have tended to fight free-floating and non-strategic wars of aggression without real enemies at the same time as professing to have the highest values and the absolute enmity that accompanies these. The government policy documents and critical frameworks of 'global war' have been so accepted that it is assumed that it is the strategic interests of Western actors that lie behind the often irrational policy responses, with 'global war' thereby being understood as merely the extension of instrumental struggles for control. **This perspective seems unable to contemplate the possibility that it is the lack of a strategic desire for control that drives and defines 'global' war today.** Very few studies of the 'war on terror' start from a study of the Western actors themselves rather than from their declarations of intent with regard to the international sphere itself. This methodological framing inevitably makes assumptions about strategic interactions and grounded interests of domestic or international regulation and control, which are then revealed to explain the proliferation of enemies and the abstract and metaphysical discourse of the 'war on terror' (Chandler, 2009a). For its radical critics, the abstract, global discourse merely reveals the global intent of the hegemonizing designs of biopower or neoliberal empire, as critiques of liberal projections of power are 'scaled up' from the international to the global. Radical critics working within a broadly Foucauldian problematic have no problem grounding global war in the needs of neoliberal or biopolitical governance or US hegemonic designs. These critics have produced numerous frameworks, which seek to assert that global war is somehow inevitable, based on their view of the needs of late capitalism, late modernity, neoliberalism or biopolitical frameworks of rule or domination. From the declarations of global war and practices of military intervention, rationality, instrumentality and strategic interests are read in a variety of ways (Chandler, 2007). Global war is taken very much on its own terms, with the declarations of Western governments explaining and giving power to radical abstract theories of the global power and regulatory might of the new global order of domination, hegemony or empire. The alternative reading of 'global war' rendered here seeks to clarify that the declarations of global war are a sign of the **lack of political stakes** and strategic structuring of the international sphere **rather than frameworks for asserting global domination.** We increasingly see Western diplomatic and military interventions presented as justified on the basis of value-based declarations, rather than in traditional terms of interest-based outcomes. This was as apparent in the wars of humanitarian intervention in Bosnia, Somalia and Kosovo – where there was no clarity of objectives and therefore little possibility of strategic planning in terms of the military intervention or the post-conflict political outcomes – as it is in the 'war on terror' campaigns, still ongoing, in Afghanistan and Iraq. There would appear to be a **direct relationship between the lack of strategic clarity shaping** and structuring **interventions and the lack of political stakes involved in their outcome.** In fact, the globalization of security discourses seems to reflect the **lack of political stakes rather than the urgency of the security threat** or of the intervention. Since the end of the Cold War, the central problematic could well be grasped as one of withdrawal and the emptying of contestation from the international sphere rather than as intervention and the contestation for control. The disengagement of the USA and Russia from sub-Saharan Africa and the Balkans forms the backdrop to the policy debates about sharing responsibility for stability and the management of failed or failing states (see, for example, Deng et al., 1996). It is the lack of political stakes in the international sphere that has meant that the latter has become more open to ad hoc and **arbitrary interventions as** states and international institutions use the **lack of strategic imperatives** to **construct their own meaning through intervention.** As Zaki Laïdi (1998: 95) explains: war is not waged necessarily to achieve predefined objectives, and it is in waging war that the motivation needed to continue it is found. In these cases – of which there are very many – war is no longer a continuation of politics by other means, as in Clausewitz's classic model – but sometimes the initial expression of forms of activity or organization in search of meaning. . . . War becomes not the ultimate means to achieve an objective, but the most 'efficient' way of finding one. **The lack of political stakes in the international sphere would appear to be the precondition for the globalization of security discourses and the ad hoc and often arbitrary decisions to go to 'war'.** In this sense, global wars reflect the fact that the international sphere has been reduced to little more than a vanity mirror for globalized actors who are **freed from strategic necessities** and **whose concerns are no longer structured in the form of political struggles against 'real enemies'.** The mainstream critical approaches to global wars, with their heavy reliance on recycling the work of Foucault, Schmitt and Agamben, appear to invert this reality, portraying the use of military firepower and the

implosion of international law as a product of the high stakes involved in global struggle, rather than the lack of clear contestation involving the strategic accommodation of diverse powers and interests.

No global war impact

Teschke 11

(Benno Gerhard, IR prof at the University of Sussex, "Fatal attraction: a critique of Carl Schmitt's international political and legal theory", International Theory (2011), 3 : pp 179-227)

For at the centre of the heterodox – partly post-structuralist, partly realist – neo-Schmittian analysis stands the conclusion of The Nomos: the thesis of a structural and continuous relation between liberalism and violence (Mouffe 2005, 2007; Odysseos 2007). It suggests that, in sharp contrast to the liberal-cosmopolitan programme of 'perpetual peace', the geographical expansion of liberal modernity was accompanied by the intensification and de-formalization of war in the international construction of liberal-constitutional states of law and the production of liberal subjectivities as rights-bearing individuals. Liberal world-ordering proceeds via the conduit of wars for humanity, leading to Schmitt's 'spaceless universalism'. In this perspective, a straight line is drawn from WWI to the War on Terror to verify Schmitt's long-term prognostic of the 20th century as the age of 'neutralizations and de-politicizations' (Schmitt 1993). But this attempt to read the history of 20th century international relations in terms of a succession of confrontations between the carrier-nations of liberal modernity and the criminalized foes at its outer margins seems unable to comprehend the complexities and specificities of 'liberal' world-ordering, then and now. For in the cases of Wilhelmine, Weimar and fascist Germany, the assumption that their conflicts with the Anglo-American liberal-capitalist heartland were grounded in an antagonism between liberal modernity and a recalcitrant Germany outside its geographical and conceptual lines runs counter to the historical evidence. For this reading presupposes that late-Wilhelmine Germany was not already substantially penetrated by capitalism and fully incorporated into the capitalist world economy, posing the question of whether the causes of WWI lay in the capitalist dynamics of inter-imperial rivalry (Blackbourn and Eley 1984), or in processes of belated and incomplete liberal-capitalist development, due to the survival of 're-feudalized' elites in the German state classes and the marriage between 'rye and iron' (Wehler 1997). It also assumes that the late-Weimar and early Nazi turn towards the construction of an autarchic German regionalism – Mitteleuropa or Großraum – was not deeply influenced by the international ramifications of the 1929 Great Depression, but premised on a purely political–existentialist assertion of German national identity. Against a reading of the early 20th century conflicts between 'the liberal West' and Germany as 'wars for humanity' between an expanding liberal modernity and its political exterior, there is more evidence to suggest that these confrontations were interstate conflicts within the crisis-ridden and nationally uneven capitalist project of modernity. Similar objections and caveats to the binary opposition between the Western discourse of liberal humanity against non-liberal foes apply to the more recent period. For how can this optic explain that the 'liberal West' coexisted (and keeps coexisting) with a large number of pliant authoritarian client-regimes (Mubarak's Egypt, Suharto's Indonesia, Pahlavi's Iran, Fahd's Saudi-Arabia, even Gaddafi's pre-intervention Libya, to name but a few), which were and are actively managed and supported by the West as anti-liberal Schmittian states of emergency, with concerns for liberal subjectivities and Human Rights secondary to the strategic interests of political and geopolitical stability and economic access? Even in the more obvious cases of Afghanistan, Iraq, and, now, Libya, the idea that Western intervention has to be conceived as an encounter between the liberal project and a series of foes outside its sphere seems to rely on a denial of their antecedent histories as geopolitically and socially contested state-building projects in pro-Western fashion, deeply co-determined by long histories of Western anti-liberal colonial and post-colonial legacies. If these states (or social forces within them) turn against their imperial masters, the conventional policy expression is 'blowback'. And as the Schmittian analytical vocabulary does not include a conception of human agency and social forces – only friend/enemy groupings and collective political entities governed by executive decision – it also lacks the categories of analysis to comprehend the social dynamics that drive the struggles around sovereign power and the eventual overcoming, for example, of Tunisian and Egyptian states of emergency without US-led wars for humanity. Similarly, it seems unlikely that the generic idea of liberal world-ordering and the production of liberal subjectivities can actually explain why Western intervention seems improbable in some cases (e.g. Bahrain, Qatar, Yemen or Syria) and more likely in others (e.g. Serbia, Afghanistan, Iraq, and Libya). Liberal world-ordering consists of differential strategies of building, coordinating, and drawing liberal and anti-liberal states into the Western orbit, and overtly or covertly intervening and refashioning them once they step out of line. These are conflicts within a world, which seem to push the term liberalism beyond its original meaning. The generic Schmittian idea of a liberal 'spaceless universalism' sits uncomfortably with the

realities of maintaining an America-supervised 'informal empire', which has to manage a persisting interstate system in diverse and case-specific ways. But it is this persistence of a worldwide system of states, which encase national particularities, which renders challenges to American supremacy possible in the first place.

AT: VTL

Life has intrinsic and objective value achieved through subjective pleasures---its preservation should be an a priori goal

Kacou 8

(Amien WHY EVEN MIND? On The A Priori Value Of "Life", Cosmos and History: The Journal of Natural and Social Philosophy, Vol 4, No 1-2 (2008) cosmosandhistory.org/index.php/journal/article/view/92/184)

Furthermore, that manner of finding things good that is in pleasure can certainly not exist in any world without consciousness (i.e., without "life," as we now understand the word)—slight analogies put aside. In fact, we can begin to develop a more sophisticated definition of the concept of "pleasure," in the broadest possible sense of the word, as follows: it is the common psychological element in all psychological experience of goodness (be it in joy, admiration, or whatever else). In this sense, pleasure can always be pictured to "mediate" all awareness or perception or judgment of goodness: there is pleasure in all consciousness of things good; pleasure is the common element of all conscious satisfaction. In short, it is simply the very experience of liking things, or the liking of experience, in general. In this sense, pleasure is, not only uniquely characteristic of life but also, the core expression of goodness in life—the most general sign or phenomenon for favorable conscious valuation, in other words. This does not mean that "good" is absolutely synonymous with "pleasant"—what we value may well go beyond pleasure. (The fact that we value things needs not be reduced to the experience of liking things.) However, what we value beyond pleasure remains a matter of speculation or theory. Moreover, we note that a variety of things that may seem otherwise unrelated are correlated with pleasure—some more strongly than others. In other words, there are many things the experience of which we like. For example: the admiration of others; sex; or rock-paper-scissors. But, again, what they are is irrelevant in an inquiry on a priori value—what gives us pleasure is a matter for empirical investigation. Thus, we can see now that, in general, something primitively valuable is attainable in living—that is, pleasure itself. And it seems equally clear that we have a priori logical reason to pay attention to the world in any world where pleasure exists. Moreover, we can now also articulate a foundation for a security interest in our life: since the good of pleasure can be found in living (to the extent pleasure remains attainable),[17] and only in living, therefore, a priori, life ought to be continuously (and indefinitely) pursued at least for the sake of preserving the possibility of finding that good. However, this platitude about the value that can be found in life turns out to be, at this point, insufficient for our purposes. It seems to amount to very little more than recognizing that our subjective desire for life in and of itself shows that life has some objective value. For what difference is there between saying, "living is unique in benefiting something I value (namely, my pleasure); therefore, I should desire to go on living," and saying, "I have a unique desire to go on living; therefore I should have a desire to go on living," whereas the latter proposition immediately seems senseless? In other words, "life gives me pleasure," says little more than, "I like life." Thus, we seem to have arrived at the conclusion that the fact that we already have some (subjective) desire for life shows life to have some (objective) value. But, if that is the most we can say, then it seems our enterprise of justification was quite superficial, and the subjective/objective distinction was useless—for all we have really done is highlight the correspondence between value and desire. Perhaps, our inquiry should be a bit more complex.

Life is always valuable

Torchia 2, Professor of Philosophy, Providence College, Phd in Philosophy, Fordham College (Joseph, "Postmodernism and the Persistent Vegetative State," The National Catholic Bioethics Quarterly Summer 2002, Vol. 2, No. 2, http://www.lifeissues.net/writers/torc/torc_01postmodernismandpvs1.html)

Ultimately, Aquinas' theory of personhood requires a metaphysical explanation that is rooted in an understanding of the primacy of the existence or esse of the human person. For humans beings, the upshot of this position is clear: while human personhood is intimately connected with a broad range of actions (including consciousness of oneself and others), the definition of personhood is not based upon any specific activity or capacity for action, but upon the primacy of esse. Indeed, human actions would have neither a cause nor any referent in the absence of a stable, abiding self that is rooted in the person's very being. A commitment to the primacy of esse, then, allows for an adequate recognition of the importance of actions in human life, while providing a principle for the unification and stabilizing of these behavioral features. In this respect, the human person is defined as a dynamic being which actualizes the potentiality for certain behavior or operations unique to his or her own existence. Esse thereby embraces all that the person is and is capable of doing. In the final analysis, **any attempt to define the person in terms of a single attribute, activity, or capability** (e.g., consciousness) flies in the face of the depth and multi-dimensionality which is part and parcel of personhood itself. To do so **would abdicate the ontological core of the person and the very center which renders human activities intelligible.** And Aquinas' anthropology, I submit, provides an effective philosophical lens through which the depth and profundity of the human reality comes into sharp focus. In this respect, Kenneth Schmitz draws an illuminating distinction between "person" (a term which conveys such hidden depth and profundity) and "personality" (a term which pertains to surface impressions and one's public image).40 The preoccupation with the latter term, he shows, is very much an outgrowth of the eighteenth century emphasis upon a human individuality that is understood in terms of autonomy and privacy. This notion of the isolated, atomistic individual was closely linked with a subjective focus whereby the "self" became the ultimate referent for judging reality. By extension, such a presupposition led to the conviction that only self-consciousness provides a means of validating any claims to personhood and membership in a community of free moral agents capable of responsibilities and worthy of rights. In contrast to such an isolated and enclosed conception (i.e., whereby one is a person by virtue of being "set apart" from others as a privatized entity), Schmitz focuses upon an intimacy which presupposes a certain relation between persons. From this standpoint, intimacy is only possible through genuine self-disclosure, and the sharing of self-disclosure that allows for an intimate knowledge of the other.41 For Schmitz, such a revelation of one's inner self transcends any specific attributes or any overt capacity the individual might possess.42 Ultimately, Schmitz argues, intimacy is rooted in the unique act of presencing, whereby the person reveals his or her personal existence. But such a mystery only admits of a metphysical explanation, rather than an epistemological theory of meaning which confines itself to what is observable on the basis of perception or sense experience. Intimacy, then, discloses a level of being that transcends any distinctive properties. Because intimacy has a unique capacity to disclose being, it places us in touch with the very core of personhood. Metaphysically speaking, intimacy is not grounded in the recognition of this or that characteristic a person has, but rather in the simple unqualified presence the person is.43

Preventing death is the first ethical priority – it's the only impact you can't recover from.

Bauman 95 Zygmunt Bauman, University of Leeds Professor Emeritus of Sociology, 1995, Life In Fragments: Essays In Postmodern Morality, p. 66-71

The being-for is like living towards-the-future: a being filled with anticipation, a being aware of the abyss between future foretold and future that will eventually be; it is this gap which, like a magnet, draws the self towards the Other, as it draws life towards the future, making life into an activity of overcoming, transcending, leaving behind. The self stretches

towards the Other, as life stretches towards the future; neither can grasp what it stretches toward, but it is in this hopeful and desperate, never conclusive and never abandoned stretching-toward that the self is ever anew created and life ever anew lived. In the words of M. M. Bakhtin, it is only in this not-yet accomplished world of anticipation and trial, leaning toward stubbornly an-other Other, that life can be lived - not in the world of the `events that occurred'; in the latter world, `it is impossible to live, to act responsibly; in it, I am not needed, in principle I am not there at all." Art, the Other, the future: what unites them, what makes them into three words vainly trying to grasp the same mystery, is the modality of possibility. A curious modality, at home neither in ontology nor epistemology; itself, like that which it tries to catch in its net, `always outside', forever `otherwise than being'. The possibility we are talking about here is not the all-too-familiar unsure-of-itself, and through that uncertainty flawed, inferior and incomplete being, disdainfully dismissed by triumphant existence as `mere possibility', `just a possibility'; possibility is instead `plus que la reahte' - both the origin and the foundation of being. The hope, says Blanchot, proclaims the possibility of that which evades the possible; `in its limit, this is the hope of the bond recaptured where it is now lost."' The hope is always the hope of *being fu filled,* but what keeps the hope alive and so keeps the being open and on the move is precisely its *unfu filment.* One may say that the paradox *of hope* (and the paradox of possibility founded in hope) is that it may pursue its destination solely through betraying its nature; the most exuberant of energies expends itself in the urge towards rest. Possibility uses up its openness in search of closure. Its image of the better being is its own impoverishment . . . The togetherness of the being-for is cut out of the same block; it shares in the paradoxical lot of all possibility. It lasts as long as it is unfulfilled, yet it uses itself up in never ending effort of fulfilment, of recapturing the bond, making it tight and immune to all future temptations. In an important, perhaps decisive sense, it is selfdestructive and self-defeating: its triumph is its death. The Other, like restless and unpredictable art, like the future itself, is a *mystery.* And being-for-the-Other, going towards the Other through the twisted and rocky gorge of affection, brings that mystery into view - makes it into a challenge. That mystery is what has triggered the sentiment in the first place - but cracking that mystery is what the resulting movement is about. The mystery must be unpacked so that the being-for may focus on the Other: one needs to know what to focus on. (The `demand' is *unspoken,* the responsibility undertaken is *unconditional;* it is up to him or her who follows the demand and takes up the responsibility to decide what the following of that demand and carrying out of that responsibility means in practical terms.) Mystery - noted Max Frisch - (and the Other is a mystery), is an exciting puzzle, but one tends to get tired of that excitement. `And so one creates for oneself an image. This is a loveless act, the betrayal." Creating an image of the Other leads to the substitution of the image for the Other; the Other is now fixed - soothingly and comfortingly. There is nothing to be excited about anymore. I know what the Other needs, I know where my responsibility starts and ends. Whatever the Other may now do will be taken down and used against him. What used to be received as an exciting surprise now looks more like perversion; what used to be adored as exhilarating creativity now feels like wicked levity. Thanatos has taken over from Eros, and the excitement of the ungraspable turned into the dullness and tedium of the grasped. But, as Gyorgy Lukacs observed, `everything one person may know about another is only expectation, only potentiality, only wish or fear, acquiring reality only as a result of what happens later, and this reality, too, dissolves straightaway into potentialities'. Only death, with its finality and irreversibility, puts an end to the musical-chairs game of the real and the potential - it once and for all closes the embrace of togetherness which was before invitingly open and tempted the lonely self." `Creating an image' is the dress rehearsal of that death. But creating an image is the inner urge, the constant temptation, the *must* of all affection . . . It is the loneliness of being abandoned to an unresolvable ambivalence and an unanchored and formless sentiment which sets in motion the togetherness of being-for. But what loneliness seeks in togetherness is an end to its present condition - an end to itself. Without knowing - without being capable of knowing - that the hope to replace the vexing loneliness with togetherness is founded solely on its own unfulfilment, and that once loneliness is no more, the togetherness (the being-for togetherness) must also collapse, as it cannot survive its own completion. What the loneliness seeks in togetherness (suicidally for its own cravings) is the foreclosing and pre-empting of the future, cancelling the future before it comes, robbing it of mystery but also of the possibility with which it is pregnant. Unknowingly yet necessarily, it seeks it all to its own detriment, since the success (if there is a success) may only bring it back to where it started and to the condition which prompted it to start on the journey in the first place. The togetherness of being-for is always in the future, and nowhere else. It is no more once the self proclaims: `I have arrived', `I have done it', `I fulfilled my duty.' The being-for starts from the realization of the bottomlessness of the task, and ends with the declaration that the infinity has been exhausted. This is the tragedy of being-for - the reason why it cannot but be death-bound while simultaneously remaining an undying attraction. In this tragedy, there are many happy moments, but no happy end. Death is always the foreclosure of possibilities, and it comes eventually in its own time, even if not brought forward by the impatience of love. The catch is to direct the affection to staving off the end, and to do this against the affection's nature. What follows is that, if moral relationship is grounded in the being-for togetherness (as it is), then it can exist as a project, and guide the self's conduct only as long as its nature of a project (a not yet-completed project) is not denied. Morality, like the future itself, is forever not-yet. (And this is why the ethical code, any ethical code, the more so the more perfect it is by its own standards, supports morality the way the rope supports the hanged man.) It is because of our loneliness that we crave togetherness. It is because of our loneliness that we open up to the Other and allow the Other to open up to us. It is because of our loneliness (which is only belied, not overcome, by the hubbub of the being-with) that we turn into moral selves. And it is only through allowing the togetherness its possibilities which only the future can disclose that we stand a chance of acting morally, and sometimes even of being good, in the present.

War = Structural Violence

We turn structural violence

Goldstein 1

(Joshua Goldstein, Int'l Rel Prof @ American U, 2001, War and Gender, p. 412)

First, peace activists face a dilemma in thinking about causes of war and working for peace. Many peace scholars and activists support the approach, "if you want peace, work for justice." Then, if one believes that sexism contributes to war one can work for gender justice specifically (perhaps among others) in order to pursue peace. This approach brings strategic allies to the peace movement (women, labor, minorities), but rests on the assumption that injustices cause war. The evidence in this book suggests that causality runs at least as strongly the other way. War is not a product of capitalism, imperialism, gender, innate aggression, or any other single cause, although all of these influence wars' outbreaks and outcomes. Rather, war has in part fueled and sustained these and other injustices.[9] So, "if you want peace, work for peace." Indeed, if you want justice (gender and others), work for peace. Causality does not run just upward through the levels of analysis, from types of individuals, societies, and governments up to war. It runs downward too. Enloe suggests that changes in attitudes towards war and the military may be the most important way to "reverse women's oppression." The dilemma is that peace work focused on justice brings to the peace movement energy, allies, and moral grounding, yet, in light of this book's evidence, the emphasis on injustice as the main cause of war seems to be empirically inadequate.

No Prior Questions

No prior questions- scholarly orientations cause gridlock

Owen 2

(David, Southampton political theory reader, "Re-orienting International Relations: On Pragmatism, Pluralism and Practical Reasoning", Millennium 31.3, SAGE)

Commenting on the 'philosophical turn' in IR, Wæver remarks that '[a] frenzy for words like "epistemology" and "ontology" often signals this philosophical turn', although he goes on to comment that these terms are often used loosely.4 However, loosely deployed or not, it is clear that debates concerning ontology and epistemology play a central role in the contemporary IR theory wars. In one respect, this is unsurprising since it is a characteristic feature of the social sciences that periods of disciplinary disorientation involve recourse to reflection on the philosophical commitments of different theoretical approaches, and there is no doubt that such reflection can play a valuable role in making explicit the commitments that characterise (and help individuate) diverse theoretical positions. Yet, such a philosophical turn is not without its dangers and I will briefly mention three before turning to consider a confusion that has, I will suggest, helped to promote the IR theory wars by motivating this philosophical turn. The first danger with the philosophical turn is that it has an inbuilt tendency to prioritise issues of ontology and epistemology over explanatory and/or interpretive power as if the latter two were merely a simple function of the former. But while the explanatory and/or interpretive power of a theoretical account is not wholly independent of its ontological and/or epistemological commitments (otherwise criticism of these features would not be a criticism that had any value), it is by no means clear that it is, in contrast, wholly dependent on these philosophical commitments. Thus, for example, one need not be sympathetic to rational choice theory to recognise that it can provide powerful accounts of certain kinds of problems, such as the tragedy of the commons in which dilemmas of collective action are foregrounded. It may, of course, be the case that the advocates of rational choice theory cannot give a good account of why this type of theory is powerful in accounting for this class of problems (i.e., how it is that the relevant actors come to exhibit features in these circumstances that approximate the assumptions of rational choice theory) and, if this is the case, it is a philosophical weakness—but this does not undermine the point that, for a certain class of problems, rational choice theory may provide the best account available to us. In other words, while the critical judgement of theoretical accounts in terms of their ontological and/or epistemological sophistication is one kind of critical judgement, it is not the only or even necessarily the most important kind. The second danger run by the philosophical turn is that because prioritisation of ontology and epistemology promotes theory-construction from philosophical first principles, it cultivates a theory-driven rather than problem-driven approach to IR. Paraphrasing Ian Shapiro, the point can be put like this: since it is the case that there is always a plurality of possible true descriptions of a given action, event or phenomenon, the challenge is to decide which is the most apt in terms of getting a perspicuous grip on the action, event or phenomenon in question given the purposes of the inquiry; yet, from this standpoint, 'theory-driven work is part of a reductionist program' in that it 'dictates always opting for the description that calls for the explanation that flows from the preferred model or theory'.5 The justification offered for this strategy rests on the mistaken belief that it is necessary for social science because general explanations are required to characterise the classes of phenomena studied in similar terms. However, as Shapiro points out, this is to misunderstand the enterprise of science since 'whether there are general explanations for classes of phenomena is a question for social-scientific inquiry, not to be prejudged before conducting that inquiry'.6 Moreover, this strategy easily slips into the promotion of the pursuit of generality over that of empirical validity. The third danger is that the preceding two combine to encourage the formation of a particular image of disciplinary debate in IR—what might be called (only slightly tongue in cheek) 'the Highlander view'—namely, an image of warring theoretical approaches with each, despite occasional temporary tactical alliances, dedicated to the strategic

achievement of sovereignty over the disciplinary field. It encourages this view because the turn to, and prioritisation of, ontology and epistemology stimulates the idea that there can only be one theoretical approach which gets things right, namely, the theoretical approach that gets its ontology and epistemology right. This image feeds back into IR exacerbating the first and second dangers, and so a potentially vicious circle arises.

Prior questions will never be fully settled---must take action even under conditions of uncertainty

Cochran '99

(Molly, Assistant Professor of International Affairs at Georgia Institute for Technology, "Normative Theory in International Relations", 1999, pg. 272)

To conclude this chapter, while modernist and postmodernist debates continue, while we are still unsure as to what we can legitimately identify as a feminist ethical/political concern, while we still are unclear about the relationship between discourse and experience, it is particularly important for feminists that we proceed with analysis of both the material (institutional and structural) as well as the discursive. This holds not only for feminists, but for all theorists oriented towards the goal of extending further moral inclusion in the present social sciences climate of epistemological uncertainty. Important ethical/political concerns hang in the balance. We cannot afford to wait for the meta-theoretical questions to be conclusively answered. Those answers may be unavailable. Nor can we wait for a credible vision of an alternative institutional order to appear before an emancipatory agenda can be kicked into gear. Nor do we have before us a chicken and egg question of which comes first: sorting out the metatheoretical issues or working out which practices contribute to a credible institutional vision. The two questions can and should be pursued together, and can be via moral imagination. Imagination can help us think beyond discursive and material conditions which limit us, by pushing the boundaries of those limitations in thought and examining what yields. In this respect, I believe international ethics as pragmatic critique can be a useful ally to feminist and normative theorists generally.

Prereqs bad

Cochran 99

(Molly, GIT international affairs professor, Normative Theory in International Relations, 272)

institutional vision. The two questions can and should be pursued together, and can be via moral imagination. Imagination can help us think beyond discursive and material conditions which limit us, by pushing the boundaries of those limitations in thought and examining what yields. In this respect, I believe international ethics as pragmatic critique can be a useful ally to feminist and normative theorists generally.

Ethics

Extinction First

Extinction impacts must be prioritized-any alternative frame fails in the context of public policy

Isaac 2

(Jeffrey, political science professor Indiana University, "Ends, Means, and Politics, Dissent Magazine, Spring 2002)

Power is not a dirty word or an unfortunate feature of the world. It is the core of politics. Power is the ability to effect outcomes in the world. Politics, in large part, involves contests over the distribution and use of power. To accomplish anything in the political world, one must attend to the means that are necessary to bring it about. And to develop such means is to develop, and to exercise, power. To say this is not to say that power is beyond moral- ity. It is to say that power is not reducible to morality. As writers such as Niccolo Machiavelli, Max Weber, Reinhold Niebuhr, and Hannah Arendt have taught, an unyielding concern with moral goodness undercuts political responsibility. The concern may be morally laudable, reflecting a kind of personal integrity, but it suffers from three fatal flaws: (1) It fails to see that the purity of one's intention does not ensure the achievement of what one intends. Abjuring violence or refusing to make common cause with morally compromised parties may seem like the right thing; but if such tactics entail impotence, then it is hard to view them as serving any moral good beyond the clean con- science of their supporters; (2) it fails to see that in a world of real violence and injustice, moral purity is not simply a form of powerless- ness; it is often a form of complicity in injustice. This is why, from the standpoint of politics—as opposed to religion—pacifism is always a potentially immoral stand. In categorically repudiating violence, it refuses in principle to oppose certain violent injustices with any effect; and (3) it fails to see that politics is as much about unintended consequences as it is about intentions; it is the effects of action, rather than the motives of action, that is most significant. Just as the alignment with "good" may engender impotence, it is often the pursuit of "good" that generates evil. This is the lesson of communism in the twentieth century: it is not enough that one's goals be sincere or idealistic; it is equally important, always, to ask about the effects of pursuing these goals and to judge these effects in pragmatic and historically contextualized ways. Moral absolutism inhibits this judgment. It alienates those who are not true believers. It promotes arrogance. And it undermines political effectiveness.

AT: Extinction Inevitable

Extinction does not make our efforts worthless.

Trisel 4

Although our works will not last forever, this should not matter if we accomplished what we set out to do when we created these works. Wanting our [end page 390] creations to endure forever was not likely part of our goal when we created them. If we accomplish our goals and then later in life conclude that these accomplishments were of no significance, then this is a sign that a desire for long-lastingness has crept into the standards that we use to judge significance. Escalating desires can lead to escalating standards since the standards that we establish reflect our goals and desires. Including long-lastingness as a criterion for judging the significance of our efforts is unreasonable. If one includes long-lastingness as part of the standard, then one will feel that it is necessary for humanity to persist forever. There is no need for humanity to live forever for our lives and works to be significant. If the standard that we adopt for judging significance does not include long-lastingness as part of the standard, then it will not matter whether humanity will endure for a long time. Like Tolstoy, we may be unable to keep from wanting to have our achievements remembered forever. We may also be unable to keep from wanting our works to be appreciated forever. But we can refrain from turning these desires into standards for judging whether our efforts and accomplishments are significant. If we can keep from doing this, it will be to our advantage. Then, during those times when we look back on life from an imagined perspective that encompasses times after humanity has become extinct, we will not conclude that our efforts amounted to nothing. Rather, we will conclude that many people made remarkable accomplishments that made their lives, and possibly the lives of others, better than they would have been if these goals had never been pursued. And if we expand our evaluation, as we should, to take into account all experiences associated with living, not just goal-related experiences, we will conclude not that life was empty, but that living was worthwhile.

AT: Zizek Ethics

Their "don't compromise" style ethics are foolish—revolutionary consistency trades off with compassion and good judgment.

