily entail rejecting material existence: things can exist as simultaneously material and rhetorical constructs. Material might be experienced "directly" by a body, but what—and how—this material "is" depends on filters that shape perception. Repeated stress on a knee may promote swelling, strain ligaments, and alter the shape of cartilage. Depending on the way it is described, this might be understood as "injury," expected "wear and tear," or "a natural consequence of running long distances." If the condition causes pain, it might be considered "trauma," a "danger signal," or the simple "cost that one pays for extraordinary performance." To say and understand what happened we use "stress," "swelling," "ligaments," and "cartilage" as concepts that we have created to relate to the experience in particular ways. Substitute "stress" with "strenuous activity," "work," "play," or "abuse" and the condition changes yet its materiality remains the same. Exchange "swelling," with "inflammation," "being sore," "recovery mechanisms," or "cushioning," and this alters the proscribed treatments. Replace "ligaments" and "cartilage" with "tissues," "sinews," "flesh," or "well designed structural components" and the anatomy itself becomes something else. The event could not be explained at all if the words were lost or it involved something unnamed. The context in which observers place something and the implications of the words used to make it meaningful rhetorically construct the experience. We say what happened, and if we do not or cannot, then the characteristics of the event remain undefined, unfixed, and mutable. Material may exist independently of our subjective awareness, but what something is, how it should be, and why it matters cannot exist except as a function of language. Whatever the factual (or material, or empirical, or scientific) status of disability, my only concern here is the concept's meaning. Disability is a loaded term, weighted down with tools and supplies sufficient for the task of making difference. Such baggage begs to be unpacked. But the project quickly becomes complicated because the ropes that bind the luggage are largely invisible as common sense. Racism and sexism may have no legitimate place in this "civilized" world, but the precepts governing modern civility continue to allow an ableist orientation. This requires those who would undermine ableist thinking to **step outside of the rhetorical foundations bounded by ableist assumptions in order to recognize ableism as a destructive and dangerous perspective.** In rhetorical terms, the problem is one of studying from within a rhetoric that denies its own rhetoricity.

Alt Solves

Recognizing ableist speech is an act against ableism on the whole – ableism is so ingrained as to not be questioned, yet their language sanctions and reinforces it

Cherney 11 [James L Cherney, former college debater, PhD in Communication and Culture @ Westminster, and undergraduates in Public Speaking, Body Rhetoric, and the Disability Rights Movement; "The Rhetoric of Ableism"; Disability Studies Quarterly, Vol 31 No 3; 2011; accessed 07/31/2015; <http://dsq-sds.org/article/view/1665/1606>.]

Recognizing ableism requires a shift in orientation, a perceptual gestalt framed by the filter of the term "ableism" itself. The same texts that broadcast "Ableism!" to those oriented to perceive it are usually read innocently even when viewed from a liberal, humanitarian, or progressive perspective. Ableism is so pervasive that it is difficult to identify until one begins to interrogate the governing assumptions of well-intentioned society. Within the space allowed by these rhetorical premises, ableism appears natural, necessary, and ultimately moral discrimination required for the normal functioning of civilization. Consider a set of stairs. An ableist culture thinks little of stairs, or even sees them as elegant architectural devices—especially those grand marble masterpieces that elevate buildings of state. But disability rights activists see stairs as a discriminatory apparatus—a "no crips allowed" sign that only those aware of ableism can read—that makes their inevitable presence around government buildings a not-so-subtle statement about who belongs in our most important public spaces. But the device has become so accepted in our culture that the idea of stairs as oppressive technology will strike many as ludicrous. Several years ago when I began to study ableism, a professor—unconvinced of the value of the project—questioned my developing arguments by pointing to a set of steps and exclaiming, "Next you'll be telling me that those stairs discriminate!" He was right. The professor's surprise suggests that commonplace cultural assumptions support themselves because the very arguments available against them seem unwarranted and invalid.

Interrogating stairs was such an outrageous idea that a simple reductio ad absurdum argument depicted the critique of ableism as a fallacy. As an ingrained part of the interpretive frameworks sanctioned by culture, ableism gets reinforced by the everyday practice of interpreting and making sense of the world. Using this idea of what ableism does at the intersection of rhetoric and ideology, I next develop a way of understanding how it operates. I argue that this way of conceiving ableist thinking as rhetorical practice identifies potential approaches for challenging ableism

Root Cause

Their fear of the dangerous, deviant, impaired body justifies human rights abuses, murder, and devalued lives – discrimination against people of color, women, and immigrants has always been through their alignment with disability

Siebers 10 [Tobin Siebers, Department of English Language and Literature at the University of Michigan; "The Aesthetics of Human Disqualification"; University of Michigan Press; 10/28/2010; accessed 07/31/2015; <http://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=1&ved=0CCoQFjAA&url=http%3A%2F%2Fdisabilities.temple.edu%2Fmedia%2Fds%2Flecture20091028siebersAesthetics_FULL.doc&ei=LWz4T6jyN8bHqAHLkY2LCQ&usg=AFQjCNGdkDuSJkRXMHgbXqvuyyeDpldVcQ&sig2=UCGDC4tHbeh2j7-Yce9lsA>.]

Surprisingly little thought and energy have been given to disputing the belief that nonquality human beings do exist. This belief is so robust that it supports the most serious and characteristic injustices of our day. Disqualification at this moment in time justifies discrimination, servitude, imprisonment, involuntary institutionalization, euthanasia, human and civil rights violations, military intervention, compulsory sterilization, police actions, assisted suicide, capital punishment, and murder. It is my contention that disqualification finds support in the way that bodies appear and in their specific appearances—that is, **disqualification is justified through the accusation of mental or physical inferiority** based on aesthetic principles. Disqualification is produced by naturalizing inferiority as the justification for unequal treatment, violence, and oppression. According to Snyder and Mitchell, disability serves in the modern period as "the master trope of human disqualification." They argue that disability represents a marker of otherness that establishes differences between human beings **not as acceptable or valuable variations but as dangerous deviations**. Douglas Baynton provides compelling examples from the modern era, explaining that during the late nineteenth and early twentieth centuries in the United States **disability identity disqualified other identities defined by gender, race, class, and nationality.** Women were deemed inferior because they were said to have mental and physical disabilities. People of color had fewer rights than other persons based on accusations of biological inferiority. Immigrants were excluded from entry into the United States when they were poor, sick, or failed standardized tests, even though the populations already living there were poor, sick, and failed standardized tests. In every case, disability identity served to justify oppression by amplifying ideas about inferiority already attached to other minority identities. Disability is the trope by which the assumed inferiority of these other minority identities achieved expression. The appearance of lesser mental and physical abilities disqualifies people as inferior and justifies their oppression. It is now possible to recognize disability as a trope used to posit the inferiority of certain minority populations, but it remains extremely difficult to understand that mental and physical markers of inferiority are also tropes placed in the service of disability oppression. Before disability can be used as a disqualifier, disability, too, has to be disqualified. Beneath the troping of blackness as inbuilt inferiority, for example, lies the troping of disability as inferior. Beneath the troping of femininity as biological deficiency lies the troping of disability as deficiency. The mental and physical properties of bodies become the natural symbols of inferiority via a process of disqualification that seems biological, not cultural—which is why disability discrimination seems to be a medical rather than a social problem. If we consider how difficult it is at this moment to disqualify people as inferior on the basis of their racial, sexual, gender, or class characteristics, **we may come to recognize the ground that we must cover in the future before we experience the same difficulty disqualifying people as inferior on the basis of disability**. We might also recognize the work that disability performs at present in situations where race, sexuality, gender, and class are used to disqualify people as physically or mentally inferior.

A2 Ableism K

Alt Fails

Language arguments are unable to create deep change to systems – just leads to new words coded for disability, being offensive our of round, and subtlety in language they can't critique out of

Roskoski and Peabody 91 [Matthew Roskoski, and Joe Peabody, debate coaches and former debaters writing on theory issues, critiques, and risk management; "A Linguistic and Philosophical Critique of Language "Arguments""; Florida State University; 1991; accessed 07/31/2015; <http://debate.uvm.edu/Library/DebateTheoryLibrary/Roskoski&Peabody-LangCritiques>.]

Language "Arguments" Are Counterproductive There are several levels upon which language "arguments" are actually counterproductive. We will discuss the quiescence effect, deacademization, and publicization. The quiescence effect is explained by Strossen when she writes "the censorship approach is diversionary. It makes it easier for communities to avoid coming to grips with less convenient and more expensive, but ultimately more meaningful approaches" (Strossen 561). Essentially, the argument is that allowing the restriction of language we find offensive substitutes for taking actions to check the real problems that generated the language. Previously, we have argued that the language advocates have erroneously reversed the causal relationship between language and reality. We have defended the thesis that reality shapes language, rather than the obverse. Now we will also contend that to attempt to solve a problem by editing the language which is symptomatic of that problem will generally trade off with solving the reality which is the source of the problem. There are several reasons why this is true. The first, and most obvious, is that **we may often be fooled into thinking that language "arguments" have generated real change**. As Graddol and Swan observe, "when compared with larger social and ideological struggles, linguistic reform may seem quite a trivial concern," further noting "there is also the danger that effective change at this level is mistaken for real social change" (Graddol & Swan 195). The second reason is that the language we find objectionable can serve as a signal or an indicator of the corresponding objectionable reality. The third reason is that restricting language only limits the overt expressions of any objectionable reality, **while leaving subtle and hence more dangerous expressions unregulated**. Once we drive the objectionable idea underground it will be more difficult to identify, more difficult to root out, more difficult to counteract, and more likely to have its undesirable effect. The fourth reason is that objectionable speech can create a "backlash" effect that raises the consciousness of people exposed to the speech. Strossen observes that "ugly and abominable as these expressions are, they undoubtably have had the beneficial result of raising social consciousness about the underlying societal problem…" (560). The second major reason why language "arguments" are counterproductive is that they contribute to deacademization. In the context of critiquing the Hazelwood decision, Hopkins explains the phenomenon: To escape censorship, therefore, student journalists may eschew school sponsorship in favor of producing their own product. In such a case, the result would almost certainly be lower quality of high school journalism… The purpose of high school journalism, however, is more than learning newsgathering, writing, and editing skills. It is also to learn the role of the press in society; it is to teach responsibility as well as freedom. (Hopkins 536). Hyde & Fishman further explain that to protect students from offensive views, is to deprive them of the experiences through which they "attain intellectual and moral maturity and become self-reliant" (Hyde & Fishman 1485). The application of these notions to the debate round is clear and relevant. If language "arguments" become a dominant trend, **debaters will not change their attitudes. Rather they will manifest their attitudes in non-debate contexts**. Under these conditions, the debaters will not have the moderating effects of the critic or the other debaters. Simply put, sexism at home or at lunch is worse than sexism in a debate round because in the round there is a critic to provide negative though not punitive feedback. The publicization effects of censorship are well known. "Psychological studies reveal that whenever the government attempts to censor speech, the censored speech - for that very reason - becomes more appealing to many people" (Strossen 559). These studies would suggest that language which is critiqued by language "arguments" becomes more attractive simply because of the critique. Hence language "arguments" are counterproductive.

Not a Voting Issue

Not a voting issue – in round education, cross-x, and out of round discussion solve, we won't do it again

Roskoski and Peabody 91 [Matthew Roskoski, and Joe Peabody, debate coaches and former debaters writing on theory issues, critiques, and risk management; "A Linguistic and Philosophical Critique of Language "Arguments""; Florida State University; 1991; accessed 07/31/2015; <http://debate.uvm.edu/Library/DebateTheoryLibrary/Roskoski&Peabody-LangCritiques>.] Potential for offensive language: glang

The battle against {offensive speech} will be fought most effectively through persuasive and creative educational leadership rather than through punishment and coercion... The sense of a community of scholars, an island of reason and tolerance, is the pervasive ethos. But that ethos should be advanced with education, not coercion. It should be the dominant voice of the university within the marketplace of ideas; but it should not preempt that marketplace. (Smolla 224-225).1 We emphatically concur. It is our position that a debater who feels strongly enough about a given language "argument" ought to actualize that belief through interpersonal conversation rather than through a plea for censorship and coercion. Each debater in a given round has three minutes of cross-examination time during which he or she may engage the other team in a dialogue about the ramifications of the language the opposition has just used. Additionally even given the efficacy of Rich Edwards' efficient tabulation program, there will inevitably be long periods between rounds during which further dialogue can take place. It is our position that interpersonal transactions will be more effective methods of raising consciousness about the negative ramifications of language. These interactions can achieve the goals intended by language "arguments" without the attendant infringements upon the freedom of speech.

Language ≠ Reality

Language doesn't create reality – they assume the Sair-Whorf hypothesis, but can't defend it – means no reason to vote neg

Roskoski and Peabody 91 [Matthew Roskoski, and Joe Peabody, debate coaches and former debaters writing on theory issues, critiques, and risk management; "A Linguistic and Philosophical Critique of Language "Arguments""; Florida State University; 1991; accessed 07/31/2015; <http://debate.uvm.edu/Library/DebateTheoryLibrary/Roskoski&Peabody-LangCritiques>.]

It has become fashionable lately for CEDA debaters to present language "arguments" in CEDA debate rounds. The essential defining element of a language "argument" is that it critiques not the actual arguments of the debater but rather the language or rhetoric the debater offers. It will be our position that such "arguments" are inadequate for several reasons. These reasons cluster around our analysis of the syllogism that comprises language "arguments." The major premise of language "arguments" is that language creates reality, the minor premise is that certain language is undesirable, and the conclusion is that the debater using the unacceptable language ought to be sanctioned with a ballot. We will deny the first premise and offer three reasons why the conclusion is incorrect. Language Does Not Create Reality Language "arguments" assume the veracity of the Sapir- Whorf hypothesis. Usually, this is made explicit in a subpoint labeled something like "language creates reality." Often, this is implicitly argued as part of claims such as "they're responsible for their rhetoric" or "ought always to avoid X language." Additionally, even if a given language "argument" does not articulate this as a premise, the authors who write the evidence comprising the position will usually if not always assume the Sapir-Whorf hypothesis. Perhaps the most common example is the popular sexist language "argument" critiquing masculine generic references. Frequently debaters making this "argument" specifically state that language creates reality. The fact that their authors assume this is documented by Khosroshahi: The claim that masculine generic words help to perpetuate an androcentric world view assumes more or less explicitly the validity of the Sapir-Whorf hypothesis according to which the structure of the language we speak affects the way we think. (Khosroshahi 506). We believe this example to be very typical of language "arguments." If the advocate of a language "argument" does not defend the Sapir-Whorf hypothesis, then there can be no link between the debater's rhetoric and the impacts claimed. This being the case, we will claim that a refutation of the Sapir-Whorf hypothesis is a sufficient condition for the refutation of language "arguments". Certainly no logician would contest the claim that if the major premise of a syllogism is denied, then the syllogism is false. Before we begin to discuss the validity of the hypothesis, we ought first to note that there are two varieties of the Sapir-Whorf hypothesis. The strong version claims that language actually creates reality, while the weak version merely claims that language influences reality in some way (Grace). As Bloom has conceded, the strong version - "the claim that language or languages we learn determine the ways we think" is "clearly untenable" (Bloom 275). Further, the weak form of the hypothesis will likely fail the direct causal nexus test required to censor speech. The courts require a "close causal nexus between speech and harm before penalizing speech" (Smolla 205) and we believe debate critics should do the same. We dismiss the weak form of the hypothesis as inadequate to justify language "arguments" and will focus on the strong form. Initially, it is important to note that the Sapir-Whorf hypothesis does not intrinsically deserve presumption, although many authors assume its validity without empirical support. The reason it does not deserve presumption is that "on a priori grounds one can contest it by asking how, if we are unable to organize our thinking beyond the limits set by our native language, we could ever become aware of those limits" (Robins 101). Au explains that "because it has received so little convincing support, the Sapir-Whorf hypothesis has stimulated little research" (Au 1984 156). However, many critical scholars take the hypothesis for granted because it is a necessary but uninteresting precondition for the claims they really want to defend. Khosroshahi explains: However, the empirical tests of the hypothesis of linguistic relativity have yielded more equivocal results. But independently of its empirical status, Whorf's view is quite widely held. In fact, many social movements have attempted reforms of language and have thus taken Whorf's thesis for granted. (Khosroshahi 505).

Language is a reflection of our understanding of reality – changing language won't change perceptions

Roskoski and Peabody 91 [Matthew Roskoski, and Joe Peabody, debate coaches and former debaters writing on theory issues, critiques, and risk management; "A Linguistic and Philosophical Critique of Language "Arguments""; Florida State University; 1991; accessed 07/31/2015; <http://debate.uvm.edu/Library/DebateTheoryLibrary/Roskoski&Peabody-LangCritiques>.]

The second reason that the hypothesis is flawed is that there are problems with the causal relationship it describes. Simply put, it is just as plausible (in fact infinitely more so) that reality shapes language. Again we echo the words of Dr. Rosch, who says: {C}ovariation does not determine the direction of causality. On the simplest level, cultures are very likely to have names for physical objects which exist in their culture and not to have names for objects outside of their experience. Where television sets exists, there are words to refer to them. However, it would be difficult to argue that the objects are caused by the words. The same reasoning probably holds in the case of institutions and other, more abstract, entities and their names. (Rosch 264).

Perm – Do Both

Permutation solves – can do aaff and incorporate disability issues

Ho 5 (Anita,The College of St. Catherine, Assistant professor of philosophy and a cocoordinator of the Center for Women, Economic Justice and Public Policy, "Mainstreaming Disability: A Case in Bioethics," 2005, http://www.syr.edu/gradschool/pdf/resourcebooksvideos/Pedagogical%20Curb%20Cuts.pdf, Page 21-22)

In promoting diverse perspectives, we also need to pay attention to **how we incorporate disability issues**. It is not enough that instructors include materials about disabilities. As previously mentioned, some textbooks do discuss disability issues, but they do so from an able-bodied bias, which can perpetuate various stereotypes regarding disability. An inclusive course must balance various perspectives and incorporate the voices of people with disabilities. **Students need to critically examine how and why the existing structure may affect individuals of various characteristics and experiences differently**. Some may worry that incorporation of disability issues will distract students from the most important topics. Some instructors have told me that, just as it is often impossible to add an extra course to the curriculum, they have no time for a disability topic in their already-full schedules. I challenge the uncritical assumption that the current able-bodied curriculum is best, such that any change would compromise the quality of the learning. Some instructors mistakenly assume that incorporation of disability issues means that we must replace the mainstream topics with disability topics. However, as previously mentioned, disability is not an additional "topic" that is separate from other issues. It is not enough to spend a week "tackling" disability issues. Rather, disability perspectives are an important part of most topics. Many issues have important implications for people with and without disabilities. The strategy is not to replace 6 mainstreaming disability "traditional topics" with "disability topics." Instead, the strategy is to examine or incorporate the disability perspective in these "traditional" topics.

Blackness Perm

\<Permutation text\>

Only a combined focus on race and disability can combat the double edged sword of racism and ableism which are historically intertwined – our use of the language of disability resolves the contradiction

Newman 12 [Adam Newman, earning a PhD in English from Emory; "Blackness and Disability: Critical Examinations and Cultural Interventions. Ed. Christopher M. Bell. Germany: LIT Verlag, 2011. 161 pp."; Disability Studies Quarterly; Vol 32, No 3; 2012; accessed 07/28/2015; <http://dsq-sds.org/article/view/3285/3119>.]

Bell's choice to <u>focus on black</u>, and more precisely, African American, <u>experiences of disability</u> in this volume <u>highlights the ways in which blackness and disability have been historically conjoined in the American imagination</u>. Leonard Kriegel refers to this fact in "Uncle Tom and Tiny Tim: Some Reflections On The Cripple as Negro," one of the earliest works of DS to deal with both disability and race, albeit quite problematically, when he directly places the experiences of African Americans in parallel with those of Americans with disabilities by suggesting that in light of the success of the Civil Rights Movement for African Americans, "No one can teach the cripple … [or] serve as so authoritative a model in the quest for identity, as can the black man" (417). But in spite of these previously recognized parallels and convergences between blackness and disability, as Bell points out in his introduction to the volume, "<u>too much critical work in African American studies posits the African American body politic in an ableist</u> (read non-disabled) <u>fashion … [and] too much critical work in Disability Studies is concerned with white bodies</u>" (3). Thus, Bell offers his volume as <u>a dual intervention, into both the "structuralist body politics underpinning African American studies and the whiteness at the heart of Disability Studies</u>" (3). While Bell presents his anthology as a <u>dual intervention</u>, too often the <u>pieces</u> contained therein <u>seem unable to speak to both fields</u>. The reason for this failure, in my opinion, is the decision Bell and many of the contributors make <u>to eschew the vocabulary of DS and even the word "disability" altogether</u>. According to Bell, this conscious decision <u>"points the reader to the notion of disability in all its ambiguity,"</u> thus "call[ing] to mind the shifting parameters of disability definition" (3). While the <u>interrogation of disability as a stable category is certainly important</u>, considering the book's status as an introductory volume for this area of inquiry, the lack of explicit engagement with DS scholarship in some of the essays makes disability feel overlooked or assumed rather than interrogated. <u>Blackness and Disability would have benefitted from more explicit and direct exposition on the intersectionality of blackness and disability, perhaps in the form of explanatory apparatuses</u> around the contributions, but more preferably in the essays themselves. Of the volume's essays, the one which manages most successfully to engage with the issues and scholarship on both race and disability is Michelle Jarman's, "Coming Up from Underground: Uneasy Dialogues at the Intersections of Race, Mental Illness, and Disability Studies." Focusing on Bebe Moore Campbell's final novel, 72-Hour Hold (2005), Jarman attempts to untangle the "many <u>ruptures, gaps, and potential areas of discussion around historical and contemporary intersections of psychiatric treatment, disability, and race"</u> that appear in Campbell's specific depiction of mental illness/disability (10). In particular, Jarman <u>concentrates on the parallels</u> Campbell draws betw<u>een mental disability and race by depicting mental disability in the novel through the language of slavery, and subsequently the experimental psychiatric interventions in the novel through the language of the Underground Railroad</u>. As Jarman suggests, this unique figuration "provides Campbell with a foundation to connect contemporary resistance and distrust of the dominant medical establishment to racialized histories of mental illness, and <u>the very real dangers of being read as both "black" and "crazy" in the United States"</u> (11). Further, Jarman <u>argues</u> that the <u>connections</u> that the novel draws, <u>though often uneasy and problematic, especially for disability studies scholars, make it an excellent starting point for further consideration of the intersecting narratives of race and mental difference</u>. 3

Coalitions Perm

Even for the non-disabled, disidentifying through the process of ableist language such as "crip" allows transformative coalition building processes between race, ethnic, gender and sexuality studies

Schalk 13 [Sami Schalk, assistant professor at Albany Arts, PhD in Gender Studies at Indiana University, research focuses on the representation of disability in contemporary African American literature; "Coming to Claim Crip: Disidentification with/in Disability Studies"; Disability Studies Quarterly Vol 33 No 2; 2013; accessed 07/30/2015; <http://dsq-sds.org/article/view/3705/3240>.] All the cards in this block speak specifically from the point of view of queer WOC. Potential for offensive language: crip/crippled by a nondisabled person (she explains herself as 'crip-identified')

As a young gender, race, and disability studies scholar, my entry into and relationship with/in this last field of study is not the story many expect when I tell them that I do disability studies. Unlike many people in the field, I am not (yet) a person with a disability and I am not (yet) the parent, guardian, sibling, or partner of a person with a disability. Ten to 15 years ago, being a nondisabled 1 disability studies researcher 2 with no immediate, personal experience with disability would have been relatively unusual. However, due to the growth of disability studies as an academic field since the 1990s, more people are encountering disability theory in the course of their academic careers whether or not they identify as or have a personal relationship with a person with a disability. Although I do not identify as a person with a disability, I nonetheless have come to identify with the term "crip" as elucidated by feminist and queer crip/disability theorists such as Carrie Sandahl, Robert McRuer, and Alison Kafer. As a fat, black, queer woman, my experiences have led me to have particular personal and political connections to the term "crip" and a disidentified relationship with disability studies. In what follows, I argue that disidentification can be used by minoritarian subjects to disidentify with other minoritarian subjects, communities, and/or representations and that this kind of disidentifying process among/across/between minoritarian subjects can allow for coalitional theory and political solidarity. By coalitional theory, I mean theories which are inclusive of multiple minority groups without being limited to only those people who occupy multiply minoritized positions. Regarding political solidarity, I follow Chandra Talpade Mohanty who defines solidarity as follows: In terms of mutuality, accountability, and the recognition of common interests as the basis for relationships among diverse communities…who have chosen to work and fight together. Diversity and difference are central values here—to be acknowledged and respected, not erased in the building of alliances (2003, p. 7). My goal here is to show through both my own experiences and existing theory how disidentification with/in disability studies and identification with crip offers transformative possibilities for disability studies to make stronger academic and political connections to other identity-based fields, particularly race/ethnic and sexuality/queer studies—connections that the field has not yet been able to make thus far in substantive and lasting ways. 3

Disidentification allows the potential for critical understandings of multiple intersecting fields within a radical frame of identification – it relies on representations and theories which are used, yet left behind

Schalk 13 [Sami Schalk, assistant professor at Albany Arts, PhD in Gender Studies at Indiana University, research focuses on the representation of disability in contemporary African American literature; "Coming to Claim Crip: Disidentification with/in Disability Studies"; Disability Studies Quarterly Vol 33 No 2; 2013; accessed 07/30/2015; <http://dsq-sds.org/article/view/3705/3240>.] Potential for offensive language: crip/crippled by a nondisabled person (she explains herself as 'crip-identified')

I am primarily using disidentification as elucidated by José Esteban Muñoz (1999) in Disidentifications: Queers of Color and the Performance of Politics. He defines disidentification as a strategic survival strategy of identification for/of/by those with multiple intersecting marginal identities whom Muñoz refers to as minoritarian subjects. Muñoz's theorization of disidentification relies upon Michel Pecheux's reworking of Louis Althusser's theory of interpellation in which disidentification is defined as a third identification stance in relation to dominant ideology that refuses to either fully conform or fully resist. Muñoz uses disidentification similarly to understand how queers of color relate and/or respond

to dominant representations, particularly through performance. For example, Muñoz opens the book with a description of Marga Gomez's performance piece, Marga Gomez Is Pretty, Witty, and Gay, in which Gomez sees lesbians on television for the first time and is captivated by their mysterious allure because the women are all depicted wearing raincoats, wigs, and sunglasses to hide their identities. Muñoz uses this as an example of a minoritarian subject negotiating and reinterpreting a mainstream image intended as negative. He insists that the act of disidentification is neither assimilationist nor anti-assimilationist, but rather, it's an alternative political resistance strategy that works with and against dominant ideology at the same time for the performative and political purposes of minoritarian subjects. In Aberrations in Black: Toward a Queer of Color Critique, Roderick A. Ferguson (2004) makes similar claims about the possibilities of disidentification regarding queer of color critique's disidentification with historical materialism. Ferguson writes that to disidentify means to take up with revisions, to determine "the silences and ideologies that reside within critical terrains" (p. 5) and refuse to take up or extend legacies of racism, sexism, or homophobia in theory and research. 10 Disidentification is therefore a way to locate one's self within, take up and (re)use representations and theories in ways that were not originally intended. Disidentification is not, however, the only useful minoritarian political strategy and may not be appropriate or effective for all subjects or situations (Muñoz, 1999). Despite the fact that both Ferguson and Muñoz focus on queers of color (minoritarian subjects) disidentifying with dominant (majoritarian) representations and theories, both indirectly suggest that disidentification can be used by minoritarian subjects in relation to other minoritarian representations. For example, Muñoz suggests that a queer woman might disidentify with the work of Frantz Fanon (2004), being critical of its sexist and homophobic moments while still finding and revising useful aspects of the text. Fanon, a black psychiatrist and postcolonial philosopher, is not a majoritarian subject, however, he is privileged on multiple fronts and his discussions of women and homosexuals in Black Skins, White Masks, for example, adheres to majoritarian ideology in regard to these other minoritarian subjects. As documented by intersectionality scholars such as Kimberlé Crenshaw (1991), Lisa Duggan (2002), and Jasbir Puar (2007), different subjects can simultaneously resist certain hegemonic ideologies while being complicit in others. Taking up this adapted understanding of disidentification, I find myself, a minoritarian subject, disidentifying with disability studies, a minoritarian field of research, because although the field's resistance to the pathologization of non-normative bodies appeals to me as a nondisabled, fat, black, queer woman, the shortage of substantive race analysis within the field and the relatively minor attention given to issues of class and sexuality trouble me deeply and disallow me any direct Good Subject 11 identification. The whiteness of disability studies has already been noted by Chris Bell (2006) in his essay "Introducing White Disability Studies: A Modest Proposal." However, the ubiquitous citation of this essay as the reference for disability studies scholars attempting to acknowledge race in relation to disability simply underscores the need for more critical scholarship on race in the field at this time. 12 While this lack of a substantial amount of research on race and disability does not necessarily mean there are also no people of color within the field (because people of color do not necessarily do research on race), the racial diversity of the disability studies researcher population that I've witnessed is minimal. The continued conspicuous presence of my racialized body at disability studies conferences and events disconcerts me and makes me wary of being tokenized. These emotions further facilitate my disidentification with/in disability studies. Following Ferguson and Muñoz, because this collection of theories and practices do not seem originally intended for me, as a researcher I must take up and revise disability theories and scholarship while refusing to extend its legacy of whiteness and racism. Despite the disjuncture I experience in the field as it currently exists, I still have a deeply personal, emotional affinity with disability studies scholar and activist communities. This affinity is what facilitates my coming to claim and identify with crip. Note here, that there are a few key differences between disidentification and identifying with as I am using them. Disidentification is primarily in respect to representations, ideologies, and theories which have important, useful aspects that the disidentifying subject takes up, uses, or revamps while leaving behind or being critical of other problematic or damaging elements. To identify with, as I will explain more below, is to personally and politically align oneself with a group one may or may not belong to, but with which one feels a positive connection. I discuss these concepts separately in order to distinguish my relationship to the field of disability studies from my relationship to the concept of crip, not to claim one form of identification is more positive or useful than the other. In fact, disidentification and identifying with have important areas of overlap and intersection. Crip is a term many people within disability studies and activist communities use not only in reference to people with disabilities, but also to the intellectual and art culture arising from such communities. Crip is shorthand for the word "cripple" which has been (and is) used as an insult toward people with disabilities, but which has been re-appropriated as an intra-group term of empowerment and solidarity. Thus, crip "is a term which has much currency in disability activism and culture but still might seem harsh to those outside those communities" (Kafer, 2013, p. 15). An early proponent of

crip's social and political potential, Carrie Sandahl (2003) describes crip as a "fluid and ever-changing" term which "expanded to include not only those with physical impairments but those with sensory or mental impairments as well" (p. 27). In a footnote to her use of the term, Sandahl recognizes the still-developing state of disability studies and writes: "If I had my druthers, I would replace the term disability studies with crip theory or crip studies to represent its radical edge" (p. 53; original emphasis).

Claiming identification within disability studies creates potential for solidarity in intersectionality

Schalk 13 [Sami Schalk, assistant professor at Albany Arts, PhD in Gender Studies at Indiana University, research focuses on the representation of disability in contemporary African American literature; "Coming to Claim Crip: Disidentification with/in Disability Studies"; Disability Studies Quarterly Vol 33 No 2; 2013; accessed 07/30/2015; <http://dsq-sds.org/article/view/3705/3240>.] Potential for offensive language: crip/crippled by a nondisabled person (she explains herself as 'crip-identified')

I know that my body/mind/desire/behavior (and the culture which interprets it) is not fixed. I am **crip-identified because I am not afraid of this instability**. I am not afraid of this instability because I am crip-identified. My identification with crip is neither simply personal nor purely academic. It is both of these things as well as highly political and it is this politics of claiming crip as a nondisabled, fat, black, queer woman that I believe has the most value for the future of disability studies. My identification with crip is not a cure-all for the problems of race, class, and sexuality within the field of disability studies. It also certainly does not fix the problem of disability being left out of intersectional analyses in race and ethnic studies, queer and sexuality studies, and women's and gender studies. However, I believe being crip-identified is an enactment of solidarity which can be beneficial politically, socially, and academically for multiple minoritarian groups. I want disability studies scholars not only to consider how to bring disability to, for example, black studies or to bring blackness to disability studies, but also consider how we as disability studies scholars and activists might disidentify with people of color, women, queers, or gender non-conforming people. How can we identify with social categories we don't identify as and how can this benefit us all? What are the similar, but not same, aspects of the lived experiences of people of color and people with disabilities? We would do well to ask those who identify as both, but the burden of proof should not lie with them alone. Disability studies has a long history of borrowing from work in other fields and civil rights movements, but this borrowing tends to emphasize the difference or exceptionality of disability 19 rather than its similarities or overlap—the places where disidentification across/between/among minoritarian subjects could occur. This coalitional politics through minoritarian subjects disidentifying with other minoritarian subjects, representations, theories or practices need not, however, be for political or intellectual purposes alone. It can also be, like my coming to claim crip, deeply personal and affective. For me, no space is more emblematic of the creative, affective possibilities of minoritarian disidentification and identifying with than the Society for Disability Studies dance. As Petra Kuppers (2011) contends, disability culture, and thus disability dance space, is more process than product. Therefore the things I describe here are examples of the work and values which go into creating disability dance space. Since my first SDS in 2008, I have returned each year ready to dance. I'd like to now return to these lived experiences and explore how Society for Disability dances have helped me claim crip. I earlier described the dances as having an ethos of community and love. This ethos that first drew me into SDS is established by a firm commitment to access and inclusion on the part of those who plan the conference and dance as well as individual members. Although many members are old-timers who return to the annual conference to re-connect with activist and scholar friends whom they may only see once or twice a year, everyone still dances with everyone else across (dis)ability, generational, and academic/activist divides, welcoming newcomers to the mix with encouraging smiles, shouts, signs, and applause. The SDS dance is a space of non-judgment, not only about people's individual dance styles and movements, but also individual's choices about how to engage. Although sometimes a group of friends may egg on a shyer companion, for the most part, people are free to dance, mill around, stay still, or take breaks on the side and outside of the room for food, drink, and general respite. For example, if a person who finds social situations taxing decides to abruptly walk out, they can do so without needing to make excuses or worry about raising eyebrows from others. There is no single way to participate. There are no "best" dancers who take up the entire floor doing all the "right" moves to Beyoncé's "Single Ladies" because at these dances there are no wrong moves. We're all right.

Censorship Bad

Freedom of speech is key to the future of society – censorship corrupts the first amendment and totalitarian states

Roskoski and Peabody 91 [Matthew Roskoski, and Joe Peabody, debate coaches and former debaters writing on theory issues, critiques, and risk management; "A Linguistic and Philosophical Critique of Language "Arguments""; Florida State University; 1991; accessed 07/31/2015; <http://debate.uvm.edu/Library/DebateTheoryLibrary/Roskoski&Peabody-LangCritiques>.]

If there is any principle of the Constitution that more imperatively calls for attachment than any other it is the principle of free thought - not free thought for those who agree with us, but freedom for the thought that we hate. (Holmes 654). Certainly this principle would prohibit the enforcement of any language "argument." If one despised the rhetoric of a given debater enough to vote against that debater, then as Holmes suggests, the principles of the Constitution require one to refrain from censorship. The Civil Liberties Union of Massachusetts articulated the essence of this argument so eloquently that their entire statement deserves repetition here: When language wounds, the natural and immediate impulse is to take steps to shut up those who utter the wounding words. When, as here, that impulse is likely to be felt by those who are normally the first amendment's staunchest defenders, free expression faces its greatest threat. At such times, it is important for those committed to principles of free expressions to remind each other of what they have always known regarding the long term costs of short term victories bought through compromising first amendment principles. (Strossen 487). Certainly debaters and debate coaches, whose entire activity is premised upon the freedom of expression, ought to be among the staunchest defenders of that freedom. When we are asked to censor the rhetoric of a debater, as the C.L.U. warns, we ought to think long and hard about the risks associated with playing fast and loose with free speech. As Brennan notes, the mandate "to inculcate moral and political values is not a general warrant to act as 'thought police' stifling discussion of all but state-approved topics and advocacy of all but the official position." (Brennan 577). Not only does the first amendment create a moral or deontological barrier to language "arguments", the principles it defends also create a pragmatic barrier. The free and sometimes irreverent discourse protected by the first amendment is essential to the health and future success of our society. History has borne out the belief that the freedom to challenge convictions is essential to our ability to adapt to change. As Hyde and Fishman observe, university scholars must be allowed to "think the unthinkable, discuss the unmentionable, and challenge the unchallengeable" because "major discoveries and advances in knowledge are often highly unsettling and distasteful to the existing order." This leads them to conclude that "we cannot afford" to impose "orthodoxies, censorship, and other artificial barriers to creative thought" (Hyde & Fishman 1485). Given the rapid pace of political and technological change that our society faces, and given that debates often focus around the cutting edge of such changes, the imposition of linguistic straitjackets upon the creative thought and critical thinking of debaters would seem to uniquely jeopardize these interests. This is not just exaggerated rhetoric, nor is it merely our old debate disadvantages in new clothes. Hyde & Fishman's claims have been repeatedly validated by historical events. Had Elie Wiesel debated in Germany, a "Zionist language" argument would not have been unlikely. As Bennett Katz has argued, The essentiality of freedom in the community of American Universities is almost self-evident... To impose any strait jacket upon the intellectual leaders in our colleges and universities would imperil the future of our Nation... Teachers and students must always remain free to inquire, to study and to evaluate, to gain new maturity and understanding; otherwise our civilization will stagnate and die. (Katz 156).

Commodification Turn

Turn – Making it a voting issue only exacerbates the power relations they claim to resist – commodifying the lived experiences of PWD for their own academic gain
Kitchin 2000 (Rob, Prof of Geography, Nat'l Univ of Ireland, "The Researched Opinions on Research: Disabled People and Disability Research," Disability & Geography, v15, #1, pp25-47)

Many disabled academics, such as Oliver (1992), are unhappy at the widespread exclusion of disabled people from disability discourse and call for the adoption of research strategies that are both emancipatory (seeking 'positive' societal change) and empowering (seeking 'positive' individual change through participation). They suggest that current research on disability issues is flawed and problematic in a number of respects. Most crucially, they **argue that disability research is not representative of disabled peoples' experiences and knowledges.** This is because, as noted, the vast majority of research is conducted by non-disabled researchers. **They contend that it is only disabled people who can know what it is like to be disabled and so only disabled people who can truly interpret and present data** from other disabled people. **Moreover, they argue that research concerning disability research is invariably researcher-orientated, based around the desires and agendas of the (non-disabled) researcher** and able-bodied funding agencies, **rather than subject(s) of the research (disabled people**; Sample, 1996). Indeed, Oliver (1992) argues that **the traditional 'expert' model of research** represents a 'rape model of research' that is alienating, and **disempowers and disenfranchises disabled research participants by placing their knowledge into the hands of the researcher to interpret and make recommendations on their behalf; that researchers are compounding the oppression of disabled respondents through exploitation for academic gain.**

Race Turn

Disability studies replicates whiteness

Bell 10 (Christopher M. Bell was Disabilities Studies Fellow at the Center of Human Policy, Law, and Disability Studies at Syracuse University (deceased), "Introducing White Disability Studies A Modest Proposal, The Disability Studies Reader, edited by Lennard J. Davis, p.275)

Bubba Gumps matter-of-fact rejoinder to Dorian Gray is, I think, indicative of the whiteness of Disability Studies in its present incarnation. The fact that Disability Studies is marketed as such when it is in actuality an artificial (read: limited and limiting) version of the field does nothing to prevent it from being understood as Disability Studies, which is what Bubba, by extension, apprised Dorian of. I contend that it is disingenuous to keep up the pretense that the field is an inclusive one when it is not. On that score, I would like to concede the failure of Disability Studies to engage issues of race and ethnicity in a substantive capacity, thereby entrenching whiteness as its constitutive underpinning. In short, I want to call a shrimp a shrimp and acknowledge Disability Studies for what it is, White Disability Studies. In contradistinction to Disability Studies, While Disability Studies recognizes its tendency to whitewash disability history, ontology and phenomenology. White Disability Studies, while not wholeheartedly excluding people of color from its critique, by and large focuses on the work of white individuals and is itself largely produced by a corps of white scholars and activists. White Disability Studies envisions nothing ill-advised with this leaning because it is innocently done and far too difficult to remedy. A synoptic review of some of the literature and related aspects of Disability Studies bears this out.

Defense of Crip

The word "crip" and derivatives has multi-use potential, and that transgressivity is meaningful

Schalk 13 [Sami Schalk, assistant professor at Albany Arts, PhD in Gender Studies at Indiana University, research focuses on the representation of disability in contemporary African American literature; "Coming to Claim Crip: Disidentification with/in Disability Studies"; Disability Studies Quarterly Vol 33 No 2; 2013; accessed 07/30/2015; <http://dsq-sds.org/article/view/3705/3240>.] Potential for offensive language: crip/crippled by a nondisabled person (she explains herself as 'crip-identified')

Sandahl, McRuer and Kafer all emphasize the relationship of crip and queer. Sandahl (2003) insists that li<u>ke queer, crip is not only a noun and adjective, but also a verb: to "crip" means to spin "mainstream representations or practices to reveal able-bodied assumptions and exclusionary effects [...to] expose the arbitrary delineation between normal and defective and the negative social ramifications of attempts to homogenize humanity"</u> (p. 37). Crip as verb can therefore be understood as a specific form of disidentification. Making further connections between crip and queer, Sandahl writes: As a pejorative, the term queer was originally targeted at gays and lesbians, yet its rearticulation as a term of pride is currently claimed by those who may not consider themselves homosexual, such as the transgendered, transsexuals, heterosexual sex radicals, and others. [...Although] I have never heard a n<u>ondisabled person seriously claim to be crip (as heterosexuals have claimed to be queer)</u>, I would not be surprised by this practice. <u>The fluidity of both terms makes it likely that their boundaries will dissolve</u> (p. 27). This specific aspect of the <u>relationship between queer and crip</u>, the possibility of these terms referring to or <u>being claimed by people not previously referenced by them, is critical to the current direction of crip theory and to my own identification with the term</u>. Kafer (2013) writes that <u>crip, or crip affiliation, could include both "those who lack a 'proper'</u> (read: medically acceptable, doctor-provided, and insurer-approved) <u>diagnosis</u> for their symptoms" <u>and, more complexly, "people identifying with disability and lacking not only a diagnosis but any 'symptoms' of impairment"</u> (p. 12-13). In a related vein, McRuer (2006) writes that <u>although one must be "attuned to the dangers of appropriation," it is both theoretically and politically "important to raise issues about what it means, for the purposes of solidarity, to come out as something you are—at least in some ways—not"</u> (p. 37). I align myself with McRuer's "coming out crip" and Kafer's "crip affiliation" by claiming crip and declaring myself a crip-identified, fat, black, queer woman. Kafer writes: <u>Claiming crip can be a way of acknowledging that we all have bodies and minds with shifting abilities</u>, and that <u>such shifts have political and social meanings and histories</u>. It can be a way of imagining multiple futures, <u>claiming crip as a desired and desirable location, regardless of one's own embodiment or mental/psychological processes</u>... thinking through what nondisabled claims to crip might entail will require exploring whether such claims might be more available, more imaginable, to some people than others (and on what basis) (pp. 13). I argue that my particular <u>relationship to racial, gender, and sexuality systems of oppression and privilege is what makes claiming crip available to me</u>. The ways in which my fat, black, queer, woman's body/mind/desire/behavior is constantly read and reacted to as non-normative, sometimes excessively so, makes me feel particularly akin to those who identify as disabled and/or crip, people whose bodies/minds/desires/behaviors are also outside the social norm. In this way, I argue that I am similarly situated in regard to many vectors of power as people with disabilities and that interrogation into the processes which have so situated us are needed in order <u>to develop coalitional theory and political solidarity</u>. It is important to emphasize that I am calling myself <u>crip-identified</u>, meaning that <u>I identify with not as crip</u>, a distinction McRuer (2006) suggests in his work, but does not make sufficiently clear. I use identify with to mean having acknowledged and prioritized political and personal connections to a group with which one does not identify as a member. <u>To identify with means to feel implicated by the culture and politics of another group and seek to better understand this link</u>. While to identify with could be understood as analogous to being an ally, I contend that there is something more personal, sustained, and affective about it. <u>Identifying with is a careful, conscious joining—a standing/sitting among rather than by or behind a group</u>—which seeks to reduce separation while acknowledging differences in privileges and oppression. I connect identifying with to Cathy Cohen's (2005) call for a radical politics of shared resistance built on identities as they are impacted by and invested with different degrees of normative power. Identifying with is particularly important in the case of disability which, as many have noted, is the only identity category which one can join at any moment without intent. <u>I use crip-identified as something different than disability ally because it is an almost-not-quite-yet identification</u>. I

am crip-identified not only because my body/mind/desire/behavior is non-normative in terms of race, gender, sexuality, and size, but also <u>because of its precarious relationship to disability as this term is currently culturally understood.</u>

Defense of Hip Hop

The language of hip hop is a unique form of reclamation – it flips the script to make disability an admired trait and creates new meanings

Porco 14 [Alex S. Porco, Ph.D. in poetic theory State University of New York at Buffalo, with a research focus in hip hop and culture; "Throw Yo' Voice Out: Disability as a Desirable Practice in Hip-Hop Vocal Performance"; Disability Studies Quarterly; Vol 34 No 4; 2014; accessed 07/28/2014; <http://dsq-sds.org/article/view/3822/3790>.]

Hip-hop culture is a form of vernacular theory and practice.3 The vernacular is rooted in an archive of everyday language and images shared by disenfranchised citizens. The vernacular is grounded in local communities and concerns yet, in accordance with the logic of late capitalism and globalization, transmissible and adaptable to distant locales. The vernacular is also synonymous with improvisation, which requires sensitivity to, and awareness of, changing situational exigencies. Finally, the vernacular is a renewable resource, perpetually engaged in the dialectical process "of tearing down old vocabularies and proposing new ones" (Magee 9). In hip-hop culture, the idiomatic phrase, flip the script, describes an act of tactical resistance to dominant power structures: it means to invert or, at least, interrupt the value system that privileges certain language rules, technological imperatives, cultural spaces and objects, and master narratives. As vernacular theory and practice, **hip-hop flips the script on disability, transforming a physical condition and social stigma into a desirable aesthetic value**. The history of hip-hop provides numerous analogous instances of flippin' the script. In 1988, recording duo Eric B. and Rakim released "Follow the Leader," an Afrofuturistic riff on the Pied Piper of Hamelin legend. The song includes Rakim's oft-quoted couplet, "I can take a phrase that's rarely heard, flip it, / Now it's a daily word." Rakim's punning turn of phrase establishes the relationship between language, style, and currency. More importantly, it speaks to the influence of hip-hop slang on contemporary popular culture: it's ubiquitous— from the playground to the classroom, from the stoop to the White House. Hip-hop culture's influence on the English language is more formally recognized through governing bodies like the editorial board of the Oxford English Dictionary (OED). In recent years, the OED has made headlines by including "crunk," "bling," "jiggy," "dope," "phat," and "balla." Rappers have used these words and **invested them with hip-hop-specific meanings**.

Hip hop has the potential to challenge ableism through historical connections to blackness and their intersectional experiences

Porco 14 [Alex S. Porco, Ph.D. in poetic theory State University of New York at Buffalo, with a research focus in hip hop and culture; "Throw Yo' Voice Out: Disability as a Desirable Practice in Hip-Hop Vocal Performance"; Disability Studies Quarterly; Vol 34 No 4; 2014; accessed 07/28/2014; <http://dsq-sds.org/article/view/3822/3790>.]

Finally, hip-hop culture flips the script on strategies of representation, too. Rappers provide alternative or "minority" perspectives on significant political events, historical figures, and cultural objects and symbols.6 So, for example, Public Enemy's "Fight the Power" interrogates representations of popular history that advocate exclusively for white cultural heroes: Elvis was a hero to most But he never meant shit to me you see Straight up racist that sucker was Simple and plain Motherfuck him and John Wayne Cuz I'm Black and I'm proud I'm ready and hyped plus I'm amped Most of my heroes don't appear on no stamps Chuck D. proposes a new black hero rescued from the sediment of popular culture. In response to (white) visuals, Chuck D. presents (black) audio: "the sounds" of James Brown's "funky drummer," designed to generate racial pride and to inspire social change. Thus, Chuck D. situates his listener at what Jennifer Stoever-Ackerman calls "the sonic color-line … a socially constructed boundary where racial difference is produced, coded, and policed through the ear" (par. 1). And Chuck D.'s witty rhyme, "amped" and "stamps," highlights the competition between audio and visual epistemologies.7 The foregoing genealogy of hip-hop's flip the script aesthetic and ethic is meant to situate hip-hop in unique relation to disability as a practice and Disability Studies as a field. Hip-hop artists emphasize that cultural meanings, norms, and values— including (but not limited to) ableism— are open to social agents and processes that stage "the intersection of different 'accentings' in the same discursive terrain" (Hall 298). But to quote Tricia Rose, "Without historical

contextualization, aesthetics are naturalized, and cultural practices are made to appear essential to a given group of people. On the other hand, without aesthetic considerations, Black cultural practices are reduced to extensions of socialhistorical circumstances" ("Black Text/Black Context" 223). Disability is a key "vanishing mediator" between the hip-hop aesthetic and its social-historical context (Jameson 26). This essay aims to make disability present and audible as a mediating practice; and it proposes that hip-hop's self-conscious acts of transvaluation challenge the discursive dominance of ableism.8

Generic

Just because words are insulting to people with disabilities does not moot their utility and uniqueness in language – not using it after being called out solves

Watson 14 [Rebecca Watson, previous podcast host, travels around the globe giving speeches on science, tech, art, skepticism, and critical thinking; "Insults, Slurs, and Stupidity"; Skepchick, a collection of works focused on science and critical thinking; 02/15/2014; accessed 07/27/2015; <http://skepchick.org/2014/02/insults-slurs-and-stupidity/>.] Potential for offensive language: stupid. This card also might be pretty offensive in a few other ways, read through it first.

There is currently a, er, lively discussion happening in the comments of Surly Amy and Elyse's DDoS Valentine post over the use of words like "stupid" and "idiot" to describe people who are ignorant. A few commenters are arguing that those words are triggering for people with mental disabilities and so they should not be used. I disagree, and as of right now I'm content allowing words like "stupid" to continue to be used across the Skepchick Network. I might consider requesting that writers include a content note at the top of posts that contain that language, but I'm still not really sure it's necessary at this point. There are a few points in this discussion that I felt it necessary to highlight. First of all, if you are a person who is triggered by the word "stupid," you have my immense sympathy. Last night I was considering this discussion while watching Netflix, and I must have heard the word "stupid" or a synonym at least once every ten minutes. Even in conversation with friends, it happens near-constantly: my stupid cat woke me up with his butt in my face. The stupid PS3 controller isn't working. The stupid me forgot to take the cloth bags from the car into the grocery store. I've been triggered once before and it was extremely unpleasant, to the point that I laid in bed in the fetal position crying for a few hours. A person who is triggered by words like "stupid" and "idiot" must quite seriously live a horrific life dominated by fear and pain, and I sincerely hope they get therapeutic help. I have no doubt that there are such people, just as there are probably people who are triggered by other insults. I could certainly imagine a person with a newly installed colostomy bag being triggered by words like "shitty." Perhaps someone who was orally raped is triggered when someone says that something "sucks." Maybe someone with a cleft palate is triggered when the word "ugly" is used to describe everything from faces to personalities to carpets. And if I was friends with any of those people and I used one of those words in their presence and they took me aside and told me about their pain, **I would absolutely avoid saying those words in their presence**. I would not, though, avoid saying those words elsewhere, because those words are not slurs. Compare any of them to the word "kike," for instance. "Kike" is a word that has no other usage besides dehumanizing and marginalizing Jewish people. Yes, it has been thrown at me, a gentile through and through, but even then it was meant to insult some perceived Jewishness in my person. The word "retard" has been thrown at me, a person with no developmental disabilities, but it is quite obviously always meant to shame me by aligning me with people with disabilities. The word "cunt" is thrown at men, but every time it is meant to unambiguously connect them with the disgusting, lesser vagina. "Stupid," on the other hand, accurately describes a thing or a person or an action that is foolish, ignorant, or vapid, and we cannot drop useful words like that from our vocabulary entirely because some people find them upsetting. Elyse's valentine specifically addressed people who were incapable of learning that silencing us is impossible – a fool's errand, if you will. The word "stupid" and its synonyms must be used to make that clear, even if those words are **also** used to insult people with developmental disabilities. So yes, just as we won't stop using the word "creep" to accurately describe people and behaviors that we deem "creepy," we won't stop using words like "stupid" to accurately describe people and behaviors that we deem ignorant or foolish.*

Biopower

A focus on biopower is key – exclusion on the basis of disability is fading as surveillance otherizes people with disability as a threat to norms and the health of the population

Anders 13 [Abram Anders, Assistant Professor of Business Communication, English PhD @ Penn State; "Foucault and "the Right to Life": From Technologies of Normalization to Societies of Control"; Disability Studies Quarterly; Vol 33 No 2; 2013; accessed 07/29/2015; <http://dsq-sds.org/article/view/3340/3268>.]

<u>Bodies</u>, through their <u>history, development, and functionality are penetrated thoroughly and effectively by force and are thereby enmeshed in relations of power</u>. <u>Through these relations of power, individuals and eventually forms of subjectivity are constituted as objects to be studied</u> and sites of the application of techniques of power. If for Canguilhem norms are a polemical concept, then for Foucault they are a "technique of intervention" (Foucault, Abnormal 50). In one of Foucault's most famous formulations, he argues that the <u>institutions of biopower do not primarily employ the model of</u> **the exclusion of lepers, but rather the inclusive models of quarantine, surveillance, and regulation of the plague**: "<u>Rather than the massive, binary division between one set of people and another, it called for multiple separations</u>, individualizing distributions, an organization in depth of surveillance and control, an intensification and a ramification of power" (Discipline and Punish 198). Under the quarantine model, <u>the prohibitive function of the law is increasingly replaced with a process of normalization that seeks to maximize the life of both the individual and the species</u>: Such a power has <u>to qualify, measure, appraise, hierarchize</u>, rather than display itself in its murderous splendor; it does not have to draw the line that separates the enemies of the sovereign from his obedient subjects; it effects distributions around the norm … (Foucault, The History of Sexuality 144) In the age of biopower, <u>the oppressed, pathologized, and criminalized are no longer excluded as enemies; they become necessarily integrated as endemic threats to the health of the body politic</u>. In administering the life of both the society and the individual, in terms of both social deviance and pathological dysfunction, the norm is the common tool: "<u>The norm is something that can be applied to both a body one wishes to discipline and a population one wishes to regularize</u>" (Foucault, Society Must Be Defended 252-3).

<mark>\<Permutation text\></mark>

Changing surveillance surround disability is the best way to solve – some state intervention is necessary, but not to the current paternalistic extent, and the aff can solve the individualization of the state through a reconception of power.

Anders 13 [Abram Anders, Assistant Professor of Business Communication, English PhD @ Penn State; "Foucault and "the Right to Life": From Technologies of Normalization to Societies of Control"; Disability Studies Quarterly; Vol 33 No 2; 2013; accessed 07/29/2015; <http://dsq-sds.org/article/view/3340/3268>.]

Of course, <u>no one wants the social stigma associated with disability, but social recognition of disability determines the practical help a person receives</u> from doctors, government agencies, insurance companies, charity organizations, and often from family and friends. (Wendell 264) Though the primary goal of this study has been <u>a historical-critical understanding of the ways in which biopower has sought to grasp or circumscribe the human differences associated with disability, it is also important to recognize that disabled people have generally benefited from these "advances."</u> One of the most perplexing aspects of <u>engaging in disability studies and activism is that it is difficult to imagine doing without these forms of intervention</u>. Yet, <u>this difficulty only foregrounds the fact that disabled people are uniquely vulnerable to the control of disciplinary mechanisms</u> through their dependence on medical care and intervention. <u>What makes contemporary forms of power so insidious is that they are productive</u>. While <u>political accommodations</u> extended through legislation and medical care is clearly valuable and necessary, they <u>are clearly problematic to the degree that they have been structured as</u>

paternalistic; that is, interventions to improve the health or quality of life of the individual are often administered in ways that imbed forms of control and governance. In structuring the possible field of others, these disciplines not only configure material and social contexts for the actions of individuals, but discursively shape the identity of individuals with disabilities through the authority of scientific knowledge. Undoubtedly, this is the reason why a great deal of critique has focused on disciplines and institutions. In a very sober account of the current state of disability studies, Snyder and Mitchell support the value of disciplinary critique as it has been made through the work of Foucault for one. However, they also point to a need for speaking to the experience of disability: The theoretical diagnosis had been limited to an archaeology of institutional power that sought artificially to stabilize meanings of the body. To narrate a phenomenology of the body requires an approach that can capture its defining elasticity—not as an established fact, but rather as a mutable, temporal, "first-person" organism. Such is the domain of literature and art. (381-2) The point is not to recover some authentic self prior to relations of power, but rather to reconfigure our status as subjects through the manipulation of our relation to our selves. Certainly, art or literature that involves discovering new modes of "self-knowledge" is one way to begin challenging the modes of subjugation characteristic of disability as an identity. Through Foucault, we should recognize that the call for a "right to life" emerges along with the disciplinary forms of governmentality that increasingly structure relationships of the self to the self. Ultimately, the struggle against the modes of subjugation concomitant with institutional attempts to ameliorate conditions of "suffering and limit" should be recognized as a crucial aspect of the experience of disability: The conclusion would be that the political, ethical, social, philosophical problem of our days is not to try to liberate the individual from the state, and from the state's institutions, but to liberate us both from the state and from the type of individualization linked to the state. (Foucault, "The Subject and Power" 134) Individual human beings have never been and will never be completely independent; they will never exist outside of relations of power. Similarly, dependence on disciplinary forms of care will continue to be a fact of life for many. Thus, disability studies should focus on critique of disciplines and institutions as a means of challenging the degree of control involved in relations of dependence, along with attempts to discover new modes of subjectivity or forms of self-knowledge—ultimately, to challenge the ways in which we are subjugated through and made subject to technologies of normalization.

Foucault's perception of the body has always been inclusive of disability – the disability rights movement was born out of biopower to create a politic against universalizing liberalism

Anders 13 [Abram Anders, Assistant Professor of Business Communication, English PhD @ Penn State; "Foucault and "the Right to Life": From Technologies of Normalization to Societies of Control"; Disability Studies Quarterly; Vol 33 No 2; 2013; accessed 07/29/2015; <http://dsq-sds.org/article/view/3340/3268>.]

First and foremost, Foucault's work is relevant for contemporary disability studies because of his theorization of the body as a thoroughly and inexorably politicized space. In his genealogical studies, Foucault undertakes the task to "expose a body totally imprinted by history and by the process of history's destruction of the body" ("Nietzsche, Genealogy, History" 357). Foucault's work challenges the traditional "social model" of disability insofar as it reifies and naturalizes "impairments" as the transhistorical and neutral foundations of disability. Building on continuing critique of the "social model," Tremain employs Foucault's work to argue that impairments themselves are not "intrinsic defects that demand to be corrected or eliminated (as the 'medical model' assumes)" but rather are "created by social and economic arrangements and conditions that can be transformed" (Tremain, "Biopower …" 598). Foucault's work challenges us to recognize that the "difficult physical realities" of disability are themselves socially constructed and to undertake the task of diagnosing the forces that produce them. 4 There is no outside to the historical effects and socio-political operations of power on the body. Second, and complementarily, Foucault theorizes the modern social field in terms of biopolitics. He argues any attempt to understand modern political struggles and the claims of rights

discourse must begin by recognizing such claims as a political response to what he characterizes as the triumph of biopower. As Foucault describes it, biopower is the proper name for the emergence and integrated exercise of both a technology of discipline, which produces docile bodies, and the normative regulation of populations; it takes life itself as the object of its exercise: "One might say that the ancient right to take life or let live was replaced by a power to foster life or disallow it the point of death" (The History of Sexuality 138). While biopower takes life as its object of exercise, it does so by applying itself to the "everyday life categories of the individual." Biopower extends the mechanisms of disciplinary societies through an intensification of individuals' relationships to themselves and their own self-governance: "it is a form of power that makes individuals subjects. There are two meanings of the word "subject": subject to someone else by control and dependence, and tied to his own identity by a conscience or self-knowledge" (Foucault, "The Subject and Power" 130). In light of Foucault's analysis, the disability studies movement should be understood as an effect of biopower; that is, it constitutes disabled people as subjects who claim a "right to life," a claim that relies on the essential promise of a form of power that produces "disability" as a socially and politically marginalized identity. As Wendy Brown argues in States of Injury: Power and Freedom in Late Modernity (1995), in liberal societies such claims are filtered through the discourse of universal human rights: In this story, the always imminent but increasingly politically manifest failure of liberal universalism to be universal—the transparent fiction of state universality—combines with the increasing individuation of social subjects through capitalist disinternments and disciplinary productions. Together, they breed the emergence of politicized identity rooted in disciplinary productions but oriented by liberal discourse toward protest against exclusion from a discursive formation of universal justice. (58)

Cyborgs Addendum

Sexism

The aff's binarist embrace of cyborgs allows implicit male neutrality to continue, and their queer project fails to recognize the queerness at the heart of cyborgs and AI

Zimmer 14 [A. E. Zimmer, writer on theater, gender performance, film, and technology; "CYBORG INTELLIGENCE: DISMANTLING GENDER IN THE AGE OF CHATBOTS"; Topical Cream, womens' magazine covering fashion, art, technology, and topical issues, based in New York; 07/07/2014; accessed 07/25/2015; <http://topicalcream.info/editorial/cyborg-intelligence-dismantling-gender-in-the-age-of-chatbots/>.]

Eugene Goostman: smart name for the smart robot crowned champion of the infamous Turing Test, the standard for determining machine intelligence created by British mathematician and computer scientist Alan Turing. At the 2014 Turing Test At The Royal Society in London, the robot, under the guise of a 13-year-old Ukrainian boy, answered questions about his hometown of Odessa, his Jewishness, his pet guinea pig, and his father, a gynecologist ("My friends say he is a "beaver-doctor" – but I guess they lie – he is not a veterinary!"). After successfully convincing 33% of visitors that he was indeed human, Eugene was hailed as a long-coveted, shining bit of proof: at long last, our technologies were approaching fantastic, sci-fi proportions. Media outlets lit digital torches, sounding the news of this cyborg heir apparent, only to find out later that by most qualifications, this star pupil Eugene had actually failed. The reason for our star pupil's flunking? It turns out Eugene's satisfying performance was less about his abilities to "think" intelligently , than it was about his programmer's abilities to account for his flaws. The bot's programmers admitted that the description of Eugene as a 13-year-old with "a boyish personality", with English as a second language, greatly helped convince judges of the robot's humanity. Such a description allowed for more human "forgiveness" for Eugene's mistakes of syntax, grammatical errors, misspellings, and the like. Blunders aside, what's perhaps most interesting about Eugene's personality is the decision to call him male. After all, what does it mean when the most "intelligent" machine "passes" as a boy? How important is it that **when a machine pretends to be a young, (presumably straight) white male , it is lauded for its success and intelligence**? Eugene Goostman is a chatterbot– the kind of algorithm that made you waste hours on AIM with Smarter Child, or Cleverbot. They are systems of relatively simple strategy: programmers wire robots with lists of potential phrases and through matching these phrases to data, generate a response. They also frequently use techniques like phrase repetition as well. Algorithmically speaking, there have been plenty of chatterbots equally capable, as Eugene in "faking human" that've received far less hype and adulation. This is particularly true of those bots gendered female. Consider ELIZA (note the Pygmalion namesake), a famous 1964 program modeled after your most infuriating psychotherapist. You can even ask SIRI about her. Though her programming logic was fairly simple, ELIZA was revolutionary for her appeal with humans , as many of her "patients" reported growing attachment to the bot. While its newfound popularity pinned ELIZA as a contender for passing Turing's Test, her victory never came to fruition. Eventually her programming was used in new chatterbots with new names, some of them gender neutral, most of them male-identified. Before you knew it, that was the last "female" chatbot given any shred of Turing Test credibility. It only takes a quick Google Search to see how the second-wave feminist chatbots have fared: There's Athena, the loftily-titled GoddessBot, a "nice and unpretentious" french bot named Jane, Mitsuku, "your new virtual friend... here 24 hours a day just to talk to you". You catch the idea. None of these chatterbot programs convince humans of much of anything other than some validation for their latest fetish, yet Eugene's "personality" absolved him of these shortcomings. It's not that the Ukrainian bot was smart enough to pass the Turing Test, but–unlike its feminized counterparts– the qualities of its imagined gender, age and sexual identity allowed the robot's "passing" to the public. What's the value of gendering our Artificial Intelligence? Perhaps it's a programmer's matter of habit, a partiality to A.I.'s history of a "neutral" standard that's categorically male. And yet, **A.I.'s history has never been "neutral"– it is implicitly gendered, and implicitly queer**–Alan Turing himself, godfather of Artificial Intelligence, led his life as an openly gay man of the 1940s. The very concession of his queerness found him **criminally prosecuted for homosexuality, subjected to horrific violence** that would lead to his suicide: one apple bite, laced with cyanide. Many A.I. enthusiasts rarely, if ever, entertain the truth of their hero's life. Similarly, the gender politics at the core of Turing's original "test" are often disregarded–which of course is no test at all, but something entirely different. "Turing never proposed a test in which a computer pretends to be human," says Karl MacDorman, associate professor of human-

computer interaction at Indiana University. "Turing proposed an imitation game in which a man and a computer compete in pretending to be a woman. In this competition, the computer was pretending to be a 13-year-old boy, not a woman, and it was in a competition against itself, not a man." Though it's no secret that <u>tech has a gender problem, what's makes A.I.'s problem with gender particularly hard to stomach</u> is how this study tends to thrive on imagination. <u>Robots</u>, after all, <u>are</u> ridiculous things, <u>stuff of dreams and nightmares</u>. <u>In them we plant</u> very human <u>hopes and fears for the future– the considerations of robot bodies and the constructions of robo-minds are</u> often chrome negotiations of <u>our human lives</u> and their fleshy experiences. So <u>when the "smartest" machine in the world is a 13-year old boy,</u> cracking vulgar genital jokes about his gyno dad, what fiction are we selling ourselves? <u>When the very inventor of machine consciousness was an openly gay man, chemically castrated</u> for this very admission?

Cyberfeminism, borne from the Cyber Manifesto, has lost its radical political power by participation in hegemonic masculinity as "empowerment" and coopted by racism as society recognizes the cyborg as legitimate

Fernandez 1 [Maria Fernandez, art historian (Ph.D. Columbia University, 1993) whose interests centre on post-colonial studies, electronic media theory, Latin American art and the intersections of these fields.; "WHATEVER HAPPENED TO THE CYBORG MANIFESTO?"; MUTE VOL 1, NO. 20 – DIGITAL COMMONS; 07/10/2001; accessed 07/25/2015; http://www.metamute.org/editorial/articles/whatever-happened-to-cyborg-manifesto.] Aff fails

In an era <u>when nearly everything</u>, from small seeds to large computer networks, <u>entails practical or metaphorical organic and machinic fusions, the 'cyborg'</u>, that product of early Cold War cybernetic theory, and <u>detourned by Haraway</u> a generation later, **has lost its political clout**. Haraway's cyborg, "not of woman born", the illegitimate <u>offspring of militarism and patriarchal capitalism</u>, <u>was modeled upon the 'meztisaje' (racial mixing) of Mexican Americans</u>. Acknowledging that <u>she wrote the piece</u> at a particular historical moment and <u>primarily for women, Haraway's cyborg was an inconstant figure able to incorporate spiral dancers, electronic factory workers, poets, and engineers</u>; a figure <u>that allied diverse oppositional strategies</u>, from writing to biotechnology. Given this radical theoretical openness, <u>what did the Cyborg Manifesto (CM) really manage to achieve?</u> 1> CM was <u>an early recognition of</u> the fundamental and <u>irreversible changes</u> brought about by digital technologies. Pre-dating Dolly, the Visible Man, the Visible Woman, and the (purported) completion of the Genome Project, <u>Haraway discerned society's transformation into a "polymorphous information system"</u> and "the translation of the world into a problem of coding," both phenomena with specific effects for women worldwide. In the 1980s, Haraway was one of a handful of cultural critics to write about the double-edged possibilities of biotechnology, a major focus of cultural work today. Her prediction that <u>control strategies applied to women to give birth to new human beings would be developed using the language "of goal achievement for individual decision-makers" had, by the 1990s, has been all too fully borne out</u>. 2> <u>CM urged feminists to embrace new technologies</u> as tools for feminist ends. This was a pressing antidote to the pernicious notion, popular at the time, that women belonged exclusively to 'nature'. The manifesto proposed <u>that feminists definitely could and should **use the master's tools to destroy**</u> (or at least disrupt) **the master's house**. 3> CM contributed to the growth of a pan-global labour consciousness, acknowledging the key role of women as workers in the global economy. It also inspired the development of '<u>cyberfeminism'</u> in various parts of the world. But <u>in contrast to Haraway's feminist, socialist and antiracist politics</u>, cyberfeminism <u>eschewed definitions</u>, political affiliations (including feminism) **and even goals**.<*> **The political effectiveness of so undirected a movement is still to be determined**. <u>Issues of race and racism</u>, primary in Haraway's formulation of the cyborg, <u>have been avoided in cyberfeminism</u>. <u>This silence could prove</u> as <u>destructive</u> here as it was to second wave US feminism. One can only hope that cyberfeminism is still open to transformations. 4> <u>CM proposed feminist associations based on affinities</u>, not identity. Haraway wrote the manifesto in response to endless fragmentation of the US Second Wave feminist movement along the lines of ethnic, racial and sexual identity. The manifesto called for the <u>crossing</u> of <u>boundaries</u> and <u>for a re-organisation of women</u> on the basis of affinities of political kinship. <u>Cyberfeminists</u> followed

Haraway's lead to associate on the basis of affinities, but at present, with some exceptions, these affinities tend to be career-oriented rather than political. 5> CM reinforced and popularised earlier Utopian feminist imaginings of a world rendered gender free by technology. Effectively, what this really meant was that those who could afford medical services and technology would be able to 're-generate' themselves at will. For a small segment of the world's population this has indeed been liberating and empowering. Previously 'monstrous' prostheses became beautiful. If the original radicality of Haraway's cyborg lay in its illegitimacy, the ubiquity of digital, ex-military, and genetic technologies suggest that the cyborg is now a recognised legal citizen, much more a creature of social reality than of fiction. The utilisation of the cyborg as an image of edgy radicalism was, and still is, the territory of electronics and the fashion industry. As cyberfeminism emphasises the cyber and backpedals the feminism, the most radical politics of the manifesto have been largely ignored.

Cyborgs are expected to conform to gender norms – violating gender-social expectations makes them inaccessible and unacceptable

Park et al 14 [Benedict Tay, quals; Younbo Jung, quals; Taezoon Park, quals; "When stereotypes meet robots: The double-edge sword of robot gender and personality in human–robot interaction" pg 82-83; Computers in Human Behavior; Vol 38; 2014; Science Direct.]

The results of the current study support our objectives to ascertain the underlying social schema that can influence users' acceptance of social robots. Participants more easily accepted social robots with gender and personality that conformed to their respective occupational role stereotypes. Except for the perceived behavioral control, various factors of TPB and perceived trust are predictive of user acceptance of social robots. It is possible that perceived behavioral control could be significant beyond experimental settings where people have incomplete volitional control over their interaction with social robots. Having said that, future research needs to be conducted in field settings. With respect to user responses, we have successfully separated the effects of personality-stereotype violations from those of gender-stereotype violations. The results showed that in-role personality had a greater impact than in-role gender in terms of user response to a social robot. In spite of the interesting findings, the current study is subject to some limitations. First, this study focuses on initial acceptance rather than on long-term usage or satisfaction. Although acceptance is important in new technological implementations, user behavior could still vary in the long term. Therefore, longitudinal research needs to be designed taking into consideration other factors that may influence user behavior in the long term, including the novelty of social robots and service quality of the manufacturer. Second, we should be cautious not to over-generalize the findings. Although we included two different roles for the social robots, the experiment was conducted solely with a humanoid robot. As such, the findings may not be fully applicable to nonhumanoid robots. Future research needs to explore the effect of role stereotypes in other types of social robots, e.g., pet robots. In a similar vein, the results may vary depending on the occupational roles, such as that of an administrative assistant. Hence, future studies need to examine the effects of in-role trait violations in occupations that may be more generic with fewer associative stereotypes. Such studies would provide a more holistic understanding of social stereotypes across different occupational roles. Last but not least, one important limitation of this research is the convenience in sampling young college students. Future research is suggested to look at the stereotype effect in human– robot interactions on other potential user groups, such as the elderly. On the surface, we expect the effect of role stereotypes on elderly users to hold since they are supposed to have a greater personal need for structure and may have stronger stereotypes. As a final remark, our findings confirm that social stereotypes can be applied to human–robot interactions, and these stereotypes can provide good insight for the design of social robots by demonstrating how the three different social stereotypes of gender, personality, and occupational role interact together to influence user responses.

AT: Tuck And Yang

Commodification is inevitable there is no way to avoid it. People of colors bodies are inevitably always available for consumption.
Moten 2003

(Fred In the Break: The aesthetics of the black Radical Tradition) pgs 12-14

The value of the sign, its necessary relation to the possibility of (a universal science of and a universal) **language, is only given in the absence** or supercession **of,** or the abstraction from, **sounded speech— its essential materiality is rendered ancillary by the crossing of an immaterial border or by a differentializing inscription**. Similarly, **the truth about the value of the commodity is tied precisely to the impossibility of its speaking**, for **if the commodity could speak it would have intrinsic value, it would be infused with a certain spirit, a certain value given not from the outside, and would, therefore, contradict the thesis on value**—that it is not intrinsic—that Marx assigns it. The speaking commodity thus cuts Marx; but **the shrieking commodity cuts** Saussure, thereby cutting Marx doubly: this **by way of an irruption of phonic substance** that cuts and augments meaning with a phonographic, rematerializing inscription. **That irruption breaks down the distinction between what is intrinsic and what is given** by or of the outside; here what is given inside is that which is out-from-the-outside, **a spirit manifest in its material expense or aspiration**. For Saussure **such speech is degraded,** say, by accent, **a deuniversalizing, material difference**; for Chomsky it is degraded by a deuniversalizing agrammaticality, but Glissant knows that "the [scarred] spoken imposes on the slave its particular syntax." **These material degradations**—Wssures **or invaginations of a foreclosed universality, a heroic but bounded eroticism—are black performances**. There occurs **in such performances a revaluation or reconstruction of value, one disruptive of the oppositions of speech and writing, and spirit and matter.** It moves by way of the (phono-photo-porno-)graphic disruption the shriek carries out. **This movement cuts and augments the primal. If we return again and again to a certain passion, a passionate response to passionate utterance**, horn-voice-horn over percussion, a protest, an objection, **it is because it is more than another violent scene of subjection too terrible to pass on; it is the ongoing performance**, the preWgurative scene **of a (re)appropriation—the deconstruction and reconstruction, the improvisational recording and revaluation—of value,** of the theory of value, of the theories of value.13 **It's the ongoing event of an antiorigin** and an anteorigin, replay and reverb of an impossible natal occasion, **the performance of the birth and rebirth of a** new science, a phylogenetic **fantasy that (dis)establishes genesis, the reproduction of blackness in and as (the) reproduction of black performance(s). It's the offset and rewrite,** the phonic irruption and rewind, of my last letter, my last record date, my Wrst winter, casting of effect and affect in the widest possible angle of dispersion. **It is important to emphasize that the object's resistance is, among other things, a rupture** of two circles, the familial and the hermeneutic. The protocols of this investigation demand the consideration of that resistance as we'll see Douglass both describe and transmit it. More precisely, we must be attuned to the transmission of the very materiality that is being described while noting the relay between material phonography and material substitution.

AT: OPACITY

Their strategy of opaqueness accepts the foundational premises of racism as its starting point instead of directly challenging white supremacy. This positon of internalization leads to communal hopelessness.
Hooks, City Univeristy New York English professor, 1996

[bell, "Killing Rage: Ending Racism" http://books.google.com/books?id=3JlNFYKLheUC&q=unitary+representations#v=snippet&q=unitary%20representations&f=false, p.249-50, accessed 3-21-14, TAP]

269More than ever before in our history, ==black Americans are== succumbing to and ==internalizing== the ==racist assumption that there can be no meaningful== bonds of intimacy between blacks and whites. It is fascinating to explore why it is that black people trapped in the worst situation of racial oppres sion—enslavement—had the foresight to see that it would be disempowering for them to lose sight of the capacity of white people to transform themselves and divest of white supremacy, even as many black folks today who in no way suffer such extreme racist oppression and exploitation are convinced that white people will not repudiate racism. Con temporary black folks, like their white counterparts, have passively accepted the internalization of white supremacist assumptions. Organized ==white supremacists have always taught that there can never be trust== and intimacy ==between the superior white== race ==and== the ==inferior black race. **When black people internalize these sentiments, no resistance** to white supremacy **is taking place; rather we become complicit** in spreading racist notions==. It does not matter that so many black people feel white people will never repudiate racism because of being daily assaulted by white denial and refusal of accountability. We must not allow the actions of white folks who blindly endorse racism to determine the direction of our resistance. Like our white allies in struggle we must consistently keep the faith, by always sharing the truth that 270white people can be anti-racist, that racism is not some immutable character flaw. ¶ ==**Of course** many white people are comfortable with a rhetoric of race that suggests racism cannot be changed==, that all white people are "inherently racist" simply because they are born and raised in this society. ==Such misguided thinking socializes white people both to remain ignorant== of the way in which white supremacist attitudes are learned and to assume a posture of learned helplessness as though they have no agency—no capacity to resist this thinking. Luckily we have many autobiographies by white folks committed to anti-racist struggle that provide documentary testimony that many of these individuals repudiated racism when they were children. Far from passively accepting It as inherent, they instinctively felt it was wrong. Many of them witnessed bizarre acts of white racist aggression towards black folks in everyday life and responded to the injustice of the situation. Sadly, in our times so many white folks are easily convinced by racist whites and bLack folks who have internalized racism that they can never be really free of racism.¶ These feelings aíso then obsc]re the reality of white privi lege. As long as white folks are taught to accept racism as 'natura]" then they do not have to see themselves as con sciously creating a racist society by their actions, by their political choices. This means as well that they do not have to face the way in which acting in a racist manner ensures the maintenance of white privilege. Indeed, denying their agency allows them to believe white privilege does not exist even as they daily exercise it. If the young white woman who had been raped had chosen to hold all black males account able for what happened, she would have been exercising white privilege and reinforcing the structure of racist thought which teaches that all black people are alike. Unfortunately,¶ 271so many white people are eager to believe racism cannot be changed because internalizing that assumption downplays the issue of accountability. No responsibility need be taken for not changing something ¡fit is perceived as immutable. To accept racism as a system of domination that can be changed would demand that everyone who sees him- or herself as embracing a vision of radai social equality would be required to assert anti-racist habits of being. We know from histories both present and past that white people (and everyone else) who commit themselves to living in anti-racist ways need to make sacrifices, to courageously endure the uncomfortable to challenge and change.¶ ==Whites, people of color, and black folks are reluctant to commit themselves== fully and deeply ==to an anti-racist struggle== that is ongoing ==because there is== such a **pervasive feeling of hopelessness—a conviction that nothing will ever change**. **How any of us can** continue to hold those feelings when we study the history of racism in this society and see how much has changed makes no logical sense. ==Clearly we have not gone far enough==. In the late sixties, Martin Luther King posed the question "Where do we go from here." To live in anti-racist society ==we must **collectively** renew our commitment to a democratic vision of racial justice== and equality. ==Pursuing that vision we create a culture where beloved community flourishes and is sustained==. Those of us who know the joy of being with folks from all walks of life, all races, who are fundamentalls' anti-racist in their habits of being. need to give public testimony. Ve need to share not only what we have experienced but the conditions of change that make such an experience possible. The interracial circle of love that I know can happen because each individual present in it has made his or her own commitment to living an anti- racist life and to furthering the struggle to end white supremacy 272 will become a reality for everyone only if those of us who have created these communities

share how they emerge in our lives and the strategies we use to sustain them. Our devout commitment to building diverse communities is cen tral. These commitments to anti-racist living are just one expression of who we are and what we share with one an other but they form the foundation of that sharing. <u>Like all beloved communities we affirm our</u> differences. It is this generous spirit of affirmation that gives us the courage to challenge one another, to work through misunderstandings, especially those that have to do with race and racism. <mark><u>In a beloved community solidarity</u></mark> and trust <mark>are grounded in</mark> profound <mark>commitment to a shared vision</mark>. Those of us who are always anti-racist long for a world in which evezyone can form a beloved community where borders can be crossed and cultural hybridity celebrated. Anyone can begin to make such a community by truly seeking to live in an anti-racist world. <u>If that longing guides our vision and our actions, the new culture will be born and anti-racist communities of resis tance will emerge everywhere. That is where we must go from here.</u>

Attempts to be hidden make you more visible there I no way to get away from the gaze big brother always has eyes on you
Tuhkanen, 2009

(Mikko. The American Optic: Psychoanalysis, Critical Race Theory, and Richard Wright. Albany: State U of New York, pgs 122-124)

<u>The experience</u> of the literary, in other words, <u>would remove the African American subject from his or her fixed position in visibility,</u> from his or her subjection to the "surveillance, suspicion, reading, and rape of others" (D. A. Miller 162). Of course, taking his cue from Foucault, Miller sees such freedom as illusory: he suggests that, <u>seemingly free from surveillance, the "liberal" subject becomes in fact all the more entangled in the networks of power.</u> The experience of the novel constitutes <u>a form of disciplinary subjection that avoids the crudity of blatant, even spectacular, punishment and subjugation. The subject is embedded in the network of discipline</u> that it sees itself <u>avoiding while enjoying the sight</u> of its functioning around him or her. Indeed, <u>while in the cultural imagination of the United States,</u> literacy and education have figured as the passwords for social mobility, they have also functioned as <u>disciplinary methods guaranteeing the continuing existence of a stratified society</u>. Dana Nelson Salvino argues that, despite its promise, the dissemination of literacy among whites and blacks in antebellum America was institutionalized in "an educational system that would not radically alter the existing social balance" (144). <u>The consequences of this tendency for slaves and freedmen were felt</u> in the United States from antebellum to post-Reconstruction time. Salvino argues that "[l]iteracy could lead blacks out of physical, but not cultural and economic, bondage" (153). For Miller, <u>the novel-reading subject's experience of uninterrupted privacy, his sense of seeing without being seen, is, then, illusory. "It is built into the structure</u> of the Novel," he writes, "that every reader must realize the definitive fantasy of the liberal subject, who imagines himself free from the surveil- lance that he nonetheless sees operating everywhere around him" (162). <u>a confirmation of freedom is</u>, Miller continues, <u>essential for</u> the subject: <u>the liberal subject "seems to recognize himself most fully only when he forgets or disavows his functional implication in a system of carceral restraints or disciplinary injunctions"</u> (x). The distance that the novel-reading subject is able to take from surveillance is, in Miller's phrase, "thoroughly imaginary" (x). <u>The freedom and voyeurism of the</u> novel-reading <u>subject is imaginary</u> also in the Lacanian sense. <u>The subject, imagining himself</u> seeing <u>not seen, is all the more immobilized in the specular capture where he is caught seen without seeing,</u> as Lacan notes in his reading of Edgar Allan Poe's "The Purloined Let- ter." The subject misrecognizes <u>his position as that of an outside observer</u>, a voyeur <u>unimplicated in the field of vision, separate from the scene of "carceral restraints" that s/he assumes to survey from a distance.</u> Yet, as Wright and slave narrators make clear, <u>African American readers and writers are unable to sustain this imaginary comfort of seeing without being seen.</u> That is, as much as masters and mistresses saw in slave literacy the dangers of a pharmakon — where "the inch" of slave instruction was likely to turn into "the ell" of rebellion (Douglass, Narrative 40)—<u>the experience of the literary did not free the black subject in any unambiguous way.</u>

Afrofuturism K

Afrofuturism Bad – US Focus

Afrofuturism's unquestioning use of the United States as a central site and science fiction as a genre reinscribes racial oppression.

McCutcheon 2011 (Mark A. McCutcheon, PhD. Associate Professor, English, Athabasca University. Review: "Debating the Histories and Futures of Black SF" Published in Extrapolation Vol. 52, No. 2)

In other words, Afro-Futurism produces a kind of cyborg, anti-realist identity politics that seeks not to overcome alienation but to deepen it as a mode of resis-tance to hegemonic ontologies. Afro-Futurism's alienating effects thus take aim equally at a technocratic modern society founded on white capitalist patriarchy and the racialized terrors of slavery, and at the dominant forms of subjectivity such a society has engendered. So the consistent, conspicuous absence here of any references to Eshun, Nelson, or Rose (among others), while presumably unintended, nonetheless tends more to suppress than to enable a dialogue with Afro-Futurism—an effect exacerbated by the editor's insistent self-positioning as a "pioneer" in this field (251; cf. ix, 245). Barr's editorial self-positioning (with its problematically colonialist figuring) relates the collection's highly selective representation of Afro-Futurist history to a similarly selective representation of its territorial ambit: that is, the collec-tion frequently arrogates black Atlantic writers to black American contexts. The collection shares this kind of arrogation with Dery and Nelson, who both simply assume the U.S. supplies the defining and exemplary national site of Afro-Futurist production (Youngquist 183). In Afro-Future Females, this kind of presumptive, territorial arrogation arises among several contributors, in descriptions of sf as an unproblematically American literature, and in related assumptions about black American culture as tacit synecdoche for Other black diasporic cultures around the Atlantic or around the world. Only Dubey connects the magic-infused speculative fiction of black women writers with Paul Gilroy as well as Toni Mor- rison (35). Henton invokes "diaspora" only to describe the African-American imagination (110) and the diversities of sf form (101). That Hopkinson and some contributors to Mojo are African-Canadian (or African-Caribbean-Canadian, in Hopkinson 's case) is only mentioned in passing by Kilgore (120), who inscribes them nevertheless in "African-American involvement in fantastic fiction" (119). A salutary illustration of the collection's U.S.-centric assumptions occurs in Rogan's essay on Due and Hopkinson. Rogan reads their representations of "the reproduction of mothering" according to a provocative historical-materialist premise: that "the master/slave dialectic… reinscribe[s] itself in the relation of the black woman to capitalist patriarchy… victimized by institutionalized neglect rather than by the close scrutiny she bore as an object of property" (77). On this premise, Rogan builds an insightful reading of mother figures in the subject authors' novels. However, notwithstanding the overall perspicacity of Rogan's reading of Hopkinson according to the globalized continuities of postcolonial cultures and neoliberal hegemony, the critic is on unfamiliar ground in discussing the Canadian setting of Brown Girl in the Ring (1999), whose antagonist Rogan describes as "Canada's Premier Uttley" (90). This misreading of a provincial government leader as Canada's head of state costs Rogan's argument a relevant point about globalization: the provincial political setting makes the novel legible as a satire on Ontario's hard right turn in the mid-1990s under the neoconserva-tive regime of Premier Mike Harris, which so drastically slashed social programs and attacked minoritized groups that Hopkinson's image of downtown Toronto as a gutted inner city reads more like a shrewd urban-planning projection than a post-apocalyptic dystopia.

Afrofuturism masks Eurocentrism and colonial oppression

Albiez, 05 (Sean Albiez is Senior Lecturer in Popular Music at Southampton Solent University. He has lectured in popular music studies, music technology and media and cultural studies since 1991, and has been involved in electronic music making since the mid-1980s., Published in 2005 as 'Post Soul Futurama: African American cultural politics and early Detroit Techno' in European Journal of American Culture. Vol 24. No 2. 2005, TAM)

Cosgrove, in creating <u>a thesis that emphasizes the innovatory futurism of techno, rides roughshod over the sensitivities of the black American racial and personal subjectivity of Atkins.</u> This controversial thesis lingered in later writing on techno, with Sinker stating 'Techno ... explicitly and contemptuously refused community with Motown and motorcity gospel [in favour of] Gary "Me, I Disconnect From You" Numan'.39 Though there is some evidence to suggest Numan was more important musically to Juan Atkins than Motown, no disrespect was intended to the symbolic achievements of Gordy, and Atkins very specifically acknowledges the key role of electronic and synthesizer experimentation by Bernie Worrell (Funkadelic) and early 1970s Stevie Wonder in his music. Furthermore<u>, to cast European electronic music as an escape route for black musicians from the USA's racially antagonistic environment is to create a comforting story that perhaps helps European writers excise memories of the colonial enslavement of Africans, recasting Europe as a post-industrial sanctuary.</u>

Afrofuturism Bad - Solvency

AfroFuturism outdated and no longer works as a movement – it is open ended and message is ambiguous depending on the person

Miller '11 (Miller, Paul D. a Washington DC-born electronic and experimental hip hop musician whose work is often called by critics or his fans as "illbient" or "trip hop". He is a turntablist, a producer, a philosopher, and an author The Book of Ice. Brooklyn, NY: Mark Batty, 2011. Print.)

Every movement has its sell-by date. I think that there were a lot of flaws in the way that Afro-Futurism unfolded, and I think it missed certain pressure points in the flow of how culture evolves in this day and age. It wasn't digital enough, it didn't have a core group of people with any kind of coherent message. It was conceptually open ended without any kind of narrative. People tend to like that kind of thing. I speak of Afro-Futurism in the past tense because I think that the culture at large caught up to and bypassed many of the issues it was dealing with. Forget the idea of the "permanent underclass" that people like Greg Tate (no disrespect) kept pushing. Forget the idea that blacks are outside of any system—we are the system. I guess that many people outside of the arts have awakened to the day and age and moved on. It seemed like Afrofuturism just didn't have a cohesive situation to have music, art and literature evolve from. Sure, Afrofuturism can be used, as you put it to be a "descriptor of a body of knowledge, which does not die and outlives its progenitors (like jazz, hip-hop, deconstruction, or philosophy itself)"—but only by sleight of hand (which is sampling, anyway). It's basically a hall of mirrors, a smoke and fog routine in a middle brow cheap magic show. But hey... even that can be interesting sometimes.

Afrofuturism = Sexist

Even if their small selection of 1AC authors cite feminist principals, the Afro-Future is overwhelmingly imagined as a male dominated space. Sexism and the alienation of black woman inevitably dooms the movement.

AH 2011 (From a collection of short posts on the blog of Jakeya Caruthers, PhD Candidate in Anthropology of Education at Stanford University where she teaches courses on Black Childhood, Queer Afrofuturism and occasionally guest-lectures on representations of race, sex, and gender in popular culture. Her courses have earned her a Middlebrook Prize for Graduate Teaching and a teaching fellowship with Stanford's Center for the Comparative Study of Race and Ethnicity. June 2, 2011 http://queeringafrofuturism.tumblr.com/post/6126537901/female-presence-in-the-afro-future)

In J. Griffith Rollefson's work "The Robot Voodoo Power Thesis: Afrofuturism and anti-anti-essentialism from Sun Ra to Kool Keith" the author argues that afrofuturism, though often viewed as a constructed fantasy and sort of post human, futurist sensibility, has "real" productive potential towards the larger project of cultural theory. He argues specifically that, "By stepping out side of the white liberal tradition and rewriting blackness in all its complexity, afrofuturism offers a novel form of revolution that is rooted in a long history of black opposition". In his work Rollefson sites artists that while productive in their audacity to (re)envision and reproduce alter-destinies, still through practice and position reify notions of hetro-patriarchy and sexism. In all of his examples he presents male-bodied individuals as the leaders of this new wave of cultural thought and progression into the future. The first is the highly noted Sun Ra, band leader for the Arkestra. Rollefson highlights the leader's ability to institute a new wave of futurist thought through an insistence that he was not of this planet and neither is any black person. The author notes that Sun-Ra creates a new space through which black people can begin to let go of desires towards equal citizenship through an indoctrination into an alternate world, that of the uni-verse. Rollefson, notes that Sun Ra and other noted leaders such as George Clinton and Parliament-Funkadelic, as well as MC's such as Kool Keith "established the core tenet of anti-anti-essentialist collapsed binaries". He continues further: " I would like to assert that they do have real political efficacy because they problematize the rigid binary of blackness/whiteness and the matrix of binaries that are inscribed up this central set." Such reimagining works to blur the lines of whiteness and blackness perhaps, however, they do little to renegotiate the history of sexism and erasure that these same histories present (as an opposition) to the project of feminist politics. Through Rollefson's reading **we find that the female presence is non-existent in the theorized** (and thus archived) **afrofuture**. It is problematic to me that **no space, imaginary or otherwise, has been offered with which to combat the issues of patriarchy and sexism** that override our present quests for "Freedom". **Until** the way we think about **afro futurism is inclusive off all black bodies, the project towards liberation will continue to be stunted.** -AH

And, where women are imagined in the afro-future they remain fetishized subjects of the male gaze.

AVM 2011 (From a collection of short posts on the blog of Jakeya Caruthers, PhD Candidate in Anthropology of Education at Stanford University where she teaches courses on Black Childhood, Queer Afrofuturism and occasionally guest-lectures on representations of race, sex, and gender in popular culture. Her courses have earned her a Middlebrook Prize for Graduate Teaching and a teaching fellowship with Stanford's Center for the Comparative Study of Race and Ethnicity. 4/24/2011 http://queeringafrofuturism.tumblr.com/page/4)

To begin, these readings helped me better understand the role of music in complementing or expanding one's own identity and vision of the world. Weheliye effectively delineates the politics of the 'vocoder' effect and how it has different meanings for black and white people in relation to their perceived humanity (37). Indeed, ze effectively shows how musical effects can be used not just to carry the musician and the spectator to a new space (or an audotopia), but also to construct anew body for the musician. Foster takes on this notion in hir essay. Ze delineates how cyberspace is used by people to experience trans identification with races, genders, and sexualities 'different' than their prescribed 'bodies.' In hir reading of science fiction texts, Foster depicts cyberspace as a utopian space, where people are able to experience strength and empowerment in their identities. James in hir essay on Robo-Diva perhaps best fleshes out this phenomenon. Ze reads the work of Beyonce and Rihanna to convey how "afro-futurist robo-diva R&B can be understood as reverse-engineering the body, using music to rewire the way whiteness and patriarchy are programmed into our bodies and structures of feeling" (419). For James, "to adopt the aesthetic of the robo-diva is to throw in white patriarchy's face what it most fears – black women and black femininity not as some 'redeeming' path to 'whole-ness...' that exists solely for the purpose of nursing white culture and maintaining patriarchal privilege" (417). While I certainly appreciate James's reading of these music videos, I almost feel as if ze is glamorizing the radical potential of the robo diva. Indeed, for James, the robo diva is the embodiment of an empowered critique of a white patriarchal regime. While I agree that the robo diva can be a feminist figure, I am circumspect at James's universalizing claim. I posit that while the robo diva can be read as a reactionary, subversive feminist figure, she also can be read as a product if a patriarchal regime. From my understanding, one of the core notions of feminist theory and history is that women's bodies have been demonized by the patriarchy. Indeed, considering the historical associations of women with witches, demons, and other ill-intentioned creatures it is pretty easy to recognize that women's bodies – especially women's menstrual cycles – have been delegitimized by men. Part of the project of second wave feminism was reclamation of women's bodies. Indeed, with books like Our Bodies Ourselves, women began to educate themselves about their bodies and, in the process, empower themselves. Even with the dawn of third wave feminism, women's bodies still continue to be held under the scrutiny of the patriarchal gaze. Depictions of women in media and other public outlets still present a skinny, large-breasted figure – a paragon of beauty unattainable by women. Rates of eating disorders, diets, and self-mutiliation are still issues for the women's rights movement. This is why I am circumspect of immediately labeling the robo diva a feminist icon. Certainly, her cyborg status in many ways bolsters her body. The technology of herself can be said to fortify her from the predatory, penetrative gaze of patriarchy. However, can we not also view this re-configuration and performance of the body as yet another product of a patriarchal capitalist society? James's analysis features Beyonce and Rihanna without thinking about the type of women and the type of bodies these artists have sought to construct. Both of these women still aspire toward dominant (white) notions of beauty – they are still ridiculously toned, often perm their hair, and wear sensational, skimpy clothing to broadcast their bodies as part of their image. Both of these women are known for their bodies. Male consumers and fans often comment on how 'hot' they are. I wonder – could the robot diva simply be a fetish of the patriarchal gaze? Have Beyonce and Rihanna figured out that by playing dress up as a robot, they can further titillate the male gaze? From the discipline of ecofeminism we learn how the domination and degradation of our earth and natural resources can be read with a comparable framework as the trauma inscribed on the woman's body and experiences by patriarchy. Men have historically used technology to rape the land of its resources. Is the robo-diva just another one of these tools? Is her cyborg image really an indication of her colonization? In Kanye's "Love Lockdown" music video alien-inspired tall women stand with their arms at their shoulders as Afrofuturist men dance behind them. The camera takes a curious focus. It features the dancers dancing in-between the legs of the woman. In this moment I began to recognize – could the reproductive capacity of women simply being appropriated for by the afro-futuristic impulse for a new world, for a new body? I think it's important that we approach issues of gender difference within the afro-futuristic project with a critical eye. We cannot simply exalt the 'robo-diva; we must continue to complicate her politics and presence in order to better understand the feminist implications of afro-futurism.

Sci-Fi Bad - Feminism

The Alt can't solve- examining science from a feminist perspective reinforces sterotypes of women- as incompetent

Fehr 04 (Carla is an Associate Professor in Department of Philosophy and Religious Studies at Iowa State University. She works in the philosophy of biology, feminist philosophy and feminist science studies. "Feminism and Science: Mechanism Without Reductionism" Spring http://muse.jhu.edu/journals/nwsa/summary/v016/16.1fehr.html

Although it has been said before by such leading philosophers as Sandra Harding (1987) and Helen Longino (1987), the point that feminist theorists do not and should not endorse a single feminist method, or of a single way that women do (or ought to do) science bears repeating for at least three reasons. First, Donna Haraway (1985) has pointed out that feminism and science need to be intertwined if we are to exercise our responsibility for the practices and products of science and technology. By drawing a line between women's science and science itself, we lose our ability to address current problems within scientific practice, and we don't investigate ways in which the traditional practice of science can be interrogated and improved. Second, presuppositions of a single feminist science reinforce the cultural stereotype that women can't do science as it is traditionally construed. This further removes an already marginalized group from mainstream scientific discourse and fails to give credit to women who have fought to succeed as researchers in what continues to be a man's game. Finally, we need to guard against essentializing women's intellectual or cognitive characteristics. Advocating a single feminist science suggests that there is a single, feminine manner way in which women think or relate to other people or organize their experiments and their laboratories. This is not the case. Because of the latter two concerns, pluralism is an appropriate attitude to take toward feminism and science. Instead of endorsing a feminist method, I hope to create space for a variety of approaches.

Sci-Fi Bad – Cedes Political

We should build plausible and specific scenarios—that's key to improve policymaking and avoid existential threats

HUNTLEY et al 2010 (Wade L. Huntley, US Naval Postgraduate School; Joseph G. Bock, Kroc Institute for International Peace Studies; Miranda Weingartner, Weingartner Consulting; "Planning the unplannable: Scenarios on the future of space," Space Policy 26)

On 16 March 1966 <u>Neil Armstrong</u> deftly piloted the Gemini VIII within 0.9 meters of the pre-launched Agena Target Vehicle, then slowly <u>accomplished the world's first orbital docking</u>. Armstrong and co-pilot David Scott were still in a celebratory mood, when Scott noticed the Gemini beginning to roll. Armstrong used the Orbit Attitude and Maneuvering System thrusters, but the moment he throttled down, they started to roll again. Turning off the Agena seemed to stop the problem for a few minutes. But when it began again, the roll was accelerating. They undocked and with a long burst of translation thrusters moved away from the Agena. But the roll continued to accelerate. Tumbling now at one revolution per second, the astronauts were in danger of impaired vision and loss of consciousness. But <u>Armstrong was able to bring</u> the <u>wild oscillations under control thanks</u> in part <u>to preparation by a flight simulation training exercise that many pilots disliked, believing the simulation was</u> too <u>unlikely</u> to waste their scarce training time and energy on.26 <u>Fortunately, NASA</u> did not plan the astronauts' training based on the most likely scenarios. Instead, they <u>planned on the basis of plausible and important scenarios</u>. <u>Developing plausible scenarios helps us take the long view in a world of great uncertainty</u>.27 Scenarios are narratives of the future defined around a set of unpredictable drivers, <u>intended to expand insight</u> by identifying unexpected but important possible directions and outcomes. <u>Scenarios</u> have a timeline over which meaningful change is possible. They <u>are a useful tool for examining a number of different possible futures. They provide a means to stimulate new thinking, challenge assumptions, and provide an effective framework for dialogue</u> among a diverse group of stakeholders. <u>They can inspire new ideas and innovations</u> by helping identify common goals <u>and</u> interests that <u>transcend current political divides</u>. <u>Scenarios thus help to develop the means to work towards preferred futures.</u>28 Scenarios are stories about the way the world might turn out tomorrow; they do not need to be likely, but they ought to be plausible, internally consistent, and relevant. <u>It is precisely by considering possible</u>, even if not necessarily likely, <u>scenarios that we are best prepared for the unpredictability of the future. By encouraging creative thinking beyond the future we anticipate, scenarios help us become more resilient to unexpected events.</u> With respect to their utility in guiding policy development, three features distinguish good scenarios from simple speculations, linear predictions or fanciful musings of the future: Scenarios are decision focused. Successful scenarios begin and end by clarifying the decisions and actions the participants must make if they are to deal successfully with an uncertain future. <u>One common misconception of scenarios is that they are prescient, path dependent predictions of the future. On the contrary, scenarios are used to order our thoughts amid uncertainty, build common ground among differing perspectives, and think rationally about our options. The value of a set of scenarios accrues not from their accuracy or likelihood, but from their plausibility and the insights they generate</u>. Scenarios are imaginative. In examining a decision within the context of a number of different futures, scenarios require us to look behind fixed assumptions. They encourage participants to challenge conventional wisdom, create new contexts for existing decisions, and think creatively about options for surmounting obstacles. At their core, then, scenarios are about learning.29 Scenarios are logical. The scenario process is formal and disciplined in its use of information and analysis. The creativity and imagination inspired by scenarios can only be as effective as it is based in realistic assessments. In requiring participants to challenge each others' thoughts, perceptions, and mind-sets, the process helps clarify that reality. Scenarios first emerged following World War II as a method of military planning. This approach was reflected in Herman Kahn's assertion of the need to ''think the unthinkable'' concerning the possibilities and implications of war in the atomic age. ''In our times'', Kahn wrote in 1966, <u>''thermonuclear war may seem</u> unthinkable, immoral, insane, hideous, or <u>highly unlikely, but it is not impossible''.</u> 30 Kahn's motivation was, in part, recognition of the counter-intuitive notion that <u>planning could be a necessary means of avoidance.</u> Analyzing scenarios reached greater methodological sophistication with the work of Pierre Wack, a planner at the London offices of Royal Dutch/Shell. Wack and his colleagues refined the application of scenario thinking to private enterprise. This work helped Shell anticipate the consequences of the emergence of a cartel among oil exporting countries, and to develop various plans to cushion the blow that would (and did) result from formation of the Organization of the Petroleum Exporting Countries (OPEC) in 1960. Shell was also able to anticipate massive economic and political change in the then USSR in the late 1980s.31 Scenario analysis came to be used in the political arena when associates of Wack assisted stakeholders in South Africa in the peaceful transition from apartheid to democracy. Many doubted the country's prospects; in 1987, the Guardian Weekly quoted Margaret Thatcher's former spokesman Bernard Ingham as saying that anyone who believed the African National Congress (ANC) would one day rule South Africa was ''living in cloud cuckoo land.''32 But with operations in South Africa and an interest in preventing anarchy following the downfall of apartheid, Shell sent some of Wack's prote´ge´s, including Adam Kahane, to convene meetings of top governmental, religious, civic and business leaders at a conference site there called Mont Fleur. From February 1990, when Nelson Mandela was released from prison, to April 1994, when the first all-race elections were held, participants identified relatively certain and uncertain but plausible factors, and then formed into teams to research various alternative futures. In the midst of deep conflict and uncertainty, ''Mont Fleur'' brought people together from across ideological and political divides to think creatively about the future of their country. The collaboratively drafted scenarios were not a panacea, but did contribute to establishing a common vocabulary and enough mutual understanding

for participants to find common ground on complex decisions. In particular, the consensus on the undesirability of three particular scenarios contributed to developing the perception of shared interests that was an important element in the success of the governmental transition.33 <u>Scenario-building and analysis has become a distinct tool of US government policy making, and has been applied directly to future space security issues</u>. For example, one major US Air Force scenario-based study evaluated 25 emerging technologies and 40 separate potential weapons systems through the lens of six ''alternative futures'' in an effort to guide future Air Force policy choices.34 <u>This exercise </u>(and others like it) <u>exemplifies the potential for applying nonlinear future planning methodologies to large-scale public policy topics, including the future of space</u>. The principal deficiency of such government-sponsored efforts is simply the narrowness of their focus e they are, by design, only concerned about a single government's decision points and are shaped by the goals, dilemmas and uncertainties most relevant to that single party. Lacking is a parallel process to achieve the same kind of expansive thinking while also incorporating a full range of stakeholders. Such exercises can hardly be generated by governments.

Sci-fi empirically can't understand or affect policy

Berger 1976 – award winning science fiction author (July, Albert I., " The Triumph of Prophecy: Science Fiction and Nuclear Power in the Post-Hiroshima Period" Science Fiction Studies, Vol. 3, No. 2, JSTOR)

This <u>naivete about politics and preoccupation with technological solutions was the obverse of the prevailing SF distaste for politics</u>. Politics had <u>always had a bad press in the science-fiction magazines, being portrayed as the captive of technologically, if not socially reactionary special interests</u>. The appalling <u>scientific ignorance and prejudice displayed by Congress after Hiroshima, and its general unwillingness to be educated, merely compounded the problem in the eyes of science-fiction writers</u> and readers. This distaste for politics was testified to not only by letters-to-the-editor in Astounding and the fan magazines but also by an article by W.B. de Graeff, "Congress is too Busy" (Sept 1946), detailing with a gleeful contempt the most mundane and ridiculous chores of a member of Congress. By <u>1950 even an old stalwart like E.E. Smith could take up nearly a third of a novel-First Lensman</u> (not serialized; Fantasy Press 1950)-<u>with a detailed account of an election in which military heroes act both as police forces and as candidates arrayed against a corrupt political machi</u>ne. The <u>use of conspicuously armed poll watchers and what amounts to a military coup are justified by the criminal tactics of the opposition. Smith's villains are supposed to be the pawns of a sinister conspiracy of aliens, but their methods are described as normal American practice.</u>

SF alone isn't enough – new socio-literary techniques are needed for public engagement

Miller and Bennett 2008 - Associate Director of the Consortium for Science, Policy and Outcomes, Associate Director and CoPI of the Center for Nanotechnology in Society, and Chair of the PhD Program in Human and Social Dimensions of Science and Technology at Arizona State University. He is also a Senior Fellow in the Center for World Affairs and the Global Economy at the University of Wisconsin-Madison. He holds a PhD in electrical engineering from Cornell University AND PhD in biochemistry from Arizona State University in 2003 and today is an Assistant Research Professor in the Consortium for Science, Policy and Outcomes and the Center for Nanotechnology in Society at Arizona State University (October, Clark A. and Ira, " Thinking longer term about technology: is there value in science fiction-inspired approaches to constructing futures? " Science and Public Policy, 35(8), Ebsco)

<u>Even if science fiction offers an alternative approach to fostering thinking about longer-term developments in technology</u> — one that focuses as much or more on the social dimensions of technological change than the technological — <u>new kinds of socio-literary techniques would still be needed in order to exploit this approach in public engagement or technology assessment exercises</u>. In the past two years, <u>we have undertaken or participated in several exercises that have explored how aspects of science fiction might be used in interesting ways that we describe in brief here</u>. We do not mean these to rise to the standard of proof of concept, by any stretch of the imagination. Nevertheless, we offer them as illustrations of a couple of possible approaches we have taken, early on in our explorations of how we might use science fiction-inspired techniques to advance the objectives of societal reflection on technological futures.

Predictions about the future of space must be rigorous and realistic—their science fiction stories don't qualify

HUNTLEY et al 2010 (Wade L. Huntley, US Naval Postgraduate School; Joseph G. Bock, Kroc Institute for International Peace Studies; Miranda Weingartner, Weingartner Consulting; "Planning the unplannable: Scenarios on the future of space," Space Policy 26)

Few space security analysts have focused on the possibilities for cooperation to function more organically as an element of the evolution of human space activities, rather than simply as a structure applied to that evolution. The more organic possibility reflects the potential over time for cooperative agreements and institutions to change state interests themselves. Processes facilitating such evolution include strategic interest convergence, information creation and sharing, "spillover" and "feedback" effects, issue scope expansion and integration, and the facilitation of transnational linkages. Interacting synergistically with the interests they are influencing, such cooperation evolves dynamically as well. As such cooperation deepens its roots among all parties, it can begin to endure self-sustainably.21 The potential for more organic principles and cooperative institutions to shape the nature of political relations themselves suggests a more expansive concept of the underlying nature of interstate relations e one that need not always resemble the realist image of a Hobbesian "war of all against all". Hedley Bull's "anarchical society" and Daniel Deudney's "negarchy," for example, capture the past and present existence of international political orders that, despite the absence of hierarchical government, have functioned as qualitatively distinct governance systems.22 Application of concepts of qualitatively distinct political ordering principles to developing governance conditions of the future human presence in space is as yet largely unexplored.23 The fluidity of interests and capabilities with respect to space activities suggests a relatively large potential for organized cooperation to influence their evolution. Such cooperative principles and institutions would then become intrinsic to the dynamic political forces shaping the expanding human presence in space, growing and evolving with them, rather than acting as exogenous static structures seeking to constrain those forces.24 <u>The rate and uncertainty of change in both the technological and political dimensions of expanding human space activities complicates this task. Herein lies the value of "realistic visions". Rigorous articulations of the interplay of the wide variety of constraints, tradeoffs, uncertainties, and values entailed in human expansion into space can facilitate evaluation of the applicability of alternative governance concepts to human space activities in the context of dynamic change.</u> Among other things, such visions can explore how alternative futures in space are intimately linked to terrestrial conditions. As the human presence in space develops into an integral aspect of global life, it will increasingly reflect the prevailing conditions of global life. Anticipation of space weaponization premises continued earthly insecurity and conflict, while ambitions for growing commercial and exploratory development of space presume increasing international integration and collaboration. A future in which space becomes a domain of conflict and arms race competition may be irreconcilable with visions for increasing peaceful human presence embodied in today's growing commercial and exploratory activities. <u>Choices among alternative futures for the human presence in space may depend upon choices among</u> alternative futures for life on Earth as well. The following section reviews the potential for scenariobuilding techniques to inform these choices by providing rigorous detailed visions of future worlds that account for a wide range of current realities and span the spectra of the most important uncertainties. <u>The resulting plausible, integrated visions can yield feasible policy-relevant insights that demonstrably enable current policy making to be more farsighted.</u> Beyond the fruits of the exercises themselves, the longer time-frames entailed in scenario building also facilitate dialogue among diverse parties divided on nearer-term questions. <u>The collaboration enabled can inspire innovation and integrated analysis among diverse experts, leading to the development of a productive "epistemic community"25 addressing the full scope of future human space activities.</u> Vision development is only one aspect of long-term planning. Comprehensive knowledge generation and strategies for policy making are also required. But vision development is currently the least well advanced. <u>All global policy debate, including US national security policy making, can benefit from having a fuller range of rigorous and credible assessments of long-term prospects from which to draw</u>.

Science fiction conflates fantasy with fact—this undermines civic engagement and scientific literacy

Kluger 7/11/11 - senior writer for TIME (Jeffery, " Scientific Illiteracy After the Shuttle: Are America's Smartest Days Behind Her?" http://www.time.com/time/health/article/0,8599,2082213,00.html)

The problem is, <u>the land of the free</u> and home of the brave <u>is in danger of becoming</u> — not to put too fine a point on it — <u>the land of the dunderhead</u>, and my trip to Cape Canaveral, Fla., drove that point home. It's no secret that <u>as a people, we're rapidly losing the basic fund of knowledge we need if we're going to function well in a complex world</u>. Just last week, another dispiriting poll was released revealing how little some of us know about our national history. Only 58% of Americans can say with certainty what happened on July 4, 1776 — a figure that falls to a jaw-dropping 31% in the under-30 cohort. Fully 25% of Americans who do know that we seceded from some country or another to become a nation don't know what that former parent country was. This follows on the heels of other polls showing similar numbers of folks believing that we fought the Russians in World War II and beat them with the help of our stalwart German allies. Being historically illiterate is bad. Being scientifically illiterate, however, is even worse — if only because <u>having a working knowledge of how the world operates is essential to understanding critical areas of national policy</u>. Type the words "global warming" and "hoax" into Google and you get an appalling 10.1 million hits. The polls are all

over the map on this one, but they show that rising numbers of Americans think climate science is fraudulent or exaggerated — up to 41% in one survey. It's not merely opinion to say that those people are simply wrong. There may be raging debates among scientists about the precise severity, mechanisms and trajectory of global warming, but the basic science is established and accepted, whether you want to admit it or not. Then of course there are the 18% of Americans who believe the sun revolves around Earth and the 28% who think the moon landings were faked. Google that last one and you're taken to sites that profess to be forums for political debate. Political debate? About faking the moon landings? This isn't the Roman Senate, folks, it's fantasyland. What got me thinking about all this was a stop I made after the launch at the Kennedy Space Center Visitor Complex — a combination museum and theme park on the Cape Canaveral grounds. The center's special feature this season is called Sci-Fi Summer 2011 — and it delivers just what it promises. Adjacent to the rocket garden, with its full-size mock-ups of the U.S.'s most legendary boosters, is a massive maplike display comparing the sizes of the Saturn 1B, the Saturn 5, the Mercury Redstone, the space shuttle and the International Space Station to the Starship Enterprise. Which is fine, except that all the other spacecraft actually existed and the Enterprise, um, didn't. The spacesuits worn by Neil Armstrong, Gordon Cooper and other astronauts are similarly commingled throughout the exhibit with uniforms worn by the Klingons and Romulons. There is also an entire pavilion set aside for a Star Trek display. O.K., it's cranky to begrudge people a little fun and Star Trek is undeniably cool. But do we really not get enough fun and cool elsewhere? Is there anyone alive who thinks that what Americans need right now are more ways to divert and amuse ourselves? Mix Cooper with the Klingons or the shuttle Enterprise with the Starship Enterprise long enough and the kids who consume all this stuff will no longer be able to tell them apart. Scientific literacy is part of good citizenship. And when it comes to space science, you don't need a lick of fiction to make it fun. An engineer at NASA's Jet Propulsion Laboratory who works in the interplanetary program once explained why he loves his job by saying, "If you can't have a good time coming to work and building robots to send to Mars, give it up, man." The same used to be true of merely learning about such things. It must become true again if the U.S. is going to keep its edge.

Futurism Bad - General

Futurism is unproductive

Salam '06(Salam, Reihan. American political commentator, columnist, and author. He is the executive editor of "National Review" "The Future of Futurism." Slate. The Slate Group, 09 June 2006. Web. <http://www.slate.com/articles/technology/technology/2006/06/the_future_of_futurism.html>.)

The problem is that we mean different things by "future." The reality is that there are other ways of imagining our relationship to time. Steffen outlines six 1. THE PAST. Character is history; character is destiny. We have a way of rewriting history to suggest what the future will be. To wit: The Alamo. It has been purposed and repurposed to be a lesson that substantiates Manifest Destiny, multi-cultural origins, and even anti-tax rhetoric. It positions where we're going in the past. Steffen suggests that it's worth knowing that there is often a huge gap between what professional historians think/believe and how retellers of these stories reflect these stories. 2. SIMPLE PREDICTION. Most predictions are glaringly wrong. It is important to know the difference between predictions grounded on data and articulated as probabilities, and predictions that are simply personal opinion founded on a set of individual, qualitative beliefs. The latter is not always wrong, but the inquirer needs to be careful about them. One huge example: Climate Change. One side has assigned a set of probabilities, data, and created peer-reviewed work to predict our trajectory. Based on this scientific effort, the globe is on a track toward 7 degrees warming. There are very few predictions about what 7 degrees means because it represents such a profound change; there is no meaningful prediction. So academics and media talk about is 4 degrees and 2 degrees. "Business as usual" will land us at 4. But business as usual is not a fair way of dealing with the future. The climate models accepted by the scientific community give us budgets, curves and timelines; these are effectively predicting our future scientifically. If we want to have a more reasonable task, we must start to lower our emissions on an individual and national level. In fact, what we do now about carbon matters in a way that few moments have mattered. Impacts will be with us for thousands of years. All of this is a direct read of the world's largest peer reviewed process of prediction. This is very real. We can look and feel despair, but Steffen believes that in fact there are many incentives aligning for the private sector to re-think its relationship to carbon. One of the reasons why change will happen is that the sheer size of the assets at risk from climate change, added to how much can be made from switching to new platforms and technologies, far outweigh the fossil fuel business. Steffen maintains that, fundamentally, there is only one question: how long will politics allow this delay to continue? 1. PREDICTING THE PRESENT. Building on William Gibson, author of Neuromancer, this way of approaching time suggests that we predict the future by looking at things that have already been built in the present. (Gibson's famous quote is some semblance of: "The Future is here; it's not evenly distributed.") We can look for things in our current environs that suggest where change will take place. 1. ANTICIPATION OR PROVOCATION. This relationship to time uses new products as provocation. Steffen put up a fake-product picture of "panda jerky" (lab-grown panda meat, made into jerky, and packaged like any other FMCG). Concept cars brought to the auto shows are an example of anticipation or provocation. The TV show "Black Mirror" is this sort of speculative science fiction; its construct is that it takes one unintended consequence of a new technology and "blows it out," trying to see how technology would change the future if its taken to an extreme conclusion. Many other types of science fiction (e.g., Mad Max) are themselves provocations, and not all of them are silly. (The Red Mars, Green Mars, Blue Mars Trilogy by Kim Stanley Robinson is one such example. Its premise: What if we tried settling Mars and the people who settled decided to rethink society?). Provocation can become the grounds for more detailed

and thoughtful examination. 2. VISIONARY FUTURES. "Dune" is a detailed systems future using things that aren't possible, but an excellent vision of a different reality. These works are often about "world building." World building itself has become a popular cultural activity. It's evident in role-playing games, and the way people look at programs like "Lost". Often these visionary futures are pure entertainment. We can think of this as escapism being a future function of our society. We don't necessarily believe in what this outlines, but we are entertained.

Futurism Bad – Edelman

Embrace the death drive to allow a space for the queer

Edelman, 98 (Lee Edelman is a professor in the English Department at Tufts University, "The Future is Kid Stuff: Queer Theory, Disidentification, and the Death Drive", Jan. 1998, date accessed 7/17/15, TAM)

<u>Choosing to stand</u>, as many of us do, <u>outside the cycles of reproduction</u>, choosing to stand, as we also do, by the side of those living and dying each day with the complications of AIDS, <u>we know the deception of the societal lie that endlessly looks toward a future whose promise is always a day away.</u> We can tell ourselves that with patience, with work, with generous contributions to lobbying groups, or generous participation in activist groups, or generous doses of political savvy and electoral sophistication, <u>the future will hold a place for us-a place at the political table that won't have to come</u>, as it were, <u>at the cost of our place in the bed, or the bar, or the baths. But there are no queers in that future as there can be no future for queers. The future itself is kid stuff, reborn each day to postpone the encounter with the gap, the void, the emptiness, that gapes like a grave from within the lifeless mechanism of the signifier that animates the subject by spinning the gossamer web of the social reality within which that subject lives. If the fate of the queer is to figure the fate that cuts the thread of futurity, if the jouissance, the excess enjoyment, by which we are defined would destroy the other, fetishistic, identity-confirming jouissance through which the social order congeals around the rituals of its own reproduction, then the only oppositional status to which our queerness can properly lead us depends on our taking seriously the place of the death drive</u> as which we figure and insisting, against the cult of the child and the political culture it supports, that we are not, to quote Guy Hocquenghem, " <u>"the signifier of what might become a new form of 'social organization' (138), that we do not intend a new politics, a better society, a brighter future, since all of these fantasies reproduce the past, through displacement,   in the form of the future by construing futurity itself as merely a form of reproduction</u>. Instead we choose not to choose the child, as image of the imaginary past or as identificatory link to the symbolic future; we would bury the subject in the tomb that waits in the hollow of the signifier and pronounce at last the words we are condemned from the outset for having said anyway: that we are the advocates of abortion; that the child as figure of futurity must die; that <u>we have seen the future and it's every bit as lethal as the past; and thus what is queerest about us, queerest within us, and queerest despite us, is our willingness to insist intransitively: to insist that the future stops here.</u>

Utopianism = Passivism

Post-colonial futurism and utopianism are non-falsifiable and make it impossible to create coalitions or enact political change – its built on a flawed foundation

Niezen, 07 (Ronald Niezen holds the Katharine A. Pearson Chair in Civil Society and Public Policy in the faculties of Law and of Arts, a Tier 1 Canada Research Chair in the Anthropology of Law, and is a Professor and former Chair of the Department of Anthropology., "Postcolonialism and the Utopian Imagination", 21 September 2007)

Postcolonial futurism has no answer to the problems and paradoxes of cultural claims and collective strivings toward distinctiveness and selfdetermination other than to imagine a world in which they do not exist. Recalling that postcolonialism also encourages nationalist essentialism, this means that there are two antipathetic, mutually negating versions of postcolonial liberation: one looking toward a future of borderless global cultural liberation, another toward a more immediate, intellectuallyinspired era of cultural affirmation and autonomy. Postcolonial futurism commits the fundamental error, once widely attributed to Marxism, of anticipating a global state of collective being that underestimates the propensity toward national or minority identities based on affirmation of the rights of peoples, today often expressed in terms of cultural distinctiveness coupled with claims of political self-determination. But the national and universalist versions of postcolonial liberation are, at least in one sense, complementary. The utopian imagination is able to make particular cultural allegiances seem more palatable for global consumption, to mask the unpleasant flavours of indigenophilism and small-scale identity politics with saccharine promises of unconditional liberation from the levelling powers of nation-states. It is able to reconfigure particular cultural aspirations in a way that removes from view their tensions, contradictions and proclivities to intolerance, while leaving intact their most compelling promises of inclusion, spiritual awareness, intimacy and affirmation. This brings us to the most important question that follows from the recent resurgence of utopian visions: what is wrong with hope? Why should we deny dreamers the consolation of their fantasies? Is not the capacity to imagine a different and better world the most important component of our ability to change the world for the better? And does it POSTCOLONIALISM AND THE UTOPIAN IMAGINATION 727 Downloaded by [] at 07:10 18 July 2015 not follow that denying the possibility of imagining a radically different future might result in a crippling of the capacities to criticize present institutional injustices and dysfunctions and to create better institutions and forms of governance? There is a relatively simple answer to this: hope for the future goes astray whenever it is built upon a mistaken understanding of present conditions; and there is no definitive way to correct its errors. The utopian imagination is by its very nature free to elaborate radically different-from-the-present visions of a yet-to-be-realized society, founded on misleading, irrational understandings of the present circumstances or propensities of human social life. There is a sense in which utopianism, when tolerated as a form of intellectual discourse, can wreak havoc on recognized forms of critical etiquette. How might one, as a critic, point conclusively to a misrepresentation of the collective future? One of the appeals of utopianism is its immunity from falsification. Certain dreams are inherently adverse to the stimulants of facts, practicalities and openness to revision. The postcolonial utopian imagination is especially fraught with dilemmas and improbabilities. Although being largely premised on postmodernism's rejection of 'grand narratives', and although expressing its vision of the future as one of permissiveness and cultural freedom, it indirectly possesses its own civilizing agenda to which all others are expected to conform. Insofar as it does articulate a specific vision of future change, it anticipates the dismantling of existing structures of

nation-states and institutions of global governance, while maintaining a naı̈ve faith in the emergence, out of conditions of revolutionary change and insecurity, of a free-flowing global cultural ecumene. Does this mean that there is no form of utopian imagination applicable to conditions of planetary integration, one that can offer realizable inspiration without engaging in obscurantism, cultural fundamentalism or civilizing agendas? My perspective suggests that postcolonial idealism makes it almost impossible to learn from the actual disorderly processes of negotiating and overcoming differences. But perhaps it is yet possible to construct a vision of the future that acknowledges the untidiness and disarray of human identities. Whatever other qualities it might have, such futurism would begin with the following premise: we have more to learn from those who have struggled through conflict, compromise and reconciliation to achieve a condition of peace than from those who are content to imagine away the obstacles to an otherwise unachievable ideal.

Iconoclastic and Blueprint Utopianism Worthless.

Jacoby 5 (Jacoby, Russell. is a professor of history at the University of California Los Angeles an author, and critic of academic culture. Preface. Picture Imperfect: Utopian Thought for an Anti-Utopian Age. New York: Columbia UP, 2005. Ix. Print. Preface xv)

I turn instead to the iconoclastic utopians, those who dreamt of a superior society but who declined to give its precise measurements. In the original sense and for the original reasons, they were iconoclasts; they were protesters and breakers of images. Explicitly or implicitly they observed the biblical prohibition on graven images of the deity. "Thou shalt not make unto thee any graven image. . . . Thou shalt not bow down thyself to them, nor serve them" (Exodus ⬜⬜:⬜–⬜). This prohibition, of course, entailed no disrespect of God. On the contrary: it honored Him by refusing to circumscribe Him. In the same way that God could not be depicted for the Jews, the future could not be described for the iconoclastic utopians; it could only be approached through hints and parables. One could "hear" the future, but not see it. Ernst Bloch's ⬜⬜⬜⬜ Spirit of Utopia, the classic work in this genre, offers no concrete details about the future. He invokes a utopian spirit purely by his reflections on music, poetry, and literature. I survey the roots and contours of such iconoclastic utopianism—iconoclastic inasmuch as it eschews blueprints and utopian inasmuch as it evokes a future "bliss of the fully contented."11 The blueprint utopians have attracted the lion's share of attention—both scholarly and popular. They describe utopias in vivid colors; their proposals can be studied and embraced or rejected. From Thomas More to Edward Bellamy, their utopias took the form of stories in which travelers report of their adventures from an unknown future or land. They offered characters, events, and particulars. Bellamy's Looking Backward, a classic of blueprint utopianism, commences with a straightforward Preface xv JACOBY FM 1/24/05 9:29 PM Page xv narrative. "I first saw the light in the city of Boston in the year ⬜⬜⬜⬜." By contrast, the iconoclastic utopians offer little concrete to grab onto; they provide neither tales nor pictures of the morrow. Next to the blueprinters they appear almost as ineffable as they actually are. They vanish into the margins of utopianism. Bloch's Spirit of Utopia opens mysteriously. "I am. We are. That is enough. Now we have to begin." In regard to the future the iconoclasts were ascetic, but they were not ascetics. This point must be underlined inasmuch as iconoclasm sometimes suggests a severe and puritanical temper. If anything, it is a longing for luxe and sensuousness that defines the iconoclastic utopian, not a cold purity. In an image-obsessed society such as our own, I suggest that the traditional blueprint utopianism may be exhausted and the iconoclastic utopianism indispensable. The iconoclastic utopians resist the modern seduction of images. Pictures and graphics are not new, of course, but their ubiquity is. A curtain of images surrounds us from morning till night and from

childhood to old age. The word—both written and oral—seems to retreat in the wake of these images. "Everything," writes the theologian Jacques Ellul in his defense of modern iconoclasm, The Humiliation of the Word, "is subordinated to visualization, and nothing has meaning outside it." We are living in an "age of extreme visualization."12

Utopianism papers over the most crucial aspects of creating a new future – fully rendered political utopias are not useful roadmaps to change

Niezen, 07 (Ronald Niezen holds the Katharine A. Pearson Chair in Civil Society and Public Policy in the faculties of Law and of Arts, a Tier 1 Canada Research Chair in the Anthropology of Law, and is a Professor and former Chair of the Department of Anthropology., "Postcolonialism and the Utopian Imagination", 21 September 2007)

Attempting to define the concept of utopia introduces the multi-dimensional inconvenience of a rich literature in which there are paradigmatic historical transformations leading up to a confusion of meanings in the present. In the most general terms possible, utopianism is a literary form that describes the essential features of an ideal future society. The modern utopian tradition therefore begins with the rise of lay literacy and the development (or rediscovery) of a secular, humanistic, practical approach to human perfectibility. The term utopian imagination does not necessarily mean the disposition toward elaboration of fully formed visions of humanity's future. It also refers to more subtly rendered dreams of the future, based on assumptions of human perfectibility, usually accompanied by expectations of their actualization. It describes a future world that has already gone through revolutionary transformation, without the nature of that revolution (particularly its traumas) being fully elaborated. If there is a common logic to the many different dreams of utopia, it can be found simply in the expectation of better things tomorrow, projecting into the indeterminate future the amelioration of present deficiencies, a kind of wish fulfilment for humanity. The utopian imagination does not just depict alternative worlds, but worlds that somehow transcend the conflicts and dysfunctions of lived reality. What are the particular forms of utopian imagination that might find root in the current intellectual terrain? This question is complicated by the fact that until fairly recently there was a general consensus among social theorists that utopian thinking had dramatically declined, having been suppressed in one way or another by conditions of late modernity. Manuel and Manuel's epic survey of Western utopian thought, for example, concludes with the observation that, unlike previous ages in which there was a rich imaginary of ingenious and often bizarre alternatives to the state, family, sexual mores, private property, and so on, there was in the late twentieth century a 'discrepancy between the piling up of technological and scientific instrumentalities for making all things possible, and the pitiable poverty of goals'.5 Only two decades ago Habermas argued that the West's successful projects of social democracy and the welfare state had taken much of the allure out of utopian projects, mainly by creating a politico-economic order that forbade any radically different alternative, placing limits on dissent and particularly on radical designs for a better future.6 Views may have differed on the causes of the steep decline in utopianism in late modernity—the dampening effect of the spectacular failure of several major forms of political imperialism driven by ideological futurism, notably fascism and Soviet communism, has been the most common and straightforward explanation—and they may have differed on the significance that should be attached to the decline, ranging from 716 ISRAEL AFFAIRS Downloaded by [] at 07:10 18 July 2015 nostalgic regret to celebration of an end to a politically dangerous form of irrationalism, but until very recently there was broad consensus surrounding the view that utopian projects came quietly to an end some time during the post-World War II period of the twentieth century. Part of the reason

for this perception of decline has been an undue emphasis on fully rendered political utopias with less consideration given to alternative, comparatively formless visions of the future. But just because the modernist visions of the nineteenth and early twentieth centuries are now largely discredited does not mean that the propensity to envision an ideal future, particularly in times of accelerated global change, has diminished. We must be alert to the possibility that it has simply taken new forms, not just those familiar ideas that reject the dystopias of uncontrolled science and global tyranny, but more often creative varieties of ambitious optimism. Today, universal ideals of liberation seem to be keeping pace with new perspectives on globalization, and we should expect that out of the promise and insecurities of a rapidly integrating world there would again emerge hopeful visions of the human future.

Utopianism = Violence

Utopianism paves the way to totalitarianism and endless
Jacoby 2005

(Jacoby, Russell. professor of history at the University of California Los Angeles an author, and critic of academic culture Picture Imperfect: Utopian Thought for an Anti-Utopian Age. New York: Columbia UP, 2005. Print. Page 12-13)

The common wisdom that <u>utopias inexorably lead to dystopias not only derives from texts, it appeals to history</u> to make its case. New words help make the argument. Like "dystopia," the term "genocide" belongs to the twentieth century. Inevitably these new terms seem related; they seem to address kindred experiences. Raphael Lemkin, a Polish-Jewish refugee, coined "genocide" in 🯄🯄🯄🯄 "to denote an old practice in its modern development"—the annihilation of a national or ethnic group. He believed the Nazi practices occasioned a new word.43 While Lemkin worked tirelessly to spread the news about genocide—with few rewards44—he did not associate it with either utopia or dystopia.45 Yet <u>scholarly and conventional opinion today consistently links genocide and utopia and bills the blood bath of the twentieth century to "utopians" such as Stalin, Hitler, and Mao</u>. From Hannah Arendt's 🯄🯄🯄🯄 Origins of Totalitarianism to Martin Malia's 🯄🯄🯄🯄 Soviet Tragedy—its last chapter is titled "The Perverse Logic of Utopia"—scholars have thrown communism, Nazism, and utopia into one tub. Prestigious savants like Isaiah Berlin and Karl Popper have persuasively argued that <u>utopia leads to totalitarianism and mass murder.</u> "We must beware of Utopia," wrote Ralf Dahrendorf. "<u>Whoever sets out to implement Utopian plans will in the first instance have to wipe clean the canvas, on which the real world is painted. This is a brutal process of destruction;" it leads to hell on earth.</u>46 To question this approach requires asking what utopias are actually about—and why, for instance, Nazism should not be deemed a utopian enterprise. Even the vaguest description of utopia as a society inspired by notions of happiness, fraternity, and plenty would apparently exclude Nazism with its notion of Ayrans dominating inferiors in a Thousand Year Reich. What An Anarchic Breeze 🯄🯄 JACOBY CH 01 1/24/05 9:23 PM Page 13 connects Thomas More's Utopia and Hitler's Mein Kampf? Virtually nothing.47

Utopianism is Tyranny disguised as ideology.

Levin '12 (Levin, Mark R. Lawyer, worked in the administration of President Ronald Reagan and was a chief of staff for Attorney General Edwin Meese. Ameritopia: The Unmaking of America. New York: Threshold Editions, 2012. Print. Page 5.)

<u>Tyranny,</u> broadly define, i<u>s the use of power to dehumanize the individual and delegitimize his nature</u>. Political <u>utopianism is tyranny disguised as a desirable</u>, workable, and even paradisiacal governing ideology. <u>There are</u>, of course, <u>unlimited utopian constructs, for the mind is capable of infinite fantasies. But there are common themes</u>. <u>The fantasies take the form of grand social plans or experiments</u>, the impracticability and impossibility of which, in small ways and large, lead to the individuals subjugation. Karl <u>Popper</u>, a philosopher who eloquently <u>deconstructed the false assumption and scientific utopianism, arguing it is totalitarian in form and substance</u>, observed that "<u>[a]ny social science which does not teach the impossibility of rational social construction is entirely blind to the most important facts of social life, and must overlook the only social laws of real validity and of real importance.</u> Social sciences seeking to provide a background for social engineering cannot, therefore, be true descriptions of social facts. They are impossible in themselves. Popper argued that <u>unable to make detailed or precise sociological</u>

predictions, long-term forecasts it considers worth pursuing. (Although Popper differentiated between "piecemeal social engineering" and "utopian social engineering," it is an ahistorical, or at least a leap of faith, to suggest that one unleashed, the social engineers will not become addicted to their power; and Popper never could enunciate a practical solution.)

Utopianism is pseudo-science and reasoning, stripping individuals of their personal Identity and making them a subject of whomever is in charge.

Levin 12 (Levin, Mark R. Lawyer, worked in the administration of President Ronald Reagan and was a chief of staff for Attorney General Edwin Meese. Ameritopia: The Unmaking of America. New York: Threshold Editions, 2012. Print. Page 5.)

Utopianism substitute's glorious predictions and unachievable promises for knowledge, science, and reason, while laying claim to them all. Yet there is nothing new in deception disguised as hope and nothing original in abstraction framed as progress. A heavenly society is said to be within reach if only the individual surrenders more of his liberty and being for the general good, meaning the good as prescribed by the state. If he refuses, he will be tormented and ultimately coerced into compliance, for conformity is essential. Indeed, nothing good can come of self-interest, which is condemned as morally indefensible and empty. Through persuasion, deceit, and coercion, the individual must be stripped of his identity and subordinated to the state. He must abandon his own ambitions of the state. His first duty must be to the state - not family, community, and faith, all of which challenge the authority of the state. Once dispirited, the individual can be molded by the state with endless social experiments and lifestyles calibrations.

Utopianism is a way to try to shape individuals and divide them creating more violence and recreating the same oppressive society

Levin '12 (Levin, Mark R. Lawyer, worked in the administration of President Ronald Reagan and was a chief of staff for Attorney General Edwin Meese. Ameritopia: The Unmaking of America. New York: Threshold Editions, 2012. Print. Page 7.)

Utopianism also attempts to shape and dominate the individual by doing two things at once: it strips the individual of his uniqueness, making him indistinguishable from the multitudes that form what is commonly referred to as "the masses," but it simultaneously assigns him a group identity based on race, ethnicity, age, gender, income, etc., to highlight differences within the masses. It then exacerbates old rivalries and disputes or it incites new ones. This way it can speak to the well-being of "the people" as a whole while dividing them against themselves, thereby stampeding them in once direction or another as necessary to collapse the existing society or rule over the new one.

'Afro' K

Their use of the pre-fix 'afro' to avoid a wider discussion of futurism begs the question of why they called their args futurist in the first instance – it only creates racial dissonance that causes their argument to become incoherent
Tshepo Mahasha, black philosopher and filmmaker, 13 – Phetogo, "Art Criticism: is the prefix 'Afro-' (as in "Afro-futurism") arresting our imagination and manifesto salesmanship?" July 14, http://www.thisisafrica.me/visual-arts/detail/19943/art-criticism-is-the-prefix-afro-as-in-afro-futurism-arresting-our-imagination-and-manifesto-salesmanship.

A prefix modifies a word/statement. The prefix 'Afro-' as used in art criticism modifies existing manifestos. In my opinion, it does not promote the generation of wholly new ideas and manifestos, but only the modification of the creativity of others. The prefix 'afro-' has acquired a parasitic character, leeching off manifestos: Afro-Surrealism, Afro-Punk, Afro-Futurism and Afro-etc. I think it has the capacity to arrest African imagination, so that the African imagination only follows other manifestos, only to attach itself to them and never coming up with an original of its own. I wouldn't have a problem with it because creativity is about modifying elements that are already there to create something new, but given what's out there at this point I have an objection. Just a quick internet search reveals that the movie The Matrix is listed as Afro-futurism on some websites. It can go to the point where Afro-futurism can only be about a person of colour in a future space, when in fact for a project like 'The Matrix', the faces and races are interchangeable, it would still be what it is without black people in it. I read an Afro-Surrealist manifesto written by D. Scot Miller and it had me asking a few questions. In this manifesto, Miller outlines what isn't Afro-Surrealism. He writes, "Afro-Surrealism is not surrealism." "…Leopold Senghor, poet, first president of Senegal, and African Surrealist, made this distinction: 'European Surrealism is empirical. African Surrealism is mystical and metaphorical.'" And then he says of Afro-Surrealism, "[it] presupposes that beyond this visible world, there is an invisible world striving to manifest, and it is our job to uncover it." And he goes on to say, "Afro-Surrealists restore the cult of the past. We revisit old ways with new eyes. We appropriate 19th century slavery symbols, like Kara Walker, and 18th century colonial ones, like Yinka Shonibare. We re-introduce 'madness' as visitations from the gods, and acknowledge the possibility of magic. We take up the obsessions of the ancients and kindle the dis-ease, clearing the murk of the collective unconsciousness as it manifests in these dreams called culture" Miller claims that Afro-Surrealism is NOT Surrealism. And then he goes on to define something that's different from 'Surrealism' and calls it 'Afro-Surreal'. My question when I read Miller's Manifesto was why call it Afro-Surrealism if it is not Surrealism? Why prefix the word Surrealism with 'Afro-'? Most importantly, since it is so different from surrealism, why not call it something entirely new? Miller considers The Neptunes early music Afro-futurist. Would that same music if it was produced by a person of a different race still be considered Afro-futurist? What made it fundamentally Afro-futurist except for race?

Their use of 'afro' as a signifier to modify and distinguish their argument from other forms of criticism must be rejected – it limits imaginative possibilities and homogenizes experience

Tshepo Mahasha, black philosopher and filmmaker, 13 – Phetogo, "Art Criticism: is the prefix 'Afro-' (as in "Afro-futurism") arresting our imagination and manifesto salesmanship?" July 14, http://www.thisisafrica.me/visual-arts/detail/19943/art-criticism-is-the-prefix-afro-as-in-afro-futurism-arresting-our-imagination-and-manifesto-salesmanship.

As I have explored my views, I concluded: a) The use of the prefix 'afro-' needs to be minimized for the sake of **freeing African imagination**. Since I can't foresee and cover the entire use of the prefix, I am referring to the points that I've covered in this essay in relation to art-criticism. I see it as a **necessity** for the sake of encouraging imagination to grow, and not be restricted to – or attached to - other pre-existing manifestos and make it harder for ourselves to come up with something unique. **Minimizing the 'afro' prefix would promote fresh thinking**. Afro-manifestos have a "leeching" tinge to them. They are forms of reacting to things instead of all out attempt at 'originality' - Black people reacting to other manifestos: Punk (Afro-Punk), Surrealism (Afro-Surrealism) etc. I haven't even taken into account that Afro-futurism may be a misnomer, when looked at with the "Futurism" manifesto. b) Art critics need to be bold enough to give things stand-alone names. Everything is about encouraging invention. 'High-life' music is highlife. The implication being that any person of any descent can do Highlife music; can the same be easily said for any of the 'Afro-' prefixed semi-manifestos? Or does it pivot on race? Can a Japanese person do 'Afro-punk' and if so, would it require another prefix to be Japanese-Afro-Punk? I have difficulty answering these questions. I don't think I'm way off in imagining the South American manifesto of 'Magic Realism' would be called 'Afro-something' if it was being done by people of African descent. We need to encourage new names and manifestos. c) The African Renaissance is about creating a floor in a much larger context, one that aims for African people to be free amongst other free people. It's about freeing the African from the "struggle for reason" by collecting and restoring artefacts, and projecting these into the future so that this base will always be available to future generations. It is either within the context of ultimate freedom (Free to explore and create new black African identities, new Manifestos) and/or the offsetting of "the struggle for reason" that cultural production takes place and should be evaluated in. It must be recognized that 'some' current African Art cannot be contextualized without mention of the Renaissance and its excavations. Even as I write this I have doubts that of course I may be biased. It took a long time to finish this essay and to publish it. I wouldn't like to speak only for myself, I'd like to believe that there must be others who feel the same as I do. I don't, for a second, doubt the force of my imagination. My mind may change in time about the contents of this essay but at this point I am convinced.

Cap Links

Afro-futurism is a form of anti-historicism which abandons materialism in favor of textual and rhetorical determinations of reality. Historical disengagement abdicates power and guarantees the continuation of a white capital regime.
Foster '97 (John Bellamy, Department of Sociology at Oregon, "In Defense of History, In Defense of History, ed. Foster & Wood)

The weaknesses of postmodernism-from an emancipatory perspective- thus far overshadow its strengths. Missing from Foucault's analysis, like that of postmodernism generally, is any conception of a counter-order to the disciplinary orders described. In the more extreme case of "textual postmodernists"-those postmodernist thinkers like Derrida, as distinct from Foucault, who deny any reality outside the text-the political and historical weaknesses from a left perspective are even more glaring. By undermining the very concept of history-in any meaningful sense beyond mere story-telling-such theorists have robbed critical analysis of what has always been its most indispensable tool.'8 The denial within postmodernist theory of the validity of historical cri- tique covers up what is really at issue: the denial of the historical critique of capitalism, leading to a convergence between left thought infected by Nietzsche and the dominant liberal "end of history" conception. The danger of such ahistorical or anti-historical views, as E.P. Thompson observed, is that one loses sight not of "reason in history" in some abstract sense, but rather of "the reasons of power and the reasons of money."9 Historical materialism at its best provides a way out of this dilemma. This is not to ignore the fact that Marxism-which has sometimes given rise to its own crude interpretations and historical travesties, as in the case of Stalinism-has frequently been identified with the kind of "totalizations" and "essentialisms" that postmodernist theorists have singled out. As Thompson pointed out in a 1977 essay on Christopher Caudwell, Marxism has sometimes relied on " `essentialist' tricks of mind," the "tendency to intellectualize the social process"-"the rapid delineation of the deep proc- ess of a whole epoch." These are things that the historian (and social scientists in general) should guard against. But to abandon theory and historical explanation entirely in order to avoid "essentialism" and "foun- dationalism" is a bit like throwing out the baby in order to keep the bathwater clean. Marx himself provided another model, actively opposing theory (even "Marxist" theory) that purported to be "suprahistorical." In his Theses on Feuerbach, he presented what still ranks as the most thorough- going critique of what he called the "essentialist" conception of human beings and nature. Indeed, historical materialism has long engaged in its own self-critique, precisely in order to expel the kinds of "essentialisms," "positivisms," and "structuralisms" that have intruded on the philosophy of praxis itself-a self-critique that has produced the insights of theorists like Gramsci, Sartre, Thompson, and Raymond Williams.20 These thinkers distanced themselves from the positivistic "official Marx- ism" that grew out of the Second International and later turned into a caricature of itself in the form of Stalinism. Yet they held firm to the critique of capitalism and their commitment to the struggles of the oppressed. Moreover, these particular examples tell us that if what has sometimes been called "the postmodern agenda"-consisting of issues like identity, culture, and language-is to be addressed at all, this can only be accomplished within a historical context. And here one might openly wonder with Foucault "what difference there could ultimately be between being a historian and being a Marxist." When placed within a more holistic historical materialist context-ani- mated by the concept of praxis-the problems raised by postmodernism look entirely different. As David McNally says, "Language is not a prison- house, but a site of struggle." What the contributions in this volume have in common is the insistence that issues like language, culture, nationality, race, gender, the environment, revolution, and history itself are only effec- tively analyzed within a context that is simultaneously historical in charac- ter, materialist (in the sense of focusing on concrete practices), and revolutionary. Such analyses do not abandon the hope of transcending capitalism, nor of the notion of human progress as a possible outcome of historical strug- gles. It is said that Nicholas I, Czar of Russia, issued an order banning the word "progress." Today we no longer believe, in a nineteenth century sense, in automatic human progress, embodying some definite content-the idea that the Czar found so threatening. But this does not mean, as the philoso- pher Michael Oakeshott contended with respect to political activity in the 1950s, that we "sail a boundless and bottomless sea" that has "neither starting-point nor appointed direction" and that our only task is "to keep afloat on an even keel." History-as centuries of struggle and indeed pro- gress suggest-is more meaningful than that. To abandon altogether the concept of progress, in the more general sense of the possibility of progres- sive human emancipation, would only be to submit to the wishes of the powers that be. Such political disengagement by intellectuals on the left in the present epoch could only mean one thing: the total obeisance to capital.21 The irony of post-modernism is that while purporting to have transcended

modernity, it abandons from the start all hope of transcending capitalism itself and entering a post-capitalist era. Postmodernist theory is therefore easily absorbed within the dominant cultural frame and has even given rise recently to texts such as Postmodern Marketing, which attempts to utilize the insights of thinkers like Foucault, Derrida, Lyotard, and Baudillard to market goods within a capitalist economy. Perhaps this will be the final destiny of postmodernist theory-its absorption by the vast marketing apparatus of the capitalist economy, adding irony and color to a commercial order that must constantly find new ways to insinuate itself into the every- day lives of the population. Meanwhile, historical materialism will remain the necessary intellectual ground for all those who seek, not to revel in the "carnival" of capitalist productive and market relations, but to transcend them.22

Afrofuturism operates within the assumptions of capitalism, making liberation impossible.

Greer 09 (Olivia J. Greer, MA in Performance Studies from NYU, author and contributor to HuffPo, Alternet, "Yes We Can: (President) Barack Obama and Afrofuturism," published in Anamesa http://www.nyu.edu/pubs/anamesa/archive/fall_2009_intersections/yes_we_can_president_barack_obama_and_afrofuturism.pdf)

Multiculturalism: Yes You Can In the 1993 article in which Dery coined the term Afrofuturism, he suggested to author Samuel Delany that "the young urban blacks responsible for vital art forms such as hip-hop live in what might be called 'beeper culture,' where miniatured digital technology is everywhere at hand."19 Dery posits that technology had become omnipresent—in the United States at least—and was available now even to those members of the populace to whom access to societal advances had generally been denied. Delany took issue with Dery's assessment, responding: I can detect the possibility of a naïve assumption that the redistribution of commodities is somehow congruent with the redistribution of wealth—which it is not. Just as seriously, I can detect an assumption that the distribution of commodities is at one with access to the formation of those commodities and the commodity system... When one talks about "black youth culture as a technological culture," one has to specify that it's a technological culture that's almost entirely on the receiving end of a river of "stuff," in which the young consumers have nowhere near what we might call equitable input.20 (emphasis in original) Delany's critique of consumerism disguised as participation and power is at the root of Žižek's assertion in 1997 that the "ideology of cyberspace capitalism" obliterates individuality and the "particularity of social position." For Žižek, "cyberspace capitalism" obfuscates a crucial reality that the market— and, as he notes, the World Wide Web—relies on power relations, political decisions, and institutional conditions that necessarily remove ordinary people from proximity to power, but do so by perpetuating a fantasy of "equitable input," to use Delany's words. 21 "Yes We Can" operates within the fantasy of equitable input. It perpetuates a vision of solidarity and togetherness, but it is created and disseminated within a system in which will.i.am and his celebrity participants hold a rarified position. They are privileged because they have access to Delany's "equitable input;" they are participants in the production of technology, of the market. As Ricardo Dominguez writes in Electronic Disturbance, "the celebrity acts as empirical proof positive that electronic appearance is but a record of the natural world."22 However, without proximity, "the many" can never verify the truth of the celebrity's manifestation. It is for this very reason that Bould cautions against viewing Afrofuturism as a pure mode of resistance. Cultural production operates increasingly within a capitalist frame that, despite best intentions, can be precipitous to navigate. Žižek, like Delany and Bould, argues against the idea that subversion could exist within the structures of the market. Against the image, all-present in cultural criticism, of a radical subversive discourse or practice "censored" by the Power, one is even tempted to claim that today, more than ever, the mechanism of censorship intervenes predominantly to enhance the efficiency of the power discourse itself...The gesture of self-censorship is co-substantial with the exercise of power.23 For Žižek, the mechanism of censorship (which upholds existing power structures) is multiculturalism, which he conceives as a destructive force born out of capitalism, operating from figures of capital ("the multiculturalist") outwards. The multiculturalist "respects" (in Žižek's own scare quotes) the identity of the Other, while maintaining the distance of a "privileged universal position," and thus asserting

his own superiority. In other words, multiculturalism is an invention of capitalism that encourages the separation of cultural differences as a means to uphold the homogeneity of capitalist systems. Since, as we might put it, everybody silently accepts that capitalism is here to stay—critical energy has found a substitute outlet in fighting for cultural differences which leave the basic homogeneity of the capitalist world-system intact. So we are fighting our pc battles for the rights of ethnic minorities, of gays and lesbians, of different lifestyles, and so on, while capitalism pursues its triumphant march—and today's cultural theory, in the guise of "cultural studies," is doing the ultimate service to the unrestrained development of capitalism by actively participating in the ideological effort to render its massive presence invisible.24 will.i.am's "Yes We Can"—with its development out of the most commercial arms of the entertainment industry, its dependence on celebrity, and its strained reach toward multiraciality—raises important questions about the silent acceptance of systems of oppression. The video's vision of multicultural unity, while not presenting a clear power source, operates entirely within the capitalist homogeneity Žižek outlines. Its beautiful representatives of diversity mask the capitalist ideology behind it, which goes unquestioned by anyone in the video, or by Obama himself. Bould cites Žižek's critique, stating that science fiction's "color-blind future is multiculturalist in this way."25 For Bould, "Afrofuturism tends towards the typical cyberpunk acceptance of capitalism as an unquestionable universe and working for the assimilation of certain currently marginalized peoples into a global system that might, at best, tolerate some relatively minor (although not unimportant) reforms, but within which the many will still have to poach, pilfer, and hide to survive."26 The lack of attention to "the many" who will continue to suffer under capitalism, even if a certain disrupted contemporary appearance of racism also characterizes will.i.am's video. "Yes We Can" uses the ghosting of the past, with traces of Martin Luther King, Jr. and John F. Kennedy—images of liberation not achieved, but deferred—to push for a nostalgic hope. But hope for what: the present, the future, or even the past? The sections of Obama's speech that will.i.am chooses to highlight are those that harken back to another time. "A king who took us to the mountaintop" directly conjures up images of the civil rights movement, but also harkens back to the Bible. In other parts of his full speech, Obama spoke to the challenges of the present; but these sections are not part of the video.27 The words are moving, especially when redeployed over a soundtrack of many voices, but by the end when the word "hope" turns to "vote" what is left is a sense of what DeClue calls "survival by futurity."28 This begs the question of whether mere survival is—or should be—the end goal, or whether a more radical break for future freedom is needed. Survival, Žižek might argue, is multiculturalism. will.i.am probably does not imagine "Yes We Can" adhering to Žižek's model of multicultural censorship. Yet, "Yes We Can" is part of what Henry Jenkins describes as "new participatory culture," which is forming at the intersections of new tools and technologies that "enable consumers to archive, annotate, appropriate and recirculate media content," the promotion of "do-it-yourself (DIY) media production," and the interaction of multiple forms of media.29 Jenkins writes that these trends seem to encourage active modes of spectatorship, in which audiences gain power and autonomy in a "new knowledge culture." However, Jenkins notes—recalling Žižek—"it is wrong to assume that we are somehow being liberated through improved media technologies."30 We are more often being given the idea that we are being liberated, what Néstor García Canclini calls the "illusion of participation."31 As Žižek and Bould remind us, the idea of liberation may very well be a trap.

Conclusion The purpose of this study has not been to dislocate will.i.am's "Yes We Can" video and Obama's presidential campaign and victory from the field of Afrofuturism. It is rather to caution, as Bould does from within the field, against the dangerous assumption that Afrofuturism—or any artistic movement, for that matter—is synonymous with cultural or political resistance. DeClue's conceptualization of Obama as Afrofuturist has a relationship with Victor Turner's concept of an intercultural transmission of experience that consists of a "living through," a "thinking back," and a "willing or wishing forward."32 While hypothetically this transmission might move a society forward progressively, that it will do so is not a forgone conclusion. Particularly in electoral politics, a symbolic system rife with shared rhetoric, poll numbers, familiar gestures, and inscribed public spaces (both offline and online) allow for the equal possibility of either reenacting our political reality and stabilizing the status quo, or of finding ways to resist. Even since the election of Barack Obama, the United States (and arguably the rest of the world) faces a discouraging political climate in which capitalism is an unchallenged omnipresence, even as it collapses before our eyes. Under such circumstances, it is tempting to find signs of resistance and change in our cultural and political production. Certainly these signs can be found readily, and are heartening and galvanizing. It is important though that we "stay awake," as Octavia Butler would have us do, and be wary of simple answers. 33 Artistic production, technological advance, and future visioning will not take us the whole way to political transformation. This is a position that Žižek complicates: "Even when the change is not substantial but a mere semblance of a new beginning, the very fact that a situation is perceived by the majority of the population as a 'new beginning' opens up the space for important ideological and political rearticulations."34 "Yes We Can" shows that the navigation between status quo and resistance is problematic; outcomes can be characterized not as good or bad, positive or negative, but more in terms of what they open up. Obama—and the cultural production that has developed with him—has certainly opened up an enormous space for possibility. But if that space is filled with a status quo that is called a new beginning, we may find ourselves in a multicultural morass of pretty pictures that ask only for complacency.

Cap or Wilderson Link

If Wilderson:

Afrofuturism relies on a grammar of futurity which assumes a chronopolitical landscape in which blackness has agency. This naïve simulation allows whiteness to predetermine and maintain predictable market futures.

If Cap:

The future is pre-determined by Capitalism's drive to create predictable markets. Afrofuturism engages in product placement through a non-neutral science fiction which creates self-fulfilling demand for new technologies.

Eshun 2003 (Kodwo Eshun, Writer/Filmaker, MA in English, "Further Considerations on Afrofuturism" pubished in *The New Centennial Review*
http://muse.jhu.edu.go.libproxy.wakehealth.edu/journals/new_centennial_review/v003/3.2eshun.html)

For African artists, there were good reasons for disenchantment with futurism. When Nkrumah was deposed in Ghana in 1966, it signalled the collapse of the first attempt to build the USAF. The combination of colonial revenge and popular discontent created sustained hostility towards the planned utopias of African socialism. For the rest of the century, African intellectuals adopted variations of the position that Homi Bhabha (1992) **[End Page 288]** termed "melancholia in revolt." This fatigue with futurity carried through to Black Atlantic cultural activists, who, little by little, ceased to participate in the process of building futures. *Imagine the archaeologists as they use their emulators to scroll through the fragile files. In their time, it is a commonplace that the future is a chronopolitical terrain, a terrain as hostile and as treacherous as the past. As the archaeologists patiently sift the twenty-first-century archives, they are amazed by the impact this realization had on these forgotten beings. They are touched by the seriousness of those founding mothers and fathers of Afrofuturism, by the responsibility they showed towards the not-yet, towards becoming.* **Control through Prediction** Fast forward to the early twenty-first century. A cultural moment when digitopian futures are routinely invoked to hide the present in all its unhappiness. In this context, inquiry into production of futures becomes fundamental, rather than trivial. The field of Afrofuturism does not seek to deny the tradition of countermemory. Rather, it aims to extend that tradition by reorienting the intercultural vectors of Black Atlantic temporality towards the proleptic as much as the retrospective. It is clear that power now operates predictively as much as retrospectively. Capital continues to function through the dissimulation of the imperial archive, as it has done throughout the last century. Today, however, power also functions through the envisioning, management, and delivery of reliable futures. In the colonial era of the early to middle twentieth century, avant-gardists from Walter Benjamin to Frantz Fanon revolted in the name of the future against a power structure that relied on control and representation of the historical archive. Today, the situation is reversed. The powerful employ futurists and draw power from the futures they endorse, thereby condemning the disempowered to live in the past. The present moment is stretching, slipping for some into yesterday, reaching for others into tomorrow. **[End Page 289]** *SF Capital* Power now deploys a mode the critic Mark Fisher (2000) calls *SF* (science fiction) *capital.* SF capital is the synergy, the positive feedback between future-oriented media and capital. The alliance between cybernetic futurism and "New Economy" theories argues that information is a direct generator of economic value. Information about the future therefore circulates as an increasingly important commodity. It exists in mathematical formalizations such as computer simulations, economic projections, weather reports, futures trading, think-tank reports, consultancy papers—and through informal descriptions such as science-fiction cinema, science-fiction novels, sonic fictions, religious prophecy, and venture capital. Bridging the two are formal-informal

hybrids, such as the global scenarios of the professional market futurist. Looking back at the media generated by the computer boom of the 1990s, it is clear that the effect of the futures industry—defined here as the intersecting industries of technoscience, fictional media, technological projection, and market prediction—has been to fuel the desire for a technology boom. Given this context, it would be naïve to understand science fiction, located within the expanded field of the futures industry, as merely prediction into the far future, or as a utopian project for imagining alternative social realities. Science fiction might better be understood, in Samuel R. Delany's statement, as offering "a significant distortion of the present" (*Last Angel of History* 1995). To be more precise, science fiction is neither forward-looking nor utopian. Rather, in William Gibson's phrase, science fiction is a means through which to preprogram the present (cited in Eshun 1998). Looking back at the genre, it becomes apparent that science fiction was never concerned with the future, but rather with engineering feedback between its preferred future and its becoming present. Hollywood's 1990s love for sci-tech fictions, from *The Truman Show* to *The Matrix,* from *Men in Black* to *Minority Report,* can therefore be seen as product-placed visions of the reality-producing power of computer networks, which in turn contribute to an explosion in the technologies they hymn. As New Economy ideas take hold, virtual futures generate capital. A subtle oscillation between prediction and control is being engineered in **[End Page 290]** which successful or powerful descriptions of the future have an increasing ability to draw us towards them, to command us to make them flesh. **The Futures Industry** Science fiction is now a research and development department within a futures industry that dreams of the prediction and control of tomorrow. Corporate business seeks to manage the unknown through decisions based on scenarios, while civil society responds to future shock through habits formatted by science fiction. Science fiction operates through the power of falsification, the drive to rewrite reality, and the will to deny plausibility, while the scenario operates through the control and prediction of plausible alternative tomorrows. Both the science-fiction movie and the scenario are examples of cybernetic futurism that talks of things that haven't happened yet in the past tense. In this case, futurism has little to do with the Italian and Russian avant-gardes; rather, these approaches seek to model variation over time by oscillating between anticipation and determinism. *Imagine the All-African Archaeological Program sweeping the site with their chronometers. Again and again, they sift the ashes. Imagine the readouts on their portables, indicators pointing to the dangerously high levels of hostile projections. This area shows extreme density of dystopic forecasting, levels that, if accurate, would have rendered the archaeologists' own existence impossible. The AAAP knows better: such statistical delirium reveals the fervid wish dreams of the host market.* **Market Dystopia** If global scenarios are descriptions that are primarily concerned with making futures safe for the market, then Afrofuturism's first priority is to recognize that Africa increasingly exists as the object of futurist projection. African social reality is overdetermined by intimidating global scenarios, doomsday economic projections, weather predictions, medical reports on AIDS, and life-expectancy forecasts, all of which predict decades of immiseration. These powerful descriptions of the future demoralize us; they command us to bury our heads in our hands, to groan with sadness. Commissioned by multinationals and nongovernmental organizations (NGOs), these developmental futurisms function as the other side of the corporate utopias that make the future safe for industry. Here, we are seduced not by smiling faces staring brightly into a screen; rather, we are menaced by predatory futures that insist the next 50 years will be hostile. Within an economy that runs on SF capital and market futurism, Africa is always the zone of the absolute dystopia. There is always a reliable trade in market projections for Africa's socioeconomic crises. Market dystopias aim to warn against predatory futures, but always do so in a discourse that aspires to unchallengeable certainty.

Agamben K

The Kritik terminally reinforces state power --- retrenches 1ac impacts
Pallitto and Heyman 8 – Political Science, Seton Hall University; Department of Sociology and Anthropology, The University of Texas at El Paso (Robert and Josiah, "Theorizing Cross-Border Mobility: Surveillance, Security and Identity", 2008, http://library.queensu.ca/ojs/index.php/surveillance-and-society/article/viewFile/3426/3389) KW

One such analysis involves the concept of cosmopolitanism. Cosmopolitanism covers various phenomena within which political and cultural imaginations become relatively unbounded, losing their localized prejudices and sentiments, and thus cosmopolitanism is, predictably, often celebrated as a triumph of technology, or of social-cultural development (Vertovec and Cohen, 2002). However, its benefits are **unequally distributed, and they come at a cost**. The mobility freedom enjoyed by some depends on an **"authoritarian underside" that denies movement to others** (Sparke, 2006: 173, 174). Mobility freedom can be seen as a right or as a privilege, but either way it usually comes with greater speed of movement and lower designation of risk; that is, high rights and high speed are mutually reinforcing, and they are associated with lower risk. Those designated as "higher-risk," on the other hand, will experience risk in a double sense: they are seen to pose a higher risk of harm to others, and at the same time they themselves are more at risk for state scrutiny, detention and even mistreatment. Ulrich Beck (1992,1999) sees risks as products of modern and post-modern technological, social, and economic processes, creating new, shared domains of political collectivity that cut across traditionally bounded polities. Risk calculations made on a global scale can drive political decisionmaking, with the resulting calculations shaping the space for action in a postmodern context. This may be plausible for some issues (such as global warming), but as our analysis of securitization of movement after 9/11 shows, world risk may also result in greater differentiation of treatment and potentially segmentation of subjectivities. When applied to social groups, risk calculation is problematic because of its stratifying effect that entrenches the unequal position of those at the losing end of the rights/risk/speed calculus.

at: deleuze

Sovereign surveillance imposes self-regulation upon the populace --- we become objectified through the gaze of an unseen seer

Yet what emerges is, on the one hand, a theory of the top-down management of a population that is controlled through governmental mechanisms such as statistics-guided surveillance and police practices, and, on the other hand, the bottom-up subjectivization of population through the regulation of actions confronted with state power relations; this may also be regarded as biopolitical population control and individualizing discipline, respectively. These two streams of governmentality surface in Foucault's later writings from time to time, but he never clearly reconciles the art of government and subjectivization. This subjective 'conduct' or 'governing the self' is a self-disciplining that is made possible through the knowledge of oneself as 'the other', as the object of an unseen seer (as is discussed with the panoptic model in Discipline and Punish). This self-conduct, however, is framed in terms of the problematic of government that uses the power relation techniques of governing others to govern themselves (Foucault 2000, 340-342); but again, where do these two points converge and differ? It seems as though we must look to surveillance to answer this question. We know that surveillance is certainly a governmental 'technique' for the management and control of the population, but we also see that subjectivization is only possible via surveillance, as just mentioned with the panoptic model. However, panoptic surveillance is an ancient notion, developed at least as far back as EBII, sometime around 3000-2650BC (Yekutieli 2006, 78). The relation between the seer and the subject is no longer that of a physical perspective from a point fixe, nor is it localised in a contained space, as with Bentham's prison model. Rather, as Paul Virilio would argue, surveillance is making the traditionally confined space of the camp the very centre of the city. However, before examining the juridical-political applications of this notion, we must understand Giorgio Agamben's conception of biopolitics in terms of "bare life" and "the state of exception".

at: derrida

Derrida fundamentally misunderstands Agamben

Donahue 13 (Luke Donahue is a writer who specializes in deconstruction, "Erasing Differences between Derrida and Agamben" 2013 Oxford Literary Review p. 29-30)///CW

While Part One of Homo Sacer focuses on the sovereign who appears¶ most in the law, Part Two focuses on the banished ex-citizen who¶ appears most devoid of law and most animal. This exile is homo sacer,¶ excluded from the legal order. But while exiled from the polis, he is¶ not completely abandoned to animal life: just as the sovereign state¶ of exception still holds a relation to law, so too does homo sacer. When¶ Agamben calls homo sacer bare life, he does not mean that bare life is the¶ pure, unqualified life of zoe. Rather, bare life is a 'zone of indistinction'¶ between zoe and bios, between life that is absolutely animal and life¶ that is qualified as human and political. While bare life is commonly¶ confused with zoe, Agamben says clearly: 'Neither political bios nor¶ natural zoe, sacred life is the zone of indistinction in which zoe and bios¶ constitute each other in including and excluding each other' (HS, 90).7¶ What is more, while bare life is the play between bios and zoe, there is¶ no bios or zoe prior to the bare life of homo sacer. Just as nature and¶ culture only appear after the originary confusion between them, so the¶ condition of possibility of the appearance of either pure bios or pure¶ zoe is the originary co-contamination that 'precedes' either of them.¶ Derrida continually misunderstands these points when he identifies¶ bare life with zoe, as in the following apposition: 'bare life (zoe)'.8¶ This confusion gives Derrida the impression that 'Agamben is required¶ to demonstrate that the difference between zoe and bios is absolutely¶ rigorous' (BS, 326). But Agamben's point is just the opposite: the¶ distinction never was rigorous. There never was an original unity or¶ an original and secure difference.

Derrida misunderstands Agamben's argument --- the fact that bios and zoe cannot be separated is the entire point

Kotsko 12 (Adam Kotsko is Assistant Professor of Humanities at Shimer College in Chicago and the translator of Giorgio Agamben's Sacrament of Language: An Archeology of the Oath, The Highest Poverty: Monastic Rules and Form-of-Life, and Opus Dei: An Archeology of Duty "On Derrida's critique of Agamben" 6/30/12 https://itself.wordpress.com/2012/06/30/on-derridas-critique-of-agamben/)///CW

I have not closely studied Derrida's critique of Agamben from The Beast and the Sovereign, yet given how frequently it's been deployed by Agamben skeptics, I feel comfortable giving a brief, blog-style response to it: that bios and zoē cannot be neatly distinguished does not undermine Agamben's project, but is indeed the entire point. Agamben reads the Western tradition as a series of increasingly destructive failed attempts to separate them out in some kind of stable and sustainable way. The reason these attempts fail is that the neat distinction is impossible — indeed, even in the encounter between the sovereign (the very embodiment of bios as political life) and the homo sacer (the emblem of zoē as bare life), which should surely count as the starkest possible contrast between these two concepts of life, an uncanny overlapping occurs wherein both are included through their very exclusion.¶ Agamben is thus not trying to get rid of bios in favor of a pure zoē — i.e., to abolish politics and allow us all to return to our raw animality or unblemished nature — but to get at another politics, another form of life that would not be governed by this founding opposition of the contingent historical reality that is Western politics.¶ There is doubtless a lot to be said in critique of Agamben's project, but Derrida's critique misses its target as far as I can tell.

We internal link turn --- biopolitical control produces a logic that culminates in <u>global colonization</u> --- nobody is safe, not even the colonizers

Mendieta, 4/25/**2002** – associate professor of Philosophy at Stony Brook University (Eduardo, "'To make live and to let die' –Foucault on Racism", American Psychological Association Central Division Meeting, p. 1-2)//roetlin

Briefly, in Stoler's work I discern two main criticisms. On the one hand that Foucault failed to give enough attention to <u>the colonial dimensions of the emergence of biopolitics</u>. On the hand, Stoler affirms that Foucault abandoned the line of investigation pursued in the 1976 lectures. The first criticism is only acceptable if we weaken its claims. In other words, Foucault did fail to pay attention to the details of the way in which <u>the normalization of the political body of a population was related to projects of **foreign colonization**</u>. Yet, Foucault is not conceptually and theoretically <u>unaware of their complicity and interdependence</u>. At one point in the lectures he explicitly talks about the way in which the emergence of <u>the biopower state is a form of **internal colonization**</u>, in which <u>the tactics of the domestication and normalization of the colonized body are applied on the colonizing body</u>. The second criticism would not stand if we read the 1976 lectures, along with those in 1977, as well as his Tanner lectures, and the lectures gathered in the volume edited by Martin, Gutman, and Hutton (1988). I think that the two last volumes of the history of sexuality to be printed during Foucault's life time eclipsed his work on governmentality and political rationality (Burchell, Gordon, and Miller 1991) 2 Nonetheless, let me just offer the following synoptic overview of the lectures. The lectures dealt with: First and foremost a retrospective look at what Foucault had been doing over the last five years, since he had been elected to the Collège de France. This retrospective look sought to cull the conceptual elements of the approach that have been used in works like the Archeology of Knowledge, and Discipline und Punish. In the first two lectures, published in the 1980 volume edited by Colin Gordon, Knowledge/Power, Foucault lays out his understanding of the relationship between archeology, genealogy, and subjugated knowledges, on the one hand, and legitimate, official, and erudite forms of knowledge on the other. Foucault also distinguished between two paradigms or forms of understanding power. On one side we have what he calls <u>the economicist form of power that attributes to the sovereign a legitimate right that this then can exert upon subjects as a form of contract</u>. The key words of this representation of power are: **right, law, and jurisprudence**. This is <u>the juridical idea of power. On the other side we have</u> what Foucault calls <u>a disciplinary form of power,</u> which is above all anti-sovereign, and anti-judicial. It <u>is a form of control that exerts force by normalizing, and creating the conditions of **surveillance** that lead to subjects' docility. It is a form of power that</u> is diffused and does not act on individuals, but <u>determines a horizon of action.</u> It does not discipline, but normalizes. It does not operate on juridical rules, or rights, but on norms and standards that refer to a social technology. It is a power that emerges with the development of the human sciences, and in particular the sciences of normalization. In this way, this power is not centralized, but diffused, not owned, but anonymous, not exerted, but relayed and lived.

at: neoliberalism

Case turns the K --- the system's motor will never be jammed in a world of security's state of exception

Agamben, 2000 (Giorgio Agamben, professor of philosophy at the European Graduate School; "Means Without End," Univ. Minnesota Press, 2000, pg. 133)

Nothing is more nauseating than the impudence with which those who have turned money into their only raison d'etre periodically wave around the scarecrow of economic crisis: the rich nowadays wear plain rags so as to warn the poor that sacrifices will be necessary for everybody. And the docility is just as astonishing; those who have made themselves stolidly complicitous with the imbalance of the public debt, by handing all their savings over to the state in exchange for bonds, now receive the warning blow without batting an eyelash and ready themselves to tighten their belts. And yet those who have any lucidity left in them know that <u>the crisis is always in process and</u> that <u>it constitutes the internal motor of capitalism</u> in its present phase, much as <u>the state of exception is today the normal structure of political power</u>. And <u>just as the state of exception requires that there be increasingly numerous sections of residents deprived of political rights</u> and that in fact at the outer limit all citizens be reduced to naked life, <u>in such a way crisis, having now become permanent, demands</u> not only that the people of the Third World become increasingly poor, but also that <u>a growing percentage of the citizens of the industrialized societies be marginalized and without a job</u>. And <u>there is no so-called democratic state today that is not</u> compromised and <u>up to its neck in such a massive production of human misery</u>.

Capitalism isn't the root cause of anything --- pretending it is justifies the worst violence --- empirics prove

Aberdeen, 3 (Richard Aberdeen; 2003 "THE WAY A Theory of Root Cause and Solution" http://freedomtracks.com/ uncommonsense/theway.html)

<u>A view</u> shared by many modern activists is <u>that capitalism</u>, free enterprise, multi-national corporations <u>and globalization are the primary cause of</u> the current global <u>Human Rights problem and that by striving to</u> change or <u>eliminate these, the root problem of</u> what <u>ills</u> the modern world <u>is being addressed. This is</u> a rather unfortunate and <u>historically myopic</u> view, <u>reminiscent of early "class struggle" Marxists who soon resorted to violence as a means to achieve rather questionable ends.</u> And like these often brutal <u>early Marxists</u>, modern anarchists who <u>resort to violence to solve the problem</u> are walking upside down and backwards, <u>adding to rather than correcting, both the immediate and long-term Human Rights problem. Violent revolution</u>, including our own American revolution, <u>becomes a breeding ground for poverty, disease, starvation and often mass oppression leading to future violence</u>. Large, publicly traded corporations are created by individuals or groups of individuals, operated by individuals and made up of individual and/or group investors. These business enterprises are deliberately structured to be empowered by individual (or group) investor greed. For example, a theorized 'need' for offering salaries much higher than is necessary to secure competent leadership (often resulting in corrupt and entirely incompetent leadership), lowering wages more than is fair and equitable and scaling back of often hard fought for benefits, is sold to stockholders as being in the best interest of the bottom-line market value and thus, in the best economic interests of individual investors. Likewise, <u>major political and corporate exploitation</u> of third-world nations <u>is rooted in the individual and joint greed of corporate investors and others who stand to profit from such exploitation</u>. More than just investor greed, <u>corporations are driven by the greed of all those involved</u>, including individuals outside the enterprise itself who profit indirectly from it. If one examines "the course of human events" closely, it can correctly be surmised that <u>the "root" cause of humanity's problems comes from individual human greed and similar negative individual motivation</u>. The Marx/Engles view of history being a "class" struggle [1] does not address the root problem and is thus fundamentally flawed from a true historical perspective (see Gallo Brothers for more details). <u>So-called "classes"</u> of people, unions, corporations and political groups <u>are made up of individuals who support the particular group or organizational position based on their own individual needs, greed and desires</u> and thus, an apparent "class struggle" in reality, is an extension of individual motivation. Likewise, <u>nations engage in wars of aggression, not because capitalism</u> or <u>classes</u> of society <u>are at root cause, but because individual members of a society are individually convinced</u>

<u>that it is in their own economic survival best interest. War, poverty, starvation and lack of Human and Civil Rights have existed on our planet since long before</u> the rise of modern <u>capitalism</u>, free enterprise and multi-national corporation avarice, <u>thus the root problem obviously goes deeper than this</u>. Junior Bush and the neo-conservative genocidal maniacs of modern-day America could not have recently effectively gone to war against Iraq without the individual support of individual troops and a certain percentage of individual citizens within the U.S. population, each lending support for their own personal motives, whatever they individually may have been. While it is true that corrupt leaders often provoke war, using all manner of religious, social and political means to justify, often as not, entirely ludicrous ends, very rare indeed is a battle only engaged in by these same unscrupulous miscreants of power. And though a few iniquitous elitist powerbrokers may initiate nefarious policies of global genocidal oppression, it takes a very great many individuals operating from individual personal motivations of survival, desire and greed to develop these policies into a multi-national exploitive reality. <u>No economic or political organization and no political or social cause exists unto itself but rather, individual members power a collective agenda</u>. A workers' strike has no hope of succeeding if individual workers do not perceive a personal benefit. And similarly, <u>a corporation will not exploit workers if doing so is not believed to be in the economic best interest of those who run the corporation</u> and who in turn, must answer (at least theoretically) to individuals who collectively through purchase or other allotment of shares, own the corporation. Companies have often been known to appear benevolent, offering both higher wages and improved benefits, if doing so is perceived to be in the overall economic best interest of the immediate company and/or larger corporate entity. Non-unionized business enterprises frequently offer 'carrots' of appeasement to workers in order to discourage them from organizing and historically in the United States, concessions such as the forty-hour workweek, minimum wage, workers compensation and proscribed holidays have been grudgingly capitulated to by greedy capitalist masters as necessary concessions to avoid profit-crippling strikes and outright revolution.

Psychoanalysis has enabled modern governmentality --- its techniques are used manage populations and develop disciplinary society

Milchman and Rosenberg 02 Milchman teaches in the department of Political Science of Queens College of the City University of New York. He has published on Marxism, modern genocide, Max Weber, Heidegger, Foucault, and postmodernism. He has co-edited Postmodernism and the Holocaust, with Alan Rosenberg (Rodopi, 1998) and Martin Heidegger and the Holocaust, with Alan Rosenberg (Humanities Press, 1996), Alan is Associate Professor of Philosophy at Queens College of the City University of New York. He has published widely on psychoanalysis, the Holocaust, and the philosophies of Nietzsche, Heidegger, and Foucault. Among the books that he has co-edited are Foucault and Heidegger: Critical Encounters, with Alan Milchman (University of Minnesota Press, forthcoming); Contemporary Portrayals of Auschwitz: Philosophical Challenges, with James Watson and Detlef B. Linke (Humanity Books); Psychoanalytic Versions of the Human Condition, with Paul Marcus (NYU press, 1998); Healing Their Wounds: Psychotherapy with Holocaust Survivors and Their Families, with Paul Marcus (Praeger, 1989); and Echoes from the Holocaust: Philosophical Reflections on a Dark Time, with Gerald Myers (Temple University Press, 1988). "A Foucauldian Analysis of Psychoanalysis: A Discipline that 'Disciplines'" Academy for the Study of the Psychoanalytic Arts, http://www.academyanalyticarts.org/milch&rosen.htm/

For Foucault, the very genesis of the discipline of psychoanalysis is itself linked to historical changes in the exercise of power-relations, and in particular to the emergence of governmentality. According to the later Foucault, modern power-relations cannot be grasped on the basis of political theory's traditional model of power-law-sovereignty-repression. This juridical model of power, which still dominates political theory, and sees power as emanating from a sovereign, from the top down, ignores the fact that power today also comes from below. As Leslie Paul Thiele has argued in his explication of Foucault's contribution to a theory of power: "Power forms an omnipresent web of relations, and the individuals who support this web are as much the producers and transmitters of power as they are its objects." In place of the juridical model of power, Foucault argues that modern power-relations are instantiated through what he designates as "governmentality." For Foucault: The exercise of power consists in guiding the possibility of conduct and putting in order the possible outcome. Basically power is less a confrontation between two adversaries or the linking of one to the other than a question of government. This word must be allowed the very broad meaning which it had in the sixteenth century. `Government' did not refer only to political structures or to the management of states; rather it designated the way in which the conduct of individuals or groups might be directed: the government of children, of souls, of communities, of families, of the sick. .... To govern, in this sense, is to structure the possible field of action of others. For Foucault, then, the operations of the modern state are not restricted to interdiction or repression in the political sense, but have expanded to incorporate the practices of governmentality. Government, in the Foucauldian sense, depends on the knowledge generated by the human sciences, by the disciplines, in particular psychoanalysis; indeed, the state claims that it governs on the basis of that knowledge. Here, the central role of the human sciences in the operation of the developing disciplinary society, and its techniques for the control and management of its citizens becomes especially clear. Moreover, governmentality, and the technologies for the control of individuals, are by no means limited to the state. Indeed, according to Nikolas Rose and Peter Miller, modern, liberal societies do not leave the regulation of conduct solely or even primarily to the operations of the state and its bureaucracies: "Liberal government identifies a domain outside 'politics,' and seeks to manage it without destroying its existence and its autonomy." This is accomplished through the activities of a host of institutions and agents not formally part of the state apparatus, including psychoanalytic facilities and analysts. As Nikolas Rose has pointed out, psychoanalysis, like "All the sciences which have the prefix `psy-' or `psycho-' have their roots in this shift in the relationship between social power and the human body, in which regulatory systems have sought to codify, calculate, supervise, and maximize the level of functioning of individuals. The

`psy sciences' were born within a project of government of the human soul and the construction of the person as a manageable subject." As a manifestation of governmentality and its power-relations, psychoanalysis is implicated in the control of the individual. For Foucault, psychoanalysis is a **discipline that "disciplines**," that helps to **create politically and economically socialized, useful, cooperative**, and -- as one of the hallmarks of bio-power -- **docile individuals**. Indeed, according to John Forrester, for Foucault, psychoanalysis is "the purest version of the social practices that exercise domination in and through discourse, whose power lies in words, whose words can never by anything other than instruments of power." Of course, the aim of the analyst is not control, but the "mental health" of the individual and the "betterment" of society. Nonetheless, the result of the psychoanalytic management-oriented conception of the subject is an individual who is susceptible to techno-medical control. Moreover, as Nikolas Rose has suggested, the power-knowledge obtained by psychoanalysis (and indeed all of the psy sciences) and its technologies for the control of the individual: fed back into social life at a number of levels. Individuals could be classified and distributed to particular social locations in the light of them -- in schools, jobs, ranks in the army, types of reformatory institutions, and so forth. Further, in consequence, new means emerged for the codification and analysis of the consequences of organizing classrooms, barracks, prisons, production lines, the family, and social life itself....Hence, the psy knowleges could feed back into more general economic and social programs, throwing up new problems and opportunities for attempts to maximize the use of the human resources of the nation and to increase its levels of personal health and well-being. Whatever its impact or health and welfare, this power-knowledge enhanced the degree of control to which the person was subject, and made it possible to effectively discipline the individual. Indeed, **the existence of our developing disciplinary society is inconceivable without the psy sciences**, and the power-relations which they consolidate. The discipline and control of the individual to which psychoanalysis made its signal contribution, was linked to its conception of, and commitment to, normalization. Foucault signalled the increasing role of normality and normalization in the functioning of the developing disciplinary society in Discipline and Punish: "The judges of normality are present everywhere. We are in the society of the teacher-judge, the doctor-judge, the educator-judge, the `social worker'-judge; it is on them that the universal reign of the normative is based; and each individual, wherever he may find himself, subjects to it his body, his gestures, his behavior, his aptitudes, his achievements." For Foucault, discipline and normalization were inseparable components of the emergence of the human sciences, and their technologies. Indeed, he asserted that "a normalizing society is the historical outcome of a technology of power centered on life." Psychoanalysis did not break with this complex. Indeed, according to Foucault, "Freud was well aware of all this. He was aware of the superior strength of his position on the matter of normalization." Indeed, psychoanalysis was thoroughly implicated in the societal process in which the norm increasingly supplanted the law, in which the West was "becoming a society which is essentially defined by the norm." For Foucault: "The norm becomes the criterion for evaluating individuals. As it truly becomes a society of the norm, medicine, par excellence the science of the normal and the pathological, assumes the status of a royal science." Lest one conclude that Foucault is not referring to psychoanalysis here, he is quick to point out that "psychoanalysis, not only in the United States, but also in France, functions massively as a medical practice: even if it is not always practiced by doctors, it certainly functions as therapy, as a medical type of intervention. From this point of view, it is very much a part of this network of medical 'control' which is being established all over." Deviation from the norm, in the establishment of which psychoanalysis played a signal role, the anomaly, became the object of the technologies and therapeutic techniques of the psy sciences, psychoanalysis among them. The theological conception of evil had given way to the psychoanalytic conception of deviance, in the combat against which the analyst was now enlisted to play a leading role. As Hubert Dreyfus has claimed, "Freudian theory thus reinforces the collective

practices that allow norms based on alleged sciences of human nature to permeate every aspect of our lives." These practices then become a **lynchpin** of the developing disciplinary society and its techniques for managing people.