Nicholas BROWN English @ Illinois (Chicago) '4 {∅,S} ∈ {$}?: Or, Alain Badiou and Slavoj Žižek, Waiting for Something to Happen *New Centennial Review* 4 (3) p. 315-319

Before at we arrive at the political thesis of Žižek's writings on Lenin, it is worth pointing out that Žižek's work is shot through with an ethical imperative which is not often explicitly thematized. Like Badiou, Žižek's ethics is one of subjective self-consistency, sustained, like Badiou's, by Lacan's "*ne pas céder.*" This ethical self-consistency is not to be confused with the substantial self-consistency of the subject—we know the Lacanian barred subject, written S, never fully coincides with itself—but rather refers to a kind of "going all the way," a refusal to compromise on one's desire, even if this desire is ultimately self-destructive. Žižek's contempt for an inconsistent ethical position—where the in-itself of a political position and its for-itself fail to coincide—is palpable. Nobody provokes Žižek's ire so much as pseudo-radical academic Leftists who adopt an attitude of utter disdain towards the Third Way, while their own radicalism ultimately amounts to an empty gesture which obliges no one to do anything definite. (*Revolution,* 172) The great majority of today's "radical" academics silently count on the long-term stability of the American capitalist model, with a secure tenured position as their ultimate professional goal (a surprising number of them even play the stock market). (171) The basis of this contempt is its inconsistency: the "pseudo-radical academic Leftist" experiences his position as radical, while in fact it is nothing more than the empty quietism of Hegel's beautiful soul, benefiting from what it denounces while deriving disavowed pleasure from its presumed superiority to the same. There can be no doubt that the figure of the beautiful soul remains a potent figure for political critique. In fact, one could turn it against Žižek himself. But what is fundamentally wrong with the beautiful soul is not its inconsistency, but simply the quietism it masks. The consequence of Žižek's valorization of ethical consistency is a strange admiration for bad but consistent positions: With regard to this radical chic, our first gesture towards Third Way ideologists and practitioners should be one of praise: at least they play their game straight, and are honest in their acceptance of the global capitalist coordinates. (*Revolution,* 172) Žižek reproduces this gesture several times, with regard to, for example, the "refreshing" Francis Fukuyama ("In our intellectual space full of false protesters, here we finally have a fully pledged *apologist for the existing order*" [*Organs,* 132 n. 23), or, in the introduction to *On Belief,* his grudging preference for a reactionary fundamentalist preacher over the doctrinal equivocation of a liberal rabbi and priest. The problem with this ethics—as Brecht showed us, with ethics in general— is that, under capitalism, the only fully consistent ethical position is ruthless self-interest. There is no ethical position that is both minimally compassionate and fully ethically consistent. Mauler in *Saint Joan* is doomed to make money from all of his generous impulses; the good woman of Szechwan can only help her neighbors by taking advantage of them. In fact, this split constitutes part of capitalism's dynamism. The ideological force of capitalism is that so many people are given a subjective interest in maintaining the stability of capitalism, even if this interest involves competing with neighbors who share an "objective" interest in ending it. Any "opting out" is at present simply quixotic, and only possible on the basis of substantial privilege. Plainly, professors want tenured positions, for the same reason the unemployed want jobs: because they exist. (As for playing the stock market, this criticism buys neoliberal rhetoric hook, line, and sinker: most academics who "play the stock market" do so because universities, like many other U.S. employers, have shifted the burden of risk from their own retirement systems onto the individual employees.) For the wealthy—and this includes the famous tenured radical—self-interest only lines up with political interest in cynical defense of privilege. Our first gesture towards the pseudoradical academic should therefore be the exact opposite of Žižek's. True, academics by and large live their lives in accordance with their interest in the long-term stability of Capital; but at least they don't go all the way, contributing to its ideological legitimation in that small zone in which they timidly exercise their freedom. The only fully consistent leftist ethical position is revolutionary. Žižek has this right, but currently this position is easier to endorse than to occupy. (Of course, it would be easy to show that Žižek's own position, or mine, is just as compromised as that of our hypothetical tenured radical. But if we are not going to get upset at liberal hypocrisy, we can't get upset at Žižek's either. That would be hypocritical.) One of Žižek's hidden targets in *Revolution at the Gates* is Michael Hardt and Antonio Negri's *Empire* (which appears here only in a footnote, while it gets fuller treatment in *Organs without Bodies*). Žižek's main critique (an adaptation of Lukács's critique of utopianism) is simple but damning: their political horizon is irredeemably abstract. Global citizenship, universal minimum wage, and so on: these are obviously wonderful ideas, but without any concrete proposals for getting there, they might as well be anything else or nothing at all. The more abstract the goal, the easier it is to achieve unanimity: pretty much everyone can agree that the world ought to be just, but as soon as concrete proposals for achieving justice are proposed, all unanimity disappears. The notion of the purely immanent, unorganized "desire of the multitude" is undeniably attractive; but, since this desire is an abstraction from concrete desires that may be incompatible, how could it form itself into a political subject without the imposition of an organization transcendent to it—a Party? Hardt and Negri know this: "The only event we are awaiting is the insurgence of a powerful organization. We do not have any models to offer for this event" (2000, 411). The similarity to the Pauline language of the Event as grace is striking, but is this not also a genuinely shocking admission, a virtual admission of defeat? The event they can only await in silence is the only event that would matter. But in the absence of any attempt to answer it, how does Žižek's question—" How do we invent the organizational structure which will confer on [contemporary social unrest] the form of universal political demand?" (*Revolution,* 296)—get us any farther than Hardt and Negri's empty expectation? While Žižek fully understands the theoretical need for a Party (and here I am not talking about any particular party or even any particular form of organization, but simply the fact that organization is primary), this exigency

remains completely formal. The closest Žižek comes to attempting an answer to this fundamental question is by invoking (weirdly, it seems to me) a kind of belated cyberspace Utopia, updating Lenin's famous slogan "Socialism = electrification + the power of the soviets" as "Socialism = free access to the internet + the power of the soviets" (294). Well, this is fine as far as it goes—internet technology has a liberatory edge that cannot be realized in a market economy—but where are the soviets, exactly? The question itself—what is to be done?—is urgent: the current global political and economic instability may loosen the death grip of neoliberalism, but it doesn't guarantee that what comes after will be better. Immanuel Wallerstein even thinks the capitalist world system will collapse of its own internal contradictions somewhere between 2025 and 2075. This assertion sounds less crazy now than it did a few years ago, but it isn't very helpful for trying to influence what comes next. Once again, the attitude is one of waiting until the right conditions emerge. When Heidegger famously claimed that "only a god can save us now," this was to be understood not theologically, but as a deus ex machina: as an unforeseeable Event. It is a symptom of the weakness of the Left that we effectively agree with Heidegger. Are we really condemned to await some unexpected turn, some unforeseen development that will emerge like a god from the machine of Capital? If, on the contrary, the question is how, without any quixotic *passage à l'acte,* one is to contribute to the organization of the "multitude against Empire," then waiting for a messiah will only waste time. The equation Lenin = Paul—already implicit in Badiou, made explicit by Žižek—is false. To say there was no certainty that the revolution of 1917 would succeed is true but banal: lots of things are hard to discern without belonging to an indiscernible register of being. Lenin's writings do reveal a kind of excessiveness to his conviction, yes. But they also show an extraordinarily detailed and insightful analysis of the concrete situation, and a remarkable theorization of the political opening offered by an immanent crisis in Capital (an effort which, if we were really to "repeat Lenin" today, would have to focus on the inability of Capital to absorb the propertyless masses on its periphery). What we are offered is not really the equation of Lenin and Paul, but a choice: Lenin or Paul? Do we wait for the Event, or do we organize to bring it about? Badiou, Hardt and Negri, and Žižek—along with Heidegger—all side with Paul. Do we?

Prevent Death Key

Preventing death is the first ethical priority – it's the only impact you can't recover from.

Bauman 95

(Zygmunt Bauman, University of Leeds Professor Emeritus of Sociology, 1995, Life In Fragments: Essays In Postmodern Morality, p. 66-71)

The ==being-for is== like ==living towards-the-future==: a being filled with anticipation, a being aware of the abyss between future foretold and future that will eventually be; it is this gap which, like a magnet, draws the self towards the Other, as it draws life towards the future, making life into an activity of overcoming, transcending, leaving behind. The self stretches towards the Other, as life stretches towards the future; neither can grasp what it stretches toward, but it is in this hopeful and desperate, never conclusive and never abandoned stretching-toward that the self is ever anew created and life ever anew lived. In the words of M. M. Bakhtin, it is only in this not-yet accomplished world of anticipation and trial, leaning toward stubbornly an-other Other, that life can be lived - not in the world of the `events that occurred'; in the latter world, `it is impossible to live, to act responsibly; in it, I am not needed, in principle I am not there at all." Art, the Other, the future: what unites them, what makes them into three words vainly trying to grasp the same mystery, is the modality of possibility. A curious modality, at home neither in ontology nor epistemology; itself, like that which it tries to catch in its net, `always outside', forever `otherwise than being'. The possibility we are talking about here is not the all-too-familiar unsure-of-itself, and through that uncertainty flawed, inferior and incomplete being, disdainfully dismissed by triumphant existence as `mere possibility', `just a possibility'; possibility is instead `plus que la reahte' - both the origin and the foundation of being. The hope, says Blanchot, proclaims the possibility of that which evades the possible; `in its limit, this is the hope of the bond recaptured where it is now lost."' The hope is always the hope of *being fu filled,* but what keeps the hope alive and so keeps the being open and on the move is precisely its *unfu filment.* One may say that the paradox *of hope* (and the paradox of possibility founded in hope) is that it may pursue its destination solely through betraying its nature; the most exuberant of energies expends itself in the urge towards rest. Possibility uses up its openness in search of closure. Its image of the better being is its own impoverishment . . . The togetherness of the being-for is cut out of the same block; it shares in the paradoxical lot of all possibility. It lasts as long as it is unfulfilled, yet it uses itself up in never ending effort of fulfilment, of recapturing the bond, making it tight and immune to all future temptations. In an important, perhaps decisive sense, it is selfdestructive and self-defeating: its triumph is its death. The Other, like restless and unpredictable art, like the future itself, is a *mystery.* And being-for-the-Other, going towards the Other through the twisted and rocky gorge of affection, brings that mystery into view - makes it into a challenge. That mystery is what has triggered the sentiment in the first place - but cracking that mystery is what the resulting movement is about. The mystery must be unpacked so that the being-for may focus on the Other: one needs to know what to focus on. (The `demand' is *unspoken,* the responsibility undertaken is *unconditional;* it is up to him or her who follows the demand and takes up the responsibility to decide what the following of that demand and carrying out of that responsibility means in practical terms.) Mystery - noted Max Frisch - (and the Other is a mystery), is an exciting puzzle, but one tends to get tired of that excitement. `And so one creates for oneself an image. This is a loveless act, the betrayal." Creating an image of the Other leads to the substitution of the image for the Other; the Other is now fixed - soothingly and comfortingly. There is nothing to be excited about anymore. I know what the Other needs, I know where my responsibility starts and ends. Whatever the Other may now do will be taken down and used against him. What used to be received as an exciting surprise now looks more like perversion; what used to be adored as exhilarating creativity now feels like wicked levity. Thanatos has taken over from Eros, and the excitement of the ungraspable turned into the dullness and tedium of the grasped. But, as Gyorgy Lukacs observed, `everything one person may know about another is only expectation, only potentiality, only wish or fear, acquiring reality only as a result of what happens later, and this reality, too, dissolves straightaway into potentialities'. ==Only death, with its finality and irreversibility, puts an end to== the musical-chairs game of ==the real and the potential== - it once and for all closes the embrace of togetherness which was before invitingly ==open== and tempted the lonely self." `Creating an image' is the dress rehearsal of that death. But creating an image is the inner urge, the constant temptation, the *must* of all affection . . . It is the loneliness of being abandoned to an unresolvable ambivalence and an unanchored and formless sentiment which sets in motion the togetherness of the being-for. But what loneliness seeks in togetherness is an end to its present condition - an end to itself. Without knowing - without being capable of knowing - that the hope to replace the vexing loneliness with togetherness is founded solely on its own unfulfilment, and that once loneliness is no more, the togetherness (the being-for togetherness) must also collapse, as it cannot survive its own completion. What the loneliness seeks in togetherness (suicidally for its own cravings) is the foreclosing and pre-empting of the future, cancelling the future before it comes, robbing it of mystery but also of the possibility with which it is pregnant. Unknowingly yet necessarily, it seeks it all to its own detriment, since the success (if there is a success) may only bring it back to where it started and to the condition which prompted it to start on the journey in the first place. The togetherness of being-for is always in the future, and nowhere else. It is no more once the self proclaims: `I have arrived', `I have done it', `I fulfilled my duty.' The being-for starts from the realization of the bottomlessness of the task, and ends with the declaration that the infinity has been exhausted. This is the tragedy of being-for - the reason why it cannot but be death-bound while simultaneously remaining an undying attraction. In this tragedy, there are many happy moments, but no happy end. ==Death is always the foreclosure of possibilities==, and it comes eventually in its own time, even if not brought forward by the impatience of love. The catch is to direct the affection to staving off the end, and to do this against the affection's nature. What follows is that, if moral relationship is grounded in the being-for togetherness (as it is), then it can exist as a project, and guide the self's conduct only as long as its nature of a project (a not yet-completed project) is not denied. Morality, like the future itself, is forever not-yet. (And this is why the ethical code, any ethical code, the more so the more perfect it is by its own standards, supports morality the way the rope supports the hanged man.) It is because of our loneliness that we crave togetherness. It is because of our loneliness that we open up to the Other and allow the Other to open up to us. It is because of our loneliness (which is only belied, not overcome, by the hubbub of the being-with) that we turn into moral selves. And ==it is only through allowing the togetherness its possibilities which only the future can disclose that we stand a chance of acting morally==, and sometimes even of being good, ==in the present==.

Consequences Good

Their desire to ignore the consequences of their advocacy causes alt failure ---must evaluate consequences of proposals

Bracey 6

(Christopher A. Bracey 6, Associate Professor of Law, Associate Professor of African & African American Studies, Washington University in St. Louis, September, Southern California Law Review, 79 S. Cal. L. Rev. 1231, p. 1318)

Second, reducing conversation on race matters to an ideological contest allows opponents to elide inquiry into whether the results of a particular preference policy are desirable. Policy positions masquerading as principled ideological stances create the impression that a racial policy is not simply a choice among available alternatives, but the embodiment of some higher moral principle. Thus, the "principle" becomes an end in itself, without reference to outcomes. Consider the prevailing view of colorblindness in constitutional discourse. Colorblindness has come to be understood as the embodiment of what is morally just, independent of its actual effect upon the lives of racial minorities. This explains Justice Thomas's belief in the "moral and constitutional equivalence" between Jim Crow laws and race preferences, and his tragic assertion that "Government cannot make us equal [but] can only recognize, respect, and protect us as equal before the law." 281 For Thomas, there is no meaningful difference between laws designed to entrench racial subordination and those designed to alleviate conditions of oppression. Critics may point out that colorblindness in practice has the effect of entrenching existing racial disparities in health, wealth, and society. But in framing the debate in purely ideological terms, opponents are able to avoid the contentious issue of outcomes and make viability determinations based exclusively on whether racially progressive measures exude fidelity to the ideological principle of colorblindness. Meaningful policy debate is replaced by ideological exchange, which further exacerbates hostilities and deepens the cycle of resentment.

State/Law Key

2AC Reformism Good

Reformism is effective **and brings revolutionary change closer rather than pushing it away**

Delgado 9

(Richard Delgado 9, self-appointed Minority scholar, Chair of Law at the University of Alabama Law School, J.D. from the University of California, Berkeley, his books have won eight national book prizes, including six Gustavus Myers awards for outstanding book on human rights in North America, the American Library Association's Outstanding Academic Book, and a Pulitzer Prize nomination. Professor Delgado's teaching and writing focus on race, the legal profession, and social change, 2009, "Does Critical Legal Studies Have What Minorities Want, Arguing about Law", p. 588-590)

2. The CLS critique of piecemeal reform Critical scholars reject the idea of piecemeal reform. Incremental change, they argue, merely postpones the wholesale reformation that must occur to create a decent society. Even worse, an unfair social system survives by using piecemeal reform to disguise and legitimize oppression. Those who control the system weaken resistance by pointing to the occasional concession to, or periodic court victory of, a black plaintiff or worker as evidence that the system is fair and just. In fact, Crits believe that teaching the common law or using the case method in law school is a disguised means of preaching incrementalism and thereby maintaining the current power structure." To avoid this, CLS scholars urge law professors to abandon the case method, give up the effort to find rationality and order in the case law, and teach in an unabashedly political fashion. **The** CLS **critique of** piecemeal **reform is** familiar, **imperialistic and wrong**. Minorities know from bitter experience that occasional court victories do not mean the Promised Land is at hand**. The** critique is imperialistic in that it tells minorities and other oppressed peoples how they should interpret events affecting them. A court order directing a housing authority to disburse funds for heating in subsidized housing may postpone the revolution, **or it may not**. In the meantime, the order keeps a number of poor families warm. This may mean more to them than it does to a comfortable academic working in a warm office. It smacks of **paternalism** to assert that the possibility of revolution later outweighs the certainty of heat now, unless there is evidence for that possibility. The Crits do not offer such evidence. Indeed, some **incremental changes may bring revolutionary changes closer**, not push them further away. Not all small reforms induce complacency; some may whet the appetite for further combat. The welfare family may hold a tenants' union meeting in their heated living room. CLS scholars' critique of piecemeal reform often misses these possibilities, and neglects the question of whether total change, when it comes, will be what we want.

2AC Law k for Oppressed

The law isn't perfect but the alt's illusory radicalism fails and neglects political openings to lessen violence

Roth 2k

(Brad R. Roth 2k, Assistant Professor or Legal Studies and Political Science and Adjunct Professor of Law at Wayne State University, "Governmental Illegitimacy and Neocolonialism: Response to Review by James Thuo Gathii", Michigan Law Review, Vol. 98, No. 6, May 2000, JSTOR)

"Critical" scholars frequently seem to imagine that, in struggling against the methodological norms of their disciplines, they are struggling against the very structure of the power relations that exploit and repress the poor and weak — the metaphor being, in their minds, somehow transubstantiated into reality. **The result is** all too often, **an illusory radicalism, rhetorically colorful but programmatically vacuous**. The danger is that a fantasized radicalism will lead scholars to abandon the defense of the very devices that give the poor and weak a modicum of leverage, when defense of those devices is perhaps the only thing of practical value that scholars are in a position to contribute.*1¶ My main problem with Gathii's critique, then, is not (as he might imagine) that it is political, but that it is politically dysfunctional. More specifically, for all of Gathii's anticolonial posturing, my book is, I insist, far more effectively anticolonial than is his critique of it.¶ I. The Law and Politics of Governmental Illegitimacy¶ Professor Gathii is fully justified in subjecting Governmental Illegitimacy in International Law to an essentially political critique, for the book, like all legal scholarship, has political implications — in this case, designedly so.* This is not to say, as "critical" scholars sometimes seem to imply, that law or legal scholarship is reducible to ordinary politics. Law is a purposive project, and thus not exclusively an empirical phenomenon; "law as it is" cannot be wholly separated from "law as it ought to be."5 The purposes that drive the project, however, must be demonstrably immanent in social reality, not merely superimposed according to the predilections of the jurist; the jurist's task, at once creative and bounded, is to render a persuasive account of how those immanent purposes bind powerful actors to worthy projects (such as the self-determination of Third-World peoples) that they would not otherwise be inclined to undertake." That legal scholarship impress those who are not natural political allies is the test, not only of its scholarly merit, but also of its political merit; that friends may be disappointed is of far lesser significance.¶ This task is not to everyone's taste, and some in the academy have devoted their considerable talents to discrediting the project of legal reasoning, as conventionally understood.7 But **their efforts, though often of great intellectual sophistication, are profoundly misguided.** In their zeal to "unmask" law's legitimation of exercises of power, they fail to appreciate that law can legitimate such exercises only insofar as it simultaneously constrains them. Power holders seeking the imprimatur of legality can benefit only to the extent that they accept its limits, for violation of the limits necessarily reverses the process of legitimation.8¶ To deny such a relationship between legitimation and constraint is to assert that putative legal limits are a remarkably effective ruse — that legal rhetoric, rather improbably, fools most of the people all of the time. (Presumably, the power holders are not thought to be fool- ing themselves, since if the constraints, though objectively illusory, seem real enough to them, the rule of law would be a reality in politi- cal terms even if a chimera in philosophical terms.) On **the other hand, if law does constrain as well as legitimate the exercise of power, to neglect that point is to miss an important political opportunity.**

2AC Law Good

They are right about the state of the law – but that is not a reason to reject it – that only causes nihilistic violence and conservative cooption – we should try to make it effective even if that's impossible

Ristroph '9

(Alice, Associate Professor of Law, Seton Hall University School of Law, "Is Law? Constitutional Crisis and Existential Anxiety," *Constitutional Commentary* Vol. 25, 431-459. http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=1457&context=facpub)

One reason to care whether law is in "crisis" concerns our own expectations of the function of law. A possible achievement is to offer an alternative to violence—as we saw in Levinson and Balkin's account of the Constitution as enabling nonviolent dispute resolution.66 This might be called the anti-Thrasymachus view of law. Early in Plato's Republic (before Socrates has tamed him), a young man called Thrasymachus describes justice as "the advantage of the stronger."67 The claim is that might makes right, and Western political and legal thought has produced many efforts to prove Thrasymachus and his heirs wrong. If law distinguishes right from might, then it becomes important to say what law is, and to show that it exists. Hence, many ongoing jurisprudential debates about the criteria for a valid and functional system of law (including worries about legal indeterminacy) are motivated by worries about arbitrary power and violence.68 To show Thrasymachus to be mistaken, we want to show that the rule of law is really different from the rule of (the strongest) men. In legal theory, we could view John Austin's positivism— law as commands backed by threats of punishment—as a descendant of Thrasymachus's claim.69 Here, I want to examine briefly one of the most influential, and most plausible, efforts to show that law is something more and different from the commands of a gunman: H. L. A. Hart's response to Austin. Hart framed his discussion around the question, "What is law?".70 But perhaps, as the Stoppard passage that opened this essay suggests, beginning with this question led us to conjure an image of law with various predicates that do not, as it turns out, include existence. A second form of existential anxiety, one that I suspect shapes present talk of crisis, is the anxiety thast Thrasymachus and Austin were right and law, if it is anything more than command and force, does not exist. For my purposes here, the critical features of Hart's account are the rule of recognition and the internal point of view. Since, in most of The Concept of Law, Hart takes law's existence for granted, it is helpful to look at the passages where law's existence, or at least the existence of a particular form of law, is up for grabs. In his classic discussion of the question, "Is international law really law?", H. L. A. Hart deployed the concepts of a rule of recognition and the internal point of view to conclude that international law was at most in a state of transition toward fully legal law, moving toward law properly so called but certainly not yet there.71 At the time he wrote The Concept of Law, Hart believed that international law departed from domestic (or "municipal") law in that it lacked a widely accepted rule of recognition and in that states could not be said to take the internal point of view toward international obligations. (Hart's argument has been challenged by many contemporary scholars of international law, but that particular dispute need not occupy us here.72) For law qua law to exist, Hart argued, there must be a rule of recognition under which the authoritative status of other rules was accepted or denied, and the officials who would apply the rule of recognition must themselves take the internal point of view toward it. That is, the officials needed to view the rule of recognition as a binding, authoritative guide to their own decisions. Suppose Hart was right and the rule of recognition and the internal point of view are conditions for the existence of law. Two questions arise: what is the rule of recognition for constitutional law, and who must hold the internal standpoint toward that rule? The Constitution itself initially seems a candidate for the rule of recognition, though the fact that the Constitution must itself be interpreted leads some theorists to amend this account and say that the rule of recognition must include authoritative statements of the meaning of the Constitution, under prevailing interpretive standards.73 As for the internal point of view, we might hope that all state officials would take this point of view toward constitutional rules.74 In other words, we might hope that every state actor would comply with the U.S. Constitution because it is the Constitution, not simply to avoid injunctions, or judicial invalidation of legislative action, or liability under 42 U.S.C. § 1983. But Hart's theory does not demand universal adherence to an internal point of view. Even if legislators and other public officials complied with First or Fourth or Fourteenth Amendment doctrine only to avoid invalidation or § 1983 liability —even if these public officials were the equivalent of Holmes's bad man—Hart might find that constitutional law still existed in a meaningful sense so long as the judges applying constitutional rules believed themselves to be bound by a constitutional rule of recognition.75 Here is a possibility, one I believe we must take seriously and one that prompts anxiety about the existence of constitutional law itself: there is no common rule of recognition toward which judges and other officials take an internal point of view.76 Individual judges may adhere to their particular understandings of the rule of recognition —the Constitution as interpreted by proper originalist methods, for example, or the Constitution as elucidated by popular understandings. But the fact that individual state actors follow their own rules of recognition in good faith does not satisfy Hart's account of law, and it does not provide a satisfying alternative to Thrasymachus. (There is no reason, on the might-makes-right account, that the mighty cannot hold the good faith belief that they are pursuing a common good or acting pursuant to rule-governed authority. What matters is that their power is in fact traceable to their superior strength.) There is reason for academic observers to doubt the existence of a single rule of recognition in American constitutional law. There are too many core interpretive disputes, as discussed in Part I, and it is now widely accepted that constitutional rules are at least underdeterminatc. Should there be doubt about this claim, consider this feature of constitutional law textbooks: they include majority and dissenting opinions, and questions after each case frequently ask the reader which opinion was more persuasive. Those questions are not posed as rhetorical. For most constitutional decisions, we can say, it could have been otherwise. With a few votes switched, with a different line-up of Justices, the same precedents (and in some cases, the same interpretive methodology) could have produced a different outcome. Moreover, these suspicions of indeterminancy or underdetermi-nancy are not the unique province of the academy. Think of the discussions of Supreme Court appointments in presidential elections. Many voters, law professors or not, understand their vote for president to be also a vote for a certain kind of Justice and for certain kinds of constitutional outcomes. Discussions of Supreme Court appointments are often framed in terms of judicial methodology —"I will appoint judges who are faithful to the text of the Constitution" —but that language may be more a matter of decorum than of real constitutional faith. Judges, of course, are not ignorant of the charges of indeterminancy or of the politicization of judicial appointments. And it seems possible that the erosion of constitutional faith has reached the judiciary itself.771 claim no special insight into judicial psychology, but it seems implausible that the reasons for constitutional skepticism—the discussions of underdetermined rules, the contingency of outcomes based on 5-4 votes, and the great attention to swing justices such as Sandra Day O'Connor or Anthony Kennedy—have not influenced judges themselves. Here again it seems worthwhile to consider dissenting opinions. Justice Scalia's polemics come to mind immediately; he has often accused his colleagues of acting lawlessly.78 Yet he keeps his post and continues to participate in a system that treats as law the determinations of five (potentially lawless) Justices. It is possible, I suppose, that Justice Scalia's dissents express earnest outrage, that he is shocked (shocked) by decisions like Lawrence v. Texas79 and Boumediene. It is possible that he believes himself to be the last best hope of constitutional law properly so called. But it seems more likely that he shares the skepticism of academic observers of the Court. Though one can't help but wonder whether judges are still constitutionally devout, I should emphasize here that my argument does not turn on a claim that judges are acting in good or bad faith. Individual judges may well take the internal point of view, in Hart's terms, and strive faithfully to apply the principles they recognize as law. But it seems clear that American judges do not all hold the internal point of view toward a single, shared rule of recognition, given the nature of disagreements

among judges themselves. If there are multiple rules of recognition, varying from judge to judge, then legal outcomes will depend on which judge is empowered to make the critical decision, and Thrasymachus is not so far off the mark. Contemporary judicial disagreement is profound, and it is not just a matter of Justice Scalia's flair for colorful rhetoric. Consider Scott v. Harris, the recent decision granting summary judgment (on the basis of qualified immunity) to a police officer who had rammed a passenger car during a high-speed chase, causing an accident that left the driver a quadriplegic.80 Like most use-of-force opinions, the decision applies a deferential Fourth Amendment standard that gives police officers wide leeway. What is unusual about Harris is that, because the case arose as a civil suit under 42 U.S.C. § 1983, the critical question (whether the driver, Victor Harris, posed a sufficient threat to others' bodily safety such that the use of deadly force was reasonable) was nominally a jury question, and at summary judgment, the court should have taken the facts in the light most favorable to the non-moving party—the injured driver. Thus, in earlier use-of-force cases that reached the Court as § 1983 claims, the Court articulated the Fourth Amendment standard and then remanded the case to the trial court.81 But in Harris, the Court had access to videotapes of the chase recorded by cameras on the dashboards of the police vehicles involved.82 In the view of the eight-Justice majority, the videotape "spoke for itself": it made Harris's threat to the public so clear that no reasonable juror could conclude that the officer's use of force was unreasonable.83 Accordingly, the Supreme Court found the officer to be entitled to summary judgment.84 Doubtless there are many instances in which a court grants summary judgment to one party though non-judicial observers believe a reasonable juror could find for the other party. Harris is of particular interest, though, because the "reasonable juror" who might have found in favor of Victor Harris was clearly visible to the majority—in fact, this juror had a spokesman on the Court. Justice Stevens, the lone dissenter in Scott v. Harris, viewed the same videotape and found it to confirm the factual findings of the district court (which had denied the police offic-er's motion for summary judgment).85 Though Justice Stevens was careful not to base his argument on an actual determination of the substantive Fourth Amendment question (chiding his colleagues for doing just that and thereby acting as "jurors" rather than judges),86 he viewed the video evidence and explained how one might conclude, perfectly reasonably, that Scott had used excessive force.87 In order for the eight Justices in the Harris majority to believe their own opinion, they would have to conclude that Justice Stevens lived outside the realm of reason. Harris is nominally a dispute about what reasonable jurors could conclude, rather than a direct argument about the meaning of a particular constitutional provision. But the two reactions to the videotape should call to mind Larry Tribe's worry that American constitutional law is plagued by "deep and thus far intractable divisions between wholly different ways of assessing truth and experiencing reality."88 It is not just abortion and assisted suicide that reveal profound disagreement about what is true and real. A videotape that "speaks for itself" in the eyes of eight Justices says something entirely different to the ninth. Looking beyond the judiciary, consider the consequences of constitutional disagreement and constitutional indeterminacy for other government officials and for would-be critics of those officials. Earlier I noted that with sufficient constitutional indeterminacy, there's no such thing as an unconstitutional president. A more extreme version of this argument is that with sufficient legal indeterminancy, there's no such thing as illegality. When John Yoo wrote the Office of Legal Counsel memos that defend practices formerly known as torture, he was simply doing to bans on torture what critics had long argued it was possible to do for any law: he was trashing them.89 This was the spawn of CLS put to work in the OLC; **deconstructions on the left are now deconstructions on the right**.90 And that, of course, is cause for anxiety among those who would like to argue that George W. Bush or members of his administration acted illegally. As I suggested in the Introduction, this may be the Pyrrhic victory of critical legal studies: If the crits were correct, then there is no distinctively legal form of critique. About torture, indefinite detention, warrantless wiretapping, and so on, we can say I don't like it or it doesn't correspond to my vision of the good, but we cannot say it's illegal. To argue that the Bush administration violated the rule of law, we need to believe that the rule of law exists. But for 30 years or more, we have found reasons to doubt that it does.91 Perhaps it will seem that I am overstating the influence of legal realism and critical legal studies, or the doubts about law's existence. I'm willing to entertain those possibilities, but I do want to emphasize that the focus is on constitutional law. It's easy enough to believe in law when we see it applied and enforced by figures of authority in a recognized hierarchy. That is, the sentencing judge or the prison warden can believe in law—he has applied it himself. And the criminal should believe in law— he has felt its force. But these examples illustrate Austinian law: commands backed by force. What remains elusive, on my account, are laws that are truly laws given to oneself, and especially law given by a state to itself.92 That is why, in Part I of this essay, I suggested that brute force is a poor candidate to distinguish ordinary politics, or ordinary legal decisions, from extraordinary moments of crisis. What would be truly extraordinary is not the use of force, but its absence: a system of law truly based on consent and independent of sanction. The Constitution, in theory, is a law given unto oneself. By this I mean not simply that the Founders gave the Constitution to future generations, but that each successive generation must give the Constitution to itself: each generation must adopt the internal point of view toward the Constitution in order for it to be effective. Even once we have accepted the written text as authoritative, all but the strictest constructionists acknowledge that many meanings can plausibly be extracted from that text. (And even the strict constructionists must acknowledge that as a factual matter many meanings have been extracted; they deny only the plausibility of those varied readings.) Any law given unto oneself requires what Hart called the internal point of view, and what one more cynical might describe as self-delusion: it requires a belief that one is bound though one could at any minute walk away. It is possible, I think, that we have outwitted the Constitution: that we have become too clever, too quick to notice indeterminacy, even too post-modern to believe ourselves bound. A third possible explanation for contemporary references to crisis is professional malaise. It could be, as I suggested earlier, that after too many years of chewing what judges had for breakfast, professors have lost their appetites. It could be that the problems of originalists and historicists and popular constitutionalists don't amount to a hill of beans in this crazy world. And if these possibilities have not crossed the law professor's mind, they probably should. We might consider again Larry Tribe's explanation of his decision to stop work on his treatise of American constitutional law. There are two questions of meaning there, one of which Tribe confronts directly and the other which he brushes off quickly. Most obviously, there is the search for constitutional meaning, as Tribe acknowledges, a search that cannot be concluded within the Constitution's own text. "I see no escape from adopting some perspective... external to the constitution itself from which to decide questions not indisputably resolved one way or the other by the text and structure--------"9* Tribe goes on to wonder where these extra-constitutional criteria come from, and "who ratified the meta-constitution that such external criteria would comprise?".94 Supreme Court Justices (and other judges) must struggle with these questions, given "the public authority that they have the enormous responsibility and privilege to wield."95 But Tribe need not. He can simply decline to finish the treatise. If he declines to finish the treatise, though, we can't help asking ourselves what was at stake, and what remains at stake. If the law professor lacks the responsibility of a judge, is his constitutional theory just an amusing hobby? What was the point of the constitutional law treatise, or of other efforts to discern coherent principles of constitutional law? The significance of a treatise is the question of meaning that Tribe brushes off quickly: he says a treatise is an "attempt at a synthesis of some enduring value" and insists that his decision is not based on doubts about whether constitutional treatises arc ever worthwhile.96 But Tribe's letter leaves the "enduring value" of a treatise rather underspecified, and it is possible that current references to constitutional crisis in the academy stem from uncertainty about such questions of value. Is constitutional theory good for absolutely nothing? Only if we believe that the effort to resist Thrasymachus is futile or pointless. Constitutional theory is a species of legal and political theory, and the most intriguing forms of such theory are produced by worries that law and violence are too closely intertwined.97 Thus I suggested at the outset of this essay that existential anxiety is not always to be regretted, cured, or mocked. Such anxiety may be an important indication that we have noticed the ways in which Thrasymachus seems right, and we still care enough to try to prove him wrong.98 After so much talk of crisis and anxiety, consider an illustration from the dramatic genre. Tom Stoppard's play Jumpers features a troupe of philosophy professors who double as acrobats: "Logical positivists, mainly, with a linguistic analyst or two, a couple of Benthamite utilitarians ... lapsed Kantians and empiricists generally... and of course the usual Behaviorists... a mixture of the more philosophical members

of the university gymnastics team and the more gymnastic members of the Philosophy School."99 The Jumpers seem to practice what we would now identify as post-modern nihilism. One shoots and kills another, then conceals the murder with cheerful aplomb. Against these intellectually and physically adroit colleagues, the clumsy and old-fashioned Professor George Moore struggles to defend "the irreducible fact of goodness,"100 the possibility of a "moral conscience," and the claim that "there is more in me than meets the microscope."101 "Is God?" Moore wonders. He can neither shake nor defend his faith. Law schools, I think, are filled with moral sympathizers to Professor Moore who possess the skills of modern-day Jumpers.102 The current discourse of crisis is the latest manifestation of an old struggle between faith and doubt, and it is not one that we will resolve. On one hand, we have observed too much to believe (in law) unquestioningly. And on the other hand, we are determined to have law, even if we must make it ourselves. There was at least a smidgen of truth in John Finnis's claim that scholars of critical legal studies were "disappointed ... absolutists."103 But it is not just crits that are disappointed when they look for law and see nothing. Few scholars of any stripe want to vindicate Thrasymachus. All of this is just to reiterate the difficulty, and perhaps the necessity, of giving a law unto oneself. If constitutional law did not exist, it would be necessary to invent it.

Negative State Action = N/L

We're NOT THE LAW OR STATE AFFIRMATION – demands that a state not exclude groups doesn't reaffirm the state

Newman 10

(Saul, Reader in Political Theory at Goldsmiths, U of London, Theory & Event Volume 13, Issue 2)

There are two aspects that I would like to address here. Firstly, the notion of demand: making certain demands on the state – say for higher wages, equal rights for excluded groups, to not go to war, or an end to draconian policing – is one of the basic strategies of social movements and radical groups. Making such demands **does not necessarily mean working within the state or reaffirming its legitimacy**. On the contrary, demands are made from a **position outside the political order, and they** often **exceed the question of the implementation of this or that specific measure.** They implicitly call into question the legitimacy and even the sovereignty of the state by highlighting fundamental inconsistencies between, for instance, a formal constitutional order which guarantees certain rights and equalities, and state practices which in reality violate and deny them.