The negative attempts to put us on the couch, interpreting our fantasies for us until we don't know what we want anymore --- the rule of psychoanalysis is regardless of what you say, you mean something else --- this paradox makes politics impossible --- the impact is the 1ac
Deleuze 2004 – (Gilles, thinker, *Desert Islands and Other Texts 1953-1974*, pg. 274-280 [Originally published in Italian. "Relazione di Gilles Deleuze" and discussions in Armando Verdiglione, ed., Psicanalisi e Politica; Atti del Comvegno di studi tenuto a Milano l'8-9 Maggio 1973. Milan: Feltrinelli, 19-3, pp. 7-11, 17-21, 37-40, 44-45, 169-172. Abridged and edited.])
I would like to present five propositions on psychoanalysis. The first is this: psychoanalysis today presents a political danger all of its own that is different from the implicit dangers of the old psychiatric hospital. The latter constitutes a place of localized captivity; psychoanalysis, on the other hand, works in the open air. The psychoanalyst has in a sense the same position that Marx accorded to the merchant in feudal society: working in the open pores of society, not only in private offices, but also in schools, institutions, departmentalism, etc. This function puts us in a unique position with respect to the psychoanalytic project. We recognize that psychoanalysis tells us a great deal about the unconscious; but, in a certain way, it does so only to reduce the unconscious, to destroy it, to repulse it, to imagine it as a sort of parasite on consciousness. For psychoanalysis, it is fair to say there are **always** too many desires. The Freudian conception of the child as polymorphous pervert shows that there are always too many desires. In our view, however, there are never enough desires. We do not, by one method or another, wish to reduce the unconscious: we prefer to produce it: there is no unconscious that is already there; the unconscious must be produced politically, socially, and historically. The question is: in what place, in what circumstances, in the shadow of what events, can the unconscious be produced. Producing the unconscious means very precisely the production of desire in a historical social milieu or the appearance of statements and expressions of a new kind. My second proposition is that psychoanalysis is a complete machine, designed in advance to **prevent people from talking**, therefore from producing statements that suit them and the groups with which they have certain affinities. As soon as one begins analysis, one has the impression of talking. But one talks in vain; the entire psychoanalytical machine exists to suppress the conditions of a real expression. Whatever one says is taken into a sort of tourniquet, an interpretive machine; the patient will never be able to get to what ~~he~~ really has to say. Desire or delirium (which are in a deep sense the same thing), desire-delirium is by its nature a libidinal investment of an entire historical milieu, of an entire social environment. What makes one delirious are classes, peoples, races, masses, mobs. Psychoanalysis, possessed of a pre-existing code, superintends a sort of destruction. This code consists of Oedipus, castration, the family romance; the most secret content of delirium, i.e. this divergence from the social and historical milieu, will be destroyed so that no delirious statement, corresponding to an overflow in the unconscious, will be able to get through the analytical machine. We say that the schizophrenic has to deal not with family, nor with ~~his~~ parents, but with peoples, populations, and tribes. We say that the unconscious is not a matter of generations or family genealogy, but rather of world population, and that the psychoanalytical machine destroys all this. I will cite just two examples: the celebrated example of president Schreber whose delirium is entirely about races, history, and wars. Freud doesn't realize this and reduces the patient's delirium exclusively to his relationship with his father. Another example is the Wolfman: when the Wolfman dreams of six or seven wolves, which is by definition a pack, i.e. a certain kind of group, Freud immediately reduces this multiplicity by bringing everything back to a single wolf who is necessarily the Father. The entire collective libidinal expression manifested in the delirium of the Wolfman will be unable to make, let alone conceive of the statements that are for him the most meaningful. My third proposition is that psychoanalysis works in this way because of its automatic interpretation machine. This interpretation machine can be described in the following way: **whatever you say, you mean something different**. We can't say enough about the damage these machines cause. When someone explains to me that what I say means something other than what I say, a split in the ego as subject is produced. This split is well known: what I say refers to me as the subject of an utterance or statement, what I mean refers to me as an expressing subject. This split is conjured by psychoanalysis as the basis for castration and

prevents all production of statements. For example, in certain schools for problem children, dealing with character or even psychopathology, the child, in his work or play activities, is placed in a relationship with his educator, and in this context the child is understood as the subject of an utterance or statement; in his psychotherapy, he is put into a relationship with the analyst or the therapist, and there he is understood as an expressing subject. Whatever he does in the group in terms of his work and his play will be compared to a superior authority, that of the psychotherapist who alone will have the job of interpreting, such that the child himself is split; he cannot will acceptance for any statement about what really matters to him in his relationship or in his group. He will feel like he's talking, but he will not be able to say a single word about what's most essential to him. Indeed, what produces statements in each one of us is not ego as subject, it's something entirely different: multiplicities, masses and mobs, peoples and tribes, collective arrangements; they cross through us, they are within us, and they seem unfamiliar because they are part of our unconscious. The challenge for a real psychoanalysis, an anti-psychoanalytical analysis, is to discover these collective arrangements of expression, these collective networks, these peoples who are in us and who make us speak, and who are the source of our statements. This is the sense in which we set a whole held of experimentation, of personal or group experimentation, against the interpretive activities of psychoanalysis. My fourth proposition, to be quick, is that psychoanalysis implies a fairly peculiar power structure. The recent book by Castel, Le Psychanalysme, demonstrates this point very well. The power structure occurs in the contract, a formidable liberal bourgeois institution. It leads to "transference" and culminates in the analyst's silence. And the analyst's silence is the greatest and the worst of interpretations. Psychoanalysis uses a small number of collective statements, which are those of capitalism itself regarding castration, loss, and family, and it tries to get this small number of collective statements specific to capitalism to enter into the individual statements of the patients themselves. We claim that one should do just the opposite, that is, start with the real individual statements, give people conditions, including the material conditions, for the production of their individual statements, in order to discover the real collective arrangements that produce them.

Lacanian theory genders human activities --- makes patriarchy inevitable
Iréne **Matthis, '4** (Associate Duke Prof, "Dialogues on Sexuality, Gender, and Psychoanalysis", p. 108-109)//roetlin

From a feminist and historicizing point of view, Lacan's introduction of post-Saussurean linguistics into psychoanalysis was a mistake. Precisely because the relationship of femininity to the phallus is a purely symbolic equation for Lacan, patriarchy can never disappear. Lacan's theory of sexual difference is a watertight system, one that will always impose its own normative language of sexual difference on whatever people actually do. The historical content of the structure will change, but the structure itself will remain forever intact.[34] I may find that sixteenth-century notions of what counts as "feminine" are vastly different from our own, but the grid that produces the notion of "the feminine" in the first place remains unchanged. What I am objecting to, then, is that Lacanian theory is structured so as to formally require the "gendering" or "sexing" of a vast array of human activities. **Lacanian theory is a printing machine for gender labels**. It is incumbent on those who believe that this is an excellent thing for feminism and for psychoanalysis to justify their belief.

Gender inequality causes extinction
Bem, '93 (Psych Professor -- Cornell, The Lenses of Gender, pg. 195)//roetlin

In addition to the humanist and feminist arguments against gender polarization, there is an overarching moral argument that fuses the antihumanist and antifeminist aspects of gender polarization. The essence of this moral argument is that by polarizing human values and human experiences into the masculine and the feminine, gender polarization not only helps to keep the culture in the grip of males themselves; it also keeps the culture in the grip of highly polarized masculine values. The moral problem here is that these highly polarized masculine values so emphasize making war over keeping the peace, taking risks over giving care, and even mastering nature over harmonizing with nature that when allowed to dominate societal and even global decision making, they create the danger that humans

A2: Permutation—Top

Negotiating with sovereign power is a question of where to draw lines between forms of life and a submission to the source of sovereign power. Only a refusal to distinguish between forms of life can evade biopolitics.

Edkins & Pin-Fat '04 (Jenny – University of Wales Aberystwyth international politics professor, Veronique – University of Manchester IR lecturer, *Sovereign Lives: Power in Global Politics*, Ed. Edkins, Pin-Fat, and Shapiro, p. 18)

What this tells us is that **to contest sovereign power we need something different. In challenging sovereign power, we are** not **facing** a power relation but **a relationship of violence**, one **that denies a political voice to the form-of-life it has produced. Resistance** such as would be possible from within a power relation, and indeed as an inherent part of it, **cannot take place. Other forms of opposition must be found**, forms **that seek to reinstate a properly political relationship by producing sovereign power as a form of power relation.** Two strategies of contestation were suggested: a refusal and an acceptance. **First, the refusal. The abstract drawing of lines is the way in which sovereign power produces bare life.** This drawing of lines must be refused, wherever the lines are drawn. **Negotiating the precise location of the lines remains within the violence of sovereignty power.** On the other hand, **a refusal to draw any line takes away the ground upon which sovereign power is constituted.** It insists instead on the politics of decisioning and particular distinctions and demands that specifics of time, place, and circumstance be attended to in each instance. **Second, the acceptance. When life is produced as bare life, it is not helpful for that life to demand its reinstatement as politically qualified life. To do so would be to validate the very drawing of lines upon which sovereignty depends and which produces life as bare life in the first place. An alternative strategy is the acceptance** or what we have called the assumption **of bare life.** Through this strategy, **the subject** at one and the same time both acknowledges its status as nothing but life and demands recognition as such. It **refuses the distinction between bare life and politically qualified life and demands that all life as such is worthy of recognition.**

As is apparent, **the two strategies are the same at heart. Both seek to overturn the denial of politics that has taken place under biopolitics and to reinstate properly political power relations**, with their accompanying freedoms and potentialities. We have discussed examples of what such contestation of sovereign power might look like. Practices that contest sovereign power are apparent in many places: whether in hunger strikes, grassroots communitas, or street demonstrations, creative ways of provoking sovereign power and embroiling it into a political or power relation have been and are being found.

We must not falter in our call for subjectivity, the permutation is an attempt to negotiate the rights of the populace back into the sovereign's control

Agamben, 2000 - Professor of philosophy at the University of Verona (Giorgio; "*Means without End: Notes on Politics*"; conference; Pg. 113; DOA: 7/16/15 || NDW)

Sovereignty, therefore, is the guardian who prevents the undecidable threshold between violence and right, nature and language, from coming to light. We have to fix our gaze, instead, precisely on what the statue of Justice (which, as Montesquieu reminds us, was to be state of exception) was not supposed to see, namely, what

nowadays is apparent to everybody: that the state of exception is the rule, that naked life is immediately the carrier of the sovereign nexus, and that, as such, it is today abandoned to a kind of violence that is all the more effective for being anonymous and quotidian. If there is today a social power [potenza], it must see its own impotence [impotenza] through to the end, it must decline any will to either posit or preserve right, it must break everywhere the nexus between violence and right, between the living and language that constitutes sovereignty.

The affirmative's defense of sovereignty makes liberation impossible – their "lesser evil" logic culminates in absolute evil.

Prozorov, 2009 - Professor of Political Science at the University of Helenski (Sergie; "*The Appropriation of Abandonment: Giorgio Agamben on the State of Nature and the Political*"; Article; http://www.allacademic.com/meta/p313215_index.html; DOA: 7/16/15 || NDW)

In order to understand this claim let us consider Agamben's criticism of Schmitt's use of the notion of the katechon in his defense of state sovereignty. In Schmitt's political theology, sovereign power is analogous to the figure of the katechon in the Catholic tradition, the force that delays the advent of the Antichrist, which in turn would eventually lead to the messianic redemption (Schmitt 2003, 59-60). It is as this delaying force, as opposed to a direct agent of the Good, that the state must be appreciated. In contrast, Agamben's interpretation of the famous passage in St. Paul's Second Letter to the Thessalonians on the katechon asserts that rather than grounding something like a Christian 'doctrine of State power' (Agamben 2005b, 109), this passage harbours no positive valuation of the katechon whatsoever. Instead, the katechon (every form of constituted power) merely conceals the 'absence of law' that already characterizes the messianic present and thus does nothing other than defer or 'hold back' the moment of the messianic suspension of the law (see ibid., 95-107). Instead, in the Pauline messianic logic the semblance of the law, maintained by the katechon, must be stripped off and all power revealed as the 'absolute outlaw' (Agamben 2005b, 111). As Agamben (2005b, 110) claims, 'every theory of the State, including Hobbes's – which thinks of it as a power to block or delay catastrophe – can be taken as a secularization of this [traditional] interpretation of 2 Thessalonians 2.' Indeed, in the Schmittian reading, which characterizes most contemporary political theories, including those extremely hostile to Schmitt, the secularized katechon is legitimized as the only force that wards off the Antichrist [the anomie of the state of nature] and thus the end of the social order as we know it. On the contrary, Agamben's reading of Paul posits the katechon as an obstacle to the advent of the messianic kingdom and thus accuses the proponents of the 'Christian doctrine of state power' of a thinly disguised nihilism. '[T]he katechon is the force – the Roman Empire as well as every constituted authority – that clashes with and hides katargesis, the state of tendential lawlessness that characterizes the messianic, and in this sense delays unveiling the 'mystery of lawlessness'.' (Agamben 2005b, 111) It is as if the erstwhile champions of a Christian doctrine of power have forgotten their creed and embraced the imperfection of humanity as 'all there is'. Their valorization of the katechon obscures a simple question: 'if we longed for parousia, should we not be impatient with the interference of the katechon?' (Rasch 2007, 106) This, as Agamben shows, is precisely Paul's attitude, which is diametrically opposed to the attitude of the philosophers of the political, for whom the katechon has assumed an autonomous value: What if, after two thousand years and untold promises, we have lost our faith in the parousia and grown weary of waiting for the arrival of divine violence? Then would not delaying the Antichrist be what we should hope for? [...] The katechon, as a figure for the political, rejects the promise of the parousia and protects the community from the dangerous illusions of both ultimate perfection and absolute evil. (Rasch 2007, 107) In Rasch's view, what the defenders of the katechon fear is not so much the Antichrist but the Messiah himself, who, moreover, might well appear to them indistinct from the Antichrist: both are 'figures who promise us perfection, figures who offer us redemption and bestow upon us the guilt of failing perfection or rejecting their offer.' (Ibid., 107) There is certainly a certain irony in the 'Christian doctrine of state power' ultimately coming down to the apostasy of any recognizable Christianity in vision of an exhausted humanity that can no longer distinguish between the Antichrist and the Messiah. However, Agamben's reading of Paul leads us to a

different case of indistinction. If the katechon conceals that all power is 'absolute outlaw' and thereby defers the reappropriation of this anomie by the messianic community, then would it be too much to suggest that the katechon is the Antichrist, who perpetuates its reign by concealing the fact of its long having arrived? Absolute Evil would thus attain domination precisely by pretending, as a 'lesser evil', to ward off its own advent. By converting the seekers of redemption into the guardians of its perpetual inaccessibility, the katechon ensures the survival of greater evil in the guise of the lesser one. Thus, Agamben argues that '[it] is possible to conceive of katechon and anomos [Antichrist] not as two separate figures, but as one single power before and after the final unveiling. Profane power is the semblance that covers up the substantial lawlessness of messianic time.' (2005b, 111) As Rasch sums up Agamben's claim about the insidious manner of the self-perpetuation of sovereign power, 'embracing the political is equivalent to building concentration camps while awaiting the Antichrist' (Rasch 2007, 106). The relation to the katechon indicates nothing less than one's stand on the possibility of the transcendence of the political. While for the Schmittian orientation the political is 'all there is' and its disappearance is only thinkable as the self-destruction of humanity (cf. Laclau 2007, 20-22), Agamben's messianic approach welcomes the demise of the katechon as the condition of possibility of life beyond sovereignty that remains concealed 'only until the person now holding it back gets out of the way' (2 Thessalonians 2, 7; cited in Agamben 2005b, 110). In Walter Benjamin's messianic politics (1986), this demise of the sovereign takes the form of 'divine violence' that is neither law-preserving nor law-making and transforms the 'fictive' state of exception, inscribed within the legal order, into a 'real state of exception' that has severed all links to the law and the state form. Agamben's work from his earliest writings onwards may be viewed as an engagement with this admittedly arcane and disconcerting idea of divine violence: 'Only if it is possible to think the Being of abandonment beyond every idea of the law (even that of the empty form of law's being in force without significance) will we have moved out of the paradox of sovereignty towards a politics freed from every ban.' (Agamben 1998, 59. See also Mills 2004; Kaufman 2008) Prior to addressing the specific features of Agamben's post-sovereign politics, let us consider this idea of a politics freed from every ban in relation to the figure of state of nature.

A2: Perm—Reject Divisons of Life

Only a complete refusal to draw lines between forms of life can escape the dilemma of sovereign power.
Edkins & Pin-Fat '04 (Jenny – University of Wales Aberystwyth international politics professor, Veronique – University of Manchester IR lecturer, *Sovereign Lives: Power in Global Politics*, Ed. Edkins, Pin-Fat, and Shapiro, p. 13)

One potential form of resistance to sovereign power consists of a refusal to draw any lines between zoe and bios, inside and outside, human and inhuman. As we have shown, **sovereign power** does not involve a power relation in Foucauldian terms. It **is** more appropriately **considered to have become a form of governance or technique of administration through relationships of violence that reduce political subjects to mere bare or naked life.** As Michael Dillon puts it, "Sovereign power [is] a form of rule gone global [that] has come to develop and deploy modes of destruction whose dissemination it finds increasingly impossible to control because these have become integral to its propagation and survival."

In asking for a refusal to draw lines as a possibility of resistance, then, **we are not asking for the** elimination of power relations and, consequently, we are not asking for the **erasure of the possibility of a mode of political being that is empowered and empowering, is free and that speaks**: quite the op¬posite. Following Agamben, **we are suggesting that it is only through a refusal to draw any lines at all (and, indeed, nothing less will do) that sovereign power (as a form of violence) can be contested** and a properly political power relation can be reinstated.

We could call this escaping the logic of sovereign power. Our overall argument is that **we can escape sovereign power and reinstate a form of power relation by contesting its assumption of the right to draw lines**, that is, by contesting the sovereign ban. **Any other resistance always inevitably remains within this relationship of violence.** To move outside it (and return to a power relation), we need not only contest its right to draw lines in particular places, but also resist the call to draw any lines of the sort sovereign power demands.

Pure alt framing is key—the state coops individual action

Tran-Creque 13 Bard College, interdisciplinary research, education and art community working to understand unmanned and autonomous vehicles. By bringing together research from diverse academic and artistic perspectives which have, up until now, remained fairly silent on the issue, we aim to encourage new creative thinking and, ultimately, inform the public debate. We want to encourage dialogue between the tech world and the non-tech world, and explore new vocabularies in diverse disciplines. This is an online space for people to follow the latest news, encounter disparate views, access good writing and art, find resources for research, and engage a diverse community of thinkers and practitioners with the shared goal of understanding the drone. (Steven, Center for the Study of the Drone, "The Forever War is Always Hungry", July 5, 2013, http://dronecenter.bard.edu/the-forever-war-is-always-hungry/ //SRSL)

No War but the Forever War What exactly is one supposed to make of John Brennan's admission that the war against Al Qaeda will continue for another decade? **How did the AUMF and the Patriot Act together come to constitute something like America's Article 48, creating a permanent state of exception in which something like the NSA's "giant automated Stasi" is simply accepted as the new normal?** How did drones become an inevitable part of the near future in New York City? After all, the War on Terror really isn't anything like a war at all— at least, not in the conventional imaginary of nation states commanding disciplined military forces on established fields of battle. The United States commands a degree of military power and comparative dominance simply unprecedented in human history—what is elegantly referred to, in the anodyne language of military planners, as "asymmetry." There are no strictly defined battlefields, and the formal enemies in the War on Terror have rarely amounted to more than the insurgent army of a deposed dictator (funded and armed by the U.S., albeit long ago) and a few hundred religious students in the mountains of Central Asia. It is in fact genuinely strange how resiliently this conventional image seems to persist in both popular and intellectual imagination. Even scholarly responses to the War on Terror begin from the assumption that something new and strange is happening when battlefields and opponents alike are no longer delimited but rather always and everywhere. If one limits oneself to legal documents, this is pretty much the only possible conclusion. The conventional imagery really seems to be most useful in obscuring the more fundamental realities of what war really is. In part, war consists of the far more common practice of civil wars, guerrilla wars, genocide and internal repression—but also, in a larger sense, the fundamental state of war between the sovereign and his people that is the originary, constitutive state for sovereign power itself. The forever war, then, has effectively allowed the United States to claim sovereignty to farthest reaches of the earth. Certainly, this is not a question purely of drones: the apparatus also consists of a deep surveillance state, total international digital surveillance, a military larger than the combined militaries of the rest of the world, and extralegal rendition and detention programs. But at the edges of this arrangement, one finds Agamben's homo sacer, Fiskesjö's barbarians: those excluded from the legal order, stripped of rights, subject to death at any time—the point at which an empire converts those beyond its reach into obedient subjects or corpses. This is the logic of sovereign violence taken to its most extreme—and not insignificantly, this has been accomplished in part by euphemizing that violence, whether in the sanitized parlance of the military—"focused obstruction," "targeted killing," "kinetic action"—or the more artful, ideological euphemization by which assassination programs become complex and debatable moral issues in the liberal press. It should come as no surprise that this has been accompanied by the infinite expansion of an apparatus of domestic surveillance and control unprecedented in human history. One should never forget that the instruments of sovereignty—drones, militarized police, mass surveillance apparatus—were always directed inwards as much as outwards, because the security state secures one thing: the safety of the sovereign above all. From the perspective of sovereign power, there is no inside and there is no outside. There is only the violence to which we are all subject.

A2: Krishna

The aligment of "progressive" projects with the established political order makes systemic change impossible and guarantees the preservation of the status quo.
Agamben 2k [Giorgio – prof. philosophy European Graduate School, *Means Without End*, Univ. Minnesota Press, p. 136-138]

<**Today, the political parties that define themselves as "progressive" and the so-called leftist coalitions have won in the large cities where there have been elections. One is struck by the victors' excessive preoccupation with presenting themselves as the establishment and with reassuring at all costs the old economic, political, and religious powers.** When Napoleon defeated the Mamluks in Egypt, the first thing he did was to summon the notables who constituted the old regime's backbone and to inform them that under the new sovereign their privileges and functions would remain untouched. Since here one is not dealing with the military conquest of a foreign country, the zeal with which the head of a party-that up until not too long ago used to call itself Communist-saw fit to reassure bankers and capitalists by pointing out how well the lira and the stock exchange had received the blow is, to say the least, inappropriate. This much is certain: these **politicians will end up being defeated by their very will to win at all costs. The desire to be the establishment will ruin them just as it ruined their predecessors.**6

It is important to be able to distinguish between defeat and dishonor. The victory of the right in the 1994 political elections was a defeat for the left, which does not imply that because of this it was also a dishonor. If, as is certainly the case, this defeat also involved dishonor, that is because it marked the conclusive moment of a process of involution that had already begun many years ago. There was dishonor because the defeat did not conclude a struggle over opposite positions, but rather decided only whose turn it was to put into practice the same ideology of the spectacle, of the market, and of enterprise. One might see in this nothing other than a necessary consequence of a betrayal that had already begun in the years of Stalinism. Perhaps so. What concerns us here, however, is only the evolution that has taken place be-ginning with the end of the 1970s. It is since then, in fact, that the complete corruption of minds has taken that hypocritical form and that voice of reason and common sense that today goes under the name of progressivism.

In a recent book, Jean-Claude Milner has clearly identified and defined as "progressivism" the principle in whose name the following process has taken place: compromising. The revolution used to have to compromise with capital and with power, just as the church had to come to terms with the modem world. Thus, **the motto that has guided the strategy of progressivism during the march toward its coming to power slowly took shape: one has to yield on everything, one has to reconcile everything with its opposite, intelligence with television and advertisement, the working class with capital, freedom of speech with the state of the spectacle, the environment with industrial development,**

science with opinion, democracy with the electoral machine, bad conscience and abjuration with memory and loyalty.

Today one can see what such a strategy has led to. The left has actively collaborated in setting up in every field the instruments and terms of agreement that the right, once in power, will just need to apply and develop so as to achieve its own goals without difficulty.

It was exactly in the same way that the working class was spiritually and physically disarmed by German social democracy before being handed over to Nazism. **And while the citizens of goodwill are being called on to keep watch and to wait for phantasmatic frontal attacks, the right has already crossed the lines through the breach that the left itself had opened up.**>

A2: Pragmatism

Overcoming sovereign power is impossible as long as political options are confined to the application of praxis to sovereign goals. The very relationship between liberatory potential and sovereignty must be abandoned in order to achieve a politics of pure means where life is not reduced to a specific form to be judged and regulated.

Agamben 98 (Giorgio – Univ. Verona Philosophy professor, *Homo Sacer: Sovereign Power and Bare Life*, Stanford UP, p. 43-44)

<The strength of Negri's book lies instead in the final perspective it opens insofar as it shows how **constituting power, when conceived in all its radicality, ceases to be a strictly political concept and necessarily presents itself as a category of ontology. The problem of constituting power then becomes the problem of the "constitution of potentiality"** (Il potere costituente, p. 383), **and the unresolved dialectic between constituting power and constituted power opens the way for a new articulation of the relation between potentiality and actuality**, which requires nothing less than a re-thinking of the ontological categories of modality in their totality. The problem is therefore moved from political philosophy to first philosophy (or, if one likes, politics is returned to its ontological position). **Only an entirely new conjunction of possibility and reality, contingency and necessity**, and the other path(' tou ontos, **will make it possible to cut the knot that binds sovereignty to constituting power. And only if it is possible to think the relation between potentiality and actuality differently-and even to think beyond this relation-will it be possible to think a constituting power wholly released from the sovereign ban. Until a new and coherent ontology of potentiality** (beyond the steps that have been made in this direction by Spinoza, Schelling, Nietzsche, and Heidegger) **has replaced the ontology founded on the primacy of actuality** and its relation to potentiality, **a political theory freed from the aporias of sovereignty remains unthinkable.**> <43-44>

A2: Reform

Reform is impossible in the current apparatus - exclusion is the foundation to the modern juridicial-political system of the west

Agamben 13 [Giorgio Agamben is an Italian continental philosopher best known for his work investigating the concepts of the state of exception, "What is a destituent power?" http://www.envplan.com/fulltext_temp/0/d3201tra.pdf, pg. 6, omak]

What was my intention when I began the archeology of politics that developed into the Homo Sacer project? For me it was not a question of criticizing or correcting this or that concept, this or that institution of Western politics. It was, rather, first and foremost a matter of shifting the very site of politics itself. (For centuries, politics remained in the same place where Aristotle, then Hobbes and Marx, situated it.) The first act of investigation was therefore the identification of bare life as the first referent and stake of politics. The originary place of Western politics consists of an ex-ceptio, an inclusive exclusion of human life in the form of bare life. Consider the peculiarities of this operation: life is not in itself political, it is what must be excluded and, at the same time, included by way of its own exclusion. Life—that is, the Impolitical (l'Impolitico)—must be politicized through a complex operation that has the structure of an exception. The autonomy of the political is founded, in this sense, on a division, an articulation, and an exception of life. From the outset, Western politics is biopolitical. 2. The structure of the exception was identified in Homo Sacer 1 starting from Aristotle. The exception is an inclusive exclusion. Whereas the example is an exclusive inclusion (the example is excluded from the set to which it refers, in as much as it belongs to it), the exception is included in the normal case through its exclusion. It is this inclusive exclusion that defines the originary structure of the archē. (1) The dialectic of the foundation that defines Western ontology since Aristotle cannot be understood if one does not understand that it functions as an exception in the sense that we have seen. **The strategy is always the same: something is divided, excluded, and rejected at the bottom, and, through this exclusion, is included as the foundation**. This is true for life, which is said in many ways —vegetative life, sensitive life, intellectual life, the first of which is excluded to function as the foundation for the others— but also for being, which is also said in many ways (to on legetai pollakos), one of which will act as foundation. In the sovereign exception that founds the juridical-political system of the West, what is included through its exclusion is bare life. It is important not to confuse bare life with natural life. Through its division and its capture in the dispositif of the exception, life assumes the form of bare life, life that was divided and separated from its form. It is in this sense that one must understand the assertion at the end of Homo Sacer 1 that "the fundamental activity of sovereign power is the production of bare life as the originary political element." And it is this bare life (or 'sacred' life, if sacer designates primarily a life that can be killed without committing murder) that, in the juridical-political machine of the West, acts as a threshold of articulation between zoē and bios, natural life and politically qualified life. **And it will not be possible to think another dimension of life if we have not first managed to deactivate the dispositif of the exception of bare life.** (If we relate the dispositif of the exception to anthropogenesis, it is possible that it will be clarified through the original structure of the event of language. Language, in its taking place, both separates from itself and includes in itself life and the world. It is, in the words of Mallarmé, a beginning that is based on the negation of every principle, on its own situation in the archē. The ex-ceptio, the inclusive exclusion of the real from the logos and in the logos, is thus the original structure of the event of language.)

A2: Solves Labeling

The government cannot be included—the people and the sovereign perpetually create each other

Tran-Creque 13 Bard College, interdisciplinary research, education and art community working to understand unmanned and autonomous vehicles. By bringing together research from diverse academic and artistic perspectives which have, up until now, remained fairly silent on the issue, we aim to encourage new creative thinking and, ultimately, inform the public debate. We want to encourage dialogue between the tech world and the non-tech world, and explore new vocabularies in diverse disciplines. This is an online space for people to follow the latest news, encounter disparate views, access good writing and art, find resources for research, and engage a diverse community of thinkers and practitioners with the shared goal of understanding the drone. (Steven, Center for the Study of the Drone, "The Forever War is Always Hungry", July 5, 2013, http://dronecenter.bard.edu/the-forever-war-is-always-hungry/ //SRSL)

The Only War there Is Beginning with his observation that states are "at the same time forms of institutionalized raiding or extortion, and utopian projects," David Graeber's definition of sovereignty is simple enough: "**the right to exercise violence with impunity.**" Graeber offers the example of the Ganda kingship to the south of the Shilluk. In the late 19th century, European visitors to the court of King Mutesa offered a gift of firearms. Mutesa responded by firing the rifle in the street and killing his subjects at random. When David Livingstone asked why the Ganda king killed so many people, he was told that "if [the king] didn't, everyone would assume that he was dead." However, the notoriety of the Ganda kings for arbitrary, random violence towards their own people did not prevent Mutesa from also being accepted as supreme judge and guardian of the state's system of justice. Indeed, it was the very foundation for it. Specifically, Graeber is interested in the transcendent quality of violence: the violence and transgression of the king makes him "a creature beyond morality." Paradoxically**, the sovereign may be arbitrarily violent—the etymology here is telling—and nevertheless seen as the supreme source of justice and law.** Graeber calls this transcendent aspect of violence "divine." It isn't just that kings act like gods; it's that they do so and get away with it. This remains the case in the modern state. Walter Benjamin's famous distinction between "law-making" and "law-maintaining" violence refers to the same phenomenon. We often say that no one is above the law, but if this were true, there would be no one to bring the legal order into being in the first place: the signers of the Declaration of Independence or the American Constitution were all traitors by the legal order under which they were born. There really is no resolution to this paradox. The solution of the left is that the people may rise up periodically and overthrow the existing legal regime in a revolution. The solution of the right is Carl Schmitt's exception: that sovereignty is exercised by the head of state in putting aside the legal order. But whichever solution one prefers, this really just defers the dilemma: all sovereignty is built on a foundation of illegal acts of violence, and it always carries the immanent potential for arbitrary violence. In 19th-century accounts of rainmakers in Southern Sudan, the function of violence is even clearer. With rainmakers, as with Shilluk kings, the health of the land is tied to the health of the king. If the rains fail to fall, first people will bring petitions, then gifts. But after a certain point, if the rains still don't come, the rainmaker must either flee or face a community united to kill him. It isn't hard to see why rainmakers would want something like the state's monopoly on violence or a retinue of loyal, armed followers. But the crucial point is that insofar as "the people" could be said to exist, they were essentially seen as the collective enemy of the king. European explorers in the region often found kings raiding enemy villages only to find that the villages contained the king's own subjects. They were delivering arbitrary violence to the people they were supposed to protect. So Graeber reminds us, "predatory violence was and would always remain the essence of sovereignty." Such is the hidden logic of sovereignty. Above all, it depends on the transcendent quality of violence that allows the sovereign to become, as Hobbes put it, a "mortal god." But this is also means that arbitrary violence is the constitutive principle of sovereignty, defining the relationship between the sovereign and everything else: What we call 'the social peace' is really just a truce in a constitutive war between sovereign power and 'the people,' or 'nation'—both of whom come into existence, as political entities, in their struggle against each other. There is no inside or outside here. Contra Schmitt and his friend-enemy distinction, this constitutive war precedes wars between nations and peoples. From the perspective of sovereign power, "**there is no fundamental difference in the relation between a**

sovereign and his people, and a sovereign and his enemies," explains Graeber. **This constitutive war is a war the sovereign can never win—a forever war that can never end.**

A2: Inevitability Claims

TURN: The dominance of biopolitics is what has made these institutions inevitable. Extend our 1NC Caldwell evidence. Whatever being is an abandonment of the tradition of identity and teleology that has maintained the current political philosophy. Its refusal to accept any finite end and stay permanently in potentiality refuses the logic of supposedly inevitable metanarratives.

TURN: Inevitability claims posit a monolithic view of the present that destroys the potential to effectuate change. Rather, the present is constituted by variety of contingencies that can each be resisted.

Barry, Osborne, & Rose '96 (Andrew - lecturer in the Department of Sociology Goldsmiths College, University of London. Thomas - lecturer in the Department of Sociolou, University of Bristol, Nikolas - Professor of Sociology at Goldsmiths College, University of London, Foucault and Political Reason, "Introduction: Writing the History of the Present," London, GBR: U C L Press, Limited p. 4-5)

Foucault might be said to approach the question of the present with a particular ethos but not with any substantive or aptiti understanding of its status. His concern is not to identify some current, perhaps definitive, "crisis" in the present. **Foucault makes no reference to concepts such as post-fordism, postmodernity, "McDonaldization" or late capitalism that have often been used to characterize a certain kind of break with the past. Nor is he concerned simply with a blanket denunciation of the present. No political programmatics follow automatically from his work in this field.** Foucault once argued in an interview, that **one of the "most destructive habits of modern thought. . . is that the moment of the present is considered in history as the break, the climax, the fulfilment, the return of youth, etc." - confessing that he had himself found himself at times drawn into the orbit of such a temptation** (Foucault 1989~: 251). But if it is the case that, for example, the closing pages of Madness and civilization are unquestionably apocalyptic in their pronouncements on the present, and that Foucault himself was to regret the adoption of such apocalyptic tones, in a sense, the conception of the present does retain a certain stability across his work. Above all, one might say, **Foucault was concerned to introduce an "untimely" attitude in our relation towards the present. Untimely in the Nietzschean sense: acting counter to our time, introducing a new sense of the fragility of our time, and thus acting on our time for the benefit, one hopes, of a time to come** (Nietzsche 1983: 60, cf. Rose 199313: 1, Bell 1994: 155). **Our time, that is to say, is not presumed to be the bearer or culmination of some grand historical process, it has no inevitability, no spirit, essence or underlying cause. The "present", in Foucault's work, is less an epoch than an array of questions**; and the coherence with which the present presents itself to us - and in which guise it is re-imagined by so much social theory - is something to be acted upon by historical investigation, to be cut up and decomposed so that it can be seen as put together contingently out of heterogeneous elements each having their own conditions of possibility. **Such a fragmentation of the present is** not **undertaken** in a spirit of poststructuralist playfulness. It is undertaken with a more serious, if hopefully modest, ambition - **to allow a space for the work of freedom.** Here, indeed, the place of ethics is marked in Foucault's thought. **Analyses ofthe present are concerned with opening up "a virtual break which opens a room, understood as a room of concrete freedom, that is possible transformation";** the received fixedness and inevitability of the present is destabilized, shown as just sufliciendy fragile as to let in a little glimpse of freedom - as a practice of difference - through its fractures.

Framework Answers

Alt = Pre-Req

We're a pre-req to a productive politics

Agamben, 1998 – professor of philosophy at the College International de Philosophie in Paris (Giorgio, "Homo Sacer", Stanford University Press, p. 10)//roetlin

Foucault's death kept him from showing how he would have developed the concept and study of biopolitics. In any case, however, the entry of zoē into the sphere of the polis – the politicization of bare life as such – constitutes the **decisive event of modernity** and signals a radical transformation of the political- philosophical categories of classical thought. It is even likely that if politics today seems to be passing through a lasting eclipse, this is because politics has failed to reckon with this foundational event of modernity. The "enigmas" (Furet, L'Allemagne nazi, p.7) that our century has proposed to historical reason and that remain with us (Nazism is only the most disquieting among them) will be solved only on the terrain – biopolitics – on which they were formed. Only within a biopolitical horizon will it be possible to decide whether the categories whose opposition founded modern politics (right/left, private/public, absolutism/democracy, etc.) – and which have been steadily dissolving, to the point of entering today into a real zone of indistinction – will have to be abandoned or will, instead, eventually regain the meaning they lost in that very horizon. And only a reflection that, taking up Foucault's and Benjamins suggestion, thematically interrogates the link between bare life and politics, a link that secretly governs the modern ideologies seemingly most distant from one another, will be able to bring the political out of its concealment and, at the same time, return thought to its practical calling.

Alternative

Whatever Being k2 Ptx

-- Whatever being is characterized by pure belonging free from identity. This is conducive to a new form of politically charged community freed from domination.
Agamben 93 (Giorgio – Prof Philosophy University Macerata, *The Coming Community*, Trans. Michael Hardt, U Minnesota Press, p. 9-11)

One concept that escapes the antinomy of the universal and the particular has long been familiar to us: the example. In any context where it exerts its force, the example is characterized by the fact that it holds for all cases of the same type, and, at the same time, it is included among these. It is one singularity among others, which, however, stands for each of them and serves for all. On one hand, **every example is treated in effect as a real particular case; but on the other, it remains understood that it cannot serve in its particularity. Neither particular nor universal, the example is a singular object that presents itself as such, that shows its singularity.** Hence the pregnancy of the Greek term, for example: para-deigma, that which is shown alongside (like the German Bei-spiel, that which plays alongside). **Hence the proper place of the example is always beside itself, in the empty space in which its undefinable and unforgettable life unfolds. This life is purely linguistic life.** Only life in the word is undefinable and unforgettable. **Exemplary being is purely linguistic being. Exemplary is what is not defined by any property, except by being-called.** Not being-red, but being-called-red; not being-Jakob, but being-called-Jakob defines the example. Hence its ambiguity, just when one has decided to take it really seriously. **Being-called-the property that establishes all possible belongings** (being-called-Italian, -dog, -Communist)-**is also what can bring them all back radically into question. It is the Most Common that cuts off any real community. Hence the impotent omnivalence of whatever being. It is neither apathy nor promiscuity nor resignation. These pure singularities communicate only in the empty space of the example, without being tied by any common property, by any identity.** They are expropriated of all identity, so as to appropriate belonging itself, the sign e. Tricksters or fakes, assistants or 'toons, they are the exemplars of the coming community.

Whatever Being k2 Ethics

Whatever being is being as it always matters. It cannot be divided into forms to be valued over one another, rather it is being without particular essence, attributes, or distinguishable qualities. The example of love is telling in that love is only given to a whatever singularity, to a loved one as whatever they may be, regardless of their attributes.

Agamben '93 (Giorgio – prof of philosophy at College of International Philosophy - Paris, *The Coming Community*, p. 1-2)

<**THE COMING being is whatever being.** In the Scholastic enumeration of transcendentals (quodlibet ens est unum, verum, bonum seu perfectum-whatever entity is one, true, good, or perfect), the term that, remaining unthought in each, conditions the meaning of all the others is the adjective quodlibet. The common translation of this term as **"whatever"** in the sense of "it does not matter which, indifferently" is certainly correct, but in its form the Latin says exactly the opposite: Quodlibet ens **is** not "being, it does not matter which," but rather **"being such that it always matters."** The Latin always already contains, that is, a reference to the will (libet). **What-ever being has an original relation to desire.**

The Whatever in question here relates to singularity not in its indifference with respect to a common property (to a concept, for example: being red, being French, being Muslim), but **only in its being such as it is. Singularity is thus freed from the false dilemma that obliges knowledge to choose between the ineffability of the individual and the intelligibility of the universal. The intelligible**, according to a beautiful expression of Levi ben Gershon _(Gersonides), **is neither a universal nor an individual included in a series, but rather "singularity insofar as it is whatever singularity."** In this conception, **such-and-such being is reclaimed from its having this or that property, which identifies it as belonging to this or that set, to this or that class** (the reds, the French, the Muslims) -**and it is reclaimed not for another class nor for the simple generic absence of any belonging, but for its being-such, for belonging itself.** Thus being-such, which remains constantly hidden in the condition of belonging ("there is an x such that it belongs toy") and which is in no way a real predicate, comes to light itself: The singularity exposed as such is whatever you want, that is, lovable.

Love is never directed toward this or that property of the loved one (being blond, being small, being tender, being lame), **but neither does it neglect the properties in favor of an insipid generality** (universal love): **The lover wants the loved one with all of its predicates, its being such as it is.** The lover desires the as only insofar as it is such-this is the lover's particular fetishism. Thus, **whatever singularity** (the Lovable) **is never the intelligence of some thing, of this or that quality or essence, but only the intelligence of an intelligibility.** The movement Plato describes as erotic anamnesis is the movement that transports the object not toward another thing or another place, but toward its own taking-place-toward the Idea.

A2 Ks of Agamben

AT: Derrida

Derrida fundamentally misunderstands Agamben – he's a dumbass

Donahue 13 (Luke Donahue is a writer who specializes in deconstruction, "Erasing Differences between Derrida and Agamben" 2013 *Oxford Literary Review* p. 29-30)///CW

While Part One of Homo Sacer focuses on the sovereign who appears¶ most in the law, Part Two focuses on the banished ex-citizen who¶ appears most devoid of law and most animal. This exile is homo sacer,¶ excluded from the legal order. But while exiled from the polis, he is¶ not completely abandoned to animal life: just as the sovereign state¶ of exception still holds a relation to law, so too does homo sacer. When¶ Agamben calls homo sacer bare life, he does not mean that bare life is the¶ pure, unqualified life of zoe. Rather, bare life is a 'zone of indistinction'¶ between zoe and bios, between life that is absolutely animal and life¶ that is qualified as human and political. While bare life is commonly¶ confused with zoe, Agamben says clearly: 'Neither political bios nor¶ natural zoe, sacred life is the zone of indistinction in which zoe and bios¶ constitute each other in including and excluding each other' (HS, 90).7¶ What is more, while bare life is the play between bios and zoe, there is¶ no bios or zoe prior to the bare life of homo sacer. Just as nature and¶ culture only appear after the originary confusion between them, so the¶ condition of possibility of the appearance of either pure bios or pure¶ zoe is the originary co-contamination that 'precedes' either of them.¶ Derrida continually misunderstands these points when he identifies¶ bare life with zoe, as in the following apposition: 'bare life (zoe)'.8¶ This confusion gives Derrida the impression that 'Agamben is required¶ to demonstrate that the difference between zoe and bios is absolutely¶ rigorous' (BS, 326). But Agamben's point is just the opposite: the¶ distinction never was rigorous. There never was an original unity or¶ an original and secure difference.

Derrida misunderstands Agamben's argument – the fact that bios and zoe cannot be separated is the entire point

Kotsko 12 (Adam Kotsko is Assistant Professor of Humanities at Shimer College in Chicago and the translator of Giorgio Agamben's Sacrament of Language: An Archeology of the Oath, The Highest Poverty: Monastic Rules and Form-of-Life, and Opus Dei: An Archeology of Duty "On Derrida's critique of Agamben" 6/30/12 https://itself.wordpress.com/2012/06/30/on-derridas-critique-of-agamben/)///CW

I have not closely studied Derrida's critique of Agamben from The Beast and the Sovereign, yet given how frequently it's been deployed by Agamben skeptics, I feel comfortable giving a brief, blog-style response to it: that bios and zoē cannot be neatly distinguished does not undermine Agamben's project, but is indeed the entire point.¶ Agamben reads the Western tradition as a series of increasingly destructive failed attempts to separate them out in some kind of stable and sustainable way. The reason these attempts fail is that the neat distinction is impossible — indeed, even in the encounter between the sovereign (the very embodiment of bios as political life) and the homo sacer (the emblem of zoē as bare life), which should surely count as the starkest possible contrast between these two concepts of life, an uncanny overlapping occurs wherein both are included through their very exclusion.¶ Agamben is thus not trying to get rid of bios in favor of a pure zoē — i.e., to abolish politics and allow us all to return to our raw animality or unblemished nature — but to get at another politics, another form of life that would not be governed by this founding opposition of the contingent historical reality that is Western politics.¶ There is doubtless a lot to be said in critique of Agamben's project, but Derrida's critique misses its target as far as I can tell.

AT: Foucault Wrong

Agambens theory of Biopower si fundamentally different than Foucoults analysis
Kendrick 2012 Victoria University of Wellington (Foucault, Biopower & IR)

In summary, both sets of authors discussed above commit, **from a Foucauldian perspective**, **fundamental methodological errors.** Hardt & Negri explain power relations according to a transcendent logic, and explicitly break one of Foucault's methodological rules; "not to attempt some kind of deduction of power starting from its centre and aimed at the discovery of the extent to which it permeates into the base, of the degree to which it reproduces itself down to and including the most molecular elements of society."48 Meanwhile**, Agamben's analysis is also anti-genealogical, in that it places the present need of explaining zones of exception at the supposed origin of sovereignty, albeit an origin that perpetually re-inscribes itself as the function of sovereignty.** Yet both sets of authors have a predominant influence in the IR literature, over a dearth of more accurate Foucauldian readings**. It should seem odd then, that when the shortcomings of biopower in IR literature are identified**, it is Foucault that gets the blame. This is especially so when Foucault made it quite clear that, although his concepts and insights were produced to be freely interpreted and redeployed according to the directions of others' investigations, **certain methodological principles were integral to** his **work**. I maintain that a Foucauldian IR can only be built upon a certain level of methodological adherence to these principles. **The direction in which Agamben**, and Hardt & Negri have **ultimately led biopower is** best represented by Michael Dillon, **probably the most explicit and prolific theorist of biopower** in IR.49 Dillon is particularly interested in the ramifications of Foucault's insights into security, war, and race, and views biopolitics from this perspective. For Dillon, the central import of biopower is not that it is a strategy which promotes life, but that in promoting life its central concern is to differentiate between the fit and unfit. "Biopolitics is therefore always involved in the sorting of life for the promotion of life. Sorting life requires waging war on behalf of life against life forces that are inimical to life."**50War becomes a central concern** for Dillon because, as Foucault first states in The History of Sexuality, vol 1, **biopower not only is a power that fosters life, but concomitantly disallows life**. 51 **Foucault, however, did not pursue this line of inquiry to fully develop its implications,** and Dillon's project launches itself from the point made by Bigo that **"[t]he question of security as it relates to war, and to international war, is not really discussed by Foucault and the Foucaultians."** 52

TAG
Kendrick 2012 Victoria University of Wellington (Foucault, Biopower & IR)

Due to Agamben's view of sovereignty, it is clear that his conception of biopower is fundamentally dissimilar to Foucault. Some go so far as to say they are not talking about the same thing.40 **Agamben's biopower rests on the idea** that **'bare life' is** its object, **a mode of life that is exposed to an unconditional threat of death via the suspension of sovereignty**, a foundational practice that serves to perpetually constitute sovereign power. **Bare life exists in a 'state of exception'**, a constitutive operation that links bare life directly to sovereign power. The state of exception thus

produces **bare life which is the hidden foundation of biopolitics, which itself had been concealed** until Foucault identified practices of government that made it explicit. This objectification of bare life is absolutely incongruent with Foucault's subjectification of the life processes of a population. **It also directly contradicts Foucault**. For **Agamben, sovereign biopower produces bare life to establish itself, a process that is "immensely reductive,"**41 while for Foucault, the practice of biopower is productive – to turn the mere "being" of life into "well-being."42 Ojakangas sums up **the problem with Agamben's perspective** most succinctly when he says that **is"[b]io-power needs a notion of life that corresponds to its aims."43 The necessary correspondence between biopower and 'more-than-life' does mean Agamben is effectively talking about something different to what Foucault meant.** Schinkel (2010) even resolves this divergence in a model based on citizenship as a technology of government. On this reading **Foucauldian biopolitics is directed towards the bios, taking as its object the social body, while Agambean biopower is a zoēpolitics externally directed to persons outside the state**.44 This is an important and helpful distinction, but it leaves unresolved what branch of biopower is most pertinent to the study of international relations. Like Hardt & Negri, **the influence Agamben's work wields within the discipline of IR forces a complete appraisal of his conceptualisation**, and from a Foucauldian perspective methodological problems upset his argument. In Nietzsche, Genealogy, **History Foucault** eschews the **search for truth in origins**, whereby history becomes a handmaiden to philosophy.45 **Agamben does not observe this methodological precaution** and effectively identifies an originary moment, whereby the articulation of the concepts of zoë and bios by Aristotle constitute the birth-moment of sovereignty. **Not only does this "naively and problematically [assume] that there was once a separation between zoë and bios,"46 Blencowe points out that this reading also de-historicises biopower in a dual sense**. First it removes Foucault's work from its contexts of concern with constructed and historical statuses, which "[forecloses] any transhistorical distinctions such as zoë/bios, bare life/human life, or nature/culture". Second, "the historical specificity of notions that are central to biological thinking, such as species, is obliterated while all thought of living physicality is subsumed under a 'mere' physicality."47 **The genealogical component of Foucault's insight is thus completely removed, and an abstract transhistorical category –zoë – is introduced.**

AT: Hall***

Some biopolitics might be good, but that's not the aff --- we specifically critique the juridical biopolitics of the 1ac

THEIR AUTHOR Hall, 5/7/**2007** – Master of Arts in Political Science (Lindsay, "Death, Power, and the Body: A Bio-political Analysis of Death and Dying", Virginia Polytechnic Institute and State University, p. 9)//roetlin

Foucault was careful to distinguish sovereign power from the mechanisms of power that emerged in modernity. For him, an essential aspect of modern power is its surreptitious nature–it works so well precisely because we are intent on looking for power in rules and laws; in prohibitive mechanisms **rather than in productive ones**. While Damiens' execution was perhaps the last great hurrah for pure sovereign authority–as it would only be a few decades later that the French King himself would see his power stripped away by the cold steel blade of the guillotine–Foucault famously contended that, "in political thought and analysis, we still [have yet to] cut off the head of the king" (1978, 88-89). In other words, for Foucault, power is still represented in **juridical terms** despite the fact that deduction, the primary manifestation of sovereign authority, has become merely one element in a range of mechanisms "working to incite, reinforce, control, monitor, optimize and organize the forces under it" (1978, 136).

AT: Holocaust Trivialization

He's obviously not being literal --- he's not even claiming our experiences are on par with nazi victims

Van Munster, 5/28/**2014** – Senior Researcher at the Danish Institute for International Studies (DIIS) and teaches security studies at the Department of Political Science, University of Southern Denmark (Rens, "The War on Terrorism: When the Exception Becomes the Rule", Danish Institute for International Studies, p. 144)//roetlin

Supra fn. 4, at p. 181, passim , <u>Agamben's</u> outspoken <u>statement that the concentration camp is the political paradigm of the West **does not** purport that life today faces the **same horrors** that inhabitants of concentration camps had to confront.</u>

Biopolitics generates the groundwork for <u>racism</u> and <u>eugenics</u> --- these invisible violences outweigh any purported benefits of biopolitics --- FYI we also don't link to h triv

Van Munster, 5/28/**2014** – Senior Researcher at the Danish Institute for International Studies (DIIS) and teaches security studies at the Department of Political Science, University of Southern Denmark (Rens, "The War on Terrorism: When the Exception Becomes the Rule", Danish Institute for International Studies, p. 144-146)//roetlin

Taking his cue from Michel Foucault, Agamben maintains that <u>the sovereign right to take life has become supplemented and permeated by a right to make life</u>. In modern societies <u>the sovereign threat of death has been complemented with a concern to **take charge** of biological life</u> in order to make it more productive, fertile, healthy, etc. 11 <u>Instead of threatening with death, biopolitics is a form of power that is concerned with the correction, administration and regulation of populations</u>. Seeking to take charge of life, ''<u>it does not have to draw the line that separates the enemies</u> of the sovereign <u>from</u> his <u>obedient subjects</u>; it effects distributions around the norm.'' 12 The inclusion of pure life in politics, then, also marks a shift from law to the (statistical) norm in the sense that <u>bare life is not only, or not even first and foremost, produced in the sovereign process of taking life, but through the process of making life</u>, i.e. through the distribution of human life around a norm with the purpose of reducing life's distance to this norm. <u>Although the incorporation of bare life in the political realm has made it possible to reduce</u>, amongst others, <u>famine and mortality</u> in the West<u>, it has also given rise to 'caring' practices such as **racism and eugenics**: ''What follows is a kind of bestialization of man achieved through the most sophisticated political techniques. For the first time in history ... it becomes possible both to protect life and to authorize a holocaust.</u>'' 13 Agamben's rendering of sovereign power and bare life is driven by an ethical drive to lay bare the <u>juridico-political mechanisms of power</u> that <u>make it possible to commit acts of violence that do not count as crime.</u> 14 While **not denying the uniqueness of the suffering** in the Nazi concentration camps, <u>Agamben discovers similar structures</u> in contemporary society. He points out that <u>camp-like structures such as detention centres for illegal migrants, airport holding zones and humanitarian relief camps all produce bare life</u> in the sense that decisions on the life of people can be taken outside the normal framework of rule, but which nevertheless are not completely illegal and without connection to that law. In the context of this paper, the <u>Guantanamo Bay</u> detention centre for suspected terrorists <u>is another case in point</u>. 15 However, as Edkins has noted, Agamben has not inquired deeper into the politics of emergency or the politics of the ban in which the sovereign and homo sacer are constituted as each other's mirror image. 16 Therefore, the following sections aim to provide insight into the ways in which the American governance of the emergency of 9/11 constitute global American sovereignty on the one hand and reduce political subjects to the naked life of homo sacer .

AT: Schmitt**

The affirmation of enmity re-creates violent states of exception in which the sovereign is able to enact racialization as a tool of colonial domination

To draw out this relationship between biopolitics, capitalism and resistance I begin with the zombie's mythic origins in Haiti. For Achille Mbembe, the figure of the zombie perfectly captures the self-undermining way in which biopolitics, through ever-widening gaps of permanent emergency and states of exception, has always been as much a technology of death as of life - in his [End Page 175] memorable terminology, a necropolitics. In his essay of that name, Mbembe, echoing Agamben in proclaiming death camps the 'nomos of the political world in which we still live', argues that in the contemporary moment 'the human being truly becomes a subject - that is, separated from the animal - in the struggle and the work through which he or she confronts death (understood as the violence of negativity)' (14). Consequently, 'the state of exception and the relation of enmity have become the normative basis of the right to kill…. power (and not necessarily state power) continuously refers and appeals to exception, emergency, and a fictionalized notion of the enemy. It also labors to produce that same exception, emergency, and fictionalized enemy' (16). Extending Foucault's theory that race war is the constitutive foundation of the modern state, as well as Hannah Arendt's argument in The Origins of Totalitarianism that the two world wars reflected the reimportation of technologies of violence from the colonies (in which they were first developed) into 'civilised' metropolitan Europe, Mbembe argues that the declaration of enmity required by the state of exception is an act of racialisation that has its origins in colonialism and imperialism, as well as plantation economics and the slave trade ('Necropolitics' 18). Sovereignty in this (post)colonial valence operates in accordance with a zombic logic of quarantine and extermination: 'sovereignty means the capacity to define who matters and who does not, who is disposable and who is not' ('Necropolitics' 27). This basic assumption of disposability, and the reign of terror it engenders, has necessarily taken many different forms in the many different locations and contexts in which it has been deployed; Mbembe's own examples range from the '"savages" of the colonial world' to refugees, stateless persons, enslaved persons and the working class. Mbembe's work suggests that colonialism's assignation of nonhuman disposability to human beings can be abstracted as modernity's foundational theoretical investment, its original (and ongoing) sin. For Mbembe, the history of this assignation of disposability and the consequent 'rise of modern terror' begins not with state action but with the plantation system and the figure of the slave, which he notes 'could be considered one of the first instances of biopolitical experimentation' ('Necropolitics' 21). But the exclusion of the slave from the body politic and her subsumption into the market as an object-commodity can never be completely realised; the productive capacity, creativity and intentional mind of the enslaved are required to produce wealth for the slave-owner, but these same human values must be denied in order for the practice of slavery to be justified in the first place. This is to say, the humanity of the slave must be retained even as it is denied: [End Page 176]

Schmitts ontology leads to marginalizing violence – don't trust their apologism

Farr 9 [Evan, PhD Student in Political Science. With Friends Like These...Carl Schmitt, Political Ontology, and National Socialism]

In the next section, I will work from this foundation to map Schmitt's ontology. In doing this, I will demonstrate that Schmitt's errors involve much more than bath water. 2: Problems with the Schmittian Ontology As seen above, the agonistic attempt to salvage Carl Schmitt focuses upon Schmitt's attacks on a certain universalistic understanding liberalism. In this reading, it is liberalism that suppresses the possibility of difference, while Schmitt's antagonism and decisionism merely recognize reality: that the political always inevitably involves conflict and difference, and – no matter the insufficiency of Schmitt's solution – the key goal for political theorists is to navigate the seemingly incommensurable struggle between sometimes violently different theories of democratic legitimacy. But how compatible are the agonist and Schmittian perspectives? In this section, I will argue that Schmittian antagonism and democratic agonism

are more deeply conflicting than Chantal Mouffe and others recognize. Because Schmitt is oriented toward a statist and action-centric ontology, **his theory is significantly more dangerous** than his apologists admit.

Schmitts epistemology is flawed – his arguments are based around a defense of Nazism – prefer this evidence, its from the top of the article and cut by a straight beast

Emden 2009 [J. Emden, Department of German Studies, Rice University. How to Fall into Carl Schmitt's Trap. July.]

This is a long review and perhaps a controversial one. The much-awaited English translation of Raphael Gross's seminal book on Carl Schmitt's antisemitism, based on a doctoral dissertation at the University of Essen and first published by Suhrkamp ten years ago to much media attention in Germany, and subsequently in France, makes a substantial contribution to contemporary scholarship on Schmitt, one of the most influential public lawyers and constitutional theorists of the Weimar Republic. Preceded by a well-balanced preface by Peter C. Caldwell, which elegantly situates Gross's argument in the contemporary intellectual field, Joel Golb's translation is accurate and precise. It is, however, the argument of Gross's study which seems initially strikingly persuasive, but emerges as increasingly problematic. On the one hand, no doubt remains that Schmitt held deeply entrenched antisemitic views throughout his life. As such, Gross's study serves as a warning against the uncritical Schmitt enthusiasm that occasionally marks contemporary cultural studies, that is, a kind of desire for political Eigentlichkeit now that poststructuralist theories have run their course. On the other hand, Gross's study has a far more ambitious goal than simply providing an account of Schmitt's antisemitism and, in this respect, it does have severe limitations that require a more detailed assessment. Most importantly, Gross unwittingly falls into Carl Schmitt's trap. The central question of Gross's study is not whether Schmitt really was antisemitic--not even the most enthusiastic Schmitt apologists would seriously deny this. Neither is the central question whether traces of Schmitt's antisemitic convictions can be found throughout his political thought and his work as a constitutional scholar--needless to say, they can. Rather, Gross's project seeks to reduce Schmitt's entire way of thinking about the political and about law to the binary opposition between "friend" and "enemy"--introduced in Der Begriff des Politischen (1932)--which Gross interprets from the perspective of Schmitt's involvement in the Nazi state as the difference between a homogeneous German Volk and a perceived "other," that is, Judaism, that is not only "alien" to this Volk but threatens the latter's existential survival.[1] Seen from this perspective, Gross claims, not only does Schmitt's thought stand in clear opposition to the tradition of the liberal Rechtsstaat--indeed, the very source of his critique of the modern democratic state is to be found in his antisemitic convictions.

The alternative is the state of exception – makes the aff's impacts inevitable

Boersma, 5 (Jess Boersma teaches courses in Peninsular literatures, critical thought, and Spanish language at U of NC, "What About Schmitt? Translating Carl: Schmitt's Theory of Sovereignty as Literary Concept", published in *Discourse*, 27.2&3, Spring & Fall 2005, pp. 215-227 (Article), accessed 7/16/13, projectMUSE)

It would be too hasty to conclude that Schmitt's current critical standing indicates any kind of resolution of the polemics between left and right regarding the legacy of his legal thought and his political association with the Nazi party. It almost goes without saying that the extreme right has taken pains to revive the friend-enemy distinction, developed in Schmitt's The Concept of the Political and, in many cases, has reduced it further to a friend-foe distinction in order to justify strategies of total war and cultural, religious, and ethnic cleansing.3 On the other side of the spectrum, Giorgio Agamben, in his Homo Sacer series argues that the possibly tyrannical consequences of Schmitt's thinking on the friend-enemy distinction and the sovereign decision are not isolated to the followers of the ''Crown Jurist of the Third Reich,'' but rather are only too alive and well within the practices of present day liberal democratic states.4 Let me give one quick example of Agamben's line of thought in the form of biopolitics and the sovereign decision. In Homo Sacer: Sovereign Power and Bare Life Agamben argues

that the state of exception is fast becoming the rule, with the consequence that the state of nature and the state of law are nearly indistinguishable (38). Rather than a pure Hobbesian state of nature of all against all, the sovereign state maintains the monopoly over violence and yet the demand for obedience is no longer contingent upon the guarantee of protection. In Remnants of Auschwitz, the Nazi concentration camp is shown to be the end result of a legal process which produces a separation between the living being (zoe) and the speaking being (bios) with the aim ''no longer to make die or to make live, but to survive'' (155). Agamben then seeks to illustrate how states of exception have played out in American history by following the sovereign decisions of presidents Abraham Lincoln, Woodrow Wilson, Franklin D. Roosevelt, and George W. Bush. In the last case, he states that as a result of September 11 ''Bush is attempting to produce a situation in which the emergency becomes the rule, and the very distinction between peace and war (and between foreign and civil war) becomes impossible'' (State of Exception 22). Evidence for Agamben's claims would appear to be provided externally by the suspended legal status of the Guanta´- namo prisoners; and internally by the recent ethical and legal battles over the coma case of Terri Schiavo (whose last name happens to mean slave in Italian), along with the present debates between the legislative and the executive branches in which Attorney General Alberto Gonzales has defended the constitutional legality of President Bush's decision to not fully disclose matters regarding domestic spying.5

Schmitt's politics lead to Nazism – don't discard the obvious in favor of his apologists Farr, 9

Evan, With Friends Like These...Carl Schmitt, Political Ontology, and National Socialism, PhD Student in Political Science, University of Virginia Graduate Student Conference, http://www.virginia.edu/politics/grad_program/print/Farr_gradconference09.pdf

3: Schmitt's Nazism: Interlude or Inevitability? Carl Schmitt's membership in the Nazi Party from 1933 to 1936 is the most obvious problem for his apologists, and it has spawned a thriving body of literature seeking to demonstrate that his involvement with the Third Reich was negligible.49 According to his defenders, if Schmitt was a Nazi he was only a Nazi of opportunity, stringing along the NSDAP leadership (especially Hermann Goering) in order to retain his academic posts. Like Heidegger or Pound, Schmitt is forgiven his transgression for the sake of ostensibly non-fascist work elsewhere. This section will argue that it is a **mistake to discount Schmitt's Nazism** as an opportunistic interlude. Although he certainly did not share the millenarian, mystical mania marking the hardcore Nazi ideologues, the ontological commitments described in the foregoing section predisposed Schmitt to **sympathize with a totalitarian – and ultimately genocidal – regim**

Agamben isn't making a direct comparison, and his theories have clear reasons for the parallels he draws

Robinson 11 (Andrew – political theorist, activist based in the UK and research fellow affiliated to the Centre for the Study of Social and Global Justice (CSSGJ), University of Nottingham, "In Theory Giorgio Agamben: the state and the concentration camp," in Ceasefire Magazine, 1-7-11, https://ceasefiremagazine.co.uk/in-theory-giorgio-agamben-the-state-and-the-concentration-camp/)

Doubtless some will reject his theories for violating "Godwin's Law", or because they feel it is trivialising or decontextualising the camp to compare it to every instance of repression. This, I suspect, is based on a misunderstanding. For one thing, Agamben is not actually saying that we are all treated like camp inmates, simply that we're all at risk from being treated as if we are of this status – we could be killed by the state with impunity, even if we aren't. Also, this is not just a case of Agamben calling people he dislikes Nazis. There are clear, structural reasons for the parallels he draws. I would argue that, in contrast, the tabooing of discussion of fascistic elements of present state practices is based on a kind of irrational splitting, which wards off the subversive implications of "never again" by keeping them at a distance, pretending they "don't apply to us", they only apply to issues behind some imaginary boundary (in "undemocratic" societies for instance) which historically would prove to be far more porous. It is, I think, a peculiar perspectival blockage of radicalisms in countries like Britain to confine anti-fascism to opposing small neo-Nazi groups. In contrast, German antifa have long recognised the parallels between the repressive practices (and even the personnel) of the current German state and those of the Third Reich; so have radicals in Italy, Spain, Greece and Japan. It is only in countries like Britain and America, with no recent fascist past to compare to, where the existence of a continuum between fascism and the 'deep state' is something of a public secret, even among radicals.

The Holocaust happened for contingent, historical reasons but the camp was a key precondition

Robinson 11 (Andrew – political theorist, activist based in the UK and research fellow affiliated to the Centre for the Study of Social and Global Justice (CSSGJ), University of Nottingham, "In Theory Giorgio Agamben: the state and the concentration camp," in Ceasefire Magazine, 1-7-11, https://ceasefiremagazine.co.uk/in-theory-giorgio-agamben-the-state-and-the-concentration-camp/)

The concentration camp, and Nazi death camps such as Auschwitz in particular, are for Agamben particularly definitive or telling examples of sovereignty. The camp (which preceded the Holocaust by a long time) was a turning-point for Agamben because it made the temporary state of exception permanent, locating it in space instead of time (unlike the declaration of a state of emergency), and local to the core area of power, within its territory but outside its law (unlike the colony or warzone). This fixing of the state of exception as a permanent feature at a site in time and space intensifies the danger to people declared homo sacer. Formerly, an outlawed person would be literally banished, becoming a wandering figure driven into exile. Now, an outlawed person is not allowed to go into exile (think for instance of the immense efforts put into catching high-profile fugitives), but rather, is put in a situation suspended between inside and outside, constantly at risk of arbitrary power. For Agamben, camps differ from other disciplinary spaces (prisons, asylums and so on) because in them, anything is possible, and the guard is absolutely sovereign. The Nazi Holocaust marks a second turning point in which the horrors of the camp are revealed in all their monstrosity. The Holocaust happened when and where it did for contingent historical reasons, but its real causes were the creation of a particular kind of space, the 'camp', where people were defined as having lives not worth living, and as being vulnerable to being killed with impunity. Auschwitz is the high point of the logic of sovereignty, showing its ontological nature in its realisation: it shows where the combination of biopolitics and sovereignty leads. Auschwitz marks the point of no return which reveals the nature of sovereignty for what it really is. It thus marks the starting point for a new politics.

2nc – at: try or die

Timeframe based try or die calculations justify consolidation of power and radical, unprecented violence

The ways that authoritative institutions **invoke and order time** as a means of consolidating and expressing power often **engender violence**. Conflicting interpreta- tions of holy writ and spiritual obligation have incited bloody religious persecutions and armed conflicts for centuries. Slavoj Zizek contends that secular (not only religious) regimes justify **radical police or military action** by **invoking apocalyptic senses of time**: "Apocalyptic time is the time of the end of time, the time of emergency, of the state of exception when the end is nigh."[2] States of exception in liberal-democratic nations are also times of exception: **executive authorities** exercise unprecedented forms of violence both within and without national borders by **citing as justification allegedly temporary episodes of state emergency**.[3]

2nc – at: determinate site

Sovereign exceptionalism is spatializing, not spatially bounded

Belcher et al. 8 (Oliver Belcher – postdoctoral researcher on the RELATE Center of Excellence located at the University of Oulu, Finland, former postdoctoral researcher on the BIOS Project at the Arctic Center, University of Lapland, Finland, Lauren Martin – Academy of Finland, Postdoctoral Researcher, RELATE Centre of Excellence, Department of Geography, University of Oulu, Finland, PhD in Geography, Department of Geography, University of Kentucky, Lexington, Kentucky, Anna Secor – Full Professor, University of Kentucky, Geography Department, PhD, University of Colorado, Stephanie Simon, Tommy Wilson, "Everywhere and Nowhere: The Exception and the Topological Challenge to Geography," Published in Antipode, Volume 40, Issue 4, pages 499–503, September 2008, http://onlinelibrary.wiley.com/doi/10.1111/j.1467-8330.2008.00620.x/abstract)

Geography's use of Giorgio Agamben's work has proliferated in recent years. While approaches and interpretations of Agamben's political theory have varied, a common aim has been to apply his theory of exception to socio-geographical phenomena and to disclose "the ban" as the "originary political relation" (Diken and Laustsen 2005:24–25; Ek 2006:363; Kearns 2006; Minca 2005, 2006). The result has been a focus on the "space" of the exception as a determinate socio-temporal site, such as Guantanamo Bay. We argue that this focus on determinate spaces elides the real spatializing work of the exception, which, we emphasize, is topological (see also Coleman 2007). The problem with focusing on a static geometry of exceptional spaces is that it obscures the ways in which the exception operates as an unlocalizable process of transformation. As Brian Massumi (2002:184) puts it, the distinction between topology and static geometry is the distinction "between the process of arriving at a form through continuous deformation and the determinate form arrived at when the process stops" (see also Hannah 2006). Topologies, unlike topographies, do not map discreet locations or particular objects. While it is true that we can identify operative spaces of exception, the exception also materializes ordinary spaces. As a topological figure that creates the conditions for particular materialized sites, the exception is emergent, which is to say that it is not a preformed category but a dynamic set of techniques of power. In this way, we emphasize Agamben's relationship with Foucault, an affinity that is often lost in various interpretations of his writings. The implications of a topological and emergent understanding of the exception become clearer in the context of Agamben's idea of sovereignty as potential and actual. At the same time, our intervention aims to show how a topological, emergent understanding of the exception might open up a potential for radical politics. If the spatiality of Agamben's political theory has been treated in too fixed a manner, this tendency might in no small part be due to a confusion between Agamben's political theory and that of the primary theorist of the sovereign exception, Carl Schmitt. Schmitt argues that juridical rule and State authority are made possible by the decision on what constitutes the "normal" case (where the rule of law holds) versus the exception (where the law is suspended) (Schmitt 1985). Schmitt's idea of the "ordering of space" involves above all the decision on the exception that establishes the inside and the outside of the law. The state of exception, according to Schmitt, "designated a zone of free and empty space", that is, "a suspension of all law for a certain time and in a certain space" (Schmitt 2003:99). For Schmitt, therefore, the decision on the exception performs a juridical and territorial ordering at the same time as it demarcates a specific spatio-temporal order—the space of the exception. Agamben's departure from Schmitt on the question of space is clear in Homo Sacer, where he writes: In its archetypal form, the state of exception is therefore the principle of every juridical localization, since only the state of exception opens the space in which the determination of a certain juridical order and a particular territory first becomes possible. As such, the state of exception itself is thus **essentially unlocalizable** (even if definite spatio-temporal limits can be assigned to it from time to time) (Agamben 1998:19). Thus for Agamben the state of exception is the principle of territorialization (ordering and orienting) but is itself essentially unlocalizable. While Schmitt explicitly renders the state of exception as spatially and temporally bounded, Agamben's contribution to the theory of the exception is to reread Walter Benjamin's engagement with Schmitt and to bring into sharp relief its contemporary relevance. For Agamben, this state inaugurates a rupture within the Schmittian correspondence between order and orientation, between law and space. For Schmitt the decision on the exception merely demarcates the inside and the outside of the law, but for Agamben the exception also produces and diffuses a "zone of indistinction" within which the law and its suspension become indistinguishable. This state of exception is not itself a kind of space, but rather a technique of

government (Agamben 2005:2) that produces a topographical juridical-territorial order by determining the inside and the outside of law (as Schmitt also argues); establishes the principles by which we distinguish law from its application; and produces a topological relationship between the inside and outside of law such that they become indistinguishable (delocalization). Because topological space is always a process of becoming, we use analytics of governmentality, which itself refers to the everyday emergence of power and control, to think through how the exception works. For Foucault, governmentality refers to a field of everyday practices, organized by a complex of techniques of power that govern and optimize processes immanent to a population. In this field, discipline, government, and sovereignty are imbricated and indistinguishable, so that the exception operates as a potential (dis)ordering principle, a potential technique of government (Foucault 1991:102). For Agamben, "the declaration of the state of exception has gradually been replaced by an unprecedented generalization of the paradigm of security as the normal technique of government" (Agamben 2005:14). This governmentalization of the structure of the exception forms a "complex topological figure in which not only the exception and the rule but also the state of nature and law, outside and inside, pass through one another" (Agamben 1998:37). As a technique of government, then, the exception is never completely hidden, nor is it purely manifested. The state of exception produces material effects, even when it remains virtual. This poses an important question for geographers: how do we analyze the material effects of the virtual? If the topological character of the state of exception means that it operates at the edges of materiality, how should we make use of Agamben's theories to understand the spatiality of the exception (and governmentality, for that matter)? We argue that Agamben's limit case, the state of exception, is spatializing, not spatialized. When we say that the exception is spatializing, we emphasize processes of transformation and emergence (the topological) and fold the operation of spatialization into the field of potential. The exception thus produces a governmental potential to link specific arrays of discursive objects, procedures, and rationalities towards particular ends. Based on this understanding of Agamben, which emphasizes the emergent spatialization of the exception rather than its determinate spaces, we argue for foregrounding the idea of potentiality in geographical analyses of the exceptional. Situated on the edge of materiality, the state of exception has the potential to materialize or not to materialize actual spaces of exception. Potentiality, for Agamben, is the tension between actuality (materialization) and the potential not to be—the faculty to say "I can", without the action being materialized (Agamben 1999:179). To have a faculty, argues Agamben, means "to have a privation", ie the potential not to be. This potentiality, argues Agamben, "maintains itself in relation to actuality in the form of its suspension; it is capable of the act in not realizing it, it is sovereignly capable of its own im-potentiality" (Agamben 1998:45). For example, in his discussion of sovereignty, Agamben poses "abandonment", the rationality of power that marks the exception, as topological in that it has the ability not to be: it is potential. The exception is the zone of indistinction between constituting and constituted power. The decision on the exception "realizes itself by simply taking away its own potentiality not to be, letting itself be" (Agamben 1998:46). Topological space is therefore not only emergent and governmental, but also always potential—that is, both capable of becoming and of not becoming. It is no coincidence that in the denouement of his essay "On potentiality" that Agamben finds the "root of freedom" also within the "abyss of potentiality" (Agamben 1999:183). Agamben's political praxis is one of radical desubjectivation, a desubjectification that refuses to be captured in a topological state of exception [a synthesis between Walter Benjamin's "divine violence" (1996) and Gilles Deleuze's (2006) "Immanence: a life …"]. He writes, "We can say that between immanence and a life there is a kind of crossing with neither distance nor identification, something like a passage without spatial movement" (Agamben 1999:223). This "passage without a spatial movement" is a matrix of infinite desubjectification (Agamben 1999:232). Absolute immanence (ie potential freedom) is a call for Benjamin's barbarians: those law-destroying lives that cannot be captured in a sovereign's state of exception. It is "a life …" whose principle is "infinite desubjectification", which cannot be abandoned—a de-subject that preempts the potential state of exception, and therefore cannot be striated into the biopolitical subject of bare life, that succubus that haunts our political landscape. Just as the subjective homo sacer is the material kernel for the sovereign exception, Agamben's radical desubjectification is the material kernel for freedom. This praxis of Agamben's may be what Deleuze once said was "philosophy, nothing else but philosophy" (cited in Ek 2006:363) in response to a question on the utility of A Thousand Plateaus (Deleuze and Guattari 1980). This poses a challenge to geographers of how to produce knowledge and geographical imaginaries that at once promote just political and intellectual projects and refuse to produce subjects that can be captured.

2nc – at: 'state of exception' bad

Misreading --- our point is the duality of power <u>feeds into itself</u>

Prozorov 10 (Sergei – Professor of Political and Economic Studies at the University of Helsinki, "Why Giorgio Agamben is an optimist," in Philosophy Social Criticism, Volume 36, Number 9, p. 1056-1057, November 2010, http://psc.sagepub.com/content/36/9/1053.abstract)

<u>This</u> totalized <u>image of the global</u> ==state of exception has been criticized== as both hyperbolically excessive and internally contradictory. Paul Passavant has argued that Agamben's theory suffers from a contradictory concept of the state that also plagues his affirmative vision of the 'coming politics'.7 <u>While</u> ==Agamben== <u>is most famous for his deconstruction of the logic of sovereignty that radicalizes Schmitt's conception</u>,8 <u>he</u> ==has also==, <u>from his earliest work</u> onwards, ==confronted== <u>the more</u> ==dispersed==, 'governmentalized' modes of ==power relations characteristic of late capitalism== <u>in the manner highly influenced by</u> Guy <u>Debord's work on the society of the spectacle</u>.9 Against the argument that this conjunction of sovereignty and governmentality in the analysis of late-modern power relations constitutes a contradiction, we must recall that ==this duality of the contemporary apparatus of power is **explicitly affirmed by Agamben himself**==, <u>who</u>, similarly to Foucault's claim for the indissociability of sovereignty, discipline and government,10 <u>regularly</u> ==insists that '==<u>the system is always double</u>'.11 The inextricable link between the two aspects of the contemporary social order consists in the nihilistic deployment of life itself as a (post-)historical task. ==Both state sovereignty and the late-capitalist society of the spectacle are biopolitical and thus permanently feed into each other==. The contemporary neo-liberal governmentality extends the operation of economic rationality to life itself, whereby life is conceived as a paradigmatic form of enterprise,12 and in this manner expropriates the being-in-language that defines human existence and subjects it to the laws of exchange-value or, in Agamben's later works, 'exhibition value'.13 Conversely, sovereign power expropriates the potentiality of human existence, transforming it into the bare life that it then grounds itself in and applies itself to in the perpetual state of exception. The state does nothing more than sustain the spectacle with its apparatuses of security, while the spectacle does nothing more than perpetually produce the degraded forms-of-life that sovereign power can apply itself to.

2nc – at: utopian/mwajeh 5

We are manifestly anti-utopian --- possibility for change is <u>always already present</u>

Prozorov 10 (Sergei – Professor of Political and Economic Studies at the University of Helsinki, "Why Giorgio Agamben is an optimist," in Philosophy Social Criticism, Volume 36, Number 9, p. 1057, November 2010, http://psc.sagepub.com/content/36/9/1053.abstract)

It is evident that the danger at issue in Agamben's work is nihilism in its dual form of the sovereign ban and the capitalist spectacle. If, as we have shown in the previous sec- tion, the reign of nihilism is general and complete, we may be optimistic about the pos- sibility of jamming its entire apparatus since there is nothing in it that offers an alternative to the present 'double subjection'. Yet, where are we to draw resources for such a global transformation? ==**It would be easy to misread Agamben as an utterly utopian thinker**==, **whose intentions may be good and whose criticism of the present may be valid if exaggerated**, **but whose solutions are completely implausible if not outright embarras- sing**.23 Nonetheless, ==**we must rigorously distinguish Agamben's approach from utopian- ism**==. As Foucault has argued, ==**utopias derive their attraction from their discursive structure of a fabula**==, which makes it possible to describe in great detail a better way of life, precisely because it is manifestly impossible.24 While utopian thought easily pro- vides us with elaborate visions of a better future, it cannot really lead us there, since its site is by definition a non-place. In contrast, ==**Agamben's works**== **tell us quite little about life in a community of happy life that has done away with the state form**, **but** ==**are remark- ably concrete about the practices that are constitutive of this community**==, **precisely because** ==**these practices require nothing that would be extrinsic**== to the contemporary condition of biopolitical nihilism. Thus, ==**Agamben's coming politics is manifestly anti-utopian and draws**== **all** ==**its resources from the condition of contemporary nihilism**==.

This is offense against you --- an <u>inability to imagine</u> a different world doesn't change its <u>possiblity</u>

Kelly 14 (Mark GE – Senior Lecturer in Humanities at the University of Western Sydney, "Against prophecy and utopia: Foucault and the future," in Thesis Eleven, Volume 120, Number 1, p. 112-113, http://the.sagepub.com/content/120/1/104.full.pdf+html)

<u>It might be said that such a position is itself utopian</u>, positing a utopian vision of a world devoid of utopianism, by which to condemn the present, predicting, without knowing it, that things will work better without utopianism. Neither Foucault nor I do this, however. We offer no vision of how a world without utopianism might operate, no claim that it will lead to any particular practical consequence. ==We only identify a certain== <u>form of practice existing in the present</u> that ==we advocate==, ==over other practices== <u>in the present that I argue are immanently self-contradictory</u>. I make no claim about the dangers or lack thereof in non-utopian procedures, only that they avoid the specific dangers of utopianism and prophecy. Another possible line of objection is that anti-utopianism is associated today with reactionary politics. Alain Badiou (2001: 13) points out that today <u>any positive political project is attacked as utopian</u>, <u>which is to say as unrealistic</u>. It is true that <u>such criticisms are widespread</u>, <u>but they are often incorrect</u>. While there are utopianisms on the left, ==revolutionary thought is not generically utopian==. Revolution is compatible with my position, in the form of an immanent revolution from below, in which the participants attend to and deal with the radically new and unforeseeable conditions as they emerge in a revolutionary situation. The point is to prevent revolution being utopian or prophetic. <u>The critique that castigates left-wing politics in general as utopian is the inverse of our critique of utopianism</u>. Where we claim that utopianism fails because it attempts to say how society should work, <u>critiques of left-wing thought as utopian tend to claim that left-wing positions are insufficiently articulated, hence 'utopian' because they cannot offer an alternative vision</u>. We would argue that ==utopianism is marked **not by the absence of a utopian vision**==, **but** ==**by its presence**==. According to my argument, ==the inability to imagine how something would work is **no argument against its possibility**==, ==just as the ability to imagine how something would work **does not adequately demonstrate that it is actually possible**==, ==since the complexity of the social outstrips our ability to model society in our minds==. ==There is nothing utopian about saying that 'another world is

possible', where this slogan is raised without detailing what this world would look like. Badiou's own position is utterly non-utopian, because it is a matter of fidelity to a truth event in the past that is neither about reviving the past situation nor aiming at producing any particular future situation. Badiou's philosophy is one of profound openness which is inimical to utopianism as I have described it. Conversely, however, it is problematic to say that another world is not possible, that 'there is no alternative'. Such pronouncements are prophetic. The claim that communism is impossible has the same flaw as the claim that communism is inevitable: we cannot know whether a determinate form of social organization is either inevitable or impossible, possible or desirable, in advance. Grand historical claims are prophetic, even if they are negative, like Fukuyama's famous neo-Hegelian diagnosis of the end of history

2nc – at: ojakangas 5

Ojakangas elides the intrinsic relation between caring for living and adjudicating death

Dillon 5 (Michael – Professor of Politics and International Relations at Lancaster University, "Cared to Death: The Political Time of Your Life," in Foucault Studies, No. 2, p. 37-38, May 2005, http://rauli.cbs.dk/index.php/foucault-studies/article/viewFile/858/876)

The key point of dispute with Ojakangas concerns the self-immolating logic of biopolitics. "Not bare life that is exposed to an unconditional threat of death," he says in the introduction to his paper, "but the care of 'all living' is the foundation of biopower." (emphasis in the original). Ojakangas says: "Foucault's biopower has nothing to do with that [Agamben] kind of bare life." I agree. Foucault's biopolitics concerns an historically biologised life whose biologisation continues to mutate as the life sciences themselves offer changing interpretations and technical determinations of life. This biologised life of biopolitics nonetheless also raises the stake for Foucault of a life that is not a biologised life. So it does for Agamben, but differently and in a different way. For Foucault, the biologised life of biopolitics also raises the issue of a life threatened in supremely violent and novel ways. So it does for Agamben, but again differently and for the same complex of reasons. In contesting Agamben in the ways that he does, Ojakangas marks an important difference, then, between Foucault and Agamben. That done, perhaps the difference needs however to be both marked differently and interrogated differently. I have argued that there is a certain betrayal in the way Agamben reworks Foucault. There is however much more going on in this 'betrayal' than misconstruction and misinterpretation. There is a value in it. Exploring that value requires another ethic of reading in addition to that of the exegesis required to mark it out. For Agamben's loathing of biopolitics is I think more 'true' to the burgeoning suspicion and fear that progressively marked Foucault's reflections on it than Ojakangas' account can give credit for, since he concentrates on providing the exegetical audit required to mark it out rather than evaluate it. In posing an intrinsic and unique threat to life through the very ways in which it promotes, protects and invests life, 'care for all living' threatens life in its own distinctive ways. **Massacres have become vital.** The threshold of modernity is reached when the life of the species is wagered on its own (bio) political strategies. Biopolitics must and does recuperate the death function. It does teach us how to punish and who to kill. Power over life must adjudicate punishment and death as it distributes live across terrains of value that the life sciences constantly revise in the cause of life's very promotion. It has to. That is also why we now have a biopolitics gone geopolitically global in **humanitarian wars of intervention** and martial doctrines of virtuous war. Here, also, is the reason why the modernising developmental politics of biopolitics go racist: "So you can understand the importance - I almost said the vital importance - of racism to such an exercise of power." In racism, Foucault insists: "We are dealing with a mechanism that allows biopower to work." But: "The specificity of modern racism, or what gives it its specificity, is not bound up with mentalities, ideologies or the lies of power. It is bound up with the techniques of power, with the technology of power." In thus threatening life, biopolitics prompts a revision of the question of life and especially of the life of a politics that is not exhaustively biologised; comprehensively subject to biopolitical governance in such a way that life shows up as nothing but the material required for biopolitical governance, whether in terms posed by Foucault or Agamben. Emphasising care for all living - the promotion, protection and investment of the life of individuals and populations - elides the issue of being cared to death. Being cared to death poses the issue of the life that is presupposed, nomologically for Agamben and biologically for Foucault, in biopolitics. Each foregrounds the self-immolating logic that ineluctably applies in a politics of life that understands life biologically, in the way that Foucault documents for us, or nomologically, in the way that Agamben's bare life contends. When recalling the significance of the Christian pastorate to biopolitics, Ojakangas seems to emphasize a line of succession rather than of radical dissociation. One, moreover, which threatens to elide the intrinsic violence of biopolitics and its **essential relation with correction and death**.

If life is a production of biopolitics it is circular to claim biopolitics saves lives

Dillon 5 (Michael – Professor of Politics and International Relations at Lancaster University, "Cared to Death: The Political Time of Your Life," in Foucault Studies, No. 2, p. 37-38, May 2005, http://rauli.cbs.dk/index.php/foucault-studies/article/viewFile/858/876)

The nomological concerns the law, the biological concerns 'life' and the theological concerns the relation of life to transcendence in the form of divinity. At a philosophical level, the life of politics may be said to find its bearings in relation to the changing interpretations and correlations of force that characterise the intimate relationality of this trinity of nomos, bios and theos. Agamben takes Foucault's account of biopolitics away from history and relocates it back in the centre of these key determinants of political philosophy. Whereas Agamben's nomological account of biopolitical violence threatens a certain kind of political paralysis, however, in as much as it ontologises that violence, Ojakangas' insistence on the productivity of biopolitics threatens to elide the violent inner logic of biopolitics and to miss what Agamben's nomologically driven

ontologisation nonetheless does rigorously expose. Incomparably the most interesting thinker thinking today, one of the things that Agamben is thinking in response to the provocations of biopolitics is the question of life undetermined by the life of biopolitics, a life elevated in addition by a refiguration of transcendence without a godhead, in the form of the immanence of the messianic. He also thinks the facticity of a corporeality beyond the reduction of the body to biology. It is in these moves, among others, that he thinks beyond the initial provocation to political thought that he takes from Foucault's biopolitics. Like any such response, the issue becomes less the degree of faithlessness than the worth of the betrayal.

Death is a function of biopolitics --- it must eliminate the threat to life

Dillon 5 (Michael – Professor of Politics and International Relations at Lancaster University, "Cared to Death: The Political Time of Your Life," in Foucault Studies, No. 2, p. 37-38, May 2005, http://rauli.cbs.dk/index.php/foucault-studies/article/viewFile/858/876)

Moreover, in the biopolitical context of the circulation of life as species being, Foucault says death is not so much disqualified, but, "something to be hidden away." It loses that spectacular ritual character it once had, marking the move from one power, that of secular sovereignty, to another power, that of a sovereign God. Death does not disappear from biopolitics. Neither is it attenuated beyond political concern, quite the contrary. It changes its character, undergoing political transformation as biopolitics re-inscribes death in the process of 'recuperating the death function'. Whereas no power can ultimately exercise power over death, biopower can and does exercise power over life. One of the means by which it does so is via the biopolitical preoccupations with mortality, morbidity, pathology and mutation. Concerned with death in terms of the vital signs of life, biopolitics is also increasingly concerned these days with the re-inscription of the vital signs of life in terms of code, both molecular and digital. Contra Ojakangas, then, biopolitics does reclaim the death function, for a number of reasons and in a variety of changing ways. It must do so. Reclaiming the death function is integral to its logic. It also reflects the changing operational dynamics of biopolitics. In relation to biopolitical logic: "In the biopower system... killing, or the imperative to kill, is acceptable only if it results not in a victory over political adversaries, but in the elimination of the biological threat to and the improvement of the species or race." It is acceptable and biopolitically necessary to kill, if not necessarily in the nomological sense of being exposed to death formulated in Agamben's thesis of bare life. In relation to the operationalisation of biopolitics: if biopolitics is to promote, protect and invest life, it must engage in a continuous assay of life. This continuous biopolitical assaying of life proceeds through the epistemically driven and continuously changing interrogation of the worth and eligibility of the living across a terrain of value that is constantly changing. It is changing now, for example, in response to what the life sciences are teaching about what it is to be a living thing. It is changing as biopolitical investment analysts (politicians, risk analysts, governmental technologisers) also interrogate where the best returns on life investment happen to be located in the manifold circulation and transformation of life locally and globally. Life itself mutates in and through these very circuits, not least in relation to molecular biology and electronic communication. We can broadly interpret life science now to range from molecularised biology, through digitalization, to the new social and managerial sciences of development now prominent in the fields of global governmentality, global development policies, human security and even military strategic discourse including, for example, 'Operations Other than War".

The division between white and black is not ontological---it's contingent

Peter **Hudson 13**, Writer at the Political Studies Department, University of the Witwatersrand, "The state and the colonial unconscious", Social Dynamics: A journal of African studies, 7/12/13, http://www.tandfonline.com/doi/pdf/10.1080/02533952.2013.802867

Thus the self-same/other distinction is necessary for the possibility of identity itself.¶ There always has to exist an outside, which is also inside, to the extent it is designated¶ as the impossibility from which the possibility of the existence of the subject¶ derives its rule (Badiou 2009, 220). But although the excluded place which isn't¶ excluded insofar as it is necessary for the very possibility of inclusion and identity¶ may be universal (may be considered "ontological"), its content (what fills it) – as¶ well as the mode of this filling and its reproduction – are contingent. In other¶ words, the meaning of the signifier of

exclusion is not determined once and for all: the place of the place of exclusion, of death is itself over-determined, i.e. the very framework for deciding the other and the same, exclusion and inclusion, is nowhere engraved in ontological stone but is political and never terminally settled. Put differently, the "curvature of intersubjective space" (Critchley 2007, 61) and thus, the specific modes of the "othering" of "otherness" are nowhere decided in advance¶ a certain ontological fatalism might have it. The social does¶ not have to be divided into white and black, and the meaning of these signifiers is¶ never necessary – because they are signifiers. To be sure, colonialism institutes an ontological division, in that whites exist in¶ a way barred to blacks – who are not. But this ontological relation is really on the¶ side of the ontic – that is, of all contingently constructed identities, rather than the¶ ontology of the social which refers to the ultimate unfixity, the indeterminacy or¶ lack of the social. In this sense, then, the white man doesn't exist, the black man¶ doesn't exist (Fanon 1968, 165); and neither does the colonial symbolic itself,¶ including its most intimate structuring relations – division is constitutive of the¶ social, not the colonial division.

Rebellion and opposition to the system is possible but requires concrete change

Peter Hudson 13, Writer at the Political Studies Department, University of the Witwatersrand, "The state and the colonial unconscious", Social Dynamics: A journal of African studies, 7/12/13, http://www.tandfonline.com/doi/pdf/10.1080/02533952.2013.802867

Be **this** as it may, whiteness and blackness are **(**sustained by) determinate and contingent practices of signification; the "structuring relation" of colonialism thus itself comprises a knot of significations which, no matter how tight, can always be undone. Anti-colonial – i.e., anti-"white" – modes of struggle are not (just) "psychic**"6** but involve the "reactivation" (or "de-sedimentation")**7** of colonial objectivity itself. No matter how sediment**ed** (or global), colonial objectivity is not ontologically immune to antagonism**.** Differentiality, as Zizek insists (see Zizek 2012, chapter 11, 771 n48), immanently entails antagonism in that differentiality both makes possible the existence of any identity whatsoever and at the same time – because it is the presence of one object in another – undermines any identity ever being (fully) itself. Each element in a differential relation is the condition of possibility and the condition of impossibility of each other**. It is this dimension of antagonism that the Master Signifier covers over transforming its outside** (Other) **into an element of itself, reducing it to a condition of its possibility**.8 All symbolisation produces an ineradicable excess over itself, something it can't totalise or make sense of, where its production of meaning falters. This is its internal limit point, its real:9 an errant "object" that has no place of its own, isn't recognised in the categories of the system but is produced by it – its "part of no part" or "object small a."10 Correlative to this object "a" is the subject "stricto sensu" – i.e., as the empty subject of the signifier without an identity that pins it down.11 **That is the subject of antagonism in confrontation with the real of the social, as distinct from "subject" position based on a determinate identity**. As we've seen **under colonialism**, (the real of) **non-meaning is brought into the logic of the system – the colonised directly experiences the void of non-identity as the meaning of its subject-position (or social "identity**"). Under capitalism, "proletariat" designates this (non-designated) "part of no part," this object without a designated place, this non-totalisable excess produced by the system that can't integrate it, however, as it is not recognised in its categories. Note that under capitalism, the

working class first has to separate itself from itself qua working-class before it can become proletariat – it has to "go through" self-dissolution, whereas the colonised is always already "dissolving."

The system of white colonialism in opposition to the black body doesn't not have to exists in the strict binary that we identify it as

Peter **Hudson 13**, Writer at the Political Studies Department, University of the Witwatersrand, "The state and the colonial unconscious", Social Dynamics: A journal of African studies, 7/12/13, http://www.tandfonline.com/doi/pdf/10.1080/02533952.2013.802867

Fundamentally, for Fanon, colonialism is about the construction of white subjects and black subjects – these are in no sense necessary identities **(as racist discourse claims). Secondly,** flowing from this**,** there is no foundation to colonialism: it doesn't rest on Man or History, it is just a contingent social relation – a differential (over-determined) relation, which it's got to be if it is a contingent construction that can be transformed and replaced. Neither white nor black has value independently of their relationship – white is the difference between it and black, and vice versa. The whiteness of white, where "whiteness" = "brimming with identity self-posses- sion and sovereignty" depends on the blackness of black, where 'blackness' = without identity and self-control. Colonialism satisfies the conditions of a signifying dyad in that its elements (coloniser and colonised) do not exist independently of the relations into which they enter and through which they determine each other reciprocally (Deleuze 1973, 302). On their own, they don't have a determinate value but only acquire one through their reciprocal determination in relation. This is a differential relation, because whiteness only has its colonial meaning in its relation to blackness, and vice versa. The presence of the one in the other precludes either from attaining full identity to itself. Neither is a self-sufficient substance that can rest on itself; rather, each only exists through its relational–differential tension vis-à-vis the other in the colonial matrix. This latter is itself a contingent set of signifying practices, notwith- standing the fact that the fundamental social division they institute presents itself as "ontological". But – and this is crucial – within this interdependence, there is asymmetry: "whiteness" is the master signifier, and it has both white and black subjects in its grip. White subjects identify with it and thus see themselves through it as whole and in control of themselves – it invests them with at least the illusion of self- sufficiency and full autonomy. But black subjects also identify with it – they want to be white (a central theme of Black Skin, White Masks) and so they look at them- selves (blacks) through the white signifier also but what they see (which is exactly the same as what the white subject sees when he looks at the black) is a "body manqué" – not the "corporeal schema" (Fanon 1968, 78) the white sees when he looks at himself which gives him a body image and an image of himself which is "structurally harmonious" **(114)** but something "undefinable" and "unassimilable**" (114)** into the white order of being with which he seeks to identify – the black sees himself as "non-existent" (98, 139), with nothing to hold onto. Torn between two impossibles – to be white and to be black – the first barred and second an impossi- bility in its own terms as there is no black "being" – blackness produces no "ontological resistance" (77, 78) – "turn white or disappear**"** (71) sums up the ontological void of the black colonised subject. Made to want to be white, but incapable of this – he is black; and his blackness seen through his own "white" eyes reduces him to "nothing." The colonial symbolic is so constructed as to give the black subject nothing to hold onto – no orthopaedic support for an identity – just a whiteness

forever eluding him and a blackness that doesn't "exist" in any case. Within the colonial matrix, this is the ontological vortex that is the elementary colonial identity and lived experience of the colonised black subject; and all his compulsive (self-destructive) pathologies, his specific repertoire of "reactional" conduct, have their source in this primary ontological differential. So, fundamen- tally, colonialism is an ontological differential between white and black subjects; and this orders each and every sphere or sector of colonial society (including the economy).

While present racial movements have not been as successful as possible, there is still the possibility for systematic change we must consider first

Michael **Omi &** Howard **Winant 13**, Both have a Ph.D. in Sociology from the University of California, Santa Cruz, "Resistance is futile?: a response to Feagin and Elias", Ethnic and Racial Studies, 2013 Vol. 36, No. 6, http://www.tandfonline.com/loi/rers20

So we agree that the present prospects for racial justice are demoralizing at best. But we do not think that is the whole story. US racial conditions have changed over the post-Second World War period, in ways that Feagin and Elias tend to downplay or neglect. Some of the major reforms of the 1960s have proved irreversible; they have set powerful democratic forces in motion. These racial (trans)formations were the results of unprecedented political mobilizations, led by the black movement, but not confined to blacks alone. Consider the desegregation of the armed forces, as well as key civil rights movement victories of the 1960s: the Voting Rights Act, the Immigration and Naturalization Act (Hart- Celler), as well as important court decisions like Loving v. Virginia that declared anti- miscegenation laws unconstitutional. While we have the greatest respect for the late Derrick Bell, we do not believe that his 'interest convergence hypothesis' effectively explains all these developments. How does Lyndon Johnson's famous (and possibly apocryphal) lament upon signing the Civil Rights Act on 2 July 1964 ⏃ 'We have lost the South for a generation' ⏃ count as 'convergence'? The US racial regime has been transformed in significant ways. As Antonio Gramsci argues, hegemony proceeds through the incorpora- tion of opposition (Gramsci 1971, p. 182). The civil rights reforms can be seen as a classic example of this process; here the US racial regime ⏃ under movement pressure ⏃ was exercising its hegemony. But Gramsci insists that such reforms ⏃ which he calls 'passive revolutions' ⏃ cannot be merely symbolic if they are to be effective: oppositions must win real gains in the process. Once again**, we are in the realm of politics,** not absolute rule. So yes, we think there were important if partial victories that shifted the racial state and transformed the significance of race in everyday life. And yes, we think that further victories can take place both on the broad terrain of the state and on the more immediate level of social interaction: in daily interaction, in the human psyche and across civil society**.** Indeed we have argued that in many ways the most important accomplishment of the anti-racist movement of the 1960s in the USA was the politicization of the social. In the USA and indeed around the globe, race-based movements demanded not only the inclusion of racially defined 'others' and the democratization of structurally racist societies, but also the recognition and validation by both the state and civil society of racially- defined experience and identit**y. These demands broadened and deepened democracy itself. They facilitated not only the democratic gains made in the USA by the black movement and its allies, but**

also the political advances towards equality, social justice and inclusion accomplished by other 'new social movements': second- wave feminism, gay liberation, and the environmentalist and anti-war movements among others.

AT: Pan

The unstable nature of the IR sphere itself makes it so that new competitors will always rise and fall but our method of pre-emption is key to prevent conflicts

John J. **Mearsheimer 14**, Professor of Political Science at the University of Chicago, "Can China Rise Peacefully?", *The national interest,* 10/25/14, http://nationalinterest.org/commentary/can-china-rise-peacefully-10204

After 1989, however, American policymakers hardly had to worry about fighting against rival great powers, and thus the United States was free to wage wars against minor powers without having to worry much about the actions of the other great powers. Indeed, it has fought six wars since the Cold War ended: Iraq (1991), Bosnia (1995), Kosovo (1999), Afghanistan (2001–present), Iraq again (2003–11), and Libya (2011). It has also been consumed with fighting terrorists across the globe since September 11, 2001. Not surprisingly, there has been little interest in great-power politics since the Soviet threat withered away. The rise of China appears to be changing this situation, however, because this development has the potential to fundamentally alter the architecture of the international system. If the Chinese economy continues growing at a brisk clip in the next few decades, the United States will once again face a potential peer competitor, and great-power politics will return in full force. It is still an open question as to whether China's economy will continue its spectacular rise or even continue growing at a more modest, but still impressive, rate. There are intelligent arguments on both sides of this debate, and it is hard to know who is right. But if those who are bullish on China are correct, it will almost certainly be the most important geopolitical development of the twenty-first century, for China will be transformed into an enormously powerful country. The attendant question that will concern every maker of foreign policy and student of international politics is a simple but profound one: can China rise peacefully? The aim of this chapter is to answer that question. To predict the future in Asia, one needs a theory of international politics that explains how rising great powers are likely to act and how the other states in the system will react to them. We must rely on theory because many aspects of the future are unknown; we have few facts about the future. Thomas Hobbes put the point well: "The present only has a being in nature; things past have a being in the memory only, but things to come have no being at all." Thus, we must use theories to predict what is likely to transpire in world politics. Offensive realism offers important insights into China's rise. My argument in a nutshell is that if China continues to grow economically, it will attempt to dominate Asia the way the United States dominates the Western Hemisphere. The United States, however, will go to enormous lengths to prevent China from achieving regional hegemony. Most of Beijing's neighbors, including India, Japan, Singapore, South Korea, Russia, and Vietnam, will join with the United States to contain Chinese power. The result will be an intense security competition with considerable potential for war. In short, China's rise is unlikely to be tranquil. It is important to emphasize that my focus is not on how China will behave in the immediate future, but instead on how it will act in the longer term, when it will be far more powerful than it is today. The fact is that present-day China does not possess significant military power; its military forces are inferior to those of the United States. Beijing would be making a huge mistake to pick a fight with the U.S. military nowadays. Contemporary China, in other words, is constrained by the global balance of power, which is clearly stacked in America's favor. Among other advantages, the United States has many consequential allies around the world, while China has virtually none. But we are not concerned with

that situation here. Instead, the <u>focus is on a future world in which the balance of power has shifted</u> <u>sharply against the United States, where China controls much more relative power than it does today</u>, and where China is in roughly the same economic and military league as the United States. In essence, <mark>we are talking</mark> <mark>about</mark> a <mark>world</mark> in <mark>which</mark> <mark>China is</mark> much <mark>less constrained</mark> <mark>than</mark> it is <mark>today</mark>.

Realism makes rising powers and power conflict inevitable --- predictions of conflict are key to prevention

John J. **Mearsheimer 14**, Professor of Political Science at the University of Chicago, "Can China Rise Peacefully?", *The national interest,* 10/25/14, http://nationalinterest.org/commentary/can-china-rise-peacefully-10204

In its simplest form, my theory maintains that <mark>the</mark> basic <mark>structure of</mark> the <mark>international</mark> <mark>system forces</mark> <mark>states</mark> concerned about their security <mark>to compete with each other</mark> for power. <mark>The</mark> ultimate <mark>goal</mark> of every great power is <mark>to maximize</mark> its <mark>share</mark> <mark>of</mark> world <mark>power</mark> <mark>and</mark> eventually <mark>dominate</mark> the system. In practical terms, this means that the most powerful states seek to establish hegemony in their region of the world while also ensuring that no rival great power dominates another area. The theory begins with five assumptions about the world, which are all reasonable approximations of reality. <u>First</u> of all, <mark>states</mark> <mark>are</mark> the <mark>key actors</mark> in international politics, <mark>and</mark> <mark>no</mark> <mark>higher</mark> <mark>authority</mark> <mark>stands</mark> <mark>above</mark> them. There is no ultimate arbiter or leviathan in the system that states can turn to if they get into trouble and need help. <u>This is</u> <u>called an anarchic system</u>, as opposed to a hierarchic one. The <u>next</u> two assumptions deal with capabilities and intentions, respectively. <u>All</u> <mark>states have offensive military capabilities</mark>, although some have more than others, indeed <u>sometimes many more than others</u>. Capabilities are reasonably easy to measure because they are largely composed of material objects that can be seen, assessed, and counted. <u>Intentions</u> are a different matter. States <mark>can</mark> <mark>never</mark> <mark>be</mark> <mark>certain</mark> <mark>about</mark> <mark>the intentions of other</mark> <mark>states</mark>, because intentions are inside the heads of leaders <mark>and</mark> <mark>thus</mark> virtually <mark>impossible</mark> <mark>to see</mark> and <u>difficult to measure</u>. In particular, <u>states can never know with complete confidence whether another</u> <u>state might have its gun sights on them</u> for one reason or another. The problem of discerning states' intentions is especially acute when one ponders their future intentions, since it is almost impossible to know who the leaders of any country will be five or more years from now, much less what they will think about foreign policy. <u>The</u> <mark>theory</mark> also <mark>assumes</mark> that <mark>states</mark> <mark>rank</mark> <mark>survival</mark> <mark>as</mark> their <mark>most</mark> <mark>important</mark> goal. This is not to say it is their only goal, for <u>states</u> invariably <u>have numerous</u> ambitions. <u>However</u>, when push comes to shove, <mark>survival</mark> <mark>trumps</mark> <mark>all</mark> other goals, basically because if a state does not survive, it cannot pursue those other goals. Survival means more than merely maintaining a state's territorial integrity, although that goal is of fundamental importance; it also means preserving the autonomy of a state's policymaking process. <u>Finally,</u> <mark>states are assumed</mark> <mark>to be</mark> <mark>rational</mark> actors, which is <mark>to say they</mark> are <mark>reasonably</mark> <mark>effective</mark> at designing <mark>strategies</mark> <mark>that</mark> <mark>maximize</mark> their <mark>chances of</mark> <mark>survival</mark>. These assumptions, <mark>when</mark> <mark>combined,</mark> <mark>cause states to behave in particular ways</mark>. Specifically, in a world where there is some chance—even just a small one—that other states might have malign intentions as well as formidable offensive military capabilities, states tend to fear each other. That fear is compounded by what I call the "9-1-1" problem—the fact that there is no night watchman in an anarchic system whom states can call if trouble comes knocking at their door. <u>Accordingly,</u> <mark>they</mark> recognize they must <mark>look</mark> <mark>out</mark> <mark>for their own</mark> <mark>survival</mark>, and the best way to do that is to be especially powerful.

China is increasing it's sphere of influence now in attempt to become the new world hegemon --- recognition of impending power shift is a pre-requisite

John J. **Mearsheimer 14**, Professor of Political Science at the University of Chicago, "Can China Rise Peacefully?", *The national interest,* 10/25/14, http://nationalinterest.org/commentary/can-china-rise-peacefully-10204

If China continues its striking economic growth over the next few decades, it is likely to act in accordance with the logic of offensive realism, which is to say it will attempt to imitate the United States. Specifically, it will try to dominate Asia the way the United States dominates the Western Hemisphere. It will do so primarily because such domination offers the best way to survive under international anarchy. In addition, China is involved in various territorial disputes and the more powerful it is, the better able it will be to settle those disputes on terms favorable to Beijing. Furthermore, like the United States, a powerful China is sure to have security interests around the globe, which will prompt it to develop the capability to project military power into regions far beyond Asia. The Persian Gulf will rank high on the new superpower's list of strategically important areas, but so will the Western Hemisphere. Indeed, China will have a vested interest in creating security problems for the United States in the Western Hemisphere, so as to limit the American military's freedom to roam into other regions, especially Asia. Let us consider these matters in greater detail. Chinese Realpolitik If my theory is correct, China will seek to maximize the power gap with its neighbors, especially larger countries like India, Japan, and Russia. China will want to make sure it is so powerful that no state in Asia has the wherewithal to threaten it. It is unlikely that China will pursue military superiority so that it can go on a rampage and conquer other Asian countries. One major difference between China and the United States is that America started out as a rather small and weak country located along the Atlantic coastline that had to expand westward in order to become a large and powerful state that could dominate the Western Hemisphere. For the United States, conquest and expansion were necessary to establish regional hegemony. China, in contrast, is already a huge country and does not need to conquer more territory to establish itself as a regional hegemon on a par with the United States. Of course, it is always possible in particular circumstances that Chinese leaders will conclude that it is imperative to attack another country to achieve regional hegemony. It is more likely, however, that China will seek to grow its economy and become so powerful that it can dictate the boundaries of acceptable behavior to neighboring countries, and make it clear they will pay a substantial price if they do not follow the rules. After all, this is what the United States has done in the Western Hemisphere. For example, in 1962, the Kennedy administration let both Cuba and the Soviet Union know that it would not tolerate nuclear weapons in Cuba. And in 1970, the Nixon administration told those same two countries that building a Soviet naval facility at Cienfuegos was unacceptable. Furthermore, Washington has intervened in the domestic politics of numerous Latin American countries either to prevent the rise of leaders who were perceived to be anti-American or to overthrow them if they had gained power. In short, the United States has wielded a heavy hand in the Western Hemisphere. A much more powerful China can also be expected to try to push the United States out of the Asia-Pacific region, much as the United States pushed the European great powers out of the Western Hemisphere in the nineteenth century. We should expect China to devise its own version of the Monroe Doctrine, as imperial Japan did in the

1930s. In fact, we are already seeing inklings of that policy. For example, Chinese leaders have made it clear they do not think the United States has a right to interfere in disputes over the maritime boundaries of the South China Sea, a strategically important body of water that Beijing effectively claims as its own.

The rise of china already feared in the status quo meaning action inevitable

John J. **Mearsheimer 14**, Professor of Political Science at the University of Chicago, "Can China Rise Peacefully?", *The national interest,* 10/25/14, http://nationalinterest.org/commentary/can-china-rise-peacefully-10204

The historical record clearly demonstrates how American policymakers will react if China attempts to dominate Asia. Since becoming a great power, the United States has never tolerated peer competitors. As it demonstrated throughout the twentieth century, it is determined to remain the world's only regional hegemon. Therefore, the United States will go to great lengths to contain China and do what it can to render it incapable of ruling the roost in Asia. In essence, the United States is likely to behave toward China largely the way it behaved toward the Soviet Union during the Cold War. China's neighbors are certain to fear its rise as well, and they, too, will do whatever they can to prevent it from achieving regional hegemony. Indeed, there is already substantial evidence that countries like India, Japan, and Russia, as well as smaller powers like Singapore, South Korea, and Vietnam, are worried about China's ascendancy and are looking for ways to contain it. In the end, they will join an American-led balancing coalition to check China's rise, much the way Britain, France, Germany, Italy, Japan, and eventually China, joined forces with the United States during the Cold War to contain the Soviet Union. China is still far from the point where it has the military capability to make a run at regional hegemony. This is not to deny there are good reasons to worry about potential conflicts breaking out today over issues like Taiwan and the South China Sea; but that is a different matter. The United States obviously has a deep-seated interest in making sure that China does not become a regional hegemon. Of course, this leads to a critically important question: what is America's best strategy for preventing China from dominating Asia? The optimal strategy for dealing with a rising China is containment. It calls for the United States to concentrate on keeping Beijing from using its military forces to conquer territory and more generally expand its influence in Asia. Toward that end, American policymakers would seek to form a balancing coalition with as many of China's neighbors as possible. The ultimate aim would be to build an alliance structure along the lines of NATO, which was a highly effective instrument for containing the Soviet Union during the Cold War. The United States would also work to maintain its domination of the world's oceans, thus making it difficult for China to project power reliably into distant regions like the Persian Gulf and, especially, the Western Hemisphere.

Neg Biopower K

AT Perm

Perm doesn't solve

Bio-poltical control is constantly shifting – the permutation doesn't solve

Dillon & Guerrero 2008 (Michael and Luis L., Phd in international studies and head of Department of Security and War at Lancaster University, Deputy Postgraduate Research Director, Research Institute for Law, Politics and Justice, Biopolitics of Security in the 21st Century, Review of International Studies, January 2008, pp.4-6)

This paper does precisely that. It explains how **the biopolitics of biopower is necessarily also allied with freedom and what kind of 'freedom' is understood to be at work in it**. In explaining precisely what Foucault understands, in addition, by 'security', and how this understanding of security differs from traditional geopolitical accounts of security derived from ontologies and anthropologies of political subjectivity, the paper also clarifies why Foucault concludes that biopolitics simply is a "dispositif de sécurité". Strictly speaking, therefore, **there is no biopolitics which is not simultaneously also a security apparatus**. There is no biopolitics of this, or a biopolitics of that. **When one says biopolitics one says security**; albeit in a certain way. Biopolitics arises at the beginning of the modern age but it does not spring fully formed at its beginning. It would run entirely counter to Foucault's approach to the analytic of power relations to pretend otherwise. While acknowledging a certain kind of precursor in the pastoral power of the Church, with which it appears superficially similar but from which it diverges in its specificities, what Foucault begins to draw-out is the logic of formation which takes hold when power takes species life as its referent object, and the securing of species life becomes the vocation of a novel and emerging set of discursive formations of power/knowledge. **This biopolitical logic of formation also expresses a new and emergent experience of the real. A logic of formation is therefore** historical, local and **particular. It also installs an ontopolitics as it experiments with novel ensembles or technologies of social practice.** However generalised it may become, **biopolitics is not itself a universal phenomenon. It is the actualisation instead of a specific historical and, we would argue, evolving economy of power relations. Such ensembles of practices do not actualise themselves in perfect realisation of their logic. First, because their logic is always a contested epistemic object for them**. Second, because things always change in unintended ways. **Biopolitical security practices do not articulate a design in nature. They are contingent achievements reflecting the partial realisation of designs which seek to enact 'natures'. In the process, there are** slippages and breakages, **shifts and revisions, for which the original drivers and concerns of biopolitics no longer account.** There is nothing unusual in this. It would be unusual if it did not happen. **Mutation of the biopolitical order of power relations has continued tomerely entailed a change at the level of practice. Any change in practice is simultaneously also accompanied by a change in the experience of the real.** In general terms the shift in the nature of the real associated with biopolitics, now, is captured by the term 'emergence'.

The alternative is a process of agonism against the affirmative – we can create a space for freedom and for resistance against the bio-political notions of peace the affirmative endorses

Shinko Ass't Prof of IR at Bucknell **2008** Rosemary Millennium – Journal of International Studies Sage Publishing

According to Foucault **agonism refers to a political relationship which opens up a site from within which relations of power can be resisted and altered.**59 **In this** agonistic space individuals encounter one another and carve out the parameters of their ethical interactions. Foucault identifies the unmasking of political violence as the 'real political task in a society' because it is only by making the operation of

power visible that we can then strategise how to fight against it**.** Thus we engage in power struggles in order to alter power relations.60 **What we seek to alter are those processes of governmental individualisation** which 'separates the individual, breaks his links with others, splits up community life, forces the individual back on himself, and ties him to his own identity in a constraining way'.61 Agonism functions as the critical terrain located between the interplay of power and freedom where 'the recalcitrance of the will and the intransigence of freedom' emerge as constant provocations.62 **Agonism involves a 'relationship that** is **at the same time mutual incitement and struggle', however; such a struggle is intended to remain open and serve as a type of permanent provocation rather than devolving into a paralysing confrontation.**63 Foucault specifically rejects the idea of an essential antagonism, but he does indicate that there is an essential obstinacy affiliated with the exercise of freedom. Thus **our relations with one another are not characterised by a primordial essence that would determine our relations to be fundamentally antagonistic, but principles of freedom on the other hand, do indicate points of insubordination and struggle.**

An agonistic stance emerges in response to a political determination that an intolerability has been identified, which according to Foucault, **threatens to break our connections** (whether personal or communal) **with one another, isolate us, and/or attempt to bind us to an identity which limits and constrains us. Agonism is a particular type of resistant response that seeks to change the political dynamic that would usher in and or sustain such isolating and constraining effects.** Agonistic engagements are characterised by the search for difficult truths where morality itself is at stake, because within the terms of an agonistic encounter 'the rights of each person are in some sense immanent in the discussion [emphasis added]'.64

The permutation engages in a normalizing form of resistance – cannot solve the criticism and independently risks our impact arguments

Thomas **Dumm 96**, Professor of Political Science @ Amherst College, 1996 "Michel Foucault and the Politics of Freedom." P. 116-117

Here I am slightly ahead of myself. The problem of the normalization of norms is perhaps better discussed under the rubric "bio-power." The emergence of this more complete normalizing discourse is itself not neatly or completely separate from its own genealogy within disciplinary society. However, in working to normalize even that which resists normalization, **in normalizing** the **forms of resistance** as they emerge from delinquency, **those who engage in contemporary exercises of power may have been able to put at risk more than just a mode of freedom but the very possibility of** free **existence itself.** Normalizing the norm—is there a more succinct definition of cybernetics than that? **Normalizing the norm---is this not the great** (unannounced) **end of the various strategies aimed at human extinction?** A question that emerges for us at the end of the twentieth century is whether **the style of freedom that has accompanied disciplinary society and that has been nurtured by it**—and for the sake of brevity let us call that freedom liberal freedom---**has itself been the reason leading humankind to this moment of terminal risk**. But even if it has, this does not mean that liberal freedom has not been a way of being free. Instead, what it may suggest is that the freedom that has been so long associated with a particular organization under the banner of sovereign right may need to be rethought so that we may better understand and give shape to a politics of freedom more commensurate with the conditions of late modernity. I believe that this is what Foucault may be thinking when he urges us to rethink the form that the idea of right might take as sovereignty and normalization vitiate the very possibility of repression in a disciplinary age.

Reject the perm

Reject their spin about the aff complementing the alt—they prefigured the debate to occur on liberal terms—if we can't contest ideological framing then alternative orientations are impossible

Knox 12 [Robert, PhD Candidate, London School of Economics and Political Science, paper presented at the Fourth Annual Conference of the Toronto Group for the Study of International, Transnational and Comparative Law and the Towards a Radical International Law workshop, "Strategy and Tactics"]

This warning is of great relevance to the type of 'strategic' interventions advocated by the authors. there are **serious perils** involved in making any intervention in liberal-legalist terms for critical scholars. the first is that – as per their own analysis – liberal legalism **is not a neutral ground**, but one which is likely to favour certain claims and positions. Consequently, it will be incredibly difficult to win the argument. Moreover, even if the argument is won, the victory is likely to be a very particular one – inasmuch as it will foreclose any wider consideration of the structural or systemic causes of any particular 'violation' of the law. All of these issues are to some degree considered by the authors.44 However, given the way in which 'strategy' is understood, the effects of these issues are generally confined to the immediate, conjunctural context. As such, the emphasis was placed upon the way that the language of liberal legalism blocked effective action and criticism of the war.45 Much less consideration is placed on the way in which advancing such argument impacts upon the long term effectiveness of achieving the strategic goals outlined above. Here, the problems become even more widespread. **Choosing to couch the intervention in liberal legal terms ultimately reinforces the structure** of liberal legalism, rendering it **more difficult** to transcend these arguments.46 In the best case scenario that such an intervention is victorious, this victory would precisely seem to **underscore** the liberal position on international law. Given that international law is in fact bound up with processes of exploitation and domination on a global scale, such a victory contributes to the **legitimation of this system,** making it very difficult to argue against its logic. this process takes place in three ways. Firstly, by intervening in the debate on **its own terms,** critical scholars reinforce those very **terms, as their political goals are incorporated** into it.47 It can then be argued the law is in fact neutral, because it is able to encompass such a wide variety of viewpoints. Secondly, in discarding their critical tools in order to make a public intervention, these scholars abandon their **structural critique** at the very moment when they should hold to it most strongly. that is to say, that at the point where there is actually a space to publicise their position, they choose instead to cleave to liberal legalism. thus, even if, in the 'purely academic' context, they continue to adhere to a 'critical' position, in public political terms, **they advocate liberal legalism**. Finally, from a purely 'personal' standpoint, in advocating such a position, they undercut their ability to articulate a critique in the future, precisely because they will be contradicting a position that they have already taken. the second point becomes increasingly problematic absent a guide for when it is that liberal legalism should be used and when it should not. **Although the 'embrace' of liberal legalism is always described as 'temporary' or 'strategic',** there is actually very little discussion about the specific conditions in which it is prudent to adopt the language of liberal legalism. It is simply noted at various points that this will be determined by the 'context'.48 As is often the case, the term 'context' is invoked49 without specifying precisely which contexts are those that would necessitate intervening in liberal legal terms. Traditionally, such a context would be provided by a strategic understanding. that is to say, that the specific tactics to be undertaken in a given conjunctural engagement would be understood by reference to the larger structural aim. But here, there are simply **no considerations of this.** It seems likely therefore, that again context is understood in purely tactical terms. Martti Koskenniemi can be seen as representative in this respect, when he argued: What works as a professional argument depends on the circumstances. I like to think of the choice

lawyers are faced with as being not one of method (in the sense of external, determinate guidelines about legal certainty) but of language or, perhaps better, of style. the various styles – including the styles of 'academic theory' and 'professional practice' – are neither derived from nor stand in determinate hierarchical relationships to each other. the final arbiter of what works is nothing other than the context (academic or professional) in which one argues.50 On this reading, the 'context' in which prudence operates seems to the immediate circumstances in which an intervention takes place. this would be consistent with the idea, expressed by the authors, that the 'strategic' context for adopting liberal legalism was that **the debate was conducted in these terms**. But the problem with this understanding is surely evident. As critical scholars have shown time and time again, the contemporary world is one that is deeply saturated with, and partly constituted by, juridical relations.51 Accordingly, there are really very few contexts (indeed perhaps none) in which political debate is not conducted in juridical terms. A brief perusal of world events would bear this out.52 the logical conclusion of this would seem to be that in terms of abstract, immediate effectiveness, the 'context' of public debate will almost always call for an intervention that is couched in liberal legalist terms. This raises a final vital question about what exactly distinguishes critical scholars from liberal scholars. If the above analysis holds true, then the 'strategic' interventions of critical scholars in legal and political debates will almost always take the form of arguing these debates in their own terms, and simply picking the 'left' side. thus, whilst their academic and theoretical writings and interventions may (or may not) retain the basic critical tools, the public political interventions **will** basically **be 'liberal'.** The question then becomes, in what sense can we really characterise such interventions (and indeed such scholars) as 'critical'? The practical consequence of understanding 'strategy' in essentially tactical terms seems to mean **always struggling within the coordinates of the existing order**. Given the exclusion of strategic concerns as they have been traditionally understood, there is no practical account for how these coordinates will ever be transcended (or how the debate will be reconfigured). **As such, we have** a group of **people struggling within liberalism, on liberal terms**, who may or may not also have some 'critical' understandings which are never actualised in public interventions. We might ask then, apart from '**good intentions'** (although liberals presumably have these as well) what differentiates these scholars from liberals? Because of course liberals too can sincerely believe in political causes that are 'of the left'. It seems therefore, that **just as** – in practical terms – **strategic essentialism collapses into essentialism, so too does 'strategic' liberal legalism collapse into plain old liberal legalism**.53

Sequencing DA—jumping to include legal reform whitewashes the biopolitical security project and sidelines criticism

Krasmann 12 [Susanne, Institute for Criminological Research, University of Hamburg, "Law's knowledge: On the susceptibility and resistance of legal practices to security matters" Theoretical Criminology 16 (4) p. 380-382]

In the face of these developments, **a new debate on how to contain governmental interference in the name of security has emerged**. What is remarkable about **this debate** is that, on the one hand, it **aims at** establishing **more civil** and human **rights and** attendant **procedural safeguards** that allow for systematically calling into question the derogation of laws and the implementation of new laws in the name of security. **On the other hand, it recognizes the existence of a new dimension of threats**, particularly **in** the aftermath of the **terror attacks** of 11 September 2001. As John Ferejohn and Pasquale Pasquino (2004: 228), for instance, contend: We are faced, nowadays, with serious threats to the public safety that can occur anywhere and that cannot terminate definitively. … If we think that the capacity to deal effectively with emergencies is a precondition for republican government, then it is necessary to ask how emergency powers can be controlled in modern circumstances. **Adequate legal frameworks and**

institutional designs are required that would enable us to 'reconcile' security with (human) rights, as Goold and Lazarus (2007b: 15) propose, and enduring emergency situations with the rule of law. Traditional problems in the relationship between law and security government within this debate form a point of departure of critical considerations:2 emergency government today, rather than facing the problem of gross abuses of power, has to deal with the persistent danger of the exceptional becoming normal (see Poole, 2008: 8). Law gradually adjusts to what is regarded as 'necessary'.3 Hence, law not only constrains, but at the same time also authorizes governmental interference. Furthermore, **mainstream approaches that try to balance security and liberty are rarely able**, or **willing, to expose fully the trade-offs of their normative presuppositions**: '[T]he metaphor of balance is used as often to justify and defend changes as to challenge them' (Zedner, 2005: 510). Finally, political **responses to threats never overcome the uncertainty** that necessarily accompanies any decision addressing future events. To ignore this uncertainty, in other words, is to ignore the political moment any such decision entails, thus exempting it from the possibility of dissent. Institutional arrangements that enforce legislative control and enable citizens to claim their rights are certainly the appropriate responses to the concern in question, namely that security gradually seizes political space and transforms the rule of law in an inconspicuous manner. They establish political spaces of dispute and provide sticking points against all too rapidly launched security legislation, and thus may foster a 'culture of justification', as David Dyzenhaus (2007) has it: political decisions and the exercise of state power are to be 'justified by law', in a fundamental sense of a commitment to 'the principles of legality and respect for human rights' (2007: 137). Nonetheless, **most of these accounts**, in a way, **simply add more of the same legal principles and institutional arrangements that are well known** to us. **To frame security as a public good** and ensure that it is a subject of democratic debate, as Ian Loader and Neil Walker (2007) for example demand, is a promising alternative to denying its social relevance. **The call for security to be 'civilized', though,** once again **echoes the** truly **modern project of dealing with its inherent discontents**. **The limits of such a commitment to legality and a political 'culture of justification'** (so termed for brevity) will be illustrated in the following section. Those normative endeavours **will be challenged** subsequently by a Foucauldian account of law as practice. **Contrary to the idea that law can be addressed as an isolated, ideal body and thus treated like an instrument according to normative aspirations**, the present account renders law's reliance on forms of knowledge more discernable. **Law is susceptible**, in particular **to security** matters. **As a practice, it constantly transforms itself and**, notably, **articulates its normative claims depending upon the forms of knowledge brought into play**. Contrary to the prevailing debate on emergency government, this perspective enables us, on the one hand, to capture how **certain forms of knowledge become inscribed into the law in a way that goes largely unnoticed**. This point will be discussed on the example of automated surveillance technologies, which facilitate a particular rationality of pre-emptive action. **The conception of law as a practice, on the other hand, may also be** understood as **a tool of critique and dissent**. The recent torture debate is an extreme example of this, whereby torture can be regarded as a touchstone of law's resistance to its own abrogation. Law and reasoning The idea that a political and juridical 'culture of justification' would be able to bring about the desired results should be treated with caution—for one thing, with regard to the particular logic of legal reasoning and justification and, for another thing, because of at least two empirical observations that shed light on law's limitations vis-a-vis the governance of security. First of all, the establishment of a 'culture of justification' itself presupposes what has yet to arise, namely a common concern about governmental encroachment in the name of security and a willingness of all parties to join in that discourse, if not share in its related arguments. This presupposition, to be sure, is indispensable for inspiring communication and facilitating the exchange of arguments. Moreover, in order to take effect the tried and true liberal legal principles, like that of proportionality and necessity, clearly need to be concretized by reasoning about actual cases. Yet, **the assumption of a common concern goes**

hand in hand with a general trust in a form of communicative reason that will allow for transparency eventually on the matters at stake. Reason and to reason within 'a transparent, structured process of analysis to determine what degree of erosion is justifiable, by what measure, in what circumstances, and for how long' (Zedner, 2005: 522), **is considered basic to the solution. However, just as legal norms and principles are open to interpretation, they do not determine any normative orientations underlying the interpretative process**. As Benjamin Goold and Liorna Lazarus (2007b: 11; see also Poole, 2008: 16) observe: **'[P]re-emptive measures designed to increase security can never be truly objective or divorced from our political concerns and values**.' **Typical for the acknowledgement of competing claims still to be weighed** (Zedner, 2005: 508), **therefore, is that they end up being couched in a rather appealing rhetoric ('we should', 'judges should').** In a liberal vein, this requires a resorting to the least intrusive measures. **Competing claims are thus relegated** to the normative framework of balance (see Waldron, 2003; Zedner, 2005: 528). As regards the empirical observations, there is, first, a move in security legislation that is noticeable in western countries in which the threshold of governmental intervention has been gradually disposed in order to forestall actual offences, concrete suspicion and danger. 9/11 may be regarded as a catalyst here, as well as the fight against terrorism in general. But rather than being recent phenomena, these transformations in fact represent a continuity over decades in the identification of ever new dimensions of threats, from sexual offenders and organized crime right up to transnational terrorism.4 Although a tendency can be discerned, this is not to suggest that there have not been any disruptions to it. **Civil and human rights organizations have time and again countered these developments**, and so have higher-court rulings. Even new basic rights have been established.5 **Though** successful, **these processes were unable to thwart the general trend of making** private **space accessible to surveillance in a way that would have been unimaginable decades ago**. In this sense, paradoxically, new basic rights are rather indicators of new spaces of vulnerability. A closer look at higher courts' decisions on security legislation and additional recommendations by human rights bodies suggests that **these lead to the amendment of the laws in question but not necessarily to a change in practice. 'For, as law becomes ever more closely intertwined with a proliferating assemblage of expertise, risk consulting, administration, and discretion, it inhabits an inescapable paradox'**, as Louise Amoore (2008: 849) neatly put it. **Law for civil and human rights activists and lawyers is the very medium for challenging governmental encroachment, and, notably, the 'rule of law' represents the very principle to be defended. Under review, however, law encounters its own legislation—the modes of risk management it once itself authorized, and that will now have to be amended in accordance not only with the principles of the rule of law but also with the identified necessities of security government**.

AT Alt

AT Alt fails

The world is in a constant state of change – proper theorization is necessary to mobilize effective counter-discourses that can combat liberalism

Guillaume and Der Derian 10 [Laura, PhD in International Politics from Aberystwyth University, and James, Michael Hintze Chair of International Security Studies and Director of the Centre for International Security Studies and Research Professor of International Studies at Brown University, "Revolutionizing Virtual War: An Interview with James Der Derian," *Theory & Event* 13:2, 2010]

This means that **the world order**, to the extent we can even call it such, **is permanently becoming different,** and, pace Foucault, that this century, the twenty-first, might well become known as Deleuzian. **A premium will be placed on how quickly we will adapt to de-territorialized global events, networked accidents**, and the other in your face with every 24/7 global news cycle. **On how easily we will feel at home rather than seek refuge from the singularities of world politics that appear as paradoxes**, synchronicities, feedback, white noise, phase shifts, spatio-temporal rifts, and, not least, dreams. **On how easily technologies, especially those in the service of war, can actualize the worst as well as the best possibility. Or how important, when observation (l**et alone participation) **can actualize an event, reflexivity and responsibility becomes.** This all comes with a hard-earned caveat. We need to recognize that **such open-ended attitudes often produce defensive actions** in others **and even inactivity** in oneself; or as William Connolly once told me, 'a little vertigo is a good thing but a lot can turn you into a zombie.' Back to the undead! **The social sciences**—more so than the latest theories in the physical sciences—**are least comfortable with these free-floating ideas of spatio-temporal rifts where simulacra reverses causality**, being is simultaneously here and there, **and identity is deterritorialised by interconnectivity.** It's easy to theorize but how to live in this interzone, where critical ethical interventions routinely precede the retrieval of facts (empirical or social) and technical media constitute new virtual states of meaning and being? Obviously, both war and peace still need approaches that study what actually happened (realism) and what needs to be changed (idealism). But **what Deleuze teaches us is how world politics is also in need of virtual approaches that explore how reality is seen, framed, read, and generated in the conceptualisation and actualisation of the global event**. I understand why **this kind of talk makes many traditional scholars of international politics nervous. I have witnessed firsthand the displacement of global contingency as an unease or even anger toward the messenger rather than the mess itself**. **Identifying conditions of relativism and nihilism is not the same as advocating them; but that does not stop critics of Deleuze et al from disparaging them as 'cultural relativists' or 'nihilists.**' I've taken a few licks like this, and **not matter how often you repudiate the shoddy thinking behind it, you know there will always be more to come**. I have also witnessed how the narcissism of petty differences among social critics can lead to radically impossible prescriptions. This makes me reluctant to offer any of my own as universally applicable across differing historical epochs and political circumstances. Guillaume I suppose what I am asking is: what is the status of the idea of newness as applied to twenty first century war and politics? And, what are the tensions contained within the idea of being Critical itself, taking into account everything Deleuze has to say about flight and breakthrough. **In deploying Deleuze to diagnose and critique contemporary machinations of power**, are we actually missing what is most potentially productive in his thinking? Der Derian I **think the answer lies less in Deleuze's philosophy per se and more in what he**—along with Benjamin, Heidegger, Barthes, Virilio, Baudrillard and others—**chose to philosophize about: the newest technologies of reproduction that were changing how we frame the world**. That means we need to not just study and critique but to create media as ubiquitous, diffuse, and appealing as what the infosphere currently has on offer. Contrary to what uber-pundit Thomas Friedman

said recently—and perhaps prematurely—about the role of Facebook, blogs, and Twitter in the fraudulent elections in Iran, **sometimes tweet-tweet can beat bang-bang**. **We have seen how global media has become essential for the global circulation of power**, the waging of war, and the imagining of peace**. It is now an unparalleled force in the organisation, execution, justification, and representation of global violence**, as witnessed in the first Gulf War, the Kosovo campaign, 9/11, the Iraq War, and what has followed. **Global media continues**, in spite of concentrated efforts by a variety of countries and technical fixes**, to evade national management and control. Networked terror, network-centric warfare, and network attacks will continue to** have an intense if intermittent transnational impact. We need to respond with new strategies, concepts, and policies. But how? Fighting fire with fire, media with media, and infowar with infopeace. That **means dispensing with the conceit,** stretching from Descartes through Marx to Chomsky, **that there exists a universal truth waiting to be discovered once the veil of superstition**, **religion, media**, or false consciousness **of one sort or another is lifted** by the right technology of knowledge. It might once have been true but in our current multicultural, multimedia, heteropolar world; it **is one more truth competing among a host of others. To counter the ubiquitous surveillance, information overload, and fundamentalist thinking that has transformed global media into weapons of mass distraction**, deception, and destruction, we need to not just consume but produce counter-media now. It will not happen by primetime broadcast or even on public television: whatever independence they once enjoyed has been hijacked by corporate interests, partisan politics, and the need to meet the lowest common denominator of public culture. I think **it falls upon universities and non-governmental organizations,** as the last quasi-independent institutions, **to develop the content as well as techniques for counter-media**.

AT No Alternative

Outlining a specific discourse of resistance is a totalitarian means of exercising power: we must outline a broad alternative means of resistance to power
Pickett 05 Associate professor of Political Science at Chaldron State College 2005 [*On the Use and Abuse of Foucault For Politics* pp. 47]

Any reasonable interpretation of Foucaultian **resistance will necessarily have a large amount of indeterminacy. While it is non-hierarchical and concerned with memory and the body and the negation of power while still potentially affirmative of something else**, these various elements of **resistance** are compatible with a range of practical political engagements, such as broadly liberal or even anarchist positions. This is because Foucault **cannot lay down how or why one should struggle. Such a globalistic theory would become one more agent of power; a totalizing theory is itself "totalitarian."**66 Still**, it is possible to draw a broad political orientation out of Foucault's celebration of struggle.67 If resistance is worthwhile**, as Foucault clearly believes it is, then **the conditions which make struggle possible should be fostered.** This is why Foucault believes **there is a daily "ethico-political" choice to be made.68 We need to decide what constitutes the greatest danger and struggle against it.** From this vantage point it is possible to see why the charge of pessimism or hopelessness that is frequently brought against Foucault is misguided. He is accused of presenting power as something so ubiquitous and overwhelming that all resistance becomes pointless. On the contrary, the fact that everything is dangerous means that there are multiple opportunities for resistance. And far from being pointless, Foucault maintains that engagement presents several possibilities. Resistance gives us the possibility of changing the practices he labels 'intolerables.' Once the asylum inmate, factory worker, or "sexual deviant" is enabled to speak, and his memory of struggles and subjugated knowledge is allowed its insurrection, those who are subjected to power can force change.

AT Impacts

AT Biopower Good

We have never said all biopower is bad --- just the biopolitical surveillance of life in liberal modernity – our alternative's conception of power is key to transformative change

Chambon 99 [Adrienne, director of Ph. D program at U Toronto, Ph. D in Social Work from U Chicago, Columbia University Press New York , Reading Foucault for Social Work, "Foucault's Approach," p. 67-8]

More fundamentally, **Foucault spoke to the transformative potential of his work**. **Transformative work shows that the present is not natural and need not be taken as inevitable or absolute**. Change can come from the realization of the precarious nature of established ways and by inviting the development of alternatives. **This holds true for the client and for the worker and is of particular relevance to the academic social worker, researcher, and educator**. We come close here to the definition of **the role of the intellectual**, as well as its limits: "**The work of the intellectual ... is fruitful in a certain way to describe that-which-is by making it appear as something that might not be, or that might not be as it is**" (Foucault 1983:206). Foucault concluded: **These [forms of rationality] reside on a base of human practice and human history; and that since these things have been made, they can be unmade, as long as we know how it was that they were made**.... **Any description must always be made in accordance with these kinds of virtual fracture which open up the space of freedom understood as a space of concrete freedom, i.e., of possible transformation**. (206) **Because power is productive, it is up to us to produce new forms, after seeing through that which is all too familiar, and to realize that those new forms will generate new possibilities as well as new constraints.**

AT Biopolitics Solves War

The biopolitical imperative to secure life, in any instance, through the prevention of war by liberal means, powers a global war machine that exponentially expands in lethality

Evans and Hardt 10 [Brad, lecturer in the School of Politics and International Studies at the University of Leeds, Michael, Professor of Literature and Italian at Duke University, "Barbarians to Savages: Liberal War Inside and Out," *Theory & Event* 13:2, 2010]

Evans: **One of the most important aspects of your work has been to argue why the original sentiment which provoked Deleuze and Guattari's Nomadology narrative needed to be challenged**. **With the onset of a global war machine which showed** absolutely **no respect for state boundaries**, **matched by the rise of many local fires of resistance** which had no interest in capturing state power, the sentiment that "History is always written from the victory of States" could now be brought firmly into question. On a theoretical level alone, the need to bring the Nomadology Treatise up to date was an important move. However, there was something clearly more at stake for you than simply attempting to canonise Deleuze and Guattari. **One gets the impression** from your works that **you were deeply troubled by what was taking place with this new found humanitarianism**. Indeed, as you suggest, **if we accept that this changing political terrain demanded a rewriting of war itself—**away from geo-political territorial struggles which once monopolised the strategic field, **towards bio-political life struggles whose unrelenting wars were now to be consciously fought for** the politics of all life itself, **then it could be argued that the political stakes could not be higher**. For not only does a bio-political ascendency force a re-conceptualisation of the war effort—to include those forces which are less militaristic and more developmental (one can see this best reflected today in the now familiar security mantra "War by Other Means"), but through this process a new paradigm appears which makes it possible to envisage for the first time in human history a Global State of War or a Civil War on a planetary scale. Whilst **it was rather easy to find support for this non-State paradigm during the 1990's**—especially **when the indigenous themselves started writing of the onset of a Fourth World War** which was enveloping the planet and consuming everybody within, some have argued that the picture became more clouded with the invasion of Iraq which was simply geo-politics as usual. **The familiar language that has been routinely deployed** here **would be of US Exceptionalism**. My concern is not really to attend to this revival of an out-dated theoretical persuasion. I agree with your sentiments in Multitude that **this account can be convincingly challenged with relative ease**. Foucault has done enough himself to show that **Liberal War does not demand a strategic trade-off between geo-political and biopolitical aspirations**. **They can be mutually re-enforcing, even, or perhaps more to the point, especially within a global Liberal Imaginar**y. And what is more, we should not lose sight of the fact that **it was when major combat operations were effectively declared over**, **that is when the borderlands truly ignited**. My concerns today are more attuned to the post-Bush era, which going back to the original War on Terror's life-centric remit is once again calling for the need to step up the humanitarian war effort in order to secure the global peace. Indeed, perhaps more worrying still, given that the return of the Kantian inspired humanitarian sensibility can now be presented in an altogether more globally enlightened fashion, offering a marked and much needed departure from the destructive but ultimately powerless (in the positive sense of the word) self-serving neo-con, then it is possible to detect a more intellectually vociferous shift taking place which is rendering all forms of political difference to be truly dangerous on a planetary scale. With this in mind, I would like your thoughts on the Global State of War today. What for instance do you feel have been the most important changes in the paradigm since you first proposed the idea? And would you argue that war is still the permanent social relation of global rule? Hardt: The notion

of **a global civil war starts from the question of sovereignty. Traditionally war is conceived** (in the field of international relations, for instance, or in international law) **as armed conflict between two sovereign power**s whereas civil war designates conflict within a single territory in which one or both of the parties is not sovereign. War designates, in other words, a conflict in some sense external to the structures of sovereignty and civil war a conflict internal to them. It is clear that few if any of the instances of armed conflict around the world today fit the classic model of war between sovereign states. And perhaps even the great conflicts of the cold war, from Korea and Vietnam to countries throughout Latin America, already undermined the distinction, draping the conflict between sovereign states in the guise of local civil wars. Toni Negri and I thus claimed that in our era there is no more war but only civil wars or, really, a global civil war. It is probably more precise to say instead that the distinction between war and civil war has been undermined, in the same way that one might say, in more metaphorical terms, not that there is no more outside but rather that the division between inside and outside has been eroded. This claim is also widely recognized, it seems to me, among military and security theorists. The change from the framework of war to that of civil war, for instance, corresponds closely to thinking of armed conflicts as not military campaigns but police actions, and thus a shift from the external to the internal use of force. The general rhetorical move from war to security marks in more general terms a similar shift. The security mantra that you cite – "war by other means" – also indicates how the confusion between inside and outside implies the mixture of a series of fields that are traditionally separate: war and politics, for example, but also killing and generating forms of social life. This opens a complicated question about the ways in which contemporary military actions have become biopolitical and what that conception helps us understand about them. Rather than pursuing that biopolitical question directly, though, I want first to understand better how the shift in the relationship between war and sovereignty that Toni and I propose relates to your notion of liberal and humanitarian war. **In a war conventionally conceived, it is sufficient for the two sovereign powers to justify their actions primarily on the basis of national** interest as long as they remain within the confines of international law. Whereas those inside , in other words, are at least in principle privilege to the liberal framework of rights and representation, those outside are not. **When the relationship of sovereignty shifts**, however, and the distinction between inside and outside erodes**, then there are no such limits of the liberal ideological and political structures**. This might be a way of understanding why **contemporary military actions have to be justified in terms of discourses of human rights and liberal values**. And this might be **related**, in turn, **to** what many political theorists analyze as **the decline of liberal values in the US political sphere** at the hands of neoliberal and neoconservative logics.1 In other words, perhaps when the division declines between the inside and outside of sovereignty, on the one hand, the liberal logic must be deployed (however inadequately) to justify the use of violence over what was the outside while, on the other, liberal logics are increasingly diluted or suppressed in what was the inside. Evans: What I am proposing with the "Liberal War Thesis" borrows from some pioneering works which have already started to cover the main theoretical ground2 . Central to this approach is an attempt to critically evaluate global Liberal governance (which includes both productive and non-productive elements) by questioning its will to rule. **Liberal Peace is** thus **challenged**, not on the basis of its abstract claims to universality—juridical or **otherwise, but precisely because it's global imaginary shows a remarkable capacity to wage war— by whatever means—in order to govern all species life**. This is not, then, to be confused with some militaristic appropriation of the democratic body politic—a situation in which Liberal value systems have been completely undermined by the onslaught of the military mind. More revealing, it exposes the intricate workings of a Liberal rationality whose ultimate pursuit is global political dominance. Traces of this account can no doubt be found in Michael Ignatieff's (completely sympathetic) book Empire Lite, which notes how the gradual confluence between the humanitarian and the military has resulted in the onset of an ostensibly humanitarian empire that is less concerned with territory (although the State no

doubt still figures) than it is with governing life itself for its own protection and betterment. **Liberalism as such is considered here** (à la Foucault) **to be a technology of government or a means for strategising power which taking life to be its object** feels compelled to wager the destiny of humanity against its own political strategy. **Liberalism can therefore be said to betray a particularly** novel **strategic field in which the writing of threat assumes both planetary** (macro-specific) **and human** (micro-specific) **ascriptions**. Although it should be noted that **it is only through giving the utmost priority to life itself**—**working to secure life from each and every threat**s posed to an otherwise progressive existence, **that its global imaginary could ever hold sway**. No coincidence then that the dominant strategic paradigm for Liberals is Global Human Security. What could therefore be termed **the Liberal problematic of security of course registers as a Liberal bio-politics of security, which in the process of promoting certain forms of life equally demands a re-conceptualisation of war in the sense that not every life lives up to productive expectations, let alone shows its compliance**. In a number of crucial ways, **this approach offers both a theoretical and empirical challenge** to the familiar IR scripts which have tended to either valorise Liberalism's visionary potential or simply castigate its misguided idealism. Perhaps the most important of these is to insist upon a rewriting of the history of Liberalism from the perspective of war. Admittedly, there is much work to be done here. Not least, there is a need to show with greater historical depth, critical purpose, and intellectual rigour how Liberal war (both externally and internally) has subsequently informed its juridical commitments and not vice versa. Here I am invariably provoking the well rehearsed "Laws of War" sermon, which I believe more accurately should be rephrased to be the "Wars of Law". Nevertheless, despite this pressing need to rewrite the Liberal encounter in language whose familiarity would be capable of penetrating the rather conservative but equally esoteric/specialist field of International Relations, sufficient contemporary grounds already exist which enable us to provide a challenging account of global civil war from the perspective of Liberal bio-political rule. Michael Dillon and Julian Reid's The Liberal Way of War encapsulates these sentiments, with the following abridged passage worth quoting: **A bio-political discourse of species existence is also a bio-political discourse of species endangerment.** As a form of rule whose referent object is that of species existence, the liberal way of rule is simultaneously also a problematisation of **fear and danger involving threats to the peace and prosperity of the specie**s. Hence **its allied need**, in the pursuing the peace and prosperity of the species, **to make war on whatever threatens it. That is the reason why liberal peacemaking is lethal**. Its violence a necessary corollary of the aporetic character of its mission to foster the peace and prosperity of the species... There is, then, a martial face to liberal peace. The liberal way of rule is contoured by the liberal way of war**... Liberalism is therefore obliged to exercise a strategic calculus of necessary killing, in the course of which calculus ought to be able to say how much killing is enough...**[However] it has no better way of saying how much killing is enough, once it starts killing to make life live, than does the geopolitical strategic calculus of necessary killing'3 . This brings me to the problem of the inside/outside. On the face of it, it **is quite suggestive to account for this conflation by acknowledging the onset of a global political imaginary** that no longer permits any relationship with the outside. **One could then support the types of hypothesis you mention, which rather than affirming the best of the enlightened Liberal tradition actually correlate the hollowing out of Liberal values** to the inability to carve out any meaningful distinctions between inside/outside, peace/war, friend/enemy, good/evil, truth/falsehood and so forth. However, whilst this approach would no doubt either re-enforce the militaristic paradigm or raise further critical doubts about the post-modern/post-structural turn in political thought, it is nevertheless misleading. **The collapses of these meaningful distinctions are not inimical to Liberal rationality**. To the contrary, **the erosion of these great dialectical interplays now actually provides Liberalism with its very generative principles of formation**. I felt that you began to explore this in Empire by noting how Foucault's bio-politics was inadequate to our complex, adaptive and emergent times. To rectify this,

Deleuze's notion of Control Societies was introduced which is more in line with contemporary systems of rule.

AT Democracy Checks Biopolitics

Group their liberalism defenses – they are ultimately all semantic redefinitions, saying "well, if we called liberalism something else, and that system was good, then liberalism is good" – our alternative is crucial to foment that transformation

Beaulieu 10 [Alain Beaulieu, professor of philosophy at Laurentian University in Canada, "Towards a Liberal Utopia: The connection between Foucault's reporting on the Iranian revolution and the ethical turn," Philosophy and Social Criticism, 801-818, sage]

As we know, the principle of calculation is constitutive of biopower which 'gave itself the function of administering life [of the population]'.25 In a 'post-biopolitical' context (i.e. in a neo-liberal environment), this calculation paradigm remains effective. It finds its expression in various techniques of domination that administer virtual possibilities (not facts) considered to be dangerous. However, calculation is not the only component of the new liberal art of governing. Foucault states that **in a socio-political environment where technologies of domination prevail** over disciplines there is also room for a specific mode of counter-conduct associated with **the spiritualization of the self**. Foucault's interest in **spiritual exercises** (**techniques of liberation**) is part of a larger topic he explores in his ethics. Therein, Foucault 'commemorates' the old traditions of the 'care of the self' (epimeleia heautou) and the 'art of living' (techneˆ tou biou), which he now presents in terms of 'aesthetics of existence', 'ethopoietic' or '**art of existence'** to better designate the transformative process of the self in a world deprived of cosmic and divine orders. Are the spiritual transformations of the self merely irrational? It is perhaps this interesting question that opened the dialogue between the later Foucault and the Frankfurt School. The representatives of the Frankfurt School (at least those of the first generation) worked and thought on the opposition between power and freedom: the less capitalistic power is exercised over it, the higher level of freedom this consciousness will ideally attain. According to Foucault, this view is typical of the '**general intellectual' who, in search of universalities, misses the subtleties of power**. For Foucault, **freedom cannot be dissociated from power, and escape from all forms of power relations is impossible**. Therefore, let us use forms of power intelligently, **to liberate ourselves**. In a neo-liberal environment, certain types of power over the self, namely spiritual exercises, can be useful for giving a specific sense of resistance and liberation. This is precisely what spiritual improvement is about. Foucault's '**critical ontology of ourselves'** presented in the various versions of his text on Kant and the Enlightenment 26 constitutes an answer to the Frankfurt School's 'critical theory of society'. The critical ontology of ourselves states that **we are not merely theoretical observers**, but rather are directly, unceasingly and locally involved in practical process of transformation. Above all, critique for Foucault pursues ethical aims of self-transformation; for instance, those associated with the creation of innovative relations with the media, the creation of new duties for independent journalists, the formation of non-ideological views by individuals who put themselves in danger, etc. Foucault believes that the creative process of self-transformation eventually leads to the creation of **a 'better' or more tolerant society**. This self-fashioning has nothing to do with individualism. Indeed, **Foucault vigorously denounced what he once called the 'Californian cult of the self'**,27 clearly **pointing out that the veritable control of the self 'can only be practiced within the group'28 and that it implies a 'functional relation** [lien de finalite´] **between taking care of the self and taking care of others'**.29 Therefore, for two reasons **one must answer 'No' to the question 'Are the spiritual exercises irrational**?' First, and as we mentioned earlier, Foucault's spirituality has no religious finality. Therefore, any attempt to show that the later

Foucault became some kind of enlightened Christian mystic is bound to fail. Second, secularized spiritual power developed through a series of rational exercises shows a sense of responsibility towards the improvement of the self and others. Thus, any attempt to show that 'anything goes' in Foucault's ethics is also **predestined for failure**. Foucault's conception of spirituality can perhaps be considered to be 'irrational' in a narrow sense in that spiritual exercises are not universal. In order to maximize improvement, some of those exercises have to be adapted and others have to be created knowing that, unlike Marx and his followers, emancipation is given in a series of singular and local processes which are never and will never be achieved once and for all. Towards the end of (or right after) his coverage of the Iranian events, it became obvious to Foucault that, although revolutionary, the introducing of a spiritual dimension into practical life, is not a universal driving force of history. In that sense, Foucault's interest in multiple spiritual exercises developed within the western tradition can be understood as part of the self-critique of his journalistic experience in Iran. The Iranian Revolution gave Foucault the opportunity he needed to see **spirituality as a condition of revolutions to come**; after his condemnation of the Khomeini regime, however, it became obvious that society does not need to regress to an age of spiritual leaders or create a new, identical era. Therein lies the importance of reading Foucault's texts on the Iranian Revolution and those on the Enlightenment in tandem. If there is hope of reorganizing society, this transformative impulse will come from **autonomous, yet singular**, subjects able to select spiritual exercises and **use these exercises to improve themselves**. This rational government of the self will lead to a different, and **likely better or more tolerant, government of others**. This freedom of selection of spiritual exercises has the highest chance of being fulfilled in a liberal environment. However, liberalism left without guidance tends to develop a **roughly hewn and materialistic vision of the world**. This is why we can see Foucault's post-Iranian writings and meditations as an attempt to **spiritualize the liberal tradition**. Presenting Foucault's ethics in terms of a 'Khomeinization of the Shah' may sound baroque. Nonetheless, this seems to be the case. **By introducing a spiritual dimension into liberalism, the later Foucault's ethics combine the best of the two worlds he saw in action during the Iranian uprising**. In his dialogue with Iranian writer Baqir Parham, Foucault asserts that there have been two 'painful experiences' in the last two centuries of western culture. 30 The first was the 'theory of the all-powerful state' endorsed by the French and German intellectuals of the late 18th and early 19th centuries; Foucault is referring here to the Napoleonic Empire resulting from the French Revolution and the Prussian Empire legitimized by German idealists. The second was the Marxist socialist state. Foucault's (unachieved) 'political spirituality' is **an alternative to those experiences**. Is it Utopian to think that the spiritualization of liberalism will neutralize the principle of calculation? Is it Utopian to think that the technologies of the self will help improve ourselves and resist the technologies of domination? Is it Utopian to think that the tradition of the care of the self can still play a concrete role in the reorganization of society? Is it Utopian to think that spiritual exercises are not other means to discipline bodies? The answer to all of these questions is Yes. But would not there be different types of Utopias? The search for a 'liberal Utopia' was one of the later Foucault's preoccupations. Beaulieu 8118

Liberalism can't check the worst excesses of biopolitics.

Mitchell **Dean**, Professor of Sociology at Macquarie University, **2OO1** ("Demonic Societies: Liberalism, biopolitics, and sovereignty." Ethnographic Explorations of the Postcolonial State, ed. Hanson and Stepputat, p. 50-1)

Finally, **although liberalism may try to make safe the biopolitical imperative** of the optimization of life, **it has shown itself permanently incapable of arresting**—from eugenics to contemporary genetics---**the emergence of rationalities that make the optimization of the life of some dependent on the**

disallowing of the life of others. I can only suggest some general reasons for this. **Liberalism is fundamentally concerned to govern through what it conceives as processes that are external to the sphere of government limited by the respect for rights and liberties of individual subjects. Liberal rule thus fosters forms of knowledge of vital processes and seeks to govern through their application.** Moreover, **to the extent that liberalism depends on the formation of responsible and autonomous subjects through biopolitics and discipline, it fosters the type of governmental practices that are the ground of such rationalities.** Further, and perhaps more simply, we might consider the possibility that **sovereignty and biopolitics are so heterogeneous to one another that the derivation of political norms from the democratization of the former cannot act as a prophylactic for the possible outcomes of the latter**. We might also consider the alternative to this thesis, that **biopolitics captures and expands the division between political life and mere existence, already found within sovereignty.** In either case, **the framework of right** and law **can act as a resource for forces engaged in contestation of the effects of biopower; it cannot provide a guarantee as the efficacy of such struggle and may even be the means of the consolidation of those effects.**

Mills' and other liberalism apologists are so vague and amorphous that it's political useless – even if there is a theoretical philosophy of perfect liberalism that can exist, our links and DAs to the aff prove it's not them

Schmitt 12 [Richard, professor emeritus of philosophy at Brown University, "Comment on Charles Mills, "Occupy Liberalism!"," *Radical Philosophy Review*, Volume 15 number 2 (2012): 331-336]

Mills's argument begins with a distinction between Liberalism (capital "L") as theory and liberalism as practices and institution. **The dominant liberalism that radicals are so critical of is not the core Liberal theory but a particular incarnation of that theory**. Liberalism as theory is an "umbrella" that can be constitutive of the views of Rawls, as well as of Nozick. It can also be at the heart of both exclusionary liberalism—what Mills likes to call "Her- renvolk liberalism"—and the egalitarianism of genuine radicals. **What is this protean Liberalism?** It **involves a commitment to universal equality, to individualism. But since these key terms—individualism, equality, universality—remain indeterminate in Liberalism as a theory**, the sharp disagreements between radicals and liberals are, indeed, as Mills claims not disagreements about theory. **The theory is so abstract and**, frankly, **vague that there is little to disagree about** (unless, as a Fascist, one rejects equality altogether). **And so long as we stick to airy generalities we can all agree that equality is very desirable.** It is only when we begin to talk about what that means, that we will find radicals and liberals at each other's throats. **If they accept Mills's distinction between Liberalism**—**indeterminate declarations about the great value of equality**—**and liberalism**—**the repugnant practice of praising equality while oppressing people who are not white men**—**radicals can** do one of two things: they can follow Mills's recommendation and **stick to Liberalism as theory and thus stick to extremely abstract declarations about equality, making very sure that they never explain what they mean by equality**. (**We might call this "Commencement Address Liberalism**.") That might make them more acceptable to actually existing liberals but only at the price of giving up the fight for justice and equality as radicals understand it. **Or they can confront their political enemie**s, e.g., **contractarian liberals** ("Herrenvolk liberals") **and then they will have to draw sharp lines between themselves and the individualist**, impoverished **understanding of inequality that dominant liberalism uses to disguise the glaring injustices of our society.** Then the cat is out of the bag: the commonalities between liberals and radicals are very tenuous.

You cannot mouth the liberals' platitudes and fight against sexist, racist, and other group oppressions and hope that liberals will still agree with you. Once you talk about race and class they will discover what you are hiding under your liberal sheep's clothing. Mills supports his plea to radicals to employ the language of liberalism by claiming that, for instance, liberal denial of group oppression is not something their theory forces them to do but that it is "contingent." But it is not clear to me what that means. **Liberals have denied, overlooked, looked away from group subjugation** for 400 years at least, since the accusation of class oppression was first raised by the Diggers and Levellers in seventeenth-century England. **That's simply what liberals do**; **they make the clearly false empirical claim that prince and pauper, cleaner and billionaire owner are fundamentally the same except that one is more successful than the other due to greater effort**. **Calling that "contingent" makes it no less predictable**. **There is no reason to think that liberals will not do that for a long time to come**. Calling the denial of group oppression "contingent" suggests that liberals do not have to act as if we were all separate individuals endowed with more or less the same opportunities. Well, no, of course they don't have to do it but they have been doing it for centuries to the point where today they have managed to make "class struggle" a dirty word. **Do we have any reason to think that they are going to stop distorting reality in the near future? Talking vaguely about equality will not make them change.** If there is any hope of overcoming liberalism, it can only be through sharp confrontations of liberal distortions of the facts about equality and inequality in capitalist society. **This is more or less what Charles's paper says, when read as an answer to the question: "what can we do to persuade liberals to take us radicals seriously?"** But in the background, there is the esoteric message which answers a very different question: "What does it mean to be a radical today? What should we be thinking about and what should we be doing?" Here the question is not about how to change liberals. The question is about us, ourselves, and what it means to be a radical today. **Charles's answer** to that question **goes** more or less as follows: **Radicals and liberals share some extremely abstract principles, such as a commitment to freedom and equality. Many Liberals tend to interpret those commitments in ways that are demonstrably inadequate.**

Modern biopolitics guarantees an abstract racism that necessitates sovereign intervention—there's no such thing as perfect liberalism

Hoffmann 7 [Kasper Hoffmann, professor of International Development Studies at Roskilde University, May, Militarised Bodies and Spirits of Resistance, http://diggy.ruc.dk:8080/handle/1800/2766]

In modern forms of government, concepts of the norm and normal have played a kind mediating role in the formulation and execution of normative projects (Canguilhem 2005 [1966]; Ewald 1990). **It is through the systematic accumulation of knowledge about certain social problems and deviations that we come to know the normal and the norm that stabilise and indicate it in social contexts** (Ewald 1990: 140). **By aligning delinquent or abnormal subjectivities** (through, for instance, techniques of pedagogy, health, economic development, human development, spirituality etc.) **to the norm, the normal order, can be restored allowing normative goals to be considered "for the good"**: "[T]he good is figured in terms of adequacy – the good product is adequate to the purpose it was meant to serve. **Within the normative system, values are not defined a priori, but instead through an endless process of comparison and normalization**" (Ewald 1990: 152). Rose has made the point that the "very notion of normality has emerged out of a concern with types of conduct, thought, expression deemed troublesome or dangerous" (Rose 1996: 26), so that normality can only be understood in relation to the

abnormal. Therefore, **even if the norm has allowed modern biopower to transform negative restraints of power into more positive controls or normalisation, it is still producing dangerous subjectivities. Within liberal forms of government**, at least, **there is a long history of people who, for one reason or another, are deemed not to possess or to display the attributes** (e.g. autonomy, responsibility) **required of the juridical and political subjects of rights and who are therefore subjected to all sorts of disciplinary, bio-political and even sovereign interventions.** (Dean 1999: 134) The list of those so subjected would include at various times those furnished with the status of the indigent, the degenerate, the feeble-minded, the native, the savage, the homosexual, the delinquent, the dangerous etc. Modern so-called **"liberal" practices of government therefore also entail 'illiberal' aspects** (see Hindess 2001; Dean 1999 Chapter 7). **Liberalism always contains the possibility of non-liberal interventions in the lives of those who do not possess the attributes required to be a "citizen".** However, bio-politics is not confined to liberal forms of rule: liberalism just makes the articulation in a specific way. Other types of rule, such as **authoritarian or totalitarian forms**, also **depend on the elements of a bio-politics that is concerned with the detailed administration of life**. Rather than denying that non-liberal practices are indeed an integral part of all forms of liberal democratic government, we could see the will to establish the authority of liberal democracy – this will to power – as an element of sovereignty in the heart of the "democracy". **In modern processes of government, the focus is on the fostering and promotion of life, though in certain circumstances this fundamental "security" of the population is experienced as threatened. In such circumstances the community calls upon its fundamental right to exist as such and thus evokes its right to deny the right to life of those who are seen as a threat to the life of that same population. This** allows us to consider what **might be** thought of as **the dark side of bio-politics** (Dean 1999: 139). In Foucault's account, **bio-politics**, as concrete political method of security, **does not put an end to the practice of war; it provides it with renewed scope. This new scope allows the actual** neutralization, or even **elimination of life at the level of entire populations**, or micro populations. **It intensifies the killing, whether by "ethnic cleansing" that visits holocausts upon whole groups or by the mass slaughter of classes and groups in the name of the utopia to be achieved. Governance is now exercised at the level of life and of the population, and wars will be waged at that level on behalf of the "security" of each and all**. This brings us to the heart of Foucault's challenging thesis about bio-politics, namely that **there is an intimate connection between the exercise of a life-administering power and the commission of genocide: "If genocide is indeed the dream of modern powers […] it is because power is located at the level of life, the species, the race, and the large-scale phenomena of population**" (Foucault 1976: 180, my translation). Thus, **there seems to be a kind of inescapable connection between the power to foster life and the power to disqualify life which is characteristic of bio-power. The emergence of a bio-political racism in the** nineteenth and twentieth centuries **can be approached as a trajectory in which the demand for a homogenous social space articulated by the norm appears to turn into a life necessity.** Through the establishment of the norm, **abnormality is inscribed upon individual "other" bodies, casting certain deviations as both internal dangers to the body politic and as inheritable legacies that threatens the well-being of race: On behalf of the existence of everyone entire populations are mobilised for the purpose of wholesale slaughter in the name of the life necessity: massacres have become vital. It is as managers of life and survival, of bodies and the race, that so many regimes have been able to wage so many wars, causing so many** men **to be killed…at stake is the biological existence of a population**. (Foucault 1976: 180, my translation, emphasis) **Bio-politics** presides over the processes of birth, death, production and illness. It **acts on the human species. Within this bio-political practice the sovereign right to kill appears in a new form; as an "excess" of biopower that does away with life in the name of securing it, and in its most radical form it is a means of introducing a fundamental distinction between those who must live and those who must**

die. It fragments the biological field and establishes a break within the biological continuum of human beings by defining a hierarchy of races, a set of subdivisions in which certain races are classified as "good", fit and superior (Stoler 1995: 84). **It** therefore **establishes a positive relation between the right to kill and the assurance of life.** It posits that, **the more you kill and let die, the more you will live**. Thus, in modern biopolitical practice, **war does more than reinforce one's own kind by eliminating a racial adversary: it "regenerates" one's own race** (Stoler 1995: 56). It is essential to note that **racism as a bio-political practice does not draw on a particular theory of race – it does not need to. Instead racism designates a much more general practice which introduces a rift in the biological continuum that is the human species between those who are worthy of citizenship and those who are not. Internal threats to the health and wellbeing of a social body come from those who were deemed to lack an ethics of "how to live" and thus the ability to govern themselves. It is worth remembering that the Nazi concentration camps housed not only Jews, but also Gypsies, homosexuals, Bolsheviks and other inassimilable elements.** To sum up, **Foucault understands racism as a sort of permanent feature of biopower** and not as the paroxysmal convulsion of a decaying moral order (Stoler, 1995: 64). Foucault's argument is that **racism is not only confined within those obviously racist forms of authoritarian government such as the German Nationalist Socialist state, but that it is intrinsic to the nature of all modern, normalising governmental rationalities and their bio-political technologies.** By showing how racism possesses a polyvalent mobility, he shows that **racism is not merely an ideological discourse of exceptionally cruel regimes, but a fundamental feature of modern processes of government.**

AT Impact Defense

Maintaining liberalism's legitimacy cements violent grand strategy and disdain for democracy

Morrissey 11 [John, Lecturer in Political and Cultural Geography, National University of Ireland, Galway, has held visiting research fellowships at University College Cork, City University of New York, Virginia Tech and the University of Cambridge, Geopolitics, 16.2, "Liberal Lawfare and Biopolitics: US Juridical Warfare in the War on Terror", DOI DOI: 10.1080/14650045.2010.538872]

A bigger question, of course, **is what** the US military practices of **lawfare and juridical securitization say about our contemporary moment. Are they** essentially **'exceptional'** in character, prompted by the so-called exceptional character of global terrorism today? **Are** they therefore enacted in 'spaces of exceptions' **or are they**, in fact, **simply** contemporary **examples of** Foucault's 'spaces of **security'** that are **neither exceptional nor indeed a departure from**, or perversion of, **liberal democracy**? As Mark Neocleous so aptly puts it, has the "liberal project of 'liberty"' not always been, in fact, a "project of security"?116 This 'project of security' has long invoked a powerful political dispositif of 'executive powers', typically registered as 'emergency powers', but, as Neocleous makes clear, of the permanent kind.117 For Neocleous, the pursuit of 'security' – and more specifically 'capitalist security' – marked the very emergence of liberal democracies, and continues to frame our contemporary world. In the West at least, that world may be endlessly registered as a liberal democracy defined by the 'rule of law', but, as Neocleous reminds us, **the assumption that the law**, decoupled from politics, **acts as the ultimate safeguard of democracy is simply false** – a key point affirmed by considering the US military's extensive waging of liberal lawfare. As David Kennedy observes, **the military lawyer who "carries the briefcase of rules and restrictions" has long been replaced** by the lawyer who "participate[s] in discussions of strategy and tactics".118

The US military's liberal lawfare reveals how the **rule of law is simply a**nother **securitization tactic in liberalism**'s **'pursuit** of security'; a pursuit that paradoxically eliminates fundamental rights and freedoms in the 'name of security'.119 **This is a 'liberalism' defined by** what Michael Dillon and Julian Reid see as a commitment to waging 'biopolitical war' for the securitization of life – '**killing to make live'**.120 **And** for Mark Neocleous, **(neo)liberalism's fetishisation of 'security'** – as both a discourse and a technique of government – **has resulted in a world defined by anti-democratic** technologies of **power**.121 In the case of the US military's forward deployment on the frontiers of the war on terror – and its juridical tactics to secure biopolitical power thereat – this has been made possible by constant reference to a neoliberal 'project of security' registered in a language of 'endless emergency' to 'secure' the geopolitical and geoeconomic goals of US foreign policy.122 The US military's continuous and indeed growing military footprint in the Middle East and elsewhere can be read as a 'permanent emergency',123 the new 'normal' in which geopolitical military interventionism and its concomitant biopolitical technologies of power are necessitated by the perennial political economic 'need' to securitize volatility and threat.

CONCLUSION: ENABLING BIOPOLITICAL POWER IN THE AGE OF SECURITIZATION

Law and force flow into one another. We make war in the shadow of law, and law in the shadow of force.

— David Kennedy, Of War and Law 124

Can a focus on lawfare and biopolitics help us to **critique our contemporary moment's** proliferation of **practices** of securitization – practices that appear to be primarily concerned with coding, quantifying, governing and anticipating life itself? In the context of the US military's war on terror, I have argued above that it can. If, as David Kennedy points out, **the** "emergence of a **global** economic and commercial **order has amplified the role of background legal regulations as** the **strategic terrain** for transnational activities of all sorts", this also includes, of course, 'warfare'; and for some time, the US military has recognised the "opportunities for creative strategy" made possible by proactively waging lawfare beyond the battlefield.125 As Walter Benjamin observed nearly a century ago, **at the very heart of military violence is a "lawmaking character".**126 And it is this 'lawmaking character' that is integral to the biopolitical technologies of power that secure US geopolitics in our contemporary moment. **US lawfare focuses "the attention of the world on this or that excess" whilst simultaneously arming "the most heinous human suffering in legal privilege", redefining horrific violence as** "collateral damage, **self-defense, proportionality, or necessity".**127 **It involves a mobilisation of the law that is precisely channelled towards "evasion", securing classified Status of Forces A**greement**s and "offering at once the experience of safe ethical distance and careful pragmatic assessment, while parcelling out responsibility**, attributing it, denying it – even sometimes embracing it – **as a tactic of** statecraft and **war".**128

Since the inception of the war on terror, the US military has waged incessant lawfare to legally securitize, regulate and empower its 'operational capacities' in its multiples 'spaces of security' across the globe – whether that be at a US base in the Kyrgyz Republic or in combat in Iraq. I have sought to highlight here these tactics by demonstrating how the execution of **US geopolitics relies upon a proactive legal-**biopolitical **securitization** of US troops **at the frontiers** of the American 'leasehold empire'. For the US military, legal-biopolitical apparatuses of security enable its geopolitical and geoeconomic projects of security on the ground; they plan for and legally condition the 'milieux' of military commanders; and in so doing they render operational the pivotal spaces of overseas intervention of contemporary US national security conceived in terms of 'global governmentality'.129 In the US global war on terror, it is lawfare that facilitates what Foucault calls the "biopolitics of security" – when life itself becomes the "object of security".130 For the US military, this involves the eliminating of threats to 'life', the creating of operational capabilities to 'make live' and the anticipating and management of life's uncertain 'future'.

Some of the most key contributions across the social sciences and humanities in recent years have divulged how **discourses of 'security', 'precarity' and 'risk' function centrally in the governing dispositifs of our contemporary world**.131 In a society of (in)security, **such discourses have a profound power to invoke danger as "requiring extraordinary action".**132 In the ongoing war on terror, registers of emergency play pivotal roles in the justification of military securitization strategies, where 'risk', it seems, has become permanently binded to 'securitization'. As Claudia Aradau and Rens Van Munster point out, the "perspective of **risk management" seductively effects practices of military securitization to be seen as necessary,** legitimate and indeed therapeutic.133 US tactics of liberal lawfare in the long war – the conditioning of the battlefield, the sanctioning of the privilege of violence, the regulating of the conduct of troops, the interpreting, negating and utilizing 24 of international law, and the securing of SOFAs – are vital security dispositifs of a broader 'risk- securitization' strategy involving the deployment of liberal technologies of biopower to "manage dangerous irruptions in the future".134 It may well be fought beyond the battlefield in "a war of the pentagon rather than a war of the spear",135 but **it is lawfare that ultimately enables the 'toxic combination' of US geopolitics and biopolitics defining the current age of securitization**.

The impact is extinction

Szentes 8 [Tamas, Professor Emeritus at the Corvinus University of Budapest. "Globalisation and prospects of the world society," 4/22/08, http://www.eadi.org/fileadmin/Documents/Events/exco/Glob.___prospects_-_jav.pdf]

It's a common place that human society can survive and develop only in a lasting real peace. Without peace countries cannot develop. **Although since 1945 there has been no world war**, but --numerous local wars took place, --terrorism has spread all over the world, undermining security even in the most developed and powerful countries, --**arms race and militarisation have not ended with the** collapse of the **Soviet bloc, but escalated and continued, extending also to w**eapons of **m**ass **d**estruction **and** misusing enormous **resources** badly needed for development, --**many** "invisible **wars" are** suffered by the poor and oppressed people, **manifested in** mass misery, **poverty**, unemployment, homelessness, starvation and malnutrition, epidemics and poor health conditions, exploitation and oppression, racial and other discrimination, physical terror, organised injustice, **disguised** forms of **violence**, the denial or regular infringement of the democratic rights of citizens, women, youth, ethnic or religious minorities, etc., **and** last but not least, in the degradation of human environment, which means that --the "war against Nature", i.e. the **disturbance of ecological balance**, wasteful management of natural resources, and large-scale pollution of our environment, is still going on, causing also losses and fatal dangers for human life. **Behind global terrorism and "invisible wars" we find striking international and intrasociety inequities and distorted development patterns , which tend to generate social as well as international tensions, thus paving the way for unrest and "visible" wars**. It is a commonplace now that peace is not merely the absence of war. **The prerequisites of a lasting peace between and within societies involve not only -**

though, of course, necessarily - demilitarisation, but also a systematic and gradual elimination of the roots of violence, of the causes of "invisible wars", of the structural and institutional bases of large-scale international and intra-society inequalities, exploitation and oppression. **Peace** requires a process of social and national emancipation, a progressive, democratic transformation of societies and the world bringing about equal rights and opportunities for all people, sovereign participation and mutually advantageous co-operation among nations. It further requires a pluralistic democracy on global level with an appropriate system of proportional representation of the world society, articulation of diverse interests and their peaceful reconciliation, by non-violent conflict management, and thus also a global governance with a really global institutional system. Under the contemporary conditions of accelerating globalisation and deepening global interdependencies in our world, peace is indivisible in both time and space. It **cannot exist if reduced to a period only after or before war, and cannot be safeguarded in one part of the world** when some others suffer visible or invisible wars. Thus, peace requires, indeed, a new, demilitarised and democratic world order, which can provide equal opportunities for sustainable development. "Sustainability of development" (both on national and world level) is often interpreted as an issue of environmental protection only and reduced to the need for preserving the ecological balance and delivering the next generations not a destroyed Nature with overexhausted resources and polluted environment. However, **no ecological balance can be ensured, unless the** deep international **development gap and intra-society inequalities are substantially reduced**. Owing to global interdependencies there may exist hardly any "zero-sum-games", in which one can gain at the expense of others, but, instead, the "negative-sum-games" tend to predominate, in which everybody must suffer, later or sooner, directly or indirectly, losses. Therefore, **the** actual **question is** not about "sustainability of development" but rather about the "sustainability of human life", i.e. **survival of [hu]mankind** – because of ecological imbalance and globalised terrorism. When Professor Louk de la Rive Box was the president of EADI, one day we had an exchange of views on the state and future of development studies. We agreed that development studies are not any more restricted to the case of underdeveloped countries, as the developed ones (as well as the former "socialist" countries) are also facing development problems, such as those of structural and institutional (and even system-) transformation, requirements of changes in development patterns, and concerns about natural environment. While all these are true, today I would dare say that besides (or even instead of) "development studies" we must speak about and make "survival studies". While the monetary, financial, and debt crises are cyclical, we live in an almost permanent crisis of the world society, which is multidimensional in nature, involving not only economic but also socio-psychological, behavioural, cultural and political aspects. **The narrow-minded**, election-oriented, selfish **behaviour** motivated by thirst for power and wealth, which still characterise the political leadership almost all over the world, **paves the way for** the **final**, last **catastrophe. One cannot doubt**, of course, **that** great **many positive** historical **changes have also taken place** in the world in the last century. Such as decolonisation, transformation of socio-economic systems, democratisation of political life in some former fascist or authoritarian states, institutionalisation of welfare policies in several countries, rise of international organisations and new forums for negotiations, conflict management and cooperation, institutionalisation of international assistance programmes by multilateral agencies, codification of human rights, and rights of sovereignty and democracy also on international level, collapse of the militarised Soviet bloc and system-change3 in the countries concerned, the end of cold war, etc., to mention only a few. **Nevertheless, the crisis** of the world society **has** extended and **deepened**, approaching to a point of bifurcation that necessarily puts an end to the present tendencies, either by the final catastrophe or a common solution. **Under** the circumstances provided by **rapidly progressing science and tech**nological revolutions, **human society cannot survive unless such profound intra-society and international inequalities prevailing today are** soon **eliminated**. Like a single spacecraft, the Earth can no longer afford to have a 'crew' divided into two parts: the rich, privileged, wellfed, well-educated, on the one hand, and the poor, deprived, starving, sick and uneducated, on the other. Dangerous 'zero-sum-games' (which mostly prove to be "negative-sum-games") can hardly be played any more by visible or invisible wars in the world society. Because of global interdependencies, the apparent winner becomes also a loser. The real choice for the world society is between negative- and positive-sum-games: i.e. between, on the one hand, continuation of visible and "invisible wars", as long as this is possible at all, and, on the other, transformation of the world order by demilitarisation and democratization. **No ideological** or terminological **camouflage can conceal this** real **dilemma any more**, which is to be faced not in the distant future, by the next generations, but in the coming years, because of global terrorism soon having nuclear and other mass destructive weapons, and also **due to irreversible changes** in natural environment.

ST Borders K

Turns Case

Turns case—the aff uses the US-Mexico border as a basis for politics which recreates the ontological divide that has allowed border violence to persist in the first place. Only the alternative can destabilize this understanding of the border as a static function of the law.