Reform Possible

State Can be Reformed

The state can be reformed – We need to change our thinking

Austin 2014

(Lisa M. Austin Associate Professor Faculty of Law University of Toronto ; Lawful Illegality: What Snowden Has Taught us About the Legal Infrastructure of the Surveillance State; 2014 ; http://poseidon01.ssrn.com/delivery.php?ID=506001013065022030094093080076001123025021068055070080202508609102607011509001600503105712211102200903610911800009300000108607301708401207606112600500606511509109500502907312200109507710706510402406709410206610307609409709100200400408910511909108%5&EXT=pdf&TYPE=2; B ; AWEY)

As Dyzenhaus has argued, some of the post 9/11 debate regarding emergencies and the rule of law concerns the different responses one might take to the existence of either legal black holes or legal grey holes. A black hole is where the legislature seeks to carve out a space of no-law; a grey hole is "one in which there is the facade or form of the rule of law rather than any substantive protections."4 The space created by such holes is a space for executive discretion and the need for such space derives from the perceived exceptional nature of national emergencies, where it is difficult to anticipate in advance what that emergency will be and how one should This framework of emergencies, with its themes of uncertainty and unforseeability, is both helpful and unhelpful when applied to state surveillance. It is helpful in that the exceptional nature of terrorism has deeply influenced contemporary methods of state surveillance. One aspect of the exceptional nature of terrorism is indeed its unpredictability. It is difficult to anticipate who will engage in acts of terrorism: agents of foreign powers, members of existing and known terrorist organizations, affiliates abroad, or homegrown extremists? It is difficult to anticipate where an attack will take place, whether many civilians will be at risk, the potential scale of an attack, and so on. Another aspect of the exceptional nature of terrorism is the type of risk it is seen to be — not just a risk of potentially catastrophic harm but a deep political threat to the state. For example, the US considers itself to be at "war" against al Queda. 6 The extraordinary nature of the threat of terrorism also underpins the US response of seeking to prevent future terrorist attacks, with a "never again" mentality.7 However, focusing on the exceptional nature of emergencies can detract us from the most salient features of the state surveillance methods Snowden has revealed to the world: they are in fact a rational, systematic, planned response to the perceived need to prevent terrorist attacks. In other words, the framework of emergencies concerns whether what is needed is a discretionary space for executive authority — either legal black holes or legal grey holes — to nimbly respond to exceptional circumstances that cannot be foreseen in advance. But state surveillance premised on the idea of collecting the "haystack" to find the "needle" is not about preserving discretion at all. It is about applying rational analytic methods to the problem of preventing certain kinds of threats that have been identified at least at some level of generality (e.g. terrorist threat).8 The proper frame of the rule of law challenge is not about the question of whether executive discretionary authority in relation to emergencies can and should be constrained by the reason of the law; instead, it is about whether mass surveillance as a mode of rational social ordering is in conflict with the deepest commitments of law as a mode of rational social ordering. When we talk about the legality of surveillance, therefore, we need to focus less on the spaces of discretion and more on the systematic features of surveillance that put strain on our traditional understandings of the rule of law. In particular, I want to flag three issues. The first is the issue of secrecy and the degree to which it is demanded by the national security context. My claim is that it creates pressure for unilateral, rather than objective and public, interpretations of the law. The second is the issue of legal complexity, especially as it relates to law reform initiatives. Where there is an increased blurring between regular law enforcement, border control, and terrorism investigations, as well as increasingly complex relationships between private sector communications intermediaries and the state, gaining a clear public understanding of proposed changes to lawful access laws or the full significance of legal cases before the courts, is extremely difficult. The third is the issue of jurisdiction and the extent to which national boundaries and questions of status (like citizenship) affect the lawfulness of surveillance. In particular, I argue that instead of providing us with the tools for accountability, status and jurisdiction allow for the leveraging of national boundaries to create an international surveillance regime with questionable accountability.

Reforms Work

Pure resistance entrenches the status quo---must be willing to propose imperfect reforms

Pyle 99

(Jefferey, Boston College Law School, J.D., magna cum laude Race, Equality and the Rule of Law: Critical Race Theory's Attack on the Promises of Liberalism, 40 B.C.L. Rev. 787)

For all their talk of "realism,"'" race-crits are strangely unrealistic in their proposals for reform. 1 m7 Most probably realize that radical measures like racial or ethnic reparations are not likely to be granted, especially by a court. But even unrealistic proposals are rare, because race-crits generally prefer not to suggest solutions, but to "resist" the dominant legal thought, doctrine and policy, whatever that happens to be.'" As Derrick Bell has put it, "most critical race theorists are committed to a program of scholarly resistance, and most hope scholarly resistance will lay the groundwork for wide-scale resistance."'" How this ivory tower oppositionalism would foment grassroots revolt is unclear, because CRT professors rarely suggest anything practical. Rather, their exhortations are meant, as Bell says, to "harass white folks" and • thereby "make life bearable in a society where blacks are a permanent, subordinate class."'" One of the race-erns' few practical programs of "resistance" is Paul Butler's proposal that inner-city juries practice racially-based jury nullification.'91 jurors of color, Butler argues, have the "moral responsibility" not to apply the criminal law to blacks and whites equally, but to "etnancipate some guilty black outlaws" because "the black community" would be "better off" if there were fewer black men in prison.'" Butler rejects the ordinary democratic process of legal reform.' Democracy, he says, ensures a "permanent, homogenous majority" of whites that "dominat[es]" African Ainericans.w5 Butler is probably correct that occasional acts of jury nullification might well express the resentment that many African Americans justifiably feel towards discriminatory law enforcement.'"`' As Randall Kennedy has pointed out, however, black Americans are disproportionately the victims of crimes,'97 and therefore tend to favor more, not less, criminal prosecution and punishment. 1 "8 The race-crits' preference for "resistance"'99 over democratic participation seems to flow from a fear of losing their status as "oppositional scholars] "200 to the game of mainstream law and politics, which they regard as "an inevitably co-optive process?"' Better to be radically opposed to the "doniinant political discourse""2 and remain an out than to work within the current system and lose one's "authenticity?" In rejecting the realistic for the "authentic," however, race-crits begin to look like academic poseurs—ideological purists striking the correct radical stance, but doing little within the confines of the real world, so sure are they that nothing much can be done."

Change from Within k

Change must happen from within the state

Dussel| 2011

(Enrique Domingo Dussel Ambrosini (born December 24, 1934) is an Argentine-Mexican writer and philosopher; A note regarding political organization: strategic action ; 2011 ; From Critical Theory to the Philosophy of Liberation: Some Themes for Dialogue, page 33; AWEY)

In the same way, this lack of realism with respect to state institutions results in a lack of critical realism in political strategy. I am not speaking of a "politics of organization," but rather a "politics of events." Lacking a strategic institutional reference – like the state (which should nevertheless always be transformed) – strategic mediations become insignificant. In the end, for Negri, the global multitude faced with the specter of Empire (which for him lacks both an army and an exteriority) confronts the efforts of some organizations like the NGOs. This multitude will accumulate very little power (potentia) while under the control of and managed by the mediocracy (as Giorgio Agamben, who knows well the political power of media magnates like Berlusconi, refers to it), which inevitably fabricates the interpretation of all political actions and institutions. It is true that it is the interpretation of the event that creates the consciousness of the multitudes, as public opinion is manipulated through a sort of "fabricated meaning" that completely distorts those same events. In the end, what occurred in Seattle, Genoa, or Cancun is what the media presented through the distortion of information. The media outlets don not argue; they present video and images, they grind them up and repeat them, and they create an imaginary, fetishized unanimity with complete control over the meaning of the political. Is it possible in such a situation to passively await the maturation of a politics of events? It would seem that the reason and the political will of the oppressed masses, of the particular postcolonial states, of the marginalized, impoverished, of the original peoples of all the continents, of the excluded and the "wretched of the earth," also demands institutional mediation. Be they as they may, the unforeseeable, the already known, or the transformable, such institutions are necessary so that an empirical strategy might begin to clear the path. When the World Social Forum in Porto Alegre asserts that "Another world is possible!" – the practical postulate of all postulates – it slowly begins to invent from below, without firm presuppositions, humble in the face of the experiences of that globally-networks and united base. This base comprises political organizations on all levels, from the economic, household, neighborhood, sporting, artistic, cultural, and theoretical spheres, etc., new social movements whose participants know how to transform themselves into political actors in different institutions, not only in civil society but likewise in political society. Political parties, which need to transform themselves as reality demands, would need to play a new and more active role, not as a vanguard, but rather as a political school, as the rearguard of the popular masses, as a critical institution in the exercise of power, elaborating alternatives, as a site for the discussion of postulates, projects, models, ends, strategies, tactics, means... so that the reproduction and development of life in political community might be possible, so that its democratic, symmetrical, authorized participation might be possible, within a realism of that feasibility which is situated between anarchist impossibility (which is empirically impossible) and conservative impossibility (which is empirically possible, but open to criticism). Hope, beyond conservative pessimism, but more proximate than the extreme optimism of the anarchist, becomes mobilized when it exercises a feasible power which transforms the existing structures from the perspective of a postulate which needs only be filled with content: "A world in which all worlds fit!," as the Zapatistas proclaim.

Law Key to Natives

Legal reform is vital to provide meaningful redress for past violence to natives—can't fix the law outside of the law

Bradford 2

(William Bradford 2, Chiricahua Apache. LL.M., 2001, Harvard Law School; Ph.D., 1995, Northwestern University, "With a Very Great Blame on Our Hearts": 1 Reparations, Reconciliation, and an American Indian Plea for Peace with Justice, 27 Am. Indian L. Rev. 1)

[*17] Nevertheless, even if the non-Indian majority would reject the American Myth in the interest of mending national fences, the path to Indian redress winds through terrain unmapped heretofore. Compensation and apologies, gestures potentially part of an amicable settlement, are not germane to the resolution of Indian claims for injustices that cannot be remedied save by reinvestiture of lands and sovereignty in self-determining Indian tribes. 70 This requires not merely an abstract acknowledgment of the value of pluralism but a comprehensive program of legal reform that dispenses with doctrines and precedents perpetuating the denial of the human rights of Indian tribes and people. 71 As law, more than any other social variable, has reproduced the subordination of Indians in the United States, 72 legal reform occupies a central position in the claim for Indian redress. 73¶ [*18] In short, proponents of Indian redress must not only displace a flawed version of history: they must articulate a proposal for remediation that transports the American people far beyond the strictures of existing law to enable the peaceful restoration of Indian lands and powers of self-government. 74 Such a transformative mission cannot be accomplished by positing Indians and the non-Indian majority as adversaries, as would reparations; rather, redress of Indian claims and the healing of the American nation -- crucial foci of the drive toward perfection -- necessitate dialogue, reconciliation, and joint authorship of a future history of peace, harmony, and justice. 75¶ Part II of this Article offers a disquieting version of U.S-Indian history that accelerates erosion of the American Myth and acquaints the non-Indian majority with the necessary factual predicate to Indian redress. Parts III and IV contrast the assumptions, procedures, and remedies that distinguish reparations and reconciliation, 76 the dominant contending models of redress available to group victims of human injustice, and demonstrate that, because it offers the best hope for a peaceful American coexistence marked by mutual respect for sovereignty, reconciliation is a more appropriate avenue to Indian redress. Several preliminary proposals, including the introduction of traditional tribal peacemaking as perhaps the most appropriate form of [*19] reconciliation, will be offered to stimulate thinking.

Defense

AT: Quick Fix Solutions

Chocolate laxatives K is silly

Olson 9

(Dan T. Olson 9 - MA in theology from Fuller Theological Seminary and am in the process of completing another MA in philosophy at LMU, 8/1/9, Hauerwas, Zizek, Patagonia And Rob Bell: Capitalism's Chocolate Laxatives And The Church

http://dtomolson.wordpress.com/2009/08/01/hauerwas-zizek-patagonia-and-rob-bell-capitalisms-chocolate-laxatives-and-the-church/)

To get back to the point, Zizek suggests that the reason these liberal-communists and their chocolate laxatives must be rejected is that they are the quick fixes that allow the system to continue to grind on, grinding up the masses as it does. The chocolate laxative may momentarily loosen your stool, but it will not fix the main cause of the problem. In order to do that one must stop living off of chocolate and eat some roughage, which doesn't taste all that good to a palate used to sugar, cocoa and butter. One possible danger in Zizek's answer, for me, is that it is in danger of making the same mistake that every other purely human revolution, insurrection, or rescue mission has made. That is, in view of what must be achieved some sacrifices must be made—some heads of the aristocracy, some infidels, a couple of thousand Iraqi or Afghani civilians lives or the massive suffering and starvation of many of the wretched of the earth who depend on the charity of the liberal communists. For the Christian this is always unacceptable. People are not goods to be used no matter how lofty the purpose but persons to be loved. (Of course how this love works itself out is what is in question here.) Many theologians have told us, rightly, that the poor are the sight of the in breaking and redeeming work of Christ. This is different than being the subjective location of, or potential for, the revolution. One must be careful that in order to achieve one's end, the end of capitalist hegemony, an end that I believe is completely in line with the Gospel, one does not sacrifice those who cannot choose otherwise. This does not mean that on the other hand we shut our eyes and continue to rejoice in liberal communists and chocolate laxatives. We cannot be content to wear our Tom's Shoes and Gap Red T-shirts while drinking our fair trade coffee and going about our day pleased with the current social order. There has to be a third or middle way, a political option better than Elizabeth's ecclesial via media.

Law Inevitable

Law is inevitable – repressing the state increases its abusive activity

McCormick '99

(John P., Assistant Political Science Pf - Yale, American Political Science Review. v93, p. June 1999)//akim

Conventionalism is often considered to be a way of avoiding the naked prejudices of individual judges constituting the law. As a solution, whatever a community of judges in a particular culture could be expected to agree upon in a similar case ought to be adopted as a guideline for a judge's particular opinion in a given case. Indeed, in his early legal work, Schmitt ([1912] 1969, 71-9, 86) offers this as a solution to the problem of judicial subjectivism.8 Here Schmitt trusts in the [foot notes] [header] hegemony of the conservative interpretive methods of the late Kaiserreich to promote judicial consensus in much the manner that Fiss (1982, 1985), for instance, trusts in something approaching a postwar American liberal consensus in his own formulation of conventionalism. These examples, of course, potentially exacerbate rather than alleviate the problem of judicial arbitrariness: The cultural prejudice of a particular profession as a whole is no better solution to the problem of indeterminacy from a normative perspective than, on the one hand, a subjectively all-powerful lawgiver judge, or, on the other, a mechanically objective automaton judge. Collective prejudice is ultimately just as problematic as individual prejudice. It may temporarily reduce the threat of indeterminacy by guaranteeing more predictable results, but it does so in a way that is still, in the last instance, arbitrary. Schmitt abandons conventionalism in his mature writings of the 1920s and early 1930s; CLS has always rejected it, perhaps appropriately, as elitist. According to Schmitt, in their revulsion to arbitrary discretion, liberals sought to eliminate the state institutionally from jurisprudential concerns, just as they wished to eliminate, hermeneutically, the personal, subjective decision from such matters. But they were equally unsuccessful in each endeavor. Specifically, the adherence to legal formalism under conditions of an emerging welfare state allows more state intervention than was ever dreamed of by absolute monarchs. To Schmitt's mind, in the early twentieth century, the formalism of liberalism serves as an ideology that belies the so-called materialization of law that is brought about by state activity in the new era of welfare-state or Sozialstaat interventionism. Schmitt observes presciently that as state activity addresses complex and variegated social and economic situations, law is formulated in a more open-ended and less finely discernible manner. In the service of widescale state intervention into particular spheres of society, more discretion becomes exercised by bureaucratic administrators, including judicial officers, in implementing broadly defined social policy. Rather than a formal guideline for members of society, **law becomes a material part of social reality**.9 By **repressing the state,** the legal formalists not only do not prevent arbitrary state functioning but also **allow its activity to proliferate more extensively and undetected to an even greater degree**. Unlike CLS at a later date, however, Schmitt's concern with this situation is not that state officials and the powerful interests they represent potentially abuse their power through such functioning; rather, the state is actually, in the end, exhausted by it. The welfare state is a weakened state that overextends itself, not a dangerously strong coercive state.

State Inevitable

State is inevitable – only way to change is to work within it.

Dussel| 2011

(Enrique Domingo Dussel Ambrosini (born December 24, 1934) is an Argentine-Mexican writer and philosopher; The sphere of feasibility: Empire and the "dissolution of the particular state" ; 2011 ; From Critical Theory to the Philosophy of Liberation: Some Themes for Dialogue, page 29; AWEY)

All institutions, responding in their founding moment to demands for the permanence and extension of life, include a certain degree of discipline. Anti-institutional critics are quite right to show that this discipline becomes quickly (or even from its origin) repressive. This was Marcuse's subject in Eros and Civilization. The state is a political macro-institution. More recently, M. Foucault opposed the political binary of oppressor-oppressed as wielded by the only instance of the exercise of power (the state) and equally affirmed by standard Marxism.75 He tried to show that power was disseminated, through multipolar rather than bipolar structures, in micro-institutions that discipline the body on different epistemic levels and justify the exercise of power. The panoptical power of prisons, psychiatric clinics, schools etc., fragment power, and as such undermine the over-simplified view of power as based macro-institutionally in the state. The old tradition of which this sort of critique is a part – begun by Stirner and Bakunin, continued by Sorel and Pelloutier, and which runs deeply at present in Foucault himself, along with Negri and Holloway – expresses a need for the "dissolution of the state." This, however, brings in the entire institutional question within the philogenetic development of the human species that have progressively become "fixed" in systemic structures and institutions. Finally, it is on these latter that the entire problematic of diagnosing the nature of politics and economics is based, which provides the foundation for a properly contingent level of strategy. Political action that seeks to change or "transform" the world inevitably confronts institutions. In a situation of chaos or pure original dissidence (disidencia originaria), there can be no transformation or dissent. To chaos one can only "con-form," institutionalizing it toward the permanence of life by way of this "institutionalizing (instituyente) power."76 Original dissidence, on the other hand, is death and non-power, because when there is no consensus or agreement the "powers-to-posit" 77 of each member oppose and cancel out one another (and it is not possible to create any mediation to sustain life). The starting point should be some sort of consensus. The "form" of the institution or consensus is open to change, to be "trans-formed" through a moment of overcoming chaos with creative dissidence, into a higher form. To trans-form or change is not simply to destroy: it is to de-construct in order to innovate and move toward a better construction. Revolution is not only, or primarily, or principally destruction: it means having a principle that orients the deconstruction just as much as it orients the new construction (it is not the business of destroying everything, only that which is irretrievable). Those who lack criteria and principles for a new construction (note that I am not saying a "re-construction"), are not revolutionaries but simply destructive and barbaric. It would not be possible for millions of human beings to maintain and expand communal life without institutions. Should we irrationally return to the Paleolithic era? No. We are dealing with the "trans-formation" (what Marx called Veraenderung) of those institutions which began as lifeenhancing mediations, but which have since become instruments of death, impediments to life, instruments of an exclusion which can be observed empirically in the cry arising from the pain of the oppressed, the ones suffering under unjust institutions. Such entropically-repressive institutions exercise a power-over78 their victims, whose power-to-posit79 their own mediations is negated, and who are thereby repressed.

Individual Ethics Fail

Individual ethical orientations aren't effective – it's more productive to rearticulate systems from the inside

Pugh 10

(Jonathan, Newcastle Postcolonial Geographer, "The Stakes of Radical Politics have Changed: Post-crisis, Relevance and the State", Globalizations, March-June, ebsco)

In this polemical piece I have just been talking about how, following an ethos of radicalism as withdrawal from the state, some from the radical Left were incapable of being able to respond to the new stakes of radical politics. In particular, they were not found at the state, where the passive public turned to resolve the crisis. I will now go on to examine how in recent years significant parts of the radical Left have also tended to prioritise raising awareness of our ethical responsibilities, over capturing state power. I am going to say that it is important to create this awareness. However, in an effort to draw attention to the stakes of politics as we find them now, post-2008, I will also point out that we should not place too much faith in this approach alone. Against the backdrop of what I have just been saying, it is important to remember that while much attention is focused upon President Obama, in many other parts of the world the Right and fundamentalism are gaining strength through capturing state power. The perception that the USA has changed is accompanied by a sense of relief among many radicals. However, the European Elections of 2009, the largest trans-national vote in history, heralded a continent-wide shift to the Right (and far Right) in many places—in Austria, Belgium, Bulgaria, Cyprus, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Italy, Estonia, Lithuania, Luxembourg, Poland, Portgual, Slovenia, Spain, Romania, as just some examples (Wall Street Journal, 2009). Despite Obama's election and a near depression, neo-liberalism continues to be implemented through a world spanning apparatus of governmental and intergovernmental organisations, think tanks and trans-national corporations (Massey, 2009; Castree, 2009). The power of the Right in countries like Iran, while checked, remains unchallenged by the Left. Albertazzi et al. (2009) draw attention to how a disconnected Left is leaving power in the hands of the Right in many other countries nationally, like Italy for example. Reflecting upon contemporary radical politics, the British Labour politician Clare Short (2009, p. 67) concludes: In the fog of the future, I see a rise of fascistic movements . . . I am afraid it will all get nastier before we see a rise in generous, radical politics, but I suspect that history is about to speed up in front of our eyes and all who oppose the radicalisation of fear, ethnic hatred, racialism and division have to be ready to create a new movement that contains the solutions to the monumental historical problems we currently face. So, the stakes of politics are clear. The Right is on the rise. Neo-liberal ideology is still dominant. How is the Left responding to these stakes? I have already discussed how some from the radical Left are placing too much faith in civil society organisations that seek to withdraw from the state. I will now turn to how others have too much faith in the power of raising awareness of our ethical responsibilities. Post-crisis, the increasing popularity of David Chandler's (2004, 2007, 2009a, 2009b) work reflects the sense that radicals too often celebrate the ethical individual as a radical force, at the expense of wider representational programmes for change. His central argument is that this leaves radicals impotent. Chandler (2009a, p. 78–79) says that many radicals argue that there is nothing passive or conservative about radical political activist protests, such as the 2003 anti-war march, anti-capitalism and anti-globalisation protests, the huge march to Make Poverty History at the end of 2005, involvement in the World Social Forums or the radical jihad of Al-Qaeda. I disagree; these new forms of protest are highly individualised and personal ones— there is no attempt to build a social or collective movement. It appears that theatrical suicide, demonstrating, badge and bracelet wearing are ethical acts in themselves: personal statements of awareness, rather than attempts to engage politically with society. In one way, Chandler's reflective insight here is not particularly unique. Many others also seem to think that radicals today are too isolated and disengaged (Martin, 2009).5 Neither is it particularly original to say that there is too much emphasis upon creativity and spontaneity (what Richard Sennett, 2004, calls 'social jazz'), and not enough upon representational politics. Indeed, go to many radical blogs and you find radicals themselves constantly complaining about how it has become too easy to sign up to ethical web petitions, email complaints, join a variety of ethical causes, without actually developing the political programmes themselves that matter. So it is not Chandler's point about radicals being disengaged from instrumental politics that concerns me here. It is his related point—that there has been a flight into ethics, away from political accountability and responsibility that I find intriguing. Personal statements of ethical awareness have become particularly important within radical politics today. It is therefore interesting to note, as I will now discuss, that we have been here before. In his earlier writings Karl Marx (1982) criticised the German Idealists for retreating into ethics, instead of seizing the institutions of power that mattered for themselves. Unwilling to express their self-interests politically through capturing power, the Idealists would rather make statements about their ethical awareness. Such idealism, along with an unwillingness to be held accountable for political power, often goes hand in hand. For Marx, it is necessary to feel the weight, but also the responsibility of power. Chandler argues that, just as when the early Marx critiqued German Idealism, we should now be drawing attention to the pitfalls of the flights to ethics today. He says: In the case of the German bourgeoisie, Marx concludes that it is their weakness and fragmentation, squeezed between the remnants of the ancien re´gime and the developing industrial proletariat, which explains their ideological flight into values. Rather than take on political responsibility for overthrowing the old order, the German bourgeoisie denied their specific interests and idealised progress in the otherworldly terms of abstract philosophy, recoiling from the consequences of their liberal aspirations in practice. (Chandler, 2007, p. 717) Today we are witnessing a renewed interest in ethics (Lai¨di, 1998; Badiou, 2002). Fragmented, many radicals retreat into abstract ethical slogans like 'another world is possible', 'global human rights', or 'making poverty history'. As discussed above, we are also of course seeing the return of Kant's cosmopolitanism. While I think we should not attack the ethical turn for its values, as many of these around environmental issues and human rights are admirable, it is equally important to say that the turn to ethics

seems to reflect a certain lack of willingness to seize power and be held accountable to it. For the flight to ethics, as it often plays out in radical politics today, seems to be accompanied by scepticism toward representational politics. Continuing with this theme for a moment, Slavoj Zizek (2008) also sheds some more light upon why ethics (when compared to representational politics) has become so important to the Left in recent years. He says that many of us (he is of course writing for the Left) feel that we are unable to make a real difference through representational politics on a larger scale, when it comes to the big political problems of life. Zizek (2008, p. 453) talks of this feeling that 'we cannot ever predict the consequences of our acts'; that nothing we do will 'guarantee that the overall outcome of our interactions will be satisfactory'. And he is right to make this point. Today, our geographical imaginations are dominated by a broader sense of chaos and Global Complexity (Urry, 2003; Stengers, 2005). These ways of thinking, deep in the psyche of many radicals on the Left may be one other reason why so many have retreated into ethics. When we do not really believe that we can change the world through developing fine detailed instruments, capturing the state, or predictive models, we are naturally more hesitant. It is better to try and raise ethical awareness instead. Whereas in the past power was something to be won and treasured, something radicals could use to implement a collective ideology, today, with the risk posed by representation in fragmented societies, top-down power often becomes a hazard, even an embarrassment, for many on the Left (Laï¨di, 1998). This is, as I have already discussed, where the Right and neo-liberal ideologues are seizing the opportunity of the moment. Putting what I have just said another way, there is a need to be clear, perhaps more so in these interdisciplinary times—ethics and politics (particularly representational politics) are different. Of course they are related. You cannot do politics without an ethical perspective. **But my point here is that the Right and neo-liberal ideologues will not simply go away if the Left adopt or raise awareness of alternative ethical lifestyles**. The Right are willing to capture state power, particularly at this time when the state is increasingly powerful. When we compare the concerted political programme of neo-liberalism, first developed by Reagan, Thatcher, the IMF, the World Bank, NATO, multi-national banks, and the G20, as just some of many examples, ethical individuals across the world offer some counter-resistance. But the 2008 crisis, and the response of protests like the Alternative G20, demonstrated how weak ethical resistance is in the face of the institutions of the neo-liberal economy. Another reason for this is because the ethical individual contributes so much to neo-liberal societies themselves. To explain how, we must briefly step back. The new social movements of previous decades have, in general, been effectively recuperated by the existing system of capital, by satisfying them in a way that neutralised their subversive potential. This is how capital has maintained its hegemonic position in post-Fordist societies. Luc Boltanski and Eve Chiapello (2005) explain how capitalists have worked with, rather than against, the characteristics of new social movements. They say the new social movements desire for autonomy, the ideal of self-management, the anti-hierarchical exigency, and the search for authenticity, were important in developing post-Fordism. These replaced the hierarchical framework of the Fordist period with new forms of networked control. And so, in this way, we see that the relationship between new social movements and capital has been productive. In turn, and this is the important point I want to make about the present moment, clearly the stakes of radical politics have now changed once more. As discussed earlier, it would now seem that post-Fordist society is actually more hierarchical and controllable than many previously thought. Without the neoliberal state, and the public's subordination to its actions, it would not now exist in anything like its present form. Our subordination to the state has stopped a post-crisis implosion of neo-liberalism. And this is of course where one of the central characteristics of the ethical individual has been so productive. Endemic individualism, so dominant in liberal societies, has been recuperated by the ethical individual who is unwilling to seize the state. **So the salient point here is that the ethical individual is reflective of the conservative forces in society today.**

Micro-Resistance Fails – State Key

The alt doesn't adequately create counterhegemonies-micro resistance empirically relies on the myth they will spill up but never do-the AFF's vision of institutional change is more effective.

Lobel 7

(Orly, UCSD law professor, "The Paradox of Extralegal Activism: Critical Legal Consciousness and Transformative Politics", http://www.harvardlawreview.org/media/pdf/lobel.pdf)

Both the practical failures and the fallacy of rigid boundaries generated by extralegal activism rhetoric permit us to broaden our inquiry to the underlying assumptions of current proposals regarding transformative politics — that is, attempts to produce meaningful changes in the political and socioeconomic landscapes. The suggested alternatives produce a new image of social and political action. This vision rejects a shared theory of social reform, rejects formal programmatic agendas, and embraces a multiplicity of forms and practices. Thus, it is described in such terms as a plan of no plan,211 "a project of projects,"212 "anti-theory theory,"213 politics rather than goals,214 presence rather than power,215 "practice over theory,"216 and chaos and openness over order and formality. As a result, the contemporary message rarely includes a comprehensive vision of common social claims, but rather engages in the description of fragmented efforts. As Professor Joel Handler argues, the commonality of struggle and social vision that existed during the civil rights movement has disappeared.217 There is no unifying discourse or set of values, but rather an aversion to any metanarrative and a resignation from theory. Professor Handler warns that this move away from grand narratives is self-defeating precisely because only certain parts of the political spectrum have accepted this new stance: "[T]he opposition is not playing that game . . . . [E]veryone else is operating as if there were Grand Narratives . . . ."218 Intertwined with the resignation from law and policy, the new bromide of "neither left nor right" has become axiomatic only for some.219 The contemporary critical legal consciousness informs the scholarship of those who are interested in progressive social activism, but less so that of those who are interested, for example, in a more competitive securities market. Indeed, an interesting recent development has been the rise of "conservative public interest lawyer[ing]."220 Although "public interest law" was originally associated exclusively with liberal projects, in the past three decades conservative advocacy groups have rapidly grown both in number and in their vigorous use of traditional legal strategies to promote their causes.221 This growth in conservative advocacy is particularly salient in juxtaposition to the decline of traditional progressive advocacy. Most recently, some thinkers have even suggested that there may be "something inherent in the left's conception of social change — focused as it is on participation and empowerment — that produces a unique distrust of legal expertise."222 Once again, this conclusion reveals flaws parallel to the original disenchantment with legal reform. Although the new extralegal frames present themselves as apt alternatives to legal reform models and as capable of producing significant changes to the social map, in practice they generate very limited improvement in existing social arrangements. Most strikingly, the cooptation effect here can be explained in terms of the most profound risk of the typology — that of legitimation. The common pattern of extralegal scholarship is to describe an inherent instability in dominant structures by pointing, for example, to grassroots strategies,223 and then to assume that specific instances of counterhegemonic activities translate into a more complete transformation. This celebration of multiple micro-resistances seems to rely on an aggregate approach — an idea that the multiplication of practices will evolve into something substantial In fact, the myth of engagement obscures the actual lack of change being produced, while the broader pattern of equating extralegal activism with social reform produces a false belief in the potential of change. There are few instances of meaningful reordering of social and economic arrangements and macro-redistribution. Scholars write about decoding what is really happening, as though the scholarly narrative has the power to unpack more than the actual conventional experience will admit.224 Unrelated efforts become related and part of a whole through mere reframing. At the same time, the elephant in the room — the rising level of economic inequality — is left unaddressed and comes to be understood as natural and inevitable.225 This is precisely the problematic process that critical theorists decry as losers' self-mystification, through which marginalized groups come to see systemic losses as the product of their own actions and thereby begin to focus on minor achievements as representing the boundaries of their willed reality. The explorations of micro-instances of activism are often fundamentally performative, obscuring the distance between the descriptive and the prescriptive. The manifestations of extralegal activism — the law and organizing model; the proliferation of informal, soft norms and norm-generating actors; and the celebrated, separate nongovernmental sphere of action — all produce a fantasy that change can be brought about through small-scale, decentralized transformation. The emphasis is local, but the locality is described as a microcosm of the whole and the audience is national and global. In the context of the humanities, Professor Carol Greenhouse poses a comparable challenge to ethnographic studies from the 1990s, which utilized the genres of narrative and community studies, the latter including works on American cities and neighborhoods in trouble.226 The aspiration of these genres was that each individual story could translate into a "time of the nation" body of knowledge and motivation.227 In contemporary legal thought, a corresponding gap opens between the local scale and the larger, translocal one. In reality, although there has been a recent proliferation of associations and grassroots groups, few new local-statenational federations have emerged in the United States since the 1960s and 1970s, and many of the existing voluntary federations that flourished in the mid-twentieth century are in decline.228 There is, therefore, an absence of links between the local and the national, an absent intermediate public sphere, which has been termed "the missing

middle" by Professor Theda Skocpol.229 New social movements have for the most part failed in sustaining coalitions or producing significant institutional change through grassroots activism. Professor Handler concludes that this failure is due in part to the ideas of contingency, pluralism, and localism that are so embedded in current activism.230 Is the focus on small-scale dynamics simply an evasion of the need to engage in broader substantive debate? It is important for next-generation progressive legal scholars, while maintaining a critical legal consciousness, to recognize that not all extralegal associational life is transformative. We must differentiate, for example, between inward-looking groups, which tend to be self-regarding and depoliticized, and social movements that participate in political activities, engage the public debate, and aim to challenge and reform existing realities.231 We must differentiate between professional associations and more inclusive forms of institutions that act as trustees for larger segments of the community.232 As described above, extralegal activism tends to operate on a more divided and hence a smaller scale than earlier social movements, which had national reform agendas. Consequently, within critical discourse there is a need to recognize the limited capacity of small-scale action. We should question the narrative that imagines consciousness-raising as directly translating into action and action as directly translating into change. Certainly not every cultural description is political. Indeed, it is questionable whether forms of activism that are opposed to programmatic reconstruction of a social agenda should even be understood as social movements. In fact, when groups are situated in opposition to any form of institutionalized power, they may be simply mirroring what they are fighting against and merely producing moot activism that settles for what seems possible within the narrow space that is left in a rising convergence of ideologies. The original vision is consequently coopted, and contemporary discontent is legitimated through a process of self-mystification.