Vaughan-Williams 09—Professor of International Security @ the University of Warwick (Nick, 2009, Edinburgh University Press, "BORDER POLITICS: The Limits of Sovereign Power," pp. 53-55, rmf)

More specifically, Walker argues that <u>the principle of state sovereignty 'offers both a spatial and a temporal resolution to questions about what political community can be</u>, <u>given the priority of citizenship and particularity over universalist claims to a common human identity'</u>.90 The principle of state sovereignty gives a double resolution to the problem of universality and particularity. On the one hand, <u>the existence of an international sovereign states system permits cultural particularity</u> ('<u>citizenship'</u>) <u>within a broader framework of universal norms of interaction ('common human identity')</u>. On the other hand, the generalisation of the sovereign state as a particular cultural form cuts across all cultures in terms of human necessity. In other words the issue of one and many is resolved through the single formula 'one world many states'. Moreover, <u>this resolution enables and depends upon a spatial demarcation between inside and outside which</u>, in the context of the Westphalian system and modern geopolitical imaginary, <u>can be read as the concept of the border of the state</u>. <u>Spatially</u>, according to Walker, **the principle of state sovereignty 'fixes a clear demarcation between life inside and outside** a centred political community'.91 **This allows for the human aims of reason, justice, democracy and so on to be aspired to inside the sovereign state against the backdrop of perpetual warfare and barbarism outside** in the sphere of the international. It also permits notions of here and there, us and them, and affirms the presence of a political community. Temporally, these demarcations provide the condition of possibility for notions of 'progress' and 'development' inside states as defined against what happens outside them: 'between states [...] the lack of community can be taken to imply the impossibility of history as progressive teleology, and thus the possibility of merely repetition and recurrence'.92 As such, Walker argues it is precisely this spatial– temporal resolution provided by the logic of 'inside/outside' that makes 'international relations' and its theories distinctive. Walker's diagnosis of <u>the relationship between sovereignty and the inside/outside</u> problématique <u>adds an important dimension to any attempt to examine the concept of the border of the state</u>. Following his argument, <u>the many paradoxes and contradictions glossed over by the principle of state sovereignty can be 'read as points, lines, and planes, as monopolies of power and authority, borders and territories'</u>.93 These points, lines and planes reflect the emergence in postRenaissance Europe of the link between the principle of state sovereignty and 'a sense of inviolable and sharply delimited space'.94 Such points, lines and planes are often taken for granted as we have already seen, but Walker emphasises that '<u>as historical constructs, conceptions of space and time cannot be treated as some uniform background noise, as abstract ontological conditions to be acknowledged and then ignored'</u>.95 Indeed, the problematisation of these conceptions raises the stakes as far as the importance of the concept of the border of the state is concerned. The recognition that **notions of inside and outside are merely 'Cartesian coordinates that have allowed us to situate and naturalise a comfortable home for power**

and authority' calls into question the politics of global space more generally. As William E. Connolly notes, <u>once global space is reconsidered as ambiguous, contested and unstable, the function of artificially imposed borders becomes highly dubious.</u>97 <u>Against views that read borders between states act as 'limits on violence', it becomes easy to see how state borders are connected to violence in an altogether different sense</u> (a matter to which the analysis will return in Chapter 3). Historically, the transition from a system of overlapping loyalties and allegiances in favour of sharp borders did not happen peacefully. Hence, Walker comments, '<u>One has to ask how have we so easily forgotten the concrete struggles that have left their traces in the clean lines of political cartography and the codifications of international law.</u>'98 Instead of reading borders between states and the principle of state sovereignty together as a form of 'airbrushed achievement' Walker thus challenges us to reappraise this relationship as a 'site of struggle'.99

Impact

The idea that borders are a necessary social construct is based in racist and nationalistic conceptions of what it means to have coherent culture

Whyte et al. '6 (Jessica, PhD candidate in the Centre for Comparative Literature and Cultural Studies at Monash U., Australia, Carlos Fernandez, Doctor in Sociology and works as a precarious researcher @ Universidad Autónoma de Madrid, Spain, Meredith Gill, PhD candidate in the Program in Comparative Studies in Discourse and Society @ U. of Minnesota, Imre Szeman, Associate Professor of English and Cultural Studies and an Adjunct Member of the Institute for American Studies @ Humboldt U. in Berlin, "Erasing the Line, or, the Politics of the Border" ephemera 6(4), pgs. 474-477)

Does culture need borders? Is it defenceless without them? Millennia of cultural interactions, borrowings, and transmutations, and a globe populated with hybrid forms whose real origins are likely impossible to map, suggest that culture is constantly on the move, always undergoing changes and transformations, happiest when it finds itself twisted into new shapes and practices. It is safe to say that culture always already exceeds those borders in which some have hoped to confine it – whether these are national borders or aesthetic ones (like the delimitations called 'genre'). To talk about culture in reference to globalization – a time, we are constantly told, when movements of cultural ideas, forms, and practices have become if not more common then more rapid and extensive – would thus seem to require only the unlearning of the conceptual legacy of the past two centuries. It was during this time that 'culture' came of age as a modern concept (Williams, 1985) and was also partitioned off into the discrete, definable entities with which we still associate it – primarily into 'national cultures', but also into the spaces so diligently explored by anthropologists: the tribe, the village, the region, etc. "Every nation is one people", Herder writes, "having its own national form, as well as its own language" (Herder, 1800: 166). We know that such sentiments, which continue to haunt our ideas about the proper space of culture, emerged less as a scholarly or taxonomic response to 'real' cultural divisions and more out of the need to lend support to the emerging political techne of the modern state (no doubt in conjunction with the limits on movements of peoples that we have been tracking thus far.) After all of the disasters wrought by the fictions of national belonging, we global moderns are more likely to heed Adorno's warning about the borders erected around culture: "The formation of national collectivities ... common in the detestable jargon of war that speaks of the Russian, the American, surely also of the German, obeys a reifying consciousness that is no longer really capable of experience. It confines itself within precisely those stereotypes that thinking should dissolve" (Adorno, 1998: 205). And yet: even as new technologies (like the Internet) make it all but impossible to patrol the spaces of culture, the idea that culture needs borders has been given new life. The especially harsh and unforgiving climate of the global economy has created conditions that seem to require that culture be sheltered if it is to survive at all. In the era of neo-liberalism, the strain to make every dollar multiply has forced cultural practitioners to consider turning to the state for assistance – even if the state is well past the point of believing in 'art for art's sake', or in viewing the university ideal as one of 'ideal curiosity' as opposed to envisioning it as an institution where knowledge is produced as a "merchantable commodity" (Ross, 2000: 3). Contrary to what one might expect at a time when financial borders have all but disappeared, national cultures and nationalisms are being taken out of the closet, dusted off and once again worn about proudly and without embarrassment, either as a supposed shield against a global neo-liberal cultural market that is assumed in advance only to produce cultural garbage, or, more recently, as a defence of the values of Enlightenment civilization against the Islamic hordes threatening to engulf North America and Europe (best exemplified by Huntington's grotesque 'clash of civilizations' thesis.) Even in Germany, a nation that has developed an understandable wariness toward nationalisms of all kinds, it has become possible to openly discuss Leitkultur (dominant or hegemonic culture) and the need to ensure that immigrants absorb the ideas and ideals that (supposedly) define Germanic culture. Intellectual debates about globalization and cultural belonging might focus on cosmopolitanisms or a global 'multitude', or look to the myriad ways in which forms of alternative cultural productive have pushed the unlearning of the cultural borders we spoke of above. Everywhere else, it appears that not only has the nation-state survived globalization, but so too has the idea of the nation representing a people and a culture. And while such national-cultural-ethnic borders may not inhibit physical movement, they are certainly meant to block ideas, to define the formation of subjectivities, and to shape the identities and commitments of those contained by them. An essential political act is to assert again and again and again that culture is and should remain unbounded. Cultural practices and

forms have no 'natural' and 'unnatural' spaces: the idea that they do is conceptually specious and, inevitability, politically dangerous insofar as it plays a key role in enabling and legitimating the politics of inclusion and exclusion so central to operation of state sovereignty. And yet (once again): though it might be easy to challenge the regressive character of 'cultural' tests of citizenship (Gumbrecht, 2006), or of right-wing demands that immigrants of necessity assimilate appropriate 'cultural' values and traits (of the kind circulating in France, the Netherlands, Denmark, Hesse in Germany, and elsewhere), the idea that cultural expression needs protection and support in the age of globalization can nevertheless be a tempting one. The same nation-states that are running scared about the threat posed by the immigrant populations that they desperately need (for demographic and economic purposes) are also re-asserting the need for policies to foster and support cultural expression within their borders. In October 2005, member states of UNESCO voted overwhelmingly to support the 'Convention on the Protection of the Diversity of Cultural Contents and Artistic Expressions'. The convention allows states to exempt cultural products from trade agreements and permits them "to maintain, adopt, and implement policies and measures that they deem appropriate for the protection and promotion of the diversity of cultural expressions on their territory" (UNESCO, 2005). The real intent of this convention is (to no one's surprise) to put a break on US dominance of the international trade in the products of the mass cultural industries (film and television in particular). It also seeks to affirm the relative autonomy of 'cultural expressions' from the larger trade in goods, a separation that other US-led trade agreements, such as the North American Free Trade Agreement, have actively sought to undo (Szeman, 1998). Can't we affirm the (apparently) productive impulses of the state to safeguard culture from the market, while rejecting and criticizing the uses to which national culture and its politics of belonging are being put? Can't we erect cultural borders in some places, while resolutely taking them down in others?

For those critical of the dominance of economic relations to the exclusion of all else in the world – something which neo-liberal globalization has achieved par excellence – it is hard to resist the idea that cultural expression and cultural autonomy need protection from the ravages of the market. And if not the state, then who? In the context of our current neo-liberal governments, the idea of the beneficent Keynesian or social democratic state casts a long political shadow out of whose darkness it has become difficult to move. But move out of it we must. There are numerous assumptions embedded in the idea of state protection of culture – which is to say: the establishment of borders for culture – that need to be carefully disentangled and assessed. Right off, the notion that the state that is intent on patrolling and maintaining existing forms of national culture should be charged with the task of protecting and promoting 'cultural diversity' is, at a minimum, problematic. 'Diversity' is a slippery word. The celebration of diversity against encroaching Americanism or market culture is one thing; enabling diversity within national borders quite another. The defense of Enlightenment values against outsiders and the protection of culture from the market seamlessly fold over into one another: the diversity named here is, for the most part, that of already established forms of national 'high' culture – opera, classical music, museums, the fine arts – which have long had an essential role in legitimating the sovereignty of the state over its borders. As both Roberto Schwarz (1992) and Malcolm Bull (2001) have shown in different ways, anxieties about the protection and promotion of forms of 'authentic' national culture are ones that emerge out of the interests of ruling and intellectual elites, and not from the broad masses, who have little investment or interest in safeguarding the link between culture and state sovereignty. Increasingly, even the impulse to support non-market cultures is done with economic goals in mind: the support of an essential aspect of the affective labour market; the creation of conditions for so-called 'creative classes' to flourish (Florida, 2004); and the establishment of cultural distinctiveness in order to fuel tourist economies organized around encounters with managed difference. It is one thing to be critical and anxious about the impact of the market on culture; it is quite another to see the state – the funding source for the so-called 'public sector' – as heroically intervening to enable non-market social and cultural forms to flourish. The two impulses need to be disengaged. The dangers of giving states the moral authority to protect and promote culture outweigh the potential benefits, which might include strategic use of state funds by arts, cultural institutions, and so on, to engage in efforts to shatter cultural borders instead of assisting the state in reinforcing them. Documents such as the UNESCO Convention pretend to take on what Guy Debord described as 'the spectacle': that haze of mediation which has placed representation and abstraction at the centre of social life. In reality, they do nothing substantive to get at the heart of social drama of accumulation and 'separation' that Debord's concept of the spectacle is intended to capture. Remember: "The spectacle is not a collection of images; rather, it is a social relationship between people that is mediated by images" (Debord, 1995: 12). To no one's surprise, what is at issue in contemporary anxieties about cultural borders are political ones, whose real object is the maintenance of existing forms of power at all costs. Culture has no borders, it never has. Why then respond to the threat of the market by giving into the fantasy of national-cultural borders, a fantasy which, as Adorno writes, goes against the impulses of cultural practice to attack and dissolve the stereotypes that contain us? Every border erected for culture claims 'diversity' (from the market) or Enlightenment (against the unbelievers). We must refuse to operate within these borders and the easy stereotypes they offer, and direct ourselves to understanding and contesting the global political circumstances that continue to make such forms of reifying consciousness politically viable. No borders for culture! Such a call doesn't cause the threat of the neo-liberal market to culture to fade; it does, however, push us away from the false solution of cultural borders and returns us to the task of culture: the undoing of all borders, maybe even especially that singular psychic border of commodity culture, which transforms creative labour into dead things without origin.

AT: Alternatives

Alternatives to counterterror measures are utopian – we can't emancipate ourselves from the problem of terrorism

Michel and Richards 9 (Torsten Michel and Anthony Richards, May 19th 2009, False dawns or new horizons? Further issues and challenges for Critical Terrorism Studies, Critical Studies on Terrorism Vol. 2, No. 3, December 2009, pp. 406-407, accessed 7/17/15) CH

The following will raise some concerns as to how the role of emancipation is conceptualized in current examples of Frankfurt School-inspired approaches to CTS. To begin with, in addition to the critique of positivism which is inherent in various critical projects within and outside the field of International Relations, CTS clearly articulates that one of its main aims – and certainly its main normative aim – is to provide a space for emancipatory rationality (Blakeley 2007, p. 234; also Jackson 2007, pp. 249–250). Emancipation is directed at all those groups and individuals, mainly located in the global South, that suffer from the so far rigid and hegemonic discourse that characterises terrorism research. The close intertwinement with state interests has, in their view, a purely instrumental dimension that aims at reifying and cementing the dominance of Western political and institutional structures on a global and regional scale (Blakeley 2007, p. 231). From these initial observations certain problematic issues follow for the conception of emancipation so far exhibited in CTS. To begin with, on a more practical level, CTS makes the premature and optimistic assumption not only that universalising a specific set of values (i.e. Western) is a good thing but that every community will ultimately, when it comes to its senses, pursue a path of emancipation which will lead to a universalistic conception of a just society and a harmonization of norms and values (McDonald 2009, p. 121). The assumption is made that everybody wants to be 'emancipated' or that if they do not want to they should want to. One is left with the impression that, rather than reflecting the heterogeneity of human existence, CTS represents an elite body of thought derived in the West that is underpinned by the utopian aspiration that everybody wants to, or should want to, to live by a specific set of values which are seen as universally valid as they are derived from an allegedly universal application of reason. And so, rather than being liberating or emancipatory, for the vast bulk of the global population, CTS risks being narrow and itself engaged in a hegemonic project. In order to realise emancipation in this sense it is therefore necessary, presumably, to universalise a specific set of values through a continuous application of self-reflexive emancipatory reason. How emancipatory, however, is it to quash all other forms of ideology and governance that do not conform to our own? It is argued that the politics of emancipation aims to transcend 'oppressive' social divisions. What about those cultures (and indeed people's securities) that revolve around social divisions? Here again we encounter a strange lack of self-reflexivity in FSCT-inspired approaches to terrorism. Although scholars engaged in promoting this normative agenda stress the need for a continuous critical engagement, it remains unclear 'from where' their own normative agenda comes and what exactly makes it legitimate. A simple statement of conviction along the lines of 'we aim to free people from oppression' is certainly not enough to legitimise desired practices. Empirically, it may be abhorrent to us to see that the role of women in many environments apparently renders them 'insecure' from a CTS perspective, but what if this is a cultural imperative? Are we also to attempt to address the 'insecurity' of lower caste tribes and groups in relation to higher castes? Do women in developing countries and members of lower castes feel insecure or is that a state of mind that has been bestowed upon them by relativist observers who deem that they must be insecure according to the latter's own conceptions as to what must define security? As Ayoob argues, such a definition of emancipation 'refuses to acknowledge that a society or group can be emancipated without being secure and vice versa. . . . Such semantic acrobatics tend to impose a model of contemporary Western polities . . . that are far removed from Third World realities' (Ayoob 1997, pp. 126–127)

Responding to terrorism can't be reduced to discursive choices. Problematizing conventional approaches isn't sufficient.

Michel and Richards 9 (Torsten Michel and Anthony Richards, May 19th 2009, False dawns or new horizons? Further issues and challenges for Critical Terrorism Studies, Critical Studies on Terrorism Vol. 2, No. 3, December 2009, pp. 409-410, accessed 7/17/15) CH

One example as to where <u>CTS tends to overstate the case for its novelty relates to the perpetual problem of defining terrorism</u>. Ruth Blakeley maintains that one of the main problems with 'orthodox' terrorism studies is that in its conceptions 'the "terrorist label" is used as a political tool to de-legitimize certain groups, rather than as an analytical category' (Blakeley 2007, p. 230). This politicization of the term terrorism leads to a specific narrative, she argues, in which the Northern democratic states are continuously portrayed as victims under constant threat from extremist non-state actors mostly originating in the global South. Therefore, <u>Blakeley suggests that 'critically oriented scholars need to reclaim the term "terrorism" and use it as an analytical tool, rather than political tool in the service of the elite power'</u> (p. 233). The critical edge in this new take on terrorism studies should thereby bring deliverance from the dominant discourse in which terrorism studies serves as a legitimizing tool for oppressive actions conducted by hegemonic states. <u>There are</u>, however, some <u>flaws in this argument</u>. Firstly, Blakeley seems to suggest a bifurcation between a political use embedded in a specific set of structures that empower few, silence many and blame specific non-state actors, and an analytical view that would allow a 'fairer' approach to the analysis of terrorism. She says for instance: 'This means that rather than taking a literal approach to the study of terrorism and then seek instances of the phenomenon to try and determine causes and remedies' (p. 230), we end up with utilizing the terrorism label to further specific state-centric interests and shape security discourses in an advantageous way for the powerful. An analytical rather than political use, she argues, promises a more even – one might even say neutral – basis from which all instances that fit into a 'reasonable' definition of terrorism can be equally addressed (p. 229). Apart from the obvious question of whether and <u>how such an analytical use based on a 'reasonable' definition is achievable, it will certainly not fit well into a critical approach, even when broadly conceptualized.</u> This is because <u>Critical Theory has generally understood itself as a counter-movement to the abstract systematizations of German idealism in its various forms and has objected most strongly against a practical (political, social) and theoretical (abstract analytical) split of human existence</u>. Intuitively, then, Blakeley's call for an analytical use of the term 'terrorism' seems hard to combine with the overall critical outlook that CTS is proposing. Apart from these potential compatibility problems<u>, Blakeley contradicts herself in her pursuit of this analytical use.</u> Only one paragraph after proposing the necessity for critical scholars to reclaim terrorism and use it as an analytical tool within a Critical Theory oriented approach, <u>she states that such an endeavour should be pursued 'with the specific, normative aim of offering suggestions for the emancipation of people in the South from the oppressive practices of Northern powers'</u> (p. 234). <u>Emancipating oppressed people in the South</u>, as laudable as it sounds, <u>is of course a political aim in itself</u>. If CTS takes this as a central concern, however, and the emphasis on emancipation in almost all instances of T. Michel and A. Richards scholarship in this young field suggests it does, <u>then we encounter here a politicization of the terrorism label yet again, this time projected against the global hegemonic North, but nevertheless political</u>. So, we are left somewhat puzzled as to how reclaiming terrorism analytically and thereby overcoming its political abuse can be meaningfully combined with a clear and overt political agenda exhibited in CTS scholarship itself. <u>It seems fair to suggest that given the way that terrorism is used in various language-games in the international arena, a political use is unavoidable in one form or another</u> (Jackson 2007, p. 247). But <u>why then veil this political proclivity in a scholarly jargon that suggests a de-politicization and analytical revival of the term 'terrorism'?</u> On the definition itself, terrorism is surely a method that has been used by a wide variety of actors. There is nothing new in Jackson's (2007, p. 248) proclamation that we need an actor-free definition of terrorism. Such definitions have been put forward by so-called 'orthodox' terrorism scholars for many years (Schmid and Longman 1998). Of course, the terrorism perpetrated by states should not be excluded from any definition (nor should terrorism carried out by any actor) but this is not a new or contemporary revelation. <u>A perpetrator based definition is indeed not only unhelpful but it is also misses the key point that terrorism is first and foremost a method and as such no perpetrator is excluded, be they states, social movements, guerrilla groups, terrorist groups and so on</u>. As Weinberg rightly observed the notion of 'one man's terrorist is another man's freedom fighter' is confusing the goal with the activity (Weinberg 2005, p. 2). <u>An actor-free definition that strives for neutrality might look something like the following: terrorism is a particular method of force or violence and/or the threat of force or violence that has been carried out by a wide range of actors (both</u>

state and non-state), that often targets civilians, is usually for a political purpose and is usually designed to have a psychological impact beyond the immediate victims. Such a definition is not the product of some new-found momentum towards bringing the 'state back into terrorism studies' but reflects what has always been the case (at least in modern times): that terrorism is a method that has been used by a variety of actors.

They have no criteria for making epistemological and ontological choices about terrorism.

Michel and Richards 9 (Torsten Michel and Anthony Richards, May 19th 2009, False dawns or new horizons? Further issues and challenges for Critical Terrorism Studies, Critical Studies on Terrorism Vol. 2, No. 3, December 2009, pp. 407-408, accessed 7/17/15) CH

Smith suggests that 'emancipation seems to be particularly helpful in thinking about September 11 because it forces us to think through the reasons for those undertaking the attacks as well as the complex question of how to respond' (Smith 2005, p. 43). A clear link is made between 9/11, emancipation and human insecurity (which entails the lack of the provision of 'food, shelter, education, health care etc.') (Smith 2005, p. 54). While anyone could reasonably argue that there is a link between economic underdevelopment and human insecurity, to take this further and suggest a link between human insecurity and terrorism is certainly more contentious. The literature on this issue has failed to establish such a link (and indeed, in general, argues against it) (Schmid 2004, pp. 65–66; also Krueger and Maleckova 2003). Terrorism has not, in the main, been the weapon of those in poverty (for example) but of those who aim to fulfil particular political and religious ideologies. Smith therefore makes something of a quantum leap: the apparent 'degree of support' from those in less developed countries who suffer from 'human insecurity' is suddenly and speculatively propelled as a 'possible cause of terrorism' (Smith 2005, pp. 54–55). While the lack of empirical research in terrorism studies has rightly been criticised, critical security studies and CTS are arguably even more culpable in this regard when such claims are made based upon little empirical evidence. On a more abstract level it also seems unclear what the commitment to emancipation in CTS actually signifies. The term is used without any substantial clarification as to its conceptual and practical content. This seems especially troubling as Critical Theory itself is characterised by a variety of conceptualisations regarding not only the content of emancipation but also the differing views as to the possibility of achieving and pursuing in a practical way an emancipatory agenda. In CTS such reflections, however, seem not to be of any particular concern. Rather, the emancipatory potential of human reflection and action is silently assumed to be not only possible but realisable. This is connected to an underlying commitment to a specific form of rationality (Rengger 1998, pp. 82–83) that allows for deducing the problem-laden structure of contemporary academic discourse in the area of terrorism studies and a subsequent prescription for a normative-practical agenda in which the 'emancipation' of mainly the 'global Downloaded by [University of California, Berkeley] at 08:23 15 July 2015 408 T. Michel and A. Richards South' takes a prime spot. Even a quick glance over the main contributions to Critical Theory over the last decades will reveal, however, that both the actual content of emancipation as well as the potential for its realisation are hotly debated. The range of propositions we can find in this respect span from an 'engaged withdrawal' in Adorno and Horkheimer, through to the pragmatist infused communicative action within existing liberal institutionalist structures in Habermas, to the emphasis on recognition as a precondition for 'healthy citizenship' in Axel Honneth (Chambers 2004, pp. 220–239).2 Each of these (and to be clear these are only three specific, through prominent, examples of Critical scholarship) presents a completely distinct representation of the content, aim and potential for the pursuit of emancipation. CTS scholars, for better or worse, cannot simply take 'emancipation' out of these contestations and either claim a deceptive transparency of meaning manifested in 'liberating people from all kinds of violence' or retreat into an anti-foundationalist stand in which 'the concrete content of emancipation cannot and need not be determined in the beginning'. With respect to the first option the questions of the supremacy of their critical ontology as well as the authority of their epistemology remain unresolved, and with respect to the second option, the question arises as to how an emancipatory agenda can be argued for and pursued without any preconception of its substance – thus, how do the self appointed emancipators know that they are in fact emancipating? It turns out that a normative aim (in this case liberating or emancipating or simply helping the oppressed of the world) is not a viable ground on which scholarship or action for that matter can be based. As we can learn from the large trajectory of Critical Theory, such a commitment comes with its shortcomings and flaws and any possibility of following Marx's dictum to change the world must first and foremost start with a self-reflective and

critical stand towards one's own theoretical and practical commitments. A simple desire to better the world and to unmask the abuse of power (as implicitly portrayed in current instances of terrorism scholarship) is not just an external exercise of 'speaking truth to power' but relies in its very possibility on a constant commitment to internal critique and a continuous perpetuation of the 'hermeneutics of suspicion', all of which right now seem dangerously absent in CTS scholarship. In this respect, we can recall Nick Rengger's recent citation of T. S. Elliot: 'The last temptation is the greatest treason: to do the right deed for the wrong reason' (Rengger 2008, p. 961; originally in Eliot 1938, p. 44.1)

AT: Identity

Structural Reform Key

Reform has to be methodologically based around structural reform -- not a purely identity based response

Wills 12 (David Barnard, Research Fellow in the Department of Informatics and Sensors at Cranfield University, "Surveillance and Identity: Discourse, Subjectivity, and the State," 2012, pg. 24-28)//ghs-VA

<u>Resistance to Surveillance</u> There is a rich emerging literature on resistance to surveillance, which Lyon positions as an important corrective to the dystopian trends in surveillance research (2007:160). Much of this research necessarily involves paying attention to subjects of surveillance, their experience and activities. Lyon identifies a number of caveats when considering resistance to surveillance: firstly that <u>surveillance is ambiguous, it is not a purely negative phenomenon</u>, secondly that <u>surveillance is complex, with different institutions or perspectives playing a large part in the specific politics of surveillance</u>. Thirdly, that surveillance technology is not infallible (Lyon 2007:162). In analyzing surveillance, we should be wary of taking the claims of those designing or promoting surveillance technologies and practices as social fact, although intentions of technologists are important. Marx suggests that the existence of a potential for surveillance does not mean that this surveillance occurs, and that much of the reason for this is resistance of various types (Marx 2003:294). These three factors affect the way that surveillance is complied with, negotiated, and resisted. As the converse of resistance, surveillance is frequently complied with for reasons of: the widespread presence of surveillance practices, that many practices are taken for granted, that we are unaware of many surveillance practices, and that many systems are accepted as legitimate and necessary (Lyon 2007:164). Resistance can range from ad hoc and individual, (avoiding CCTV cameras by walking a different route) to organized and collective (joining a group to campaign against the introduction of identity cards), instrumental or non-instrumental, direct or strategic. Marx presents a typology of eleven forms of resistance to surveillance These include discovery, avoidance, piggy-backing, switching, distorting, blocking, masking (identification), breaking, refusal, cooperative and counter-surveillance moves (Marx 2003). These moves can be contrasted with explicitly political strategies to remove surveillance systems and practices through democratic political process or direct action. Work in political theory on resistance to surveillance often tends to take the form of analyses of privacy and practices of the regulation of personal data, emphasizing the individual, owned nature of privacy rather than collective or social resistance. Sociology has also contributed research into the experiences of the subject under surveillance. Insights have been drawn from the work of Goffman on the presentation of self (Goffman 1990). including the social work done by individuals to present an appropriate public face to other members of their social group. Additionally there are accounts drawing upon phenomenological and psychological approaches focusing on differing degrees of scopophobia and scopophillia (the fear and love of being watched) (Jay 1994). Many analyses of resistance to surveillance emerge from this level of analysis, focusing on the experience of the individual under surveillance (Ball & Wilson 2000; Koskela 2006; Matheson 2009). as do many of the artistic contributions to a cultural understanding of surveillance practices (Levin et al. 2002; MeGrath 2004). Lyon argues an important part of understanding resistance to surveillance is the subjectivities of those resisting surveillance, especially the alternate identities which can be mobilized against imposed and attributed surveillant representations (Lyon 2007:67). There is a politics of resistance associated with (he subject's own understanding of their identity or identities and interaction with the data double. <u>Another important question involves the connection between individual and collective responses</u> - understanding the ways in which individual resistance acts become taken up in collective and organized ways (Marx 2003:304). Monahan is concerned that <u>current modes of activism tend to **leave institutions, policies and cultural assumptions supportive of surveillance in place** because of their focus upon individualistic resistance to specific instances of surveillance</u> (Monahan 2006a: 1). Sieve Mann (Mann 2002) has popularised the practice and concept of sous-veillance, watching 'from below" in which surveillance technologies are turned upon those in power. Mann has built and advocated wearable cameras to facilitate this. This approach suffers from simple binary models of power, in which 'the powerful" do surveillance, and the less powerful are surveilled. Surveillance is not automatically effective in supporting the ends to which it is put. <u>Sousveillance is</u> therefore best understood as <u>surveillance that is being used to draw attention to power relations</u> (of surveillance) <u>and as a type of consciousness raising activity</u>. There is nothing wrong with this, but to assume the automatic success (or subversiveness) of sousveillance is to perpetuate some of the myths about the automatic functioning of surveillance and visual power. Photojournalists have long realised that <u>simply documenting or creating an image of some immoral or harmful practice is **not sufficient** to bring about its end</u>. Mann argues that photographing low level clerks in department stores1 is an effective way of getting to speak with the manager. This misses that the clerk is already likely under surveillance by in-store CCTV system. Surveillance, as we have seen is not simply an up/down binary Mann's form of resistance is also not available to all, being based upon technological literacy, but also on social capital. <u>Rose identifies a problem with identity based responses to surveillance</u>. He argues <u>experience of the actuarial processes of contemporary surveillance practices **does not produce collective identities** in the same way as the collective experience of</u> workplace <u>exploitation or</u>

racism (Rose 1999:236). Anticipating the same impediments, Ogura provides a potential solution to this problem. He suggests that "identity politics" should be drastically transformed. Rather than attempting to 'establish the collective identity of social minority groups against cultural, ideological or political integration or affiliation by social groups' he points in the direction of a "de-convergent politics' able to resist methodological individualism and biological determinism he sees as present in information technology identity systems. Whilst he acknowledges that we have not yet seen such a social movement or politics based on identity, he identifies "criminal* identity activity, such as fake ID cards and identity theft as manifestations of a surveillance orientated society's focus on methodological individualism and biological determinants of identity (such as biometrics). He predicts the possibility of a politics based around self-determination of identity, potentially associated with the (non-criminal) use of multiple identities, collaborative identities or anonymity (Ogura 2006). If the exploitation of identity expands and deepens, resistance against it to achieve self determination rights of who 'is' will also follow. In the very near future, we may grab hold of an alternative identity politics based on an identity of identities that is against identity exploitation. (Ogura 2006:292) Brian Martin suggests that a sense of unfairness is not inherent in the act of surveillance, but rather people's sense of unfairness is subject to a continual struggle between interests. He places privacy campaigners on one side, trying to increase a sense of concern about surveillance, with surveillance purveyors on the other side. This suggests that motivations for resistance come from understanding and evaluation of the practice of surveillance, as well as the meaning of fairness, the possibility of resistance, subject positions and political alternatives, all of which are contested discursively. One of the key elements of interpretative struggles is language (Martin 2010) Aaron Martin, Rosamunde Van Brakel and Daniel Bernhard conducted an insightful review of the literature on resistance in international relations, social psychology, information systems and education, to counter a tendency in surveillance studies accounts to focus exclusively on the resistance relationship between the surveyor and the surveilled. They address an assumption that the resisting actor, is an autonomous agent capable of interaction with technology and observers, resistance emerging because surveillance is recognised and rejected. They also find this binary in the sousveillance literature. They find instead that resistance is multiple and rhizomatic, and that many actors beyond the surveillance subject are capable of resistance. This includes powerful actors seeking to prevent other resistance, and. drawing upon information systems perspectives, technologies themselves. They find that resistance is not an unavoidable consequence of surveillance, but the result of interpreting surveillance as overbearing, and that this representation is dependent upon specific relational histories of the actors involved, including the content of previous interactions. The ability of an actor to resist, the ways they resist and the actors at whom their resistance is directed are determined in large part by the power relations of the resisting actor to others as well as by the context. (Martin et al. 2009:226) From education contexts they draw the insight that not all authority is resisted, and that authority can be allowed if it is perceived as legitimate and just. On the other hand, resistance is problematic if there is no clearly identifiable figure of dominance. They also identify the way that structural roles affect resistance, showing how different actors are likely to resist at different stages of a technology development and introduction lifecycle. For Martin et al, understanding resistance to surveillance requires understanding the context, roles and relationships of various actors. We can expand this account by suggesting these shared histories and contexts also depend upon conventional representations of the world, and of the structures of legitimate and illegitimate power. Roles are not just structural but are subjective.

AT: Cuomo/Positive Peace

Extinction outweighs and turns structural violence

Matheny 7 – (Jason, Department of Health Policy and Management, Bloomberg School of Public Health, Johns Hopkins University, "Reducing the Risk of Human Extinction," Risk Analysis, Vol 27, No 5) CMR

We may be poorly equipped to recognize or plan for extinction risks (Yudkowsky, 2007). We may not be good at grasping the significance of very large numbers (catastrophic outcomes) or very small numbers (probabilities) over large timeframes. We struggle with estimating the probabilities of rare or unprecedented events (Kunreuther et al., 2001). Policymakers may not plan far beyond current political administrations and rarely do risk assessments value the existence of future generations.18 We may unjustifiably discount the value of future lives. Finally, extinction risks are market failures where an individual enjoys no perceptible benefit from his or her investment in risk reduction. Human survival may thus be a good requiring deliberate policies to protect. It might be feared that consideration of extinction risks would lead to a reductio ad absurdum: we ought to invest all our resources in asteroid defense or nuclear disarmament, instead of AIDS, pollution, world hunger, or other problems we face today. On the contrary, programs that create a healthy and content global population are likely to reduce the probability of global war or catastrophic terrorism. They should thus be seen as an essential part of a portfolio of risk-reducing projects. Discussing the risks of "nuclear winter," Carl Sagan (1983) wrote: Some have argued that the difference between the deaths of several hundred million people in a nuclear war (as has been thought until recently to be a reasonable upper limit) and the death of every person on Earth (as now seems possible) is only a matter of one order of magnitude. For me, the difference is considerably greater. Restricting our attention only to those who die as a consequence of the war conceals its full impact. If we are required to calibrate extinction in numerical terms, I would be sure to include the number of people in future generations who would not be born. A nuclear war imperils all of our descendants, for as long as there will be humans. Even if the population remains static, with an average lifetime of the order of 100 years, over a typical time period for the biological evolution of a successful species (roughly ten million years), we are talking about some 500 trillion people yet to come. By this criterion, the stakes are one million times greater for extinction than for the more modest nuclear wars that kill "only" hundreds of millions of people. There are many other possible measures of the potential loss—including culture and science, the evolutionary history of the planet, and the significance of the lives of all of our ancestors who contributed to the future of their descendants. Extinction is the undoing of the human enterprise. In a similar vein, the philosopher Derek Parfit (1984) wrote: I believe that if we destroy mankind, as we now can, this outcome will be much worse than most people think. Compare three outcomes: 1. Peace 2. A nuclear war that kills 99% of the world's existing population 3. A nuclear war that kills 100% 2 would be worse than 1, and 3 would be worse than 2. Which is the greater of these two differences? Most people believe that the greater difference is between 1 and 2. I believe that the difference between 2 and 3 is very much greater . . . . The Earth will remain habitable for at least another billion years. Civilization began only a few thousand years ago. If we do not destroy mankind, these thousand years may be only a tiny fraction of the whole of civilized human history. The difference between 2 and 3 may thus be the difference between this tiny fraction and all of the rest of this history. If we compare this possible history to a day, what has occurred so far is only a fraction of a second. Human extinction in the next few centuries could reduce the number of future generations by thousands or more. We take extraordinary measures to protect some endangered species from extinction. It might be reasonable to take extraordinary measures to protect humanity from the same.19 To decide whether this is so requires more discussion of the methodological problems mentioned here, as well as research on the extinction risks we face and the costs of mitigating them.20

Their conception of violence is reductive and can't be solved

Boulding 77¶ Twelve Friendly Quarrels with Johan Galtung¶ Author(s): Kenneth E. Boulding Reviewed work(s): Source: Journal of Peace Research, Vol. 14, No. 1 (1977), pp. 75-86 Published ¶ Kenneth Ewart Boulding (January 18, 1910 – March 18, 1993) was an economist, educator, peace activist, poet, religious mystic, devoted Quaker, systems scientist, and interdisciplinary philosopher.[1][2] He was cofounder of General Systems Theory and founder of numerous ongoing intellectual projects in economics and social science. ¶ He graduated from Oxford University, and was granted United States citizenship in 1948. During the years 1949 to 1967, he was a

faculty member of the University of Michigan. In 1967, he joined the faculty of the University of Colorado at Boulder, where he remained until his retirement.

Finally, we come to the great Galtung metaphors of 'structural violence' 'and 'positive peace'. They are metaphors rather than models, and for that very reason are suspect. Metaphors always imply models and metaphors have much more persuasive power than models do, for models tend to be the preserve of the specialist. But when a metaphor implies a bad model it can be very dangerous, for it is both persuasive and wrong. The metaphor of structural violence I would argue falls right into this category. The metaphor is that poverty, deprivation, ill health, low expectations of life, a condition in which more than half the human race lives, is 'like' a thug beating up the victim and 'taking his money away from him in the street, or it is 'like' a conqueror stealing the land of the people and reducing them to slavery. The implication is that poverty and its associated ills are the fault of the thug or the conqueror and the solution is to do away with thugs and conquerors. While there is some truth in the metaphor, in the modern world at least there is not very much. Violence, whether of the streets and the home, or of the guerilla, of the police, or of the armed forces, is a very different phenomenon from poverty. The processes which create and sustain poverty are not at all like the processes which create and sustain violence, although like everything else in 'the world, everything is somewhat related to everything else. There is a very real problem of the structures which lead to violence, but unfortunately Galitung's metaphor of structural violence as he has used it has diverted attention from this problem. Violence in the behavioral sense, that is, somebody actually doing damage to somebody else and trying to make them worse off, is a 'threshold' phenomenon, rather like the boiling over of a pot. The temperature under a pot can rise for a long time without its boiling over, but at some 'threshold boiling over will take place. The study of the structures which underlie violence are a very important and much neglected part of peace research and indeed of social science in general. Threshold phenomena like violence are difficult to   study because they represent 'breaks' in the systenm rather than uniformities. Violence, whether between persons or organizations, occurs when the 'strain' on a system is too great for its 'strength'. The metaphor here is that violence is like what happens when we break a piece of chalk. Strength and strain, however, especially in social systems, are so interwoven historically that it is very difficult to separate them. The diminution of violence involves two possible strategies, or a mixture of the two; one is Ithe increase in the strength of the system, 'the other is the diminution of the strain. The strength of systems involves habit, culture, taboos, and sanctions, all these 'things which enable a system to stand lincreasing strain without breaking down into violence. The strains on the system 'are largely dynamic in character, such as arms races, mutually stimulated hostility, changes in relative economic position or political power, which are often hard to identify. Conflicts of interest 'are only part 'of the strain on a system, and not always the most important part. It is very hard for people ito know their interests, and misperceptions of 'interest take place mainly through the dynamic processes, not through the structural ones. It is only perceptions of interest which affect people's behavior, not the 'real' interests, whatever these may be, and the gap between percepti'on and reality can be very large and resistant to change. However, what Galitung calls structural violence (which has been defined 'by one unkind commenltator as anything that Galitung doesn't like) was originally defined as any unnecessarily low expectation of life, on that assumption that anybody who dies before the allotted span has been killed, however unintentionally and unknowingly, by somebody else. The concept has been expanded to include all 'the problems of poverty, destitution, deprivation, and misery. These are enormously real and are a very high priority for research and action, but they belong to systems which are only peripherally related to 'the structures whi'ch produce violence. This is not rto say that the cultures of violence and the cultures of poverty are not sometimes related, though not all poverty cultures are cultures of violence, and certainly not all cultures of violence are poverty cultures. But the dynamics lof poverty and the success or failure to rise out of it are of a complexity far beyond anything which the metaphor of structural violence can offer. While the metaphor of structural violence performed a service in calling attention to a problem, it may have d'one a disservice in preventing us from finding the answer.

The status quo is structurally improving

Indur **Goklany 10**, policy analyst for the Department of the Interior – phd from MSU, "Population, Consumption, Carbon Emissions, and Human Well-Being in the Age of Industrialization (Part III — Have Higher US Population, Consumption, and Newer Technologies Reduced Well-Being?)", April 24, http://www.masterresource.org/2010/04/population-consumption-carbon-emissions-and-human-well-being-in-the-age-of-industrialization-part-iii-have-higher-us-population-consumption-and-newer-technologies-reduced-well-being/#more-9194

In my previous post I showed that, notwithstanding the Neo-Malthusian worldview, human well-being has advanced globally since the start of industrialization more than two centuries ago, despite massive increases in population, consumption, affluence, and carbon dioxide emissions. In this post, I will focus on long-term trends in the U.S. for these and other indicators. Figure 1 shows that despite several-fold increases in the use of metals and synthetic organic chemicals, and emissions of CO2 stoked by increasing populations and affluence, life expectancy, the single best measure of human well-being, increased from 1900 to 2006 for the US. Figure 1 reiterates this point with respect to materials use. These figures indicate that since 1900, U.S. population has quadrupled, affluence has septupled, their product (GDP) has increased 30-fold, synthetic organic chemical use has increased 85-fold, metals use 14-fold, material use 25-fold, and CO2 emissions 8-fold. Yet life expectancy advanced from 47 to 78 years. Figure 2 shows that during the same period, 1900–2006, emissions of air pollution, represented by sulfur dioxide, waxed and waned. Food and water got safer, as indicated by the virtual elimination of deaths from gastrointestinal (GI) diseases between 1900 and 1970. Cropland, a measure of habitat converted to human uses — the single most important pressure on species, ecosystems, and biodiversity — was more or less unchanged from 1910 onward despite the increase in food demand. For the most part, life expectancy grew more or less steadily for the U.S., except for a brief plunge at the end of the First World War accentuated by the 1918-20 Spanish flu epidemic. As in the rest of the world, today's U.S. population not only lives longer, it is also healthier. The disability rate for seniors declined 28 percent between 1982 and 2004/2005 and, despite quantum improvements in diagnostic tools, major diseases (e.g., cancer, and heart and respiratory diseases) now occur 8–11 years later than a century ago. Consistent with this, data for New York City indicate that — despite a population increase from 80,000 in 1800 to 3.4 million in 1900 and 8.0 million in 2000 and any associated increases in economic product, and chemical, fossil fuel and material use that, no doubt, occurred —crude mortality rates have declined more or less steadily since the 1860s (again except for the flu epidemic). Figures 3 and 4 show, once again, that whatever health-related problems accompanied economic development, technological change, material, chemical and fossil fuel consumption, and population growth, they were overwhelmed by the health-related benefits associated with industrialization and modern economic growth. This does not mean that fossil fuel, chemical and material consumption have zero impact, but it means that overall benefits have markedly outweighed costs. The reductions in rates of deaths and diseases since at least 1900 in the US, despite increased population, energy, and material and chemical use, belie the Neo-Malthusian worldview. The improvements in the human condition can be ascribed to broad dissemination (through education, public health systems, trade and commerce) of numerous new and improved technologies in agriculture, health and medicine supplemented through various ingenious advances in communications, information technology and other energy powered technologies (see here for additional details). The continual increase in life expectancy accompanied by the decline in disease during this period (as shown by Figure 2) indicates that the new technologies reduced risks by a greater amount than any risks that they may have created or exacerbated due to pollutants associated with greater consumption of materials, chemicals and energy, And this is one reason why the Neo-Malthusian vision comes up short. It dwells on the increases in risk that new technologies may create or aggravate but overlooks the larger — and usually more certain — risks that they would also eliminate or reduce. In other words, it focuses on the pixels, but misses the larger picture, despite pretensions to a holistic worldview.

War turns structural violence

Bulloch 8

Millennium - Journal of International Studies May 2008 vol. 36 no. 3 575-595

Douglas Bulloch, IR Department, London School of Economics and Political Science.

He is currently completing his PhD in International Relations at the London School of Economics, during which time he spent a year editing Millennium: Journal of International Studies

But **the idea that poverty and peace are directly related presupposes that wealth inequalities are** – in and of themselves – **unjust, and that the solution to the problem of war is to alleviate** the injustice that inspires conflict, namely **poverty.** However, it also suggests that poverty is a legitimate inspiration for violence, otherwise there would be no reason to alleviate it in the interests of peace. It has become such a commonplace to suggest that poverty and conflict are linked that **it rarely suffers any examination**. To suggest **that war causes poverty is** to utter **an obvious truth, but** to suggest **the opposite is** – on reflection – **quite hard to believe. War is an expensive business** in the twenty-first century, **even asymmetrically.** And just to examine Bangladesh for a moment is enough at least to raise the question concerning the actual connection between peace and poverty. The government of Bangladesh is a threat only to itself, and despite 30 years of the Grameen Bank, Bangladesh remains in a state of incipient civil strife. So although Muhammad Yunus should be applauded for his work in demonstrating the efficacy of micro-credit strategies in a context of development, it is not at all clear that this has anything to do with resolving the social and political crisis in Bangladesh, nor is it clear that this has anything to do with resolving **the problem of peace and war** in our times. It does speak to the Western liberal mindset – as Geir Lundestad acknowledges – but then perhaps this exposes the extent to which **the Peace Prize itself has simply become** an award that reflects a degree of **Western liberal wish-fulfilment**. **It is** perhaps **comforting to believe that poverty causes violence, as it serves to endorse** a particular kind of concern for the developing world that in turn regards **all problems as** fundamentally **economic rather than** deeply – and potentially radically – **political.**

We indict their methodology – the desirability of positive peace is unverifiable

Paris '1

ASSISTANT PROF OF POLITICAL SCIENCE @ UNIVERSITY OF COLORADO BOULDER (ROLAND, INTERNATIONAL SECURITY, FALL)

For those who study, rather than practice, international politics, the task of transforming the idea of human security into a useful analytical tool for scholarly [End Page 92] research is also problematic. Given the hodgepodge of principles and objectives associated with the concept, it is far from clear what academics should even be studying. **Human security seems capable of supporting virtually any hypothesis-- along with its opposite--depending on the prejudices** and interests of **the** particular **researcher**. Further, **because the concept of human security encompasses both physical security and more general notions of** social, economic, cultural, and psychological **well-being, it is impractical to talk about certain socioeconomic factors "causing" an increase or decline in human security**, given that these factors are themselves part of the definition of human security. **The study of causal relationships requires a degree of analytical separation that the notion of human security lacks**. 21

Turn: Positive peace undercuts the ability to discriminate between aggressors and victims of organized violence

Khong '1

SENIOR RESEARCH ADVISOR @ INSTITUTE OF DEFENCE AND STRATEGIC STUDIES (YUEN FOONG, GLOBAL GOVERNANCE, VOL. 7)

A strong case for taking human security seriously is its assumed impact on international peace and security. As Axworthy puts it, "**Human security puts people first** and recognizes that their safety is integral to the promotion and maintenance of international peace and security." However, how valid is this generalization? **One problem with this causal generalization is its reluctance to make distinctions between people. Are there certain people who forfeit their right to protection because of their** direct or indirect **actions**? **Would it not be foolhardy to put the safety of** Slobodan **Milosevic and his supporters on par with** that of the **Bosnian Muslims**? The former threatened not only the security of the latter but the peace and stability of the entire Balkans. NATO's bombing of Serbia suggests that states seldom do what the human security agenda recommends. NATO put itself and its organizational credibility first and the plight of the Kosovars second. By bombing Serbia, NATO sought to undermine the safety of the Se rbs and to force Serbian leaders to cease their policy of ethnic cleansing. This example suggests that **the human security approach is far too universalistic**. Like the earlier criticism of its inability to prioritize threats, **it is also unable to discriminate among people**. Thus, the approach's universalism robs it of much of its productive policy content.

Turn: Positive peace undermines stability – it reject necessary measures of insecurity that are needed for the greater good

Khong '1

SENIOR RESEARCH ADVISOR @ INSTITUTE OF DEFENCE AND STRATEGIC STUDIES (YUEN FOONG, GLOBAL GOVERNANCE, VOL. 7)

The assumption that "putting people and their safety first brings peace" can also be questioned from a second, related perspective. Is not the real issue how much of our safety we are willing to trade off for how much peace? Consider the case of nuclear deterrence and its contribution to general peace and security during the Cold War. In the 1950s and 1960s, Americans and Russians lived under the constant fear of nuclear war while their leaders continued to build weapons with more powerful and versatile warheads. U.S. schools held drills where students ducked under their desks in anticipation of a nuclear explosion nearby. From the human security perspective, this psychological terror should be addressed by eliminating nuclear weapons. Would the elimination of nuclear weapons contribute to greater peace among nations? Nuclear deterrence, however insecure it made individuals and states, has been critical in maintaining general peace. **The alleviation of human insecurity does not necessarily mean greater peace and security. As the nuclear deterrence example shows, some measure of human psychological insecurity may be necessary for maintaining peace**.

We have to solve large-scale violent conflicts before we can focus on everyday forms of violence – they're a barrier to peace

Goldstein '01

PROF OF INTERNATIONAL RELATIONS @ AMERICAN UNIV (JOSHUA, WAR AND GENDER, P. 412)

First, peace activists face a dilemma in thinking about causes of war and working for peace. Many peace scholars and activists support the approach, "if you want peace, work for justice." Then, if one believes that sexism contributes to war one can work for gender justice specifically (perhaps among others) in order to pursue peace. This approach brings strategic allies to the peace movement (women, labor, minorities), but rests on the assumption that injustices cause war. **The evidence** in this book **suggests that causality runs at least as strongly the other way. War is not a product of capitalism, imperialism, gender, innate aggression, or any other single cause**, although all of these influence wars' outbreaks and outcomes. Rather, **war has** in part **fueled and sustained these and other injustices**. 9 So," **if you want peace, work for peace**." Indeed, **if you want justice** (gender and others), **work for peace**. Causality does not run just upward through the levels of analysis, from types of individuals, societies, and governments up to war. It runs downward too. Enloe suggests that changes in attitudes towards war and the military may be the most important way to "reverse

women's oppression." The dilemma is that peace work focused on justice brings to the peace movement energy, allies, and moral grounding, yet, in light of this book's evidence, **the emphasis on injustice** as the main cause of war **seems** to be **empirically inadequate**.

Turn: National security is a prerequisite for positive peace – case comes first

Luck '2

PROF OF INTERNATIONAL AND PUBLIC AFFAIRS @ COLUMBIA (EDWARD C., GLOBAL GOVERNANCE, JANUARY)

In this respect, it should be recognized that **the recent emphasis on human security**, though welcome, **cannot be** conceptually or operationally **divorced from the parallel pursuit of national security**. **The latter may not be a sufficient** condition **to ensure the former, but it tends to be** a **NECESSARY** one. **Secure states**, it appears, **are less likely to abuse their citizens** or to permit others to do so than are insecure ones. **In an age of** intrastate and transnational **conflicts in which civilian casualties are abhorrently high**, **it is** generally **where states are weakest that human security is most gravely threatened**. In most cases, the first steps toward restoring human security will involve rebuilding or reshaping national institutions so that they are more capable, democratic, inclusive, responsive, transparent, and tolerant. Both international institutions and transnational civil society can play important supporting parts in these efforts--but again as supplements, not substitutes, for the state. For one thing, they can begin by acknowledging the need for stronger, not weaker, states. An underappreciation of the centrality of the state has also encouraged exaggerated rhetoric about the capacities and purposes of international organization and of civil society, as well as about the nature of their relationship. Most serious students of international organization, myself included, are also its advocates. As such, we need to take care not to confuse what we are seeking with what we are assessing. In our fascination with what is new in the world, we must not neglect the enduring importance of what is not. Nonstate actors matter, for example, largely because of the ways they influence the priorities and behavior of states. Likewise, international institutions play a critical role in many fields today precisely because we are still in the midst of the nation-state era. In a time of weapons of mass destruction and of economic globalization, the capacity of states for good or ill is such that the moderating influences of transnational civil society, global norms, and international organization ca n sometimes make a critical difference. But they cannot substitute for the state or for the domestic political processes that ultimately determine its policy choices. The powers of nonstate actors are derivative, their operational capacities limited, and their legitimacy compromised by their lack of accountability, sovereignty, and democratic structures.

AT: Complexity K

Our scenario planning is an essential part of the creative process that is called for by complexity and is essential to communication and mobilizing collective action while disrupting deterministic thinking

McDaniel 2k3

(Reuben R. Chair in Health Care Management at UT-Austin with Michelle E. Jordan-Elementary School Teacher; Brigitte F. Fleeman-Research Associate in Educational Psychology at UT-Austin. "Surprise, Surprise, Surprise! A Complexity Science View of the Unexpected" Health Care Management Review July/Sept 2003)

Scenario Planning **Scenario planning often is used to whittle down possible futures to the most likely, to try and conceive of and develop scenarios that actually could happen**.[65,66] The assumption is that ''everyone working in health care must be able to predict the future in order to prepare for it.''[67(p.43)] **Thinking about the future is important in CAS** but thinking should not be based on confidence that you can predict the future and, therefore, be ready for it. Scenario planning should be about learning how to think in the face of unexpected events—not about learning what to expect. The success of scenario planning is not a function of how well you have predicted possible futures, but of how well you practice dealing with the unexpected. **Scenario planning hones the skills of adapting to surprises and the unexpected**. **We don't know what is going to happen** in the future, **but still we must act. Scenario planning can help facilitate collective mobilization**[68] **by enhancing communication** through common **vocabulary, sharing views, and a wide appreciation of the significant influence of events** outside the manager's control.[67] **Scenario planning can force managers to confront uncertainty by giving them several different future outlooks**,[69] **helping them visualize a broader world of possibilities**, **and sparking creative, ''what-if'' thinking.** [66] **Flexible strategic responses need to be developed**. **In appropriately done scenario planning, ''unspoken assumptions about the future are surfaced, mental models are challenged, and more often than not, the blinders to creativity and resourcefulness are lifted**.''[66(p.71)]

Complexity theory has zero validity as a means of interpreting real world events. Lack of empirical observations means complexity cannot interpret our social reality or improve policy making

Rosenhead, 98

(Jonathan, Professor London School of Economics, Complexity theory and management practice, http://human-nature.com/science-as-culture/rosenhead.html [1/2512])

It hardly needs saying that **there is no formally validated evidence demonstrating that the complexity theory-based prescriptions** for management style, structure and process do produce the results claimed for them. These results are generally to do with long-term survival, a phenomenon not susceptible to study using short-term experimental methods. **Such evidence as is adduced is almost exclusively anecdotal in character**. The stories range from improving tales of successful corporate improvisation, to longer accounts of organisational death wishes or of innovation which bypasses the obstruction of the formal hierarchy; there are also approving quotations from business leaders. **The problem with anecdotal evidence is that it is most persuasive to those who experienced the events in question, and to those who are already**

persuaded. For others it can be hard to judge the representativeness of the sample of exhibits. This is especially so if, even unintentionally, different standards of proof or disproof are used for different sides of an argument. Such distortions do occur in Stacey (1992). Thus the advantage of opportunistic policies is supported by presenting examples of success, while the perils of formal planning methods are driven home by examples of failure. Yet obviously opportunism has its failures, and analytic techniques even have their modest achievements – which are not cited. In the absence of a conclusive case based on evidence of organisational success, it is not surprising that great weight is placed on the authority of science. Wheatley (1992) has it in her title – "Leadership and the New Science". Merry (1995) relegates it to his sub-title, but in the plural: "Insights from the New Sciences of Chaos, Self-Organization and Complexity". Indeed 'New Sciences', always capitalised, runs through his book like the message in Blackpool rock. However all management complexity authors lean heavily on 'science' in their texts. These are liberally peppered with phrases like "Scientific discoveries have shown that…" or "The science of complexity shows that…". The illustrative examples provided are commonly of natural rather than social or managerial phenomena – the behaviour of molecules when the temperature of liquid rises, a laser beam, the weather… This invocation of (natural) science comes out clearly in a passage on page 11 of Stacey (1996). A list of Nobel and other eminent scientists who have developed "the science of complexity" is presented. So far this science has "focused primarily on the evolution of life and the behavior of chemical and physical systems". However "it is not only to natural systems that this science applies; as I will show in Chapter One, we too constitute such systems". These systems which "we" also constitute are complex adaptive systems – precisely those to which the findings of the "new science" apply. Or do they? If we are to accept the argument from scientific authority there are a number of links in the argument. First we have to accept that the "findings" do actually apply to the natural systems which natural scientists have investigated. Then we have to accept that these findings can be generalised to all such systems. Then we have to accept that organisations (let us leave individual humans out of it) do constitute systems of the same kind. And then we have to accept that findings can be transferred across from one domain to a quite different one. This could be a long haul! We should start with the least problematic element – the solidity of those natural science results in their own domains. There are indeed a considerable number of findings which have passed stringent tests of scientific validity. (We should ignore any ultra-Popperian objections that all scientific results can only be provisional, a spur to refutation – or we will have no solid ground to stand on.) Stewart (1989) provides a good source of such examples – the weather (of course), ecological cycles, fluid dynamics, chemical clocks… Experiments are only possible in some cases, but in all observations of real world events fit patterns consistent with aspects of complexity theory. What follows from this is that complexity theory is a field within which some surprising and diverse results have been found, leading on to some further intriguing conjectures. What does not follow is that any such result necessarily applies to all situations which share some of its structural features (for example, mathematical structure). **Many of the 'results' cited in the complexity literature are not**, however, **firmly grounded** in this way **on empirical observations**. **They are the outputs of computer simulations. Typically some simple laws of behaviour and interaction are postulated,** and **the computer is used to see how the operations of these laws would translate into long-term developmen**t or macro-behaviour. For example Kauffman (1993, 1995) models how an organism might evolve through an 'adaptive walk' of mutations across available alternatives, depending on the degree of cross-coupling of the organism's component parts. Krugman (1996) shows how aggregate patterns of land use (eg the formation of multiple business districts, racial segregation) could result from individual responses to purely local conditions. Stacey (1996) reports a wide variety of simulations, mostly produced under the auspices of the Santa Fe Institute, in which simple rules of individual behaviour generate replications of the flocking of birds, the trail-laying of ants, the dynamics of organism-parasite systems…In each case the computer tracks the way in which such simple laws, if they were to hold, could produce patterned order. Evidently **such demonstrations,** absorbing though they may be, **cannot constitute proofs that these laws are indeed the cause of the observed behaviour**. Indeed Kauffman (1993) in the introduction to his 700 page volume, stresses that "this is not a finished book …Premises and conclusions stand open to criticism." Krugman (1996) adopts an informal approach, and allows himself to include "a few wild speculations". That is well and good – but it would be as well if the 'not proven' dimension of complexity theory was prominently acknowledged in this way by all those involved in extrapolating its results into new territory. Mittleton-Kelly (1997) recognises **a further need for circumspection** which **arises in essaying to transfer complexity theory formulations from the natural to the social domain**. **Behaviour in the former may be assumed to be governed by laws; in the latter, awareness of a claimed law may itself generate changed behaviour. In this crucial respect, social systems** (including organisations and their managements) **are fundamentally different from all other complex systems.** It can be seen from this that **scientific authority is an unsafe ground for asserting that specific results from complexity theory necessarily apply to organisations**, or that **complexity-based lessons** constitute imperatives for management practice. Krugman (1996), on the concluding page of his exploration of the relevance of complexity theory for economics, states "at this point I **have no recommendations to offer**." By contrast in the management complexity literature there is a tendency to make just such unwarranted statements – both generalisations and prescriptions. Both tendencies can be amply illustrated from a single work – Stacey (1992).

Complexity theory is unmerited and alienates the public – we need to focus on resolving short terms threats

Rosenhead, 98

(Jonathan, Professor London School of Economics, Complexity theory and management practice, http://human-nature.com/science-as-culture/rosenhead.html [1/2512])

This account of attempts to apply ideas from complexity theory to management practice has been broadly critical – critical of claims for the authoritative status of what would be better presented as stimulating metaphors. **It is indeed curious that a message based on the importance of accepting instability, uncertainty and the limits to our knowledge should be presented with such an excess of certainty**. The explanation for this paradox may lie in the twin heritage of management complexity. **The 'systems' community world-wide has been particularly prone to sectarianism and evangelism**, **while the audience** for management texts is conditioned to **expect large generalisations supported anecdotally**. It can be a heady mixture. **This conceptual imperialism is both unfortunate and unnecessary**.

Unfortunate **because some of those exposed to these ideas may reject them on grounds of over-selling**, **while others** (recall that complexity theory proper is far from transparent) **may be persuaded to place more reliance on the 'findings' than is merited**. Unnecessary, because management complexity has indeed generated metaphorically based insights which are novel and instructive. Many thoughtful managers of complex organisations in turbulent times will, I believe, appreciate them as an enrichment of their world-view. That is to say, they will recognise there features of the organisational world in which they operate, set within a framework which makes them both more understandable and more significant. Evidently any selection of 'added value' insights will depend on personal perspective. For me there are a number of plus points. Consider the handling of the long-term. Long-term planning has taken such a battering that the complexity-based view that it is impossible anyway can hardly classify as startling. However Stacey's extension of this critique to cover the view of 'strategy as vision' is a powerful antidote to much management writing. (I will continue to relate these comments principally to Stacey's work.) He makes a good case (Stacey 1992, pp 126-144) that a single vision to serve as intended organisational future, motivator of behaviour and guarantor of corporate cohesion is a thoroughly bad idea. It produces a culture of dependency, restricts the expression of conflicting views, and generates shared mental models tending towards groupthink. One must hope that this debunking of 'the vision thing' will prove influential. Not that the long-term is dismissed as an effective irrelevance. ==**What is proposed is a refocusing**==: rather than establish a future target and work back to what we do now to achieve it, the sequence is reversed. ==**We should concentrate on the significant issues which need to be handled in the short-term**, **and ensure that the debate about their long-term consequences is lively and engaged**==. Read in this way, the lesson of complexity theory is not to justify short-termism, but ==**to point towards a more practicable way of taking the future into account**==.

--Evaluating high-impact, low-probability events key to prevent catastrophe

Why is surprise the permanent condition of the U.S. political and economic elite? In 2007-8, when the global financial system imploded, the cry that no one could have seen this coming was heard everywhere, despite the existence of numerous analyses showing that a crisis was unavoidable. It is no surprise that one hears precisely the same response today regarding the current turmoil in the Middle East. The critical issue in both cases is the artificial suppression of volatility--the ups and downs of life--in the name of stability. It is both ==**misguided and dangerous to push unobserved risks further into the statistical tails of the probability distribution of outcomes and allow these high-impact, low-probability "tail risks" to disappear from policymakers' fields of observation**==. What the world is witnessing in Tunisia, Egypt, and Libya is simply what happens when highly constrained systems explode. ==Complex systems that have artificially suppressed volatility tend to become extremely fragile, while at the same time exhibiting no visible risks.== In fact, ==they tend to be too calm and exhibit minimal variability== as silent risks accumulate beneath the surface. Although the stated intention of political leaders and economic policymakers is to stabilize the system by inhibiting fluctuations, the result tends to be the opposite. These artificially constrained systems become prone to "Black Swans"--that is, they become extremely vulnerable to large-scale events that lie far from the statistical norm and were largely unpredictable to a given set of observers. ==**Such environments eventually experience massive blowups**, c==atching everyone off-guard and undoing years of stability or, in some cases, ending up far worse than they were in their initial volatile state. Indeed, the longer it takes for the blowup to occur, the worse the resulting harm in both economic and political systems. Seeking to restrict variability seems to be good policy (who does not prefer stability to chaos?), so it is with very good intentions that policymakers unwittingly increase the risk of major blowups. And it is the same misperception of the properties of natural systems that led to both the economic crisis of 2007-8 and the current turmoil in the Arab world. The policy implications are identical: ==**to make systems robust, all risks must be visible and out in the open**==--fluctuat nec mergitur (it fluctuates but does not sink) goes the Latin saying.

Complexity theory is too simplistic and results in inaction

Hendrick 9 (Diane; Department of Peace Studies – University of Bradford, "Complexity Theory and Conflict Transformation: An Exploration of Potential and Implications,"
June, http://143.53.238.22/acad/confres/papers/pdfs/CCR17.pdf)

It is still relatively early days in the application of complexity theory to social sciences and ¶ there are doubts and criticisms, either about the applicability of the ideas or about the ¶ expectations generated for them. It is true that the translation of terms from natural science to ¶ social science is sometimes contested due to the significant differences in these domains, and ¶ that there are concerns that the meanings of terms may be distorted, thus making their use ¶ arbitrary or even misleading. Developing new, relevant definitions for the new domain ¶ applications, where the terms indicate a new idea or a new synthesis that takes our ¶ understanding forward, are required. In some cases, particular aspects of complexity theory ¶ are seen as of only limited applicability, for example, self-organisation (see Rosenau's ¶ argument above that it is only relevant in systems in which authority does not play a role).¶ There are those who argue that much that is being touted as new is actually already known,¶ whether from systems theory or from experience, and so complexity theory cannot be seen as ¶ adding value in that way. There are also concerns that the theory has not been worked out in ¶ sufficient detail, or with sufficient rigour, to make itself useful yet. Even that it encourages ¶ woolly thinking and imprecision.¶ In terms of application in the field, it could be argued that it may lead to paralysis, in fear of ¶ all the unexpected things that could happen, and all the unintended consequences that could ¶ result, from a particular intervention. The proposed adaptability and sensitivity to emerging ¶ new situations may lead to difficulties in planning or, better expressed, must lead to a ¶ different conception of what constitutes planning, which is, in itself, challenging (or even ¶ threatening) for many fields. The criteria for funding projects or research may not fit ¶ comfortably with a complexity approach, and evaluation, already difficult especially in the ¶ field of conflict transformation, would require a re-conceptualisation. Pressure for results ¶ could act as a disincentive to change project design in the light of emergent processes. There ¶ may be the desire to maintain the illusion of control in order to retain the confidence of ¶ funders. On the other hand, there are fears that complexity may be used as an excuse for poor ¶ planning, and implementation, which is a valid concern for funders. In addition, there may be ¶ scepticism that the co-operation and co-ordination between different researchers or ¶ interveners, (let alone transdisciplinary undertakings) appropriate to working on complex ¶ problem domains, will not work due to differing mental models, competing interests and ¶ aims, competition for funding, prestige, etc. Such attempts appear, therefore, unrealistic or ¶ unfeasible.

AT: Terror K

Terrorism studies are epistemologically and methodologically valid---our authors are self-reflexive

Michael J. **Boyle '8**, School of International Relations, University of St. Andrews, and John Horgan, International Center for the Study of Terrorism, Department of Psychology, Pennsylvania State University, April 2008, "A Case Against Critical Terrorism Studies," Critical Studies On Terrorism, Vol. 1, No. 1, p. 51-64

Jackson (2007c) calls for the development of an explicitly CTS on the basis of what he argues preceded it, dubbed 'Orthodox Terrorism Studies'. The latter, he suggests, is characterized by: (1) its poor methods and theories, (2) its state centricity, (3) its problemsolving orientation, and (4) its institutional and intellectual links to state security projects. Jackson argues that the major defining characteristic of CTS, on the other hand, should be 'a skeptical attitude towards accepted terrorism "knowledge"'. **An implicit presumption from this is that terrorism scholars have laboured for all of these years without being aware that their area of study has an implicit bias, as well as definitional and methodological problems**. In fact, **terrorism scholars are not only well aware of these problems, but also have provided their own** searching **critiques** of the field at various points during the last few decades (e.g. Silke 1996, Crenshaw 1998, Gordon 1999, Horgan 2005, esp. ch. 2, 'Understanding Terrorism'). **Some of those scholars** most associated with the critique of empiricism implied in 'Orthodox Terrorism Studies' **have also engaged in deeply critical examinations of the nature of sources, methods, and data in the study of terrorism**. For example, Jackson (2007a) regularly cites the handbook produced by **Schmid and Jongman** (1988) to support his claims that theoretical progress has been limited. But this fact was well recognized by the authors; indeed, in the introduction of the second edition they **point out** that they have not revised their chapter on theories of terrorism from the first edition, because the **failure to address** persistent conceptual and **data problems** has undermined progress in the field. The point of their handbook was to sharpen and make more comprehensive the result of research on terrorism, not to glide over its methodological and definitional failings (Schmid and Jongman 1988, p. xiv). Similarly, **Silke's** (2004) **volume on the state of the field of terrorism research performed a similar function**, highlighting the shortcomings of the field, in particular the lack of rigorous primary data collection. **A non-reflective community of scholars does not produce such scathing indictments of its own work.**

Terror is a real threat driven by forces the aff can't resolve---we should reform the war on terror, not surrender---any terror attack turns the entire case

Peter **Beinart 8**, associate professor of journalism and political science at CUNY, The Good Fight; Why Liberals – and only Liberals – Can Win the War on Terror and Make America Great Again, vii-viii

APPLYING THAT TRADITION today is not easy. Cold war liberals devel- oped their narrative of national greatness in the shadow of a totalitarian ¶ superpower. Today, the United States faces no such unified threat. Rather, it faces a web of dangers—from disease to environmental degradation to weapons of mass destruction—all fueled by globalization, which leaves America increasingly vulnerable to pathologies bred in distant corners of the world. And at the center of this nexis sits jihadist terrorism, a new totalitarian movement that lacks state power but harnesses the power of globalization instead. ¶ Recognizing that the United States again faces a totalitarian foe does not provide simple policy prescriptions, because today's totalitarianism takes such radically different form. But it reminds us of something more basic, that liberalism does not find its enemies only on the right—a lesson sometimes forgotten in the age of George W. Bush. ¶ Indeed, it is because liberals so despise this president that they increasingly reject his trademark phrase, the "war on terror." Were this just a semantic dispute, it would hardly matter; better alternatives to war on terror abound. But the rejection signifies something deeper: a turn away from the very idea that anti-totalitarianism should sit at the heart of the liberal project. For too many liberals today, George W. Bush's war on terror is the only one they can imagine. This alienation may be understand- able, but that does not make it any less disastrous, for it is liberalism's principles—even more than George W. Bush's—that jihadism threatens. If today's liberals cannot rouse as much passion for fighting a movement that flings acid at unveiled women as they do for taking back the Senate in 2006, they have strayed far from liberalism's best traditions. And if they believe it is only George W. Bush who threatens America's freedoms, they should ponder what will happen if the United States is hit with a

<mark>nuclear</mark> or contagious biological <mark>attack</mark>. **No matter who is president**, Republican or Democrat, **the reaction will make John Ashcroft look like the head of the ACLU**.

--- AT: Root Cause

Solving the root causes of terrorism is impossible because of expansive jihadist demands---the aff's attempt at reconciliation collapses causes global violence

Peter **Beinart 8**, associate professor of journalism and political science at CUNY, The Good Fight; Why Liberals – and only Liberals – Can Win the War on Terror and Make America Great Again, 100-2

While different U.S. policies may be more or less important at differ- ent times, most experts agree that it is American actions ("what we do"), not American values ("who were are") that have made the United States the target of salafist jihad. While in his ideal world Bin Laden would cer- tainly like to see the United States ditch its barbaric culture and convert to Islam, that is low on his list of concerns. As he himself has pointed out, if Al Qaeda were offended primarily by the licentiousness Western societies practice at home, it would have attacked Sweden. ¶ The problem is that while salafists might theoretically leave the United States alone if we left them alone, their concerns are vast and their hostility to liberal values is profound. Salafism is not a universalist ideology in the way that Communism was. (That is not to say its devotees do not dream of a world completely under God's rule—they do—only that the cultural barriers preventing, say, an Argentinean from adopting the religion of Qutb are far greater than the barriers preventing him from adopting the religion of Marx.) But neither is salafism easy to avoid. Bin Laden has said the United States can escape "this ordeal" of terrorism if "it leaves the Arabian Peninsula, and stops its involvement in Palestine, and in all the Islamic world." Unfortunately, Zawahiri, his second in command, has defined the Islamic world as stretching from "Eastern Turkestan [Xinjiang, in western China] to Andalusia [Spain and Portugal]." Azzam has gone further, including among the territory that must be "returned to us so that Islam will reign again" sub- Saharan African countries like Chad, Eritrea, and Somalia and Asian nations like Burma and the Philippines. Salafists want to restore the caliphate that once ruled much of the Islamic world. But even at its eighth- century peak, the caliphate only stretched from In- dia to Spain. Under Al Qaeda's more expansive definition, it seems to include every country or region once under Muslim rule. To comply with those terms, the United States would have to **retreat** virtually **to the Western Hemisphere.** ¶ Needless to say, for the United States to withdraw from a swath of territory stretching from West Africa to Southeast Asia would constitute a **geostrategic revolution**. American power is the guarantor of last resort for the government of Pakistan, which has nuclear weapons, a volatile border with nuclear- armed India, and salafist elements in its security services. It plays the same role in Jordan and Egypt, the lynchpins of peace between Israel and the Arab world. And, of course, America protects the Saudi monarchy, whose kingdom sits atop one quarter of the world's proven oil reserves. As the Bush administration has rightly recognized, these relation- ships are unsustainable in their current form, and America's long-t erm safety requires that its clients evolve in a democratic direction, even if it means they prove less compliant. But were the jihadist movement to force the United States to withdraw its military, political, or economic influence ¶ from these crucial areas—producing governments with dramatically dif- ferent orientations—**the consequences for American security, the world economy, and regional peace could be grave**. ¶ And a withdrawal from the Muslim world would not only imperil American interests, it would also imperil American values. Al Qaeda may not hate us for "who we are"—unless "who we are" obligates us to oppose what might be called "religious cleansing," the violent purification of large swaths of the globe. After all, **if the United States withdrew from its war against salafism, salafism would still be at war**. Al Qaeda's ultimate goal is not to expel the United States from Islamic lands; it is to establish a new caliphate that ushers in God's rule on earth. And the many enemies of that effort—non- Muslims, apostate Muslims, liberated female Muslims, gay and lesbian Muslims—would still blemish the Islamic world, representing jahiliyyah in its myriad sinful forms. ¶ Where those enemies have no army to defend them, the result has been terror. Where they do, the result has been endless war. It is a **virtual axiom** of international politics that salafists will try to seize control of any local conflict— from the Philippines to Chechnya to Kashmir to Iraq—that pits Sunni Muslims against their neighbors. And the more they succeed, the less likely it is that such a conflict will end. Many Muslims, including many non-s alafist

Islamists, also support Muslim insurgencies around the world. In Iraq, they may support attacks on American troops. But since they see jihad as a means to some concrete goal, political compromise is possible. Salafists, however, who see jihad as a means to usher in a messianic age, will accept no outcome that leaves Muslims under non- Muslim rule, because such a compromise threatens the path to paradise.

AT: Terrorism Experts

We should be skeptical of claims of so-called terrorism experts – they assume a distinction between non-state and state sanctioned violence

Toivanen 10 [Reetta Toivanen, Centre of Excellence in Global Governance Research , University of Helsinki, August 12, 2010, "Counterterrorism and expert regimes: some human rights concerns", *Critical Terror Studies,* 3:2, p. 278] //dickies

This article tackles two different but interrelated problems in relation to the peculiar relationship between the governments and expert bodies, which may result in the lowering of human rights standards or in a direct violation of inherent human rights. On the one hand, the governments have used the rhetoric of terrorism to advance their own goals in targeting unwanted groupings in the country by defining them (with the help of experts) as terrorists. On the other hand, and maybe even more fundamentally, the problem is that some of the expert bodies are veiled in deep secrecy and civil society has no effective means to determine the contents of their expert information which impacts the governmental policies in the 'the War on Terror'.3 Without discarding the fact that there is a historical continuum in governmental repression towards persons defined as national enemies, the rhetoric of the global War on Terror gives the phenomenon a new quality.4 More importantly, I shall tackle the question of the potential dangers of using covert security expert information to guide governments in their actions, from the perspective of internationally agreed human rights. In the first part of this article, I shall ponder on the popular rhetoric of the 'War on Terror' and analyse the usefulness of such rhetoric in the production of expert knowledge capable of ignoring fundamental human rights standards. Governments all over the world are troubled in the face of national and international security challenges. However, in their efforts to create stability and security, they seem to carry an inbuilt weakness which results in serious harm to the human rights standards, as some individuals and groups become categorised as the 'others' who deserve less rights or no rights at all. I shall then introduce the theoretical framework for analysing counterterrorism as masked in something that can be called authoritative or expert knowledge. The focus of this section lies on the authoritative knowledge of the security experts who are pivotal in the production of the practice labelled here as 'othering'. At the end of the article, the consequences of such rhetoric for the very core values of democratic societies – human rights and freedoms – are scrutinised. I shall argue that the fact that democratic decision-makers agree to rely on expert knowledge that casts security as an opposite of freedom has the potential to increase terrorist threats.

Their reliance on so-called "experts" reifies governmental control and legitimizes violence against those deemed threats

Toivanen 10 [Reetta Toivanen, Centre of Excellence in Global Governance Research , University of Helsinki, August 12, 2010, "Counterterrorism and expert regimes: some human rights concerns", *Critical Terror Studies,* 3:2, p. 277-278] //dickies

This paper focuses on counterterrorism measures practised by governments and on what is called authoritative or expert knowledge on terrorism and counterterrorism, i.e. the knowledge that affects how the governments plan and carry out their counterterrorism activities. It contends that the expertise behind the governmental positions and actions taken to counter the phenomena defined as terrorism is problematic in various ways: many of the expert bodies are veiled in secrecy, and they cannot be made accountable for their advice. Therefore, there is a danger of abuse and false 'calculation' of risk, as well as a high danger that the experts act in political conformity with the dominant forces in the state. Accordingly, this article poses the following question: what are the consequences of unaccountable and secret expertise for the application of internationally agreed human rights standards? I am especially interested in knowledge which seems to produce a coherent and consistent 'body of facts' which is then used by governments and intergovernmental organisations alike in the creation and application of their counterterrorism policies and strategies. This 'body of facts' has been criticised by some scholars, because it seems to overemphasise non-state terror and to overlook terror that emanates from the states (Jackson 2009, Breen Smyth 2007, Miller and Mills 2009, Toivanen 2008). It is also said to resemble a political ideology through which the actions taken by the government are legitimised and the acts of those opposing the governmental actions are discredited as terrorism. Some researchers have also blamed the terrorism experts for adopting an uncritical view of the sources of terrorism studies,

i.e. the sources from which their 'knowledge' emanates (Jackson 2007, Silke 2004, Breen Smyth 2007, Gunning 2007).1 My recent research has addressed, from a legal–anthropological perspective, the ways in which the <u>expert bodies contribute to the process which is here called 'othering'</u>, i.e. <u>the practice of depicting potential terrorists as foreign and as strange as possible</u>. <u>It is through this process that they are stripped of their basic human rights</u>. In this contribution, I shall argue that <u>governments across the globe have adopted counterterrorism measures which have resulted in human rights violations.</u> This is not just the case in countries such as Nigeria and Myanmar (which are regularly accused of human rights abuses in the media). All countries of the world, even countries with no direct experience of international terrorism, such as Finland,2 have adopted anti-terrorism laws and policies. As the phenomenon of terrorism is highly complex, the governments have relied on both international and national expert bodies to give them advice and consult them on how terrorist attacks could be effectively avoided.

Mainstream terrorism studies reinforce notions of Western prestige – they predetermine causes and responses.

We can find an example of such an approach to knowledge–production in the work of Robert Pape. In his book, Dying to Win, **Pape defines terrorism as that which "involves the use of violence by an organization other than a national government to intimidate or frighten a target audience"** (Pape 2005a, 9, my emphasis). This definition is directly lifted from the US State Department's document "Patterns of Global Terrorism 2003" (US Department of State 2004). Acknowledging that such a definition could be broadened to include the actions of states, **Pape maintains that "such a definition would distract attention from what policy makers would most like to know: how to combat the threat posed by non-state actors to the national security of the United States and our allies"** (Pape 2005a, 280). In tying the value of his intellectual project to the governmental requirements of the US and their allies, **Pape's work is fairly typical of mainstream terrorism studies**. For example, Martha Crenshaw's review article on recent work in the field, which criticises the lack of a shared definition of suicide terrorism, cautions that this lack of precision matters "not only for analytical clarity and consistency and data collection but also for the policies of state actors" (Crenshaw 2007, 140). In more general terms, David Miller and Tom Mills' 2009 article on the presence of terrorism expertise in the main- stream media quantitatively examines the political narratives of the top-100 most-cited "terror experts" in the English-speaking news media. They find that **the majority of these experts are "ideologically committed and practically engaged in supporting Western state power"** (Miller and Mills 2009, 414–415). ∂ Terrorism studies accepts as authoritative the state's articulation of terrorism as a security problem and mobilises the authority of the state for the purposes of establishing ∂ the legitimacy of its intellectual project. In return **the state is associated with the prestige and authority of terrorism studies as an academic field, which is itself tied to the institution of the university as a privileged domain** in the production of truth and knowl- edge. A treatment of terrorism studies in terms of an analytics of governmentality forces us to pay attention to these mutually constitutive relations of power and authority**. It** also **requires us to consider terrorism studies not as mere academic exercise, but as a practice; that is, as a specific way of acting in and on the world**. Furthermore, **we are pressed to think about how this practice interacts with myriad other practices that are simultaneously at work in our contemporary regime of governmentality,** one that I am calling counter- terrorism, **and how this "network of practices**" (Rose 1999, 234) **supports, reinforces and guarantees certain conceptions of security.**

Homeland security funding drives terrorism research – academic consensus on terrorism is corrupt.

Altheide 6 [David L. Altheide, Emeritus Regents' Professor in the School of Justice and Social Inquiry at Arizona State University, where he taught for 37 years. His work has focused on the role of mass media and information technology in social control. Dr. Altheide received the Cooley Award three times, given to the outstanding book in symbolic interaction, from the Society for the Study of Symbolic Interaction, 2006, "Terrorism and the Politics of Fear", Altamira Press, p. 36-37] //dickies

The penchant of universities for <u>chasing large research grants</u> continued following the 9/11 attacks, but now the emphasis <u>shifted from crime to terrorism</u>. As with many institutions in the United States that pursued the multi-billion-dollar largesse to "fight terrorism," <u>universities ramped up their</u> typically slow <u>bureaucratic processes to approve new academic majors by adding terrorism and security to their repertoire</u>: Over the last three years, nearly 1<u>00 private and state colleges have introduced programs in terrorism and emergency management</u>. In New York City, both Metropolitan

College, which changed its name from Audrey Cohen College in 2002, and John Jay College of Criminal Justice have introduced master's programs that specialize in terrorism and disaster management. New York University is putting together a certificate program focusing on homeland security. (Hoffman 2004) Some of the programs were tied to established areas of study involving disaster and emergency preparedness, but more was involved than just offering a timely curriculum to curious students: This year, the Department of Homeland Security has doled out about $70 million in grant money to colleges and universities. With the agency's annual budget of $32 billion, there is the powerful lure of new jobs at state and local agencies, as well as corporations that benefit from its grants. (Hoffman 2004) The universities' most recent linkage to agencies perpetuates the framing of fear rather than offering alternative perspectives that may generate research questions to help uncover other takes on the problem. The politics of fear is self-sustaining, guiding even the "study of fear" along certain directions. Thus, these new programs were not oriented to such questions as, What do the 9/11 attacks (and other events) tell us about the place of the United States in the international order? Rather, the questions deal with reaction and adjustment within a fear framework: "All the students we have been involved with haven't seen this as a political issue, but as a way to come together for their country," said Melvin Bernstein, the director of university

Orthodox terror discourse is inextricably linked to the military-industrial-academic complex

David **Miller &** Tom **Mills** (200**9**) "The terror experts and the mainstream media: the expert nexus and its dominance in the news media", Critical Studies on Terrorism, 2:3, 415-418, http://dx.doi.org/10.1080/17539150903306113

The early experts created an 'invisible college' of terrorism expertise, described by researchers such as Reid who has done more than any other to introduce the term to studies of terrorism expertise (Schmid et al. 2005, Reid 1983, 1993, Reid and Chen 2007). The term has even been used by orthodox authors such as Alex Schmid (Schmid et al. 2005, p. 185). The term 'invisible college' originates in the sociology of science. Although he did not coin it, Derek de Solla Price first developed it in the early 1960s to describe informal communication networks of scientists who come to form an elite and to dominate a field (Price 1963). Price noted that elite scholars come to form an 'in-group' of around 100 people and that: For each group there exists a sort of commuting circuit of institutions, research centers, and summer schools giving them an opportunity to meet piecemeal, so that over an interval of a few years everybody who is anybody has worked with everybody else in the same category. (Price 1986, pp. 74–76) In extensive work on the invisible college of terrorism experts, Reid (and latterly Chen) have noted that the terror experts met the definition of an invisible college because they 'communicated informally, convened periodic terrorism meetings, developed terrorism incident databases . . . shared ideas, and secured funding' (Reid and Chen 2007, p. 43). It is important to note that Price did not conceive of the invisible college as a 'power group' and in fact saw them as an elite resulting from an 'expectable inequality', which 'automatically reinforce their exclusiveness only by their excellence' (Price 1971, p. 74). In our view, this rather sanguine view is certainly mistaken in the case of terror experts. As Reid (1997) notes: In terrorism research, the influence of knowledge producers is severely skewed by the limited types of data used: the invisible college's publications, government documents and media coverage. Thus, development of knowledge in terrorism research has resulted in . . . political bias and policy-oriented studies. (p. 101) However, Price is correct to note that the hierarchical status of the experts is accomplished in part by 'the overpowering effect of their contribution relative to that of the rest' (Price 1971, p. 74). This can be seen in the terrorism field where the control and arbitration of access to the field and to the in-group is tightly organised around a small number of journals (Burnett and Whyte 2005, Raphael 2008, Reid and Chen 2007). But the in-group is not simply a network that whilst politically or ideologically biased exists either in parallel with, or apart from, other structures of power Both counterinsurgency theoryst and 'terrorism studies' have a shared history of intertwined relations with the military, the government and the arms industry. These kinds of connections were famously called the 'military–industrial complex' by President Dwight Eisenhower in his 1961 farewell address (Eisenhower 1961). Later, in the 1960s, Senator William Fulbright spoke out against the military influence on academia, warning that, 'in lending itself too much to the purposes of government, a university fails its higher purposes' (cited in Turse 2004). He also called attention to the existence of a 'military–industrial–academic complex' (Fulbright 1970). This directs our attention to the ideological and

practical role of terror experts in reproducing power relations, as opposed simply to studying and writing about terrorism in a political and social vacuum. Our argument in this article conceives of the official nexus of terror experts as performing useful services for other elements of the 'power elite', to use the phrase coined by the sociologist C. Wright Mills (Mills 1956). Thus, we are interested not just in the network of experts, but the way in which they operate in wider networks of power. We are interested, in other words, in 'embedded expertise' to use the phrase recently adopted by critical authors (Burnett and Whyte 2005). Embedded expertise implies both a network of knowledge and integration with other powerful institutions, including policing, the military, intelligence agencies, the arms and security industry, and last but not least, the media industries. It also implies a conception of orthodox terrorism expertise as part of hegemonic processes, meaning specifically, those which contribute to the reproduction of the 'common sense' consensus of policy and other elite fora (including the mainstream media) (Miller 2001). To be more explicit about this, we are also saying that the contribution that orthodox terror expertise makes is a matter of information management. This puts us squarely on the territory of the discussion of propaganda in Western nations. Noam Chomsky has put this in his characteristically straightforward way. In 'democratic societies', he notes, 'the state is much more limited in its capacity to control behavior by force' than in 'totalitarian' societies: Since the voice of the people is allowed to speak out, those in power better control what that voice says – in other words, control what people think. One of the ways to do this is to create political debate that appears to embrace many opinions, but actually stays within very narrow margins. (Chomsky 1987) While it may be hard for some to accept this characterisation, we are trying here to outline the kind of territory of discussion that is necessary if we are to take the field of terror expertise and the study of the state seriously. In this article, we emphasise just one such arena, that of the mainstream news media.

Terror scholars inevitably support state agendas, upholding traditional notions of terror

David **Miller &** Tom **Mills** (200**9**) "The terror experts and the mainstream media: the expert nexus and its dominance in the news media", Critical Studies on Terrorism, 2:3, 414-415, http://dx.doi.org/10.1080/17539150903306113

Terrorism experts are ubiquitous in mainstream media coverage of political violence. They provide commentary and analysis and are used as a resource especially to fill news space in the absence of hard information. But before the 1970s, there were very few academics who studied 'terrorism'. War, revolution, political violence, social movements, and counterinsurgency were all topics of some note in the social sciences – but not terrorism. Of course, 'terrorism studies' is not sharply divorced from such previous work. It emerges as an academic specialism from these topics and in particular from the theory and practice of counterinsurgency, itself only forged in the 1950s and 1960s in relation to decolonisation and the rise of the United States as a global superpower (Maechling 1988, Schlesinger 1978). The ideas prominent in orthodox terrorism studies, and often the theorists themselves, have strong roots in counterinsurgency doctrine and practice (Klare 1988, McClintock 1992). Orthodox terrorism experts are, in other words, ideologically committed and practically engaged in supporting Western state power. Of course, the defenders of the orthodoxy deny this characterisation of their craft (Horgan and Boyle 2008), but as we will show, it is hard to draw any evidentially based alternative conclusion. This paper reports the first findings of a study of the phenomenon of terrorism expertise.1 It focuses in particular on the relationship between the experts and the mainstream media rather than on their relations with policy processes, the private sector, think-tanks and other private institutes, the legal system, or directly with government, police or armed groups. These will be the subjects of later work. Our analysis of the media is largely quantitative and is not intended to rehearse arguments about how and why the patterns that emerge exist. Rather, we are interested here in questions about the relative status of the experts featured in the media, as compared with other measures of their expertise such as citation or publication analysis. We see terrorism knowledge not as some ideologically neutral expertise on a natural phenomenon, but as being created to reflect the priorities and values of certain social interests. The very existence of 'terrorism

experts' promotes the idea that the surface similarities between acts of violence provide a solid foundation for generalisations about 'terrorism', whatever the political or social context. We use the term 'terrorologist' to designate those writers whose main work is focused explicitly on 'terrorism', as opposed to those active in area studies or in examining some other dimension or macro levels in which 'terrorism' might play a part (Herman and O'Sullivan 1989).

Comprehensive studies prove being considered a terrorism expert requires connections to the military-industrial complex.
David **Miller &** Tom **Mills** (200**9**) "The terror experts and the mainstream media: the expert nexus and its dominance in the news media", Critical Studies on Terrorism, 2:3, 424-418, http://dx.doi.org/10.1080/17539150903306113

The analysis of the top 100 most prominent 'experts' provides a clear picture of the tendency of such experts to be linked to parts of the 'military–industrial–academic complex'. We have also shown that their views coincide with the values and policies pursued by the military–industrial complex to a significant degree. This is no minor point. It is clear that to be regarded as a terror expert it is important though not essential to be close to the institutions of the state, the military and associated industrial interests. But our data does not show which way round the influences run. Is it the centres of power in the military–industrial complex that drives the activities and ideas of the terror experts or the other way around? Do the experts in other words make any difference to the operations of power? To explore this we need to examine the extent to which the terror experts are part of a network including other experts, academic and private institutions and think-tanks, state institutions and corporate entities. We have chosen four experts to profile here. We selected three experts who are very widely cited in the news media (all of them being amongst the top twelve in terms of citations in our sample), together with one outlier to illustrate the similar but not identical paths to prominence of a new breed of 'expert' since 11 September 2001. We chose terror experts who have some university affiliation but who are also very well networked with private and state agencies. It is important that we focus on the academic component of the network because they have more credibility than those whose expertise are based in experience, or is in effect paid advocacy (as in many of the think- tanks). Thus, we did not select Noam Chomsky (number 2, not at the core of the network and very much a lone critical voice), Sidney Jones, Daniel Pipes, Jason Burke, Avi Dichter (numbers 3, 6, 8, and 9, respectively, who do not have academic tenure). We also choose not to focus on Clive Williams (number 4), Francis Fukuyama (number 5), Anthony Cordesman (number 10) or Alan Dershowitz (number 11), on the grounds that Williams is a former intelligence officer, Fukuyama and Dershowitz are not primarily known for their work on terrorism, and Cordesman, though well connected, is no longer at an academic institution but at a think-tank. We selected Rohan Gunaratna, Paul Wilkinson and Bruce Hoffman (numbers 1, 7 and 12) as academics that are also at the centre of the terror expert network and are amongst the most reputable. Our findings on the connections and on the quality of some of the work of these experts is a cautionary tale for those seeking to rely on the information and knowledge supplied by the most credible media experts on terrorism. We also chose Evan Kohlman who does not have academic tenure and is, as we shall see, a representative of the more overtly propagandistic elements of the nexus of interests. Although some 27% of the 100 terror experts with the most press prominence were either alternative or critical in our terms, we excluded them for our current purposes as we want to show how the core of the network coheres. The aim here is not to outline the ideas and views of the experts and subject them to critique, nor to produce an analysis of their impact on the media or on public opinion. Rather, we want to demonstrate how some of the key most prominent experts in global English language press are actually part of an invisible college of interconnected public terror experts whose views are strikingly similar and whose activities are linked to state and corporate priorities. The case studies were compiled using publicly available bio- graphical data in the standard way of Power Structure Research (Domhoff 2007). We have also utilised investigative research techniques to unearth obscure data and hidden information (Northmore 1996).