Alt Fails/State Good/Reformable

Either the alternative is ontologically incompatible and the alternative does nothing or it necessitates dissolution of the state which fails

Gay 12

(Paul, CBS department of organization professor, "Leviathan calling Some notes on sociological anti-statism and its consequences", Journal of Sociology, 48.4, SAGE)

Because the state is imperfect – indeed, in being born it had to renounce perfection, as Weber famously argued in The Profession and Vocation of Politics (1994), both its own and that of those it sought to rule, making do instead with its capacity to enforce peace and their capacity to act peaceably **– it is not necessarily wise to insist on benchmarking the state against moral ideals which are alien to its constitution**. In seeking to make the state conform to certain politically and morally expressivist ideals – whether liberal or communitarian, cosmopolitan or transnationalist, or any other such ideals – critics of the state can come dangerously close to endorsing its retheologization, or its dissolution. Michael Ignatieff (2001: 35) makes precisely this point when he argues that individual rights cannot and should not function as transcendental limits on state action because they are themselves the product of action by sovereign states. They are historical entitlements to legal action, contingent upon the state's capacity to establish and maintain security. Under conditions of peace the sovereign state, in its guise as security state, can almost seem to disappear, and the state becomes the addressee of a wide range of additional demands and expectations. As soon as the security envelope is threatened, however, whether internally (incitement to insurrection, domestic terrorism, economic crisis) or externally (foreign terrorism, invasion, economic crisis) then civil liberties and rights are retracted to the extent that is necessary to protect the space within which they were unfolded in the first place (Hunter, 1998, 2005). It should therefore come as no surprise – in fact it should be taken as evidence of its 'stateness' – that contemporary liberal-democratic states default to their 'foundational' security setting when under threat. It would be a worry if they did not, for this would be evidence of their transcendence or 'hollowing out'. What still seems so difficult for those seeking to moralize the state, and what conjoins them with earlier critics, is their distrust of the independence or autonomy of the state as an impersonal structure of rule. In particular, these modern critics seem unable, or unwilling, to accept that the state cannot possibly undertake its core functions of pacification and security unless it can decide for itself, 'without internal impediment', what can be publicly expressed or just who can own what, and why. It is the state, and the state alone, that can and must: judge the degree of jeopardy in every instance. The state carries, and must carry, the authority of its own subjects' will and choice to make that judgement on their behalf and to act, decisively, upon it. Indeed, each subject has a right against every other that it should do just this. (Dunn, 2000: 84) It is in this sense, as I indicated earlier, the authority of the state is both 'binding and content-independent': Part of the whole point of having such a free-standing coercive structure (the state) is that it be independent…. **As long as the basic fact remains, there is always going to be a gap between the political power of the state and the effective powers of the populace, and, on this argument, that is a good thing**… in a world populated by other states, many of them predatory, it is essential for the minimal self-defence of a certain population that it be organized as a state, or one might think that it was necessary [as recent events indicate all too clearly] to have an independent power that could intervene in the economy to prevent it from selfdestruction. (Geuss, 2001: 129, emphasis in original) The very rationale of the state as an 'independent coercive apparatus', one beyond the direct control of its subjects, means that it will always be antithetical to the moralizing ideal of popular sovereignty. From a statist point of view, this is a major factor in its favour. **Attempts by critics of various sorts to neuter the authoritarian or absolutist pedigree of the state through**, for instance, **abrogating its room for manoeuvre** by opposing its discretionary powers, **are**, from this statist viewpoint, **misguided, not least because they can** in certain circumstances **undermine the very conditions that made the state** and the liberal rights associated with it **possible** in the first place (Geuss, 2001; Hunter, 2005). The 'critique and expose' line of reasoning, which seeks to somehow evacuate, water down or occlude the continuing and crucial practical importance of sovereignty and an associated 'absolutist' capacity, also extends to contemporary sociological discussions of the state. Here, the effects of the ongoing 'moment of theory', in particular some of its 'constructionist' and 'constructivist' variants, are evident (for a detailed discussion see Hunter, 2006, 2007, 2009). Much important work in the latter vein has sought to puncture reifications of the state as a free-standing entity, indicating instead how 'state effects' are produced in, and as a result of, the relations established between a diverse range of materials, mundane practices and devices. However, while ostensibly signaling an adherence to empirical history and positive description, this body of work has tended to be highly theoretical and epochal in orientation. A

number of consequences have flowed from this, not least of which has been the effective disappearance of the state as an object of sociological analysis. Two pieces inspired by the work of Michel Foucault – Rose and Miller's (1992) 'Political Power beyond the State' (with its focus on 'governmentality') and Timothy Mitchell's (1999) 'Society, Economy, and the State Effect' (with its focus on 'disciplinary society') – serve as representative examples of this tendency. They do so precisely because they are more epochal theoretical positions than they are historical descriptions. In following a certain Foucauldian line, one which programmatically distinguishes between a 'before' and an 'after', instituting an epochal break between singular power exercised via absolutist sovereignty and plural powers exercised via normalizing disciplines and techniques of conduct, these and other such analyses are simply trading on an ahistorical theoretical distinction which supposedly contrasts perfectly antithetical ways of exercising power. As such, they have little to say about the historical emergence of the state and its instituted purposes, and thus equally little to say about how and why the manner of the state's historical existence makes it unamenable to being reduced to theoretical abstractions such as the 'juridico-discursive' or 'governmentality'. Their epochal theoretical orientation and concomitant lack of historical contextualization effectively render them incapable of comprehending how the absolutist security state was and remains the default setting for the contemporary liberal-democratic state (Hunter, 2005).

Institutions KT Solve Anti-Blackness

the law is obviously problematic, but that's a reason we should hold it accountable to live up to its ideals

Crenshaw 88

(Kimberle, Law @ UCLA, "RACE, REFORM, AND RETRENCHMENT: TRANSFORMATION AND LEGITIMATION IN ANTIDISCRIMINATION LAW", 101 Harv. L. Rev. 1331, lexis)

Questioning the Transformative View: Some Doubts About Trashing The Critics' product is of limited utility to Blacks in its present form. The implications for Blacks of trashing liberal legal ideology are troubling, even though it may be proper to assail belief structures that obscure liberating possibilities. Trashing legal ideology seems to tell us repeatedly what has already been established -- that legal discourse is unstable and relatively indeterminate. Furthermore, trashing offers **no idea of how to avoid the negative consequences of engaging in reformist discourse** or how to work around such consequences. Even if we imagine the wrong world when we think in terms of legal discourse, **we must nevertheless exist in a present world** where legal protection has at times been a blessing -- albeit a mixed one. The fundamental problem is that, although Critics criticize law because it functions to legitimate existing institutional arrangements, it is precisely this legitimating function that has made law **receptive to** certain demands in this area. The Critical emphasis on deconstruction as the vehicle for liberation leads to the conclusion that engaging in legal discourse should be avoided because it reinforces not only the discourse itself but also the society and the world that it embodies. Yet Critics offer little beyond this observation. Their focus on delegitimating rights rhetoric seems to suggest that, once rights rhetoric has been discarded, there exists a more productive strategy for change, one which does not reinforce existing patterns of domination. Unfortunately, **no such strategy has yet been articulated**, and it is difficult to imagine that racial minorities will ever be able to discover one. As Frances Fox Piven and Richard Cloward point out in their [*1367] excellent account of the civil rights movement, popular struggles are a reflection of institutionally determined logic and a challenge to that logic. 137 **People can only demand change in ways that reflect the logic of the institutions that they are challenging**. 138 Demands for change that do not reflect the institutional logic -- that is, demands that do not engage and subsequently reinforce the dominant ideology -- will probably be **ineffective.** 139 The possibility for ideological change is created through the very process of legitimation, which is triggered by crisis. Powerless people can sometimes trigger such a crisis by challenging an institution internally, that is, by using its own logic against it. 140 Such crisis occurs when powerless people force open and politicize a contradiction between the dominant ideology and their reality. The political consequences [*1368] of maintaining the contradictions may sometimes force an adjustment -- an attempt to close the gap or to make things appear fair. 141 Yet, because the adjustment is triggered by the political consequences of the contradiction, circumstances will be adjusted only to the extent necessary to close the apparent contradiction. This approach to understanding legitimation and change is applicable to the civil rights movement. Because Blacks were challenging their exclusion from political society, the only claims that were likely to achieve recognition were those that reflected American society's institutional logic: legal rights ideology. Articulating their formal demands through legal rights ideology, civil rights protestors exposed a series of contradictions -- the most important being the promised privileges of American citizenship and the practice of absolute racial subordination. Rather than using the contradictions to suggest that American citizenship was itself illegitimate or false, civil rights protestors proceeded as if American citizenship were real, and demanded to exercise the "rights" that citizenship entailed. By seeking to restructure reality to reflect American mythology, Blacks relied upon and ultimately benefited from politically inspired efforts to resolve the contradictions by granting formal rights. Although it is the need to maintain legitimacy that presents powerless groups with the opportunity to wrest concessions from the dominant order, it is the very accomplishment of legitimacy that forecloses greater possibilities. In sum, the potential for change is both created and limited by legitimation. 139 The possibility for ideological change is created through the very process of legitimation, which is triggered by crisis. Powerless people can sometimes trigger such a crisis by challenging an institution internally, that is, by using its own logic against it. 140 Such crisis occurs when powerless people force open and politicize a contradiction between the dominant ideology and their reality. The political consequences [*1368] of maintaining the contradictions may sometimes force an adjustment -- an attempt to close the gap or to make things appear fair. 141 Yet, because the adjustment is triggered by the political consequences of the contradiction, circumstances will be adjusted only to the extent necessary to close the apparent contradiction. This approach to understanding legitimation and change is applicable to the civil rights movement. Because Blacks were challenging their exclusion from political society, the only claims that were likely to achieve recognition were those that reflected American society's institutional logic: legal rights ideology. Articulating their formal demands through legal

rights ideology, civil rights protestors exposed a series of contradictions -- the most important being the promised privileges of American citizenship and the practice of absolute racial subordination. Rather than using the contradictions to suggest that American citizenship was itself illegitimate or false, civil rights protestors proceeded as if American citizenship were real, and demanded to exercise the "rights" that citizenship entailed. By seeking to restructure reality to reflect American mythology, Blacks relied upon and ultimately benefited from politically inspired efforts to resolve the contradictions by granting formal rights. Although it is the need to maintain legitimacy that presents powerless groups with the opportunity to wrest concessions from the dominant order, it is the very accomplishment of legitimacy that forecloses greater possibilities. In sum, the potential for change is both created and limited by legitimation.

Movements Fail

Have to transform systems from the inside out-otherwise rhetoric changes but not policies.

McCormack 10

(Tara, PhD in International Relations from the University of Westminster, Critique, Security and Power: The political limits to emancipatory approaches, pg 59-61)

In chapter 7 I engaged with the human security framework and some of the problematic implications of 'emancipatory' security policy frameworks. In this chapter I argued that the shift away from the pluralist security framework and the elevation of cosmopolitan and emancipatory goals has served to enforce international power inequalities rather than lessen them. Weak or unstable states are subjected to greater international scrutiny and international institutions and other states have greater freedom to intervene, but the citizens of these states have no way of controlling or influencing these international institutions or powerful states. This shift away from the pluralist security framework has not challenged the status quo, which may help to explain why major international institutions and states can easily adopt a more cosmopolitan rhetoric in their security policies. As we have seen, the shift away from the pluralist security framework has entailed a shift towards a more openly hierarchical international system, in which states are differentiated according to, for example, their ability to provide human security for their citizens or their supposed democratic commitments. In this shift, the old pluralist international norms of (formal) international sovereign equality, non-intervention and 'blindness' to the content of a state are overturned. Instead, international institutions and states have more freedom to intervene in weak or unstable states in order to 'protect' and emancipate individuals globally. Critical and emancipatory security theorists argue that the goal of the emancipation of the individual means that security must be reconceptualised away from the state. As the domestic sphere is understood to be the sphere of insecurity and disorder, the international sphere represents greater emancipatory possibilities, as Tickner argues, 'if security is to start with the individual, its ties to state sovereignty must be severed' (1995: 189). For critical and emancipatory theorists there must be a shift towards a 'cosmopolitan' legal framework, for example Mary Kaldor (2001: 10), Martin Shaw (2003: 104) and Andrew Linklater (2005). For critical theorists, one of the fundamental problems with Realism is that it is unrealistic. Because it prioritises order and the existing status quo, Realism attempts to impose a particular security framework onto a complex world, ignoring the myriad threats to people emerging from their own governments and societies. Moreover, traditional international theory serves to obscure power relations and omits a study of why the system is as it is: [O]mitting myriad strands of power amounts to exaggerating the simplicity of the entire political system. Today's conventional portrait of international politics thus too often ends up looking like a Superman comic strip, whereas it probably should resemble a Jackson Pollock. (Enloe, 2002 [1996]: 189) Yet as I have argued, contemporary critical security theorists seem to show a marked lack of engagement with their problematic (whether the international security context, or the Yugoslav break-up and wars). Without concrete engagement and analysis, however, the critical project is undermined and critical theory becomes nothing more than a request that people behave in a nicer way to each other. Furthermore, whilst contemporary critical security theorists argue that they present a more realistic image of the world, through exposing power relations, for example, their lack of concrete analysis of the problematic considered renders them actually unable to engage with existing power structures and the way in which power is being exercised in the contemporary international system. For critical and emancipatory theorists the central place of the values of the theorist mean that it cannot fulfil its promise to critically engage with contemporary power relations and emancipatory possibilities. Values must be joined with engagement with the material circumstances of the time.

Institutional Focus Key

Institutional focus is necessary --- alt fails

Myers 13,

(Ella Assistant Professor of Political Science and Gender Studies at the University of Utah, 2013, Worldly Ethics: Democratic Politics and Care for the World, p. 44-45)

Unfortunately, Connolly is inconsistent in this regard, for he also positions Foucauldian self- artistry as an "essential preliminary to," and even the necessary "condition of," change at the macropolitical level.104 That is, although Connolly claims that micropolitics and political movements work "in tandem," each producing effects on the other,105 he sometimes privileges "action by the self on itself" as a starting point and necessary prelude to macropolitical change. This approach not only avoids the question of the genesis of such reflexive action and its possible harmful effects but also indicates that collective efforts to alter social conditions actually await proper techniques of the self. For example, in a rich discussion of criminal punishment in the United States, Connolly contends that "today the micropolitics of desire in the domain of criminal violence has become a condition for a macropolitics that reconfigures existing relations between class, race, crime and punishment."106 Here and elsewhere in Connolly's writing the sequencing renders these activities primary and secondary rather than mutually inspiring and reinforcing.107 It is a mistake to grant chronological primacy to ethical self-intervention, however. How, after all, is such intervention, credited with producing salient effects at the macropolitical level, going to get off the ground, so to speak, or assuredly move in the direction of democratic engagement (rather than withdrawal, for example) if it is not tethered, from the beginning, to public claims that direct attention to a specific problem, defined as publicly significant and changeable? How and why would an individual take up reflexive work on the desire to punish if she were not already attuned, at least partially, to problems afflicting current criminal punishment practices? And that attunement is fostered, crucially, by the macropolitical efforts of democratic actors who define a public matter of concern and elicit the attention of other citizens.108 For reflexive self- care to be democratically significant, it must be inspired by and continually connected to larger political mobilizations. Connolly sometimes acknowledges that the arts of the self he celebrates are not themselves the starting point of collaborative action but instead exist in a dynamic, reciprocal relation with cooperative and antagonistic efforts to shape collective arrangements. Yet the self's relation with itself is also treated as a privileged site, the very source of democratic spirit and action. This tendency to prioritize the self's reflexive relationship over other modes of relation defines the therapeutic ethics that ultimately emerges out of Foucault's and, to a lesser degree, Connolly's work. This ethics not only elides differences between caring for oneself and caring for conditions but also celebrates the former as primary or, as Foucault says, "ontologically prior." An ethics centered on the self's engagement with itself may have value, but it is not an ethics fit for democracy.

State k Change

Social movements end and resort to institutional bureaucratic agencies—empirics prove the only way for progressive change is through the state

Schneiberg and Lounsbury 07 (Marc Schneiberg, PhD University of Wisconsin, and Michael Lounsbury, Canada Research Chair in Entrepreneurship & Innovation Associate Dean of Research Univ. of Alberta, "Social Movements and Institutional Analysis", ph online @ http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.465.3710&rep=rep1&type=pdf)//akim

Schneiberg (2007; Schneiberg, King &¶ Smith 2008) takes this avenue of research a¶ step further in analyzing the development of¶ mutual, cooperative and publicly owned¶ enterprise in the US economy. For the most¶ part, populists and the radical anti-corporate¶ movements of the late nineteenth and early¶ twentieth centuries faced decisive defeats in¶ their efforts to forge alternatives to corporate¶ capitalism. But even though they collapsed,¶ these movements nevertheless left behind¶ organizational, cultural and institutional¶ legacies – bit and pieces of the paths they had¶ pursued, including theories of order, regulatory¶ fragments, local movement chapters, and¶ alternative systems of enterprise in key industries.¶ These legacies of previous mobilization,¶ in turn, served as legitimating structures, platforms¶ and infrastructures for subsequent collective¶ mobilization in the same or related¶ industries during the Progressive era, and¶ then in the early New Deal. Indeed, successive¶ waves of reformers and anti-corporate¶ forces built or transposed theories, moral sentiments¶ and cooperative forms out from insurance¶ and other early sites of alternative¶ enterprise into the dairy and grain industries,¶ the electrical utility industry and banking,¶ elaborating what amounts to a secondary path¶ of industrial order in the US economy.¶ Haveman, Rao and Paruchuri's (2007)¶ study of Progressivism and savings and loans¶ associations likewise highlights the distal¶ and often unintended effects of movements¶ on organizational fields. Progressive activists¶ quite deliberately and directly sought to¶ reform a variety of economic institutions,¶ from the railroads to savings and loan associations.¶ Yet they also fostered Progressive¶ models of rationality, **bureaucratization** and¶ **expert management within the thrift industry** indirectly, via two intermediary institutions.¶ Activists formed Progressive newspapers¶ that exposed corruption and promulgated¶ reform principles, and promoted city-manager¶ forms of municipal government that¶ exemplified those principles, providing tangible¶ analogies for reformers within the thrift¶ industry. Both institutions promoted the constitutive¶ legitimacy of bureaucracy, prompting¶ saving and loans associations to adopt¶ organizational forms more consistent with¶ 'modernist' moral sentiments.¶ Nor are these processes confined to economic¶ industries or organizational dynamics.¶ As Armstrong (2002, 2005) illustrates, the¶ legacy of initial movements may also include¶ the establishment of new identities, cultural¶ tools such as frames and logics, and 'creative¶ contexts' that enable subsequent groups to¶ continue struggles, mobilize and realize¶ new gains in their efforts. The rise of the¶ New Left in the 1960s enabled the creation¶ of new kinds of lesbian/gay organizational¶ identities in San Francisco in the early 1970s.¶ The development of gay identity politics, in¶ turn, proved crucial in structuring subsequent¶ lesbian/gay organizations as well as enabling¶ changes within mainstream organizations¶ such as the establishment of domestic partner¶ benefits (Creed & Scully 2000; Scully &¶ Creed 2005). While this work traces the¶ sequencing and layering from 'outsider' to¶ 'insider' movements, it would be interesting¶ to also understand how 'insider' movements¶ facilitate 'outsider' mobilizations.¶ Overall, the approach to movements and¶ **institutions** that we advocate **celebrates the¶ heterogeneity of actors, multiple logics and¶ practice variation**. A focus on such multiplicity¶ revises the isomorphic imagery of the¶ canonical two-stage diffusion and punctuated¶ equilibrium models (e.g., Tolbert & Zucker¶ 1983). Such a perspective concentrates less¶ on the contagion of unitary practices or a singular¶ rationality, but rather on multiple forms¶ of rationality that inform the decision making¶ of actors in fields (Bourdieu 1984), and provide¶ foundations for ongoing struggle and¶ contestation. This conceptualization of institutionalization¶ and fields as multiple, fragmented¶ and contested (Schneiberg & Soule¶ SOCIAL MOVEMENTS AND INSTITUTIONAL ANALYSIS 665¶ 9781412931236-Ch27 11/22/07 7:09 PM Page 665¶ 2005; Washington & Ventresca 2004;¶ Lounsbury 2007) is a crucial ontological¶ starting point for a new wave and generation¶ of institutional scholars. And when combined¶ with a renewed attention to movements, it¶ directs analytical attention to how historical¶ legacies of prior social action

become embedded in existing fields, providing bases for sequences of mobilization, and the construction of new paths from the elements or ruins of old or forgotten orders. The early work in this direction has proven fruitful and promises to propel institutional analysis for many years to come.

The alt fails and locks in the status quo approach to surveillance ---the embrace of <contingency, radical democracy, alterity> discounts the role of political institutions in modern life and reduces politics to an individualistic project of ethical self-improvement and becoming

Lavin 6

(Chad, teaches political theory at Tulane University, Fear, Radical Democracy, and Ontological Methadone, Polity (2006) 38, 254-275

While liberalism exhorts us to take comfort in the promises and assurances of a fixed identity, radical democracy suggests revealing this identity for the reification that it is so that we can move beyond a tolerant modus vivendi and toward an ethical comportment of generosity and meaningful democracy. They prescribe, as a cure for postmodern agency panic, an enthusiastic embrace of the contingency of everyday life, a series of practices of the self that force an examination of the existential resentment felt by subjects of liberal capitalism: Don't adhere to a manufactured map! Learn to be at home in homelessness! The problem of fear, they suggest, resides in a dogmatic clinging to an untenable and disintegrating myth of subjectivity with an unrealizable promise of control. Their response to the fear of homelessness runs directly counter to the conspiracy theorist: with a model of contingency rather than conspiracy, there are no villains, thus no reservoir for depositing and segregating one's fear. Rather than depositing this fear at the feet of a scapegoat, face it; overcome it. ¶ While challenging the liberal fetish for reifying a historical production and thus closing the door on possibilities for alternative subjects to emerge, radical democrats also acknowledge the work done by liberalism to remove metaphysical obstacles to the expression of agency. As such, their claim is not antiliberal so much as it is postliberal, interrogating the limits of the liberal subject in pursuit of a more open approach to identity and difference. For the identities and attachments that have been forged through liberalism are anything but fetters to the unhindered exercise of democracy and production of difference. They are not only productive of many of the freedoms that we enjoy today in the liberal world (e.g., civil rights and liberties, relative government accountability), they also offer valuable solace from a hostile and increasingly unpredictable existence. But because the prescription for those suffering from agency panic tends to be found in the capitalist myths of merit, autonomy, and authenticity, we might look at liberalism as the opiate of the people, easing our pain, but preventing us from doing the work necessary to attend to the source of our ills. Perhaps liberalism, then, for all its value and appeal, is a habit we need to kick. **Radical democrats recommend sobering up and facing our fears head-on. But where's the Betty Ford Center for radical democracy?** ¶ If the fundamentalist drive to reify assumptions and the democratic drive to challenge them are two responses to the same panic that results from social pluralization (as Connolly convincingly claims), the question remains: why do some subjects flee from this fear (through fundamentalism), while others draw from it strength and forbearance (through radical democracy)? What resources allow some subjects to respond to revealed inadequacies of their foundational beliefs with a gracious humility while others respond by desperately clinging to and fundamentalizing the contested position? ¶ The short answer is that the democratic move is not an easy one to make. While liberal cognitive maps respond to the complexity of contemporary power networks with a promise of predictability and stability through the claims to fixed identity, rational control, and market efficiency, radical democracy promises precisely what subjects of liberalism fear: enduring instability. The ethos of forbearance asks subjects not only to accept social and political instability today, but ontological instability forever after (whereas the fundamentalizing moves promise order not only in the future, but now). By introducing contingency into the very substance of being, this approach leaves us in indeterminacy without even a promise of finding answers; it is "tentative, experimental," emphasizing the need for perpetual work of "cultivation" without the promise of attaining a stable system;41 it is "a risky and ambiguous enterprise" always threatening to destroy self-confidence as soon as it is built;42 it offers "no necessary political consequences," but only possible gains in freedom.43 ¶ Going back to Hobbes, radical democrats suggest that we should embrace rather than run from or even merely tolerate the very conditions we fear: unknowability, instability, and discord. Further, Connolly and Butler insinuate unmistakably that liberal authenticity has been thoroughly debunked, still adhered to only by potential or actual fascists who (at best) have been thoroughly colonized by the culture industry and the ideological apparatuses of the state or (at worst) have no sympathy for the contemporary movements interested in expanding the democratic web to include currently disenfranchised populations. They thus imply that it is the social critic who bears the mantle of democracy, and that it is not fear but a stubborn authoritarian desire that

obliges resistors to slap the table to illustrate its non-discursiveness and pound their chests to prove their individuated, corporeal, nonporous existence. (A spectre is haunting criticism—the spectre of Leninism.) We can almost hear radical democrats responding that liberal individualists have nothing to lose but their chains.¶ But if the reigning paradigms of identity and order offer solace from an increasingly indeterminate and unpredictable world (complete with massive layoffs, abandonment of traditional gender norms, declining national sovereignty, and other existential disintegrations), then by what standard can radical democrats call upon the subjects of liberal capitalism to reject the myths that make lives livable? These calls might be the ontological counterpart of ham-fisted approaches to drug abuse, exhorting addicts to take responsibility for themselves and quit cold turkey, with little attention to the social and psychological dynamics that lead millions of users to abuse narcotics, hallucinogens, opiates, and amphetamines—be they consumers of heroin, religious fervor, Xanax, or extreme corn chips and suburban assault vehicles.¶ The sales pitch for radical democracy rarely accounts for the degree to which citizens are interpellated as subjects of fear. Connolly is more than aware of the interpellations that subjects of capitalism receive; large sections of The Ethos of Pluralization are dedicated to the relationship between economic anxiety and the drive to fundamentalism, and Why I Am Not a Secularist is largely an indictment of secularism (and much of American liberalism) for failing to account for the habits inscribed on the body that rational argumentation cannot erase.44 His attention to what he calls "the visceral register," and his recommendation that the left take a lesson from William Bennett on how to appeal to this register is both compelling and timely.45 Unfortunately, Connolly's intellectual trajectory has shifted away from the social and political apparatuses which inculcate these habits and toward the level of neurology to explain the inward mechanisms of habits and ethics;46 while he never denies the relevance of social and political institutions (he merely argues that "too many cultural theorists" ignore the biological components of thinking and ethics), his trajectory has led him to speak more about what practices of the self might lead to more democracy and less about the institutional production of subjects who actually fear democracy.47 As White convincingly argued well before this latest turn toward biological studies, Connolly takes attitudes to have primacy over issues of justice, leading him to prematurely curtail pursuit of the obviously compatible institutional dimension of criticism.48¶ The common scoundrel in such critiques of liberalism, the prototypical antidemocratic citizen, is typified by Archie Bunker and his white working-class buddies. Resentful, socially and economically conservative, and easily seduced by reactionary propagandists, this was the face of fundamentalism before 9/11. Notably, this is a population whose economic viability and (therefore) ability to live up to conventional norms of masculinity have been taking it in the gut in recent decades. Identifying the threats that have constituted this subject, Connolly notes the familiar targets: civil rights, Vietnam, feminism, dismantling of the welfare state, environmentalism, and a decline in the availability of industrial jobs.49 Along with these transformations in established relations of power, we can also add to this list (which Connolly may or may not have intended to be exhaustive) the supposed death of grand narratives declared by critical intellectuals. Traditional cognitive maps are not only becoming obsolete in the wake of shifting terrain, but they are being criticized for being defective from the get-go. Given this, is the rise in public fear a surprise? As Jameson's, Melley's, and Furedi's attention to the paucity of concepts suggests, isn't the declining availability of cognitive maps to those threatened by shifting networks of power a prime candidate for Connolly's list?50¶ If fundamentalisms feed on the anxieties endemic to late capitalist (dis)order; if market ideology, conspiracy theories, and aggressive nostalgia are degraded attempts to construct cognitive maps that might provide threatened subjects with a sense of agency; what does radical democracy offer in their stead? Traditional fundamentalisms are popular precisely because they treat the agency panic and existential angst accelerated by global capitalism and postmodern culture. Again, Connolly recognizes the absence of viable democratic supplements to the decline of grand narratives, and he laments that the world's most zealous moralizers have effectively filled that void. But claims that rethinking liberalism's ontological commitments cannot be an afterthought of political emancipation (but must be coterminous with or preliminary to it), betray an inattention to how a postmodern ethos is intimately tied to the various psychological, economic, and political securities that cognitive maps often provide. While Connolly's diagnosis of fundamentalist epidemics clearly highlights their social and economic roots, he presents a postmodern sensibility as a treatment for the anxieties of identity without considering the role that this move may have played in actually producing those anxieties by threatening the cherished existence of those perhaps most in need of their help.51 My concern is not the diagnosis, but the prescription, as it is for a regimen that few have any interest in adopting.¶ Radical democracy is premised on the idea that its ontology and ethics are necessary to an enactment of the pluralism that liberalism purports to offer, transcending mere tolerance toward a generous fostering of otherness and a meaningfully democratic way of life. At the same time, however, it is insensitive to the profound threat that genealogy poses to those who receive their only respite from a

truly tenuous existence from their myths. While its pitch suggests that it is ontologically more defensible, ethically more admirable, and practically more conducive to a generous ethical-political comportment (contentions with which I agree, incidentally), it does not consider the sheer difficulty (and often terror) in adopting such a position. Certainly, it does not speak to the members of society who are the most economically, politically, and/or socially disadvantaged, whose daily survival is so tenuous as to not provide the luxury for the practices of self-cultivation which it advocates.¶ I am far from the first to call attention to the dangers of and aversions to genealogy. The aristocratic baggage of Nietzscheanism, from which radical democrats have vigorously sought to distance themselves, stems largely from Nietzsche's acknowledgement of the difficulties of abandoning foundations. No friend of pity, Nietzsche nevertheless prescribes revaluing our constitutive values only to a privileged class, maintaining that we cannot ask lambs to be birds of prey.52 Similarly, William James discusses the differential capacities of modern subjects to be at home in homelessness, expressing concern for those who might not be ready or able to make such a move. He argues (with unfortunate terminology) that the "healthy" has a responsibility to attend to the "sick" soul, and that some are not ready, willing, or able to abandon their most cherished myths: "Some constitutions need them too much."53 Returning to our liberal fundamentalist, Rorty emphasizes that "most people" are not interested in facing the contingency of their identities, and that "there is something very cruel about" revealing their contestability and groundlessness.54¶ While these arguably elitist arguments might sit uncomfortably with the radically democratic impulses of Connolly and Butler, which is more democratic: Throwing everybody into the same pool? Or realizing that not everybody knows how to swim? Or realizing that some citizens, having seen their parents devoured by sharks, might think the waters unsafe? Connolly reads Rorty's courteous capitulation to fear as an abandonment of irony precisely where it is most important. Whereas Rorty coddles subjects of fear, Connolly scolds them for their cowardice.55¶ I do not mean to suggest that consistency would oblige radical democrats to respect discourses hostile to pluralization (Connolly addresses this issue repeatedly). Nor do I want to imply that we should refrain from attacking the antidemocratic presumptions of various fundamentalisms. But I am concerned that the approach to fundamentalism in this literature is something much closer to hostility than sympathy (to say nothing of empathy). For all of its talk of generosity, radical democracy remains quite stingy with regard to this issue. Accepting that there remains a compatibility between foundational thought and undemocratic or authoritarian politics, the apparent expectation that the articulation of this compatibility might convince any lingering fundamentalists of their error **is distressing**. In fact, Connolly effectively labels those lacking in the material, philosophical, or psychological resources necessary for the move he recommends latent brownshirts, thus betraying not only a commitment to liberal voluntarism, but also a striking lack of generosity toward those still in need of comforting maps.56¶ Radical democrats clearly recognize the material conditions that may not provide the comfort necessary to develop an ethos of generosity. As diagnosticians, they are certainly attuned to the tactics applied by institutions (markets, ideologies, militaries) to subjects and the constant interpellation of subjects of fear. Nevertheless, the prescribed micropolitics of desire summons a heroic capacity to respond generously to the myriad threats we encounter. Recommending that subjects abandon the cognitive maps (Christianity, conspiracy theories, market fundamentalism) that allow them to find their bearings in increasingly complicated and vast networks of power, they ultimately reduce liberal fundamentalism to a problem of individual priorities and ethical failures rather than a medical condition requiring professional treatment or (better) a **public health issue** not easily or appropriately tied to any individual's preferences. **As in contemporary U.S. drug policy** rhetoric, **the addiction is all-too-easily reduced to an issue of personal responsibility, taking focus away from the institutions** responsible for the daily interpellation of subjects of fear.¶ Conclusion¶ Despite a relatively mature Constitution, Americans are no strangers to instability. In recent decades, the assurances of job security and the welfare state have fallen victim to a vicious market ideology; traditional codes of masculinity and femininity have become increasingly unrealizable with Martha Stewart and J. Lo doing their best to humiliate the ladies, Bill Gates and Vin Diesel the gentlemen; and illusions of effective agency have been ravaged by unprecedented technological and geopolitical transformations. In this condition, though radical democrats denounce the comforting liberal myth of the autonomous individual as a ruse of antidemocratic power, its ideology of identity, authenticity, and responsibility provides relief from the ontological homelessness endemic to a world with ever fewer uncontested narratives. Liberalism allows us to personalize and segregate various anonymous hostilities, facilitating displacements of general anxieties onto welfare moms, homosexual teachers, professional women, non-white street criminals, Zionist Occupied Governments, and Islamic fundamentalists.¶ While the reactionary grasp at liberal fundamentalism certainly constitutes an obstacle to a democratic politics of difference, it is also the case that subjects of late capitalism are interpellated as subjects of fear, reared to understand every component of society with suspicion. Navigating the breathtaking and impersonal forces of bureaucratic capitalism with categories which emphasize (indeed, almost exclusively mention) the powers of isolated individuals, we are led to an ever more hopeless situation. As history moves on and our cognitive maps seem less and less relevant for helping us chart networks of power, we feel an overwhelming sense of powerlessness. The ideology of autonomy, authenticity, and responsibility seems an entirely logical aid for coping with this agency panic. Indeed, liberalism both creates and then assuages the fears of late capitalism.¶ In this age of Panic, in which our surroundings appear at least comparably if not more alive and efficacious than our selves, radical democrats trenchantly reveal liberal ideology as an addictive and distorting source of relief. But in prescribing a micropolitics of desire to kickstart the stalled project of

democratization, they locate the work of politics in the contested site of the individual and discount the degree to which these individuals actually fear the unpredictable and radically democratic order being promised. Contesting the validity of the cognitive maps most commonly used to steer a course through institutions of social and political power, they ask subjects to abandon the anesthetizing components of liberal fundamentalism for a world composed of unstable identities and provisional reconciliations that are grounded in a set of ontological commitments that are weak at best. But as all but the most steadfast purveyors of simplification in the so-called war on drugs realize, addiction is inscribed on the body, and requires both desire and treatment to be overcome. Radical democrats realize why we are identity junkies. But where, oh where, are the ontological treatment centers and methadone clinics?