AT: Framework

We should generate space for debates over the epistemological and ontological assumptions of counter-terrorism.

Jackson 9 (Richard Jackson, Deputy Director at the National Centre for Peace and Conflict Studies, PhD from the University of Canterbury, "Critical Terrorism Studies: An Explanation, a Defence and a Way Forward," p.6-8, 12-15-2009,

In addition to the particular ontological position outlined above, I argue that critical research on terrorism should also exhibit a deep awareness of key epistemological issues, including the way in which knowledge is produced as a social process, the subjectivity of the researcher, and the link between knowledge and power, and consequently, the ways in which knowledge can be employed as „a political technology" in the maintenance of hegemony by elites, institutions, and groups. In other words, a critical approach to terrorism research begins with the fundamental acceptance that wholly objective or neutral knowledge – „truth" – about terrorism is impossible and there is always an ideological, ethical-political dimension to the research process (Toros and Gunning, 2009). This does not mean that all knowledge about the social world is hopelessly insecure, that we reject scholarly standards and procedures in research, or that „anchorages" – relatively secure knowledge claims – cannot be found and built upon (Booth, 2008; Herring, 2008; Toros and Gunning, 2009). Rather, it suggests that, in addition to a commitment to the highest standards of scholarship, research on terrorism should also be characterised by a continuous and critical reflexivity in regards to its epistemology, ethics, and praxis. Importantly, such reflexivity itself opens up new areas of research, starting with the key question: who is terrorism research for and how does terrorism knowledge support particular interests? The ontological position that terrorism is socially constructed and constituted by its context leads us, epistemologically, to call for a broadening of the focus of terrorism research to include both state and non-state terrorism, counter-terrorism, and other forms of violence such as structural or domestic violence, as well as (relevant) non-violent behaviour and social context (see Toros and Gunning, 2009; Gunning, 2009). Such a broadening will serve to de-exceptionalise terrorist violence by placing socio-historical context at the heart of the investigation, restoring a past and a future to terrorism, allowing the concept to evolve along with the social world, and seeing (counter-)terrorism as part of wider political, societal, and economic dynamics. Engaging social movement theory, specific area studies expertise, and ethnographical methods constitute three practical paths to making context more central to terrorism research (Gunning, 2009; Sluka, 2009; Dalacoura, 2009; Breen Smyth, 2009). Similarly, a central concern of CTS scholars must be to expand the set of accepted research topics to include those which have been ignored or silenced as a result of dominant ideological commitments. In particular, besides a greater 7 focus on historical context, there is a real need to „bring the state back in to terrorism studies" (Blakeley, 2007) – to examine the nature and causes of state terrorism, particularly that by Western democratic states. It is also vital to make gender much more central to terrorism research (Sylvester and Parashar, 2009), among many other topics (see below). The ontological rejection of traditional theory"s „fetishization of parts" means, among other things, that epistemologically, a critical approach to terrorism should embed the phenomenon in broader social and political theory. Greater inter-disciplinarity – with a view to eventually doing away with disciplinary boundaries altogether – is one way to do this, although it is important to heed Booth"s warning against lowest common denominator inter-

disciplinarity (Booth 2008). The establishment of an explicitly „critical" field should help to bring in those from cognate disciplines who have so far shunned Terrorism Studies because of its reputation, earned or not, for political bias and lack of theoretical sophistication (see Gunning 2007a; Dalacoura, 2009). Another way to embed terrorism research in broader theory is to link terrorism more explicitly to the broader social processes of which it is part, and study it for what it has to say about these broader processes (see Gunning, 2009). <u>One of the consequences of the ontological and epistemological positions adopted by CTS is a commitment to transparency in regard to the researcher"s own values and standpoints, particularly as they relate to the geo-political interests and values of the society in which they live and work. In turn, this implies an abiding commitment to seeking to overcome the Euro/Westo-centric, Orientalist, and masculinised forms of knowledge which currently characterise the Terrorism Studies and Security Studies fields and social science more generally</u> (see Toros and Gunning, 2009; Gunning, 2009; Sylvester and Parashar, 2009). It also implies a commitment to taking subjectivity seriously, in terms of both the researcher and the research subject (see Breen Smyth, 2009). This means being aware of and transparent about the values and impact of the researcher on the process and outcomes of the research, and being willing to seriously engage with the subjectivity of the „terrorist". Importantly, this latter point implies an additional commitment to engaging in primary research when relevant, as opposed to relying primarily on secondary sources – a long-standing practice in terrorism research due to the perceived difficulties and dangers of face-to-face encounters with „terrorists" (see Zulaika and Douglass, 1996). In terms of methodological issues, as already suggested, CTS is committed to methodological and disciplinary pluralism in terrorism research. In particular, CTS sees value in post-positivist and non-International Relations-based methods and approaches, including discourse analysis, poststructuralism, constructivism, Critical Theory, historical materialism, and ethnography. <u>Importantly, CTS refuses to privilege materialist, rationalist, and positivist approaches to social science over interpretive and reflectivist approaches (</u>in the context of critical international relations, see Price and Reus-Smit, 1998: 261), <u>and seeks to avoid an exclusionary commitment to the narrow logic of traditional social scientific explanation based on linear notions of cause and effect. Instead, CTS argues that post-positivist approaches which subscribe to an interpretive „logic of understanding" can usefully open space for questions and perspectives that are often foreclosed by positivism and rationalism.</u> Furthermore, it can be argued that this stance is more than simply methodological; it is also political in the sense that it does not treat one model of social science as if it were the sole bearer of legitimacy (see Smith, 2004: 514).

Current approaches to the study of terrorism reify notions of illegitimate violence. Bringing into the debate questions behind the process of terrorism is necessary to break this cycle

David **Jones and** MLR **Smith**, **2009**, Jones is an associate professor in the Political Sciences at the University of Queensland in Australia, Smith is a professor of Strategic Theory at King's College in London, *Studies in Conflicts and Terrorism,* "We're all Terrorists Now"

Although there may exist strategic, even normative, grounds for conceptu- alizing terrorism as a coherent object of knowledge, this essentialist ortho- doxy is unfortunate for two reasons. First, **by attributing terrorism an objective existence, mainstream terrorism studies offers very limited space for reflecting on the historical and social processes through which this** identity, behaviour or threat **has**

been constituted. With the interpretive, symbolic and discursive contexts of its creation – **to say nothing of the power relations traversing these contexts – presumed largely irrelevant for under-standing this phenomenon, terrorism remains consistently and artificially detached from the processes of its construction.** In this sense, we could do far worse than remember Foucault's (1981: 67) famous cautionary note when encountering claims to speak the truth about terrorism: 'We must not imagine that the world turns towards us a legible face which we would have only to decipher'. ∂ Foucault's meta-theoretical caution will not, of course, convince everyone that further critical reflection in this field is needed. By turning to the very specific, and narrow, essence attributed to terrorism within the mainstream debates, however, it may be possible to garner further support for such a programme. As the above discussion suggests, **existing studies remain over-** ∂ **whelmingly structured by a conception of their object as an unconventional form of illegitimate violence**. With relatively few exceptions, the majority of scholars working here are content to tie their understanding of terrorism both to activities of particular non-state actors and to the targeting of par- ticular victims: non-combatants or (more emotively) 'innocent civilians'. **With reflections on the nature and causes of terrorism already framed around this double condemnation, then, discussions relating to the legitimacy of terrorism, or**, indeed, **the possibility of state terrorism, become systematically excluded from this field of enquiry before they emerge**. As outlined below, it is an attempt to contest these exclusionary practices that largely motivates the first, broadening, face of critical terrorism studies. ∂ Given the above preference for a specific and narrow essentialist frame- work, it is perhaps unsurprising that terrorism studies has oriented towards policy-relevant research. In seeking not only to define and explain, but also to prevent or resolve, its object of knowledge, **this structuring of the discipline necessarily mobilizes a very limited conception of academic responsibility**. In Cox's (1996: 88) famous terminology, as noted by Gunning (2007), terrorism studies has overwhelmingly functioned as a problem-solving pursuit that: ∂ takes the world as it finds it, with the prevailing social and power relationships and the institutions into which they are organized, as the given framework for action. **The general aim of problem solving is to make these relationships and institutions work smoothly by dealing effectively with particular sources of trouble**. ∂ As Cox's remarks suggest, **the problem-solving approach to the study of terrorism is normatively problematic in reducing academic responsibility to a technical exercise of risk governance or management. At best, such a reduc- tion militates against any notion of critical enquiry aimed at contesting or destabilizing the status quo**: of 'saying the unsayable' in Booth's (2008: 68) terminology. **At worst, it simply reifies a tired and unstable inside/outside dichotomy that legitimizes the state's continued monopoly on violence**. Either way, the continued structuring of the mainstream literature around the above debates fails to offer any meaningful participatory role for engaged, active scholarship. ∂ In sum, although characterized by considerable diversity, the terrorism studies literature suffers from key analytical and normative limitations. Analytically, **the preference for a narrow essentialist framework not only neglects the processes of terrorism's construction, it also reduces the space available for discussing the (il)legitimacy of particular violences.** Norma- tively, the preference for producing policy-relevant, problem-solving research works to detach academic responsibility from any notion of critical enquiry. These limitations, I argue, open considerable space for the emergence of a critical terrorism studies agenda.

We must be willing to debate underlying assumptions of counter-terrorism – procedural limits on debate turn the academy into a tool of state violence.
Rod **Thornton**; School of Politics and International Relations, University of Nottingham , Nottingham, UK. Dec 16 **2011** "Counterterrorism and the neo-liberal university: providing a check and balance? Critical Studies on Terrorism", 4:3, (p421-429)

(http://www.tandfonline.com/doi/abs/10.1080/17539153.2011.623419#.VakgHflTZ_A)

But <u>universities are not typically ready to deal with extremism</u>. Traditionally, <u>universities are bastions of free-thinking liberalism</u>, establishments <u>that</u>, in the words of many university's statutes, '<u>encourage debate and dissent</u>'. The government's own counterterrorism document Prevent recognises this standpoint. It says that universities 'promote and facilitate the exchange of opinion and ideas and enable debate as well as learning' (Prevent 2011, p. 71). <u>Radicalism</u>, if not indeed extremism, <u>might be seen as part and parcel of such 'exchanges'</u>. However, <u>when</u> the term '<u>national security' starts to be used by government</u>, <u>then this traditional concept of campuses providing a comfortable home to debate and dissent comes under threat.</u>

'<u>Security' is a many-faceted concept</u> when the 'enemy' is terrorism. And it is the nature of counterterrorism <u>that</u> it must, at least to some degree, involve a holistic approach. If the 'enemy' is among us, then the spread of counterterrorist actors must be wide: 'Counterterrorism <u>is not specific to any one agency</u> or department' (Silke 2011, p. 3). Included here are <u>universities</u>. They <u>are now</u> themselves, as one report puts it, '<u>non- traditional security actors</u>' (Beider <u>and</u> Briggs 2010, p. 53). But, of course, if universities do take on such a role then <u>their 'enemy' must include a number of their own students</u>. As Nina Power puts it, in the new security environment, 'lecturers are to become informants; their students the enemy within – "terrorists"' (Power 2011, p. 29). Universities have also to be aware of the 'fear factor' involved in counterterrorism. This leads to one of the principal mantras of any agency tasked with counterterrorism – 'better safe than sorry'. The shooting by police of the innocent Brazilian electrician, Jean Charles de Menezes, in the wake of the 7 July London bombings is indicative of where such thinking can lead. <u>In the climate of fear, terms such as 'debate and dissent'</u> on the campuses of universities – these new security actors – <u>can begin to take on other, sinister, meanings and become euphemisms for the expression of extremist views.</u>

AT: Case Outweighs

The aff's discourse of terror that focuses on *uncertainty* and *pre-emptive action* instead of empirical evidence creates a self-fulfilling prophecy

Jackson 15 [Richard Jackson is professor of peace studies at the National Centre for Peace and Conflict Studies, University of Otago, New Zealand. He is the author and editor of eight books on terrorism, political violence and conflict resolution, and more than 50 journal articles and book chapters, 2015, "The epistemological crisis of counterterrorism", *Critical Studies on Terrorism*, p. 35-36]//dickies

Joseba Zulaika (2012, 51) suggests that <u>the epistemological crisis of counterterrorism is characterised by "the perversion of temporality, the logic of taboo, non-hypothetical knowledge, secret information, the passion for 'expert' ignorance, mystical causation and dual sovereignty"</u>. While all these characteristics are indeed present in contemporary counterterrorist thought and practice, it is not clear that they are all necessarily constitutive of the crisis; some are, to my mind, initially, at least, consequences of the crisis. I suggest instead that <u>the epistemological crisis can be identified by four primary characteristics: (1) the rejection of previous knowledge about terrorism and the embrace of total uncertainty or "anti-knowledge"</u> about any aspect of future terrorist threats; (2) <u>the adherence to an extreme precautionary dogmatism in which the "unknown" is reflexively governed through preemptive action</u>; (3) <u>the consequent legitimisation and institutionalisation of imagination and fantasy as a necessary counterterrorist too</u>l; and (4) <u>the acceptance of a permanent ontological condition of "waiting for terror</u>" in relation to the next attack (Zulaika and Douglass 1996, 26). To put it another way, we could say that the epistemological crisis is constituted by a known, an unknown and a moral imperative. <u>The known of the epistemological crisis is the assertion that, no matter what, there will be more terrorist attacks;</u> we are simply waiting for the next inevitable terrorist outrage. <u>As many officials and terror experts have expressed it, "it is not if but when"</u> the next attack occurs, <u>and no matter what, "there will always be terrorism"</u> (Zulaika 2012, 59; original emphasis). For example, <u>officials are prone to argue that even if the Israel-Palestine conflict was settled, or Western forces withdrew from Iraq, or al Qaeda was defeated</u>, or any number of other possible developments took place, <u>it would not matter because there would still be terrorism in any case</u>. Zulaika (2012) argues that <u>this kind of projection</u> (or fatalistic attitude) <u>shares the characteristics of "oracular revelation" in witchcraft societies, in that it is an unfulfilled hypothetical that "will become real with time</u>… the horror will happen no matter what". The unknown is simply that we do not, and cannot, know exactly who, when, where, why or how the next inevitable attack will occur – because the terrorists are shadowy, cunning, adaptive, innovating, etc. <u>Central to this particular state of unknowing are the unknown knowns,</u> or, the "subjugated knowledge" (Jackson 2012b) <u>which is wilfully ignored or suppressed</u>. As I explain below, it is well known within the defence establishment and official policymaking circles that military intervention such as the invasions of Iraq and Afghanistan provokes further terrorism, as does the continuing existence of the Critical Studies on Terrorism 35 Downloaded by [University of California, Berkeley] at 07:59 15 July 2015 Guantanamo Bay detention centre, the use of torture and rendition, and the drone killing programme. Nevertheless, as Zulaika (2012, 56; original emphasis) puts it: "These are known facts, yet they are made to be unknown when concrete policies are to be taken". Finally, <u>the moral imperative is that we simply have to do everything in our power to prevent the unknown but inevitable coming terrorist attack</u>. <u>This is an extreme precautionary dogmatism, reflected in Dick Cheney's 1% doctrine</u> (see Zulaika 2012, 61–64), <u>which asserts that "doing something is better than doing nothing</u>", and in Francois Ewald's (2002) notion of "risk beyond risk". <u>The logic of this paradigm "dictates that uncertainty and lack of knowledge can no longer be regarded as an excuse for inaction in the face of a potentially catastrophic threat</u>" (De Goede 2011, 9). In other words, <u>in a reversal of empirically-informed preventive decision-making approaches</u> which proceed on the basis of what is known about a certain risk, such as the risks posed by disease or automobile accidents<u>, the counterterrorist must instead act upon what is unknown as projected through imagination and fantasy</u>. The important point is that <u>not acting is never an option, even if it means constructing a self-fulfilling prophesy or causing unnecessary suffering</u>. In the end, it is in the combination and interaction of these three elements that the epistemological crisis of counterterrorism is constituted. I refer to it as a "crisis" primarily because <u>it produces a state of deep anxiety and even panic about the</u> future, and because it involves an intense state of tension between the known and the unknown. Looking at both the field of terrorism studies and the social practices of counterterrorism, <u>there are a great many actions and attitudes that appear at face value to be nonsensical, irrational, obviously wasteful</u>, or,

at the very least, counterproductive (see Mueller 2006; Mueller and Stewart 2011, 2012; among others, for numerous examples). There are also a great many actions that are highly destructive, unnecessarily abusive of human rights and which lead to evident **self-fulfilling prophesies**. In this section, I provide a brief overview of a few select examples among many, drawn from different areas of counterterrorist thought and practice, to illustrate the diverse ways in which the epistemological crisis manifests itself. I argue that the examples described here are not anomalous or idiosyncratic, but rather illustrative of the internal logic of counterterrorist thought which is constituted by the epistemological crisis. Within the epistemic framework of contemporary counterterrorism, they are in fact, perfectly logical, reasonable, and by now normalised ways of thinking and acting. Importantly, the epistemic crisis is not confined to official counterterrorism. As a number of studies have demonstrated, within terrorism studies there is a persistent epistemic crisis about the nature and threat of al Qaeda itself (see Jackson 2015; Hellmich 2011, 2012) – especially in comparison to what is known about other groups such as Hamas, the IRA, ETA, the Italian Red Brigades, and others. Despite being the most researched and scrutinised group in history, terrorism experts cannot settle on the necessary knowledge base to agree on whether it is a hierarchical organisation, a diffused network, a franchise, an ideology, a figment of the Western imagination – or a combination of all of these. We know it exists, but we seemingly cannot know whether it is still a major threat or not, what really drives it, or how best to respond to it. Despite all the intellectual activity in the field, al Qaeda remains a "known unknown". This academic epistemic crisis is magnified in the world of institutional counterterrorism.

Terrorism threat assessment and journalism relies on government sources – produces threat inflation.

Altheide 6 [David L. Altheide, Emeritus Regents' Professor in the School of Justice and Social Inquiry at Arizona State University, where he taught for 37 years. His work has focused on the role of mass media and information technology in social control. Dr. Altheide received the Cooley Award three times, given to the outstanding book in symbolic interaction, from the Society for the Study of Symbolic Interaction, 2006, "Terrorism and the Politics of Fear", Altamira Press, p. 117-119] //dickies

 A politics of fear rests on the discourse of fear. The politics of fear serves as a conceptual linkage for power, propaganda, news and popular culture, and an array of intimidating symbols and experiences such as crime and terrorism. The politics of fear resides not in an immediate threat from an individual leader (e.g., Senator Joseph McCarthy [Griffith 1987]) but rather in the public discourse that characterizes social life as dangerous, fearful, and filled with actual or potential victims. This symbolic order invites protection, policing, and intervention to prevent further victimization. A public discourse of fear invites the politics of fear. It is not fear per se that is important in social life but rather how fear is defined and realized in everyday social interaction. The role of the news media is very important in carrying selective news sources' messages. News sources are claims makers, and studies of crime news show that government and police officials dominate how crime is framed (Ericson, Baranek, and Chan 1987, 1989; Surette 1992). Likewise, government and military officials also dominated news reports about terrorism and fear: But how men and women interpret and respond to their fear—these are more than unconscious, personal reactions to imagined or even real dangers. They are also choices made under the influence of belief and ideology, in the shadow of elites and powerful institutions. There is, then, a politics of fear. Since September 11, that politics has followed two distinct tracks: First, state officials and media pundits have defined and interpreted the objects of Americans' fears—Islamic fundamentalism and terrorism—in anti-political or non-political terms, which has raised the level of popular nervousness; and, second, these same elites have generated a fear of speaking out not only against the war and US foreign policy but also against a whole range of established institutions. (Robin 2002) Newspapers as well as television network news relied heavily on administration sources that directed the focus and language of news Terrorism and the Politics of Fear 117 coverage. This was particularly apparent with those persons interviewed. A study by the Columbia Journalism Review documented this trend: It exacerbates our tendency to rely on official sources, which is the easiest, quickest way to get both the "he said" and the "she said," and, thus, "balance." According to numbers from the media analyst Andrew Tyndall, of the 414 stories on Iraq broadcast on NBC, ABC, and CBS from last September to February, all but thirty-four originated at the White House, Pentagon, and State Department. So we end up with too much. An analysis by Fairness and Accuracy in Reporting (FAIR) of network

news interviewees one week before and one week after Secretary of State Colin Powell addressed the United Nations about Iraq's alleged possession of weapons of mass destruction found that <u>two-thirds of the guests were from the United States, with 75 percent of these being current or former government or military officials, while only one</u>—Senator Kennedy—<u>expressed skepticism or opposition to the impending war with Iraq</u>. Even newsmagazines like Newsweek concurred that the news was being managed: <u>News management is at the heart of the administration's shake-up of Iraq policy</u>. <u>The National Security Council recently created four new committees</u> to handle the situation in Iraq. <u>One is devoted entirely to media coordination— stopping the bad news from overwhelming the good.</u> (Newsweek, October 27, 2003) Very dramatically, <u>journalists cried on camera, wore flag lapels, and often referred to those involved in planning and fighting the Afghanistan and Iraq wars as "we."</u> Moreover, <u>they invoked routinely the claim that the "world is different," that security and safety can no longer be taken for granted</u>, <u>and that many sacrifices would have to be made</u> (Altheide 2004). Numerous observers raised serious questions about the role that journalism played in covering the attacks, the wars with Afghanistan and Iraq that followed, and the increased surveillance and control of United States citizens: The major media fully ignored gangbuster stories reported exhaustively overseas. Among them were: (1). a manifesto that described the invasion of Iraq and pacification of the Mideast penned in 1998 by a think tank whose board included a raft of current administration hawks. . . . In a rare case of breaking ranks, one news "celeb," NBC correspondent Ashleigh Banfield, took her industry to task in a speech at Kansas State University April, averring that it had painted a "glorious, wonderful picture" of war that "wasn't journalism." Quoting Robert McChesney (Professor of Communications at the University of Illinois) "If the Soviet Union cited reasons like this in their invasion of Afghanistan and Pravda reported nothing but what the government said, we 118 Chapter 6 would've dismissed it out of hand. Our press hasn't been much better. That sends a lot of Americans maybe not consciously but intuitively, looking for something our media is not offering." (Grimm 2003, p. 37) <u>The collective identity of victim of terrorist attacks was promoted by news reports stressing communal suffering as well as opportunities to participate in helping survivors and in defeating terrorism</u>. More traditional and culturally resonant narratives about crime, drugs, and evil were transformed into the "terror story." Sorrow, suffering, empathy, and pain were merged with fear and vengeance. <u>National character was played out in scenarios of heroics, sacrifice, suffering, marketing, and spending. This was the context for constructing the politics of fear</u>.

Be skeptical of their authors – government officials dominate news media coverage – this reinscribes the politics of fear and institutionalizes authoritarian control

Altheide 6 [David L. Altheide, Emeritus Regents' Professor in the School of Justice and Social Inquiry at Arizona State University, where he taught for 37 years. His work has focused on the role of mass media and information technology in social control. Dr. Altheide received the Cooley Award three times, given to the outstanding book in symbolic interaction, from the Society for the Study of Symbolic Interaction, 2006, "Terrorism and the Politics of Fear", Altamira Press, p. 121-131] //dickies

But this is different from the Chandra Levy or O.J. Simpson overreactions. We are a different country from the one that weathered those stories. We feel more vulnerable to terrorism, and no matter how you cut it, this killer is a terrorist. His purpose, or at least one of them, is to spread terror. And the media playing right into his hands, as if Sept. 11 never happened. "We may be entering a time when what has been ghetto-ized in Israel and the Middle East breaks its boundaries," says UC Berkeley dean of journalism Orville Schell, referring to suicide bombers and other acts of terrorism. "The unspoken thought is, 'What if this guy is a Muslim?' The media is feeding this most paranoid fear of all but without acknowledging it. . . . The national climate of fear, energized by this psycho sniper, demands that the media examine its decisions more critically than ever. What kind of coverage serves the public interest? What information helps, and more important what harms?" (Ryan 2002, p. A23) Terrorism and the Politics of Fear 121 Next, figure 6.2 shows the massive increase in reports that associated fear with terrorism. Fear in headlines and terrorism in news reports greatly exceeded the increases in fear and crime. Each of the newspapers increased the linkage of fear with terrorism by more than 1,000 percent, with the San Francisco Chronicle exceeding 4,500 percent (having pub- 122 Chapter 6 Figure 6.1. Percentage Increase of "Fear" in Headlines and "Crime" in Reports for Five Newspapers after 9/11/01 Figure 6.2. Percentage Increase of "Fear" in Headlines and "Terrorism" in Reports for Five Newspapers after 9/11/01 lished only two reports of this nature before 9/11) at time 1. Clearly, terrorism was a relatively new and bold connection for fear. This included a few articles that were critical of the government's use of fear to exact more social control, but the overwhelming majority demonstrated that terrorism was bonded to the discourse of fear. <u>A context of crime reporting proved to be consequential for the seemingly easy public acceptance of governmental proposals to expand surveillance and social control. The resulting measures reflected a foundational politics of fear that promoted a new public discourse and justification for altering everyday life and social interaction</u>. While the following discussion is informed by insights of others about social context and change (Shapiro 1992; Thiele 1993) and various studies about fear and the media (Furedi 1997; Glassner 1999) and especially fear and crime (Chiricos et al. 1997; Ferraro

1995), my focus is on political action that utilizes widespread audience perceptions about fear as a feature of crime, violence, deviance, terrorism, and other dimensions of social disorder. The politics of fear is buffered by news and popular culture stressing fear and threat as features of entertainment that increasingly are shaping public and private life as mass-mediated experience has become a standard frame of reference for audiences, claims makers, and individual actors (Best 1995). Similar to propaganda, messages about fear are repetitious and stereotypical of outside "threats" and especially suspect and "evil others." These messages also resonate moral panics, with the implication that action must be taken to not only defeat a specific enemy but also save civilization. Since so much is at stake, it follows that drastic measures must be taken—that compromises with individual liberty and even perspectives about "rights," the limits of law, and ethics must be "qualified" and held in abeyance in view of the threat. In addition to propaganda effects, the constant use of fear pervades crises and normal times; it becomes part of the taken-for-granted word of "how things are," and one consequence is that it begins to influence how we perceive and talk about everyday life, including mundane as well as significant events. Tracking this discourse shows that fear pervades our popular culture and is influencing how we view events and experience. This is particularly relevant for the use of victims and victimization, particularly in the context of 9/11. Still another consequence of the emphasis on "fear" that foretells the emerging politics of fear is the rise of victimization. Entertaining news emphasizes "fear" and institutionalizes "victim" as an acceptable identity. Other work has shown that "fear" and "victim" are informed by perceived membership (Altheide et al. 2001). While news reports strengthened the connection between terrorism and fear, a critical symbol in the politics of fear is "victim and victimization." Terrorism and the Politics of Fear 123 Figure 6.3 shows the relationship of "fear," "crime," and "victim." This figure demonstrates that there was a much larger increase in the eighteen months after 9/11 in reports with "fear" within two words of "victim" than there was "fear" within two words of "crime." Most striking for our argument about the expanded focus of "fear" and "victim" beyond crime after 9/11 was the clear increases in "fear" within two words of "victim" across the span of nationally prominent newspapers. USA Today increased reports with "fear" within two words of "victim" by 280 percent, while the Los Angeles Times, the New York Times, and the Washington Post, often regarded as among the nation's most prestigious newspapers, saw increases of nearly 100 percent. Examining the five newspapers shows that each greatly increased reports with "fear" within two words of "victim" at time 2: Los Angeles Times: 108 percent; New York Times: 89 percent; Washington Post: 91 percent; San Francisco Chronicle: 33 percent; and USA Today: 280 percent. Moreover, three of the five newspapers published fewer reports with "fear" within two words of "crime" during the eighteen months after 9/11. Indeed, all newspapers had either very little increase or a decrease in reports of "fear" within two words of "crime" at time 2. For example, USA Today showed a 20 percent increase and the New York Times a 10 percent increase, while the Los Angeles Times (–25 percent), the Washington Post (–8 percent), and the San Francisco Chronicle (–13 percent) presented less coverage about "fear" within two words of "crime" than they did prior to 9/11. Another way to illustrate the magnitude of change in these newspapers' reports about "fear" within two words of "victim" compared to "fear" and "crime" is to add the percentage increases in the former and the total change (increases minus decreases) in reports about "fear" and "crime." The five newspapers' cumulative increase from time 1 to time 2 in reports with "fear" within two words of "victim" was 493 124 Chapter 6 Figure 6.3. Percent Changes in Report with "Fear" within Two Words of "Victim" and "Fear" after 9/11 percent, with a cumulative decrease of 16 percent in reports showing "fear" within two words of "crime." This means that "fear" and "victim" became more closely linked at time 2 across these major news media. The world of popular culture and news stressing crime and victimization promotes the pervasive awareness of "victimage" that is easily cultivated by officials who respond to terrorist acts. Victims abound in American life. Victims are but the personal side of crisis; a crisis is where victims reside. A personal crisis may affect "one victim," but more generally "crisis" refers to "social crisis," involving numerous people. All take place in a time of fear. All of this requires that citizens have information and constant reminders of the pitfalls and hazards of life, whether potential or realized (Ericson and Haggerty 1997). News reports, talk shows, newsmagazine shows, and a host of police and reality crime dramas seem to proclaim that everybody is a victim of something even though they may not know it. The notion that "life is hard" and that things don't always work out the way we'd like seems to be lost on popular-culture audiences who clamor for "justice," "revenge," and, of course, redemption, often in the form of monetary rewards. And it is not just in the United States: It is in the USA that victimhood is most developed as an institution in its own right. . . . Victimhood is one of the central categories of the culture of abuse. . . . Celebrities vie with one another to confess in graphic detail the painful abuse they suffered as children. The highly acclaimed BBC interview with Princess Diana symbolized this era of the victim. (Furedi 1997, p. 95) Just as our culture has become obsessed with fear, it has also become accepting of victim and victimization. My analysis of news and popular culture indicates that these two terms are linked. We even use the term "victim": when we don't have a victim, as in "victimless crime," although reports are far more likely to stress the "victim" status. And certain domestic violence "presumptive arrest" policies define people as "crime victims" even though they do not perceive themselves as such and refuse to press charges. We even have "indirect victim." Patriotism was connected with an expansive fear of terrorism and enemies of the United States. The term "terrorism" was used to encompass an idea as well as a tactic or method. The waging of the "war on terrorism" focused on the "idea" and the "method," depending on the context of discussion and justification. The very broad definition of terrorism served the central authorities' purposes while also justifying action of others (e.g., Israel) in their own conflicts. Figure 6.4 provides another important piece to the conceptual argument about the politics of fear. These data show that each of the newspapers substantially increased the

number of reports with fear within two Terrorism and the Politics of Fear 125 words of "terrorism" after 9/11: Los Angeles Times: 1,467 percent; New York Times: 986 percent; Washington Post: 1,100 percent; San Francisco Chronicle: 1,620 percent; and USA Today: 2,950 percent. Clearly, terrorism was strongly linked to the discourse of fear. DISCUSSION A brief recap of the argument is that claims makers' accounts of the attacks of 9/11 contributed to an expanding use of "fear" with "victim" and "victimization" that increased much faster than an already established tradition of reports linking "fear" and "crime." "Victim" and "terrorism" did not replace "crime" but simply expanded the "fear" and "victim" connection that has long been associated with "crime." And it is this expansion that is consistent with the politics of fear. The point can be further illustrated. A closer "internal" look at variations in the Los Angeles Times indicates that the emphasis on crime decreased when compared to more attention given to terrorism. Examining other data (not provided here) shows that at time 1 (eighteen months prior to 9/11), only 1 percent of stories with "fear" in the headlines had "crime" and "terrorism" in the report. This increased to 8 percent at time 2. Most striking is the headline changes. There was a 1,600 percent increase in reports with "terrorism" and "fear" in the headlines at time 2. 126 Chapter 6 Figure 6.4. Changes (%) in Reports with "Fear" within Two Words of "Terrorism," after 9/11/01 The upshot is that "terrorism" and "victim" have been more closely joined with "fear" at time 2, while time 1 reporting was more likely to associate "fear" and "victim" with "crime." "Victim" continued to "grow" from "crime" at time 2, but it was engorged by "fear." While "crime" and "terrorism" do coexist and can expand together, "terrorism" became more strongly associated with "victim." The discourse of fear now includes terrorism as well as victimization and crime. Terrorism and fear have been joined through victimization. Crime established a solid baseline in its association with fear, and it continues to grow, but it is terrorism that now occupies the most news space. The primary reason for this, as noted previously in the discussion of news sources, is that government officials dominate the sources relied on by journalists. When journalists rely heavily on government and military officials not only to discuss an immediate war or military campaign but also for information about the security of the country, rationale for more surveillance of citizens, and comments about related domestic and international issues, then the body politic is symbolically cultivated to plant more reports and symbols about the politics of fear. This is particularly true during periods of war, such as the ongoing war with Iraq. Messages that the war on terrorism and the importance of homeland security, including periodic elevated "terror alerts," will not end soon lead journalists to turn to administration news sources for information about the most recent casualties, operations, and reactions to counterattacks as well as the omnipresent reports about soldiers who have perished and those who are still in peril. In this sense, news updates from authoritative sources quickly merge with orchestrated propaganda efforts. Terrorism plays well with audiences accustomed to the discourse of fear as well as political leadership oriented to social policy geared to protecting those audiences from crime. I am proposing, then, that the discourse of fear is a key element of social fears involving crime and other dreaded outcomes in the postmodern world. As rhetoricians have noted, terrorism is easily included within this perspective: Terrorism, then, is first and foremost discourse. There is a sense in which the terrorist event must be reported by the media in order for it to have transpired at all. (Zulaika and Douglass 1996, p. 14) The pervasive threat of terrorism is given credibility by events that are interpreted as part of an unfolding and very uncertain schema for the future: Terrorism discourse singles out and removes from the larger historical and political context a psychological trait (terror), an organizational structure (the Terrorism and the Politics of Fear 127 terrorist network), and a category (terrorism) in order to invent an autonomous and aberrant realm of gratuitous evil that defies any understanding. The ironic dimension of terrorism discourse derives from its furthering the very thing it abominates. (Zulaika and Douglass 1996, p. 22) Terrorism is more than a narrative, but its essence is the definition of the situation, one that extends beyond the present into a distal future, gray but known. The forebodingness of events (e.g., the 9/11 attacks) is cast as a terrible trend inevitability, but the power comes from the uncertainty of "when" and "where." Like the prospective victims of crime in the future, citizens will be made terrorist victims in the future. Terrorism—and especially the attacks of 9/11— enabled political actors to expand the definition of the situation to all Americans as "victims." Moreover, all those fighting to protect actual and potential victims should be permitted to do their work, unimpeded by any concerns about civil liberties or adding context and complexity to the simple analysis that was offered: evil people were attacking good people, and evil had to be destroyed: Victimhood has also been expanded through the concept of the indirect victim. For example, people who witness a crime or who are simply aware that something untoward has happened to someone they know are potential indirect victims. . . . With the concept of the indirect victim, the numbers become tremendously augmented. Anyone who has witnessed something unpleasant or who has heard of such an experience becomes a suitable candidate

for the status of indirect victim. (Furedi 1997, p. 97) <u>Victims are a by-product of fear and the discourse of fear</u>.
I contend that "fear" and "victim" are linked through social power, responsibility, and identity. The linkage involves concerns about safety and perceptions of risk. Thus, President Bush was relying on more than skilled speechwriters in connecting the mafia and terrorism; he was also relying on audiences' acceptance of mythical mafia "dons" and "godfathers" depicted in entertainment to grease the conceptual slide of terrorism as a similar threat. What audiences were presumed to share, then, was the sense that terrorism, like crime (especially "Mafia Crime"), was a monstrous black hand that was invisible, omnipresent, and all powerful and that could be stopped only by a stronger force if ordinary Americans were to survive. I refer specifically to the "role and identity of victim," as held by numerous audiences who expect victims to perform certain activities, speak a certain language, and in general follow a cultural script of "dependence," "lacking," and "powerlessness" while relying on state-sponsored social institutions to save and support them (Garland 2001). Clearly, the terrorists, like their criminal predecessors, had put us all at risk: 128 Chapter 6 The precondition for the emergence of the victim identity was the consolidation of the consciousness of risk. In the UK and the USA, the growing fear of crime and the growing perception of risks have contributed to the sentiment that everyone is a potential victim. However, crime and the fear of crime are only the most striking manifestations of the kind of insecurity that strengthens the belief that everyone is at risk. (Furedi 1997, p. 100) Recall that the politics of fear refers to decision makers' promotion and use of audience beliefs and assumptions about danger, risk, and fear in order to achieve certain goals. <u>The politics of fear promotes attacking a target</u> (e.g., crime or terrorism), <u>anticipates further victimization</u>, <u>curtails civil liberties</u>, <u>and stifles dissent as being unresponsive to citizen needs or even "unpatriotic."</u> The Homeland Security Office advised the American people to buy duct tape and plastic sheeting as a barrier to terrorism. This advisory had little to do with "chemical protection" and much to do with <u>the politics of fea</u>r. As one observer noted, Since September 11, that politics <u>has followed two distinct tracks</u>: First, <u>state officials and media pundits have defined</u> and interpreted the objects of Americans' <u>fears—Islamic fundamentalism and terrorism—in anti-political or non-political terms</u>, which has raised the level of popular nervousness; and, second, <u>these same elites have generated a fear of speaking out not only against the war and US foreign policy but also against a whole range of established institutions</u>. (Robin 2002) This argument has no counterproposal because of the symbolic links that are made between an event, a threat, and the avowed character and purpose of the terrorists, who, like criminals, are construed as lacking any reason, moral foundation, or purpose except to kill and terrify. Not likely to be ravaged by childhood diseases or workplace injuries, postindustrial citizens are prime potential victims, viewing mass-mediated scenarios of crime, mayhem, and destruction; they have no option but to believe and wait: <u>The most typical mode of terrorism discourse in the United States has been</u>, indeed, <u>one of Waiting for Terror.</u> . . . That which captivates every mind is something so meaningless that it may never happen, yet we are forced to compulsively talk about it while awaiting its arrival. In the theater of the absurd, "no significance" becomes the only significance. . . . When something does happen, after decades during which the absent horror has been omnipresent through the theater of waiting, the vent becomes anecdotal evidence to corroborate what has intuited all along—the by-now permanent catastrophe of autonomous Terror consisting of the waiting for terror. (Zulaika and Douglass 1996, p. 26) Terrorism and the Politics of Fear 129 There can be no fear without actual victims or potential victims. In the postmodern age, victim is a status and representation and not merely a person or someone who has suffered as a result of some personal, social, or physical calamity. Massive and concerted efforts by moral entrepreneurs to have their causes adopted and legitimated as "core social issues" worthy of attention have led to the wholesale adaptation and refinement of the use of the problem frame to promote victimization (Best 1995). Often couching their "causes" as battles for "justice," moral entrepreneurs seek to promote new social definitions of right and wrong (Johnson 1995; Spector and Kitsuse 1977). As suggested previously with the examples of hoaxes, victims are entertaining, and that is why they abound. They are evocative, bringing forth tears, joy, and vicarious emotional experience. But victim is more. Victim is now a status, a position that is open to all people who live in a symbolic environment marked by the discourse of fear. We are all potential victims, often vying for official recognition and legitimacy. CONCLUSION I suggest that the politics of fear is a dominant motif for news and popular culture. Moreover, within this framework, news reporting about crime and terrorism are linked with "victimization" narratives that make crime, danger, and fear very relevant to everyday life experiences. The social construction of social problems, as Best (1999) noted, is an ongoing process, building from previous experience. However, the politics of fear as public discourse represents an emergent feature of the symbolic environment: moral entrepreneurs' claims making is easier to market to audiences anchored in fear and victimization as features of crime and terrorism. The politics of fear can be theoretically useful in understanding the relevance of mass-mediated fear in contemporary popular culture and political life. This concept is useful for clarifying the closer ties between entertainment-oriented news and popular culture on the one hand and media-savvy state officials on the other. Consider an example of a news report about a dispute in Phoenix, Arizona, over regulating "low-rider" cruising. An attorney for the low-riders stated, Unfortunately this bill might be considered by some Hispanics as a form of state-sponsored terrorism through vague local ordinances. (Arizona Republic, April 21, 2004, p. B1) On the one hand, the politics of fear is consistent with entertainmentoriented news and mass media, particularly its resonance with "victim" and victimization. On the other hand, the politics of fear helps political 130 Chapter 6 decision makers as news sources and as political actors define social life as dangerous and requiring formal social control and state intervention. The politics of fear joined crime with victimization through the "drug war," interdiction and surveillance policies, and grand narratives that reflected numerous cultural myths about moral and social "disorder." We are in the midst of an emerging politics of fear that discourages criticism and promotes caution and reliance on careful procedures to "not be hasty," to "cover oneself," to "not be misunderstood." The politics of fear promotes extensive use of disclaimers, those linguistic devices that excuse a comment to follow by providing an explanation to not "take it the wrong way," usually taking the form of "I am not unpatriotic, but . . ." or "I support our troops as much as anyone, but . . .". Very few politicians will stand up to the politics of fear because it is the defining bulwark of legitimacy. Skillful propaganda and the cooperation of the most powerful news media enabled simple lies

to explain complex events. Like entertaining crime reporting, anticipation of wars, attacks, and the constant vigilance to be on guard is gratifying for most citizens who are seeking protection within the symbolic order of the politics of fear. The skillful use of heightened "terrorist alerts" to demand attention to the task at hand is critical in avoiding any detractor. And that is the key point: an otherwise sensible or cautionary remark that signals that one is aware, rational, and weighing alternatives marks one as a detractor, someone who is "against the United States." The rituals of control are easier to accept as they become more pervasive and institutionalized. Fear is perceived as crime and terrorism, while police and military forces are symbolically joined as protectors. The politics of fear with a national or international justification is more symbolically compelling than "mere crime in the streets." Accompanying heightened terror alerts are routine frisks, intrusive surveillance, and the pervasive voyeuristic camera, scanning the environment for all suspicious activity. The next chapter discusses how the politics of fear has been extended to control of the Internet.

Terrorist scenarios are based off of speculative fantasy rather than empirical facts

Jackson 15 [Richard Jackson is professor of peace studies at the National Centre for Peace and Conflict Studies, University of Otago, New Zealand. He is the author and editor of eight books on terrorism, political violence and conflict resolution, and more than 50 journal articles and book chapters, 2015, "The epistemological crisis of counterterrorism", *Critical Studies on Terrorism,* p. 41-43]//dickies

Another example of the epistemological crisis, and a direct consequence of the epistemic blind within which knowledge about what terrorists have done previously can no longer be considered a reliable guide to what they might do in the future, is the prevalence of fantasy thinking in counterterrorist thought and practice (see Jackson 2012a). As a number of scholars have recently shown (see Zulaika 2012; Heath-Kelly 2012a), fantasy, exaggeration, hyper-caution and even forms of magical realism are now central themes in counterterrorism and security practice, and bizarre fantasy-imbued behaviour by security officials seems to occur on an almost daily basis. The case of James Fitzgerald cited above, in which terrorism books were re-x-rayed, could be viewed as an example of (subconscious) magical realist thinking by counterterrorist officials: it certainly seems bizarre that books could be thought to hide dangerous materials detectable only by a second x-ray, unless they had some magical quality. In addition to the banal everyday examples of security officials at airports searching very elderly passengers and babies' diapers when it is obvious they pose no threat, serious discussions have taken place within official institutions about the possibility that terrorists could introduce biological weapons into the water supply through fire hydrants (Cooper 2007) or that they might use hang-gliders to deliver suicide bombs into urban areas (Clendenning 2012). It has also been seriously suggested that candy machines might be vulnerable to terrorists (Fahim 2007) wanting to poison unwary American children and 40 R. Jackson Downloaded by [University of California, Berkeley] at 07:59 15 July 2015 that hundreds of American amusement and water parks remain vulnerable to attack by terrorists (Department of Homeland Security 2009). More recently, the town of Keene, New Hampshire, "received national attention when it was revealed that the police department had applied to purchase a military-style BearCat mine-resistant armoured vehicle. The application named the pumpkin festival – a traditional local event for the past 24 years, in which thousands of people flock to see numerous displays of jack-o'- lanterns, and other festive jollities – as a possible target for terrorists" (Woolf 2014). What these and many other cases illustrate is the essential role of imagination and fantasy in counterterrorism; that is, officials imagining unrealistic – or at least exaggerated or realityenhanced – possible terrorist scenarios and then treating them as real threats requiring a material response, or at least serious consideration, from officials. What I am suggesting is that the prevalence of fantasy and magical thinking in counterterrorism flows directly from, and is constitutive of, the profound lack of knowledge that officials and experts claim to have about terrorism and the actual threat it poses. It is not antithetical to, but rather illustrative of, the epistemological crisis in which terrorism is perceived as fundamentally unknown, incalculable and unpredictable – a Rumsfeldian "unknown unknown" (see also de Goede's 2011 notion of "threat imaginaries"). Once counterterrorism officials believe that they cannot really know with any certainty who, where, when, how or why terrorists might strike, or what potential danger they may pose (conventional, nuclear, chemical, biological), then the only option to detect and deal with them is to try and imagine what they might do – which of course, inevitably leads to fantasy in counterterrorist thought and

practice. Hollywood and imaginative counterterrorism It is by now well-known that in October 2001, following the terrorist attacks on New York and Washington, a three-day summit was held at the University of Southern California Institute for Creative Technology (ICT), which brought together counterterrorism officials and Hollywood screenwriters, directors and producers (for an incisive analysis of this meeting, see Frank 2014, 1–8). The aim of the meeting was "to brainstorm about possible terrorist targets and schemes in America and to offer solutions to those threats" (Huck cited in Frank 2014, 1). Frank argues that this meeting grew directly out of the widespread belief that the 9/11 attacks represented, in large part, a failure of imagination: According to this line of reasoning, counterterrorism cannot confine itself to the accumulation of data concerning the goals, strategies, and means of terrorist networks; it also depends on ingenuity in the imagination of future events. In addition to analyzing facts, it must speculatively work through possibilities, think in the subjunctive. And who else would be better suited for this task than screenwriters and directors, who have been tirelessly imagining attacks on domestic targets for several decades? It must have been this thought that prompted Washington to seek the advice of Hollywood, in the hope of being able "to devise plausible ways in which terrorists might launch new attacks against the US." (Frank 2014, 3–4) In other words, preventing future terrorist attacks would necessitate putting the creative imagination to work in devising terrorist scenarios. Later, the 9/11 Commission would reinforce this epistemic reorientation, suggesting: "It is therefore crucial to find a way of routinising, even bureaucratising, the exercise of imagination" (cited in Frank 2014, 3). Frank goes on to rightly note that this episode is a striking example of the epistemological crisis of counterterrorism and makes perfect sense within its internal structure. Moreover, it indicates a reluctance to deal with real or "known" actors, events, histories, Critical Studies on Terrorism 41 Downloaded by [University of California, Berkeley] at 07:59 15 July 2015 subjectivities and conditions of emergence. That is, the fact that terrorism experts were not consulted instead of film makers exemplifies the first condition of the epistemological crisis, namely, the rejection of previous knowledge about terrorism. When we cannot know anything about the real nature of terrorism, except that it is an unknown, unpredictable threat, it makes sense to turn to the experts in fantasy and imagination for advice.

Their threats are not real but constructed by an irrational fear of the unknown

Jackson 15 [Richard Jackson is professor of peace studies at the National Centre for Peace and Conflict Studies, University of Otago, New Zealand. He is the author and editor of eight books on terrorism, political violence and conflict resolution, and more than 50 journal articles and book chapters, 2015, "The epistemological crisis of counterterrorism", *Critical Studies on Terrorism,* p.38]//dickies

In a more recent example, the Australian government changed its terrorism alert level to extreme in September 2014 as the crisis involving Islamic State heated up. According to the Australian authorities, "the top level, 'extreme', indicates that a terrorist attack 'is imminent or has occurred'" (Hurst and Murphy 2014). In announcing the change, however, Prime Minister Abbott said: "I want to stress that this does not mean that a terror attack is imminent… We have no specific intelligence of particular plots. What we do have is intelligence that there are people with the intent and the capability to mount attacks" (Hurst and Murphy 2014). In other words, having no evidence that an attack is imminent, we must nonetheless raise the threat level to imminent because we do have evidence of the (universal adversary's) terrorist's intent. The known intent of the terrorists is sufficient to act: "we need to be aware that there are people who wish to do us harm… So we see an increase particularly in intent – I won't go into all of the details but I think it is important that we raise awareness partly by raising the threat level" (Hurst and Murphy 2014). The known intent of the terrorist is sufficient to overrule the unknown time and location of the attack, creating an imperative to act preemptively to raise the threat level to imminent. We are now in an ontological limbo of "waiting for terror": the attack is imminent and not imminent at the same time. While it could be argued that these are exaggerated or exceptional instances easily dismissed as representative of occasional official idiocy, I would argue that in fact, they perfectly illustrate the nature and structure of the epistemic crisis at the heart of counterterrorist thought. The epistemic crisis lies precisely in the tension between what is seen to be "known" for certain (that there are imaginative and capable terrorists who have the intent to attack us again), what remains uncertain or "unknown" (who they are exactly, and when, where, why and how they will attack) and the moral imperative to do something to preempt it.

AT: Pragmatism

Critical terror studies and active engagement with the political process is an effective way to move beyond critique, finding ways to replace political strategies of terror with non-violent ones
<u>Jackson 7</u>

(Richard Jackson, Department of International Politics, University of Wales, Aberystwyth, Penglais, Aberystwyth, Ceredigion, Wales, UK, "the core commitments of critical terrorism studies", European Political Science 2007, pp. 249-250)

<u>In practice, such a standpoint necessarily entails transparency in specifying one's political–normative stance and values, a continuous critical reflexivity regarding the aims, means and outcomes of terrorism research, particularly as it intersects with state counter-terrorism, and an enduring concern with questions of politics and ethics.</u> In turn, this has clear implications for research funding, knowledge production and the ethics of research in 'suspect communities'. <u>It also entails an enduringly critical stance towards projects of state counter-terrorism, particularly as they affect human and societal security. CTS recognises that such a stance involves a delicate and creative balance between avoiding complicity in oppressive state practices through a continual process of critique, while simultaneously maintaining access to power in order to affect change. From this perspective, CTS is determined to go beyond critique and deconstruction and actively work to bring about positive social change – in part through an active engagement with the political process and the power holders in society. In short, based on an acceptance of a fundamental prior responsibility to 'the other', CTS sees itself as being engaged in a critical praxis aimed at ending the use of terror by any and all actors and in promoting the exploration of non-violent forms of conflict transformation. Specifically, this entails a willingness to try to understand and empathise with the mindsets, world views and subjectivities of non-Western 'others' and a simultaneous refusal to assume or impute their intentions and values</u> (Barkawi, 2004). <u>CTS scholars recognise that in relation to the 'terrorist other', this is a taboo stance within Western scholarship. Moreover, it is a taboo that has been institutionalised in a legal framework in which withholding information from the authorities is a crime</u>, in which academics are being asked to report on their students and in which attempting to understand the subjectivities of 'terrorist' suspects could be interpreted as 'glorification of terrorism' – a crime under UK law. Nonetheless, <u>CTS scholars view it as both analytically and ethically responsible and remain committed to defending the intellectual and ethical integrity of such work.</u>

Deconstructing traditional modes of terrorism studies produces practical changes.
<u>Jackson 7</u>

(Richard Jackson, Department of International Politics, University of Wales, Aberystwyth, Penglais, Aberystwyth, Ceredigion, Wales, UK, "the core commitments of critical terrorism studies", European Political Science 2007, pp. 246-247)

Without discounting the contributions of positivist social science, I would argue that <u>CTS rests firstly upon an understanding of knowledge as a social process constructed through language, discourse and inter-subjective practices</u>. From this perspective, it is understood that <u>terrorism knowledge always</u>

reflects the social–cultural context within which it emerges, which means among other things that it tends to be highly gendered and Eurocentric. CTS understands that knowledge is always intimately connected to power, that knowledge is 'always for someone and for some purpose' and that 'regimes of truth' function to entrench certain hierarchies of power and exclude alternative, counter-hegemonic forms of knowledge and practice. CTS therefore begins with an acceptance of the basic insecurity of all knowledge and the impossibility of neutral or objective knowledge about terrorism. It also evinces an acute sensitivity to the ways in which terrorism knowledge can be deployed as a political technology in the furtherance of hegemonic projects and directs attention to the interests that underlie knowledge claims. Thus, CTS starts by asking: who is terrorism knowledge for, and what functions does it serve in supporting their interests? There are at least three practical consequences of this broad epistemological orientation. First, similar to the field of critical security studies (CSS), CTS begins from an analysis of the epistemological and ontological claims that make the discipline possible in the first place (Williams and Krause, 1997); in particular, the false naturalism of traditional theory and the political content of all terrorism knowledge. More specifically, its research focuses in part on uncovering and understanding the aims of knowledge production within terrorism studies, the operation of the terrorism studies epistemic community and more broadly, the social and political construction of terrorism knowledge. Such analysis can be achieved using deconstructive, narrative, genealogical, ethnographic and historical analyses, as well as Gramscian and constructivist approaches. The purpose of such research is not simply descriptive nor is it to establish the 'correct' or 'real truth' of terrorism; rather, its aim is to destabilise dominant interpretations and demonstrate the inherently contested and political nature of the discourse – to reveal the politics behind seemingly neutral knowledge. A second practical consequence for CTS research is a continuous and transparent critical–normative reflexivity in the knowledge-production process (Shaw, 2003). That is, CTS research acknowledges the impossibility of neutral or objective terrorism knowledge and evinces an acute awareness of the political uses to which it can be put, as well as its inbuilt biases and assumptions. It thus attempts to avoid the uncritical use of labels, assumptions and narratives regarding terrorism in ways that would naturalise them or imply that they were uncontested. Crucial in this respect is an appreciation of the inherently gendered and Eurocentric character of dominant knowledge and discourse on terrorism. A third consequence for CTS research is methodological and disciplinary pluralism; in particular, a willingness to adopt post-positivist and non-IR-based methods and approaches. In this sense, CTS refuses to privilege materialist, rationalist and positivist approaches to social science over interpretive and reflectivist approaches (Price and Reus-Smit, 1998: 261). Avoiding an exclusionary commitment to the narrow logic of traditional social scientific explanation based on linear notions of cause and effect, CTS accepts that constructivist and poststructuralist approaches that subscribe to an interpretive 'logic of understanding' can open space for questions and perspectives that are foreclosed by positivism and rationalism. **This stance is** more than methodological; it is also **political in the sense that it does not treat one model of social science as if it were the sole bearer of legitimacy** (Smith, 2004: 514).

AT: Indicts

AT: Horgan & Boyle

Only critical perspectives on terrorism account for massive levels of state violence.

Ruth **Blakeley**, Department of Politics and International Relations, University of Kent , Canterbury, UK, 7-11-20**08**," The elephant in the room: a response to John Horgan and Michael J. Boyle ," *Critical Studies on Terrorism*, Vol. 1, No. 2, 151–165, http://dx.doi.org/10.1080/17539150802184561

An important aim of scholars associated with the CTS agenda is to foster further studies on state terrorism by liberal democratic states from the Global North, since this has been a widely used strategy by the US, Britain, and France, among others, but has received relatively little attention among terrorism scholars within IR, as well as across the social sciences. Horgan and Boyle have suggested that such calls constitute a 'reinventing of the wheel', because they associate those calls with criticisms that CTS scholars have made of how terrorism has been defined, which, they argue, is simply going over old ground. Furthermore, they point out that many terrorism scholars do acknowledge that the state is 'a primary, if not the most important, agent of terror' (Horgan and Boyle 2008, p. 56), and that in this regard, it is not clear how CTS is offering anything novel. My contention here is firstly, that it is not the definitions of terrorism that are being challenged so much as their applications, and secondly, that acknowledging that states, including Northern democratic ones, are perpetrators of terror does not adequately over- come the dearth of research in this area. In this regard, CTS does of original, since it goes well beyond simply reworking definitions or acknowledging the complicity of liberal democratic states in state terrorism. It establishes a credible research agenda and begins the analytical work that is needed. This includes, as I will show below, identifying incidents of Northern state terrorism, situating them within a taxonomy of all forms of political violence, analysing their origins and purposes, identifying which state actors are involved, and assessing their impacts, within the context of wider foreign policy objectives. It is the case that to label acts of repression 'state terrorism', they need to be consistent with accepted definitions of terrorism, and that if state actions fall outside of that remit, they should be understood as another form of political violence. This is not to say that there is a consensus on even the key elements of the definition of terrorism, but that there is a group of themes that do overlap. Nevertheless, I have found that many acts of violence committed by Northern democracies do fit existing definitions of terrorism, and that in turn, existing definitions are more than adequate for encompassing acts of terror committed by the state. One aspect of my own work has been to explore whether the use of torture constitutes a form of state terrorism and I conclude that in some circumstances it does (Blakeley 2007b). Yet Horgan and Boyle argue that 'the underlying point of the CTS critique of current definitions of terrorism appears to be that many other forms of violence – for example, state terrorism – fall out of conventional definitions of terrorism' (Horgan and Boyle 2008, p. 56). This has not been my experience, and neither has it been my intention to rework definitions of terrorism, since, as they note, numerous terrorism scholars have explored the many problems associated with defining and conceptualising terrorism, and have come up with definitions that are adequate. Indeed, as work by Christopher Mitchell, Michael Stohl, David Carleton, and George Lopez shows, accepted definitions do not in and of themselves preclude actions by states. They argue that to be labelled terrorism, acts carried out either by the state or by non-state actors must involve 'purposive behavior or intention on the part of the "terrorist actor"'; 'the act or threat of violent harm to a victim(s)'; 'observation of the effects of the act or harm by some ultimate target(s)'; 'identification by the target with the victim'; 'some degree of terror induced in the target(s) through a "demonstration effect" and the act of identification'; 'altered behavior ("compellance") or abandoned behaviour ("deterrence") as a direct result of the terrorist demonstration' (Mitchell et al. 1986, p. 5). This definition is distinguished from other forms of coercion and violence by the intention of the actor and the direction of the attempt to influence, in the sense that any actor deploying the strategy 'must have the intention of inducing extreme fear in some population of observers as the main objective for the strategy to count as "true" terrorism' (Mitchel l et al. 1986, p. 6). Similarly, as I have previously discussed (Blakeley 2007a), the definition offered by Wilkinson (1992, pp. 228–229), and repeated widely by IR scholars, does not preclude the state as a perpetrator.

Critical terrorism studies focus on state violence can shift the paradigm for counter-terrorism policy.

Ruth **Blakeley**, Department of Politics and International Relations, University of Kent , Canterbury, UK,

Finally, Horgan and Boyle ask 'whether there is a different intellectual project at work here', where 'the goal is to link the causes of "terrorism" to the bad behaviour of Western governments, capitalism or social economic inequalities' (Horgan and Boyle 2008, p. 58). They state that if this is the case, the CTS project needs to be transparent. My own work does not focus on the causes of non-state terrorism, which in the above articulation is set up as a response to Western practices. I will therefore leave that question for others to address. Nevertheless, I, and the few other scholars that have studied state terrorism by liberal democratic states, have always been transparent about one of the main aims of our work, an explicitly normative one, which is to assess and challenge the use of coercive practices by liberal democratic states, particularly state terrorism, to achieve their foreign policy objectives in the Global South, which have included the spread of global capitalism to ensure access to resources and markets. In this regard the work does look specifically at the relationship between state terrorism and capitalism, and where relevant, pursuant social and economic inequalities. Specifically, it is concerned with cases where liberal democratic states consider the use of terror by themselves or by their elite allies in the Global South to be functional to the achievement of their aims (Blakeley 2006, 2007b, Stokes 2005). Indeed, state terrorism only makes sense when we link it to the wider foreign policy objectives it is intended to serve. In my own analysis of US interventions in Latin America during the Cold War, declassified documents indicate that while the US publicly defended such interventions as a means of containing communism, there was often an underlying material imperative. Officials explicitly pointed to the economic threats posed to the US when left-wing governments were elected, and frequently stated that interventions to support repressive regimes would serve US capitalist interests. The coup in Argentina which saw the establishment of a military dictatorship from 1976 to 1982, for example, unleashed widespread, largely indiscriminate repression, in what became known as the Dirty War. Just two days after the coup, US Secretary of State Henry Kissinger had expressed his approval of the economic benefits that could ensue for the US. William Rogers informed Kissinger that 'we're going to look for a considerable effort to involve the US – particularly in the financial field', and Kissinger replied, 'Yes, but that's in our interest' (Kissinger 1976). Estimates of the numbers of people that were killed or disappeared under the military dictatorship range from 9000 to 30,000, many of whom were also tortured in Argentina's secret detention centres (Amnesty International 2003). The US Embassy in Argentina had itself compiled documentation of nearly 10,000 human rights violations, most of them disappearances by 1979, which it sent to the State Department 'for the Department's permanent records and use' (US Embassy, Argentina 1979). Despite this knowledge, military support for the regime was ongoing. There are many similar examples of US sponsorship of state terrorism in Latin America during the Cold War, where declassified documents show just how much that support was driven by US efforts to protect and promote US capital (Blakeley forthcoming). In analysing these links, there is also an emancipatory goal. In the first instance, this goal is to halt the use of state terrorism by exposing it. The case of the Chilean Diaspora is instructive. Pinochet's regime was gradually undermined in part as a result of efforts by political exiles from Chile, including academics, to raise global awareness of the atrocities committed by the regime, resulting in its condemnation by other states (Ropp and Sikkink 1999). This helped bring an end to the regime and to years of repression, in which the Chilean National Commission on Truth and Reconciliation (CNCTR) found that during and in the years following the coup, 2279 people were killed. Of those, 815 were victims of execution and death by torture, 957 disappeared following arrest, and the remainder were killed either as a result of war tribunals, during political protests, alleged escape attempts, or gun battles (CNCTR 1991). Identifying state terrorism and raising awareness about it is one way that CTS scholars can assist those struggling against repression. Emancipation also implies that elites be dissuaded from using or sponsoring terrorism. To date, this is the area in which the least amount of work has been undertaken by those of us studying the issue, but it should be afforded greater attention. State terrorism is often used or sponsored by

liberal democratic states as a response to a perceived threat to its own interests; in Latin America during the Cold War, the US used and sponsored terrorism as a means to counter the perceived threat from left-wing insurgent groups (Blakeley 2006, 2007b). As Ken Booth argues: when powerful states use violence [...] they are not acting in a manner calculated to make violence less likely; if they achieve success in their own terms, they do so only by proving to others that strategic violence can have political utility. (Booth 2005, p. 273) This undermines their moral legitimacy. One of the challenges for scholars within CTS is therefore to challenge the perceptions of elites that consider specific groups of people to constitute security threats. This may help prevent violations of human rights, as well as the undermining of states proclaiming to be liberal democratic. The starting point is to explore the consequences of state terrorism, not only for victims, but for perpetrating states. A leading figure in France's counter-insurgency campaign in Algeria in the 1950s and 1960s, Jean-Jacques Massu, years late r admitted that the widespread use of torture, often a tool of state terrorism, served no useful or necessary intelligence purpose in overcoming terrorism, but had turned most of the Algerian population against the French, pushing them into the arms of the Front de Libération National (MacMaster 2004, p. 9). One priority for those working on state terrorism with in CTS must be to critically examine state responses to threats that involve the use or sponsorship of state terrorism, evaluate its strategic usefulness as well as its impacts on human rights, and then to challenge elites that deploy such practices.

Useful K Answers

this position.10 **The distinction between government**ality **as a heuristic and government**ality **as a descriptive tool is central for debating political agency** I argue that, notwithstanding their critique of liberalism, **scholars who use government**ality **as a descriptive tool** rely on the same ontological assumptions as the liberal order they criticize and do move away from Foucault's focus on historical practices in order to **privilege abstract theorizations**. By using government**ality** **as a description** of "liberalism" or "capitalism" instead of as a methodology of inquiry on power's contingent modalities and technologies, **these scholars tend to reify** a substantialist ontology that ultimately reinforces a liberal conceptualization of subjects and power as standing in a relation of externality and stifles the possibility of reimagining political agency on different grounds. "**Descriptive governmentality" constructs a critique** of the liberal international order **based** up **on a** n ontological **framework that presupposes that power and subjects are entities** possessing qualities **that preexist relations**. Power is imagined as a "mighty totality," and subjects as monads endowed with potentia. As a result, the problematique of political agency is portrayed as a quest for the "liberation" of a subject ontologically gifted with a freedom that power inevitably oppresses. In this way, the conceptualization of political agency remains confined within the liberal struggle of "freedom" and "oppression." Even researchers who adopt a Foucauldian vocabulary end up falling into what Bigo has identified as "traps" of political science and international relations theorizing, specifically essentialization and ahistoricism. **I argue** here **that** in order to reimagine political agency an ontological and epistemological turn is necessary, one that relies upon a relational ontology. Relational ontological positions question adopting abstract stable entities, such as "structures," "power," or "subjects," as explanations for what happens. Instead, they explore how these pillar concepts of the Western political thought came to being, what kind of practices they facilitate, consolidate and result from, what ambiguities and aporias they contain, and how they are transformed.12 Relational ontologies nurture **"modest" conceptualizations of political agency** and also **question the** overwhelming stability of "mighty totalities," such as for instance the international liberal order or **the state**. **In this framework** **political action has more to do with playing with the cards** that are **dealt to us to produce practical effects in specific contexts than** with **building idealized** "new totalities" **where perfect conditions might exist. The political ethics that results** from non-substantialist ontological positions is one that privileges "modest" engagements and **weights political choices with regard to the consequences and** distributive **effects they may produce** in the context where they are made **rather than based upon** their **universal normative aspirations.** 13 **The New Util Card**

Even a small risk of nuclear war isn't worth taking – preventing existential risk
Baum, Global Catastrophic Risk Institute executive director, 3-14-15

[Seth, Blue Marble Space Institute of Science researcher, Columbia University Center for Research on Environmental Decisions affiliate researcher, Pennsylvania State University Geography PhD, Contemporary Security Policy 36(1), "Winter-Safe Deterrence: The Risk of Nuclear Winter and Its Challenge to Deterrence" http://sethbaum.com/ac/2015_Deterrence.pdf, p.3-5, accessed 4-19-15, TAP]

The concept of nuclear winter was first developed in the early 1980s by scientists including Paul Crutzen, who later won a Nobel Prize in Chemistry for his work on the ozone hole, and legendary astronomer Carl Sagan.3 Sagan went to great lengths to raise awareness about nuclear winter in the 1980s and early 1990s.4 This episode apparently had some influence on policy, with Mikhail Gorbachev citing it as a factor in his desire to cool that era's nuclear tensions and reverse the arms race.5 After fading from

the spotlight, nuclear winter began a bit of a comeback in 2007 with the publication of new research examining nuclear winter with the latest scientific models.6 Several follow-up studies and commentaries have been published since, and research is ongoing.7 In technical terms, 'nuclear winter' refers specifically to a cooling of Earth's surface such that winter-like temperatures occur during summer, as caused by a sufficiently large nuclear war. Cooling to warmer-than-winter temperatures can be called 'nuclear autumn'. Per this definition, nuclear winter/autumn is part of a broader suite of environmental consequences of nuclear war. However, all of the environmental consequences can have profound consequences for the planet and for human civilization, and likewise are important for policy. No separate term has been coined for the full suite of environmental consequences of nuclear war, so this paper will use 'nuclear winter' as shorthand for the full suite. This use of 'nuclear winter' may be interpreted metaphorically: a time of cold, darkness, and death. Nuclear winter is caused by the burning of cities, industrial facilities, trees, and other flammable materials, which sends smoke into the atmosphere. The main effects of the smoke derive from the fact that the smoke rises high up into the atmosphere, past the clouds, into the stratosphere where it will not quickly fall back out in rain. At this altitude, the smoke spreads across the planet and gradually falls back out over the next ten to twenty years. While it is aloft, the smoke absorbs incoming sunlight and blocks it from reaching the surface. As the smoke absorbs sunlight, the stratosphere warms, causing ozone depletion at a potentially massive scale.8 The ozone depletion causes more ultraviolet radiation to reach Earth's surface. Increased UV radiation can harm living organisms, including humans. Harmful effects include skin cancer and eye damage to animals and the inhibition of photosynthesis in plants.9 Meanwhile, the smoke blocking sunlight from reaching the surface causes colder surface temperatures and less precipitation. Precipitation declines because there is less heat to power the hydrological cycle. The main harmful effect that has been identified is a decline in plant growth, including agricultural production. Secondary effects could include disease outbreaks and additional conflicts.10 The effects occur worldwide, regardless of where the detonations occur, though detonation location can affect the spatial distribution of impacts. For both UV radiation and cooling, the magnitude of the disruption is proportionate to the amount of smoke put into the atmosphere, which in turn depends on the number of nuclear detonations, the bombs' yields, the detonation locations, and other factors. Regarding detonation location, a key variable is whether the detonation occurs in a city, and if it does, the population density of the city. Other locations such as industrial zones can also produce significant quantities of smoke. This is why nuclear weapons testing has not caused nuclear winter: The tests were conducted in remote locations or at high altitude, and thus did not have much to burn. The location of a city on the globe can also make a difference given Earth's topography and atmospheric circulation patterns, but this effect is smaller. The most heavily studied nuclear winter scenario involves war between India and Pakistan in which each country uses 50 nuclear weapons, each with a 15 kiloton yield, comparable to the Little Boy weapon dropped on Hiroshima. The studies assume that the weapons are dropped on each country's major cities, and not on e.g. remote military targets, producing 5 teragrams of smoke.11 In this scenario, ozone loss would range from 20% to 70% from low to high latitudes.12 Temperatures would fall about 1.25ºC within the first year. Even ten years after, temperatures would still be about 0.5ºC below normal.13 Crop yields in China and the Midwestern United States are projected to decline by around 10-30%.14 One analysis estimates that at least two billion people would be at risk of starvation.15 A core point is that **even a 'limited' regional nuclear war could have catastrophic global consequences**. It should be emphasized that what drives nuclear winter is the quantity of smoke entering the stratosphere, not where the nuclear war occurs. Thus a comparably large nuclear war between other countries would have similar global climatic and humanitarian effects. The India-Pakistan scenario offers an illustrative and relatively probable case, but any nuclear weapon state except North Korea could produce similar effects. A larger nuclear exchange involving American and Russian arsenals would cause further disruption. An exchange of about 1200 weapons could produce about 50 teragrams of smoke, causing temperatures to fall by about 4ºC. For 4000 weapons—around what New START prescribes—there could be 150 teragrams of smoke, with a temperature fall of about 8ºC. Agriculture failure would

be so severe and widespread that it becomes easier to count the survivors than the fatalities.16 Climate scientist Alan Robock, who has led many of the recent nuclear winter studies, expects some **survivors** 'especially in Australia and New Zealand'.17 While this is hardly a cheerful evaluation, even this **may be too optimistic**. Hopefully some people somewhere would find some way to survive. But the conditions would be harsh enough that **survival is no guarantee**.18 Finally, it should be acknowledged that, over the years, there has been some scepticism of whether nuclear winter would actually occur, or would occur with enough severity to be worth factoring into security policy.19 To an extent, one cannot be sure what would happen, because a large exchange of nuclear weapons has fortunately never occurred. However, there are at least two reasons to believe that the current round of nuclear winter science is yielding results that are at least in the general vicinity of what would actually happen. One reason is that the science uses modern climate models developed for the study of global warming. Global warming has its own sceptics and controversies, which has led to the climate models being heavily scrutinized.20 **Climate science may well be the most carefully vetted of all the sciences. The nuclear winter researchers are themselves distinguished climate scientists and are using state-of-the-art climate models**. And two distinct nuclear winter research groups from two different countries using two different sets of models both report approximately the same results.21 While some uncertainties in the science of nuclear winter remain and additional research could provide additional confidence, it should be expected that the current research results are basically sound. The second reason for believing that nuclear winter would occur is that it has a historical precedent in volcano eruptions. Volcano eruptions, like nuclear weapon detonations, cause large amounts of smoke to rise into the atmosphere. An insightful example is the 1815 Mount Tambora eruption. The Tambora eruption caused temperatures to fall by about 0.5ºC, resulting in major food shortages and other disruptions, such that 1816 is now known as the 'Year Without Summer'.22 While humanity ultimately survived Tambora, nuclear war could put even more smoke into the atmosphere and cause more severe disruption. It thus is important to factor into nuclear security policy. Risk Analysis of Winter-Safe Nuclear Arsenal Limits It is in every country's interest to avoid nuclear winter. No country would benefit from the increased exposure to UV radiation and decreased agricultural yields, among other harms, all of which would occur worldwide regardless of where the weapons were used. This point raises two questions: what is needed to avoid nuclear winter, and how far countries should go to avoid it. Answering both questions suggests adhering to limits to nuclear weapon arsenal sizes that keep the world safe from nuclear winter. Given uncertainty about both what future wars may occur and the severity of nuclear winter if nuclear war does occur, answering these questions benefits from analysis to identify policies that perform well in light of the uncertainty. The severity of nuclear winter is a function of the amount of smoke produced in a nuclear exchange, which in turn depends on the number, yield, and location of detonations in the exchange. How small of a nuclear arsenal would be needed to keep human civilization safe from nuclear winter? The short answer is, nobody knows. Modern climate modelling provides a pretty good understanding of the climatic consequences. There are some important uncertainties in the climate science, but the big uncertainty is how well humans will cope. Research on the allimportant human factor is frighteningly scarce, limited mainly to a few studies connecting the climate science to agricultural models.23 This research is instructive, but it leaves basic questions unanswered about the total human impacts of nuclear winter. Consider one of the most detailed studies of the human consequences of nuclear winter, by Ira Helfand of the International Physicians for the Prevention of Nuclear War.24 This is the study that found at least two billion at risk of starvation from an India-Pakistan exchange of 100 nuclear weapons (50 per country). The two billion estimate comes from converting agriculture declines into nutrition loss for the people who are already malnourished. As the study notes, the figure does not estimate deaths from second-order effects like disease outbreaks and additional conflicts. Perhaps a mild nuclear winter could even trigger a conflict in which additional nuclear weapons are built and used. The stakes may be even higher in the future as developments in synthetic biology, geoengineering, and other technologies render civilization more powerful but less stable.25 The bottom line is that **even a smaller nuclear exchange might have catastrophic global consequences**. But on the other hand, it might not. Nobody knows. Making policy under such heavy uncertainty is a difficult challenge, but it is also a familiar one. One cannot predict the consequences of a military campaign, but decisions on whether and how to wage it must be made. One cannot predict the consequences of a new technology, but decisions about whether and how to regulate it must be made. And so on for quite a large portion of ongoing policy decisions. Here it is important to bring in the ethics of

global catastrophic risk. A global catastrophe is an event that causes great harm to the entirety of global human civilization. Catastrophes of this magnitude take on a special ethical significance. Carl Sagan was perhaps the first to recognize this in his own discussion of nuclear winter. The astronomer saw the big picture: **Human extinction means the loss of all people who could ever exist into the distant future**.26 Contemporary scholars further understand that even without total human extinction, a permanent collapse of human civilization is of comparable significance.27 **Ultimately what is at stake is the long-term trajectory of human civilization,** its success or its failure.

Frontline – State Heuristic Good

Our heuristic means we learn about the State without being it. It won't entrench dominant norms _BUT WE ALSO_ don't' invert the error and NEVER learn about them. Our framework teaches contingent, but engaged, middle grounds. No _State pessimism bias_ or _optimism bias for extreme Alts_.

-we are defending a contingent state that does not exist now but we can bring it about

-Learning about the state good

-We don't have to say the state is always good. Our model gives us another tool to combat pressing issues

Zanotti '14

Dr. Laura Zanotti is an Associate Professor of Political Science at Virginia Tech. Her research and teaching include critical political theory as well as international organizations, UN peacekeeping, democratization and the role of NGOs in post-conflict governance."Governmentality, Ontology, Methodology: Re-thinking Political Agency in the Global World" – <u>Alternatives: Global, Local, Political</u> – vol 38(4):p. 288-304,. A little unclear if this is late 2013 or early 2014 – The Stated "Version of Record" is Feb 20, 2014, but was originally published online on December 30th, 2013. Obtained via Sage Database.

By questioning substantialist representations of power and subjects, inquiries on the possibilities of political agency are reframed in a way that focuses on power and subjects' relational character and the contingent processes of their (trans)formation in the context of agonic relations. Options for resistance to government al scripts are not limited to "rejection," "revolution," or "dispossession" to regain a pristine "freedom from all constraints" or an immanent ideal social order. It is found instead in multifarious and **contingent struggles** that are constituted **within** the scripts of **government** al **rationalities** and at the same time exceed and **transform them**. This approach questions oversimplifications of the **complex** ities of liberal political rationalities and of their interactions with non-liberal political players and nurtures a radical skepticism about identifying universally good or bad actors or abstract solutions to political problems. International power interacts in complex ways with diverse political spaces and within these spaces it is appropriated, hybridized, redescribed, hijacked, and tinkered with. **Government** ality as a **heuristic** focuses on performing complex diagnostics of events. It invites historically situated explorations and careful differentiations rather than overarching demonization s of "power," romanticizations of the "rebel" or the "the local." More broadly, theoretical formulations that conceive the subject in non-substantialist terms **and** focus on processes of subjectification, on the ambiguity of power discourses, and on hybridization as the terrain for political transformation, open ways for reconsidering political agency beyond the dichotomy of oppression/rebellion. These alternative formulations also **foster** an ethic s of political engagement, to be continuously taken up through plural and uncertain practices, that demand continuous attention to "what happens" instead of fixations on "what ought to be." 83 Such ethics of engagement would not await the revolution to come or hope for a pristine "freedom" to be regained. Instead, it would constantly attempt to twist the working of power by playing with whatever cards are available and would require intense processes of reflexivity **on the consequences** of political choices. To conclude with a famous phrase by Michel Foucault "my point is not that everything is bad, but that everything is dangerous, which is not exactly the same as bad. If everything is dangerous, then we always have something to do. So **my position leads not to apathy but to hyper- and pessimistic activism.**" 84

We're "State-as-heuristic", not "State-as-descriptor". That distinction matters for Framework and Links. If "fiat's fake", heuristics still mean we'll learn contingent toolkit items AND avoid pitfalls of foundational "descriptor" frameworks. Those reify and over-value idealism.

While there are important variations in the way international relations scholars use governmentality theory, for the purpose of my argument I identify two broad trajectories.2 One body of scholarship uses governmentality as a **heuristic** tool to explore modalities of local and international government and to assess their effects in the contexts where they are deployed; the other adopts this notion as a **descriptive** tool to theorize the globally oppressive features of international liberalism. Scholars who use governmentality as a heuristic tool tend to conduct inquiries based upon analyses of practices of government and resistance. These scholars rely on ethnographic inquiries, emphasizes the multifarious ways government works in practice to include its oppressive trajectories and the ways uneven interactions of governmental strategies and resistance are contingently enacted. As examples, Didier Bigo, building upon Pierre Bourdieu, has encouraged a research methodology that privileges a relational approach and focuses on practice;3 William Walters has advocated considering governmentality as a research program rather than as a ''depiction of discrete systems of power;''4 and Michael Merlingen has criticized the downplaying of resistance and the use of ''governmentality'' as interchangeable with liberalism.5 Many other scholars have engaged in contextualized analyses of governmental tactics and resistance. Oded Lowenheim has shown how ''responsibilization'' has become an instrument for governing individual travelers through ''travel warnings'' as well as for ''developing states'' through performance indicators;6 Wendy Larner and William Walters have questioned accounts of globalization as an ontological dimension of the present and advocated less substantialized accounts that focus on studying the discourses, processes and practices through which globalization is made as a space and a political economy;7 Ronnie D. Lipschutz and James K. Rowe have looked at how localized practices of resistance may engage and transform power relations;8 and in my own work, I have studied the deployment of disciplinary and governmental tools for reforming governments in peacekeeping operations and how these practices were hijacked and resisted and by their targets. Scholars who use governmentality as a **descriptive tool** focus instead on one particular trajectory of global liberalism, that is on the convergence of knowledge and scrutiny of life processes (or biopolitics) and violence and theorize global liberalism as an extremely effective formation, a coherent and powerful Leviathan where biopolitical tools and violence come together to serve dominant classes or state's political agendas. As I will show, Giorgio Agamben, Michael Hardt and Antonio Negri, and Sergei Prozorov tend to embrace

AT: Hidden Motives

Pointing out hidden motives doesn't work – it doesn't disprove our specific argument and it isn't falsifiable.
Karlsson, Debunking Denialism, 2012

[Emil, "The Role of Motives in Arguments" http://debunkingdenialism.com/2012/07/06/the-role-of-motives-in-arguments/]

What is the role of motives in arguments? Is it important or relevant what motives a person has for arguing for the validity of his or her arguments? Or is it just a convenient way to shield oneself from accepting that one is mistaken?¶ It may be useful to look at the concept of substitution in cognitive psychology. It occurs when one is replacing the actual question with a question that requires fewer cognitive resources to answer. The classic example is when the question being evaluated concerns how common or how statistically likely something is. This is, for many, usually replaced by the simpler question of "how easy can I imagine examples" of this something. The answer most people give to the question "How common is crimes by a certain ethnic minority?" will depend on how easy it is to imagine examples that you know of it, usually corresponding to how frequent it has been portrayed in the media. This is called availability heuristics. Other examples of substitution is replacing "how likely is this product to succeed in the market place?" with "how much do I like it?".¶ Could something similar be going on when people start discussing the motives of an individual instead of the merits of his or her arguments? The harder question, namely "is this a reasonableness argument?", is substituted by the easier question, namely "do I like this person's position?". This is usually no (otherwise there would be little point in having an adversarial argument). So then this has to be expressed, and of course the opponent won't say "well, I don't like your position, therefore your argument is wrong", because that would be weird. Instead, I would wager that the person would start calling into question the motives of the proponent instead, since no actual evaluation of the merits of the argument has taken place.¶ So, in addition to being logically fallacious, the rhetorical technique of appealing to the motives of a person making an argument (instead of addressing the actual argument), it is really a form of cognitive error. Clearly, the merits of a particular claim does not depend on the motives of the person putting forward the argument. It only rests on the evidence and arguments for or against the particular proposition.¶ The action of dismissing the argument by calling into the question or pointing out the motives of the person making the argument can be put into a few different fallacies, such as appeal to motive, argumentum ad hominem circumstantial, genetic fallacy, bulverism, subject/motive shift, red herring, non sequitur or straw man. It will vary depending on the specifics of the situation and sometimes it will fulfill several of these fallacies. Here are some examples of how to categorize it:¶ Appeal to motive: an argument is attacked by calling into question the motives of the person making the argument.¶ Argument ad hominem circumstantial: a more general form, where an argument is attacked by someone pointing out that the person making the argument finds himself in a particular context that he or she tends to take that position.¶ Genetic fallacy: a fallacy where an argument is evaluated based on the personal characteristics of the person making the argument, or on the source of the argument in general.¶ Bulverism and subject/motive shift: a type of argumentum ad hominem circumstantial fallacy where the argument for a position is rejected because it can be explained why a person held that position.¶ Red herring: usually an intentional attempt at distracting the conversation from the actual issue (i.e. the truth or falsity of the argument).¶ Non sequitur: because it does not follow that a person's motives makes the argument he or she puts forward incorrect.¶ Straw man: the person does not actually have the motives that is being assumed.¶ They all are applicable, but one does not want to continue to derail the discussion by getting into the details of why the opponents obsession with one's motives. That is just an intellectual dead-end. Instead, it may be useful to point out that it is an appeal to motive and that the validity of a person's argument has nothing to do with that person's motives. That covers the rational aspect of the rebuttal, but it is also important to state that one does not have that particular motive, and to write a little bit about how one agree with some of the contentions presented by the other person. If you are arguing against the death penalty, it can be beneficial to state that no, you do not secretly want criminals ending the life of children or completely remove personal responsibility from society and that you, in fact, think that a criminal justice system that prevents and reduces crime is of paramount importance. You do not have to have the exact same view of what makes an effective criminal justice system, only that you share some of the same overarching values on the issue. This can defuse some of the antagonism in the debate.

Breaks down dialogue.
Benjamin and Smallwood, CRACKED, 2011

[Kathy and Karl, "5 Logical Fallacies That Make You Wrong More Than You Think" http://www.cracked.com/article_19468_5-logical-fallacies-that-make-you-wrong-more-than-you-think.html]

#3. <u>We Think Everyone's Out to Get Us</u>¶If you're smart and savvy, you know not to trust anyone. <u>This is why we can excuse ourselves for using</u> shady or flat-out <u>dishonest tactics to win an argument</u>. We're sure the other guy is doing much, much worse.¶Getty¶"I will yield that the sky is blue, if you acknowledge that the moon landing was engineered by an unfrozen Walt Disney."¶<u>The world is so full of hidden agendas and stupid ideologies that we have to do whatever we can to keep up</u>. And "whatever we can" is often code for lying.¶The Science:¶Think about all the people you've disagreed with this month. How many of them do you think were being intentionally dishonest? <u>Experts say you're almost definitely overshooting the truth. It's called the trust gap</u>, and scientist see it crop up every time one human is asked to estimate how trustworthy another one is. In one study, subjects were asked to rate the likelihood that strangers would share pretend winnings with them. The subjects figured about half were trustworthy enough to share. When it came time to actually share, about 80 percent came through. The <u>subjects thought the world was almost twice as corrupt as it actually is</u>.¶Getty¶"Most of the people in this calculus class would cut my throat for a value meal."¶<u>The problem, as another study found, is that when you assume someone is lying, you rarely find out that you're wrong. You just walk away congratulating yourself on being able to sniff out an ambush from a mile away</u>.¶"Why would he flee the country? He loves surprise parties, poker and judging blow job contests."¶<u>We start assuming people have ulterior motives and hidden agendas as early as age 7 and from that point on, we never have to lose another argument for the rest of our lives</u>. After all, if we assume the person we're arguing with is lying, the only thing they can prove to us is that they're a really good liar. This is how racism, sexism and any other sort of discrimination work. Once someone's made-up their mind that color is the culprit, convincing them otherwise is going to be close to impossible, no matter how ridiculous the scenario.¶"I can't buy anymore white cars from you, Sneaky Pete. They keep blowing up. What other colors do you have in this model?"¶This is also where you get claims like, "Those conservatives don't really think taxes are too high, they secretly hate poor people!" or "Those liberals don't really think the poor need assistance, they're secretly communists!" <u>It's impossible to learn anything from a conversation with someone who you think is lying to you. The more arguments you get into with those lying extremists from the other side of the aisle, the more you learn about how they lie, the faster your brain turns off after they start talking</u>.

AT: Serial Policy Failure

Alt fails – it is locked in the ivory tower – they can't solve serial policy failure.
Walt, Harvard University international relations professor, 2011

[Stephen, "International Affairs and the Public Sphere" http://publicsphere.ssrc.org/walt-international-affairs-and-the-public-sphere/]

On the one hand, **there is a widespread sense that academic research on global affairs is of declining practical value, either as a guide to policymakers** or as part of broader public discourse about world affairs. Former policymakers complain that **academic writing is "either irrelevant or inaccessible to policy-makers. . . locked within the circle of esoteric scholarly discussion."** This tendency helps explain Alexander George's recollection that policymakers' eyes "would glaze as soon as I used the word theory."[1] As **Lawrence Mead noted** in 2010: "**Today's political scientists often address very narrow questions and they are often preoccupied with method and past literature. Scholars are focusing more on themselves, less on the real world. . . . Research questions are getting smaller and data-gathering is contracting. Inquiry is becoming obscurantist and ingrown."[2] Within the field of international affairs, this trend has led to repeated calls to "bridge the gap" between the ivory tower and the policy community**.[3] Consistent with that aim, a number of prominent **scholars** have recently organized workshops or research projects **seeking to challenge this "cult of irrelevance" and** deprogram its adherents, although it is not clear whether these efforts will succeed in reversing the current drift.[4] This online symposium **reflects** a similar **concern: how can the academic world contribute to a healthy public conversation about our collective fate, one that leads to more effective or just solutions to contemporary problems and helps humankind avoid major policy disasters**?

Frontline – AT: Structural Violence

War causes structural violence, not the other way around

Joshua **Goldstein**, American University International Relations Professor, 20**01**, "War and Gender: How Gender Shapes the War System and Vice Versa," p.411-412

I began this book hoping to contribute in some way to a deeper understanding of war—an understanding that would improve the caches of someday achieving real peace, by deleting war from our human repertoire. In following the thread of gender running through war, I found the deeper understanding I had hoped for - a multidisciplinary and multilevel engagement with the subject. Yet **I became** somewhat more **pessimistic about how quickly or easily war may end. The war system emerges**, from the evidence in this book, **as** relatively **ubiquitous and robust. Efforts to change this system must overcome** several **dilemmas** mentioned in this book. First, **peace activists face a dilemma in thinking about causes of war and working for peace.** Many peace **scholars and activists support the approach, "if you want peace, work for justice."** Then, **if one believes that sexism contributes to war, one can work for gender justice** specifically (perhaps among others) **in order to pursue peace**. This approach brings strategic allies to the peace movement (women, labor, minorities), **but rests on the assumption that injustices cause war**. The evidence in this book suggests that **causality runs** at least as **strongly the other way. War is not a product of capitalism, imperialism, gender**, innate aggression, **or any other single cause**, although all of these influence wars' outbreaks and outcomes. Rather, **war has** in part **fueled and sustained these and other injustices**.9 So, "if you want peace, work for peace." Indeed, **if you want justice** (gender and others), **work for peace. Causality does not run just upward through the levels of analysis, from types of individuals, societies, and governments up to war. It runs downward too**. Enloe suggests that changes in attitudes towards war and the military may be the most important way to "reverse women's oppression." The dilemma is that peace work focused on justice brings to the peace movement energy, allies, and moral grounding, yet, in light of this book's evidence, the **emphasis on injustice** as the main cause of war **seems** to be **empirically inadequate**.