Psychoanalysis

2AC Psycho Bad

Psychoanalysis is not empirical and has no explanatory power --- prefer social science because it can explain events based on causal relationships

Sadovnikov 7

(Slava York University, "Escape from Reason: Labels as Arguments and Theories", Dialogue XLVI (2007), 781-796, philpapers.org/archive/SADEFR.pdf)

The way McLaughlin shows the rosy prospects of psychoanalytical social theory boils down to this: there are people who labour at it. He reports on Neil Smelser's lifelong elaborations of psychoanalytical sociology, which prescribed the use of Freudian theories. Then he presents a "powerful" psychoanalytical theory of creativity of Michael Farrell, commenting on how the theorist "usefully utilizes psychoanalytic insights," though McLaughlin does not specify them. He correctly expects that I might not view his examples as scientific. Their problems begin well before that. First, due to their **informative emptiness, or tautological character**, all they amount to is rewordings of everyday assumptions. Second, due to their vagueness these accounts are compatible with any outcomes; in other words, **they lack explanatory and predictive power**. The proposed ideas are too inarticulate to subject to intersubjective criticism, and **to call them empirical or scientific** theories **would be**, no **matter how comforting, a gross misuse of words.** ¶ On the constructive side, a psychoanalytic theorist may be challenged to unambiguously formulate her suppositions and specify conditions of their disproof, to leave out what we already well know and smooth out internal inconsistencies, and revise the theories in view of easily available counter-examples and competing accounts. Only after having done this can one present candidate theories to public criticism and thus make them part of science, and fruitfully discuss their further refinements. Another suggestion is not to label them "powerful theories," "classics," or anything else before their real scrutiny begins. ¶ That criticism and disagreement are indispensable for **science is not a "Popperian orthodoxy**," although Popper does champion this idea; it is the pivot of the tradition (which we owe to the Greeks) which identifies rationalism with criticism. 4 McLaughlin ostensibly bows to the critical tradition but does not put it to use. Instead of critical evaluation of the theories in question he writes of "compelling case," "powerful analytic model," and "useful conceptual tool." ¶ On the methodological side of the issue, we should inquire into the mode of thinking common to Fromm and all adherents of confirmation-ism. The trick consists in mere replacement of familiar words with new, more peculiar ones; customary expressions are substituted by "instrumental intimacy," "collaborative circles," and "idealization of a self-object." Since the new, funnier, and pseudo-theoretical tag does the job of naming just as well, it "shows how" things work. The new labels in the cases criticized here do not add anything to our knowledge; nor do they explain. We have seen Fromm routinely abuse this technique. The vacuity of Fromm's explanations by character type was the central point in my analysis of Escape , yet McLaughlin conveniently ignores it and, like Fromm, uses the method of labelling as somehow supporting his cause. ¶ The widely popular practice of mistaking new labels for explanations has been exposed by many methodologists in the history of philosophy, but probably the most famous example of such critique comes from Molière. In the now often-quoted passage, his character delivers a vacuous explanation of opium's property to induce sleep by renaming the property with an offhand Latinism, "virtus dormitiva." The satire acutely points not only at the impostor doctor's hiding his lack of knowledge behind foreign words, but also at the emptiness of his alleged explanation. (Pseudo-theoretical literature is boring precisely because of its "dormitive virtue," its shuffling of labels without rewarding inquiring minds.) ¶ Let me review notable criticisms of this approach in the twentieth century by Hempel, Homans, and Weber leaving aside their forerunners. This problem was discussed in the famous debate between William Dray and Carl Hempel. Dray argues, contra the nomological account of explanation, that historians and social scientists often try to answer the question, "What is this phenomenon?" by giving an "explanation-by-concept" (Dray 1959, p. 403). A series of events may be better understood if we call it "a social revolution"; or the appropriate tag may be found in the expressions "reform," "collaboration," "class struggle," "progress," etc.; or, to take Fromm's suggestions, we may call familiar motives and actions "sadomasochistic," and any political choice save the Marxist "escape from freedom."¶ Hempel agrees with Dray that such concepts may be explanatory, but they are so only if the chosen labels or classificatory tags refer to some uniformities, or are based on nomic analogies. In other words, our new label has explanatory force if it states or implies some established regularity (Hempel 1970, pp. 453-57). For example, you travel to a foreign country and, strolling along the street, see a boisterous crowd. Your guide may explain the crowd with one of several terms: that it is the local soccer team's fans celebrating its victory, or it is a local religious festival, or a teachers' strike, etc. The labels applied here—celebration, festival, strike— have explanatory value, because we know that things they refer to usually manifest themselves in noisy or unruly

mass gatherings.¶ If, on the other hand, by way of explaining the boisterous crowd the guide had invoked some hidden social or psychological forces, or used expressions such as embodiment, mode of production, de-centring, simulacra, otherness, etc., its causes would remain obscure. If she had referred to psychoanalytic "character types" (say, Fromm's authoritarian, anal, or necrophiliac types), the explanation would not make much sense either. Nothing prevents us nevertheless from unconditionally attaching all these labels to any event. The mistake McLaughlin and confirmationists persistently make is in thinking that labelling social phenomena alone does theoretical and explanatory work. 5 George Homans observed the prevalence of this trick some decades ago:¶ Much modern sociological theory seems to us to possess every virtue except that of explaining anything. … The theorist shoves various aspects of behavior into his pigeonholes, cries "Ah-ha!" and leaves it at that. Like magicians in all times and places, the theorist thinks he controls phenomena if he is able to give them names, particularly names of his own invention. (1974, pp. 10-11)

Non-Falsifiable

Do not let them shield their criticism with unfalsifiablity - sidelines truth and makes it impossible to debate - research proves

Kay et al 15

(Justin P. Friesen [Ph.D in Psychology at The University of Winnipeg] Troy H. Campbell [Ph.D student at Duke University and in Fall 2015 a professor at the University of Oregon] Aaron C. Kay [Associate Professor of Management and Associate Professor of Psychology & Neuroscience at Duke University], 2015, "The Psychological Advantage of Unfalsifiability: The Appeal of Untestable Religious and Political Ideologies, " Journal of Personality and Social Psychology, Vol. 108, No. 3, http://dx.doi.org/10.1037/pspp0000018, Pages 524-525, MX)

We conclude with a discussion of the macro social effects of unfalsifiability on belief, particularly how unfalsifiability may lead to polarization and intractability at a societal level and how people may actively wish to remove science from the discussion in an order to give their cherished beliefs an armor of unfalsifiability. Experiment 4 in particular may resonate with anyone who has watched cable news and seen a pundit tell a scientist that the data is just the scientist's "opinion" and immediately turn a conversation of objective metrics into a conversation of "beliefs." It seems as if people are motivated not only to deny isolated scientific findings but reduce the role of scientific inquiry in answering important social questions as doing so shields one's own beliefs in an armor of unfalsifiability. For example, 2012 Republican vicepresidential candidate Paul Ryan said: "Even if Washington could be good at picking winners and losers—which they're not—they shouldn't be in the business of picking winners and losers. That's not the role of government." (Stewart, 2012) Ryan believes the facts are on his side, but should he turn out to be wrong, he has already preemptively couched the issue of limited government as unfalsifiable moral principle instead of the more falsifiable question of government effectiveness. It seems increasingly difficult to have rational discussion in the polarized political climate (DiMaggio, Evans, & Bryson, 1996). The current research suggests that this difficulty may be, at least in part, because people's beliefs are not based on falsifiable statements. Moreover, if including unfalsifiability is one defensive response to threat, popular beliefs systems may evolve to include more aspects of unfalsifiability over time, such as by marginalizing the relevance of science if they suspect that science does not support their beliefs. To the extent that scientific inquiry is the best method to test hypotheses and falsify beliefs, people who have salient psychological needs, other than needs for accuracy, may progressively distance their beliefs from science and the corresponding social discourse. Scientists must be aware of such tendencies and see that even flawless and clearly communicated science may not convince people because people often have a powerful trump card hidden up their sleeve: unfalsifiability. Our findings also have applied applications for the communication of science, and future research should take into account the defensive functions of unfalsifiability. For instance when unfalsifiability is most likely to be incorporated, under what mindsets people will permit themselves to hold falsifiable beliefs, how does temporary versus ultimate unfalsifiability influence beliefs, and how unfalsifiability might feel uncomfortable. These results and speculations suggest that unfalsifiability may be a dangerous force in society at large. Though it might benefit individuals psychologically or groups socially, unfalsifiability might also lead people and societies to continually make truthdefying decisions. To the extent that the success of a society largely depends on its ability to respect good data and change behavior accordingly (Sheikh, 2013), a devotion not just to ideas but to testing those ideas is necessary for the welfare and improvement of the society. Understanding the appeal of unfalsifiability is therefore an important question for a world that seems, on the one hand, actively interested in testable scientific data as evidenced by recent reforms in the United States to evidence-based policy (Baron, 2012; Borstein, 2012) but, on the other hand, at times seems to wish to remove the data from the discussion. This puzzle must be solved if evidence-based policy is to win out.

Robinson

Lacanianism relies on a prior assumptions and functions at the ontological rather than the political- it's use of universals obfuscates the fact that it's neither original nor applicable

Robinson 4

(Andrew Robinson [Postgraduate Student, School of Politics, University of Nottingham], 2004, "The Politics of Lack," British Journal of Politics & International Relations, Volume 6, Pages 260-262, MX)

For Lacanians, the return of the Real is always a disruptive, almost revolutionary event which shatters the entire social totality constructed around its exclusion. Every social order, therefore, has a single touchy 'nodal point' which it must maintain, or else it will collapse. Since the exclusion of a Real element is supposed to be necessary, Lacanians urge that one reconcile oneself to the inevitability of lack. Lacanian politics is therefore about coming to terms with violence, exclusion and antagonism, not about resolving or removing these. The acceptance of lack takes the form of an Act or Event, in which the myth of subjective completeness is rejected and the incompleteness of the self is embraced. The primary ethical imperative in Lacanian politics is to 'accept' the primacy of antagonism, i.e. the central ontological claim of the Lacanian edifice itself. Mouffe, for instance, demands that one accept 'an element of hostility among human beings' as something akin to a fact of human nature (2000, 130–132). She attacks deconstructive and dialogical approaches to ethics for being 'unable to come to terms with "the political" in its antagonistic dimension'. Such approaches lack 'a proper reflection on the moment of "decision" which characterises the field of politics' and which necessarily 'entail[s] an element of force and violence' (ibid., 129–130). Mouffe's alternative involves a politics which 'acknowledges the real nature of [the] frontiers [of the social] and the forms of exclusion that they entail instead of trying to disguise them under the veil of rationality or morality' (ibid., 105). She celebrates democracy, but her version of democracy depends on 'the possibility of drawing a frontier between "us" and "them" ' and 'always entails relations of inclusion–exclusion' (ibid., 43). The derivation of such views is unclear from the text, but seems to be that, since everyone needs a master-signifier as an element in their psyche, and since such a signifier arises through the machinations of 'the political', therefore the exclusionary and violent operations of coercive state apparatuses must be accepted as an absolute necessity for any kind of social life. This is Hobbesian statism updated for a post-modern era. As should by now be clear, the central claims of Lacanian theory are ontological rather than political. Indeed, since Lacan's work deals with politics only very occasionally, the entire project of using Lacan politically is fraught with hazards. With rare exceptions, Lacanian theorists put ontology in the driving seat, allowing it to guide their political theorising. Political discourse and events are subsumed into a prior theoretical framework in a manner more reminiscent of an attempt to confirm already-accepted assumptions than of an attempt to assess the theory itself. Among the authors discussed here, i ek takes this the furthest: the stuff of theory is 'notions', which have a reality above and beyond any referent, so that, if reality does not conform to the notions, it is 'so much the worse for reality' (in Butler, Laclau and i ek 2000, 244). The selection and interpretation of examples, whether in concrete analysis of political discourse or in theoretical exegesis, is often selective in a way which appears to confirm the general theory only because inconvenient counterexamples are ignored. The entire edifice often appears wholly a priori and non-falsifiable, and the case for its acceptance is extremely vague. Most often, the imperative to adopt a Lacanian as opposed to (say) a Rawlsian or an orthodox Marxist approach is couched in terms of dogmatically-posited demands that one accept the idea of constitutive lack. A failure to do so is simply denounced as 'shirking', 'blindness', 'inability to accept' and so on. In this way, Lacanian theory renders itself almost immune to analytical critique on terms it would find acceptable. Furthermore, a slippage frequently emerges between the external 'acceptance' of antagonism and its subjective encouragement. For instance, Ernesto Laclau calls for a 'symbolisation of impossibility as such as a positive value' (in Butler, Laclau and i ek 2000, 1999, original emphasis). The differences between the texts under review mainly arise around the issue of how to articulate Lacanian themes into a concrete political discourse. This becomes especially clear in the Butler, Laclau and i ek volume from which the above quotation is taken. Laclau and i ek share a theoretical vocabulary and agree on a number of issues of basic ontology. However, they both—and each in an equally dogmatic way—insist on a particular decontestation of this vocabulary in their analysis of contemporary events. For Laclau, Lacanian analysis dovetails with 'radical democracy', whereas for i ek, it entails a radical refusal of the status quo from a standpoint cross-fertilised with insights from Hegel, Kant and the Marxist tradition. This disagreement represents a broader split of Lacanian theorists into two camps: radical democrats' who follow Laclau's line that liberal democracy is a realisation of the Lacanian model through the acceptance of antagonism and its conversion into symbolically accepted electoral and interest-group competition, and more-or-less nihilistic Lacanians such as i ek and Badiou who maintain that a Lacanian politics requires a radical break with the present political system. Butler, for her part, is not sufficiently committed to an ontology of lack to accept the other protagonists' inability to provide substantial argumentation for their positions. She calls Lacanian theory a 'theoretical fetish', because the 'theory is applied to its examples', as if 'already true, prior to its exemplification'. Articulated on its own self-sufficiency, it shifts its basis to concrete matters only for pedagogical purposes (in Butler, Laclau and i ek 2000, 26–27). She suggests, quite accurately, that the Lacanian project is in a certain sense 'a theological project', and that its heavy reliance on a priori assumptions impedes its ability to engage with practical political issues, using simplification and a priori reasoning to 'avoid the rather messy psychic and social entanglement' involved in studying specific political cases (ibid., 155–156). She could perhaps have added that, in practice, the switch between ontology and politics is usually accomplished by the transmutation of single instances into universal facts by means of a liberal deployment of words such as 'always', 'all', 'never' and 'necessity'; it is by this specific discursive move that the short-circuit between 'theology' and politics is achieved. Butler questions the political motivations involved in such practices. 'Are we using the categories to understand the phenomena, or marshalling the phenomena to shore up the categories "in the name of the father" [i.e. the master-signifier]?' (ibid., 152). The problems raised by Butler are serious, and reflect a deeper malaise. Aside from the absence of any significant support for their basic ontological claims, the two Lacanian camps both face enormous problems once they attempt to specify their political agendas. For the Laclauians, the greatest difficulty is that of maintaining a 'critical' position even while endorsing assumptions

remarkably close to those of the analytical-liberal mainstream. The claim that liberal democracy is necessary to take the bite out of intractable conflicts arising from human nature, and the resultant condemnation of 'utopian' theories such as Marxism for ungrounded optimism and resultant totalitarian dangers, is hardly original. To take one example, it arises in Rawls' discussion of 'reasonable pluralism' and the 'burdens of difference' in Political Liberalism (1996, Lecture 2 and passim). Since much of the appeal of Lacanian theory depends on its claims to be offering a new, radical approach to politics, such similarities must be downplayed.

AT: Lack

Desire does not lack - their conception ignores the reality that need is a product of desire - turns the criticism because only desire can solve

Deluze and Guatarri 72

(Gilles Deleuze [French philosopher], Félix Guattari [French psychiatrist and political activist], 1972, Anti - Oedipus: Capitalism and Schizophrenia, Translated from the French by Robert Hurley, Mark Seem, and Helen R. Lane, Pages 26-28, MX)

If desire produces, its product is real. If desire is productive, it can be productive only in the real world and can produce only reality. Desire is the set of passive synthes s that engineer partial objects, flows, and bodies, and that function as units of production. The real is the end product, the result of the passive syntheses of desire as autoproduction of the unconscious. Desire does not lack anything; it does not lack its object. It is, rather, the subject that is missing in desire, or desire that lacks a fixed subject; there is no fixed subject unless there is repression. Desire and its object are one and the same thing: the machine, as a machine of a machine. Desire is a machine, and the object of desire is another machine connected to it. Hence the product is something removed or deducted from the process of producing: between the act of producing and the product, something becomes detached, thus giving the vagabond, nomad subject a residuum. The objective being of desire is the Real in and of itself.* There is no particular form of existence that can be labeled "psychic reality." As Marx notes, what exists in fact is not lack, but passion, as a "natural and sensuous object." Desire is not bolstered by needs, but rather the contrary; needs are derived from desire: they are counterproducts within the real that desire produces. Lack is a countereffect of desire; it is deposited, distributed, vacuolized within a real that is natural and social. Desire always remains in close touch with the conditions of objective existence; it embraces them and follows them, shifts when they shift, and does not outlive them. For that reason it so often becomes the desire to die, whereas need is a measure of the withdrawal of a subject that has lost its desire at the same time that it loses the passive syntheses of these conditions. This is precisely the significance of need as a search in a void: hunting about, trying to capture or become a parasite of passive syntheses in whatever vague world they may happen to exist in. It is no use saying: We are not green plants; we have long since been unable to synthesize chlorophyll, so it's necessary to eat. . . . Desire then becomes this abject fear of lacking something. But it should be noted that this is not a phrase uttered by the poor or the dispossessed. On the contrary, such people know that they are close to grass, almost akin to it, and that desire "needs" very few things—not those leftovers that chance to come their way, but the very things that are continually taken from them—and that what is missing is not things a subject feels the lack of somewhere deep down inside himself, but rather the objectivity of man, the objective being of man, for whom to desire is to produce, to produce within the realm of the real. The real is not impossible; on the contrary, within the real everything is possible, everything becomes possible. Desire does not express a molar lack within the subject; rather, the molar organization deprives desire of its objective being. Revolutionaries, artists, and seers are content to be objective, merely objective: they know that desire clasps life in its powerfully productive embrace, and reproduces it in a way that is all the more intense because it has few needs. And never mind those who believe that this is very easy to say, or that it is the sort of idea to be found in books. "From the little reading I had done I had observed that the men who were most in life, who were moulding life, who were life itself, ate little, slept little, owned little or nothing. They had no illusions about duty, or the perpetuation of their kith and kin, or the preservation of the State. . . . The phantasmal world is the world which has never been fully conquered over. It is the world of the past, never of the future. To move forward clinging to the past is like dragging a ball and chain."30 The true visionary is a Spinoza in the garb of a Neapolitan revolutionary. We know very well where lack—and its subjective correlative—come from. Lack (manque)* is created, planned, and organized in and through social production. It is counterproduced as a result of the pressure of antiproduction;the latter falls back on (serab at sur) the forces of production and appropriates them. It is never primary; production is never organized on the basis of a pre-existing need or lack (manque). It is lack that infiltrates itself, creates empty spaces or vacuoles, and propagates itself in accordance with the organization of an already existing organization of production. The deliberate creation of lack as a function of market economy is the art of a dominant class. This involves deliberately organizing wants and needs (manque) amid an abundance of production; making all of desire teeter and fall victim to the great fear of not having one's needs satisfied; and making the object dependent upon a real production that is supposedly exterior to desire (the demands of rationality), while at the same time the production of desire is categorized as fantasy and nothing but fantasy.

Perm/No Link Stuff

Permutation

Permutation do the Alternative - Severing the 1AC allows us to pass from attachment to detachment thus reclaiming our identities as Lacanian subjects and re-instituting desire

Scott 15

(Maria Scott [PhD in French at Trinity College Dublin], 2015, "Deciphering the Gaze in Lacan's "Of the gaze as objet petit a"'," DS Project, MX)

The always renewed re-institution of desire is at the core of Lacanian ethics. In order to renew one's desire, it is necessary first to fall sway to the drive. In Seminar XI, the satisfaction of the drive's requirements, as for example in the viewing of art, becomes the ethical goal of analysis. After the seminars on the gaze, the object a appears in Seminar XI as the libido or genital drive. This 'pure life instinct' is the 'organ' from which the subject separates in order to exist in society. Because this instinct is 'irrepressible,' however, the subject must renew continually her detachment from the libido, so as neither to revert to an undetermined 'hommelette,' nor to become frozen as a signifier. The subject is truly itself, according to Lacan, only in the passage from attachment to detachment: 'The subject is this emergence which, just before, as subject, was nothing, but which, having scarcely appeared, solidifies into a signifier.' The Lacanian subject has, therefore, 'no other being than as a breach in discourse' and 'manifests itself in daily life as a fleeting interruption of something foreign or extraneous,' 'a pulsation, an occasional impulse or interruption that immediately dies away or is extinguished.'

Perm Do Both

Permutation do both - Pragmatism and psychoanalysis are more similar than most realize

Hanlon 1

(Christopher Hanlon [PhD in Philosophy at University of Massachusetts Amherst], May 2001, "Pragmatism and the Unconscious: Language and Subject in Psychoanalytic Theory, Pragmatist Philosophy, and American Narrative," Scholarwork@UMassAmherst, http://scholarworks.umass.edu/dissertations/AAI3012135/, Page 19, MX)

This dissertation represents an attempt to seriously entertain the notion that pragmatism and psychoanalysis may already be on speaking terms, though in ways quite apart from those Rorty suggests in his essay on Freud. It explores this possibility by investigating the relations between classical American pragmatist philosophy and the psychoanalysis of Jacques Lacan, relations sometimes secured through textual transmission and, at other moments, striking conceptual affinity. Through readings of a handful of signal texts—both "pragmatist" and "psychoanalytic"--which stand at the intersections of postmodern theory and American intellectual history, it enters into a network of problems: problems of language and consciousness, of body and mind, of gender and race, of power and know ledge, of fantasy and reality, of philosophy, of literature, of reading. Thus, while working to produce an acquaintance between some key issues of concern for Americanist intellectual historians and some of the key concepts of Lacan's theoretical corpus, it will continually pose questions which are normally thought of as "clinical" in their psychoanalytic context, but which may also serve to enliven what have become a series of ossified debates within American philosophical, literary, and cultural critical circles.

No Death Drive

No death drive - human destructiveness is a complex development process

De Masi 14

(Franco De Masi [Training and Supervising Analyst of the Italian Psychoanalytical Society and former President of Centro Milanese di Psicoanalisi and Secretary of the Training Milanese Institute. He is a medical doctor and a psychiatrist who worked for twenty years in psychiatric hospitals.], 10/29/14, "Is the concept of the death drive still useful in the clinical field?," The International Journal of Psychoanalysis, 96:445–458, doi: 10.1111/1745-8315.12308, Pages 546-547, MX)

In this contribution I have attempted to distinguish aggression, which can assume the form of hate and violence, from destructiveness. The point of view suggested is that the concept of death instinct does not find a convincing explanation in the analytic clinical practice. By contrast, it is possible to consider destructiveness as a transformative potential inherent in the human mind, when life conditions become objectively and subjectively impossible to tolerate. In the sphere of mental phenomena, destructiveness underlies severe psychopathologies such as perversion, anorexic and borderline syndromes, drug addiction and psychoses. In the social and political field, destructiveness was responsible for the greatest tragedies of the last century, such as Nazism and the derivatives of ideological communism. In addressing the problems presented by the analytic treatment of some patients, we face considerable uncertainty when seeking to establish a link between infantile traumas and destructive pathologies. While acknowledging the role of infantile trauma in the generation of adult suffering, we find that in some cases it is not always easy to establish evidence of repeated violent trauma in infancy. The common element favouring such pathology is in fact the mental absence of the parents – their indifference to the child's emotional development. This emotional remoteness allows a child, already in early infancy, to stand aloof from reality and to take refuge in (megalomanic, phantasy-related or sexualized) psychic withdrawal involving incipient pathological identification with grandiose, destructive characters, who are felt to be providers of pleasure, so that the world of relationships is progressively abandoned. My idea is that human destructiveness does not derive from an original availability (the death instinct) but needs a long and complex development and is sometimes prompted by environmental destructiveness. In this regard, it seems essential to assume the existence of an internal pathological organization that forms gradually and tends to conquer the mind. The transformative process favouring the construction of an inhuman world takes place in a state of mind that is dissociated from the rest of the personality. In this psychic retreat destructiveness gives rise to a mental excitation that makes evil pleasurable and irresistible. Whereas aggression is exhausted once the aim of lowering tension has been accomplished, destructiveness, sustained as it is by pleasure, tends to be self-perpetuating. The power acquired by the pathological destructive organization over the rest of the personality depends on the role of the superego which coincides with a perverse psychopathological structure that has an intimidatory, seductive power. In my opinion (De Masi, 1999) the problem of pleasure is very complex: pleasure does not depend only on the defence of the self against the demands of external reality, or on drive discharge. In its production, the destructive mechanisms, directed against the subject's own self or others, seem as efficacious as those involved in the survival of the individual through self-affirmation and satisfaction of the drives. Thus, human destructiveness is very strongly linked to pleasure that gets satisfaction from evil. To achieve this goal, and for primal aggressiveness to be transformed into destructiveness, a long process is required in which the innate resources are combined with the environmental causes so as to get to a perverse constellation that enhances the destructive act as evidence of power, superiority and omnipotence.

No Scapegoating

No Scapegoating - empirical study proves

Gollwitzer 4

(Mario Gollwitzer [PhD in Psychology from University of Trier], 4/7/4, "Do Normative Transgressions Affect Punitive Judgments? An Empirical Test of the Psychoanalytic Scapegoat Hypothesis," Personality and Social Psychology Bulletin, Pages 1657-1659, MX)

The psychoanalytic scapegoat hypothesis implies (a) that individuals who are guilty of violating a law or norm tend to impose harsher punitive judgments on comparable wrongdoers than nonguilty individuals and (b) that transgressors' punitiveness should be amplified by the subjectively perceived decision conflict. A new alter native hypothesis was derived from research on blame avoidance and empathy: If individuals were really funda mentally concerned with avoiding self-ascriptions of blame by applying "defensive" attributions (Shaver, 1970, 1985), then it follows that transgressors should impose more lenient punishment on comparable offenders, especially under circumstances of similarity. Although the blame-avoidance hypothesis directly contradicts the implications of the scapegoat hypothesis, both effects might be present depending on situation specific or person-specific factors. If these factors are not controlled for, the paradoxical situation could occur that the two effects cancel each other out (Schmitt et al., 2003). Among the most theoretically plausible of such person-specific factors is authoritarianism. This variable is expected to moderate the transgression-punitiveness relation. In other words: The scapegoat effect is expected to occur among high authoritarians, whereas the leniency effect should occur among low authoritarians. The data presented here largely support the blame avoidance motivation account: Punitive judgment scores were higher among nontransgressors, regarding both vignette transgressions in immoral temptation situations and actually committed transgressions reported by par ticipants. This effect was consistent across all six criminal cases in both vignette and actual transgressions. Further more compared with a "baseline measure" of punitive judgments, the present results suggest that it is not a harshness bias on the side of the nontransgressors that causes this effect but rather, a mildness bias on the side of the transgressors. Although this finding is a clear corroboration for the blame-avoidance hypothesis, one could argue (a) that transgressors simply do not care about the norm they transgress and (b) that transgression decision and punitiveness share a common cause, that is, the moral reprehensibility of the deed. The first explanation implies that conflict scores do not differ between trans gressors and nontransgressors. This is, however, not the case, because conflict scores were—except for the moonlighter scenario—consistently higher among transgressors than among nontransgressors. The suggestion that transgressors' mildness bias was simply due to their recklessness can therefore be ruled out. The sec ond explanation would result in the argument that the relation between transgression decision and punitive judgments is spurious, because they can both be traced back to the same cause, that is, the moral evaluation of the deed. The mediation effect of moral evaluation was not significant in the present analyses: The effect sizes of transgression decisions on punitive judgments remained largely unaffected by entering moral evaluation scores as a covariate. This finding contradicts the alternative hypothesis that moral evaluation was the common cause for transgression decisions as well as for punitive judgments. Besides investigating the main effect of transgression decision on punitiveness, we tested whether the subjectively experienced decision conflict in a dilemma situa tion affects punitive judgments among transgressors. Although the size of this correlation was consistently positive in sign across the six scenarios, it was not statistically deviate from 0. Thus, this particular finding cannot be used as an argument for or against the scapegoat hypothesis. Taking authoritarianism as a possible moderator variable into account was a further attempt to demonstrate scapegoating effects in a subpopulation where they appear to be most likely to occur. The negative sign of the three-way interaction regression coefficient shows that this was not the case. One might think of the possibility that this three-way interaction did not emerge because authoritarianism and transgression decisions were con founded. This would be a reasonable interpretation because authoritarianism implies conventionalism, which means refraining from committing something unlawful because it is unlawful (Adorno et al., 1950). Therefore, it could be that individuals high in authoritarianism principally do not give in to immoral temptations. Contrary to this speculation, however, transgression decisions in each of the six vignettes were correlated only weakly with authoritarianism (−.05 < r < .12, average r = .04). Thus, nontransgressors are not automatically high authoritarians. Taken together, the present study presents both weak and strong results. The major aim was to test the psycho analytic scapegoat hypothesis against an alternative hypothesis based on a blame-avoidance motivation. Concerning the main effect of transgression on punitive judgments, the results strongly support the blame avoidance hypothesis. Concerning the effect of transgressors' decision conflict on punitive judgments, however, the results support neither the scapegoat nor the blame-avoidance motivation hypothesis. One could think of other empirical accesses to the effect of decision conflicts. For example, the subjective quality of experienced decision conflicts in tempting situations might have trait-like qualities: Individuals might consistently differ in the way they perceive and solve moral decision conflicts and in the amount of unease connected to these decision conflicts. These inter individual differences could be assessed and tested as predictors for punitive judgments. Second, moral conflicts may be better captured by assessing them on a more idiosyncratic level. Participants could be interviewed about temptation situations in which they recall having experienced a strong decision conflict; subsequently, their punitive judgments could be assessed in an adaptively constructed criminal case vignette that resembles this particular temptation. Finally, a possible conflict-punitiveness relation might be moderated by other vari ables than authoritarianism. Because fear of an "Id breakthrough" is considered the crucial motor of scapegoating by Freud (1923/1990), trait anxiety appears to be a suitable moderator variable. It is remarkable that a prominent theoretical account such as the psychoanalytic scapegoat hypothesis, which is discussed among principal penological theories in stan dard textbooks on legal studies (e.g., Göppinger, 1997; Kaiser, 1996; Schwind, 2002), has never received the empirical attention that it might deserve. The present study was a first attempt to test specifically derived impli cations of the scapegoat hypothesis. It seems that although the process of scapegoating and its psycho dynamic roots,

as conceptualized in psychoanalytic writings, is not testable as such, its implications can be incorporated into contemporary accounts of punitiveness and retributive justice. If these implications repeatedly fail to receive empirical backup, the scapegoat hypothesis should be at least reformulated, or dismissed.

Vote Aff: Abandon Search

The gaze is resistant to understanding because Lacan wants it to be - vote affirmative to abandon the search

Scott 15

(Maria Scott [PhD in French at Trinity College Dublin], 2015, "Deciphering the Gaze in Lacan's "Of the gaze as objet petit a"'," DS Project, MX)

Each of my four readings of the gaze has been shown to correspond to a mode of the subject's relation to the object a (\$ ◊ a) as formulated by Lacan. The four-fold structure worked out here might be read as corresponding to Lacan's description of the subject's relation to the object a as one of 'envelopment-development-conjunction-disjunction.' The quartet is a recurrent figure in Seminar XI, in which the four fundamental concepts of psychoanalysis, the four partial drives, the four elements composing the montage of the drive, and the four 'vicissitudes' of the drive are all invoked. Indeed, Lacan draws attention to the pattern by stating that 'it is curious that there are four vicissitudes as there are four elements of the drive.' Furthermore, while for Freud the drive combines active, passive, and reflexive modes, Lacan invents in Seminar XI a fourth mode, which contains the others, and which he claims involves a 'movement of appeal' toward the Other. Lacan's seminars on the gaze mix and match the various versions of the object a in a way that seems designed to confuse the auditor-reader. Their logic would seem to mimic the visual anamorphosis that they take to emblematize the workings of the gaze. It is possible that the concept of the gaze outlined in Seminar XI is resistant to understanding precisely because it obeys laws similar to those governing the gaze itself. In other words, Lacan's logic of the gaze may operate to captivate us by means of its elusiveness; an elusiveness that may ultimately be maddening enough to force us to renounce our search for it and symbolize our failure.