Structural violence doesn't escalate – prefer proximate causes

Hinde and Pulkkinnen, Cambridge psychology professor and University of

Jyväskylä psychology professor, **2000**

[Robert and Lea, DRAFT Background Paper for Working Group 1: HUMAN AGGRESSIVENESS AND WAR, 50th Pugwash Conference On Science and World Affairs: "Eliminating the Causes of War" Queens' College, Cambridge, UK, 3-8 August http://www.pugwash.org/reports/pac/pac256/WG1draft1.htm]

People are capable of perpetrating the most **terrible** acts of **violence** on their fellows. From before recorded history humans have killed humans, and violence is potentially present in every society. There is no escaping the fact that the capacity to develop a propensity for violence is part of human nature. **But that does not mean** that **aggression is inevitable**: temporary **anger need not give rise to persistent hostility**, **and hostility need not give rise to** acts of **aggression**. And people also have the capacity to care for the needs of others, and are capable of acts of great altruism and self-sacrifice. A subsidiary aim of this workshop is to identify the factors that make aggressive tendencies predominate over the

cooperative and compassionate ones. **Some degree of conflict** of interest **is often present in relationships between individuals**, in the relations **between groups of individuals** within states, **and in** the **relations between states**: **we are concerned with the factors that make such conflicts escalate into violence.** The answer to that question depends critically on the context. While there may be some factors in common, **the bases of individual aggressiveness are very different from those involved in mob violence, and they differ** yet again **from the factors influencing the bomb-aimer pressing the button in a large scale international war**. In considering whether acts which harm others are a consequence of the aggressive motivation of individuals, **it is essential to recognise the diversity of such acts, which include interactions between individuals, violence between groups, and wars of the WW2 type**. We shall see that, with increasing social complexity, individual aggressiveness becomes progressively less important, but other aspects of human nature come to contribute to group phenomena. Although **research on human violence has focussed too often on the importance of one factor or another, it is essential to remember** that **violence** always **has multiple causes, and the interactions between the causal factors remain largely unexplored**.

EXTN – AT: Structural Violence

Their conception of violence is reductive and can't be solved
Boulding, University of Colorado Boulder economics professor, 1977

[Kenneth, Journal of Peace Research No. 1, Vol. XIV, "Twelve Friendly Quarrels with Johan Galtung" JSTOR, p.83-4]

Finally, we come to the great Galtung metaphors of <mark>'structural violence' 'and 'positive peace'</mark>. They <u>are metaphors rather than models, and for that very reason</u> <mark>are suspect</mark>. Metaphors always imply models and metaphors have much more persuasive power than models do, for models tend to be the preserve of the specialist. But when a metaphor implies a bad model it can be very dangerous, for it is both persuasive and wrong. The metaphor of structural violence I would argue falls right into this category. The metaphor is that poverty, deprivation, ill health, low expectations of life, a condition in which more than half the human race lives, is 'like' a thug beating up the victim and 'taking his money away from him in the street, or it is 'like' a conqueror stealing the land of the people and reducing them to slavery. The implication is that poverty and its associated ills are the fault of the thug or the conqueror and the solution is to do away with thugs and conquerors. <u>While there is some truth in the metaphor, in the modern world at least there is not very much. Violence, whether of the streets and the home, or of the guerilla, of the police, or of the armed forces, is a very different phenomenon from poverty. The processes which create and sustain poverty are not at all like the processes which create and sustain violence,</u> although like everything else in 'the world, everything is somewhat related to everything else.

There is a very real problem of the structures which lead to violence, but unfortunately Galitung's <u>metaphor of structural violence</u> as he has used it <u>has diverted attention from this problem.</u> <mark>Violence</mark> in the behavioral sense, that is, somebody actually doing damage to somebody else and trying to make them worse off, <mark>is a 'threshold' phenomenon,</mark> rather like the boiling over of a pot. <mark>The temperature under a pot can rise for a long time without its boiling over, but at some 'threshold boiling over will take place</mark>. The study of the structures which underlie violence are a very important and much neglected part of peace research and indeed of social science in general. <u>Threshold phenomena like violence are difficult to study because they represent 'breaks' in the system rather than uniformities. Violence, whether between persons or organizations, occurs when the 'strain' on a system is too great for its 'strength'</u>. The metaphor here is that <mark>violence is like what happens when we break a piece of chalk</mark>. Strength and strain, however, especially in social systems, are so interwoven historically that it is very difficult to separate them.

The diminution of violence involves two possible strategies, or a mixture of the two; one is the increase in the strength of the system, 'the other is the diminution of the strain. The strength of systems involves habit, culture, taboos, and sanctions, all these 'things which enable a system to stand increasing strain without breaking down into violence. The <u>strains on the system 'are largely dynamic in character</u>, such as arms races, mutually stimulated hostility, changes in relative economic position or political power, which are often hard to identify. Conflicts of interest 'are only part 'of the strain on a system, and not always the most important part. <u>It is very hard for people to know their interests, and misperceptions of 'interest take place mainly through the dynamic processes, not through the structural ones. It is only perceptions of interest which affect people's behavior, not the 'real' interests, whatever these may be, and the gap between perception and reality can be very large and resistant to change</u>.

However, what Galitung calls <mark>structural violence</mark> (which has been defined 'by one unkind commentator as anything that Galitung doesn't like) <u>was originally defined as any unnecessarily low expectation of life, on that assumption that anybody who dies before the allotted span has been killed, however unintentionally and unknowingly, by somebody else. The concept</u> <mark>has been expanded to include all</mark> 'the <mark>problems</mark> of poverty, destitution, deprivation, and misery. These are enormously real and are a very high priority for

research and action, but they belong to¶ systems ==which are only peripherally related¶ to '==the structures which produce ==violence==.

This is not to say that the cultures of violence¶ and the cultures of poverty are not¶ sometimes related, though <u>not all poverty¶</u> <u>cultures are cultures of violence, and certainly¶ not all cultures of violence are poverty¶ cultures. But the dynamics of poverty and¶ the success or failure to rise out of it are of¶ a complexity far beyond anything which the¶ metaphor of structural violence can offer.¶ While the metaphor of structural violence¶ performed a service in calling attention to¶ a problem,</u> ==it may have done a disservice in¶ preventing us from finding the answer==.

Negative peace is a prerequisite.

<u>Elshtain</u>, U Chicago Social and Political Ethics Professor, Princeton University Advanced Study Institute Fellow, Rockefeller Foundation Resident Scholar, Guggenheim Fellow, 200**8**

[Jean Bethke, "Peace, Order, Justice: Competing Understandings," Millennium, 36.3, Sage]

We arrive, finally at model III. Let's call this hard-headed peace. This is a ==**peace**== that ==**is mindful**== at every point ==**of justice**== claims **and ==the overriding need for at least a modicum of civil order== and tranquility if ==other worthy goals, including justice== claims, are to be heard and ==worked towards at all==**. Within hard-headed peace, various dichotomies – not only realism/idealism but peace/war – as absolutes, break down. We recognise, with Hedley Bull and others, that ==**war plays a central role in the maintenance of international law** and the preservation of the balance of power, ==**thereby effecting changes that are just**==. Of course, ==**war can** also ==**be a destroyer of order and a force for injustice**== – but we cannot pace, the peace advocates I have criticised - condemn every war in advance as necessarily a paragon of the latter rather than the former.¶ As with every human endeavour this limited – neither absolute nor perpetual – ==**peace is a precious, fragile human achievement.**== Its advocates recognise that we often need disturbers of the peace should a 'peace' be unjust even as we require defenders of the peace against those who would overturn it in the name of some dangerously eschatological political ideology – the triumph of the Aryan race, the triumph of the universal class – with their death camps and gulags to deal with those who stand in the way of the absolutist projects.¶ I recall being haunted by a story I read – an ancient Chinese parable – of the necessary precondition for perpetual peace, namely, that one should be so far removed from any other 'city' that, in the dead calm of night, the echoes of a dog barking could not carry – not alert some other city that aliens, strangers, were within striking distance. Your only options, if you heard that dog bark, were to go kill the inhabitants of the other city and destroy it or to incorporate them – to make them as 'one' with yourself – for the mere existence of this alien entity marred 'peace'. Extreme, yes. But instructive, for it alerts us to the often ontologically suspicious features or absolute or perpetual peace – the presence of the alien suffices to mar it. **As much as I loved the late John Lennon** and remain an unreconstructed Beatlesmaniac – his song '==**Imagine' is the stringing together of empty banalities**==: no states, no religion, **nothing to kill or die for, and ==the world will be as one. Fat chance. I don't know how one gets from== the song's subjectivist ==anarchy to perpetual peace==** but we confront the high hill of moral upmanship yet again in popular, simplistic form.¶ **If**, however, **you find the moral problems of international politics 'infinitely complex, bewildering and perplexing',** in Martin Wight's words**, it makes you a 'natural Grotian'**. I'm going to have to reflect on his claim a bit

more but this much is clear to me: <mark>**War will never be abolished, so we must limit it ethically and politically**</mark> in the manner of just war teaching **and here debates will turn on how 'thick' the restraints must be**;¶**Human nature** – yes, I said it – politically incorrect as it is – **is a complex admixture of** good and evil, nastiness and niceness, good **Harry Potter with a bit of** evil **Voldemortian temptation** thrown in and **this is unavoidable** That means we should be appropriately humble about even our best intentions, for on this earth there is neither absolute good nor absolute evil as a characteristic of either persons or states; We must recall and recuperate an earlier moral conception of sovereignty to live alongside the monopoly of the means of violence definition of the state, namely, an understanding of sovereignty as responsibility; Correlatively, this means sovereigns can 'unsovereign' themselves, as Kings could unking themselves and transmogrify into tyrants: this in the medieval right of resistance tradition. Failed state phenomena indicate a moral as well as a political failure; indeed, the new 'responsibility to protect' norm, it seems to me, requires something of this moral notion of sovereignty as responsibility if, or when, we arrive at the conclusion of failure. A rogue state similarly signifies a failure.¶There is, of course, a question: who is authorised to act on behalf of the normative conception of sovereignty? It is clear to me that, in the history of my own country, notions of our own security come from enlarging our sphere of responsibility.¶How well, or poorly, or wisely, or stupidly, we have done this is, of course, open to fierce contestation, but my point is that a notion of responsibility – not absolute, disinterested responsibility, of course – is a salient feature of American thinking on war and peace. The dangers in this position lie in either overconstruing one's responsibilities or falling into isolationism if, in acting out responsibilities, one encounters intransigent difficulties or failure. Limited notions of peace and justice carry with them notions of limited culpability; no one is in full and absolute control of events. It behooves us to be less than grand in what we propose to undertake and to enact.¶Martin Wight cites Nehru, speaking of Gandhi, as having said that it was 'his supreme ambition to wipe every tear from every eye'. Nehru indicated, dryly, that perhaps <mark>**we could lessen human suffering and misery but eliminating it altogether was beyond our capacity.**</mark> For those of us for whom <mark>**the universe is by no means 'curable'**</mark>, <mark>**those seeking absolute cures are dangerous if,**</mark> at times, <mark>**noble**</mark> people. <mark>**Ambiguity in our thinking about peace, order and justice within international politics is not a shortcoming**</mark> lowing **from some 'imperfectly theorised' perspective or methodological weakness but,** instead, <mark>**inherent in the complexities of the subject matter**</mark>. <mark>**If you make it simple you are**</mark>, quite frankly, <mark>**unreliable**</mark> in some basic sense.¶In a 1996 book, Augustine and the Limits of Politics, I laid out the basis of an Augustinian political ethic – one that does not aspire to and cannot provide a total political catechism or architectonic of world order: The earthly city is never free from the dangers of bloodshed, sedition, and war. A human being cannot even be certain of 'his own conduct on the morrow,' let alone specify and adjudicate that of others in ways he or she foreordains. <mark>**In this world of discontinuities**</mark> and profound yearnings, of sometimes terrible necessities, <mark>**a human being can yet strive to**</mark> maintain or to create an order that approximates justice, **to** <mark>**prevent the worst from happening**</mark>, and to resist the seductive lure of grandiosity.

AT: Root Cause/All Violence

No single cause of violence.
Muro-Ruiz, London School of Economics, 2002

[Diego, Politics Volume 22, Issue 2, pages 109–117, May 2002, "The Logic of Violence" Wiley]

<u>Violence is</u>, most of the time, <u>a wilful choice, especially if it is made by an organi-sation. Individuals present the scholar with a more difficult case to argue for. Scholars of violence have now a wide variety of perspectives they can use – from sociology and political science, to psychology, psychiatry and even biology – and should escape easy judgements.</u> However, <u>the fundamental difficulty for all of us is the absence of a synthetic, general theory able of integrating less complete theories of violent behaviour. In the absence of such a general theory</u>, researchers should bear in mind that <u>violence is a complex and multifaceted phenomenon that resists mono-causal explanations. Future research on violence will have to take in account the variety of approaches, since they each offer some understanding of the logic of violence</u>.

chrome&espv=210&es_sm=122&ie=UTF-8]

I suppose it is correct to say that, if Schopenhauer is right, <u>if life is never worth living, then according to utilitarianism we should all commit suicide</u> and put an end to humanity. <u>But this does not mean that, each of us should commit suicide</u>. I commented on this in chapter two when I presented the idea that utilitarianism should be applied, not only to individual actions, but to collective actions as well.¶It is a well-known fact that <u>people rarely commit suicide. Some even claim that no one who is mentally sound commits suicide. Could that be taken as evidence for the claim that people live lives worth living? That would be rash</u>. Many people are not utilitarians. They may avoid suicide because they believe that it is morally wrong to kill oneself. It is also a possibility that, <mark>even if people lead lives not worth living, they believe they do. And even if some may believe that their lives</mark>, up to now, <mark>have not been worth living, their future lives will be better. They may be mistaken about</mark> this. They may hold false expectations about the future.¶<mark>From the point of view of evolutionary biology, it is natural to assume that people should rarely commit suicide</mark>. If we set old age to one side, it has <u>poor survival value</u> (of one's genes) <u>to kill oneself</u>. So it should be expected that it is difficult for ordinary people to kill themselves. But then <u>theories about cognitive dissonance, known from psychology, should warn us that we may come to believe that we live better lives than we do.</u>¶My strong belief is that most of us live lives worth living. However, I do believe that our ¶lives are close to the point where they stop being worth living. But then it is at least not very far-fetched to think that they may be worth not living, after all. My assessment may be too optimistic.¶Let us just for the sake of the argument <u>assume that our lives are not worth living, and let us accept that, if this is so, we should all kill ourselves</u>. As I noted above, <u>this does not answer the question what we should do, each one of us</u>. My conjecture is that we should not commit suicide. The explanation is simple. <u>If I kill myself, many people will suffer.</u> Here is a rough explanation of how this will happen:¶... <u>suicide "survivors" confront a complex array of feelings</u>. Various <u>forms of guilt are</u> quite <u>common</u>, such as that arising from (a) the belief that one contributed to the suicidal person's anguish, or (b) the failure to recognize that anguish, or (c) the inability to prevent the suicidal act itself. <u>Suicide also leads to rage, loneliness, and awareness of vulnerability in those left behind</u>. Indeed, the sense that suicide is an essentially selfish act dominates many popular perceptions of suicide. ¶<mark>The fact that all our lives lack meaning, if they do, does not mean that others will follow</mark> my example. <u>They will go on with their lives and their false expectations</u> — at least for a while devastated because of my suicide. <u>But then I have an obligation, for their sake, to go on with my life</u>. It is highly likely that, <u>by committing suicide, I create more suffering (in their lives) than I avoid (in my life).</u>

<u>Going on with my life in spite of the fact that it lacks meaning</u> (contains a net surplus of pain over happiness) <u>is not such a big deal. Even if the net balance of the rest of my life does consist of pain rather than happiness, this is something I am already used to. I have strategies to cope with it. They are not perfect. After all, given the hypothesis in this section, my net balance will be negative. However, this is a sacrifice, not too heavy, I should make in the best interest of my dear ones.</u>

EXTN – AT: V2L

Value to life is subjective and resilient.
The Onion, 2010

[Issue 46 19, 5-10-10, "Exhausted Noam Chomsky Just Going To Try And Enjoy The Day For Once" http://www.theonion.com/articles/exhausted-noam-chomsky-just-going-to-try-and-enjoy,17404/]

Describing himself as "terribly exhausted," famed linguist and political dissident Noam Chomsky said Monday that he was taking a break from combating the hegemony of the American imperialist machine to try and take it easy for once.¶"I just want to lie in a hammock and have a nice relaxing morning," said the outspoken anarcho-syndicalist academic, who first came to public attention with his breakthrough 1957 book Syntactic Structures. "The systems of control designed to manufacture consent among a largely ignorant public will still be there for me to worry about tomorrow. Today, I'm just going to kick back and enjoy some much-needed Noam Time."¶"No fighting against institutional racism, no exposing the legacies of colonialist ideologies still persistent today, no standing up to the widespread dissemination of misinformation and state-sanctioned propaganda," Chomsky added. "Just a nice, cool breeze through an open window on a warm spring day."¶Sources reported that the 81-year-old Chomsky, a vociferous, longtime critic of U.S. foreign policy and the political economy of the mass media, was planning to use Monday to tidy up around the house a bit, take a leisurely walk in the park, and possibly attend an afternoon showing of Date Night at the local megaplex.¶Sitting down to a nice oatmeal breakfast, Chomsky picked up a copy of Time, a deceitful, pro-corporate publication that he said would normally infuriate him.¶"Yes, this magazine may be nothing more than a subtle media tool intended to obfuscate the government's violent agenda with comforting bromides, but I'm not going to let that get under my skin," Chomsky said. "I mean, why should I? It's absolutely beautiful outside. I should just go and enjoy myself and not think about any of this stuff."¶Added Chomsky, glancing back over at the periodical, "Even if it is just another way in which individuals are methodically fed untruths that slowly shape their perceptions of reality, dulling their ability to challenge and defy a government bent on carrying out its own selfish and destructive—no, no Noam, not today, none of that today."¶According to sources close to the thinker, Chomsky also considered taking time to "plop down on the couch in [his] boxers and watch TV," but grew suddenly enraged when The Price Is Right came on, commodifying the lie of American consumer satisfaction in a pseudo- entertainment context.¶"Just change the channel, just relax and switch to something that isn't mindless pabulum for the masses," said Chomsky, reaching for the remote control. "No need to get furious."¶Chomsky, who often defines himself as a libertarian socialist, then changed the channel to ESPN, taking a moment to acknowledge the role of professional sports as a "weapon of mass distraction," keeping the American people occupied with trivial competitions so they do not focus on opposing the status quo with grassroots movements against foreign and domestic policies that ultimately harm them.¶"Stupid NBA playoffs," Chomsky said. "At least it's better than that NCAA March Madness crap. A university is supposed to be a center of learning that questions the state's crafted messaging, not an entertainment factory."¶Sources said Chomsky took what was supposed to be a refreshing drive in the countryside, only to find himself obsessing over the role petroleum plays in the economic and military policies that collude with multinational corporate powers.¶After stopping at a roadside McDonald's, Chomsky was unable to enjoy the Big Mac he purchased, due to the popular restaurant chain's participation in selling "a bill of goods" to the American people, who consume the unhealthy fast food and thereby bolster the capitalist system

rather than buying from local farmers in order to equalize the distribution of wealth and eat more nutritiously.¶Chomsky also found the burger to be too salty.¶"All right, all right," the noted critic and philosopher said, "I'm going back home, writing one—just one—reasoned, scathing essay, and getting it out of my system. But then I'm definitely going back to the park to walk around and just enjoy the nice weather. I'm serious."¶"Because there's got to be more to life than the way that wage slavery strips the individual of his or her inherent dignity and personal integrity," Chomsky continued. "Right?"

General K Answers

Sokal

The liberal left has lost all meaning in their work – it has devolved to pretty words and flashy philosophical ideas. A physicist was able to get his fake article into a left leaning journal even though it was pure nonsense.

Sokal '95 – Professor of Physics at New York University (Alan, "A Physicist Experiments With Cultural Studies," http://physics.nyu.edu/faculty/sokal/lingua_franca_v4/lingua_franca_v4.html)//DWB

For some years I've been troubled by an apparent decline in the standards of intellectual rigor in certain precincts of the American academic humanities. But I'm a mere physicist: if I find myself unable to make head or tail of jouissance and différance, perhaps that just reflects my own inadequacy.¶ So, to test the prevailing intellectual standards, I decided to try a modest (though admittedly uncontrolled) experiment: Would a leading North American journal of cultural studies -- whose editorial collective includes such luminaries as Fredric Jameson and Andrew Ross -- publish an article liberally salted with nonsense if (a) it sounded good and (b) it flattered the editors' ideological preconceptions?¶ The answer, unfortunately, is yes. Interested readers can find my article, ``Transgressing the Boundaries: Toward a Transformative Hermeneutics of Quantum Gravity,'' in the Spring/Summer 1996 issue of Social Text. It appears in a special number of the magazine devoted to the ``Science Wars.''¶ What's going on here? Could the editors really not have realized that my article was written as a parody?¶ In the first paragraph I deride ``the dogma imposed by the long post-Enlightenment hegemony over the Western intellectual outlook'':¶ "that there exists an external world, whose properties are independent of any individual human being and indeed of humanity as a whole; that these properties are encoded in ``eternal'' physical laws; and that human beings can obtain reliable, albeit imperfect and tentative, knowledge of these laws by hewing to the ``objective'' procedures and epistemological strictures prescribed by the (so-called) scientific method".¶ Is it now dogma in Cultural Studies that there exists no external world? Or that there exists an external world but science obtains no knowledge of it?¶ In the second paragraph I declare, without the slightest evidence or argument, that ``physical `reality' [note the scare quotes] ... is at bottom a social and linguistic construct.'' Not our theories of physical reality, mind you, but the reality itself. Fair enough: anyone who believes that the laws of physics are mere social conventions is invited to try transgressing those conventions from the windows of my apartment. (I live on the twenty-first floor.)¶ Throughout the article, I employ scientific and mathematical concepts in ways that few scientists or mathematicians could possibly take seriously. For example, I suggest that the ``morphogenetic field'' -- a bizarre New Age idea due to Rupert Sheldrake -- constitutes a cutting-edge theory of quantum gravity. This connection is pure invention; even Sheldrake makes no such claim. I assert that Lacan's psychoanalytic speculations have been confirmed by recent work in quantum field theory. Even nonscientist readers might well wonder what in heavens' name quantum field theory has to do with psychoanalysis; certainly my article gives no reasoned argument to support such a link.¶ Later in the article I propose that the axiom of equality in mathematical set theory is somehow analogous to the homonymous concept in feminist politics. In reality, all the axiom of equality states is that two sets are identical if and only if they have the same elements. Even readers without mathematical training might well be suspicious of the claim that the axiom of equality reflects set theory's ``nineteenth-century liberal origins.''¶ In sum, I intentionally wrote the article so that any competent physicist or mathematician (or undergraduate physics or math major) would realize that it is a spoof. Evidently the editors of Social Text felt comfortable publishing an article on quantum physics without bothering to consult anyone knowledgeable in the subject.¶ The fundamental silliness of my article lies, however, not in its numerous solecisms but in the dubiousness of its central thesis and of the ``reasoning'' adduced to support it. Basically, I claim that quantum gravity -- the still-speculative theory of space and time on scales of a millionth of a billionth of a billionth of a billionth of a centimeter -- has profound political implications (which, of course, are ``progressive''). In support of this improbable proposition, I proceed as follows: First, I quote some controversial philosophical pronouncements of Heisenberg and Bohr, and assert (without argument) that quantum physics is profoundly consonant with ``postmodernist epistemology.'' Next, I assemble a pastiche -- Derrida and

general relativity, Lacan and topology, Irigaray and quantum gravity -- held together by vague rhetoric about ``nonlinearity'', ``flux'' and ``interconnectedness.'' Finally, I jump (again without argument) to the assertion that ``postmodern science'' has abolished the concept of objective reality. Nowhere in all of this is there anything resembling a logical sequence of thought; one finds only citations of authority, plays on words, strained analogies, and bald assertions.¶ In its concluding passages, my article becomes especially egregious. Having abolished reality as a constraint on science, I go on to suggest (once again without argument) that science, in order to be ``liberatory,'' must be subordinated to political strategies. I finish the article by observing that ``a liberatory science cannot be complete without a profound revision of the canon of mathematics.'' We can see hints of an ``emancipatory mathematics,'' I suggest, ``in the multidimensional and nonlinear logic of fuzzy systems theory; but this approach is still heavily marked by its origins in the crisis of late-capitalist production relations.'' I add that ``catastrophe theory, with its dialectical emphases on smoothness/discontinuity and metamorphosis/unfolding, will indubitably play a major role in the future mathematics; but much theoretical work remains to be done before this approach can become a concrete tool of progressive political praxis.'' It's understandable that the editors of Social Text were unable to evaluate critically the technical aspects of my article (which is exactly why they should have consulted a scientist). What's more surprising is how readily they accepted my implication that the search for truth in science must be subordinated to a political agenda, and how oblivious they were to the article's overall illogic.¶ Why did I do it? While my method was satirical, my motivation is utterly serious. What concerns me is the proliferation, not just of nonsense and sloppy thinking per se, but of a particular kind of nonsense and sloppy thinking: one that denies the existence of objective realities, or (when challenged) admits their existence but downplays their practical relevance. At its best, a journal like Social Text raises important questions that no scientist should ignore -- questions, for example, about how corporate and government funding influence scientific work. Unfortunately, epistemic relativism does little to further the discussion of these matters.¶ In short, my concern over the spread of subjectivist thinking is both intellectual and political. Intellectually, the problem with such doctrines is that they are false (when not simply meaningless). There is a real world; its properties are not merely social constructions; facts and evidence do matter. What sane person would contend otherwise? And yet, much contemporary academic theorizing consists precisely of attempts to blur these obvious truths -- the utter absurdity of it all being concealed through obscure and pretentious language.¶ Social Text's acceptance of my article exemplifies the intellectual arrogance of Theory -- meaning postmodernist literary theory -- carried to its logical extreme. No wonder they didn't bother to consult a physicist. If all is discourse and ``text,'' then knowledge of the real world is superfluous; even physics becomes just another branch of Cultural Studies. If, moreover, all is rhetoric and ``language games,'' then internal logical consistency is superfluous too: a patina of theoretical sophistication serves equally well. Incomprehensibility becomes a virtue; allusions, metaphors and puns substitute for evidence and logic. My own article is, if anything, an extremely modest example of this well-established genre.¶ Politically, I'm angered because most (though not all) of this silliness is emanating from the self-proclaimed Left. We're witnessing here a profound historical volte-face. For most of the past two centuries, the Left has been identified with science and against obscurantism; we have believed that rational thought and the fearless analysis of objective reality (both natural and social) are incisive tools for combating the mystifications promoted by the powerful -- not to mention being desirable human ends in their own right. The recent turn of many ``progressive'' or ``leftist'' academic humanists and social scientists toward one or another form of epistemic relativism betrays this worthy heritage and undermines the already fragile prospects for progressive social critique. Theorizing about ``the social construction of reality'' won't help us find an effective treatment for AIDS or devise strategies for preventing global warming. Nor can we combat false ideas in history, sociology, economics and politics if we reject the notions of truth and falsity.¶ The results of my little experiment demonstrate, at the very least, that some fashionable sectors of the American academic Left have been getting intellectually lazy. The editors of Social Text liked my article because they liked its conclusion: that ``the content and methodology of postmodern science provide powerful intellectual support for the progressive political project.'' They apparently felt no need to analyze the quality of the evidence, the cogency of the arguments, or even the relevance of the arguments to the purported conclusion.¶ Of course, I'm not oblivious to the ethical issues involved in my rather unorthodox experiment. Professional communities operate largely on trust; deception undercuts that trust. But it is important to understand exactly what I did. My article is a theoretical essay based entirely on publicly available sources, all of which I have meticulously footnoted. All works cited are real, and all quotations are rigorously accurate; none are invented. Now, it's true that the author doesn't believe his own argument. But why

should that matter? The editors' duty as scholars is to judge the validity and interest of ideas, without regard for their provenance. (That is why many scholarly journals practice blind refereeing.) If the Social Text editors find my arguments convincing, then why should they be disconcerted simply because I don't? Or are they more deferent to the so-called ``cultural authority of technoscience'' than they would care to admit?¶ In the end, <u>I resorted to parody for a simple pragmatic reason</u>. <u>The targets of my critique have by now become a self-perpetuating academic subculture that typically ignores (or disdains) reasoned criticism from the outside</u>. In such a situation, a more direct demonstration of the subculture's intellectual standards was required. But how can one show that the emperor has no clothes? **Satire is by far the best weapon**; <u>and the blow that can't be brushed off is the one that's self-inflicted</u>. I offered the Social Text editors an opportunity to demonstrate their intellectual rigor. Did they meet the test? I don't think so.¶ I say this not in glee but in sadness. After all, I'm a leftist too (under the Sandinista government I taught mathematics at the National University of Nicaragua). On nearly all practical political issues -- including many concerning science and technology -- I'm on the same side as the Social Text editors. But <u>I'm a leftist (and feminist) because of evidence and logic, not in spite of it. Why should the right wing be allowed to monopolize the intellectual high ground?</u>¶ And why should self-indulgent nonsense -- whatever its professed political orientation -- be lauded as the height of scholarly achievement?

Radical Alts

Alt can't transition from theory to political change

Gibson 8

(John, Postdoctoral Fellow, University of Kent, "The Myth of the Multitude: The Endogenous Demise of Alter-globalist Politics," Global Society, Vol. 22, No. 2, April, 2008)

Crucially, such assessments view the rhizomatic structures and reflexive capacities of alter-globalist agents as also negating the internal antagonism and factionalism often associated with social movements. Hardt understands the World Social Forum as fulfilling the promise of anti-hierarchical politics—an infinitesimally open-ended collection of struggles converging around a basic commitment to resist neoliberalism, in which ideological differences cease to produce significant schisms.16 Stephen Gill has argued that alter-globalist practices counter long-standing differences between "new" and "old" social movements, **creating a radically fluid "postmodern Prince"** in the process.17 Similarly, Jackie Smith has argued that the demand for "democracy", functioning as an open signifier for the desire for greater personal control over biopolitics, **is the sole commonality** in otherwise plural alter-globalist spaces.18 Such claims resemble Laclau and Mouffe's model of a Logic of Equivalence, in which a vast collection of particular social movements and political demands resonate in accordance with one another through the use of a central empty signifier (in this case, "democracy") as an open point for infinite re-inscriptions, and whose ontological closure is permanently resisted.19 In such interpretations, the pronoun "we" in alterglobalist contexts is devoid of any fixed subjective content and is radically democratic. The political moment is defined within such discourses by Kingsnorth's "one no". Unity is structured around a shared rejection of transnational neoliberal capitalism, facilitating cross-cultural forms of identification and epistemic exchange, resisting any fixed meaning of the collective subject that undertakes activism. The **central dilemma** for activist life becomes whether the "many yeses" arising in its wake can exert counter-hegemonic power in a long-term war of position.20 However, although such accounts appear to present sources of optimism that dominant technocratic and individualist frames of global politics can be countered successfully**, there are reasons to doubt their claims**. After reaching an early apogee of 250,000 protesters at the Genoa G8 meeting in 2001, in the wake of 11 September 2001 **summit protests have declined significantly**, both in terms of frequency and attendees. The protest in Miami against the Free Trade Area of the Americas (FTAA) agreement in November 2003, advertised within movement circles as an event that would exceed the importance of Seattle, drew a crowd of below 10,000, and failed to generate any significant media coverage.21 The 2004 G8 summit in Georgia was met by hundreds, rather than thousands of protesters, and planned solidarity actions elsewhere failed to materialise.22 Likewise, the 2004 London May Day gathering was cancelled after poorly attended planning meetings, and in 2005 fewer than two dozen self-declared anti-capitalists played cricket on the lawn south of the House of Commons.23 The direct action protests conducted around the Gleneagles G8 summit **were undertaken by only a few thousand**, and controversial protest tactics, including acts of vandalism in Auchterarder, generated considerable internal schisms.24 Social Forums have also become beset by difficulties. **Intra-movement concerns reflect a growing atrophy**; the absence of a venue for the prospective fifth European Social Forum reflects a scenario in which "there is no more cooperation between our forces than there was before Florence [in 2002]".25 To compound matters, some activists have complained that such events are becoming **dominated by resource-heavy NGOs**.26 The World Social Forum has become frequented by political elites. Gerhard Schro¨der and Jacques Chirac both attended the 2003 event, transgressing its Charter of Principles, in which the WSF exists in "opposition to a process of globalisation commanded by the large multinational corporations and by the governments and international institutions at the service of those corporations' interests, with the complicity of national governments".27 Activists often assert **that the current impasse is temporary**, that as new ways of pushing forward are imagined there will be a corresponding resurgence of antineoliberal politics. However, rather than the **current lull** representing a temporary period of torpor for alter-globalist politics, **a number of entrenched weaknesses within the dominant myths of alter-globalist networks stymie its capacity to embody radical democracy**. Caution is required against the hubris evident in the prevailing accounts of a **fluid subject, conscious of its counter-hegemonic potential** as a source of the dissolution of the neoliberal world order. **Such mythology is ridden with inherent deficiencies**

that are rarely addressed by participants. Rather than a global multitude taking shape, <u>in many respects we see</u> **only the phantasm of such a polis**, **and one that depends upon the active repression of contradictions and flaws in order to maintain the idealised image of the multitude** presented by such prominent movement commentators as Klein and Kingsnorth.

Framework

Surveillance-Specific

Discuss Surveil k Resist

Discussion of surveillance is key to resist the surveillance state – deliberation through the public can bring about change

Rice 15

(Rebecca, University of Montana, "Resisting NSA Surveillance: Glenn Greenwald and the public sphere debate about privacy," pg online @ http://scholarworks.umt.edu/cgi/viewcontent.cgi?article=5439&context=etd YDEL)

Public deliberation can be viewed as a form of resistance through Greenwald's rhetoric.¶Though many scholars have looked at microresistance to surveillance power, Greenwald asks ¶the public to resist through deliberation, which he considers an antidote to surveillance. This¶solution grapples with the contradiction of the US as surveillance state and the US as a¶democracy. The public sphere will continue to discuss these competing values, sharing in¶alternative projections of the future (Goodnight, 2012a). Greenwald encourages the public to¶create a shared vision of a state with transparency in the public sphere and privacy for citizens.¶ Implications for Journalism and Whistleblowing¶ Greenwald's rhetoric also has implications for the practices of journalism and¶ whistleblowing. Though he argues that journalists should do more to question the US¶ surveillance state, he finds himself constrained by journalistic expectations. These lead to a¶debate over the boundaries of journalism and how to portray whistleblowers.¶ Greenwald as journalist or advocate. Greenwald's critique of the media offers¶another path of resistive action for special actors within the public sphere. The media serves¶the public sphere by spreading information, as Habermas (1974) says, "in a large public body¶ this kind of communication requires specific means for transmitting information and¶ influencing those who receive it. Today newspapers and magazines, radio and television are¶ the media of the public sphere" (p. 49). Greenwald's critique of the media calls for the media¶to uphold their public sphere function and transmit information, even state secrets, for public¶deliberation. However, differences between Greenwald's Guardian articles and NPTH show¶ that even though Greenwald says journalists should be advocates, he himself is constrained by¶ journalistic expectations.¶ Greenwald's writings in The Guardian fulfill less of an advocacy role than his writings¶ in NTPH. Greenwald's newspaper articles often: 1) explain information about surveillance ¶ programs in common language, 2) quote various organizations' standpoints and knowledge¶ about the programs and, 3) explain why these revelations are significant (e.g. they demonstrate¶ that the NSA concealed programs, they demonstrate that Americans are being spied on without¶ a court warrant). Importantly, many of Greenwald's stronger advocacy claims, like the¶ argument that the NSA functions as a panopticon, are not mentioned until NPTH. Other¶ functions of the book include: 1) demonstrating the negative private effects of surveillance, 2)¶ linking surveillance to the compromise of democratic ideals, and 3) suggesting possible¶ solutions. Though Greenwald encourages journalists to provide a check on the government and¶advocate for change, his claims are tempered in his own newspaper articles. Greenwald¶ discusses this directly as he talks about trouble publishing with The Guardian throughout¶ NPTH. Greenwald prepared his first story about BOUNDLESSINFORMANT, but was told¶ that The Guardian editors would have to meet with their lawyers before publishing. Publishing¶ US government secrets, he was told, could be considered a crime under the Espionage Act.¶ The Guardian agreed to consult with the government to demonstrate that they did not intend to¶harm national security. Greenwald waited impatiently in Hong Kong for three days as his¶ editor conferred with Guardian lawyers. He considered leaving and publishing the documents¶ independently, but admits that "doing it alone, without institutional protection, would be far¶ riskier" than publishing with a large newspaper (2014, p. 69). Though Greenwald says¶journalists should be stronger critics of the US government, he himself struggled with¶institutional and journalistic constraints as he reported the NSA stories.

The public sphere through discussion can combat the surveillance state- the public has the power to remove NSA secrecy resulting in legal reform

Rice 15

(Rebecca, University of Montana, "Resisting NSA Surveillance: Glenn Greenwald and the public sphere debate about privacy," pg online @ http://scholarworks.umt.edu/cgi/viewcontent.cgi?article=5439&context=etd YDEL)

The key finding from Greenwald's case is that the public sphere can be used as¶ resistance to surveillance power, though this solution may not satisfactorily solve the¶ overreaches of surveillance power. Greenwald links Foucauldian ideas of surveillance to the¶ NSA, and then poses the solution of public deliberation. The public sphere may be a strong¶ form of resistance against surveillance because of the incompatibility of the technical values of¶ surveillance with the public sphere: if, as Greenwald says, the NSA is successful in retaining¶ its power because it is secret, a public sphere discussion strips away the NSA's power by¶ removing its secrecy. Central tenets of the public sphere include public access and openness¶ (Asen and Brouwer, 2001), and central tenets of surveillance power include public¶ inaccessibility and technical closure. By framing surveillance as at odds with the public¶ sphere, Greenwald makes the argument that only through the public sphere can we resist¶ surveillance on a large-scale. Greenwald's rhetoric bridges the theoretical gap between public¶ sphere scholarship and Foucault's idea of surveillance power, demonstrating how these¶ conflicting values may overlap in ways that are productive for resistance.¶

Public discussion acts as resistance to NSA surveillance- only engaging in deliberation the state can limit surveillance

Rice 15

(Rebecca, University of Montana, "Resisting NSA Surveillance: Glenn Greenwald and the public sphere debate about privacy," pg online @ http://scholarworks.umt.edu/cgi/viewcontent.cgi?article=5439&context=etd YDEL)

The public sphere as resistance. The resistive subject Greenwald calls into being¶ would be an active public sphere participant who questions the surveillance state through¶ public discussion. Though this subject would take small steps to preserve online privacy,¶ Greenwald spends much of NPTH explaining broader solutions to surveillance. NPTH¶ constitutes an attempt to use the public sphere to resist NSA surveillance.¶ Resistance literature has often focused on small ways to resist surveillance power. ¶ Foucault focuses on personal, transversal struggles against surveillance power, because¶ surveillance power stems from compartmentalization and control over the body The body is¶ "approached as an object to be analyzed and separated into its constituent parts," forging the¶ creation of a docile, useful subject (Dreyfus & Rabinow, 1983, p. 153). As a result, struggles¶ against this control are often anarchistic, immediate, and focused on the individual (Foucault,¶ 1983). Greenwald acknowledges this effect, and argues that surveillance leads to the internal¶ suppression of dissenting thoughts as a result. However, Greenwald does not advocate for just¶ a small, personal solution to this control over the body.¶ Greenwald's appeals are an example of using the public sphere as a form of resistance¶ to surveillance. Though this idea differs from acts of microresistance, Greenwald's suggestions¶ still fit with Foucauldian ideas of resistance, and show how the public sphere can play a part in¶ that resistance. Greenwald argues that citizens can engage in public deliberation to negotiate¶ with the surveillance state. This echoes Foucault's idea of "not being governed quite so much,"¶ or critique (1997, p. 45). Foucault (1997) says that critique is based on several anchoring¶ points, including universal rights. The act of critique asserts that the subject does not want to¶ accept laws because they are unjust. Critique asks "What are the limits of the right to govern?"¶ (Foucault, 1997, p. 46). People may engage in critique to negotiate the way they are being¶ governed if they find the rules of governance to be contrary to natural rights. Greenwald¶ encourages critique through public deliberation about the limits of the surveillance state. He¶ draws on American values like political freedom and freedom of expression, thus using¶ American rights as a basis for critiquing surveillance. Greenwald's call to action echoes¶ Foucault's idea of critique. ¶ Rice 58¶ Greenwald's ideas also run parallel to Habermas's functions of the public sphere.¶ Greenwald's solution is similar to the way Habermas (1974) describes the bourgeois public¶ sphere, which was a medium through which private needs were communicated to the state. A¶ key demand of this bourgeois public was that they "opposed the principle of supervision—that¶ very principle which demands that proceedings be made public" (p. 52). This group was¶ concerned with private autonomy and the restriction of state power to a few areas. Thus,¶ Habermas argues that the public sphere can be used to negotiate private freedoms. This¶ becomes the link between the public sphere and Foucauldian ideas of surveillance: using the¶ public sphere, citizens can collectively negotiate to be governed less. Greenwald demonstrates¶ that the NSA's surveillance is a public problem, calling on the American public to deliberate¶ about the future of surveillance.

Talking about surveillance helps us change policies

Greenwald 2014

(Glenn Edward Greenwald is an American lawyer, journalist and author. He was a columnist for Guardian US from August 2012 to October 2013. He was a columnist for Salon.com from 2007 to 2012, and an occasional contributor to The Guardian. ; No Place to Hide ; May 13, 2014 ; Introduction: 7-8 ; AWEY)

In the fall of 2005, without much in the way of grandiose expectations, I decided to create a political blog. I had little idea at the time how much this decision would eventually change my life. My principal motive was that I was becoming increasingly alarmed by the radical and extremist theories of power the US government had adopted in the wake of 9/11, and I hoped that writing about such issues might allow me to make a broader impact than I could in my then-career as a constitutional and civil rights lawyer. Just seven weeks after I began blogging, the New York Times dropped a bombshell: in 2001, it reported, the Bush administration had secretly ordered the National Security Agency (NSA) to eavesdrop on the electronic had been going on for four years and had targeted at least several thousand Americans. The subject was a perfect convergence of my passions and my expertise. The government tried to justify the secret NSA program by invoking exactly the kind of extreme theory of executive power that had motivated me to begin writing: the notion that the threat of terrorism vested the president with virtually unlimited authority to do anything to "keep the nation safe," including the authority to break the law. The ensuing debate entailed complex questions of constitutional law and statutory interpretation, which my legal background rendered me well suited to address. I spent the next two years covering every aspect of the NSA warrantless wiretapping scandal, on my blog and in a bestselling 2006 book. My position was straightforward: by ordering illegal eavesdropping, the president had committed crimes and should be held accountable for them. In America's increasingly jingoistic and oppressive political climate, this proved to be an intensely controversial stance.

Talking about government policies allow us to become informed

Greenwald 2014

(Glenn Edward Greenwald is an American lawyer, journalist and author. He was a columnist for Guardian US from August 2012 to October 2013. He was a columnist for Salon.com from 2007 to 2012, and an occasional contributor to The Guardian. ; No Place to Hide ; May 13, 2014 ; Introduction: 7-8 ; AWEY)

It was this background that prompted Edward Snowden, several years later, to choose me as his first contact person for revealing NSA wrong-doing on an even more massive scale. He said he believed I could be counted on to understand the dangers of mass surveillance and extreme state secrecy, and not to back down in the face of pressure from the government and its many allies in the media and elsewhere. The remarkable volume of top secret documents that Snowden passed on to me, along with the high drama surrounding Snowden himself, have generated unprecedented worldwide interest in the menace of mass electronic surveillance and the value of privacy in the digital age. But the underlying problems have been festering for years, largely in the dark. There are, to be sure, many unique aspects to the current NSA controversy. Technology has now enabled a type of ubiquitous surveillance that had previously been the province of only the most imaginative science fiction writers. Moreover, the post-9/11 American veneration of security above all else has created a climate particularly conducive to abuses of power. And thanks to Snowden's bravery and the relative ease of copying digital NSA story resonate with numerous episodes from the past, stretching back across the centuries. Indeed, opposition to government invasion of privacy was a major factor in the establishment of the United States itself, as American colonists protested laws that let British officials ransack at will any home they wished. It was legitimate, the colonists agreed, for the state to obtain specific, targeted warrants to search individuals when there was evidence to establish probable cause of their wrongdoing. But general warrants—the practice of making the entire citizenry subject to indiscriminate searches—were inherently illegitimate. The Fourth Amendment enshrined this idea in American law. Its language is clear and succinct: "The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no warrants shall issue, but upon probable cause, supported by oath or

affirmation, and particularly describing the place to be searched, and the persons or things to be seized." It was intended, above all, to abolish forever in America the power of the government to subject its citizens to generalized, suspicionless surveillance. The clash over surveillance in the eighteenth century focused on house searches, but as technology evolved, surveillance evolved with it. In the mid-nineteenth century, as the spread of railways began to allow for cheap and rapid mail delivery, the British government's surreptitious opening of mail caused a major scandal in the UK. By the early decades of the twentieth century, the US Bureau of Investigation—the precursor of today's FBI—was using wiretaps, along with mail monitoring and informants, to clamp down on those opposed to American government policies. No matter the specific techniques involved, historically mass surveillance has had several constant attributes. Initially, it is always the country's dissidents and marginalized who bear the brunt of the surveillance, leading those who support the government or are merely apathetic to mistakenly believe they are immune. And history shows that the mere existence of a mass surveillance apparatus, regardless of how it is used, is in itself sufficient to stifle dissent. A citizenry that is aware of always being watched quickly becomes a compliant and FBI's spying shockingly found that the agency had labeled half a million US citizens as potential "subversives," routinely spying on people based purely on their political beliefs. (The FBI's list of targets ranged from Martin Luther King to John Lennon, from the women's liberation movement to the anti-Communist John Birch Society.) But the plague of surveillance abuse is hardly unique to American history. On the contrary, mass surveillance is a universal temptation for any unscrupulous power. And in every instance, the motive is the same: suppressing dissent and mandating compliance. Surveillance thus unites governments of otherwise remarkably divergent political creeds. At the turn of the twentieth century, the British and French empires both created specialized monitoring departments to deal with the threat of anticolonialist movements. After World War II, the East German Ministry of State Security, popularly known as the Stasi, became synonymous with government intrusion into personal lives. And more recently, as popular protests during the Arab Spring challenged dictators' grasp on power, the regimes in Syria, Egypt, and Libya all sought to spy on the Internet use of domestic dissenters. Investigations by Bloomberg News and the Wall Street Journal have shown that as these dictatorships were overwhelmed by protestors, they literally went shopping for surveillance tools from Western technology companies. Syria's Assad regime flew in employees from the Italian surveillance company Area SpA, who were told that the Syrians "urgently needed to track people." In Egypt, Mubarak's secret police bought tools to penetrate Skype encryption and eavesdrop on activists' calls. And in Libya, the Journal reported, journalists and rebels who entered a government monitoring center in 2011 found "a wall of black refrigerator-size devices" from the French surveillance company Amesys. The equipment "inspected the Internet traffic" of Libya's main Internet service provider, "opening emails, divining passwords, snooping on online chats and mapping connections among various suspects." The ability to eavesdrop on people's communications vests immense power in those who do it. And unless such power is held in check by rigorous oversight and accountability, it is almost certain to be abused. Expecting its temptations runs counter to every historical example and all available evidence about human nature.

Talking about what government surveillance policies do is key to change

Greenwald 2014

(Glenn Edward Greenwald is an American lawyer, journalist and author. He was a columnist for Guardian US from August 2012 to October 2013. He was a columnist for Salon.com from 2007 to 2012, and an occasional contributor to The Guardian. ; No Place to Hide ; May 13, 2014 ; Chapter 5: The Fourth Estate ; AWEY)

Shortly before he died in 2005, the heralded Vietnam war correspondent David Halberstam gave a speech to students at the Columbia Journalism School. The proudest moment of his career, he told them, was when US generals in Vietnam threatened to demand that his editors at the New York Times remove him from covering the war. He had, Halberstam said, "enraged Washington and Saigon by filing pessimistic dispatches on the war." The generals considered him "the enemy" since he had also interrupted their press conferences to accuse them of lying. For Halberstam, infuriating the government was a source of pride, the true purpose and calling of journalism. He knew that being a journalist meant taking risks, confronting rather than submitting to abuses of power. Today, for many in the profession, praise from the government for "responsible" reporting—for taking its direction about what should and should not be published—is a badge of honor. That this is the case is the true measure of how far adversarial journalism in the United States has fallen.

Transparency Key

Public scrutiny solves – transparency is the only mechanism

Rice 15

(Rebecca, University of Montana, "Resisting NSA Surveillance: Glenn Greenwald and the public sphere debate about privacy," pg online @ http://scholarworks.umt.edu/cgi/viewcontent.cgi?article=5439&context=etd)//akim

Greenwald's created public. Warner (2002) encourages scholars to frame publics discursively, saying they exist "**by virtue of being addressed**" (p. 413). Greenwald calls a concerned public into being throughout NPTH, often by discussing his readers as a collective"we." Greenwald's created audience is concerned about surveillance, and willing to take publicaction to advocate for reform. Greenwald emphasizes the choice readers can make with Snowden's leaked NSA documents. He says that Snowden's leaks can create a **new discussion about surveillance**, or they can fade due to public apathy. In the introduction to NPTH, he writes That's what makes Snowden's revelations so stunning and so vitally important. By daring to expose the NSA's astonishing surveillance capabilities and its even more astounding ambitions, he has made it clear, with these disclosures, that we stand at a historic crossroads. Will the digital age usher in the individual liberation and political freedoms that the Internet is uniquely capable of unleashing? Or will it bring about a system of omnipresent monitoring and control, beyond the dreams of even the greatest tyrants of the past? Right now, **either path is possible**. Our actions will determine where we end up. (2014, p. 6). Greenwald gives the audience two choices and links their actions to the two potential paths. In this way, he begins the process of public deliberation, which Goodnight (2012a) describes as a momentary pause in which we examine political paths, both taken and untaken. "As deliberation raises expectations that are feared or hoped for, public argument is a way to share in the construction of the future," he says (Goodnight, 2012a, p. 198). Greenwald shares his interpretation of the choice the public must make with this information. He projects two alternative futures based on the public's deliberation about privacy. This shared future is emphasized through his use of the words "our," "everyone," and "we," which link readers together as the American public. Greenwald's projected paths put the decision into the readers' hand, emphasizing the public's ability to act and intervene in technical surveillance. Through invitations to deliberate, Greenwald addresses his readers as part of a public sphere. Greenwald also argues that deliberation is an effective way to resist surveillance and curb surveillance abuses. Greenwald offers an example from his own life. He says he first learned of the power of deliberation when he heard from Laura Poitras, another journalist who accompanied him on the trip to Hong Kong. She said that she had been detained in airports dozens of times as a result of her writing and filmmaking. Greenwald covered the interrogations of Poitras in a Salon article, which received substantial attention. In the months afterward, Poitras was notdetained again. In NPTH, Greenwald writes "The lesson for me was clear: national security officials do not like the light. They act abusively and thuggishly only when they believe they are safe, in the dark. **Secrecy is the linchpin of abuse of power,** we discovered, **its enabling force Transparency is the only real antidote"** (2014, p. 12). Greenwald generalizes this example to other abuses of power. He says that power without deliberation is "the ultimate imbalance, permitting the most dangerous of all human conditions: the exercise of limitless power with no transparency or accountability" (2014, p. 169). Greenwald presents public deliberation as thesolution and antithesis to surveillance, which he calls for the public to undertake. Afteraddressing readers as members of this public, Greenwald names special actors within the public sphere who can also help to effect change.

Public Sphere Disc k Ref NSA

Public sphere discussions aid in congressional reforms to tighten its reigns on the NSA

Rice 15 (Rebecca, University of Montana, "Resisting NSA Surveillance: Glenn Greenwald and the public sphere debate about privacy," pg online @ http://scholarworks.umt.edu/cgi/viewcontent.cgi?article=5439&context=etd)//akim

Government reform. First, Greenwald says **the government must make changes** in order to curb abuses from the NSA, and that readers should pressure the government to do so. Greenwald says that public branches of the government do not have enough control over the NSA. Giving examples of reform that occurred after his reporting, Greenwald says that he and Snowden were pleased by a bipartisan bill introduced to US Congress. This bill proposed defunding the NSA, which was "by far the most aggressive challenge to the national security state to emerge from Congress since the 9/11 attacks" (2014, p. 249). The bill did not pass, but only by a small margin, which Greenwald portrays as **a hopeful sign of reform**. Additionally, Greenwald suggests "converting the FISA court into a real judicial system, rather than the onesided current setup in which only the government gets to state its case, would be a positive reform" (2014, p. 251). Greenwald's suggestions for change go beyond individual acts to put pressure on government policy reform. By reforming the FISA court, the secrets of the NSA would be public knowledge. Though Greenwald writes about power from a Foucauldian perspective, he proposes large acts of resistance to the public problems created by surveillance in addition to small acts to resist the discipline of individual bodies. These ideas are compatible with Foucault's (1997) idea of critique, however, which he defines as "the art of not being governed quite so much" (p. 45). Greenwald asks the audience to **resist through public sphere discussion** in order to negotiate the way they are governed. He argues that discussion through the public sphere can **alter power relations** between citizens and the US surveillance state. Though the government is considered completely separate from the public sphere by many scholars (Habermas, 1974), others push back on this idea (e.g. Asen & Brouwer, 2001). In the case of the NSA, other government branches are considered members of the public by Greenwald. Greenwald notes that many congressional members were unaware of the tactics used by the NSA, including spying on Congress itself (2014). For these reasons, Greenwald specifically calls on Congress to be part of the solution. This should occur through legislative reform spurred by public pressure. Greenwald's summoned public addresses politicians as well as average citizens.¶

Debate k Surv Policies

Surveillance policies should be questioned through forms of debate

Rice 15 (Rebecca, University of Montana, "Resisting NSA Surveillance: Glenn Greenwald and the public sphere debate about privacy," pg online @ http://scholarworks.umt.edu/cgi/viewcontent.cgi?article=5439&context=etd)//akim

Emphasis on multiple voices. Greenwald also moves the groundings of the surveillance debate by making it just that—a debate. He writes about the variety of voices discussing surveillance, which demonstrates that surveillance is more than just a technical talking point. In his early articles for The Guardian, Greenwald does this by quoting many technical experts, government voices, and special interest groups. In his first article for The Guardian, revealing the program PRISM, Greenwald takes statements from several US senators, including Ron Wyden, who Greenwald says raised concerns about surveillance for years before the leaked documents came to light (2013a). Greenwald also takes statements from Jameel Jaffer, the director of the American Civil Liberties Union (ACLU) Center for Democracy. Jaffer said that "the military has been granted unprecedented access to civilian communications" (Greenwald, 2013a, p. 6). Greenwald quotes public figures who state their concern about the effects surveillance could have on the public. These statements contrast with quotes from government officials, which are left without commentary. In his articles in The Guardian, Greenwald airs a variety of voices so that **readers may begin to engage in the debate**. Greenwald also moves the debate into the public sphere by revealing information to which the government and technology companies must respond. For example, in NPTH Greenwald tells the story of writing an article for The Guardian about PRISM. He says that NSA documents showed that technology companies cooperated with the NSA, but the companies denied this when contacted. When deciding what to do, Greenwald chose to write both statements into his story: Let's not take a position on who's right. Let's just air the disagreement and **let them work it out in public**,' I proposed. Our intention was that the story would force an open discussion of what the **Internet industry** had agreed to do with their users' communications; if their version clashed with the NSA documents, they would need to resolve it with the world watching, which is how it should be (2014, p. 76). This move parallels one way that Goodnight (2012a) says that technical arguments become public. If a technical argument becomes unreconcilable, "**both groups may take to the public forum governing the technical community's business**, each contesting for leadership and control of scarce resources. If one side or the other is dissatisfied with the verdict, then the boundaries of the special community are in jeopardy, as disgruntled advocates appeal to a more general public" (p. 202). Greenwald forces this eruption of appeals to the public by reporting that technology companies are cooperating with the NSA. Because these reports damage technology companies' reputations, they must respond to their consumer base, or the public. As Goodnight (2012a) says, "An arguer can accept the sanctioned, widely used bundle of rules, claims, procedures and evidence to wage a dispute. Or, the arguer can inveigh against any or all of these 'customs' in order to bring forth a new variety of understanding... In the variety of argument endeavors, this tension is expressed by attempts to expand one sphere of argument at the expense of another" (p. 200). Greenwald **challenges the sanctioned forms** of argument about surveillance. Using common examples mixed with technical evidence, he expands the argument into the public sphere at expense of the technical. Goodnight (2012b) says that "arguments engage social change when the systems of authority embedded in spheres not only fail to provide resolution but the expectations themselves (as implicit norms, conventions of propriety, or explicit rules) become part of the debate" (p. 260). Greenwald makes the technical sphere rules part of the debate by explaining the value of citizen deliberation. He presents the public with options, which serve as the antithesis to the NSA's secrecy, or lack of options, for public participation in their programs. Using these strategies, Greenwald moves arguments about surveillance **out of the technical sphere and into the public sphere**. Greenwald also discusses the effects of surveillance in more detail, and calls the public to resist surveillance. These appeals to privacy look less at the actors, or the technical sphere, and more at the surveillance apparatus itself.

Surv State Resist k Democ

Greenwald reifies Foucauldian ideas through resistance from the public sphere – this challenges the surveillance state and democratic ideals

Rice 15 (Rebecca, University of Montana, "Resisting NSA Surveillance: Glenn Greenwald and the public sphere debate about privacy," pg online @ http://scholarworks.umt.edu/cgi/viewcontent.cgi?article=5439&context=etd)//akim

The public sphere as resistance. The resistive subject Greenwald calls into being¶ would be an active public sphere participant who questions the surveillance state through¶ public discussion. Though this subject would take small steps to preserve online privacy,¶ Greenwald spends much of NPTH explaining broader solutions to surveillance. NPTH¶ constitutes an attempt to use the public sphere to resist NSA surveillance.¶ Resistance literature has often focused on small ways to resist surveillance power. ¶ Rice 57¶ Foucault focuses on personal, transversal struggles against surveillance power, because¶ surveillance power stems from compartmentalization and control over the body. The body is¶ "approached as an object to be analyzed and separated into its constituent parts," forging the¶ creation of a docile, useful subject (Dreyfus & Rabinow, 1983, p. 153). As a result, struggles¶ against this control are often anarchistic, immediate, and focused on the individual (Foucault,¶ 1983). Greenwald acknowledges this effect, and argues that surveillance leads to the internal¶ suppression of dissenting thoughts as a result. However, Greenwald does not advocate for just¶ a small, personal solution to this control over the body.¶ Greenwald's appeals are an example of using **the public sphere as** a form of **resistance¶ to surveillance.** Though this idea differs from acts of microresistance, Greenwald's suggestions¶ still **fit with Foucauldian** ideas of resistance, and show how the public sphere can play a part in¶ that resistance. Greenwald argues that citizens can engage in public deliberation to negotiate¶ with the surveillance state. This echoes Foucault's idea of "**not being governed quite so much,**"¶ or critique (1997, p. 45). Foucault (1997) says that critique is based on several anchoring¶ points, including universal rights. The act of critique asserts that the subject does not want to¶ accept laws because they are unjust. Critique asks "What are the limits of the right to govern?"¶ (Foucault, 1997, p. 46). People may engage in critique to negotiate the way they are being¶ governed if they find the rules of governance to be contrary to natural rights. Greenwald¶ encourages critique through public deliberation about the limits of the surveillance state. He¶ draws on American values like political freedom and freedom of expression, thus using¶ American rights as a basis for critiquing surveillance. Greenwald's call to action echoes¶ Foucault's idea of critique. ¶ Rice 58¶ Greenwald's ideas also run parallel to Habermas's functions of the public sphere.¶ Greenwald's solution is similar to the way Habermas (1974) describes the bourgeois public¶ sphere, which was a medium through which private needs were communicated to the state. A¶ key demand of this bourgeois public was that they "opposed the principle of supervision—that¶ very principle which demands that proceedings be made public" (p. 52). This group was¶ concerned with private autonomy and the restriction of state power to a few areas. Thus,¶ Habermas argues that the public sphere can be used to negotiate private freedoms. This¶ becomes the link between the public sphere and Foucauldian ideas of surveillance: using the¶ public sphere, citizens can collectively negotiate to be governed less. Greenwald demonstrates¶ that the NSA's surveillance is a public problem, calling on the American public to deliberate¶ about the future of surveillance.¶ Greenwald links this solution to personal control, however, by explaining how¶ surveillance impacts our individual thoughts and actions. In these ways, his solution does fit¶ with some of Foucault's ideas of a transversal struggle, namely that his solution struggles with¶ state control over the individual and critiques power for its effects (Foucault, 1983).¶ Greenwald (2014) says that "people radically change their behavior when they know they are¶ being watched" (p. 173) as he demonstrates the effects of surveillance power. He then links¶ these behavioral changes to the suppression of free speech, saying that "mass surveillance kills¶ dissent in a deeper and more important place as well: in the mind" (2014, p. 177-178).¶ Greenwald argues that surveillance power controls the individual and critiques power for its¶ effects. Though Greenwald is encouraging a public debate, he claims that this debate will help¶ negotiate surveillance power that creates control over individual bodies, thus drawing on some ¶ Rice 59¶ of Foucault's ideas of resistance as he talks about the public sphere.¶ This solution demonstrates the tension between the surveillance state and the¶ democratic republic, as Greenwald wrestles with the US as both a security state and a¶ democracy. He ponders this contradiction as he explains the panopticon, saying¶

Democracy requires accountability and consent of the government, which is only¶ possible if citizens know what is being done in their name. The presumption is that,¶ with rare exception, they will know everything their political officials are¶ doing...conversely the presumption is that the government, with rare exception, will not¶ know anything that law-abiding citizens are doing. That is why we are called private¶ individuals, functioning in our private capacity. Transparency is for those who carry¶ out public duties and exercise public power. Privacy is for everyone else (2014, p.¶ 209).¶ The fact that the NSA knows more about US citizens than citizens know about the agency¶ poses challenges to this model of government. As a result, Greenwald encourages the exercise¶ of democratic rights to combat surveillance. The public sphere has the capability to put¶ pressure on government officials and demand surveillance reform. Greenwald asks us to resist¶ using the public sphere. This solution arises as a result of the rhetorical situation, which pits¶ privacy against security. Greenwald encourages the audience to select privacy. He spends time¶ deescalating the permanent emergency of terrorism to demonstrate that NSA surveillance is¶ abusive and unnecessary, and then appeals to values which support public deliberation.¶ Public deliberation can be viewed as a form of resistance through Greenwald's rhetoric.¶ Though many scholars have looked at microresistance to surveillance power, Greenwald asks ¶ Rice 60¶ the public to resist through deliberation, which he considers an antidote to surveillance. This¶ solution grapples with the contradiction of the US as surveillance state and the US as a¶ democracy. The public sphere will continue to discuss these competing values, sharing in¶ alternative projections of the future (Goodnight, 2012a). Greenwald encourages the public to¶ create a shared vision of a state with transparency in the public sphere and privacy for citizens.

Activism k Engage Govt

Political activism is key to engage the public as well as the government. Discussions in debate are the first step to create real change.

Rice '15 – University of Montana (Rebecca, Theses, Dissertations, Professional Papers from University of Montana Graduate School, "Resisting NSA Surveillance: Glenn Greenwald and the Public Sphere Debate about Privacy," Paper 4480, http://scholarworks.umt.edu/cgi/viewcontent.cgi?article=5439&context=etd)//DWB

Greenwald's case is itself an example of the groundings of argument shifting between¶ Goodnight's three spheres of argument. Greenwald employed several tactics to move¶ surveillance toward publicly-based appeals. These include demonstration of public effects,¶ explanations of technical jargon, and the inclusion of multiple voices in the surveillance¶ debate. Greenwald drafts proposed solutions which would **engage US citizens, the US¶ government,.** and journalists Notably, these solutions focus on these groups rather than¶ technical communities with the technical capabilities to alter surveillance practices. Thus,¶ Greenwald refuses to contain surveillance within the technical sphere and instead encourages¶ the public to deliberate. This example adds to previous case studies of overlap between the¶ technical and public spheres of argument. Previous scholarship has often focused on the¶ eclipse of the public sphere by the technical (e.g. Farrell & Goodnight, 1981; Hauser, 1987;¶ Schiappa, 2012; Sovacool, 2009). Greenwald's case is an example of pushback on this¶ infiltration, and shows that just as arguments can become insulated within the technical sphere,¶ they can also be removed and placed back into the public. Journalistic activism may be an¶ important part of this move, and will be discussed in a subsequent section. ¶

Individual Actions can impact the government on Surveillance

Greenwald 2014

(Glenn Edward Greenwald is an American lawyer, journalist and author. He was a columnist for Guardian US from August 2012 to October 2013. He was a columnist for Salon.com from 2007 to 2012, and an occasional contributor to The Guardian. ; No Place to Hide ; May 13, 2014 ; Introduction: 10-14 ; AWEY)

Indeed, even before Snowden's revelations, it was already becoming clear that treating the United States as somehow exceptional on the issue of surveillance is a highly naive stance. In 2006, at a congressional hearing titled "The Internet in China: A Tool for Freedom or Suppression?," speakers lined up to condemn American technology companies for helping China suppress dissent on the Internet. Christopher Smith (R-NJ), the congressman presiding over the hearing, likened Yahoo!'s cooperation with Chinese secret police to handing Anne Frank over to the Nazis. It was a full throated harangue, a typical performance when American officials speak about a regime not aligned with the United States. But even the congressional attendees couldn't help noting that the hearing happened to take place just two months after the New York Times revealed the vast warrantless domestic wiretapping carried out by the Bush administration. In light of those revelations, denouncing other countries for carrying out their own domestic surveillance rang rather hollow. Representative Brad Sherman (D-CA), speaking after Representative Smith, noted that the technology companies being told to resist the Chinese regime should also be careful regarding their own government. "Otherwise," he warned prophetically, "while those in China may see their privacy violated in the most heinous ways, we here in the United States may also find that perhaps some future president asserting these very broad interpretations of the Constitution is reading our e-mail, and I would prefer that not happen without a court order." Over the past decades, the fear of terrorism—stoked by consistent exaggerations of the actual threat—has been exploited by US leaders to justify a wide array of extremist policies. It has led to wars of aggression, a worldwide torture regime, and the detention (and even assassination) of both foreign nationals and American citizens without any charges. But the ubiquitous, secretive system of suspicionless surveillance that it has spawned may very well turn out to be its most enduring legacy. This is so because, despite all the historical parallels, there is also a genuinely

new dimension to the current NSA surveillance scandal: the role now played by the Internet in daily life. Especially for the younger generation, the Internet is not some standalone, separate domain where a few of life's functions are carried out. It is not merely our post office and our telephone. Rather, it is the epicenter of our world, the place where virtually everything is done. It is where friends are made, where books and films are chosen, where political activism is organized, where the most private data is created and stored. It is where we develop and express our very personality and sense of self. To turn that network into a system of mass surveillance has implications unlike those of any previous state surveillance programs. All the prior spying systems were by necessity more limited and capable of being evaded. To permit surveillance to take root on the Internet would mean subjecting virtually all forms of human interaction, planning, and even thought itself to comprehensive state examination. From the time that it first began to be widely used, the Internet has been seen by many as possessing an extraordinary potential: the ability to liberate hundreds of millions of people by democratizing political discourse and leveling the playing field between the powerful and the powerless. Internet freedom—the ability to use the network without institutional constraints, social or state control, and pervasive fear—is central to the fulfillment of that promise. Converting the Internet into a system of surveillance thus guts it of its core potential. Worse, it turns the Internet into a tool of repression, threatening to produce the most extreme and oppressive weapon of state intrusion human history has ever seen. That's what makes Snowden's revelations so stunning and so vitally important. By daring to expose the NSA's astonishing surveillance capabilities and its even more astounding ambitions, he has made it clear, with these disclosures, that we stand at a historic crossroads. Will the digital age usher in the individual liberation and political freedoms that the Internet is uniquely capable of unleashing? Or will it bring about a system of omnipresent monitoring and control, beyond the dreams of even the greatest tyrants of the past? Right now, either path is possible. Our actions will determine where we end up.

Surveillance Info k Govt Overreach

Becoming informed about surveillance policies allow us to challenge government overreach

Greenwald 2014

(Glenn Edward Greenwald is an American lawyer, journalist and author. He was a columnist for Guardian US from August 2012 to October 2013. He was a columnist for Salon.com from 2007 to 2012, and an occasional contributor to The Guardian. ; No Place to Hide ; May 13, 2014 ; Chapter 5: The Fourth Estate ; AWEY)

One of the principal institutions ostensibly devoted to monitoring and checking abuse of state power is the political media. The theory of a "fourth estate" is to ensure government transparency and provide a check on overreach, of which the secret surveillance of entire populations is surely among the most radical examples. But that check is only effective if journalists act adversarially to those who wield political power. Instead, the US media has frequently abdicated this role, being subservient to the government's interests, even amplifying, rather than scrutinizing, its messages and carrying out its dirty work. In this context, I knew that media hostility toward my reporting on Snowden's disclosures was inevitable. On June 6, the day after the first NSA article ran in the Guardian, the New York Times introduced the possibility of a criminal investigation. "After writing intensely, even obsessively, for years about government surveillance and prosecution of journalists, Glenn Greenwald has suddenly put himself directly at the intersection of those two issues, and perhaps in the crosshairs of federal prosecutors," the paper proclaimed in a profile of me. My NSA reporting, it added, "is expected to attract an investigation from the Justice Department, which has aggressively pursued leakers." The profile quoted the neoconservative Gabriel Schoenfeld of the Hudson Institute, who has long advocated the prosecution of journalists for publishing secret information, calling me "a highly professional apologist for any kind of anti-Americanism no matter how extreme." The most revealing evidence of the Times's intentions came from the journalist Andrew Sullivan, who was quoted in the same profile saying, "Once you get into a debate with [Greenwald], it can be hard to get the last word," and "I think he has little grip on what it actually means to govern a country or run a war." Disturbed by the use of his comments out of context, Andrew later sent me his full exchange with the Times reporter Leslie Kaufman, which included praise for my work that the paper had notably chosen to omit. What was more telling, however, were the original questions Kaufman had sent him: • "He obviously had strong opinions, but how is he as a journalist? Reliable? Honest? Quotes you accurately? Accurately describes your positions? Or is more advocate than journalist?" • "He says you are a friend, is this so? I get the sense that he is something of a loner and has the kind of uncompromising opinions that makes it hard to keep friends, but could be wrong." The second question—that I'm "something of a loner" who has trouble keeping friends—was, in some sense, even more significant than the first. Discrediting the messenger as a misfit to discredit the message is an old ploy when it comes to whistle-blowing, and it often works.

The NSA spies solely to collect data than prevent terrorism

Rice 15 (Rebecca, University of Montana, "Resisting NSA Surveillance: Glenn Greenwald and the public sphere debate about privacy," pg online @ http://scholarworks.umt.edu/cgi/viewcontent.cgi?article=5439&context=etd)//akim

First, Greenwald says the NSA is insulated within the technical sphere, and the agency favors technical reasoning, shifting control over who makes decisions about surveillance from the FISA court to the NSA operatives themselves. "The vast amount of discretion vested in NSA analysts is also demonstrated by the training and briefings given to them by the agency," Greenwald says as he reports on the FISA courts to The Guardian (2013d, p. 8). He cites a leaked NSA memo which instructs analysts to use their own judgment and creativity to determine if a target is inside or outside of the United States. Though the FISA court is supposed to be consulted if a surveillance target could be within the US, Greenwald says "the decisions about who has their emails and telephone calls intercepted by the NSA is made by the NSA itself, not by the FISA court" (2013d, p. 9). Though there are legal limits which keep the government from examining the content of these communications, "there are no technical limits on the ability of either the agency or its analysts to do so" (2013d, p. 9). The NSA analysts have specialized, technical knowledge. Here, the groundings of the argument are not legal (as Greenwald says the FISA court does not review the NSA's decisions), but technical, and insulated within the NSA. Greenwald's description of the NSA parallels Goodnight's idea of the technical sphere. Goodnight (2012b) says that within the

technical sphere, "technical arguments are stamped with procedure and rule where state of the art practice is always at issue" (p. 260). Greenwald similarly argues that within the NSA, technical capabilities are favored over ethical arguments against spying. Greenwald also portrays the NSA and its partners as insulated and secretive, or separated from the public sphere. Greenwald argues that the surveillance community is a revolving door of government officials and large defense companies who work together to produce lucrative and powerful results: The post-9/11 era has seen a massive explosion of resources dedicated to surveillance. Most of those resources were transferred from the public coffers (i.e., the American taxpayer) into the pockets of private surveillance defense corporations…Companies like Booz Allen Hamilton and AT&T employ hordes of former top government officials, while hordes of current top defense officials are past (and likely future) employees of those same corporations. Constantly growing the surveillance state is a way to ensure that the government funds keep flowing, that the revolving door stays greased (p. 168). Greenwald names the actors in the surveillance state frequently in his articles and book. These actors include high-up government officials and government contractors. He says that the groups work together to control information and remain insulated. Large technical companies are also complacent in this surveillance, according to Greenwald. In his articles in The Guardian, Greenwald begins introducing these figures. In his first article, about PRISM, Greenwald names Microsoft, Yahoo, Apple, Facebook, Skype, and AOL as companies that participate in the NSA's information-sharing programs (2013a). He says that "collectively, the companies cover the vast majority of online email, search, video, and communications networks" (2013a, p. 3). In NPTH, Greenwald reflects that Snowden's documents reveal "a slew of secret negotiations between the NSA and Silicon Valley about providing the agency with unfettered access to the companies' systems" (2014, p. 112). These companies control a large share of online communications, and they cooperate with the NSA. Greenwald links the NSA together with other technical experts to demonstrate the vast power of the technical elite. These groups have access to most communications, and can spy on the **majority of online messages.** This is a specialized skill unique to the technical community. Greenwald also emphasizes the breadth of surveillance, and links it to the power of the NSA. Reflecting on the Snowden documents in NPTH, Greenwald says Even as someone who had spent years writing about the dangers of secrecy US surveillance, I found the sheer vastness of the spying system genuinely shocking, all the more so because it had clearly been implemented with virtually **no accountability, no transparency, and no limits.** The thousands of discrete surveillance programs described by the archive were never intended by those who implemented them to become public knowledge (2014, p. 91). Greenwald notes the link between power and the breadth of power. He says that the NSA collects a vast amount of data simply because it can. "The mere fact that it (the NSA) has the capability to collect those communications has become one rationale for doing so" (2014, p. 95). Greenwald says that the NSA uses a "collect it all" philosophy, and "the agency is devoted to one overarching mission: to prevent the slightest piece of electronic communication from evading its systemic grasp" (2014, p. 94). Not only is the surveillance community isolated, **the community is corrupt**: the NSA collects data **not to prevent terrorism but to contain its power.** Displaying many internal NSA memos and presentations, Greenwald demonstrates that the NSA celebrates the gathering of information, and more information is always considered better. In one presentation, Greenwald says, the NSA writes that XKEYSCORE is valuable because "the program captures 'nearly everything a typical user does on the internet'" (2014, p. 153). Greenwald also displays unflattering NSA memos, which demonstrate what he calls the agency's "ego." He points to the title of one presentation designed internally for NSA personnel: "The Role of National Interests, Money, and Egos," and says that "these three factors together…are the primary motives driving the United States to maintain global surveillance domination" (2014, p. Rice 32 167). By discussing the extent of surveillance gathered, Greenwald characterizes the NSA as greedy—the agency grasps at data and hoards it away from the public. Using the "collect it all" philosophy, Greenwald gives the surveillance community, and in this case the technical sphere, a new connotation: the community is not just isolated because of its specializations, but because of its **interest in power.** Greenwald says the NSA has a "contemptuous and boastful spirit of supremacy behind them" (2014, p. 94). As Farrell and Goodnight (1981) say, arguments grounded in the technical sphere preclude practitioners from social responsibility (p. 296). Greenwald argues that the NSA is not interested in the **ethics of surveillance**, but solely in its **technical capabilities to spy.** Greenwald furthers this characterization by discussing oversight of surveillance. He says that the so-called checks on surveillance are ineffective, because they, too, are shrouded in secrecy. Commenting on the FISA court, which issues warrants for NSA surveillance, Greenwald says The uselessness of this institution as a true check on surveillance abuses is obvious because the FISA court lacks virtually every attribute of what our society generally understands as the minimal elements of a justice system. It meets in complete secrecy; only one party—**the government—is permitted to attend** the hearings and make its case; and the court's rulings are automatically designated **'Top Secret'** (2014, p. 128).

Discourse k Challenge Surv State

Our discourse is important to challenge the surveillance state

Greenwald 2013

Edward Snowden predicted more than a month ago while still in hiding in Hong Kong that the US government would seek to demonise him, telling the Guardian that he would be accused of aiding America's enemies. In the second instalment of an interview carried out before he revealed himself as the NSA whistleblower, Snowden insisted that he was a patriot and that he regards the US as a fundamentally good country. But he said he had chosen to release the highly classified information because freedoms were being undermined by intelligence agency "excesses". The interview was conducted on June 6 in a hotel room in Hong Kong. The first part of the interview was released on Sunday June 9, starting a media frenzy and intensifying US efforts to track him down. Snowden has since fled Hong Kong for Moscow, where he is reportedly marooned while resisting US attempts to extradite him to face charges under the Espionage Act. In the newly released interview excerpts, he predicted he would be portrayed not as a whistleblower but a spy. "I think they are going to say I have committed grave crimes, I have violated the Espionage Act. They are going to say I have aided our enemies in making them aware of these systems. But this argument can be made against anyone who reveals information that points out mass surveillance systems," he said. Asked whether he had sought a career in the intelligence community specifically to become a mole and reveal secrets, Snowden, 30, said he had joined government service very young, first enlisting in the US army immediately after the invasion of Iraq out of a belief in "the goodness of what we were doing. I believed in the nobility of our intentions to free oppressed people overseas." But his views shifted over the length of his career as he watched the news, which he saw as propaganda, not truth. "We were actually involved in misleading the public and misleading all the publics, not just the American public, in order to create certain mindset in the global consciousness and I was actually a victim of that." He had not fallen out of love with America, only its government. "America is a fundamentally good country. We have good people with good values who want to do the right thing. But the structures of power that exist are working to their own ends to extend their capability at the expense of the freedom of all publics." In the new excerpts, he explained his motivation for revealing the information. "I don't want to live in a world where everything that I say, everything I do, everyone I talk to, every expression of creativity or love or friendship is recorded," he said. "And that's not something I'm willing to support, it's not something I'm willing to build and it's not something I'm willing to live under." Advertisement He also insisted he had continued with his job while waiting for political leaders to rein in what he decribed as "government excesses". But, he said, "as I've watched I've seen that's not occuring, and in fact we're compounding the excesses of prior governments and making it worse and more invasive. And no one is really standing to stop it." Snowden has been attacked by his critics for first going to Hong Kong, which is part of China, even though it enjoys freedoms not available on the mainland, and to Russia. He has been offered asylum in Venezuela, Bolivia and Nicaragua but faces the practical problem of how to get to any of these countries. The most recent poll, for the Huffington Post and YouGov, suggested a shift in support away for Snowden, with 38% saying they feel he did the wrong thing in leaking documents against 33% who felt he did the right thing. After the first interview, 35% said he did the wrong thing while 38% said he had done the right thing. The interview took place immediately after the Guardian published the first leak about a court order to Verizon ordering it to hand over US customers' call records to the NSA. Snowden explained why he thought that story and the other subsequent leaks about the NSA and its partnership with the corporate sector had to be made public. "They are getting everyone's calls, everyone's call records and everyone's internet traffic as well." In reference to one surveillance system – Boundless Informant – that he said allowed the NSA to track data it was accumulating, he said: "The NSA lied about the existence of this tool to Congress and to specific congressmen in response to previous inquiries about their surveillance activities." He was part of the internet generation that grew up on the understanding that it was free, he said. The partnership between the intelligence agencies and the corporate sector was a "dangerous collaboration", especially for an organisation like the the NSA that has demonstrated time and again "it works to shield itself from oversight".

Key to Policymaking

Discourse about surveillance policies key to effective policy making

Greenwald 2014

(Glenn Edward Greenwald is an American lawyer, journalist and author. He was a columnist for Guardian US from August 2012 to October 2013. He was a columnist for Salon.com from 2007 to 2012, and an occasional contributor to The Guardian. ; No Place to Hide ; May 13, 2014 ; Epilogue ; AWEY)

In the very first online conversation I had with Edward Snowden, he told me he had only one fear about coming forward: that his revelations might be greeted with apathy and indifference, which would mean he had unraveled his life and risked imprisonment for nothing. To say that this fear has gone unrealized is to dramatically understate the case. Indeed, the effects of this unfolding story have been far greater, more enduring, and more wide-ranging than we ever dreamed possible. It focused the world's attention on the dangers of ubiquitous state surveillance and pervasive government secrecy. It triggered the first global debate about the value of individual privacy in the digital age and prompted challenges to America's hegemonic control over the Internet. It changed the way people around the world viewed the reliability of any statements made by US officials and transformed relations between countries. It radically altered views about the proper role of journalism in relation to government power. And within the United States, it gave rise to an ideologically diverse, trans-partisan coalition pushing for meaningful reform of the surveillance state. One episode in particular underscored the profound shifts brought about by Snowden's revelations. Just a few weeks after my first Snowden-based article for the Guardian exposed the NSA's bulk metadata collection, two members of Congress jointly introduced a bill to defund that NSA program. Remarkably, the bill's two cosponsors were John Conyers, a Detroit liberal serving his twentieth term in the House, and Justin Amash, a conservative Tea Party member in only his second House term. It is hard to imagine two more different members of Congress, yet here they were, united in opposition to the NSA's domestic spying. And their proposal quickly gained dozens of cosponsors across the entire ideological spectrum, from the most liberal to the most conservative and everything in between—a truly rare event in Washington. When the bill came up for a vote, the debate was televised on C-SPAN, and I watched it while chatting online with Snowden, who was also watching CSPAN on his computer in Moscow. We were both amazed at what we saw. It was, I believe, the first time he truly appreciated the magnitude of what he had accomplished. One House member after another stood up to vehemently denounce the NSA program, scoffing at the idea that collecting data on the calls of every single American is necessary to stop terrorism. It was by far the most aggressive challenge to the national security state to emerge from Congress since the 9/11 attacks. Until the Snowden revelations, it was simply inconceivable that any bill designed to gut a major national security program could receive more than a handful of votes. But the final vote tally on the Conyers-Amash bill shocked official Washington: it failed by just a tiny margin, 205–217. Support for it was wholly bipartisan, with 111 Democrats joining 94 Republicans to vote for the bill. This discarding of traditional partyline divisions was as exciting to Snowden and me as the substantial support for reining in the NSA. Official Washington depends upon blind tribalism engendered by rigid partisan warfare. If the red versus blue framework can be eroded, and then transcended, there is much more hope for policy making based on the actual interests of the citizenry. Over the following months, as more and more NSA stories were published around the world, many pundits predicted that the public would lose interest in the subject. But, in fact, interest in the surveillance discussion only intensified, not just domestically but internationally. The events of a single week in December 2013—more than six months after my first report appeared in the Guardian—illustrate just how much Snowden's disclosures continue to resonate and just how untenable the NSA's position has become. The week began with the dramatic opinion issued by US federal judge Richard Leon that the NSA metadata collection was likely to be found in violation of the Fourth Amendment to the US Constitution, denouncing it as "almost Orwellian" in scope. As noted, the Bush-appointed jurist pointedly added that the government had not cited a single instance "in which analysis of the NSA's bulk metadata collection" had stopped a terrorist attack. Just two days later, President Obama's advisory panel, formed when the NSA scandal first broke, issued its 308-page report. That report, too, decisively rejected the NSA's claims about the vital importance of its spying. "Our review suggests that the information contributed to terrorist investigations by the use of [the Patriot Act's] section 215 telephony meta-data was not essential to preventing attacks," the panel wrote, confirming that in not a single instance would the outcome have been different "without the section 215 telephony meta-data program."

Challenge Govt by Challenge Policy

The government is powerful, we can choose to challenge it by combatting it's policies.

Greenwald 2014

(Glenn Edward Greenwald is an American lawyer, journalist and author. He was a columnist for Guardian US from August 2012 to October 2013. He was a columnist for Salon.com from 2007 to 2012, and an occasional contributor to The Guardian. ; No Place to Hide ; May 13, 2014 ; Chapter 5: The Fourth Estate ; AWEY)

Other steps, too, can be taken to reclaim online privacy and limit state surveillance. International efforts— currently being led by Germany and Brazil—to build new Internet infrastructure so that most network traffic no longer has to transit the United States could go a long way toward loosening the American grip on the Internet. And individuals also have a role to play in reclaiming their own online privacy. Refusing to use the services of tech companies that collaborate with the NSA and its allies will put pressure on those companies to stop such collaboration and will spur their competitors to devote themselves to privacy protections. Already, a number of European tech companies are promoting their email and chat services as a superior alternative to offerings from Google and Facebook, trumpeting the fact that they do not—and will not— provide user data to the NSA. Additionally, to prevent governments from intruding into personal communications and Internet use, all users should be adopting encryption and browsing-anonymity tools. This is particularly important for people working in sensitive areas, such as journalists, lawyers, and human rights activists. And the technology community should continue developing more effective and user-friendly anonymity and encryption programs. On all of these fronts, there is a great deal of work still to be done. But less than a year after I first met Snowden in Hong Kong, there is no question that his disclosures have already brought about fundamental, irreversible changes in many countries and many realms. And beyond the specifics of NSA reform, Snowden's acts have also profoundly advanced the cause of government transparency and reform in general. He has created a model to inspire others, and future activists will likely follow in his footsteps, perfecting the methods he embraced. The Obama administration, which has brought more prosecutions against leakers than all prior presidencies combined, has sought to create a climate of fear that would stifle any attempts at whistle-blowing. But Snowden has destroyed that template. He has managed to remain free, outside the grasp of the United States; what's more, he has refused to remain in hiding but proudly came forward and identified himself. As a result, the public image of him is not a convict in orange jumpsuit and shackles but an independent, articulate figure who can speak for himself, explaining what he did and why. It is no longer possible for the US government to distract from the message simply by demonizing the messenger. There is a powerful lesson here for future whistle-blowers: speaking the truth does not have to destroy your life. And for the rest of us, Snowden's inspirational effect is no less profound. Quite simply, he has reminded everyone about the extraordinary ability of any human being to change the world. An ordinary person in all outward respects —raised by parents without particular wealth or power, lacking even a high school diploma, working as an obscure employee of a giant corporation—he has, through a single act of conscience, literally altered the course of history. Even the most committed activists are often tempted to succumb to defeatism. The prevailing institutions seem too powerful to challenge; orthodoxies feel too entrenched to uproot; there are always many parties with a vested interest in maintaining the status quo. But it is human beings collectively, not a small number of elites working in secret, who can decide what kind of world we want to live in. Promoting the human capacity to reason and make decisions: that is the purpose of whistle-blowing, of activism, of political journalism. And that's what is happening now, thanks to the revelations brought about by Edward Snowden.

Nuclear Weapons Impact

Terrorism threats are all <u>fear mongering</u> and justifies many NSA programs used for <u>economic espionage</u> and <u>surveillance</u>

Rice 15 (Rebecca, University of Montana, "Resisting NSA Surveillance: Glenn Greenwald and the public sphere debate about privacy," pg online @ http://scholarworks.umt.edu/cgi/viewcontent.cgi?article=5439&context=etd)//akim

Creation of a Permanent Emergency Greenwald also explores how the surveillance community **stifles discussion.** He says that the community draws on **appeals to fear**, particularly of terrorism, to keep the public complacent. These fear appeals confine debate to **technical experts** and keep debate away from the public sphere. This idea functions similarly to Taylor's (2007) discussion of the creation of a **"permanent emergency"** which prevents deliberation about US nuclear policy. Taylor (2007) says that **"secrecy limits public knowledge of nuclear matters, and this limitation is in turn used¶** to justify excluding an 'uninformed' public from subsequent deliberation. Additionally, "'national security' is commonly invoked to discourage public debate of nuclear policy on the **assumption** that such **debate might damage national security** itself" (p. 173). Greenwald attributes squelched discussion to claims of national security as well, and asserts that these claims are unjustified. First, Greenwald says that surveillance advocates have repeatedly cited **prevention of terrorism as justification for the NSA's power.** "The post-9/11 American veneration of security above all else has **created** a climate particularly conducive to **abuses of power**," Greenwald writes as he introduces his encounter with Snowden (2014, p. 2). In NPTH, Greenwald says "Surveillance cheerleaders essentially offer only one argument in defense of mass **surveillance**: it is only carried out to stop terrorism and keep people safe. Indeed, invoking an external threat is a **historical tactic** of choice **to keep the population submissive** to government powers... Ever since the 9/11 attack, US officials reflexively produce the word 'terrorism'" (2014, p. 202). Linking surveillance to a powerful fear appeal, like terrorism, keeps citizens complacent, according to Greenwald. Greenwald says the government often claims there is a need for secrecy surrounding these programs in order to protect national security. "Every time a lawsuit is brought contesting the legality of intercepting Americans' communications without warrants, the Obama DOJ raises claims of secrecy, standing and immunity to prevent any such determination from being made," he writes in an article for The Guardian (2013d, p. 5). Taylor (2007) says that **the US government often cites the need for secrecy and exigency as reasons to limit public discussion on nuclear weapons**. Post-9/11, the Bush administration linked these arguments to rogue states and terrorists (Taylor, 2007). Greenwald says that the threat of terrorism is invoked to keep surveillance away from public scrutiny. The threat of terrorism, along with the secrecy of proceedings previously discussed, allow the government to maintain the state of **permanent emergency** with little evidence of the effectiveness of surveillance.¶ Greenwald, however, finds these claims to be exaggerated. He says, "What is perhaps so¶ remarkable about the bottomless exploitation of the threat of terrorism is that it is so plainly exaggerated. **The risk of any American dying in a terrorist attack is** infinitesimal, **considerably less than the chance of being struck by lightning**" (2014, p. 205). Greenwald finds that statistically, the threat of terrorism is low. Responding to the argument that the NSA could prevent the next 9/11, Greenwald says "the implication is rank **fearmongering and deceitful** in the extreme" (2014, p. 204). He points out that the CIA had several reports about al-Qaeda before 9/11, but failed to act on the warnings. Therefore, collecting more information will not solve the intelligence problems (2014). Additionally, revealing NSA programs does not threaten national security. When writing his first article based off of Snowden's documents, Greenwald says he contemplated any threats to national security, but believed "the idea that 'terrorists' would benefit from exposing the order [to authorize Boundless Informant] was laughable: any terrorists¶ capable of tying their own shoes would already know that the government was trying to monitor their telephone communications" (2014, p. 66). Greenwald argues that the fear of terrorism is overblown, and that reporting about the NSA would not harm national security because terrorists are already on guard against surveillance. Greenwald also says that many NSA programs are not¶ being used to prevent terrorism. Greenwald says that "a substantial number of the agency's¶ activities have nothing to do with antiterrorism efforts or even with national security. Much of¶ the Snowden archive revealed what can only be called **economic espionage**" (2014, p. 134). This¶ refers to NSA documents

that revealed economic spying on foreign energy companies. This¶ spying takes place in order to "gain enormous advantage for American industry" by providing¶ economic and trade information, which the NSA has supplied to the State Department and others¶ during negotiations with other countries (2014, p. 138-139). Greenwald argues that terrorism is¶ an exaggerated threat, and is not the sole motivation for NSA surveillance. These arguments call¶ into question the NSA's main justification for their unchecked power. Greenwald makes the first¶ move toward dismantling the technical sphere isolation of surveillance by claiming that ¶ Rice 36¶ arguments in favor of this isolation are invalid. The creation of a permanent emergency stifles¶ public discussion, keeping surveillance within the realm of technical deliberation. Greenwald¶ thus spends time dismantling the illusion of the constant threat of terrorism, which he sees as¶ created to protect and expand governmental power.

General

Legal Debates Good

Simulated legal debates are crucial for social transformation---teaching legal **precision** is **net-better** for eliminating oppression **even if** one-shot legal solutions don't work the first time

Klare '11

(Karl Klare, George J. & Kathleen Waters Matthews Distinguished University Professor, Northeastern University School of Law, "Teaching Local 1330—Reflections on Critical Legal Pedagogy," ('11). School of Law Faculty Publications. Paper 167. http://hdl.handle.net/2047/d20002528)

By now it has begun to dawn that one of the subjects of this class session is how lawyers translate their moral intuitions and sense of justice into legal arguments. Most beginning students have found themselves in the situation of wanting to express their **moral intuitions** in the form of legal arguments but of feeling powerless to do so. A common attitude of Northeastern students is that a lawyer **cannot turn moral and political convictions into legal arguments** in the context of case-litigation. If you are interested in directly pursuing a moral and/or political agenda, at a minimum you need to take up legislative and policy work, and more likely you need to **leave the law altogether and take up grass roots organizing** instead. I insist that we keep the focus on litigation for this class period. After the straw poll, I ask the students to simulate the role of Staughton Lynd's legal assistants and to assume that the court has just definitively rejected the claims based on contract, promissory estoppel, and the notion of a community property right. However, they should also assume, counter-factually, that Judge Lambros stayed dismissal of the suit for ten days to give plaintiffs one last opportunity to come up with a theory. I charge the students with the task of making a convincing common law argument, supported by respectable legal authority, that the plaintiffs were entitled to substantial relief. Put another way, I ask the students to prove that Judge Lambros was mistaken—that he was legally wrong—when he concluded that there was no basis in existing law to vindicate the workers' and community's rights. In some classroom exercises, I permit students to select the side for which they wish to argue, but I do not allow that in this session. All students are asked to **simulate the role** of plaintiffs' counsel and to **make the best arguments they can**—**either because they** actually **believe such arguments and/or because in their simulated role** they are fulfilling their ethical **duty to provide** zealous **representation**. A recurring, instant reflex is to say: "it's simple—the workers' human rights were violated in the Youngstown case." I remind the class that the challenge I set was to come up with a common law theory. The great appeal of human rights discourse for today's students is that it seems to provide a technical basis upon which their fervent moral and political commitments appear to be legally required. "What human rights?" I ask. The usual answers are (1) "they had a right to be treated like human beings" or (2) "surely there is some human right on which they can base their case." To the first argument I respond: "well, how they are entitled to be treated is exactly what the court is called upon in this case to decide. Counsel may not use a re-statement of the conclusion you wish the court to reach as the legal basis supporting that conclusion." To the second response I reply: "it would be nice if some recognized human right applied, but we are in the Northern District of Ohio in 1980. Can you cite a pertinent human rights instrument?" (Answer: "no.") The students then throw other ideas on the table. Someone always proposes that U.S. Steel's actions toward the community were "unconscionable." I point out that unconscionability is a defense to contract enforcement whereas the plaintiffs were seeking to enforce a contract (the alleged promise not to close the plant if it were rendered profitable). In any case, we have assumed that the judge has already ruled that there was no contract. Another suggestion is that plaintiffs go for restitution. A restitution claim arises when plaintiff gives or entrusts something of value to the defendant, and the defendant wrongfully refuses to pay for or return it. But here we are assuming that Judge Lambros has already ruled that the workers did not endow U.S. Steel with any property or value other than their labor power for which they were already compensated under the applicable collective bargaining agreements. If the community provided U.S. Steel with value in the nature of tax breaks or infrastructure development, the effect of Judge Lambros' ruling on the property claim is to say that these were not investments by the community but no-strings-attached gifts given in the hope of attracting or retaining the company's business. At this point I usually give a hint by saying, "if we've ruled out contract claims, and we've ruled property claims, what does that leave?" Aha, torts! A student then usually suggests that U.S. Steel committed the tort of intentional infliction of emotional distress (IIED).15 I point out that, even if it were successful, this theory would provide plaintiffs relief only for their emotional injuries, but not their economic or other losses, and most likely would not provide a basis for an injunction to keep the plant open. In any event, IIED is an intentional tort. What, I ask, is the evidence that U.S. Steel intends the plant shutdown to cause distress? The response that "they should know that emotional distress will result" is usually not good enough to make out an intentional tort. An astute student will point out that in some jurisdictions it is enough to prove that the defendant acted with reckless disregard for the likelihood that severe emotional distress would result. I allow that maybe there's something to that, but then shift ground by pointing out that a prima facie requirement of IIED is that the distress suffered go beyond what an "ordinary person" may be expected to endure or beyond the bounds of "civilized behavior."16 Everyone knows that plants close all the time and that the distress accompanying job-loss is a normal feature of American life. A student halfheartedly throws out negligent infliction of emotional distress, to which my reply is: "In what way is U.S. Steel's proposed conduct negligent? The problem we are up against here is precisely that the corporation is acting as a rational profit-maximizer." A student always proposes that plaintiffs should allege that what U.S. Steel did was "against public policy." First of all, I say, "public policy" is not a cause of action; it is a backdrop against which conduct or contract terms are assessed. Moreover, what public policy was violated in this case? The student will respond by saying "it is against public policy for U.S. Steel to leave the community devastated." I point out once again that that is the very conclusion for which we are contending—it is circular argument to assert a statement of our intended conclusion as the rationale for that conclusion. This dialogue continues for awhile. One ineffective theory after another is put on the table. Only once or twice in the decades I have taught this exercise have the students gotten close to a viable legal theory. **But this is not wasted time**—learning occurs in this phase of the exercise. The point conveyed is that while law and morals/politics are inextricably intertwined, they are not the same. For one thing, lawyers have a distinct way of talking about and analyzing problems that is characteristic of the legal culture of a given time and place. So-called "legal reasoning" is actually a repertoire of **conventional, culturally approved rhetorical moves and counter-moves** deployed by lawyers to create an appearance of the legal

necessity of the results for which they contend. In addition, good lawyers actually possess useful, specialized knowledge not generally absorbed by political theorists or movement activists. Legal training sensitizes us to the many complexities that arise whenever general norms and principles are implemented in the form of rules of decision or case applications. Lawyers know, for example, that large stakes may turn on precisely how a right is defined, who has standing to vindicate it, what remedies it provides, how the right is enforced and in what venue(s), and so on. We are not doing our jobs properly if we argue, simply, "what the defendant did was unjust and the plaintiff deserves relief." No one needs a lawyer to make the "what the defendant did was unjust" argument. As Lynd"s account shows, the workers of Youngstown did make that argument in their own, eloquent words and through their collective resistance to the shut-downs. If "what the defendant did was unjust" is all we have to offer, lawyers bring no added value to the table. Progressive students sometimes tell themselves that law is basically gobbledygook, but that you can assist movements for social change if you learn how to spout the right gobbledygook. In this view of legal practice, "creativity" consists in identifying an appropriate technicality that helps your client. But in the Youngstown situation, we are way past that naïve view. There is no "technicality" that can win the case. In this setting, a social justice lawyer must use the bits and pieces lying around to generate new legal knowledge and new legal theories. And these new theories must say something more than "my client deserves to win" (although it is fine to commence one"s research on the basis of that moral intuition). The class is beginning to get frustrated, and around now someone says "well, what do you expect? This is capitalism. There"s no way the workers were going to win." The "this-is-capitalism" ("TIC") statement sometimes comes from the right, sometimes from the left, and usually from both ends of the spectrum but in different ways. The TIC statement precipitates another teachable moment. I begin by saying that we need to tease out exactly what the student means by TIC, as several interpretations are possible. For example, TIC might be a prediction of what contemporary courts are most likely to do. That is, TIC might be equivalent to saying that "it doesn"t matter what theory you come up with; 999 US judges out of 1,000 would rule for U. S. Steel."17 I allow that this is probably true, but not very revealing. The workers knew what the odds were before they launched the case. Even if doomed to fail, a legal case may still make a contribution to social justice if the litigation creates a focal point of energy around which a community can mobilize, articulate moral and political claims, educate the wider public, and conduct political consciousness-raising. And if there is political value in pursuing a case, we might as well make good legal arguments. On an alternative reading, the TIC observation is more ambitious than a mere prediction. It might be a claim that a capitalist society requires a legal structure of a certain kind, and that therefore professionally acceptable legal reasoning within capitalist legal regimes cannot produce a theory that interrogates the status quo beyond a certain point. Put another way, some outcomes are so foreign to the bedrock assumptions of private ownership that they cannot be reached by respectable legal reasoning. A good example of an outcome that is incompatible with capitalism, so the argument goes, is a court order interfering with U.S. Steel"s decision to leave Youngstown. This reading of the TIC comment embodies the idea that legal discourse is encased within a deeper, extra-legal structure given by requirements of the social order (capitalism), so that within professionally responsible legal argument the best lawyers in the world could not state a winning theory in Local 1330. Ironically, the left and the right in the class often share this belief. I take both conservative and progressive students on about this. I insist that the claim that our law is constrained by a rigid meta-logic of capitalism—which curiously parallels the notion that legal outcomes are tightly constrained by legal reasoning—is just plain wrong. Capitalist societies recognize all sorts of limitations on the rights of property owners. Professor Singer"s classic article catalogues a multitude of them.18 The claim is not only false, it is a dangerous falsehood. To believe TIC in this sense is to limit in advance our aspirations for what social justice lawyering can accomplish.

Now the class begins to sense that I am not just playing law professor and asking rhetorical questions to which there are no answers. The students realize that I actually think that I have a theory up my sleeve that shows that Judge Lambros was wrong on the law. If things are going well, the students begin to feel an emotional stake in the exercise. Many who voted in the straw poll that the plaintiffs deserved to win are anxious to see whether I can pull it off. Other students probably engage emotionally for a different reason—the ones who have been skeptical or derisive of my approach all term hope that my "theory," when I eventually reveal it, is so implausible that I will fall flat on my face. I begin to feed the students more hints. One year I gave the hint, "What do straying livestock, leaking reservoirs, dynamite blasting, and unsafe products have in common?"—but that made it too easy. Usually my hints are more oblique, as in "does anything you learned about accident law ring a bell?" Whatever the form, the students take the hints, and some start cooking with gas. Over the next few minutes, the pieces usually fall into place. The legal theory toward which I have been steering the students is that U.S. Steel is strictly liable in tort for the negative social effects of its decision to disinvest in Youngstown. I contend that that is what the law provided in Ohio in 1980, and therefore a mechanism was available for the District Court to order substantial relief. A basic, albeit contested theme of modern tort law, which all students learn in first year, is that society allows numerous risky and predictably harmful activities to proceed because we deem those activities, on balance, to be worthwhile or necessary. In such cases, the law often imposes liability rules designed to make the activity pay for the injuries or accidents it inevitably causes. For more than a century, tort rules have been fashioned to force actors to take account of all consequences proximately attributable to their actions, so that they will internalize the relevant costs and price their products accordingly. The expectation is that in the ordinary course of business planning, the actor will perform a cost/benefit analysis to make sure that the positive values generated by the activity justify its costs. Here, I remind the students of the famous Learned Hand Carroll Towing formula19 comparing B vs. PL, where B represents the costs of accident avoidance (or of refraining from the activity when avoidance is impossible or too costly); and P x L (probability of the harm multiplied by the gravity of the harm) reflects foreseeable accident costs.20 The tort theory that evolved from this and similar cost/benefit approaches is called "market deterrence." The notion is that liability rules should be designed to induce the actor who is in the best position to conduct this kind of cost/benefit analysis with respect to a given activity to actually conduct it. Such actors will have incentives to make their products and activities safer and/or to develop safer substitute products and activities.21 Actors will then pass each activity"s residual accident costs on to consumers by "fractionating" and "spreading" such costs through their pricing decisions. As a result, prices will give consumers an accurate picture of the true social costs of the activity, including its accident costs. Consumers are thus enabled to make rational decisions about whether to continue purchasing the product or activity in light of its accident as well as its production costs. In principle, if a particular actor produces an unduly risky product (in the sense that its accident costs are above "market level"), that actor"s products will be priced above market, and he/she will be driven out of business.22 Tort rules have long been crafted with an eye toward compelling risky but socially valuable activities or enterprises to internalize their external costs. My examples—to which the students were exposed in first year—are the ancient rule imposing strict liability for crop damage caused by escaping livestock;23 strict liability under the doctrine of Rylands v. Fletcher for the escape of dangerous things brought onto one"s property;24 strict liability under Restatement (Second) § 519 for damage caused by "abnormally dangerous activities" such as dynamite blasting;25 and most recently, strict products liability.26 Of course, there are many exceptions to this approach. For example, "unavoidably unsafe" or "Comment k products" are deemed non-defective and therefore do not carry strict liability. And of course the U.S. largely rejected Rylands. Why was that? Because, as memorably stated in Losee v. Buchanan: "We must have factories, machinery, dams, canals and railroads. They are demanded by the manifold wants of mankind, and lay at the basis of all our civilization."27 In assuming that entrepreneurial capitalism would be stymied if enterprises were obliged to pay for the harms they cause, the Losee court accepted a strong version of TIC. Time permitting, I touch briefly on the debate about whether the flourishing of the negligence principle in the U.S. subsidized 19th century entrepreneurial capitalism,28 the possible implications of the Coase Theorem for our discussion of Local 1330,29 and the debate about whether it is appropriate for courts to fashion common law rules with an eye toward their distributive as well as efficiency consequences.30 With this as background, I argue that the District Court should

have treated capital mobility—investors" circulation of capital in search of the highest rate of return—as a risky but socially valuable activity warranting the same legal treatment as straying cattle and dynamite blasting. Capital mobility is socially valuable. It is indispensable for economic growth and flexibility. Capital mobility generates important positive externalities for "winners," such as economic development and job-creation at the new site of investment. However, capital mobility also predictably causes negative external effects on "bystanders" (the ones economists quaintly label "the losers"). We discussed some of these externalities at the outset of the class—the trauma associated with income interruption and pre-mature retirement, waste or destruction of human capital, multiplier effects on the local economy, and social pathologies and community decline of the kind experienced in Youngstown. The plaintiffs should have argued that capital mobility must internalize its social dislocation costs for reasons of economic efficiency, and that this can be accomplished by making investors strictly liable in tort for the social dislocation costs proximately caused by their capital mobility decisions. An investor considering shifting capital from one use to another will compare their respective rates of return. In theory, the investment with the higher return is socially optimal (as well as more profitable for the individual investor). The higher-return investment enlarges the proverbial pie. But investors must perform accurate comparisons of competing investment opportunities in order for the magic hand of the market to perform its magic. A rational investor bases her analysis primarily on price signals reflecting estimated rates of return on alternative investment options. This comparison will yield an irrational judgment leading to a socially suboptimal investment decision unless the estimated rate of return on the new investment reflects its external effects, both positive and negative. Investors often have public-relations incentives to tout the positive economic consequences promised at the new location. To guarantee rational decision making, the law must force investors contemplating withdrawal of capital from an enterprise to also carefully consider the negative social dislocation costs properly attributable to the activity of disinvestment. This can be achieved by making capital mobility strictly liable for its proximately caused social dislocation costs.31 This approach erects no inefficient barriers to capital mobility, nor does it bar all disinvestment decisions that may cause disruption and loss in the exit community. Other things being equal, if the new investment discounted by the social dislocation costs of exit will generate a higher rate of return than the current use of the capital, the capital should be disinvested from the old use and transferred to the new use. However, if investors are not forced by liability rules to take into account the social dislocation costs of disinvestment, the new investment opportunity will appear more attractive than it really is in a social sense. The situation involves a classic form of market failure. The market is imperfect because investors are not obliged to take into account the negative social dislocation costs proximately caused by their decisions. Inaccurate price signals lead to the overproduction of capital movement and therefore to a suboptimal allocation of resources. Apart from any severance and unemployment benefits received by workers at the old plant, the social dislocation costs of disinvestment are almost entirely externalized onto the workers and the surrounding community. Strict tort liability will induce investors and their downstream customers to fractionate and spread the dislocation costs of capital mobility when pricing the products of the new activity. This will provide those who use or benefit from the new activity at the destination community more accurate signals as to its true social costs and oblige them to fractionally share in the misfortunes afflicting the departure community. Suppose, for example, that U.S. Steel invested the money it took out of Youngstown toward construction of a modern, high-tech steel mill in a Sunbelt state. The price of steel produced at the new mill should fractionally reflect social dislocation costs in Youngstown. According to legal "common sense" and mainstream economic theory, the movement of capital from a lesser to a more profitable investment is an unambiguous social good. Allowing capital to migrate to its highest rate of return guarantees that society"s resources are devoted to their most productive uses. Society as a whole is better off if capital is permitted freely to migrate to the new investment and there to grow the pie. In short, the free mobility of capital maximizes aggregate welfare. We are all "winners" in the long run, even if some unfortunate "losers" might get hurt along the way. It follows as an article of faith that any legal inhibition on the mobility of capital is inefficient and socially wasteful. This is why mainstream legal thinking refuses to accord long-term workers or surrounding communities any sort of "property interest" in the enterprise which a departing investor is obliged to buy out before removal.32 An unwritten, bed-rock assumption of US law is that capital is not and should not be legally responsible for the social dislocation costs occasioned by its mobility.33 Such costs are mostly externalized onto employees and the surrounding community, even if the exit community had subsidized the old investment with tax breaks and similar forms of corporate welfare. The legal common sense about capital mobility is mistaken. It is not a priori true that the movement of capital toward the greatest rate of return unambiguously enhances aggregate social welfare. Free capital mobility maximizes aggregate welfare and allocates resources to their most productive uses only in a perfect market; that is, only in the absence of market failure. The claim that free capital mobility is efficient is sometimes true, and sometimes it is not. It all depends on the particular facts and circumstances on the ground. Voilà. Judge Lambros was wrong. In 1980, a mechanism did exist in our law to recognize the plaintiffs" claims and afford them substantial relief for economic, emotional, and other losses.34 All that was required was a logical extension of familiar torts thinking. Had Judge Lambros correctly applied well-known and time-honored torts principles, he would have treated the social dislocation costs of the plant closure as an externality that must be embedded in U.S. Steel"s calculations regarding the relative profitability of the old and new uses to which it might put its capital. This would close the gap between private and social costs, thereby tending to perfect the market. Notice an important rhetorical advantage of this theory—its core value is economic efficiency. The plaintiffs can get this far along in their argument without mentioning "fairness," "equity," or "justice," let alone "human rights," values that are often fatal to legal argument in U.S. courts today.35 I now brace myself for the "you gotta be kidding me" phase of the discussion. Objections cascade in. The progressive students want to be convinced that this is really happening. The mainstream students want to poke holes and debunk. A few of them are grateful at last for an opportunity to show how misguided they always knew my teaching was. Always, students assert that my summary discussion of the cost/benefit analysis omitted various costs and benefits. For example, one year I omitted to say that the social dislocation costs in the exit community must be discounted by ameliorative public expenditures such as unemployment insurance benefits. My response to this type of objection is always the same: "you are absolutely right, that cost or benefit should be included in the analysis. And here are a few more considerations we would need to address to perfect the cost/benefit analysis which I left out only in the interest of time." But I learn from this discussion; not infrequently, students contribute something I had not previously considered. A frequent objection is that the task of quantifying the social dislocation costs associated with capital mobility is just too complicated and difficult. I concede that it is a complex task and that conservative estimates might be required in place of absolute precision. I ask, however, whether it is preferable to allow investors to proceed on the basis of price-signals we know to be wrong or to induce them to use best efforts to arrive at fair estimates. Separation of powers always comes up, as it should. I go through the usual riffs. Yes, I concede, these problems cry out for a comprehensive legislative solution rather than case-by-case adjudication. But standard, well-known counter-arguments suggest that Judge Lambros should nevertheless have imposed tort liability in this case. For one thing, determining the rules of tort liability has always been within the province of courts. Deferring to the status quo (that those who move capital are not legally responsible for negative externalities) is every bit as much a choice, every bit as much "activism" or "social engineering," as altering the status quo. Legal history is filled with cases in which the legislature was only prompted to address an important public policy concern by the shock value of a court decision. Particularly is this so in cases involving the rights and interests of marginalized, insular, and under-represented groups like aging industrial workers. I note that Congress eventually responded to the plant closing problem with the WARN Act, a modest but not unimportant effort to internalize to enterprises some of the social dislocation costs of capital disinvestment. The statute liquidates these costs into a sum equal to sixty days" pay after an employer orders a plant closing or mass layoff without giving proper notice.36 I call the students" attention to the provision of WARN barring federal courts from enjoining plant closings37 and ask why Congress might have included that restriction. Another common objection concerns causation. A student will say: "The closedown of the mills, let alone the shutdown of any particular plant, could not have caused all of the suicides, heart failures, domestic violence, and so on, in Youngstown. Surely many such tragedies would have occurred anyway, even if U.S. Steel had remained. It isn"t fair to impose liability on U.S. Steel for everything bad that happened in Youngstown during the statute-of-limitations period." I immediately say that this is a terrific point, and that I was hoping someone would raise it. I compliment the student by saying that the question shows that he/she is now tapping legal knowledge. Typically, the class is concerned with causation-in-fact or "but for" causation. Their question is, how do we know that a plant shutdown caused any particular case of heart failure or suicide in Youngstown? Problems of causal uncertainty are a familiar issue, and I remind students that they were exposed to several well-known responses in Torts. A time-honored, if simplistic device is to shift the burden of proof regarding causationinfact to the defendant, when everyone knows full well that the defendant has no more information than the plaintiff with which to resolve the problem of causal uncertainty.38 In recent decades, courts have developed more sophisticated responses to problems of causal uncertainty as, for example, in the DES cases. As the court stated in Sindell:39 In our contemporary complex industrialized society, advances in science and technology create fungible goods which may harm consumers and which cannot be traced to any specific producer. The response of the courts can be either to adhere rigidly to prior doctrine, denying recovery to those injured by such products, or to fashion remedies to meet these changing needs. Just as Justice Traynor in his landmark concurring opinion in Escola . . . recognized that in an era of mass production and complex marketing methods the traditional standard of negligence was insufficient to govern the obligations of manufacturer to consumer, so should we acknowledge that some adaptation of the rules of causation and liability may be appropriate in these recurring circumstances . . . .40 At this point, some of the progressive students are beginning to salivate. They came to law school with the hope that legal reasoning would provide them a highly refined and politically neutral technology for speaking truth to power. The first semester disabuses most of them of that crazy idea. They have learned that they will not find certainty or answers in legal discourse, and that legal texts are minefields of gaps, conflicts, and ambiguities with moral and political implications. I can tell from the glint in their eyes that they are beginning to ask themselves whether this economics stuff, which they formerly shunned like the plague, might provide a substitute toolbox of neutral technologies with which to demonstrate that redress for workers and other subordinated and marginalized groups is legally required. I cannot allow them to think that. Therefore, unless an alert student has spotted it, I now reveal my Achilles" heel. The weak link in my argument is the age-old question of proximate causation. Assume we solve the causation-in-fact problem. For example, assume that by analogy to the Sindell theory of market-share liability, the court arrives at a fair method of attributing to the plant shutdown some portion of the social trauma and injuries occurring in the wake of U.S. Steel"s departure from Youngstown. How do we know whether the plant closing proximately caused these harms? What do we mean by "proximate causation" anyway, and why does it matter? These questions present another exciting, teachable moment. Naturally, the students haven"t thought about proximate cause since first year. They barely remember what it is and how it differs from causation-in-fact. Some 3Ls shuffle uncomfortably knowing that the Bar examination looms, and they are soon going to need to know about this. I provide a quick review of proximate causation which addresses the question, how far down the chain of causation should liability reach? I illustrate my points by referring to Palsgraf v. Long Island R.R,41 which all law students remember. Perhaps U.S. Steel might fairly be held accountable for the suicide of steelworkers within ninety days of the plant closing, but we might draw the line before holding U.S. Steel liable for a stroke suffered by a steelworker"s spouse five years later. Now keyed in to what proximate cause doctrine is about, the students eagerly wait for me to tell them what the "answer" is, that is, where proximate causation doctrine would draw the line in the Youngstown case. That"s when I give them the bad news. I explain that proximate causation doctrine does not provide a determinate analytical method for measuring the scope of liability. We pretend that buzzwords like "reasonable foreseeability" or "scope-of-the-risk" give us answers, but ultimately decisions made under the rubric of proximate causation are always value judgments.42 The conclusion that "X proximately caused Y" is a statement about the type of society we want to live in. At this juncture, the 3Ls grumpily realize that I am not going to be much help in preparing

them for their bar review course. I now distribute a one-page hand-out on proximate causation prepared in advance. The handout reprints Justice Andrews' remarkable observation in his Palsgraf dissent: What we . . . mean by the word „proximate" is, that because of convenience, of public policy, of a rough sense of justice, the law arbitrarily declines to trace a series of events beyond a certain point. This is not logic. It is practical politics . . . . It is all a question of expediency. There are no fixed rules to govern our judgment. There are simply matters of which we may take account.43 I point out that causation-in-fact analysis, too, always involves perspective and value judgments.44 Why assume that water escaping the reservoir diminished the value of the neighboring coal mining company's land? Why not assume that the coal company's decision to dig close to the border diminished the value of the manufacturer's land (by increasing the cost of using the type of reservoir needed in its production process)? For that matter, why assume that the cattle trample on the neighbors' crops? Why not assume that the crops get in the way of the cattle? My handout also contains my variation on Robert Keeton's famous definition of proximate cause45: When a court states that „the defendant's conduct was the proximate cause of (some portion of) the plaintiff's injuries," what the court means is that (1) the defendant's conduct was a cause-in-fact of that portion of plaintiff's injuries; and (2) the defendant's conduct and the plaintiff's specified injuries are so related that it is appropriate, from the moral and social-policy points of view, to hold the defendant legally responsible for that portion of the plaintiff's injuries. What we mean when we ask whether the social dislocation costs associated with the shutdown of the steel plant were proximately caused by capital mobility is whether these costs are, in whole or in part, properly attributable from a moral/political point of view to U.S. Steel's decision to disinvest. Economic "science" does not and cannot establish in a value-neutral manner that the social dislocation costs of the plant shutdown are a negative externality of capital mobility. A conclusion of that kind requires a value judgment that we disguise under

the rubric of "proximate causation," a value judgment about whom it is appropriate to ask to bear what costs related to what injuries. The lesson is that in legal reasoning there is no escape from moral and political choice. If things have gone according to plan, time conveniently runs out, and the class is dismissed on that note. What am I trying to accomplish in a class like this? What are the objectives of critical legal pedagogy? Legal education should empower students. It should put them in touch with their own capacity to take control over their lives and professional education and development. It should enable them to experience the possibility of participating, as lawyers, in transformative social movements. But all too often classroom legal education is deadening. The law student's job, mastering doctrine, appears utterly unconnected to any process of learning about oneself or developing one's moral, political, or professional identity. Classroom legal education tends to reinforce a sense of powerlessness about our capacity to change social institutions. Indeed, it often induces students to feel that they are powerless to shape and alter their own legal education. Much of legal education induces in students a pervasive and exaggerated sense of the constraint of legal rules and roles and the students' inability to do much about it. In capsule form, the goals of critical legal pedagogy are— • to disrupt the socialization process that occurs during legal education; • to unfreeze entrenched habits of mind and deconstruct the false claims of necessity which constitute so-called "legal reasoning"; • to urge students to see their life's work ahead as an opportunity to unearth and challenge law's dominant ideas about society, justice, and human possibility and to infuse legal rules and practices with emancipatory and egalitarian content; • to persuade students that legal discourses and practices comprise a medium, neither infinitely plastic nor inalterably rigid, in which they can pursue moral and political projects and articulate alternative visions of social organization and social justice; • to train them to argue professionally and respectably for the utopian and the impossible; • to alert them that legal cases potentially provide a forum for intense public consciousness-raising about issues of social justice; • to encourage them to view legal representation as an opportunity to challenge, push, and relocate the boundaries between intra-systemic and extra-systemic activity, that is, an opportunity to work within the system in a way that reconstitutes it; and • to show that the existing social order is not immutable but "is merely possible, and that people have the freedom and power to act upon it."46 The most important point of the class is that social justice lawyers never give up. The appropriate response when you think you have a hopeless case is to go back and do more work in the legal medium.

Fiat Good AT: Agency Turn

Fiat good

Elizabeth **SHOVE** Sociology @ Lancaster **AND** Gordon **WALKER** Geography @ Lancaster **'7**
["CAUTION! Transitions ahead: politics, practice, and sustainable transition management," *Environment and Planning C* 39 (4)]

For academic readers, our commentary argues for loosening the intellectual grip of 'innovation studies', for backing off from the nested, hierarchical multi-level model as the only model in town, and for exploring other social scientific, but also systemic theories of change. The more we think about the politics and practicalities of reflexive transition management, the more complex the process appears: for a policy audience, our words of caution could be read as an invitation to abandon the whole endeavour. If agency, predictability and legitimacy are as limited as we've suggested, this might be the only sensible conclusion. However, we are with Rip (2006) in recognising the value, productivity and everyday necessity of an **'illusion of agency'**, and of the working expectation that a difference can be made even in the face of so much evidence to the contrary. The outcomes of actions are unknowable, the system unsteerable and the effects of deliberate intervention inherently unpredictable and, ironically, it is this that sustains concepts of agency and management. As Rip argues '**illusions are productive** because they **motivate action** and repair work, and thus something (whatever) is achieved' (Rip 2006: 94). Situated inside the systems they seek to influence, governance actors – and actors of other kinds as well - are part of the **dynamics of change**: even if they cannot steer from the outside they are **necessary to processes within**. This is, of course, also true of academic life. Here we are, busy critiquing and analysing transition management in the expectation that somebody somewhere is listening and maybe even taking notice. If we removed that illusion would we bother writing anything at all? Maybe we need such fictions to keep us going, and maybe – fiction or no - somewhere along the line something really does happen, but not in ways that we can anticipate or know.

Warming Debates Good

It's specifically true for climate policy

Mitchell 10

Gordon R. Mitchell is Associate Professor and Director of Graduate Studies in the Department of Communication at the University of Pittsburgh, where he also directs the William Pitt Debating Union. Robert Asen's patient and thoughtful feedback sharpened this manuscript, which was also improved by contributions from members of the Schenley Park Debate Authors Working Group (DAWG), a consortium of public argument scholars at the University of Pittsburgh that strives to generate rigorous scholarship addressing the role of argumentation and debate in society. SWITCH-SIDE DEBATING MEETS DEMAND-DRIVEN RHETORIC OF SCIENCE. MITCHELL, GORDON R.1 Rhetoric & Public Affairs; Spring2010, Vol. 13 Issue 1, p95-120, 26p

The watchwords for the intelligence community's debating initiative— collaboration, critical thinking, collective awareness—resonate with key terms anchoring the study of deliberative democracy. In a major new text, John Gastil defines deliberation as a process whereby people "carefully examine a problem and arrive at a well-reasoned solution aft er a period of inclusive, respectful consideration of diverse points of view."40 Gastil and his colleagues in organizations such as the Kettering Foundation and the National Coalition for Dialogue and Deliberation are pursuing a research program that foregrounds the democratic telos of deliberative processes. Work in this area features a blend of concrete interventions and studies of citizen empowerment.41 Notably, a key theme in much of this literature concerns the relationship between deliberation and debate, with the latter term often loaded with pejorative baggage and working as a negative foil to highlight the positive qualities of deliberation.42 "Most political discussions, however, are debates. Stories in the media turn politics into a never-ending series of contests. People get swept into taking sides; their energy goes into figuring out who or what they're for or against," says Kettering president David Mathews and coauthor Noelle McAfee. "Deliberation is different. It is neither a partisan argument where opposing sides try to win nor a casual conversation conducted with polite civility. Public deliberation is a means by which citizens make tough choices about basic purposes and directions for their communities and their country. It is a way of reasoning and talking together."43 Mathews and McAfee's distrust of the debate process is almost paradigmatic amongst theorists and practitioners of Kettering-style deliberative democracy. One conceptual mechanism for reinforcing this debate-deliberation opposition is characterization of debate as a process inimical to deliberative aims, with debaters adopting dogmatic and fixed positions that frustrate the deliberative objective of "choice work." In this register, Emily Robertson observes, "unlike deliberators, debaters are typically not open to the possibility of being shown wrong. . . . Debaters are not trying to find the best solution by keeping an open mind about the opponent's point of view."44 Similarly, founding documents from the University of Houston–Downtown's Center for Public Deliberation state, "Public deliberation is about choice work, which is different from a dialogue or a debate. In dialogue, people oft en look to relate to each other, to understand each other, and to talk about more informal issues. In debate, there are generally two positions and people are generally looking to 'win' their side."45 Debate, cast here as the theoretical scapegoat, provides a convenient, low-water benchmark for explaining how other forms of deliberative interaction better promote cooperative "choice work." The Kettering-inspired framework receives support from perversions of the debate process such as vapid presidential debates and verbal pyrotechnics found on Crossfire-style television shows.46 In contrast, the intelligence community's debating initiative stands as a nettlesome anomaly for these theoretical frameworks, with debate serving, rather than frustrating, the ends of deliberation. The presence of such an anomaly would seem to point to the wisdom of fashioning a theoretical orientation that frames the debate-deliberation connection in contingent, rather than static terms, with the relationship between the categories shift ing along with the various contexts in which they manifest in practice.47 Such an approach gestures toward the importance of rhetorically informed critical work on multiple levels. First, the contingency of situated practice invites analysis geared to assess, in particular cases, the extent to which debate practices enable and/ or constrain deliberative objectives. Regarding the intelligence community's debating initiative, such an analytical perspective highlights, for example, the tight connection between the deliberative goals established by intelligence officials and the cultural technology manifest in the bridge project's online debating applications such as Hot Grinds. An additional dimension of nuance emerging from this avenue of analysis pertains to the precise nature of the deliberative goals set by bridge. Program descriptions notably eschew Kettering-style references to democratic citizen empowerment, yet feature deliberation prominently as a key ingredient of strong intelligence tradecraft . Th is caveat is especially salient to consider when it comes to the second category of rhetorically informed critical work invited by the contingent aspect of specific debate initiatives. To grasp this layer it is useful to appreciate how the name of the bridge project constitutes an invitation for those outside the intelligence community to participate in the analytic outreach eff ort. According to Doney, bridge "provides an environment for Analytic Outreach—a place where IC analysts can reach out to expertise elsewhere in federal, state, and local government, in academia, and industry. New communities of interest can form quickly in bridge through the 'web of trust' access control model—access to minds outside the intelligence community creates an analytic force multiplier."48 This presents a moment of choice for academic scholars in a position to respond to Doney's invitation; it is an opportunity to convert scholarly expertise into an "analytic force multiplier." In reflexively pondering this invitation, it may be valuable for scholars to read Greene and Hicks's proposition that switch-side debating should be viewed as a cultural technology in light of Langdon Winner's maxim that "technological artifacts have politics."49 In the case of bridge, politics are informed by the history of intelligence community policies and practices. Commenter Th omas Lord puts this point in high relief in a post off ered in response to a news story on the topic: "[W]hy should this thing ('bridge') be? . . . [Th e intelligence community] on the one hand sometimes provides useful information to the military or to the civilian branches and on the other hand it is a dangerous, out of control, relic that by all external appearances is not the slightest bit reformed, other than superficially, from such excesses as became exposed in the cointelpro and mkultra hearings of the 1970s."50 A debate scholar need not agree with Lord's full-throated criticism of the intelligence community (he goes on to observe that it bears an alarming resemblance to organized crime) to understand that participation in the community's Analytic Outreach program may serve the ends of deliberation, but not necessarily democracy, or even a defensible politics. Demand-driven rhetoric of science necessarily raises questions about what's driving the demand, questions that scholars with relevant expertise would do well to ponder carefully before embracing invitations to contribute their argumentative expertise to deliberative projects. By the same token, it would be prudent to bear in mind that the technological determinism about switch-side debate endorsed by Greene and Hicks may tend to flatten reflexive assessments regarding the wisdom of supporting a given debate initiative—as the next section illustrates, manifest differences among initiatives warrant context-sensitive judgments regarding the normative political dimensions featured in each case. Public Debates in the EPA Policy Process Th e preceding analysis of U.S. intelligence community debating initiatives highlighted how analysts are challenged to navigate discursively the heteroglossia of vast amounts of diff erent kinds of data flowing through intelligence streams. Public policy planners are tested in like manner when they attempt to

stitch together institutional arguments from various and sundry inputs ranging from expert testimony, to historical precedent, to public comment. Just as intelligence managers find that algorithmic, formal methods of analysis often don't work when it comes to the task of interpreting and synthesizing copious amounts of disparate data, public-policy planners encounter similar challenges. In fact, the argumentative turn in public-policy planning elaborates an approach to public-policy analysis that foregrounds deliberative interchange and critical thinking as alternatives to "decisionism," the formulaic application of "objective" decision algorithms to the public policy process. Stating the matter plainly, Majone suggests, "whether in written or oral form, argument is central in all stages of the policy process." Accordingly, he notes, "we miss a great deal if we try to understand policy-making solely in terms of power, influence, and bargaining, to the exclusion of debate and argument."51 One can see similar rationales driving Goodwin and Davis's EPA debating project, where debaters are invited to conduct on-site public debates covering resolutions craft ed to reflect key points of stasis in the EPA decision-making process. For example, in the 2008 Water Wars debates held at EPA headquarters in Washington, D.C., resolutions were craft ed to focus attention on the topic of water pollution, with one resolution focusing on downstream states' authority to control upstream states' discharges and sources of pollutants, and a second resolution exploring the policy merits of bottled water and toilet paper taxes as revenue sources to fund water infrastructure projects. In the first debate on interstate river pollution, the team of Seth Gannon and Seungwon Chung from Wake Forest University argued in favor of downstream state control, with the Michigan State University team of Carly Wunderlich and Garrett Abelkop providing opposition. In the second debate on taxation policy, Kevin Kallmyer and Matthew Struth from University of Mary Washington defended taxes on bottled water and toilet paper, while their opponents from Howard University, Dominique Scott and Jarred McKee, argued against this proposal. Reflecting on the project, Goodwin noted how the intercollegiate Switch-Side Debating Meets Demand-Driven Rhetoric of Science 107 debaters' ability to act as "honest brokers" in the policy arguments contributed positively to internal EPA deliberation on both issues.52 Davis observed that since the invited debaters "didn't have a dog in the fight," they were able to give voice to previously buried arguments that some EPA subject matter experts felt reticent to elucidate because of their institutional affiliations.53 Such findings are consistent with the views of policy analysts advocating the argumentative turn in policy planning. As Majone claims, "Dialectical confrontation between generalists and experts often succeeds in bringing out unstated assumptions, conflicting interpretations of the facts, and the risks posed by new projects."54 Frank Fischer goes even further in this context, explicitly appropriating rhetorical scholar Charles Willard's concept of argumentative "epistemics" to flesh out his vision for policy studies: Uncovering the epistemic dynamics of public controversies would allow for a more enlightened understanding of what is at stake in a particular dispute, making possible a sophisticated evaluation of the various viewpoints and merits of diff erent policy options. In so doing, the diff ering, oft en tacitly held contextual perspectives and values could be juxtaposed; the viewpoints and demands of experts, special interest groups, and the wider public could be directly compared; and the dynamics among the participants could be scrutinized. This would by no means sideline or even exclude scientific assessment; it would only situate it within the framework of a more comprehensive evaluation.55 As Davis notes, institutional constraints present within the EPA communicative milieu can complicate eff orts to provide a full airing of all relevant arguments pertaining to a given regulatory issue. Thus, intercollegiate debaters can play key roles in retrieving and amplifying positions that might otherwise remain sedimented in the policy process. Th e dynamics entailed in this symbiotic relationship are underscored by deliberative planner John Forester, who observes, "If planners and public administrators are to make democratic political debate and argument possible, they will need strategically located allies to avoid being fully thwarted by the characteristic self-protecting behaviors of the planning organizations and bureaucracies within which they work."56 Here, an institution's need for "strategically located allies" to support deliberative practice constitutes the demand for rhetorically informed expertise, setting up what can be considered a demand-driven rhetoric of science. As an instance of rhetoric of science scholarship, this type of "switch-side public 108 Rhetoric & Public Affairs debate" diff ers both from insular contest tournament debating, where the main focus is on the pedagogical benefit for student participants, and first-generation rhetoric of science scholarship, where critics concentrated on unmasking the rhetoricity of scientific artifacts circulating in what many perceived to be purely technical spheres of knowledge production.58 As a form of demand-driven rhetoric of science, switch-side debating connects directly with the communication field's performative tradition of argumentative engagement in public controversy—a different route of theoretical grounding than rhetorical criticism's tendency to locate its foundations in the English field's tradition of literary criticism and textual analysis.59 Given this genealogy, it is not surprising to learn how Davis's response to the EPA's institutional need for rhetorical expertise took the form of a public debate proposal, shaped by Davis's dual background as a practitioner and historian of intercollegiate debate. Davis competed as an undergraduate policy debater for Howard University in the 1970s, and then went on to enjoy substantial success as coach of the Howard team in the new millennium. In an essay reviewing the broad sweep of debating history, Davis notes, "Academic debate began at least 2,400 years ago when the scholar Protagoras of Abdera (481–411 bc), known as the father of debate, conducted debates among his students in Athens."60 As John Poulakos points out, "older" Sophists such as Protagoras taught Greek students the value of dissoi logoi, or pulling apart complex questions by debating two sides of an issue.61 Th e few surviving fragments of Protagoras's work suggest that his notion of dissoi logoi stood for the principle that "two accounts [logoi] are present about every 'thing,' opposed to each other," and further, that humans could "measure" the relative soundness of knowledge claims by engaging in give-and-take where parties would make the "weaker argument stronger" to activate the generative aspect of rhetorical practice, a key element of the Sophistical tradition.62 Following in Protagoras's wake, Isocrates would complement this centrifugal push with the pull of synerchesthe, a centripetal exercise of "coming together" deliberatively to listen, respond, and form common social bonds.63 Isocrates incorporated Protagorean dissoi logoi into synerchesthe, a broader concept that he used flexibly to express interlocking senses of (1) inquiry, as in groups convening to search for answers to common questions through discussion;64 (2) deliberation, with interlocutors gathering in a political setting to deliberate about proposed courses of action;65 and (3) alliance formation, a form of collective action typical at festivals,66 or in the exchange of pledges that deepen social ties.67 Switch-Side Debating Meets Demand-Driven Rhetoric of Science 109 Returning once again to the Kettering-informed sharp distinction between debate and deliberation, one sees in Isocratic synerchesthe, as well as

in the EPA debating initiative, a fusion of debate with deliberative functions. Echoing a theme raised in this essay's earlier discussion of intelligence tradecraft , such a fusion troubles categorical attempts to classify debate and deliberation as fundamentally opposed activities. Th e significance of such a finding is amplified by the frequency of attempts in the deliberative democracy literature to insist on the theoretical bifurcation of debate and deliberation as an article of theoretical faith. Tandem analysis of the EPA and intelligence community debating initiatives also brings to light dimensions of contrast at the third level of Isocratic synerchesthe, alliance formation. Th e intelligence community's Analytic Outreach initiative invites largely one-way communication flowing from outside experts into the black box of classified intelligence analysis. On the contrary, the EPA debating program gestures toward a more expansive project of deliberative alliance building. In this vein, Howard University's participation in the 2008 EPA Water Wars debates can be seen as the harbinger of a trend by historically black colleges and universities (hbcus) to catalyze their debate programs in a strategy that evinces Davis's dual-focus vision. On the one hand, Davis aims to recuperate Wiley College's tradition of competitive excellence in intercollegiate debate, depicted so powerfully in the feature film The Great Debaters, by starting a wave of new debate programs housed in hbcus across the nation.68 On the other hand, Davis sees potential for these new programs to complement their competitive debate programming with participation in the EPA's public debating initiative. Th is dual-focus vision recalls Douglas Ehninger's and Wayne Brockriede's vision of "total" debate programs that blend switch-side intercollegiate tournament debating with forms of public debate designed to contribute to wider communities beyond the tournament setting.69 Whereas the political telos animating Davis's dual-focus vision certainly embraces background assumptions that Greene and Hicks would find disconcerting—notions of liberal political agency, the idea of debate using "words as weapons"70—there is little doubt that the project of pursuing environmental protection by tapping the creative energy of hbcu-leveraged dissoi logoi diff ers significantly from the intelligence community's eff ort to improve its tradecraft through online digital debate programming. Such diff erence is especially evident in light of the EPA's commitment to extend debates to public realms, with the attendant possible benefits unpacked by Jane Munksgaard and Damien Pfister: 110 Rhetoric & Public Affairs Having a public debater argue against their convictions, or confess their indecision on a subject and subsequent embrace of argument as a way to seek clarity, could shake up the prevailing view of debate as a war of words. Public uptake of the possibility of switch-sides debate may help lessen the polarization of issues inherent in prevailing debate formats because students are no longer seen as wedded to their arguments. This could transform public debate from a tussle between advocates, with each public debater trying to convince the audience in a Manichean struggle about the truth of their side, to a more inviting exchange focused on the content of the other's argumentation and the process of deliberative exchange.71 Reflection on the EPA debating initiative reveals a striking convergence among (1) the expressed need for dissoi logoi by government agency officials wrestling with the challenges of inverted rhetorical situations, (2) theoretical claims by scholars regarding the centrality of argumentation in the public policy process, and (3) the practical wherewithal of intercollegiate debaters to tailor public switch-side debating performances in specific ways requested by agency collaborators. These points of convergence both underscore previously articulated theoretical assertions regarding the relationship of debate to deliberation, as well as deepen understanding of the political role of deliberation in institutional decision making. But they also suggest how decisions by rhetorical scholars about whether to contribute switch-side debating acumen to meet demand-driven rhetoric of science initiatives ought to involve careful reflection. Such an approach mirrors the way policy planning in the "argumentative turn" is designed to respond to the weaknesses of formal, decisionistic paradigms of policy planning with situated, contingent judgments informed by reflective deliberation. Conclusion Dilip Gaonkar's criticism of first-generation rhetoric of science scholarship rests on a key claim regarding what he sees as the inherent "thinness" of the ancient Greek rhetorical lexicon.72 That lexicon, by virtue of the fact that it was invented primarily to teach rhetorical performance, is ill equipped in his view to support the kind of nuanced discriminations required for eff ective interpretation and critique of rhetorical texts. Although Gaonkar isolates rhetoric of science as a main target of this critique, his choice of subject matter Switch-Side Debating Meets Demand-Driven Rhetoric of Science 111 positions him to toggle back and forth between specific engagement with rhetoric of science scholarship and discussion of broader themes touching on the metatheoretical controversy over rhetoric's proper scope as a field of inquiry (the so-called big vs. little rhetoric dispute).73 Gaonkar's familiar refrain in both contexts is a warning about the dangers of "universalizing" or "globalizing" rhetorical inquiry, especially in attempts that "stretch" the classical Greek rhetorical vocabulary into a hermeneutic metadiscourse, one pressed into service as a master key for interpretation of any and all types of communicative artifacts. In other words, Gaonkar warns against the dangers of rhetoricians pursuing what might be called supply-side epistemology, rhetoric's project of pushing for greater disciplinary relevance by attempting to extend its reach into far-flung areas of inquiry such as the hard sciences. Yet this essay highlights how rhetorical scholarship's relevance can be credibly established by outsiders, who seek access to the creative energy flowing from the classical Greek rhetorical lexicon in its native mode, that is, as a tool of invention designed to spur and hone rhetorical performance. Analysis of the intelligence community and EPA debating initiatives shows how this is the case, with government agencies calling for assistance to animate rhetorical processes such as dissoi logoi (debating different sides) and synerchesthe (the performative task of coming together deliberately for the purpose of joint inquiry, collective choice-making, and renewal of communicative bonds).74 Th is demand-driven epistemology is diff erent in kind from the globalization project so roundly criticized by Gaonkar. Rather than rhetoric venturing out from its own academic home to proselytize about its epistemological universality for all knowers, instead here we have actors not formally trained in the rhetorical tradition articulating how their own deliberative objectives call for incorporation of rhetorical practice and even recruitment of "strategically located allies"75 to assist in the process. Since the productivist content in the classical Greek vocabulary serves as a critical resource for joint collaboration in this regard, demand-driven rhetoric of science turns Gaonkar's original critique on its head. In fairness to Gaonkar, it should be stipulated that his 1993 intervention challenged the way rhetoric of science had been done to date, not the universe of ways rhetoric of science might be done in the future. And to his partial credit, Gaonkar did acknowledge the promise of a performance-oriented rhetoric of science, especially one informed by classical thinkers other than Aristotle.76 In his Ph.D. dissertation on "Aspects of Sophistic Pedagogy," Gaonkar documents how the ancient sophists were "the greatest champions" 112 Rhetoric & Public Affairs of "socially useful" science,77 and also how the sophists essentially practiced the art of rhetoric in a translational, performative register: Th e sophists could not blithely go about their business of making science useful, while science itself stood still due to lack of communal support and recognition. Besides, sophistic pedagogy was becoming increasingly dependent on the findings of contemporary speculation in philosophy and science. Take for instance, the eminently practical art of rhetoric. As taught by the best of the sophists, it was not simply a handbook of recipes which anyone could mechanically employ to his advantage. On the contrary, the strength and vitality of sophistic rhetoric came from their ability to incorporate the relevant information obtained from the on-going research in other fields.78 Of course, deep trans-historical diff erences make uncritical appropriation of classical Greek rhetoric for contemporary use a fool's errand. But to gauge from Robert Hariman's recent reflections on the enduring salience of Isocrates, "timely, suitable, and eloquent appropriations" can help us postmoderns "forge a new political language" suitable for addressing the complex raft of intertwined problems facing global society. Such retrospection is long overdue, says Hariman, as "the history, literature, philosophy,

oratory, art, and political thought of Greece and Rome have never been more accessible or less appreciated."79 Th is essay has explored ways that some of the most venerable elements of the ancient Greek rhetorical tradition—those dealing with debate and deliberation—can be retrieved and adapted to answer calls in the contemporary milieu for cultural technologies capable of dealing with one of our time's most daunting challenges. This challenge involves finding meaning in inverted rhetorical situations characterized by an endemic surplus of

heterogeneous content.

The skills acquired in the process of debating warming policy are necessary and sufficient to overcome political apathy and dissuasion

Herbeck and Isham 10

Jon Isham

Associate Professor of Economics, Middlebury College

In the fall of 1999, Jon joined the department of economics and the program in environmental studies at Middlebury College. Jon teaches classes in environmental economics, environmental policy, introductory microeconomics, social capital in Vermont, and global climate change. Jon is co-editing a new book, Ignition: The Birth of the Climate Movement; has co-edited Social Capital, Development, and the Environment (Edward Elgar Publications); has published articles (several forthcoming) in Economic Development and Cultural Change, The Journal of African Economies, The Nonprofit and Voluntary Sector Quarterly, The Quarterly Journal of Economics, Rural Sociology, Society and Natural Resources, The Southern Economic Journal, The Vermont Law Review, and the World Bank Economic Review; and has published book chapters in volumes from Ashgate Press, The New England University Press, Oxford University Press, and Cambridge University Press. His current research focuses on building the new climate movement; the demand for water among poor households in Cambodia; information asymmetries in low-income lending; and the effect of local social capital on environmental outcomes in Vermont.

Herbeck, member of the Rubenstein School of Environment and Natural Resources and the Honors College.

Getting to 350 parts per million CO2 in the atmosphere will require massive investments in clean-energy infrastructure—investments that can too often be foiled by a combination of special interests and political sclerosis. Take the recent approval of the Cape Wind project by the U.S. Department of the Interior. In some ways, this was great news for clean-energy advocates: the project's 130 turbines will produce, on average, 170 megawatts of electricity, almost 75 percent of the average electricity demand for Cape Cod and the islands of Martha's Vineyard and Nantucket.1 But, because of local opposition by well-organized opponents, the approval process was lengthy, costly, and grueling —and all for a project that will produce only 0.04 percent of the total (forecasted) U.S. electricity demand in 2010.2,3 Over the next few decades, the world will need thousands of large-scale, low-carbon electricity projects—wind, solar, and nuclear power will certainly be in the mix. But if each faces Cape Wind–like opposition, getting to 350 is unlikely. How can the decision-making process about such projects be streamlined so that public policy reflects the view of a well-informed majority, provides opportunities for legitimate critiques, but does not permit the opposition to retard the process indefinitely? One answer is found in a set of innovative policy-making tools founded on the principle of deliberative democracy, defined as "decision making by discussion among free and equal citizens."4 Such approaches, which have been developed and led by the Center for Deliberative Democracy (cdd.stanford.edu), America Speaks (www.americaspeaks.org), and the Consensus Building Institute (cbuilding.org), among others, are gaining popularity by promising a new foothold for effective citizen participation in the drive for a clean-energy future. Deliberative democracy stems from the belief that democratic leadership should involve educating constituents about issues at hand, and that citizens may

significantly alter their opinions when faced with information about these issues. Advocates of the approach state that democracy should shift away from fixed notions toward a learning process in which people develop defensible positions.5 While the approaches of the Center for Deliberative Democracy, America Speaks, and the Consensus Building Institute do differ, all of these deliberative methodologies involve unbiased sharing of information and public-policy alternatives with a representative set of citizens; a moderated process of deliberation among the selected citizens; and the collection and dissemination of data resulting from this process. For example, in the deliberative polling approach used by the Center for Deliberative Democracy, a random selection of citizens is first polled on a particular issue. Then, members of the poll are invited to gather at a single place to discuss the issue. Participants receive balanced briefing materials to review before the gathering, and at the gathering they engage in dialogue with competing experts and political leaders based on questions they develop in small group discussions. After deliberations, the sample is asked the original poll questions, and the resulting changes in opinion represent the conclusions that the public would reach if everyone were given the opportunity to become more informed on pressing issues.6 If policymakers look at deliberative polls rather than traditional polls, they will be able to utilize results that originate from an informed group of citizens. As with traditional polls, deliberative polls choose people at random to represent U.S. demographics of age, education, gender, and so on. But traditional polls stop there, asking the random sample some brief, simple questions, typically online or over the phone. However, participants of deliberative polls have the opportunity to access expert information and then talk with one another before voting on policy recommendations. The power of this approach is illustrated by the results of a global deliberative process organized by World Wide Views on Global Warming (www.wwviews.org), a citizen's deliberation organization based in Denmark.7 On September 26, 2009, approximately 4,000 people gathered in 38 countries to consider what should happen at the UN climate change negotiations in Copenhagen (338 Americans met in five major cities). The results derived from this day of deliberation were dramatic and significantly different from results of traditional polls. Overall, citizens showed strong concern about global warming and support for climate-change legislation, contrary to the outcomes of many standard climate-change polls. Based on the polling results from these gatherings, 90 percent of global citizens believe that it is urgent for the UN negotiations to produce a new climate change agreement; 88 percent of global citizens (82 percent of U.S. citizens) favor holding global warming to within 2 degrees Celsius of pre-industrial levels; and 74 percent of global citizens (69 percent of U.S. citizens) favor increasing fossil-fuel prices in developed countries. However, a typical news poll that was conducted two days before 350.org's International Day of Climate Action on October 24, 2009, found that Americans had an overall declining concern about global warming.7 How can deliberative democracy help to create solutions for the climate-change policy process, to accelerate the kinds of policies and public investments that are so crucial to getting the world on a path to 350? Take again the example of wind in the United States. In the mid-1990s, the Texas Public Utilities Commission (PUC) launched an "integrated resource plan" to develop long-term strategies for energy production, particularly electricity.8 Upon learning about the deliberative polling approach of James Fishkin (then at the University of Texas at Austin), the PUC set up deliberative sessions for several hundred customers in the vicinity of every major utility provider in the state. The results were a surprise: it turned out that participants ranked reliability and stability of electricity supply as more important characteristics than price. In addition, they were open to supporting renewable energy, even if the costs slightly exceeded fossil-fuel sources. Observers considered this a breakthrough: based on these public deliberations, the PUC went on to champion an aggressive renewable portfolio standard, and the state has subsequently experienced little of the opposition to wind-tower siting that has slowed development in other states.8 By 2009, Texas had 9,500 megawatts of installed wind capacity, as much as the next six states (ranked by wind capacity) in the windy lower and upper Midwest (Iowa, Minnesota, Colorado, North Dakota, Kansas, and New Mexico).9 Deliberative democracy has proven effective in a wide range of countries and settings. In the Chinese township of Zeguo, a series of deliberative polls has helped the Local People's Congress (LPC) to become a more effective decision-making body.10 In February 2008, 175 citizens were randomly selected to scrutinize the town's budget—and 60 deputies from the LPC observed the process. After the deliberations, support decreased for budgeting for national defense projects, while support rose for infrastructure (e.g., rural road construction) and environmental protection. Subsequently, the LPC increased support for environmental projects by 9 percent.10 In decades to come, China must be at the forefront of the world's investments in clean-energy infrastructure. The experience of Zeguo, if scaled up and fully supported by Chinese leaders, can help to play an important role. Deliberative democracy offers one solution for determining citizen opinions, including those on pressing issues related to climate change and clean energy.

AT: Discourse First

Discourse fails

Schwartz, 9

(Joseph, Poli Sci Prof @ Temple, "The Future of Democratic Equality," Routledge, pg 64-5)

'Discursive' performance is not the sole manner by which individuals deal with (and express) the material and cultural structural realities that both empower and constrain individuals. For example. **individuals cannot readily "discursively perform" themselves out of their socio-economic or class position.** There is a certain materiality to poverty or to being "bossed" that can't simply be "ironically" and "performatively" transformed. Class relations are structural, as well as discursive. The greater difficulty in forming unions in the United States- as compared to other advanced industrial democracies- has much to do with American legal, ideological, and political constraints and not simply with the rel- ative inefficacy of the "performative," "counter-hegemonic" behavior of (frag- mented) individuals. Even the "parodic" possibilities of "gender" reversal are constrained by the communities in which one resides. **Is the "reversal" of "drag" a viable public possibility in a violently homophobic community?** Were not the "performative" options of a Matthew Sheperd (extremely) more limited than those of a gay or lesbian student at a "progressive" residential liberal arts college (and unsafe-and even degrading and violent-social spaces confront gay and lesbian people and women and students of color in the most allegedly "cosmopolitan" of social spaces). Simply put, **distinct "social spaces" set differ- ential constraints on "performative" choices.** Of course, how individuals express class, race, gender, and sexuality does, in part, involve how we "perform" (or "racist") cultural and discursive "norms." Hence, the inevitable controversies over "authenticity" within racial, sexual, and ethnic communities, as well as criticism of people taking on the mores of a class different from those who share their "place" in the labor process, neighborhood, or income strata. But there are material constraints to **performative "choice": one can't "perform" one's way out of an under-funded inner city school** or out of being a **laid-off auto worker with dim prospects of finding a new job with comparable wages and benefits.** Traditional sociological theories of **"structuration"** provide **greater insight into how these individuals would deal with these social dilemmas** than do **micro-level theories of the discursive construction of subjectivity.** To her credit, Wendy Brown is more concerned with issues of class and political economy than are many post-structuralist political theorists. She expressly claims to bring class back into her political analysis and condemns identity poli- tics as a "phantasmagorical reflection of the 'middle-class' American dream." But there is little attention in her work to developing a political strategy that could promise a structural and material redistribution of power, rather than an alter- ation of how we think of epistemology, discourse, and politics." While ideology and culture play a relatively autonomous role in constituting subjectivity, both have a material structure that must be altered if society is to be democratized. Brown implies that radical social change does not as much involve democratiz- ing social structural relations as it does popularizing a radical epistemological approach to discourse. Brown argues that if we will ourselves to "surrender epis- temological foundations" and give up "specifically moral claims" we will all be able to engage in "the sheerly political: 'wars of position' and amoral contests about the just and good in which truth is always grasped as coterminous with power, as always already power, as the voice of power.""" Even if one resists asking whether democracy can rest on "amoral" principles, one can still ask whether Brown's Foucauldian assertation that power and truth are co-terminous can distinguish between more or less democratic forms of power? The post-structuralist hyper- emphasis on "discourse" and the agonal construction of the self also overly devalues the state as an arena for political reform. Brown's work makes a positive political contribution by warning social movements about fetishing the struggle for group rights within the law as potential minefields of "reversed" power/knowledge formations. State regulation and technocratic control which claim to defend the interests of newly, legally- recognized identities may yield the perverse consequence of "domesticating" the identity of the insurgent social group (e.g. state micro-management of the work place in "comparable worth legislation," or enforcement of patriarchal values in regard to punitive workfare or "child support" regulation)?" Sometimes, as Brown contends, new-found rights may enhance separation and alienation between and within individuals and groups, as well as constitute new forms of state regulation in the name of the impersonal subject. But Brown rejects the possibility (and historical reality) that new "rights" can, in other contexts, con- tribute to human emancipation by enhancing individual choice and freedom. To deny this is to ignore the elective affinity between the struggle for "rights" and struggles to achieve political equality for formerly subordinate peoples. Not all new-found rights are "co-optative" and a "reinscribing of domination.""7 Nor will the conflict within the American polity over how we should interpret and defend

"rights" ever cease. One only has to witness contemporary political con- conflict over "abortion rights," "voting rights," "gun rights," etc. Rights are both politically contested and protective of certain forms of human choice and agency. Rights do not "fix" identities as intransigently as Brown and other post-structuralists claim. Do rights only serve, as Brown contends, to promote "the discursive denial of historically layered and institutionally secured bounds, by denying with words the effects of relatively wordless, politically invisible, yet material constraints"?" Patri- cia Williams and other critical race theorists have argued that being included under the state's equal protection law helped limit violence against people of color." Despite legitimate fears about excessive state regulation of sexuality, would Brown reject the use of state force to limit domestic violence? How does her philosophical fear of the bureaucratic-regulatory powers of the state speak to the experience of hundreds of thousands of women who have been spared the "privatization" of domestic violence by the extension of the rights of state author- ity (e.g. the police) to act against violence within the household? Are such prac- tices solely evidence of the "reconstruction of domination by the regulation of the technocratic-bureaucratic state"? Of course, state regulation of domestic violence may, in Brown's language, produce a female subject "dependent upon the pater- nal state" for protection. But is this not preferable to the prior form of paternal state that let a man be the violent definer of "rights" in his home?

AT: Individual Ethics First

Individual ethical orientations aren't effective – it's more productive to rearticulate systems from the inside

Pugh 10

(Jonathan, Newcastle Postcolonial Geographer, "The Stakes of Radical Politics have Changed: Post-crisis, Relevance and the State", Globalizations, March-June, ebsco)

In this polemical piece I have just been talking about how, following an ethos of radicalism as withdrawal from the state, some from the radical Left were incapable of being able to respond to the new stakes of radical politics. In particular, they were not found at the state, where the passive public turned to resolve the crisis. I will now go on to examine how in recent years significant parts of the radical Left have also tended to prioritise raising awareness of our ethical responsibilities, over capturing state power. I am going to say that it is important to create this awareness. However, in an effort to draw attention to the stakes of politics as we find them now, post-2008, I will also point out that we should not place too much faith in this approach alone. Against the backdrop of what I have just been saying, it is important to remember that while much attention is focused upon President Obama, in many other parts of the world the Right and fundamentalism are gaining strength through capturing state power. The perception that the USA has changed is accompanied by a sense of relief among many radicals. However, the European Elections of 2009, the largest trans-national vote in history, heralded a continent-wide shift to the Right (and far Right) in many places—in Austria, Belgium, Bulgaria, Cyprus, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Italy, Estonia, Lithuania, Luxembourg, Poland, Portgual, Slovenia, Spain, Romania, as just some examples (Wall Street Journal, 2009). Despite Obama's election and a near depression, neo-liberalism continues to be implemented through a world spanning apparatus of governmental and intergovernmental organisations, think tanks and trans-national corporations (Massey, 2009; Castree, 2009). The power of the Right in countries like Iran, while checked, remains unchallenged by the Left. Albertazzi et al. (2009) draw attention to how a disconnected Left is leaving power in the hands of the Right in many other countries nationally, like Italy for example. Reflecting upon contemporary radical politics, the British Labour politician Clare Short (2009, p. 67) concludes: In the fog of the future, I see a rise of fascistic movements . . . I am afraid it will all get nastier before we see a rise in generous, radical politics, but I suspect that history is about to speed up in front of our eyes and all who oppose the radicalisation of fear, ethnic hatred, racialism and division have to be ready to create a new movement that contains the solutions to the monumental historical problems we currently face. So, the stakes of politics are clear. The Right is on the rise. Neo-liberal ideology is still dominant. How is the Left responding to these stakes? I have already discussed how some from the radical Left are placing too much faith in civil society organisations that seek to withdraw from the state. I will now turn to how others have too much faith in the power of raising awareness of our ethical responsibilities. Post-crisis, the increasing popularity of David Chandler's (2004, 2007, 2009a, 2009b) work reflects the sense that radicals too often celebrate the ethical individual as a radical force, at the expense of wider representational programmes for change **His central argument is that this leaves radicals impotent**. Chandler (2009a, p. 78–79) says that many radicals argue that there is nothing passive or conservative about radical political activist protests, such as the 2003 anti-war march, anti-capitalism and anti-globalisation protests, the huge march to Make Poverty History at the end of 2005, involvement in the World Social Forums or the radical jihad of Al-Qaeda. I disagree; these new forms of protest are highly individualised and personal ones– **there is no attempt to build a social or collective movement** It appears that theatrical suicide, demonstrating, badge and bracelet wearing are ethical acts in themselves: personal statements of awareness, rather than attempts to engage politically with society. In one way, Chandler's reflective insight here is not particularly unique. Many others also seem to think that radicals today are too isolated and disengaged (Martin, 2009).5 Neither is it particularly original to say that there is too much emphasis upon creativity and spontaneity (what Richard Sennett, 2004, calls 'social jazz'), and not enough upon representational politics. Indeed, go to many radical blogs and you find radicals themselves constantly complaining about how it has become too easy to sign up to ethical web petitions, email complaints, join a variety of ethical causes, without actually developing the political programmes themselves that matter. So it is not Chandler's point about radicals being disengaged from instrumental politics that concerns me here. It is his related point—that there has been a flight into ethics, away from political accountability and responsibility that I find intriguing. Personal statements of ethical awareness have become particularly important within radical politics today. It is therefore interesting to note, as I will now discuss, that we have been here before. In his earlier writings Karl Marx (1982) criticised the German Idealists for retreating into ethics, instead of seizing the institutions of power that mattered for themselves. Unwilling to express their self-interests politically through capturing power, the Idealists would rather make statements about their ethical awareness. Such idealism, along with an unwillingness to be held accountable for political power, often goes hand in hand. For Marx, it is necessary to feel the weight, but also the responsibility of power. Chandler argues that, just as when the early Marx critiqued German Idealism, we should now be drawing attention to the pitfalls of the flights to ethics today. He says: In the case of the German bourgeoisie, Marx concludes that it is their weakness and fragmentation, squeezed between the remnants of the ancien re´gime and the developing industrial proletariat, which explains their ideological flight into values. Rather than take on political responsibility for overthrowing the old order, the German bourgeoisie denied their specific interests and idealised progress in the otherwoldly terms of abstract philosophy, recoiling from the consequences of their liberal aspirations in practice. (Chandler, 2007, p. 717) Today we are witnessing a renewed interest in ethics (Lai¨di, 1998; Badiou, 2002). Fragmented, many radicals retreat into abstract ethical slogans like 'another world is possible', 'global human rights', or 'making poverty history'. As discussed above, we are also of course seeing the return of Kant's cosmopolitanism. While I think we should not attack the ethical turn for its values, as many of these around environmental issues and human rights are admirable, it is equally important to say that the turn to ethics

seems to reflect a certain lack of willingness to seize power and be held accountable to it. For the flight to ethics, as it often plays out in radical politics today, seems to be accompanied by scepticism toward representational politics. Continuing with this theme for a moment, Slavoj Zizek (2008) also sheds some more light upon why ethics (when compared to representational politics) has become so important to the Left in recent years. He says that many of us (he is of course writing for the Left) feel that we are unable to make a real difference through representational politics on a larger scale, when it comes to the big political problems of life. Zizek (2008, p. 453) talks of this feeling that 'we cannot ever predict the consequences of our acts'; that nothing we do will 'guarantee that the overall outcome of our interactions will be satisfactory'. And he is right to make this point. Today, our geographical imaginations are dominated by a broader sense of chaos and Global Complexity (Urry, 2003; Stengers, 2005). These ways of thinking, deep in the psyche of many radicals on the Left may be one other reason why so many have retreated into ethics. When we do not really believe that we can change the world through developing fine detailed instruments, capturing the state, or predictive models, we are naturally more hesitant. It is better to try and raise ethical awareness instead. Whereas in the past power was something to be won and treasured, something radicals could use to implement a collective ideology, today, with the risk posed by representation in fragmented societies, top-down power often becomes a hazard, even an embarrassment, for many on the Left (Laï¨di, 1998). This is, as I have already discussed, where the Right and neo-liberal ideologues are seizing the opportunity of the moment. Putting what I have just said another way, there is a need to be clear, perhaps more so in these interdisciplinary times—ethics and politics (particularly representational politics) are different. Of course they are related. You cannot do politics without an ethical perspective. **But my point here is that the Right and neo-liberal ideologues will not simply go away if the Left adopt or raise awareness of alternative ethical lifestyles**. The Right are willing to capture state power, particularly at this time when the state is increasingly powerful. When we compare the concerted political programme of neo-liberalism, first developed by Reagan, Thatcher, the IMF, the World Bank, NATO, multi-national banks, and the G20, as just some of many examples, ethical individuals across the world offer some counter-resistance. But the 2008 crisis, and the response of protests like the Alternative G20, demonstrated how weak ethical resistance is in the face of the institutions of the neo-liberal economy. Another reason for this is because the ethical individual contributes so much to neo-liberal societies themselves. To explain how, we must briefly step back. The new social movements of previous decades have, in general, been effectively recuperated by the existing system of capital, by satisfying them in a way that neutralised their subversive potential. This is how capital has maintained its hegemonic position in post-Fordist societies. Luc Boltanski and Eve Chiapello (2005) explain how capitalists have worked with, rather than against, the characteristics of new social movements. They say the new social movements desire for autonomy, the ideal of self-management, the anti-hierarchical exigency, and the search for authenticity, were important in developing post-Fordism. These replaced the hierarchical framework of the Fordist period with new forms of networked control. And so, in this way, we see that the relationship between new social movements and capital has been productive. In turn, and this is the important point I want to make about the present moment, clearly the stakes of radical politics have now changed once more. As discussed earlier, it would now seem that post-Fordist society is actually more hierarchical and controllable than many previously thought. Without the neoliberal state, and the public's subordination to its actions, it would not now exist in anything like its present form. Our subordination to the state has stopped a post-crisis implosion of neo-liberalism. And this is of course where one of the central characteristics of the ethical individual has been so productive. Endemic individualism, so dominant in liberal societies, has been recuperated by the ethical individual who is unwilling to seize the state. **So the salient point here is that the ethical individual is reflective of the conservative forces in society today.**

Roleplay k Agency

The aff solves – Debate roleplaying specifically activates agency

Hanghoj 8

(Thorkild, University of Aarhus School of Education Assistant Professor, "PLAYFUL KNOWLEDGE An Explorative Study of Educational Gaming", http://static.sdu.dk/mediafiles/Files/Information_til/Studerende_ved_SDU/Din_uddannelse/phd_hum/afhandlinger/2009/ThorkilHanghoej.pdf)

Thus, debate games require teachers to balance the centripetal/centrifugal forces of gaming and teaching, to be able to reconfigure their discursive authority, and to orchestrate the multiple voices of a dialogical game space in relation to particular goals. These Bakhtinian perspectives provide a valuable analytical framework for describing the discursive interplay between different practices and knowledge aspects when enacting (debate) game scenarios. In addition to this, Bakhtin's dialogical philosophy also offers an explanation of why debate games (and other game types) may be valuable within an educational context. One of the central features of multi-player games is that players are expected to experience a simultaneously real and imagined scenario both in relation to an insider's (participant) perspective and to an outsider's (co-participant) perspective. According to Bakhtin, the outsider's perspective reflects a fundamental aspect of human understanding: In order to understand, it is immensely important for the person who understands to be located outside the object of his or her creative understanding – in time, in space, in culture. For one cannot even really see one's own exterior and comprehend it as a whole, and no mirrors or photographs can help; our real exterior can be seen and understood only by other people, because they are located outside us in space, and because they are others (Bakhtin, 1986: 7). As the quote suggests, every person is influenced by others in an inescapably intertwined way, and consequently no voice can be said to be isolated. Thus, it is in the interaction with other voices that individuals are able to reach understanding and find their own voice. Bakhtin also refers to the ontological process of finding a voice as "ideological becoming", which represents "the process of selectively assimilating the words of others" (Bakhtin, 1981: 341). Thus, by teaching and playing debate scenarios, it is possible to support students in their process of becoming not only themselves, but also in becoming articulate and responsive citizens in a democratic society.

SS = Reflexivity

And, Switch-Side debate causes reflexivity and tolerance

Koehle 10

(Joe, Phd candidate in communications at Kansas, former West Georgia debater http://mccfblog.org/actr/wp-content/uploads/2010/12/Koehle_Paper_ACTR-editedPDF.pdf.)

Much like criticism of the sophists has persisted throughout time; criticism of switch side debate has been a constant feature since the advent of tournament-style debating. Harrigan documents how numerous these criticisms have been in the last century, explaining that Page 15 Koehle 15 complaints about the mode of debate are as old as the activity itself (9). The most famous controversy over modern switch side debate occurred in 1954, when the U.S. military academies and the Nebraska teachers" colleges decided to boycott the resolution: "Resolved: That the United States should extend diplomatic relations to the communist government of China." The schools that boycotted the topic argued that it was ethically and educationally indefensible to defend a recognition of communists, and even went so far as to argue that "a pro-recognition stand by men wearing the country"s uniforms would lead to misunderstanding on the part of our friends and to distortion by our enemies" (English et al. 221). Switch side debate was on the defensive, and debate coaches of the time were engaged in virulent debate over the how to debate. The controversy made the national news when the journalist Edward Murrow became involved and opined on the issue in front of millions of TV viewers. English et al. even go so far as to credit the "debate about debate" with helping accelerate the implosion of the famous red- baiting Senator Joseph McCarthy (222). The debate about debate fell back out of the national spotlight after the high-profile incident over the China resolution, but it never ended in the debate community itself. The tenor of the debate reached a fever pitch when outright accusations of modern sophistry (the bad kind) were published in the Spring 1983 edition of the National Forensic Journal, when Bernard K. Duffy wrote, "The Ethics of Argumentation in Intercollegiate Debate: A Conservative Appraisal." Echoing the old Platonic argument against sophistic practice, Duffy argued that switch side debate has ignored ethical considerations in the pursuit of teaching cheap techniques for victory (66). The 1990"s saw a divergence of criticisms into two different camps. The first camp was comprised of traditional critics who argued that debate instruction and practice promoted form over substance. For example, a coach from Boston College lamented that absent a change, "Debate instructors and their students will become the sophists of our age, susceptible to the traditional indictments elucidated by Isocrates and others" (Herbeck). Dale Bertelstein published a response to the previously cited article by Muir about switch side debate that launched into an extended discussion of debate and sophistry. This article continued the practice of coaches and communications scholars developing and applying the Platonic critique of the sophists to contemporary debate practices. Alongside this traditional criticism a newer set of critiques of switch side debate emerged. Armed with the language of Foucauldian criticism, Critical Legal Studies, and critiques of normativity and statism, many people who were uncomfortable with the debate tradition of arguing in favor of government action began to question the reason why one should ever be obliged to advocate government action. They began to argue that switch side debate was a mode of debate that unnecessarily constrained people to the hegemony of debating the given topic. These newer criticisms of switch side debate gained even more traction after the year 2000, with several skilled teams using these arguments to avoid having to debate one side of the topic. William Spanos, a professor of English at SUNY Binghamton decided to link the ethos of switch side debate to that of neo-conservatism after observing a debate tournament, saying that "the arrogant neocons who now saturate the government of the Bush...learned their „disinterested" argumentative skills in the high school and college debate societies and that, accordingly, they have become masters at disarming the just causes of the oppressed." (Spanos 467) Contemporary policy debate is now under attack from all sides, caught in its own dissoi logoi. Given the variety of assaults upon switch side debate by both sides of the political spectrum, how can switch side debate be justified? Supporters of switch side debate have made many arguments justifying the value of the practice that are not related to any defense of sophist Page 17 Koehle 17 techniques. I will only briefly describe them so as to not muddle the issue, but they are worthy of at least a cursory mention. The first defense is the most pragmatic reason of all: Mandating people debate both sides of a topic is most fair to participants because it helps mitigate the potential for a topic that is biased towards one side. More theoretical justifications are given, however. Supporters of switch side debate have argued that encouraging students to play the devil"s advocate creates a sense of self-reflexivity that is crucial to promoting tolerance and preventing dogmatism (Muir 287). Others have attempted to justify switch side debate in educational terms and advocacy terms, explaining that it is a path to diversifying a student"s knowledge by encouraging them to seek out paths they may have avoided otherwise, which in turn creates better public advocates (Dybvig and Iversen). In fact, contemporary policy debate and its reliance upon switching sides creates an oasis of argumentation free from the demands of advocacy, allowing students to test out ideas and become more well-rounded advocates as they leave the classroom and enter the polis (Coverstone). Finally, debate empowers individuals to become critical thinkers capable of making sound decisions (Mitchell, "Pedagogical Possibilities", 41).

Rez as Heuristic

Evaluate the desirability of the plan---using the resolution as a heuristic for deliberation is necessary to produce democratic citizens able to responding to manipulation and deception used by those in power---this does not necessitate excluding conjuring, but does necessitate having a common background for normative evaluation

Dahlberg 5

(Lincoln The University of Queensland, Center for Critical and Cultural Studies, Visiting Fellow, The Habermasian public sphere: Taking difference seriously?, Theory and Society (2005) 34:111-126)

I believe this critique of power, transparency, and the subject is largely based upon a poor characterization of Habermas' position. There are three main misunderstandings that need to be cleared up here, to do with power as negative, as able to be easily removed, and as able to be clearly identified. First, Habermas does not define power as simply negative and as therefore needing to be summarily removed from the public sphere. The public sphere norm calls for "coercion-free communication" and not power-free communication. Habermas emphasizes the positive power of communicative interaction within the public sphere through which participants use words to do things and make things happen.60 Communicative rationality draws on the "**force of better argument**" to produce more democratic citizens, culture, and societies. Subjects are indeed molded through this constituting power, but their transformation is towards freedom and autonomy rather than towards subjugation and normalization. As Jeffrey Alexander points out, **to act according to a norm is not the same as to be normalized**.61 The public sphere norm provides a **structure through which critical reflection** on constraining or dominating social relations and possibilities for freedom **can take place.** As Chambers argues, rational discourse here is about "the endless questioning of codes," the reasoned questioning of normalization.62 This is the very type of questioning critics like Lyotard, Mouffe, and Villa are engaged in despite claiming the normalizing and repressive power of communicative rationality. These critics have yet to explain adequately how they escape this performative contradiction, although they may not be too concerned to escape it.63 The form of power that is to be excluded from discourse in the public sphere is that which limits and disables democratic participation and leads to **communicative inequalities**. Coercion and domination are (ideally) excluded from the public sphere, which includes forms of domination resulting from the maldistribution of material and authoritative resources that lead to **discursive inequalities**. This emphasis on the ideal exclusion of coercion introduces the second point of clari- fication, that the domination free public sphere is an idealization for the purposes of critique. Habermas is more than aware of the fact that, as Nancy Fraser, Mouffe, and Young remind us, coercive forms of power, including those that result from social inequality, can never be completely separated from the public sphere.64 Claims that such power has been removed from any really-existing deliberative arena can only be made by ignoring or hiding the operation of power. However, **this does not mean that a reduction in coercion** and domination cannot be achieved. Indeed, this is precisely what a democratic politics must do. To aid this project, the public sphere conception **sets a critical standard for evaluation of everyday communication**. Chambers puts this nicely: **Criticism requires a normative backdrop against which we criticize.** Crit-icizing the ways power and domination play themselves out in discourse presupposes a conception of discourse in which there is no [coercive] power and domination. In other words, to defend the position that there is a mean- ingful difference between talking and fighting, persuasion and coercion, and by extension, reason and power involves beginning with idealizations. That is, it involves drawing a picture of undominated discourse.65 However, this discussion of the idealizing status of the norm does not answer claims that it invokes a transparency theory of knowledge. I would argue that such claims not only fall prey to another performa-tive contradiction – of presupposing that the use of rational discourse can establish the impossibility of

rational discourse revealing truth and power – but are also based on a poor reading of Habermas' theory of communicative rationality. This is the third point of clarification. In contrast to the metaphysics of presence, the differentiation of persuasion from coercion in the public sphere does not posit a naive theory of the transparency of power, and meaning more generally. The public sphere conception as based upon communicative rationality does not assume a Cartesian (autonomous, disembodied, decontextualized) subject who can clearly distinguish between persuasion and coercion, good and bad reasons, true and untrue claims, and then wholly re-move themselves and their communications from such influence. For Habermas, subjects are always situated within culture. The public sphere is posited upon intersubjective rather than subject-centered rationality. It is through the process of communicative rationality, and not via a Cartesian subject, that manipulation, deception, poor reasoning, and so on, are identified and removed, and by which meanings can be understood and communicated. In other words, it is through rational-critical communication that discourse moves away from coercion or non-public reason towards greater rational communication and a stronger public sphere. The circularity here is not a problem, as it may seem, but is in fact the very essence of democratization: throughthe practice of democracy, democratic practice is advanced. This democratizing process can be further illustrated in the important and challenging case of social inequalities. Democratic theorists (bothdeliberative and difference) generally agree that social inequalities al-ways lead to some degree of inequalities in discourse. Thus, the ide-alized public sphere of full discursive inclusion and equality requires that social inequalities be eliminated. Yet how is social inequality to befullyidentified,letaloneeliminated? The idealization seems wholly in-adequate given contemporary capitalist systems and associated social inequality. However, it is in the very process of argumentation, even if flawed, that the identification and critique of social inequality, and thus of communicative inequality, is able to develop. Indeed, public sphere deliberation often comes into existence when and where people become passionate about social injustice and publicly thematize problems of social inequality. Thus the "negative power" of social inequality – as with other forms of coercion – is brought to light and critique by the very discourse it is limiting. This is not to say that subjects are merely effects of discourse, that there are no critical social agents acting in the process. It is not to say that 125 subjects within discourse cannot themselves identify negative forms of power, cannot reflexively monitor their own arguments, cannot rationally criticize other positions, and so on. They can, and in practice do, despite the instability of meaning. The point is that this reasoning and understanding is (provisionally) achieved through the subject's situatedness in discourse rather than via a pre-discursive abstract subject. As Kenneth Baynes argues, it is through discourse that subjects achieve a degree of reflective distance (what we could call autonomy) from their situations, "enabling them to revise their conceptions of what is valuable or worthy of pursuit,[and]to assess various courses of action with respect to those ends." 66 Democratic discourse generates civic-oriented selves, inter-subjective meanings and understandings, and democratic agreements that can be seen as the basis of public sovereignty. How-ever, the idea of communicatively produced agreements, which in the public sphere are known as public opinions, has also come under ex-tensive criticism in terms of excluding difference, criticism that I wantto explore in the next section. The ends of discourse: Public opinion formation The starting point of discourse is disagreement over problematic validity claims. However, a certain amount of agreement, or at least mutual understanding, is presupposed when interlocutors engage in argumentation. All communication presupposes mutual understanding on the linguistic terms used – that interlocutors use the same terms in the same way.67 Furthermore, in undertaking rational-critical discourse, according to Habermas' formal pragmatic reconstruction, interlocutors also presuppose the same formal conditions of argumentation. These shared presuppositions enable rational-critical discourse to be undertaken. However, as seen above, meaning is never fixed and understanding is always partial. Understanding and agreement on the use of linguistic terms and of what it means to be reasonable, reflexive, sincere, inclusive, non-coercive, etc. takes place within discourse and is an ongoing political process.

No Endless Warfare

No risk of endless warfare

GRAY 7

(Colin, Director of the Centre for Strategic Studies and Professor of International Relations and Strategic Studies at the University of Reading, graduate of the Universities of Manchester and Oxford, Founder and Senior Associate to the National Institute for Public Policy, [July 2007, "The Implications of Preemptive and Preventive War Doctrines: A Reconsideration," http://www.ciaonet.org/wps/ssi10561/ssi10561.pdf)

7. A policy that favors preventive warfare expresses a futile quest for absolute security. It could do so. Most controversial policies contain within them the possibility of misuse. In the hands of a paranoid or boundlessly ambitious political leader, prevention could be a policy for endless warfare. However, the American political system, with its checks and balances, was designed explicitly for the purpose of constraining the executive from excessive folly. Both the Vietnam and the contemporary Iraqi experiences reveal clearly that although the conduct of war is an executive prerogative, in practice that authority is disciplined by public attitudes. Clausewitz made this point superbly with his designation of the passion, the sentiments, of the people as a vital component of his trinitarian theory of war. 51 It is true to claim that power can be, and indeed is often, abused, both personally and nationally. It is possible that a state could acquire a taste for the apparent swift decisiveness of preventive warfare and overuse the option. One might argue that the easy success achieved against Taliban Afghanistan in 2001, provided fuel for the urge to seek a similarly rapid success against Saddam Hussein's Iraq. In other words, the delights of military success can be habit forming. On balance, claim seven is not persuasive, though it certainly contains a germ of truth. A country with unmatched wealth and power, unused to physical insecurity at home—notwithstanding 42 years of nuclear danger, and a high level of gun crime—is vulnerable to demands for policies that supposedly can restore security. But we ought not to endorse the argument that the United States should eschew the preventive war option because it could lead to a futile, endless search for absolute security. One might as well argue that the United States should adopt a defense policy and develop capabilities shaped strictly for homeland security approached in a narrowly geographical sense. Since a president might misuse a military instrument that had a global reach, why not deny the White House even the possibility of such misuse? In other words, constrain policy ends by limiting policy's military means. This argument has circulated for many decades and, it must be admitted, it does have a certain elementary logic. It is the opinion of this enquiry, however, that the claim that a policy which includes the preventive option might lead to a search for total security is not at all convincing. Of course, folly in high places is always possible, which is one of the many reasons why popular democracy is the superior form of government. It would be absurd to permit the fear of a futile and dangerous quest for absolute security to preclude prevention as a policy option. Despite its absurdity, this rhetorical charge against prevention is a stock favorite among prevention's critics. It should be recognized and dismissed for what it is, a debating point with little pragmatic merit. And strategy, though not always policy, must be nothing if not pragmatic.

No endless war

Rodwell 5

(Jonathan Rodwell is a PhD student at Manchester Met. researching the U.S. Foreign Policy of the late 70's / rise of 'neo-cons' and Second Cold War, "Trendy But Empty: A Response to Richard Jackson," http://www.49thparallel.bham.ac.uk/back/issue15/rodwell1.htm)

To be specific if the U.S. and every other nation is continually reproducing identities through 'othering' it is a constant and universal phenomenon that fails to help us understand at all why one result of the othering turned out one way and differently at another time. For example, how could one explain how the process resulted in the 2003 invasion of Iraq but didn't produce a similar invasion of Afghanistan in 1979 when that country (and by the logic of the Regan administrations discourse) the West was threatened by the 'Evil Empire'. By the logical of discourse analysis in both cases these policies were the result of politicians being able to discipline and control the political agenda to produce the outcomes. So why were the outcomes not the same? To reiterate the point how do we explain that the language of the War on Terror actually managed to result in the eventual Afghan invasion in 2002? Surely it is impossible to explain how George W. Bush was able to convince his people (and incidentally the U.N and Nato) to support a war in Afghanistan without referring to a simple fact outside of the discourse; the fact that a known terrorist in Afghanistan actually admitted to the murder of thousands of people on the 11h of Sepetember 2001. The point is that if the discursive 'othering' of an 'alien' people or group is what really gave the U.S. the opportunity to persue the war in Afghanistan one must surly wonder why Afghanistan. Why not North Korea? Or Scotland? If the discourse is so powerfully useful in it's own right why could it not have happened anywhere at any time and more often? Why could the British government not have been able to justify an armed invasion and regime change in Northern Ireland throughout the terrorist violence of the 1980's? Surely they could have just employed the same discursive trickery as George W. Bush? Jackson is absolutely right when he points out that the actuall threat posed by Afghanistan or Iraq today may have been thoroughly misguided and conflated and that there must be more to explain why those wars were enacted at that time. Unfortunately that explanation cannot simply come from the result of inscripting identity and discourse. On top of this there is the clear problem that the consequences of the discursive othering are not necessarily what Jackson would seem to identify. This is a problem consistent through David Campbell's original work on which Jackson's approach is based[iii]. David Campbell argued for a linguistic process that 'always results in an other being marginalized' or has the potential for 'demonisation'[iv]. At the same time Jackson, building upon this, maintains without qualification that the systematic and institutionalised abuse of Iraqi prisoners first exposed in April 2004 "is a direct consequence of the language used by senior administration officials: conceiving of terrorist suspects as 'evil', 'inhuman' and 'faceless enemies of freedom' creates an atmosphere where abuses become normalised and tolerated"[v]. The only problem is that the process of differentiation does not actually necessarily produce dislike or antagonism. In the 1940's and 50's even subjected to the language of the 'Red Scare' it's obvious not all Americans came to see the Soviets as an 'other' of their nightmares. And in Iraq the abuses of Iraqi prisoners are isolated cases, it is not the case that the U.S. militarily summarily abuses prisoners as a result of language. Surely the massive protest against the war, even in the U.S. itself, is also a self evident example that the language of 'evil' and 'inhumanity' does not necessarily produce an outcome that marginalises or demonises an 'other'. Indeed one of the points of discourse is that we are continually differentiating ourselves from all others around us without this necessarily leading us to hate fear or abuse anyone.[vi] Consequently, the clear fear of the Soviet Union during the height of the Cold War, and the abuses at Abu Ghirab are unusual cases. To understand what is going on we must ask how far can the process of inscripting identity really go towards explaining them? As a result at best all discourse analysis provides us with is a set of universals and a heuristic model

Endless violence is not a thing

Chandler 9

(David, Westminster IR professor, "War Without End(s): Grounding the Discourse of `Global War'", Security Dialogue, 40.3, SAGE)

Western governments appear to portray some of the distinctive characteristics that Schmitt attributed to 'motorized partisans', in that the shift from narrowly strategic concepts of security to more abstract concerns reflects the fact that Western states