Alt Offense

Psycho Fails in IR

Psychoanalysis treats entire nations as single patient on a couch that can be treated like an individual psyche - this approach dooms alt solvency

Rosen-Carole 10

(Adam Rosen-Carole [a Visiting Professor in the Philosophy Department at Bard College.], 2010, "Menu Cards in Time of Famine: On Psychoanalysis and Politics," The Psychoanalytic Quarterly, Volume LXXIX, Number 1, Pages 226-227, MX)

Also, we might think here of the innumerable discussions of "America's death drive" as propelling the recent invasions in the Middle East, or of the ways in which the motivation for the Persian Gulf Wars of the 1990s was a collective attempt "to kick the Vietnam War Syndrome"— that is, to solidify a national sense of power and prominence in the recognitive regard of the international community—or of the psychoanalytic speculations concerning the psychodynamics of various nations involved in the Cold War (here, of course, I have in mind Segal's [1997] work), or of the collective racist fantasies and paranoiac traits that organize various nation-states's domestic and foreign policies.7 Here are some further examples from Žižek, who, as a result of his popularity, might be said to function as a barometer of incipient trends: • What is therefore at stake in ethnic tensions is always the possession of the national Thing. We always impute to the "other" [ethnic group, race, nation, etc.] an excessive enjoyment: he wants to steal our enjoyment (by ruining our way of life) and/or he has access to some secret, perverse enjoyment. [1993, pp. 202-203] • Beneath the derision for the new Eastern European post- Communist states, it is easy to discern the contours of the wounded narcissism of the European "great nations." [2004, p. 27, italics added] • There is in fact something of a neurotic symptom in the Middle Eastern conflict—everyone recognizes the way to get rid of the obstacle, yet nonetheless, no one wants to remove it, as if there is some kind of pathological libidinal profit gained by persisting in the deadlock. [2004, p. 39, italics added] If there was ever a passionate attachment to the lost object, a refusal to come to terms with its loss, it is the Jewish attachment to their land and Jerusalem . . . . When the Jews lost their land and elevated it into the mythical lost object, "Jerusalem" became much more than a piece of land . . . . It becomes the stand-in for . . . all that we miss in our earthly lives. [2004, p. 41] Rather than explore collective subjects through analyses of their individual members, this type of psychoanalytically inclined engagement with politics treats a collective subject (a nation, a region, an ethnic group, etc.) as if it were simply amenable to explanation, and perhaps even to intervention, in a manner identical to an individual psyche in a therapeutic context.

Lacan is a pretentious charlatan whose writings are illiterate falsehoods - prefer Chomsky - he's actually alive and comprehensible

Wolters 13

(Eugene Wolter [the founder and editor of Critical-Theory.com; freelance writer; New School University graduate], 2/28/13, "Noam Chomsky Calls Jacques Lacan a 'Charlatan'," Critical Theory: Theory and Theorists, http://www.critical-theory.com/noam-chomsky-calls-jacques-lacan-a-charlatan/, MX)

Noam Chomsky appeared in a podcast on the site Veterans Unplugged back in December 2012 to give his thoughts about American militarism. When asked by the interviewer if he thought the work of Slavoj Zizek had any relevence, Chomsky started to rail against what he considers "fancy words" that mean nothing once they are "decoded". "Zizek is an extreme example, I don't see anything in what he's saying," said Chomsky. Chomsky then took a swipe at Jascques Lacan, the French psychoanalyst. Jacques Lacan I actually knew. I kind of liked him. We had

meetings everyone once in a while but quite frankly I thought he was a total charlatan, just posturing before the television cameras the way many Paris intellectuals do. Why this is influential I haven't the slightest idea I dont see anything that should be influential You can listen to the full interview at Veterans Unplugged, the convervation of Zizek and Lacan starts around 6:20. It's actually not the first time Chomsky has made this claim about Lacan and other postmodernists. An alleged text from Chomsky has been circulating on usenet and the web since 1995 where Chomsky calls Lacan "an amusing and perfectly self-conscious charlatan." The interview seems to bolster the evidence that the 1995 text in fact originated from Chomsky. In the text, Chomsky speaks of his discussions with Kristeva, Foucault, and others. Some of the people in these cults (which is what they look like to me) I've met: Foucault (we even have a several-hour discussion, which is in print, and spent quite a few hours in very pleasant conversation, on real issues, and using language that was perfectly comprehensible — he speaking French, me English); Lacan (who I met several times and considered an amusing and perfectly self-conscious charlatan, though his earlier work, pre-cult, was sensible and I've discussed it in print); Kristeva (who I met only briefly during the period when she was a fervent Maoist); and others. Many of them I haven't met, because I am very remote from from these circles, by choice, preferring quite different and far broader ones — the kinds where I give talks, have interviews, take part in activities, write dozens of long letters every week, etc. I've dipped into what they write out of curiosity, but not very far, for reasons already mentioned: what I find is extremely pretentious, but on examination, a lot of it is simply illiterate, based on extraordinary misreading of texts that I know well (sometimes, that I have written), argument that is appalling in its casual lack of elementary self-criticism, lots of statements that are trivial (though dressed up in complicated verbiage) or false; and a good deal of plain gibberish. When I proceed as I do in other areas where I do not understand, I run into the problems mentioned in connection with (1) and (2) above. So that's who I'm referring to, and why I don't proceed very far. I can list a lot more names if it's not obvious.

Psycho =/= Ptix

Lacanian theory pretends to be "radical" but falls silent on the question of politics, it's claims at revolution are undercut by a mythical explanation that justifies the status quo

Robinson 5

(Andrew Robinson [Ph.D. in Political Theory at the University of Nottingham], 2005, "The Political Theory of Constitutive Lack: A Critique," Theory & Event Volume 8, Issue 1, The Johns Hopkins University Press, 1092-311X, MX)

There is more than an accidental relationship between the mythical operation of the concept of "constitutive lack" and Lacanians' conservative and pragmatist politics. Myth is a way of reducing thought to the present: the isolated signs which are included in the mythical gesture are thereby attached to extra-historical abstractions. On an analytical level, Lacanian theory can be very "radical", unscrupulously exposing the underlying relations and assumptions concealed beneath officially-sanctioned discourse. This radicalism, however, never translates into political conclusions: as shown above, a radical rejection of anti-"crime" rhetoric turns into an endorsement of punishment, and a radical critique of neo-liberalism turns into a pragmatist endorsement of structural adjustment. It is as if there is a magical barrier between theory and politics which insulates the latter from the former. One should recall a remark once made by Wilhelm Reich: 'You plead for happiness in life, but security means more to you' (1974, 27). Lacanians have a "radical" theory oriented towards happiness, but politically, their primary concern is security. As long as they are engaged in politically ineffectual critique, Lacanians will denounce and criticize the social system, but once it comes to practical problems, the "order not to think" becomes operative. This "magic" barrier is the alibi function of myth. The short-circuit between specific instances and high-level abstractions is politically consequential. A present evil can be denounced and overthrown if located in an analysis with a "middle level". The Lacanian gesture, however, is instead to present the evil and then add a word such as "always" to it. In this way, a present problem becomes eternal and social change becomes impossible. At the very most, such change cannot affect the basic matrix posited by Lacanian theory, because this is assumed to operate above history. In this way, Lacanian theory operates as an alibi: it offers a little bit of theoretical radicalism to inoculate the system against the threat posed by a lot of politicized radicalism (cf. Barthes, 2000, 41-2). In Laclau and Mouffe's version, this takes the classic Barthesian form: "yes, liberal democracy involves violent exclusions, but what is this compared to the desert of the real outside it?" The Žižekian version is more complex: "yes, there can be a revolution, but after the revolution, one must return to the pragmatic tasks of the present". A good example is provided in one of Žižek's texts. The author presents an excellent analysis of a Kafkaesque incident in the former Yugoslavia where the state gives a soldier a direct, compulsory order to take a voluntary oath - in other words, attempts to compel consent. He then ruins the impact of this example by insisting that there is always such a moment of "forced choice", and that one should not attempt to escape it lest one end up in psychosis or totalitarianism (1989, 165-6). The political function of Lacanian theory is to preclude critique by encoding the present as myth. There is a danger of a stultifying conservatism arising from within Lacanian political theory. Echoing the 'terrifying conservatism' Deleuze suggests is active in any reduction of history to negativity (1994, 53). The addition of an "always" to contemporary evils amounts to a "pessimism of the will", or a "repressive reduction of thought to the present". Stavrakakis, for instance, claims that attempts to find causes and thereby to solve problems are always fantasmatic (1999, 87), while Žižek states that an object which is perceived as blocking something does nothing but materialize the already-operative constitutive lack (1992c, 89). It is not clear whether such hostility applies to all instances of solution, or whether there is a difference between "constitutive lack" and some kind of surplus lack arising from contingent conditions. Certainly, Lacanians often revert to contingent, empirical explanations, even when these seem contrary to their own theoretical assumptions (e.g. Laclau and Mouffe, 1985, 131). In any case, a Lacanian approach to an instance of lack, such as environmental crisis, famine or political repression, carries a large danger that a contingent phenomenon will be labelled as constitutive and thereby placed beyond criticism. For instance, the argument that, since existing food production is sufficient for the world's population, the existence of famine is an intolerable indictment of the world trade system and global power relations would be severely damaged by a Lacanian claim that an inclusive distribution system is an impossible totalitarian fantasy. Contingent explanations - for instance, that the current famine in southern Africa is a result of IMF demands that governments sell food stocks - are in competition with the Lacanian mythical gesture of explaining shortages and conflicts by reference to a constitutive impossibility of completion. Even if Lacanians believe in surplus/contingent as well as constitutive lack, there are no standards for distinguishing the two. How does one tell an expression of "constitutive lack" from an effect of a particular regime of power, or for that matter from an imagined, nonexistent bogeyman? Perhaps all instances fall into the former category anyway: if it is not possible to know whether any specific impasse is an instance of constitutive lack or not, it is not possible to know that any of them are, and there is therefore no basis for claiming with any certainty that constitutive lack exists. (Žižek effectively admits that no element in the world is Real per se, reducing his affirmation of the idea to a suggestion that its rejection would lead to liberal conclusions [Žižek and Salecl, 1996, 41-2]. This suggests that he is prepared to affirm whatever he must affirm to avoid a conclusion he has decided in advance to view as unacceptable

- a far flight from his official image as a daredevil revealing repressed truths). Even if constitutive lack exists, Lacanian theory runs a risk of "misdiagnoses" which have a neophobe or even reactionary effect. To take an imagined example, a Lacanian living in France in 1788 would probably conclude that democracy is a utopian fantasmatic ideal and would settle for a pragmatic reinterpretation of the ancién regime. Laclau and Mouffe's hostility to workers' councils and Žižek's insistence on the need for a state and a Party (e.g. Laclau and Mouffe, 1985, 178; Žižek, 2002b, 296-7; 1997a, 157) exemplify this neophobe tendency. The construction of (for instance) the relation between colonizer and colonized in terms of "constitutive antagonism" (see Laclau and Mouffe 1985, 129) turns colonialism into an expression of an unchangeable ontology and impedes the possibility of anti-colonial rebellion. It is also interesting that Newman begins his book with an intention to destroy the place of power, but concludes with the view that this is impossible. Instead of 'the anarchic desire to destroy hierarchy', he demands that power merely be reinterpreted and displaced (2001, 37, 118-19). The pervasive negativity and cynicism of Lacanian theory offers little basis for constructive activity. Instead of radical transformation, one is left with a pragmatics of "containment" which involves a conservative de-problematization of the worst aspects of the status quo. The inactivity it counsels would make its claims a self-fulfilling prophecy by acting as a barrier to transformative activity. To conclude, the political theory of "constitutive lack" does not hold together as an analytical project and falls short of its radical claims as a theoretical and political one. It relies on central concepts which are constructed through the operation of a mythical discourse in the Barthesian sense, with the result that it is unable to offer sufficient openness to engage with complex issues. If political theory is to make use of poststructuralist conceptions of contingency, it would do better to look to the examples provided by Deleuze and Guattari, whose conception of contingency is active and affirmative. In contrast, the idea of "constitutive lack" turns Lacanian theory into something its most vocal proponent, Žižek, claims to attack: a "plague of fantasies".

Psycho Masquerades As Politics

Psychoanalysis masquerades as politics while turning the world into a couch - offering hyperactive apolitical solutions to a vicious world that needs marginal improvements just like the aff

Rosen-Carole 10

By way of conclusion, the worry about psychoanalytically inclined political theory goes something like this. At the level of form, the question is: can the diagnoses and proposals that proceed from psychoanalytically inclined political theory—or any other form of political theory, for that matter—be anything more than formal placeholders or standins for viable, vibrant political life? Aren't these diagnoses and proposals what becomes of the practice of political judgment under conditions of large-scale alienation from politics, that is, under conditions in which the diagnoses and demands articulated by psychoanalytically informed political theory are wanting for the public institutions through which they could be realized? And if the so-called interventions and proposals of psychoanalytically inclined political theory sidestep the question of the institutional transformations necessary for their realization, aren't they conspiring with our blindness to the enormous institutional impediments to a progressive political future? Doesn't psychoanalytic political theory—and I would say contemporary political theory in general—bear the burden of political alienation? And might this burden be evident in, and at least partially responsible for, (1) its reactive tendency to turn all the world into a couch, and (2) its hyperactive prescriptiveness? At the level of content, the question is: might not psychoanalytically inclined political theory, precisely in homing in on the unconscious dynamics of political investment, ideological captivation, and so forth, indicate precisely the apolitical dynamics of what passes for politics? If the value of psychoanalytic political theory is in its disclosure of motivations that are self-secluding, self-distorting, or otherwise constitutively opaque and so unshareable, then isn't the allure of a psychoanalytic interpretation of ostensibly political phenomena an indication that politics has fallen under eclipse; and so, in the name of politics, might there be reason to be wary about the whole enterprise of psychoanalytically inclined political theory? Finally, then, the worry is that frustrations with the limited viability of the habits and forms of life cultivated via psychoanalytic practice (discussed in the first part of this paper) may feed the temptation to interpretive "intervention" (discussed in the second), and so menu cards in time of famine provoke the offering of meals, i.e., political proposals, that can't be delivered. If so, again, what I want to insist on is that the value of psychoanalytic theory and practice, though not to be belittled, cannot be thought apart from the viciousness of the world in which its marginal contributions and interventions are necessary.

K = Repression

The negatives claim that we must accept posited conditions founded on transgression eliminates any possibility for incremental or revolutionary reform and creates conflict by promoting antagonism as inescapable

Robinson 5

(SCHOOL OF POLITICS – NOTTINGHAM, 2K5 [ANDREW, *THEORY & EVENT*, 8:1, "The Political Theory of Constitutive Lack: A Critique")

The basic claim of Lacanian theory is that identity - whether individual or social - is founded on a lack. Therefore, social relations are always irreducibly concerned with antagonism, conflict, strife and exclusion. Chantal Mouffe, for instance, writes of 'the primary reality of strife in social life'4, while Slavoj Žižek seeks an 'ethics grounded in reference to the traumatic Real which resists symbolization'5. 'Lack ("castration") is original; enjoyment constitutes itself as "stolen"'6. According to Stavrakakis, the Real is 'inherent in human experience' and 'doesn't stop not being written'7. Hence, the primary element of social life is a negativity, which prevents the emergence of any social "whole". In Mouffe's words, 'society is the illusion... that hides the struggle and antagonism behind the scenes', putting the 'harsh reality' of antagonism behind a 'protective veil'. For Newman, 'war is the reality', whereas 'society is the illusion... that hides the struggle and antagonism behind the scenes'9. For Stavrakakis, 'personal trauma, social crisis and political rupture are constant characteristics of human experience'10. Such claims have political consequences, because they rule out the possibility of achieving substantial improvements (whether "reformist" or "revolutionary") in any area on which this fundamental negativity bears. The dimension of antagonism is, after all, 'ineradicable'. Instead of the imperative to overcome antagonism which one finds in forms as diverse as Marxian revolution and deliberative democracy, Lacanian political theory posits as the central political imperative a demand that one "accept" the underlying lack and the constitutive character of antagonism. While the various authors disagree about the means of achieving this, they agree on its desirability. Lacanian theory thus entails an ethical commitment to create conflict and antagonism. This ethics mostly expresses itself via a detour into ontology: the ethical imperative is to 'accept' or 'grasp' the truth of the primacy of lack, and the accusation against opponents is that they fall into some kind of fallacy (illusion, delusion, blindness, failure to accept, and so on). At other times, however, one finds a direct ethical advocacy of exclusion and conflict as almost goods in themselves.

Alt Offense

Turn: Imperialism of the analyst. Their psyschoanalytic reading of the social world is unethical. Their alternative and method presumes you can master the interpretation of any social system.

Dean 2

(Tim DEAN English and the Center for the Study of Psychoanalysis and Culture @ SUNY Buffalo '2 "Zizek and the Ethics of Psychoanalytic Criticism" diacritics 32.2 p. 21-41 MUSE)

This paper tackles **a problem** that is **exemplified by,** but not restricted to, Slavoj **Žižek's work: the tendency to treat** aesthetic **artifacts as symptoms of the culture in which they were produced**. Whether or not one employs the vocabulary and methods of psychoanalysis to do so, **this approach** to aesthetics has become so widespread in the humanities that it **qualifies as a contemporary critical norm**. As a norm, it may be subject to debate and even contestation. Today it is normative to read literature, film, and other cultural texts primarily as evidence about the societies that made them—evidence that necessarily requires our hermeneutic labor in order to yield its significance. This methodological protocol remains in place whether one inhabits critical perspectives as ostensibly disparate as historicist, materialist, or psychoanalytic modes of thinking; it is also a grounding assumption of cultural studies, irrespective of how one defines that critical practice. Indeed, the issue I want to address is quite as much a Marxist problem as it is a psychoanalytic one, and therefore the way in which Žižek articulates Lacan with Marx makes his work especially fertile terrain on which to engage this matter. As Žižek reminds us in The Sublime Object of Ideology, Lacan claimed that Marx invented the symptom [SO 11]—an observation that Žižek has been keen to exploit from the very beginning of his work. Žižek's combining psychoanalysis with Marxism in novel ways has helped make Lacan more palatable to contemporary critical sensibilities by politicizing psychoanalysis, demonstrating how it offers less an account of the individual than of society and culture. In Žižek's hands psychoanalytic theory appears less vulnerable to the standard criticisms that it is ahistorical and apolitical. While a number of critiques of Žižek have reiterated these common objections, nevertheless his politicizing of psychoanalysis has been particularly important during a period that witnessed the rise of new historicism, the institutionalization of cultural studies, and the escalating importance of "the political" as a sign—perhaps the sign—of humanities professors' seriousness.1 Žižek's work has gone a long way toward making Lacan seem indispensable to cultural studies, just as Juliet Mitchell's and Jacqueline Rose's work a decade earlier made Lacan seem indispensable to theoretically rigorous feminism. At a moment when the poststructuralist variant of Lacanian theory was being displaced by historicist modes of thought, Žižek emerged on the scene to revivify psychoanalysis and make it exciting again. Thus his work's appeal has an historical basis quite apart from Žižek's own personal charisma and his remarkable productivity. It is his politicizing of psychoanalysis, as much as his [End Page 21] rendering Lacan newly accessible, that has made Žižek popular. I want to argue, however, that **his style of politicizing psychoanalysis carries a significant ethical cost,** one that follows partly as a consequence of Žižek's failure to work through his theoretical relation to Althusser, from whom he derives the practice of symptomatic reading while claiming to displace the latter's version of psychoanalytic Marxism. Thus I shall be arguing for a significant distinction between a political and an ethical psychoanalysis, suggesting that we have been cultivating the former at the expense of the latter. Spaghetti Psychoanalysis The notion of the symptom is central to Žižek's thinking about politics and culture. Although in his work and in psychoanalytic theory more generally the term symptom carries a range of conceptual meanings, symptomatology remains the governing trope of Žižek's oeuvre. Following Lacan, who continued to modify the concept of the symptom throughout his career, Žižek argues that just about anything can be understood as symptomatic: [I]n the final years of Lacan's teaching we find a kind of universalization of the symptom: almost everything that is becomes in a way symptom, so that finally even woman is determined as the symptom of man. We can even say that "symptom" is Lacan's final answer to the eternal philosophical question "Why is there something instead of nothing?"—this "something" which "is" instead of nothing is indeed the symptom. [SO 71-72] **If**, for reasons to be elaborated, virtually **anything can be considered a symptom, then this conceptual move illuminates how Žižek can write about everything, how he seems** able to **render all cultural phenomena as grist to his theoretical mill. Having grasped the structural logic of the symptom, one may submit** practically **anything of interest to its explanatory grid.** And while Žižek expounds more than merely one logic of symptom formation, his structural logics—like his many books—tend to remain variations on a single theme. If, according to Lacan at the end of his career, the symptom has become a condition of subjective existence rather than a contingent problem, then there can be no possibility of curing symptoms in the manner that Freud envisioned when he invented psychoanalysis. Yet **while this universalizing of symptomatology sidelines the question of cure, it does nothing to diminish the psychoanalytic zeal for diagnosis** and interpretation. Instead, the opposite is true: **universalizing the symptom fuels the motive for diagnosis and interpretation, since symptoms are** no longer localized and self-evident but **lurking everywhere.** A hermeneutic operation becomes necessary before we can see how, for example, woman is the symptom of man.2 By shifting symptoms from the category of the exception to that of the rule, Žižek to some extent depathologizes the symptom, converting it into a subjective norm. But to the degree that **his method requires a diagnostic stance** (insofar as it encourages an intensified hermeneutic vigilance vis-à-vis the cultural field), **Žižek's symptomatology raises questions about the ethics of diagnosis.** While Lacan's universalizing of the symptom provokes fundamental [End Page 22] epistemological questions too, my primary concern lies with the ethical implications of a critical approach that regards the universe as perpetually in need of interpretation. **Reading one's world in terms of symptoms positions one** as a hermeneut **with a particular relation to the world—a relation of suspicion and** putative **mastery. Although Žižek repeatedly points out that one can never master one's "own" symptom (but only enjoy it), his method nonetheless situates the critic in a position of hermeneutic mastery over the social and cultural symptoms he or she diagnoses.** One cannot help noticing that in his dozen or so books **no cultural artifact poses** any **resistance** to Žižek's hermeneutic energy; **there is no social system** or movie or opera or novel that **he cannot interpret.** We might say that **there seems to be no cultural phenomenon that,** with his Lacanian schema**, Žižek cannot master.3 Žižek's** hermeneutic **voracity**—what Tom Cohen characterizes as his approaching "the vast samples of American popular culture with vampirelike urgency" [356]—**could be understood as** but one

more instance of ==psychoanalysis's imperialism, its tendency to find exemplifications of its principles everywhere it turns== [see Derrida; Meltzer]. I would suggest, however, that viewing cultural phenomena through the lens of symptomatology points to a larger problem, one that pertains to not only psychoanalytic criticism but also Marxism, historicism, and cultural studies. The problem lies in the way that treating aesthetic artifacts as cultural symptoms elides the specificity of art, making cultural forms too readily apprehensible as what Žižek, in one definition of the symptom, calls "the point of emergence of the truth about social relations" [SO 26]. Of course, the category of art—and, more broadly, that of aesthetic experience—does not appear in Žižek's work; speaking of "art" when discussing post-Lacanian ideology critique may appear as quaintly anachronistic. But that is exactly my point. Despite his interest in Kantian philosophy and his evocation of the sublime, Žižek's approach to culture and society leaves little conceptual space for any consideration of aesthetic effects or their significance.4

Alt Fails: Politics

Sweeping psychological generalizations have no explanatory power for politics. They represent the worst of non-falsifiable hindsight thinking.

Samuels 93

(Andrew, Training Analyst – Society of Analytical Psychology and Science Associate – American Academy of Psychoanalysis, Free Associtions, "The mirror and the hammer: depth psychology and political transformation", Vol. 3D, Psychoanalytic Electronic Publishing)

The paper is about the depth psychology of political processes, focusing on processes of political change. It is a contribution to the longstanding ambition of depth psychology to develop a form of political and cultural analysis that will, in Freud's words, 'understand the riddles of the world'. It has to be admitted that there is an equally longstanding reluctance in the non-psychological community to accept the many and varied ideas and suggestions concerning political matters that have been offered by analysts of all persuasions. I do not believe this can all be put down to resistance. There is something offensive above reductive interpretations of complex socio-political problems in exclusively psychological terms. The tendency to panpsychism on the part of some depth psychologists has led me to wonder if an adequate methodology and ethos actually exists with which to make an engagement of depth psychology with the public sphere possible. By 'politics' I mean the arrangements within a culture for the organization and distribution of power, especially economic power, and the way in which power is deployed to maintain the survival and enhance the quality of human life. Economic and political power includes control of processes of information and representation as well as the use of physical force and possession of vital resources such as land, food and water. On a more personal level, political power reflects the ability to choose freely whether to act and what action to take in a given situation. 'Politics' refers to the interplay between the personal and public dimensions of power. That is, there is an articulation between public, economic power and power as expressed on the personal, private level. This articulation is demonstrated in family organization, gender and race relations, and in religious and artistic assumptions as they affect the life of individuals. (I have also tried to be consistent in my use of the terms 'culture', 'society' and 'collective'.)1 Here is an example of the difficulty with psychological reductionism to which I am referring. At a conference I attended in London in 1990, a distinguished psychoanalyst referred to the revolutionary students in Paris in 1968 as 'functioning as a regressive group'. Now, for a large group of students to be said to regress, there must be, in the speaker's mind, some sort of normative developmental starting point for them to regress to. The social group is supposed to have a babyhood, as it were. Similarly, the speaker must have had in mind the possibility of a healthier, progressive group process — what a more mature group of revolutionary students would have looked like. But complex social and political phenomena do not conform to the individualistic, chronological, moralistic, pathologizing framework that is often imported. The problem stems from treating the entire culture, or large chunks of it, as if it were an individual or, worse, as if it were a baby. Psychoanalysts project a version of personality development couched in judgemental terms onto a collective cultural and political process. If we look in this manner for pathology in the culture, we will surely find it. As we are looking with a psychological theory in mind, then, lo and behold, the theory will explain the pathology. But this is a retrospective prophecy (to use a phrase of Freud's), twenty—twenty hindsight. In this psychoanalytic tautologizing there is really nothing much to get excited about. Too much psychological writing on the culture, my own included, has suffered from this kind of smug 'correctness' when the 'material' proves the theoretical point. Of course it does! If we are interested in envy or greed, then we will find envy or greed in capitalistic organization. If we set out to demonstrate the presence of archetypal patterns, such as projection of the shadow, in geopolitical relations, then, without a doubt, they will seem to leap out at us. We influence what we analyse and so psychological reflection on culture and politics needs to be muted; there is not so much 'aha!' as one hoped.

Alt Fails/Threats Real

Threats aren't psychological projections and the alt fails

Hoffman 86

(Stanley Hoffman 86, Center for European Studies at Harvard, "On the Political Psychology of Peace and War: A Critique and an Agenda," Political Psychology 7.1 JSTOR)

The traditionalists, even when, in their own work, they try scrupulous-ly to transcend national prejudices and to seek scientific truth, believe that it is unrealistic to expect statesmen to stand above the fray: By definition, the statesmen are there to worry not only about planetary survival, but — first of all—about national survival and safety. To be sure, they ought to be able to see how certain policies, aimed at enhancing security, actually increase in-security all around. But there are sharp limits to how far they can go in their mutual empathy or in their acts (unlike intellectuals in their advice), as long as the states' antagonisms persist, as long as uncertainty about each other's intentions prevails, and as long as there is reason to fear that one side's wise restraint, or unilateral moves toward "sanity," will be met, not by the rival's similar restraint or moves, but either by swift or skillful political or military exploitation of the opportunity created for unilateral gain, or by a for-midable domestic backlash if national self-restraint appears to result in ex-ternal losses, humiliations or perceptions of weakness. There is little point in saying that the state of affairs which imposes such limits is "anachronistic" or "unrational." To traditionalists, the radicals' stance — condemnation from the top of Mount Olympus — can only impede understanding of the limits and possibilities of reform. To be sure, the fragmentation of mankind is a formidable obstacle to the solution of many problems that cannot be handled well in a national framework, and a deadly peril insofar as the use of force, the very distinctive feature of world politics, now entails the risk of nuclear war. But one can hardly call anachronistic a phenomenon—the assertion of national identity — that, to the bulk of [HU]mankind, appears not only as a necessity but also as a positive good, since humanity's fragmentation results from the very aspiration to self-determination. Many people have only recently emerged from foreign mastery, and have reason to fear that the alternative to national self-mastery is not a world government of assured fairness and efficiency, but alien domination. As for "unrationality," the drama lies in the contrast between the ra-tionality of the whole, which scholars are concerned about—the greatest good of the greatest number, in utilitarian terms — and the rationality or greatest good of the part, which is what statesmen worry about and are responsible for. What the radicals denounce as irrational and irresponsible from the viewpoint of mankind is what Weber called the statesman's ethic of responsibility. What keeps ordinary "competitive conflict processes" (Deutsch, 1983)— the very stuff of society — from becoming "unrational" or destructive, isprecisely what the nature of world politics excludes: the restraint of the partners either because of the ties of affection or responsibility that mitigate the conflict, or because of the existence of an outsider — marriage counselor, arbitrator, judge, policeman or legislator— capable of inducing or imposing restraints. Here we come to a third point of difference. The very absence of such safeguards of rationality, the obvious discrepancy between what each part intends, and what it (and the whole world) ends with, the crudeness of some of the psychological mechanisms at work in international affairs—as one can see from the statements of leaders, or from the media, or from inflamed publics—have led many radicals, especially among those whose training or profession is in psychoanalysis or mental health, to treat the age-old contests of states in terms, not of the psychology of politics, but of individual psychology and pathology. There are two manifestations of this. One is the tendency to look at nations or states as individuals writ large, stuck at an early stage of development (similarly, John Mack (1985) in a recent paper talks of political ideologies as carrying "forward the dichotomized structures of childhood"). One of my predecessors writes about "the correspondence between development of the individual self and that of the group or nation," and concludes "that intergroup or international conflict contains the basic elements of the conflict each individual experiences psychologically" (Volkan, 1985). Robert Holt, from the viewpoint of cognitive psychology, finds "the largest part of the American public" immature, in a "phase of development below the Conscientious" (Holt, 1984). The second related aspect is the tendency to look at the notions statesmen or publics have of "the enemy," not only as residues of childhood or adolescent phases of development, but as images that express "disavowed aspects of the self" (Stein, 1985), reveal truths about our own fears and hatreds, and amount to masks we put on the "enemy" because of our own psychological needs. Here is where the clash between traditionalists and radicals is strongest. Traditionalists do not accept a view of group life derived from the study of individual development or family relations, or a view of modern society derived from the simplistic Freudian model of regressed followers identifying with a leader. They don't see in ideologies just irra-tional constructs, but often rationally selected maps allowing individuals to cope with reality. They don't see national identification as pathological, as an appeal to the people's baser instincts, more aggressive impulses or un-sophisticated mental defenses; it is, as Jean-Jacques Rousseau so well understood, the competition of sovereign states that frequently pushes people from "sane" patriotism to "insane" nationalism (Rousseau's way of preventing the former from veering into the latter was, to say the least, im-practical: to remain poor in isolation). Nor do they see anything "primitive" in the nation's concern for survival: It is a moral and structural requirement. Traditionalists also believe that the "intra-psychic" approach distorts reality Enemies are not mere projections of negative identities; they are often quite real. To be sure, the Nazis' view of the Jews fits the metaphor of the mask put on the enemy for one's own needs. But were, in return, those Jews who understood what enemies they had in the Nazis, doing the same? Is the Soviet domination of Eastern Europe, is the Soviet regime's treatment of dissidents, was the Gulag merely a convenient projection of our intrapsychic battles? Clichés such as the one about how our enemy "understands only force" may tell us a great deal about ourselves; but sometimes they contain half-truths about him, and not just revelations about us. Our fears flow not only from our private fantasies but also from concrete realities and from the fantasies which the international state of nature generates. In other words, the psychology of politics which traditionalists deem adequate is not derived from theories of psychic development and health; it is derived from the logic of the international milieu, which breeds the kind of vocabulary found in the historians and theorists of the state of nature: fear and power, pride and honor, survival and security, self-interest and reputation, distrust and misunderstanding,

commitment and credibility. It is also derived from the social psychology of small or large groups, which resorts to the standard psychological vocabulary that describes mental mechanisms or maneuvers and cognitive processes: denial, projection, guilt, repression, closure, rigidity, etc.... But using this vocabulary does not imply that a group whose style of politics is paranoid is therefore composed of people who, as private individuals, are paranoid. Nor does it relieve us of the duty to look at the objective reasons and functions of these mental moves, and of the duty to make explicit our assumptions about what constitutes a "healthy," wise, or proper social process. Altogether, traditionalists find the mental health approach to world affairs unhelpful. Decisions about war and peace are usually taken by small groups of people; the temptation of analyzing their behavior either, literal-ly, in terms of their personalities, or, metaphysically, in terms borrowed from the study of human development, rather than in those of group dynamics or principles of international politics is understandable. But it is misleading. What is pathological in couples, or in a well-ordered community, is, alas, frequent, indeed normal, among states, or in a troubled state. What is malignant or crazy is usually not the actors or the social process in which they are engaged: it is the possible results. The grammar of motives which the mental health approach brands as primitive or immature is actually rational for the actors. to the substitution of labels for explanations, to bad analysis and fanciful prescriptions. Bad analysis: the tendency to see in group coherence a regressive response to a threat, whereas it often is a rational response to the "existential" threats entailed by the very nature of the international milieu. Or the tendency to see in the effacement or minimization of individual differences in a group a release of unconscious instincts, rather than a phenomenon that can be perfectly adaptive—in response to stress or threats—or result from governmental manipulation or originate in the code of conduct inculcated by the educational system, etc.. . The habit of comparing the state, or modern society, with the Church or the army, and to analyze human relations in these institutions in ways that stress the libidinal more than the cognitive and superego factors, or equate libidinal bonds and the desire for a leader. The view that enemies are above all products of mental drives, rather than inevitable concomitants of social strife at every level. Or the view that the contest with the rival fulfills inter-nal needs, which may be true, but requires careful examination of the nature of these needs (psychological? bureaucratic? economic?), obscures the objective reasons of the contest, and risks confusing cause and function. Indeed, such analysis is particularly misleading in dealing with the pre-sent scene. The radicals are so (justifiably) concerned with the nuclear peril that the traditional ways in which statesmen and publics behave seem to vindicate the pathological approach. But this, in turn, incites radicals to overlook the fundamental ambiguity of contemporary world politics. On the one hand, there is a nuclear revolution—the capacity for total destruction. On the other hand, many states, without nuclear weapons, find that the use of force remains rational (in terms of a rationality of means) and beneficial at home or abroad—ask the Vietnamese, or the Egyptians after October 1973, or Mrs. Thatcher after the Falklands, or Ronald Reagan after Grenada. The superpowers themselves, whose contest has not been abolished by the nuclear revolution (it is the stakes, the costs of failure that have, of course, been transformed), find that much of their rivalry can be conducted in traditional ways — including limited uses of force —below the level of nuclear alarm. They also find that nuclear weapons, while—perhaps unusable rationally, can usefully strengthen the very process that has been so faulty in the prenuclear ages: deterrence (this is one of the reasons for nuclear proliferation). The pathological approach interprets deterrence as expressing the deterrer's belief that his country is good, the enemy's is bad. This is often the case, but it need not be; it can also reflect the conviction that one's country has interests that are not mere figments of the imagination, and need to be protected both because of the material costs of losing them, and because of the values embedded in them. As for war planning, it is not a case of "psychological denial of unwelcome reality" (Montville, 1985). but a — perhaps futile, perhaps dangerous—necessity in a world where deterrence may once more fail. The prescriptions that result from the radicals' psychological approach also run into traditionalist objections. Even if one accepts the metaphors of collective disease or pathology, one must understand that the "cure" can only be provided by politics. All too often, the radicals' cures consist of perfectly sensible recommendations for lowering tensions, but fail to tell us how to get them carried out —they only tell us how much better the world would be, if only "such rules could be established" (Deutsch, 1983). Sometimes, they express generous aspirations — for common or mutual security—without much awareness of the obstacles which conflict-ing interests, fears about allies or clients, and the nature of the weapons themselves, continue to erect. Sometimes, they too neglect the ambiguity of life in a nuclear world: The much lamented redundancy of weapons, a calamity if nuclear deterrence fails, can also be a cushion against failure. Finally, many of the remedies offered are based on an admirable liberal model of personality and politics: the ideal of the mature, well-adjusted, open-minded person (produced by liberal education and healthy family relations) transposed on the political level, and thus accompanied by the triumph of democracy in the community, by the elimination of militarism and the spread of functional cooperation abroad. But three obstacles remain unconquered: first, a major part of the world rejects this ideal and keeps itself closed to it (many of the radicals seem to deny it, or to ignore it, or to believe it doesn't matter). Second, the record shows that real democracies, in their behavior toward non-democratic or less "advanced" societies, do not conform to the happy model (think of the US in Central America). Third, the task of reform, both of the publics and of the statesmen, through consciousness raising and education is hopelessly huge, incapable of being pursued equally in all the important states, and — indeed — too slow if one accepts the idea of a mortal nuclear peril. These, then, are the dimensions of a split that should not be minimized or denied

Alt Fails: Cant Explain

One thing can explain all action – psychoanalysis fails

Mootz 2k

[Francis J, Visiting Professor of Law, Pennsylvania State University, Dickinson School of Law; Professor of Law, Western New England College School of Law, Yale Journal of the Law & Humanities, 12 Yale J.L. & Human. 299, p. 319-320]

Freudian psychoanalysis increasingly is the target of blistering criticism from a wide variety of commentators. 54 In a recent review, Frederick Crews reports that independent studies have begun to converge toward a verdict... that there is literally nothing to be said, **scientifically** or **therapeutically**, to the advantage of the **entire Freudian system** or any of its component dogmas Analysis as a whole **remains powerless**... and understandably so, because a thoroughgoing epistemological critique, based on commonly acknowledged standards of evidence and logic decertifies every distinctively psychoanalytic proposition. 55 The most telling criticism of Freud's psychoanalytic theory is that it has proven no more effective in producing therapeutic benefits than have other forms of psychotherapy. 56 Critics draw the obvious conclusion that the benefits (if any) of psychotherapy are neither explained nor facilitated by psychoanalytic theories. Although Freudian psychoanalytic theory purports to provide a truthful account of the operations of the psyche and the causes for mental disturbances, critics argue that psychoanalytic theory may prove in the end to be nothing more than fancy verbiage that tends to obscure whatever healing effects psychotherapeutic dialogue may have. 57 Freudian psychoanalysis failed because it could not make good on its claim to be a rigorous and empirical science. Although Freud's mystique is premised on a widespread belief that psychoanalysis was a profound innovation made possible by his genius, Freud claimed only that he was extending the scientific research of his day within the organizing context of a biological model of the human mind. 58 [*320] Freud's adherents created the embarrassing cult of personality and the myth of a self-validating psychoanalytic method only after Freud's empirical claims could not withstand critical scrutiny in accordance with the scientific methodology demanded by his metapsychology. 59 The record is clear that Freud believed that psychoanalysis would take its place among the sciences and that his clinical work provided empirical confirmation of his theories. This belief now appears to be completely unfounded and indefensible.

Freud's quest for a scientifically grounded psychotherapy was not amateurish or naive. Although Freud viewed his "metapsychology as a set of directives for constructing a scientific psychology," n60 Patricia Kitcher makes a persuasive case that he was not a blind dogmatist who refused to adjust his metapsychology in the face of contradictory evidence. n61 Freud's commitment to the scientific method, coupled with his creative vision, led him to construct a comprehensive and integrative metapsychology that drew from a number of scientific disciplines in an impressive and persuasive manner. n62 However, the natural and social sciences upon which he built his derivative and interdisciplinary approach developed too rapidly and unpredictably for him to respond. n63 As developments in biology quickly undermined Freud's theory, he "began to look to linguistics and especially to anthropology as more hopeful sources of support," n64 but this strategy later in his career proved equally [*321] unsuccessful. n65 The scientific justification claimed by Freud literally eroded **when the knowledge base underlying his theory collapsed**, leaving his disciples with the impossible task of defending a theory whose presuppositions no longer were plausible according to their own criteria of validation. n66

Advocacy for specific policy reform is key to environmental justice movements--- refusal of policy relevance ensures marginalization

Noonan 5

(Douglas S. Noonan 5, Assistant Professor, School of Public Policy, Georgia Institute of Technology, 2005, "DEFINING ENVIRONMENTAL JUSTICE: POLICY DESIGN LESSONS FROM THE PRACTICE OF EJ RESEARCH," http://www.prism.gatech.edu/~dn56/EJ.APPAM.pdf)

The negotiated nature of environmental policymaking holds some stark lessons for policymakers and analysts alike. Even if there were no uncertainty – and all of the useful scientific evidence was available – the heterogeneous interests of affected parties would persist. When policies ultimately seek to reconcile these competing interests, essentially answering questions of social choice (for which optimal solutions may not be available either in theory or due to practical limits to policy), only rarely or never would a policy process be such that selfish advocacy by interest groups yields both individually and socially optimal outcomes. In the environmental policy arena, the disconnect between the pursuit of individual interests and the pursuit of collective goals is paramount. In this sense, the acrimony surrounding many environmental policy debates is both undersandable and inevitable. ¶ Although this preface might apply equally well to discussions of "climate change policy" or "species/wilderness preservation policy," the application to environmental justice (EJ) provides an opportune arena in which to observe the interplay between environmental policymaking and the (allegedly) relevant research. Environmental justice is a major theme in environmental and social policy. Its researchers are legion. Their output is voluminous. A debate about the empirical evidence and about appropriate policies continues among academics. In more public forums, interest groups routinely cite environmental justice in advocating for policy reforms. As is typical in policy debates, advocates select evidence to cite in support of their position. **The influence of scholarly EJ research on policymakers**, however, **is less than straightforward**. If the mounting evidence provides only partial answers or, as is common, **answers to questions only marginally relevant to policymakers**, then **even hundreds of books** [1] on the subject may **do little to sway public policy**. Or, conversely, the evidence's influence may far outstrip its limited relevance. Regardless, like many other environmental policy topics, the role of scholarly research in policy design is inevitably contentious and complex. ¶ The purpose of this paper is to offer some insight about policy design from the scholarly literature on EJ. After scaling this mountain of literature, what are the important lessons to be learned for **making EJ policy?** From this vantage, this paper **critiques the field of EJ research**. It also offers some suggestions for a more policy-relevant research agenda. The conclusion returns to the broad assessment of EJ policy and suggests some future directions for designing policy and framing the discourse.

Environment impact is insulated from the alt

Minteer 5

(Ben, Arizona State biology professor, "Environmental Philosophy and the Public Interest: A Pragmatic Reconciliation," Environmental Values 14, ebsco)

This call for revisiting and rethinking the philosophical roots of Western culture, which for White were the techno-scientific worldview and its underlying religious and secular foundations in the medieval period, implied nothing less than an overhaul of the tradition, a foundation-razing process in which a new philosophy of science, technology, and nature – and perhaps a new, less arrogant relationship to the natural world – would be unearthed

and absorbed into the modern worldview. Early environmental philosophers such as Routley and Rolston, then, apparently following White in their call for a new ethic able to account for the independent value of the natural world, assumed that the anthropocentric worldview (and its destructive instrumentalisation of nature) had to be replaced with a new, nonanthropocentric outlook. Here, White's thesis about the anti-environmental implications of the Judeo-Christian religion, particularly his sweeping claim that the latter was 'the most anthropocentric religion the world has seen', offered a point of departure for environmental philosophers, who would respond in subsequent years with a series of influential criticisms of the moral humanism of the Western philosophical inheritance (e.g., Taylor 1986, Rolston 1988, Callicott 1989, Westra 1994, Katz 1996). As the field matured in the 1980s and 1990s, an exclusivist non-anthropocentric agenda established itself as the dominant approach in the field, with a few notable exceptions (of the latter, see Norton 1984, 1991; Weston 1985, and Stone 1987). The result of these developments is that the public interest never became part of the agenda of environmental philosophy in the same way, for example, that it appears to have made lasting impressions in other branches of applied philosophy such as business, engineering, and biomedical ethics. Concerned with what it perceived to be more pressing and fundamental questions of moral ontology – that is, with the nature of environmental values and the moral standing of nonhuman nature – environmental philosophers pursued questions selfconsciously cordoned off from parallel discussions in mainstream moral and political theory, which were apparently deemed too anthropocentric to inform a philosophical field preoccupied with the separate issue of the moral considerability and significance of nonhuman nature. As a consequence, instead of (for example) providing a conceptual or analytic framework for evaluating cases, practices, and policies from the perspective of ostensibly 'human-centred' concepts such as the public interest, many environmental philosophers preferred to focus exclusively on the independent status of natural values. I would argue that this original failure to link environmental values and claims to recognised moral and political concerns also helps to explain the relative inability of environmental philosophy to have a significant impact within public and private institutions over the years, again, especially when compared with other applied ethics counterparts. Environmental philosophy is and always has been concerned with 'nature's interest', not that of the public. This situation has also produced a number of unfortunate consequences for the contribution of environmental philosophy to policy discussion and debate, not to mention more concrete and on-the-ground forms of social action. One example here is the largely missed opportunity for philosophers to study and contribute to some of the more important environmental reform movements and institutional initiatives of the past three decades. Chief among these developments, perhaps, is the public interest movement that developed alongside environmental ethics in the late 1960s and early 1970s, which united consumer protection with environmental advocacy through organisations like Ralph Nader's Public Interest Research Groups (PIRGs). This list of emerging direct-action environmental movements would also have to include the growing number of grassroots organisations and groups, commonly lumped under the 'environmental justice' banner, which have sought to link the concerns of public health, safety, and community well-being to environmental protection through the language and tactics of social justice and civil rights (Gottlieb 1993, Shutkin 2000, Shrader-Frechette 2002). Had environmental philosophy worked a serious notion of the public interest into its agenda, it doubtless would have been (and would now be) much more engaged with these influential movements in citizen environmental action, not to mention a range of discussions in areas such as risk communication, pollution prevention and regulatory reform, public understanding of science, and so on.

AT: Movements

Movements/the alternative can't address immediate problems—they are multigenerational, educational ventures. Working within the system is necessary to solve particular instances of the climate problem—there's no guarantee their revolution will solve

-Working within existing political institutions is key

-It's too late to solve the whole environmental crisis, but can work to mitigate the damage

-No guarantee the alternative's regression to socialism wont' have same environmental problems

PARENTI 13

(Christian, professor of sustainable development at the School for International Training, Graduate Institute, "A Radical Approach to the Climate Crisis," *Dissent*, Summer 2013, http://www.dissentmagazine.org/article/a-radical-approach-to-the-climate-crisis)

Several strands of green thinking maintain that capitalism is incapable of a sustainable relationship with non-human nature because, as an economic system, capitalism has a growth imperative while the earth is finite. One finds versions of this argument in the literature of eco-socialism, deep ecology, eco-anarchism, and even among many mainstream greens who, though typically declining to actually name the economic system, are fixated on the dangers of "growth." All this may be true. Capitalism, a system in which privately owned firms must continuously out-produce and out-sell their competitors, may be incapable of accommodating itself to the limits of the natural world. However, that is not the same question as whether capitalism can solve the more immediate climate crisis. Because of its magnitude, the climate crisis can appear as the sum total of all environmental problems—deforestation, over-fishing, freshwater depletion, soil erosion, loss of biodiversity, chemical contamination. But halting greenhouse gas emissions is a much more specific problem, the **most pressing subset** of the **larger apocalyptic panorama**. And the very bad news is, time has run out. As I write this, news arrives of an ice-free arctic summer by 2050. Scientists once assumed that would not happen for hundreds of years. Dealing with climate change by first achieving radical social transformation—be it a socialist or anarchist or deep-ecological/neo-primitive revolution, or a nostalgia-based localista conversion back to a mythical small-town capitalism—would be a very **long and drawn-out**, maybe even **multigenerational, struggle**. It would be marked by years of mass education and organizing of a scale and intensity not seen in most core capitalist states since the 1960s or even the 1930s. **Nor is there any guarantee** that the new system would not also degrade the soil, lay waste to the forests, despoil bodies of water, and find itself still addicted to coal and oil. Look at the history of "actually existing socialism" before its collapse in 1991. To put it mildly, the economy was not at peace with nature. Or consider the vexing complexities facing the left social democracies of Latin America. Bolivia, and Ecuador, states run by socialists who are beholden to very powerful, autonomous grassroots movements, are still very dependent on petroleum revenue. A more radical approach to the crisis of climate change begins **not with a long-term vision** of an alternate society but with an honest engagement with the very compressed timeframe that current climate science implies. In the age of climate change, **these are the real parameters of politics**.

State Good

Climate change mitigation and adaptation requires a revamped role of the state—their total insistence n overthrow of capitalism is a delusion

Christian **PARENTI**, professor of sustainable development at the School for International Training, Graduate Institute, **13** ["A Radical Approach to the Climate Crisis," *Dissent*, Summer 2013, http://www.dissentmagazine.org/article/a-radical-approach-to-the-climate-crisis]

Climate change is a problem of an entirely different order of magnitude, but these past solutions to smaller environmental crises offer lessons. Ultimately, solving the climate crisis—like the nineteenth-century victory over urban squalor and epidemic contagions— will **require a re-legitimation of the state's role** in the economy. The modern story of local air pollution offers another example of the "rebellion of nature." As Jim McNeil outlines in Something New Under The Sun, smog inundations in industrial cities of the United States and Europe used to kill many people. In 1879–1880 smog killed 3,000 Londoners, and in Glasgow a 1909 inversion—where cold air filled with smoke from burning coal was trapped near the ground—killed 1,063. As late as 1952, a pattern of cold and still air killed 4,000 people in London, according to McNeil, and even more according to others. By 1956, the Britons had passed a clean air act that drove coal out of the major cities. In the United States there was a similar process. In 1953, smog in New York killed between 170 and 260 people, and as late as 1966 a smog inversion killed 169 New Yorkers. All of this helped generate pressure for the Clean Air Act of 1970. Today, a similar process is underway in China. Local air quality is so bad that it is forcing changes to Chinese energy policy. A major World Bank study has estimated that "the combined health and non-health cost of outdoor air and water pollution for China's economy comes to around $US 100 billion a year (or about 5.8% of the country's GDP)." People across China are protesting pollution. Foreign executives are turning down positions in Beijing because of the toxic atmospheric stew that western visitors have taken to calling "airpocalypse." The film director Chen Kaige, who won the Palme d'Or for his 1993 film Farewell My Concubine, told the world he couldn't think or make films because of the Chinese capital's appallingly bad air. These local pressures are a large part of what is driving Chinese investment in renewable energy. Last year China added more energy capacity from wind than from the coal sector. Capitalism vs. Nature? Some of the first thinkers to note a conflict between capitalism and non-human nature were Karl Marx and Friedrich Engels. They came to their ecology through examining the local problem of relations between town and country—expressed simultaneously as urban pollution and rural soil depletion. In exploring this question they relied on the pioneering work of soil chemist Justus von Liebig. And from this small-scale problem, they developed the idea of capitalism creating a rift in the metabolism of natural processes. Here is how Marx explained the dilemma: Capitalist production collects the population together in great centers, and causes the urban population to achieve an ever-growing preponderance. This has two results. On the one hand it concentrates the historical motive force of society; on the other hand, it disturbs the metabolic interaction between man and the earth, i.e., it prevents the return to the soil of its constituent elements consumed by man in the form of food and clothing; hence it hinders the operation of the eternal natural condition for the lasting fertility of the soil….All progress in capitalist agriculture is a progress in the art, not only of robbing the worker, but of robbing the soil. And as with "soil robbing," so too concentrations of atmospheric CO2: the natural systems are out of sync; their elements are being rearranged and redistributed, ending up as garbage and pollution. It may well be true that capitalism is incapable of accommodating itself to the limits of the natural world. But **that is not the same question** as whether or not capitalism can solve the climate crisis. Climate mitigation and adaptation are merely an effort to buy time to address the other larger set of problems that is the whole ecological crisis. This is both a pessimistic and an optimistic view. Although capitalism has not overcome the fundamental conflict between its infinite growth potential and the finite parameters of the planet's pollution sinks, **it has**, in the past, **addressed specific environmental crises**. Anyone who thinks the existing economic system must be totally transformed before we can deal with the impending climate crisis is **delusional** or in **willful denial** of the very clear findings of climate science. If the climate system unravels/// , all bets are off. The many progressive visions born of the Enlightenment will be **swallowed and forgotten by the rising seas** or smashed to pieces by the wrathful storms of climate chaos.

The political demands of climate change require reformist politics—the alternatives all or nothing attitude guarantees extinction. Perm is the best way out

Parenti 13

Hard Facts The scientific consensus, expressed in peer-reviewed and professionally vetted and published scientific literature, runs as follows: For the last 650,000 years atmospheric levels of CO_2—the primary heat-trapping gas—have hovered at around 280 parts per million (ppm). At no point in the preindustrial era did CO_2 concentrations go above 300 ppm. By 1959, they had reached 316 ppm and are now over 400 ppm. And the rate of emissions is accelerating. Since 2000, the world has pumped almost 100 billion tons of carbon into the atmosphere—about a quarter of all CO_2 emissions since 1750. At current rates, **CO_2 levels will double by mid-century**. Climate scientists believe that any increase in average global temperatures beyond 2 degrees Celsius above preindustrial levels will lead to dangerous climate change, causing large-scale desertification, crop failure, inundation of coastal cities, mass migration to higher and cooler ground, widespread extinctions of flora and fauna, proliferating disease, and possible social collapse. Furthermore, scientists now understand that the earth's climate system has not evolved in a smooth linear fashion. Paleoclimatology has uncovered evidence of sudden shifts in the earth's climate regimes. Ice ages have stopped and started not in a matter of centuries, but decades. Sea levels (which are actually uneven across the globe) have risen and fallen more rapidly than was once believed. Throughout the climate system, there exist dangerous positive-feedback loops and tipping points. A positive-feedback loop is a dynamic in which effects compound, accelerate, or amplify the original cause. Tipping points in the climate system reflect the fact that causes can build up while effects lag. Then, when the effects kick in, they do so all at once, causing the relatively sudden shift from one climate regime to another. Thus, the UN's Intergovernmental Panel on Climate Change says rich countries like the United States must cut emissions 25 percent to 40 percent below 1990 levels by 2020—only seven years away—and thereafter make precipitous cuts to 90 percent below 1990 levels by 2050. This would require global targets of 10 percent reductions in emissions per annum, starting now. Those sorts of emissions reductions **have only occurred during** economic **depressions**. Russia's near total economic collapse in the early 1990s saw a 37 percent decrease in CO_2 emissions from 1990 to 1995, under conditions that nobody wants to experience. The political implications of all this are mind-bending. As daunting as it may sound, it means that it is this society and these institutions that must cut emissions. That means, **in the short-term, realistic climate politics are reformist** politics, even if they are conceived of as **part of a longer-term anti-capitalist project** of totally economic re-organization.

Institutions Key

Their call to reject all existing institutions guarantees warming happens

Monbiot 8

(George, English Writer and Environmental and Political Activist, 9-4, "Identity Politics in Climate Change Hell," http://www.celsias.com/article/identity-politics-climate-change-hell/)

If you want a glimpse of how the movement against climate change could crumble faster than a summer snowflake, read Ewa Jasiewicz's article , published on the Guardian's Comment is Free site. It is a fine example of the identity politics that plagued direct action movements during the 1990s, and from which the new generation of activists has so far been mercifully free. Ewa rightly celebrates the leaderless, autonomous model of organising that has made this movement so effective. The two climate camps I have attended – this year and last – were among the most inspiring events I've ever witnessed. I am awed by the people who organised them, who managed to create, under extraordinary pressure, safe, functioning, delightful spaces in which we could debate the issues and plan the actions which thrust Heathrow and Kingsnorth into the public eye. Climate camp is a tribute to the anarchist politics that Jasiewicz supports. But in seeking to extrapolate from this experience to a wider social plan, she makes two grave errors. The first is to confuse ends and means. She claims to want to stop global warming, but she makes that task 100 times harder by rejecting all state and corporate solutions. It seems to me that what she really wants to do is to create an anarchist utopia, and use climate change as an excuse to engineer it. Stopping runaway climate change must take precedence over every other aim. Everyone in this movement knows that there is very little time: the window of opportunity in which we can prevent two degrees of warming is closing fast. We have to use all the resources we can lay hands on, and these must include both governments and corporations. Or perhaps she intends to build the installations required to turn the energy economy around - wind farms, wave machines, solar thermal plants in the Sahara, new grid connections and public transport systems - herself? Her article is a terryifying example of the ability some people have to put politics first and facts second when confronting the greatest challenge humanity now faces. The facts are as follows. Runaway climate change is bearing down on us fast. We require a massive political and economic response to prevent it. Governments and corporations, whether we like it or not, currently control both money and power. Unless we manage to mobilise them, we stand a snowball's chance in climate hell of stopping the collapse of the biosphere. Jasiewicz would ignore all these inconvenient truths because they conflict with her politics. "Changing our sources of energy without changing our sources of economic and political power", she asserts, "will not make a difference. Neither coal nor nuclear are the "solution", we need a revolution." So before we are allowed to begin cutting greenhouse gas emissions, we must first overthrow all political structures and replace them with autonomous communities of happy campers. All this must take place within a couple of months, as there is so little time in which we could prevent two degrees of warming. This is magical thinking of the most desperate kind. If I were an executive of E.On or Exxon, I would be delighted by this political posturing, as it provides a marvellous distraction from our real aims. To support her argument, Jasiewicz misrepresents what I said at climate camp. She claims that I "confessed not knowing where to turn next to solve the issues of how to generate the changes necessary to shift our sources of energy, production and consumption". I confessed nothing of the kind. In my book Heat I spell out what is required to bring about a 90% cut in emissions by 2030. Instead I confessed that I don't know how to solve the problem of capitalism without resorting to totalitarianism. The issue is that capitalism involves lending money at interest. If you lend at 5%, then one of two things must happen. Either the money supply must increase by 5% or the velocity of circulation must increase by 5%. In either case, if this growth is not met by a concomitant increase in the supply of goods and services, it becomes inflationary and the system collapses. But a perpetual increase in the supply of goods and services will eventually destroy the biosphere. So how do we stall this process? Even when usurers were put to death and condemned to perpetual damnation, the practice couldn't be stamped out. Only the communist states managed it, through the extreme use of the state control Ewa professes to hate. I don't yet have an answer to this conundrum. Does she? Yes, let us fight both corporate power and the undemocratic tendencies of the state. Yes, let us try to crack the problem of capitalism and then fight for a different system. But let us not confuse this task with the immediate need to stop two degrees of warming, or allow it to interfere with the carbon cuts that have to begin now. Ewa's second grave error is to imagine that society could be turned into a giant climate camp. Anarchism is a great means of organising a self-elected community of like-minded people. It is a disastrous means of organising a planet. Most anarchists envisage their system as the everyone is to be free from the coercive power of the state, this must apply to the oppressors as well as the oppressed. The richest and most powerful communities on earth - be they geographical communities or communities of interest - will be as unrestrained by external forces as the poorest and weakest. As a friend of mine put it, "when the means by which the oppressed can free themselves from persecution. But if anarchist utopia arrives, the first thing that will happen is that every Daily Mail reader in the country will pick up a gun and go and kill the nearest hippy." This is why, though both sides furiously deny it, the outcome of both market fundamentalism and anarchism, if applied universally, is identical. The anarchists associate with the oppressed, the market fundamentalists with the oppressors. But by eliminating the state, both remove such restraints as prevent the strong from crushing the weak. Ours is not a choice between government and no government. It is a choice between government and the mafia. Over the past year I have been working with groups of climate protesters who have changed my view of what could be achieved. Most of them are under 30, and they bring to this issue a clear-headedness and pragmatism that I have never encountered in direct action movements before. They are prepared to take extraordinary risks to try to defend the biosphere from the corporations, governments and social trends which threaten to make it uninhabitable. They do so for one reason only: that they love the world and fear for its future. It would be a tragedy if, through the efforts of people like Ewa, they were to be diverted from this urgent task into the identity politics that have wrecked so many movements.

Reps Good

Framework

Imagining possible changes is necessary to motivate action on the climate

Elizabeth **SHOVE** Sociology @ Lancaster **AND** Gordon **WALKER** Geography @ Lancaster **'7**
["CAUTION! Transitions ahead: politics, practice, and sustainable transition management," *Environment and Planning C* 39 (4)]

For academic readers, our commentary argues for loosening the intellectual grip of 'innovation studies', for backing off from the nested, hierarchical multi-level model as the only model in town, and for exploring other social scientific, but also systemic theories of change. The more we think about the politics and practicalities of reflexive transition management, the more complex the process appears: for a policy audience, our words of caution could be read as an invitation to abandon the whole endeavour. If agency, predictability and legitimacy are as limited as we've suggested, this might be the only sensible conclusion. However, we are with Rip (2006) in recognising the value, productivity and everyday necessity of an **'illusion of agency'** and of the working expectation that a difference can be made even in the face of so much evidence to the contrary. The outcomes of actions are unknowable, the system unsteerable and the effects of deliberate intervention inherently unpredictable and, ironically, it is this that sustains concepts of agency and management. As Rip argues '**illusions are productive** because they **motivate action** and repair work, and thus something (whatever) is achieved' (Rip 2006: 94). Situated inside the systems they seek to influence, governance actors – and actors of other kinds as well - are part of the **dynamics of change**: even if they cannot steer from the outside they are **necessary to processes within**. This is, of course, also true of academic life. Here we are, busy critiquing and analysing transition management in the expectation that somebody somewhere is listening and maybe even taking notice. If we removed that illusion would we bother writing anything at all? Maybe we need such fictions to keep us going, and maybe – fiction or no - somewhere along the line something really does happen, but not in ways that we can anticipate or know.

AT: warming distancing

In the context of warming it is important to privilege scientific data. Personal experience is a flawed approach to climate change—creates systemic bias and inaction

-can't detect climate change locally b/c of temperature fluctuations

-people are misled by extreme events instead of long term trends

-more likely to underestimate the impacts of warming

Weber and Stern **11**

(professor @ Center for Research on Environmental Studies @ ColumbiaElke U. and Paul C. Stern, "Public Understanding of Climate Change in the United States" American Psychologist Vol. 66, No. 4, 315–328 May/June)

The power and limitations of personal experience. Personal experience is a powerful teacher, readily available to everyone from an early age. Decisions based on personal experience with the outcomes of actions (e.g., touching a hot stove or losing money in the stock market) involve associative and affective processes that are fast and automatic (Weber, Shafir, & Blais, 2004). However, learning from personal experience can lead to systematic bias in understanding climate change. First, there are serious problems detecting the signal. In most U.S. locales at this time, it is virtually impossible to detect the signal of climate change from personal experience, amid the noise of random fluctuations around the central trend (Hansen, Sato, Glascoe, & Ruedy, 1998). Second, people are likely to be misled by easily memorable extreme events. Such events have a disproportionate effect on judgment (Keller, Siegrist, & Gutscher, 2006) even though they are poor indicators of trends. Extreme events by definition are highly infrequent, and it takes a long time to detect a change in the probability of an event that occurs, on average, once in 50 years or less frequently. The likelihood of an increase in the frequency or intensity of extreme climaterelated events large enough to be noticed by humans will be small for some time in many regions of the world. Even individuals whose economic livelihood depends on weather and climate events (e.g., farmers or fishers) might not receive sufficient feedback from their daily or yearly personal experience to reliably detect climate change, though recent surveys conducted in Alaska and Florida (two states in which the climate signal has been relatively strong) show that such personal exposure greatly increases the concern and willingness of citizens in these states to take action (Arctic Climate Impact Assessment, 2004; Leiserowitz & Broad, 2008).6 These studies are noteworthy for examining people's attempts to learn about climate change from personal experience, providing direct empirical evidence about the power as well as the shortcomings of this form of learning in this domain, rather than extrapolating from results of research in other domains. Third, experiential learning tends to bias the public's understanding because of a tendency to over-weight recent events (Hertwig, Barron, Weber, & Erev, 2004). The evaluation of probabilistic outcomes follows classical reinforcement learning models, in which positive (negative) consequences increase (decrease) the likelihood of a behavior that gave rise to them. Such learning processes give recent events more weight than distant events, which is adaptive in dynamic environments where circumstances change with the seasons or other cycles or trends (Weber et al., 2004). Because extreme events have a small probability of having occurred recently, they usually have a smaller impact on the decision than their objective likelihood of occurrence would warrant. But when they do occur, recency weighting gives them a much larger impact on judgment and decision than their probability warrants, making decisions from experience more volatile across past outcome histories than decisions from description (Yechiam, Barron, & Erev, 2005). As a result, nonscientists can be expected to overreact to rare events like a hurricane or a heat wave (Li, Johnson, & Zaval, 2011) but most of the time to underestimate the future adverse consequences of climate change. Beliefs in climate change have been shown to be affected by local weather conditions (Li et al., 2011), and a relatively cool 2008 may have influenced the drop in American concern about climate change in 2008–2009 (Woods Institute for the Environment, 2010). Confusing weather with climate increases the potential for these sorts of error (Weber, 2010). Climate scientists can also overreact to single vivid events, but their greater reliance on analytic processing, accumulations of data, statistical descriptions and model outputs, and scientific deliberation and debate can be expected to dampen this tendency. Without such correctives, nonscientists are more likely than scientists to accept evidence that confirms preexisting beliefs and to fail to search out disconfirming evidence (Evans, 1989). The scientific method can be seen as a cultural adaptation designed to counteract the emotionally comforting desire for confirmation of one's beliefs, which is present in everyone (M. Gardner, 1957). Finally, nonscientists differ from scientists in the way they react to uncertainty. Rather than using probability theory to gauge and express the degree of belief in possible future events and to incorporate new evidence, nonscientists respond to uncertainty in ways that are more emotional than analytic (Loewenstein, Weber, Hsee, & Welch, 2001) and in qualitatively different ways depending on whether

the uncertain events are perceived as favorable or adverse (Smithson, 2008). Nonscientists prefer concrete representations of uncertainty that relate to their experience (Marx et al., 2007). To satisfy this preference, some scientists translate probabilistic forecasts into a small set of scenarios (e.g., best- to worst-case) to facilitate strategic planning by professional groups such as military commanders, oil company managers, and policymakers (Schoemaker, 1995).

AT: Apoc Rhetoric Bad (Warming)

Disaster framing of warming overcomes fear and disbelief.

Joe **ROMM**, Fellow at American Progress, editor of Climate Progress, Ph.D. in physics from MIT, **12** [February 26, 2012, "Apocalypse Not: The Oscars, The Media And The Myth of 'Constant Repetition of Doomsday Messages' on Climate," http://thinkprogress.org/romm/2012/02/26/432546/apocalypse-not-oscars-media-myth-of-repetition-of-doomsday-messages-on-climate/#more-432546]

The two greatest myths about global warming communications are 1) constant repetition of doomsday messages has been a major, ongoing strategy and 2) that strategy doesn't work and indeed is actually counterproductive! These myths are so deeply ingrained in the environmental and progressive political community that when we finally had a serious shot at a climate bill, the powers that be decided not to focus on the threat posed by climate change in any serious fashion in their $200 million communications effort (see my 6/10 post "Can you solve global warming without talking about global warming?"). These myths are so deeply ingrained in the mainstream media that such messaging, when it is tried, is routinely attacked and denounced — and the flimsiest studies are interpreted exactly backwards to drive the erroneous message home (see "Dire straits: Media blows the story of UC Berkeley study on climate messaging") The only time anything approximating this kind of messaging — not "doomsday" but what I'd call blunt, science-based messaging that also makes clear the problem is solvable — was in 2006 and 2007 with the release of An Inconvenient Truth (and the 4 assessment reports of the Intergovernmental Panel on Climate Change and media coverage like the April 2006 cover of Time). The data suggest that strategy measurably moved the public to become more concerned about the threat posed by global warming (see recent study here). You'd think it would be pretty obvious that the public is not going to be concerned about an issue unless one explains why they should be concerned about an issue. And the social science literature, including the vast literature on advertising and marketing, could not be clearer that only repeated messages have any chance of sinking in and moving the needle. Because I doubt any serious movement of public opinion or mobilization of political action could possibly occur until these myths are shattered, I'll do a multipart series on this subject, featuring public opinion analysis, quotes by leading experts, and the latest social science research. Since this is Oscar night, though, it seems appropriate to start by looking at what messages the public are exposed to in popular culture and the media. It ain't doomsday. Quite the reverse, climate change has been mostly an invisible issue for several years and the message of conspicuous consumption and business-as-usual reigns supreme. The motivation for this post actually came up because I received an e-mail from a journalist commenting that the "constant repetition of doomsday messages" doesn't work as a messaging strategy. I had to demur, for the reasons noted above. But it did get me thinking about what messages the public are exposed to, especially as I've been rushing to see the movies nominated for Best Picture this year. I am a huge movie buff, but as parents of 5-year-olds know, it isn't easy to stay up with the latest movies. That said, good luck finding a popular movie in recent years that even touches on climate change, let alone one a popular one that would pass for doomsday messaging. Best Picture nominee The Tree of Life has been billed as an environmental movie — and even shown at environmental film festivals — but while it is certainly depressing, climate-related it ain't. In fact, if that is truly someone's idea of environmental movie, count me out. The closest to a genuine popular climate movie was the dreadfully unscientific The Day After Tomorrow, which is from 2004 (and arguably set back the messaging effort by putting the absurd "global cooling" notion in people's heads! Even Avatar, the most successful movie of all time and "the most epic piece of environmental advocacy ever captured on celluloid," as one producer put it, omits the climate doomsday message. One of my favorite eco-movies, "Wall-E, is an eco-dystopian gem and an anti-consumption movie," but it isn't a climate movie. I will be interested to see The Hunger Games, but I've read all 3 of the bestselling post-apocalyptic young adult novels — hey, that's my job! — and they don't qualify as climate change doomsday messaging (more on that later). So, no, the movies certainly don't expose the public to constant doomsday messages on climate. Here are the key points about what repeated messages the American public is exposed to: The broad American public is exposed to virtually no doomsday messages let alone constant ones, on climate change in popular culture (TV and the movies and even online). There is not one single TV show on any network devoted to this subject, which is, arguably, more consequential than any other preventable issue we face. The same goes for the news media, whose coverage of climate change has collapsed (see "Network News Coverage of Climate Change Collapsed in 2011"). When the media do cover climate change in recent years, the overwhelming majority of coverage is devoid of any doomsday messages — and many outlets still feature hard-core deniers. Just imagine what the public's view of climate would be if it got the same coverage as, say, unemployment, the housing crisis or even the deficit? When was the last time you saw an "employment denier" quoted on TV or in a newspaper? The public is exposed to constant messages promoting business as usual and indeed idolizing conspicuous consumption. See, for instance, "Breaking: The earth is breaking ... but how about that Royal Wedding? Our political elite and intelligentsia, including MSM pundits and the supposedly "liberal media" like, say, MSNBC, hardly even talk about climate change and when they do, it isn't doomsday. Indeed, there isn't even a single national columnist for a major media outlet who writes primarily on climate. Most "liberal" columnists rarely mention it. At least a quarter of the public chooses media that devote a vast amount of time to the notion that global warming is a hoax and that environmentalists are extremists and that clean energy is a joke. In the MSM, conservative pundits routinely trash climate science and mock clean energy. Just listen to, say, Joe Scarborough on MSNBC's Morning Joe mock

clean energy sometime. The major energy companies bombard the airwaves with millions and millions of dollars of repetitious pro-fossil-fuel ads. The environmentalists spend far, far less money. As noted above, the one time they did run a major campaign to push a climate bill, they and their political allies including the president explicitly did NOT talk much about climate change, particularly doomsday messaging Environmentalists when they do appear in popular culture, especially TV, are routinely mocked. There is very little mass communication of doomsday messages online. Check out the most popular websites. General silence on the subject, and again, what coverage there is ain't doomsday messaging. Go to the front page of the (moderately trafficked) environmental websites. Where is the doomsday? If you want to find anything approximating even modest, blunt, science-based messaging built around the scientific literature, interviews with actual climate scientists and a clear statement that we can solve this problem — well, you've all found it, of course, but the only people who see it are those who go looking for it. Of course, this blog is not even aimed at the general public. Probably 99% of Americans haven't even seen one of my headlines and 99.7% haven't read one of my climate science posts. And Climate Progress is probably the most widely read, quoted, and reposted climate science blog in the world. Anyone dropping into America from another country or another planet who started following popular culture and the news the way the overwhelming majority of Americans do would get the distinct impression that nobody who matters is terribly worried about climate change. And, of course, they'd be right — see "The failed presidency of Barack Obama, Part 2." It is total BS that somehow the American public has been scared and overwhelmed by repeated doomsday messaging into some sort of climate fatigue. If the public's concern has dropped — and public opinion analysis suggests it has dropped several percent (though is bouncing back a tad) — that is primarily due to the conservative media's disinformation campaign impact on Tea Party conservatives and to the treatment of this as a nonissue by most of the rest of the media, intelligentsia and popular culture.

Apocalyptic Rhet Good

It's good and solves

Veldman 12

(Robin, Flordida religion PhD student, "Narrating the Environmental Apocalypse: How Imagining the End Facilitates Moral Reasoning Among Environmental Activists", Ethics and the Environment, 17.1, JSTOR)

As we saw in the introduction, critics often argue that apocalyptic rhetoric induces feelings of hopelessness or fatalism. While it certainly does for some people, in this section I will present evidence that apocalypticism also often goes hand in hand with activism. Some of the strongest evidence of a connection between environmental apocalypticism and activism comes from a national survey that examined whether Americans perceived climate change to be dangerous. As part of his analysis, Anthony Leiserowitz identified several "interpretive communities," which had consistent demographic characteristics but varied in their levels of risk perception. The group who perceived the risk to be the greatest, which he labeled "alarmists," described climate change ETHICS & THE ENVIRONMENT, 17(1) 2012 using apocalyptic language, such as "Bad…bad…bad…like after nuclear war…no vegetation," "Heat waves, it's gonna kill the world," and "Death of the planet" (2005, 1440). Given such language, this would seem to be a reasonable way to operationalize environmental apocalypticism. If such apocalypticism encouraged fatalism, we would expect alarmists to be less likely to have engaged in environmental behavior compared to groups with moderate or low levels of concern. To the contrary, however, Leiserowitz found that alarmists "were significantly more likely to have taken personal action to reduce greenhouse gas emissions" (ibid.) than respondents who perceived climate change to pose less of a threat. Interestingly, while one might expect such radical views to appeal only to a tiny minority, Leiserowitz found that a respectable eleven percent of Americans fell into this group (ibid). Further supporting Leiserowitz's findings, in a separate national survey conducted in 2008, Maibach, Roser-Renouf, and Leiserowitz found that a group they labeled "the Alarmed" (again, due to their high levels of concern about climate change) "are the segment most engaged in the issue of global warming. They are very convinced it is happening, humancaused, and a serious and urgent threat. The Alarmed are already making changes in their own lives and support an aggressive national response" (2009, 3, emphasis added). This group was far more likely than people with lower levels of concern over climate change to have engaged in consumer activism (by rewarding companies that support action to reduce global warming with their business, for example) or to have contacted elected officials to express their concern. Additionally, the authors found that "[w]hen asked which reason for action was most important to them personally, the Alarmed were most likely to select preventing the destruction of most life on the planet (31%)" (2009, 31)—a finding suggesting that for many in this group it is specifically the desire to avert catastrophe, rather than some other motivation, that encourages pro-environmental behavior. Taken together, these and other studies (cf. Semenza et al. 2008 and DerKarabetia, Stephenson, and Poggi 1996) provide important evidence that many of those who think environmental problems pose a severe threat practice some form of activism, rather than giving way to fatalistic resignation.

Climate Reps Good

Our heuristic overcomes disbelief and mobilizes public responses

Romm 12 (Joe Romm is a Fellow at American Progress and is the editor of Climate Progress, which New York Times columnist Tom Friedman called "the indispensable blog" and Time magazine named one of the 25 "Best Blogs of 2010." In 2009, Rolling Stone put Romm #88 on its list of 100 "people who are reinventing America." Time named him a "Hero of the Environment" and "The Web's most influential climate-change blogger." Romm was acting assistant secretary of energy for energy efficiency and renewable energy in 1997, where he oversaw $1 billion in R&D, demonstration, and deployment of low-carbon technology. He is a Senior Fellow at American Progress and holds a Ph.D. in physics from MIT., 2/26/2012, "Apocalypse Not: The Oscars, The Media And The Myth of 'Constant Repetition of Doomsday Messages' on Climate", http://thinkprogress.org/romm/2012/02/26/432546/apocalypse-not-oscars-media-myth-of-repetition-of-doomsday-messages-on-climate/#more-432546)

There is intrinsic value to the future-counterfactual simulation of the 1ac – representations of future climate change impacts leads to new solutions external to the aff and avoid traditional pedagogical dilemmas of role-playing

--sex edited

--attempts to project conceptions of the past into the future rely on an anchoring bias that is flawed – new scenarios must be injected to understand new futures

Junio 13 – PhD in Political Science @ Penn, currently @ Stanford

(Timothy and Thomas Mahnken, "Conceiving of Future War: The Promise of Scenario Analysis for International Relations," International Studies Review, 15)

As noted in our discussion of the counterfactuals literature, most scholars writing about the method focus on history. We argue that future counterfactuals may assist scholars in the same ways as historical ones and offer additional benefits. Scenarios may be useful for theory building and development, identifying new hypotheses, analyzing data-poor research topics, articulating "world views," setting new research agendas, avoiding cognitive biases, and teaching. ¶ Theory Building and Development¶ The structured analysis of future counterfactuals offers a unique approach for the study of causal effects in social systems. The first category, and perhaps most significant, is the ability of researchers to use scenarios to identify variables of interest and consider ways to measure them. This is an approach

sometimes rec- ommended for qualitative research; it consists of writing a notional depiction of what a case study might look like. This exercise helps researchers to think through what variables are of greatest interest, what values those variables might take on, and how they interact to cause values of the dependent variable. Sce- nario analysis is one way in which researchers may conduct such a notional case study. Rather than introduce a timeless or historical vignette regarding fictional circumstances, the researcher may find it beneficial to place their case in the future. This helps orient the research project toward current and anticipated political issues—thus increasing the relevance of the work—even if the actual case studies are historical. Thinking through the causal process in this way helps the researcher to identify a wider range of explanatory variables, including those that have not yet occurred or may be of very low probability (but are still consis- tent with existing or proposed theoretical arguments). Scenario analysis also helps the researcher to consider the range of values that the identified indepen- dent variables may take on, as exploration of different "worlds" pushes the boundaries of the researcher's predispositions going into the research project. Robust scenario analysis thus helps the researcher to identify the upper and lower bounds of their theory.¶ Second, a commonly cited advantage of counterfactual reasoning that is useful for this process of theory building is a researcher's attempt to manipulate one variable in a causal process while holding others constant, thus isolating the effects of different values of the independent variable on the dependent vari- able. Manipulating one variable at a time to do a better job of analyzing causal processes is often very difficult to do, as, in the real world, interactions between variables often lead to unpredictable and nonlinear outcomes (Jervis 1997:34– 60). For instance, a scholar conducting an analysis of tax rates and other domes- tic legislation regarding oil may use a counterfactual of a different average oil price in the 1970s. Such a counterfactual would have some fairly obvious implica- tions for the domestic political question, but a world in which that one variable were manipulated would have a large number of equally plausible second- and third-order consequences for regional politics in the Middle East. Those conse- quences could conceivably feed back into domestic US politics, thus affecting the social system under analysis in a way the researcher may not have controlled for in the original scenario. ¶ Despite these acknowledged difficulties in using a "manipulate one variable" approach for the purpose of assaying real-world policy options, it is a useful input to the processes of building theory and research design. The best defense¶ of such an approach is that all forms of modeling involve abstractions from real- ity, and even highly unrealistic models— such as James Fearon's famous ideal condition in which war should never occur—are useful for studying real events (Fearon 1995). Furthermore, manipulating one variable at a time is more appro- priate to some kinds of counterfactual reasoning than others. Consider the three main categories of scenario use: political narratives, game theory and formal modeling, and experimentation. The "manipulate one variable" approach seems least useful to political narratives, which often try to tackle such tough questions as "What is the future of the international system?" Although scenarios offer advantages to developing and extending theory in regard to these sorts of ques- tions, particularly in assessing key drivers and articulating world views (discussed in the next subsections), a scientific approach of controlling for various social factors is unlikely to succeed. In these projects, manipulating one variable at a time serves only to develop one of many possible futures in the interest of extending the range of the theory's explanatory power.¶ On the other hand, the "manipulate one variable" approach offers more direct advantages for formal modeling and experimentation. The reasoning for each follows a comment made by Elinor Ostrom in her 1997 American Political Sci- ence Association presidential address. Ostrom suggested that "from...scenarios, one can proceed to formal models and empirical testing in field and laboratory settings" (Ostrom 1998). The experimental method with human subjects benefits strongly from the use of scenarios. In one study of how values factor into Ameri- cans' economic decision making, a team of researchers sought to "attribute sig- nificant differences in average responses between conditions to the independent variables manipulated in the hypothetical scenario; that is, to the factors intuitive neorealists should weigh heavily and intuitive economists should weigh lightly" (Herrmann, Tetlock, and Diascro 2001). That is to say, one variable related to individuals' world views could be manipulated at once in the experiment, and the researcher may test for the significance of variance between the test and con- trol groups.¶ After using scenarios to better identify variables of interest and the role of their specific values in a causal process, a third category of applications of scenario analysis to theory building is to develop new hypotheses and ways to test them. This follows from using scenarios to identify new independent variables and how their values may effect changes on the dependent variable; each new causal argu- ment may (and should) be expressed as a hypothesis to be tested in the broader research project for which the scenario analysis was developed. Additionally, "day- after" scenarios that seek to walk back the causal processes that may have led to a consequential event are particularly well suited to developing hypotheses (Holmes and Yoshihara 2008). By definition, this type of scenario analysis seeks to discover causal pathways. For instance, one might seek to chart various paths by which a particular type of social revolution may occur in a country of interest. Each narrative of how such a revolution could come to pass would result in at least one hypothesis regarding the links between the many variables of interest. These hypotheses may then be tested against historical data or used to develop new kinds of data collection methods (discussed further in the next section).¶ Finally, scenario analysis helps to explore completely new theoretical projects in a deductive way, whereas a great deal of qualitative work in political science tends to be inductive from the case study method. The use of scenario analysis may help scholars to pursue an "abductive," or hybrid, method of theory build- ing that draws on both deductive reasoning and insights from cases (Mayer and Pirri 1995). For example, a data-poor research subject, such as how states may respond to computer network attack, has few historical precedents (Mahnken 2011; Rid 2012). If a researcher were interested in identifying the circumstances under which states are more likely to resort to violence in response to cyber¶ attack, he would be confounded by the problem that never in history has a state responded with violence to such an attack. Scenario analysis beginning with the value of violent counter-attack on the dependent variable (the DV being a state's strategy choice) would help the researcher to deduce likely circumstances under which such an outcome may occur. Historical analysis, such as regarding other kinds of information threats, would be helpful for such a project, but the differ- ences between cyber and other kinds of information transmission would result in an incomplete causal narrative based on inductive reasoning alone.¶ Data-Poor Research Topics¶ Scenarios are a useful method for theory building and research design for topics that, despite being of high importance, lack an empirical base. The best example of this type of research is scholarship on nuclear warfare. An enormous literature evolved during the Cold War regarding how a nuclear war might be fought and how escalation dynamics might occur (Kahn 1962; Brown and Mahnken 2011). This literature was based almost exclusively on future counterfactuals, as there were no nuclear wars to study and a very low "n"—consisting of the Cuban Missile Crisis and very few other crises—for publicly acknowledged "close calls" (Sagan 1995). Indeed, in our survey of the use of scenarios in the discipline, more than 25% were about nuclear warfare. Other topics that are of high impor- tance but have a very low or zero "n" include great-power war, global epidemics, climate change, large-scale cyber attack, and weapon of mass destruction terrorism.¶ The points made earlier regarding the identification of new variables and hypotheses are relevant here. In addition to these advantages to new research topics, scenario analysis helps to identify new sources of data. This is partially because scenarios help to identify new independent variables, thus leading the researcher

to think about how to measure their values, but also by helping him to think of proxies for measurement when direct observation is not possible. For instance, a day-after analysis of a scenario of interest would cause the researcher to ask what [s]he would have needed to know to predict the occurrence of the future counterfactuals and in turn help the researcher to think about ways in which the discipline could identify that low-probability process if it begins to happen in the real world.¶ Articulation of "World Views"¶ In addition to the process of building theory, scenarios are useful in helping to link theories. This is known as the articulation of a "world view," which is a set of guiding logics for how an international system operates, such as realism, con- structivism, and neoliberal institutionalism (Doyle 1997). For any world view, one may use scenario analysis to narrate what the theory logically dictates ought to happen in the world. Similar to the benefit to theory building, but on a greater scale, this approach offers an opportunity for empirical validation of the world view over time. For instance, a scenario at a high level of abstraction, such as the structure of a political system, allows for the validation or invalidation of multiple theories and interactions of theories. Should behavior in the world fail to conform to the expectations of the world view, this of course offers scholars an opportunity to reconsider the guiding logics of their world view.¶ In the early 1990s, for example, a team of defense analysts had been tasked with developing a set of scenarios for the post–Cold War security environment (Project 2025 1994). They crafted a scenario of a future world dominated by conflict between radical Islam and the West that resembled in some key respects the current struggle against Al Qaeda and its Associated Movements. The sce- nario should not be seen as a prediction of current events, however. Rather, the¶ scenario was developed to test whether or not one could plausibly make the case for a global ideological conflict at a time when IR scholars such as Francis Fukuy- ama were arguing that ideological conflict had become a thing of the past (Fukuyama 1992). Islam appeared to be the most plausible universalist ideology that could trigger widespread conflict.¶ Another example is that a realist scholar may benefit from a scenario analysis of the likely futures of the European Union. Such an analysis would project dif- ferent possible outcomes—ranging from dissolution through more coherent for- eign policy and security integration—from basic premises consistent with the realist world view pitted against the premises of competing world views. The final section of this article offers an example of when John Mearsheimer conducted such an analysis more than 20 years ago; he developed scenarios regarding the future of Europe by comparing the expectations of offensive realism to other theoretical approaches.¶ Setting Research Agendas¶ The remainder of this section describes ways in which scenarios are useful to political scientists in ways other than developing theory. Scenarios are often used in the business and national security policy communities to have "smarter con- versations." This use of the scenario method differs from positivist social science and instead seeks to improve knowledge through participation in scenario exer- cises. Such exercises usually involve a facilitated discussion. One way in which scenario conversations may make researchers smarter is to identify new research questions. Thinking about critical drivers of the future may help scholars to understand areas that presently have no useful theories and to avoid the ten- dency of the political science discipline to consistently focus on a small number of questions. For instance, the New Era Foreign Policy Conference, initiated by the University of California, Berkeley, and currently cosponsored by the Ameri- can University, University of California, Berkeley, and Duke University, seeks to bring together graduate students of political science to engage in scenario analy- sis and identify future research topics.8¶ Avoiding Cognitive Biases¶ In a methods book on scenarios, James Ogilvy discussed the inability of extre- mely bright people to see ahead due to cognitive biases, that is, what people found "unthinkable," though those futures eventually came into being. In the context of discussing the future of US and USSR nuclear arsenals during a 1980s scenario exercise, Ogilvy wrote in hindsight that "two decades later we now take for granted what was then unthinkable to some very good thinkers" (Ogilvy 2002:191). This comment is very similar to an insight by Philip Tetlock that polit- ical scientists tend to view surprises as overdetermined in hindsight, but as incon- ceivable ahead of time (Weber 1996:281).¶ Scenarios, whether formally written or developed for purposes of conversation, offer a powerful way for researchers to compensate for cognitive biases endemic to any kind of human research. Scenarios do this by forcing researchers to con- front their most basic assumptions about how the world operates and by teasing out the logical implications of extreme values on the independent variables of interest. As Peter Schwartz put it,¶ "[Scenario building is] all part of a process of self-reflection: understanding your- self and your biases, identifying what matters to you, and perceiving where to put your attention. It takes persistent work and honesty to penetrate our internal mental defenses. To ensure the success of our efforts, we need a clear under- standing of the relationship between our own concerns and the wider world around us. To achieve that, it helps to have a constant stream of rich, diverse, and thought-provoking information" (Schwartz 1996:59).¶ One of the most common forms of bias that scenarios help to compensate for is an anchoring bias; that is, the tendency to interpret new information in ways that conform with our preexisting beliefs (Jervis 1976:143–202). One might also think about this as a "linear projection" bias; scholars who have a view of how the world is operating in the present (theoretically informed or not) may well project this view into the future. In addition to forcing scholars to explicitly confront these beliefs, the scenario process offers a way to think about sorting new information. A com- pleted scenario project allows a researcher to think about multiple futures (with differing plot lines for how the world arrived there) at once. Thus, new informa- tion is not automatically compared against a single linear projection into the future, but rather weighted relative to alternative futures. New information might be consistent with all hypothesized futures, in which case the new information may not lead to a new understanding. An example is the current debate regarding whether China is rising or declining relative to the United States. This literature, despite access to the same data, offers remarkably different projections regarding the future strength of each state and what this portends for the international sys- tem (Pape 2005; Layne 2009; Beckley 2011/2012; Subramanian 2011). In many cases, however, new information is likely to favor one trend line over another, thus changing how a researcher assigns probabilities to various futures.¶ Pedagogy¶ Scenarios offer many of the same benefits as simulations, recently a hot topic in the pedagogical literature, to teaching in political science (Newkirk and Hamil- ton 1979; Smith and Boyer 1996; Newmann and Twigg 2000; Simpson and Kauss- ler 2009; Sasley 2010). Indeed, scenarios are often a key part of simulation learning. For instance, in a decision-making simulation in which students are assigned the roles of heads of state, the students are often offered a scenario vignette to respond to with policy choices. The emphasis of scenarios and simu- lations in pedagogy, however, is different. The literature on simulations tends to focus on experiential learning, but recent scholarship has cast some doubt on whether or not this kind of learning improves students' knowledge of core course concepts (Raymond 2010).¶ Scenarios offer a way to make classroom exercises more explicitly oriented toward the incorporation of theories. For instance, rather than asking students to take on the roles of the President, National Security Advisor, etc., the students may be presented with a vignette and asked to analyze the strategic implications of the scenario for the United States. Both coauthors of this article have used scenarios in classroom exercises. Tom Mahnken has taught the use of scenarios for stategic planning at the Naval War College. Tim Junio used scenario exer- cises at the University of Pennsylvania. Students in the class "International Secu- rity," having been assigned Thomas Schelling's Arms and Influence and other core readings on strategy, were asked to evaluate a scenario in which the United States had committed itself to military action, but was subsequently held hostage by a foreign power.¶ In Junio's scenario, a future US President was led to believe that due to an intel- ligence breakthrough, North Korean nuclear weapon targets were rendered¶ vulnerable to a US first strike with conventional weapons. The United States and close allies saw this as an opportunity for regime change and pre-positioned US forces in the region. The US President then issued an ultimatum to the North Korean regime to vacate the country within 48 hours, akin to the US threat to Sad- dam Hussein in 2003, or face a forceful regime change at the hands of the US-led coalition. To the surprise of US leaders, North Korea's Supreme Leader went on television to announce that an unspecified number of nuclear warheads had been smuggled into the United States as a contingency against such a situation. The Supreme Leader then declared that any act of aggression against the North Korean people would be met with retaliation against the US homeland. Students in the class were asked to first discuss the strategic situation for the United States. What mistakes had been made to get the United States into that situation? What issues were at stake? Then, the students were asked to apply strategic concepts to discuss how the United States might seek to extricate itself from the situation.¶ The North Korea's blackmail scenario is an example of an extremely low-prob- ability event that almost certainly would not justify much further analysis by the intelligence and defense policy communities, but is extremely useful for peda- gogy. This kind of scenario increases student interest in the material and

forces them to engage with the theories and concepts of the course. <u>Rather than focus on policy decisions alone</u>, as simulations are likely to do, <u>students are forced to bring deductive logic to bear to assess the boundaries of the scenario.</u>¶ Demonstrations of Robust Scenario Analysis¶ Mearsheimer 1990a,b¶ A widely read example of scenario analysis, though one not often considered methodologically interesting, is John Mearsheimer's "Back to the Future: Insta- bility in Europe After the Cold War" (published more accessibly in The Atlantic as "Why We Will Soon Miss the Cold War") (Mearsheimer 1990a,b). Mearshei- mer offered several scenarios of what post–Cold War Europe might look like; the one he deemed most probable suggested that Germany (and possibly others) would develop nuclear weapons and that European states would resume security competition. Mearsheimer contrasted this scenario, driven by the theoretical expectations of offensive realism, with outcomes predicted by the democratic peace and economic interdependence perspectives.¶ The dependent variable of interest in Mearsheimer's scenario analysis was the risk of war in Europe following the end of the Cold War. His primary research question was, "Would the end of the bipolar power structure result in a higher or lower risk of war?" He considered several independent variables, including the distribution of military power (possible values: a range along a spectrum from bipolar to multipolar [unipolar perhaps being logically possible, but he does not explicitly include it as a possibility]); the character of military power, defined in terms of the distribution of nuclear weapons (possible values: aboli- tion, sustenance of existing levels, unmitigated proliferation, or mitigated prolif- eration [current nuclear powers manage their spread]); and domestic politics (possible values: degree of nationalism, ranging from high to low). Mearsheimer was explicit regarding how he believed these independent variables should effect values on his dependent variable of war proneness. Bipolar power distributions were believed to be more stable than multipolar. Nuclear weapons were expected to increase the probability of war in the first three of his four categori- cal values. High values of nationalism were expected to increase the risk of war, while low values of nationalism would reduce or keep even the risk of war.¶ The shortest formulation of Mearsheimer's theory of offensive realism is that states seek to maximize their relative power. A relevant aspect of the theory¶ that Mearsheimer articulated is states' perceptions of the costs and risks of going to war; he believed a competitive world under offensive realism might still be peaceful if the costs and risks of going to war were perceived to be high and the benefits of going to war low (Mearsheimer 1990a:12). Mearshei- mer also noted competing theoretical approaches regarding how European states were likely to behave during his analyzed time period: an international institutions perspective (IV: the strength of international institutions, ordinal), which Mearsheimer deemed irrelevant as power-seeking behavior should trump institutional concerns; democratic peace theory (IV: joint democracy, binary), which he found unpersuasive for a few reasons, including nationalism, defec- tion, and uneven spread of democracy among post-Soviet states; and pacifism (IV: binary, learned war is bad or did not), which Mearsheimer believed lacks an empirical basis.¶ Although Mearsheimer discussed these other theoretical perspectives superfi- cially, he developed a detailed account based on how he believed offensive real- ism would effect values on his three main independent variables of interest. He believed "it is certain that bipolarity will disappear, and multipolarity will emerge in the new European order" (Mearsheimer 1990a:31). He believed this because with the end of the US and Soviet spheres of influence, European states would be strongly incentivized by the anarchic character of the international system to provide for their own security. Thus, no two states were likely to emerge as clear poles in the European state system; rather, power would be diffused as many states competed with one other. Mearsheimer was highly confident in this out- come and treated it as more of a background condition than an important determinant of outcomes on his dependent variable.¶ The second two independent variables were nuclear proliferation and nation- alism. Mearsheimer viewed the most critical uncertainty regarding the future of security in Europe as the distribution and deployment patterns of nuclear weap- ons. He wrote that "the best new order would incorporate the limited, managed proliferation of nuclear weapons. This would be more dangerous than the cur- rent order, but considerably safer than 1900–1945. The worst order would be a non-nuclear Europe in which power inequalities emerge between the principal poles of power" (Mearsheimer 1990a:31). Mearsheimer offered scenarios of what it would look like if each of these outcomes resulted. Finally, Mearsheimer con- sidered the future that actually resulted, or the continuation of existing nuclear weapon ownership patterns. He argued that his theory predicted this future would not come to be, as Germany was expected to desire nuclear weapons so that they would not have to rely on Poland and Czechoslovakia to provide a bar- rier against a Soviet invasion, and because small East European states would simi- larly perceive nuclear weapons to be of the highest security interest. Nationalism was less important and factored into Mearsheimer's analysis as an interaction effect between nuclear proliferation and nationalism that may make war more likely under some conditions.¶ In summary, Mearsheimer's article provides an excellent example of scenario analysis being used to extend an existing theory and develop testable hypotheses that were subsequently falsified. His futures also constitute "plot lines" formed by the interaction of multiple variables of interest. Mearsheimer explained why he expected a particular outcome in Western Europe in the 1990s and why he did not expect other outcomes. The historical record clearly falsifies the hypoth- eses derived from his theory of offensive realism. Various reasons may explain why his theory was incorrect—such as normative claims, continued reliance on US security guarantees, and so on—but it is at least clear that his scenario-based approach framed a debate in a rigorous and clearly articulated way and has led to new areas of exploration for the discipline.¶ A second example of robust scenario analysis is a chapter from Keith Payne's book The Fallacies of Cold War Deterrence and a New Direction (Payne 2001). In this chapter, Payne used a scenario to demonstrate how the assumptions underlying traditional deterrence analysis, which were developed during the Cold War, may not apply to a conflict between the United States and China. Payne also used this scenario to demonstrate why in the theoretical sections of his book he emphasized some variables that traditional deterrence theorists downplay. His self-proclaimed purpose was to use a scenario analysis to test whether a more empirical approach, drawing on cultural and domestic political contexts, is more applicable to future conflicts than the deductive reasoning applied to the Cold War.¶ The dependent variable in Payne's analysis was whether or not an adversary is deterred. He then took traditional independent variables from the existing deterrence literature and drew on extensive secondary sources to question what relaxing assumptions about the values of those variables would do to the depen- dent variable. For instance, in deductive reasoning, such factors as a state's cul- tures (organizational and in the usual sense of tradition) are assumed to be either constant on both sides or irrelevant because other variables matter more. Payne suggested that in a particular context, these variables are not only impor- tant, but also may dominate outcomes.¶ To explain how variation in these independent variables may yield an unde- terred adversary, Payne developed an excellent "full" qualitative scenario. His pri- mary interest was Chinese decision making. The context is whether or not the United States could deter China from escalating to violent conflict during a cri- sis over the status of Taiwan. Rather than assume constant values for China on the independent variables, Payne manipulated these variables (several at once, not a "one variable at a time" approach) to show how China: is more risk toler- ant than notional adversaries in the traditional deterrence literature; considers many political issues of lower importance than the status of Taiwan; perceives it has little freedom to back down; and has difficulty understanding US demands and viewing them as credible. Factors that cause them to have these different val- ues are related to the Chinese regime's culture and incentive structures. For instance, Payne focused on how the erosion of communist ideology has led the regime to emphasize national unity and stability as justifications for its continued hold on power, thus making the Taiwan issue of high importance. His points regarding risk tolerance come from Chinese strategic culture; Payne follows ana- lysts who place great meaning in the fact that the Chinese word for "crisis" has connotations of both danger and opportunity. Variation on all of these indepen- dent variables may, Payne argued, lead to an undeterred China, although tradi- tional deterrence theory would yield a deterred China.¶ Conclusion¶ The role of academics in policymaking is a cyclical debate in the IR subfield. Following the 9/11 terrorist attacks and subsequent wars in Iraq and Afghani- stan, a vocal group has once again elevated the perspective that political science professors should be contributing to these pressing national security problems (Andres and Beecher 1989; George 1993; Putnam 2003; Monroe 2005; Nye 2009; Mead 2010). Nearly all of the discourse on "bridging the gap" between academia and the policy world emphasizes how academics may help policymak- ers, particularly with rigorous methods for testing social science hypotheses. The scenario method is one way in which political scientists may improve the policy relevance of their work. It also shows that ideas flowing in the other direction¶ are promising: the policy community and other disciplines have potential to improve the quality of political science research. The future counterfactual approach has been used by policymakers and wealth creators to improve deci- sions for decades, while our discipline has consistently relied to a great degree on the past. <u>Thinking and writing about the future in a robust way</u> offers politi- cal <u>scientists an exciting opportunity to push the boundaries of current debates and to generate new ones, while also improving the processes of teaching and theory building.</u>

We need apocalyptic framing to give us planning time for adaptive and mitigating strategies. Ongoing messages about the danger of inaction are key

-Impact is big—alarm is good because it gives us planning time and encourages adaptive measures

-We need an ongoing message about the dangers of inaction—this should be alarmist

Tom **FOWLER ET AL. 14**, Public Health, Epidemiology and Biostatistics @ University of Birmingham, United Kingdom, Sally C. Davies, Chief Medical Officer for England, and David Walker, Deputy Chief Medical Officer for England ["The risk/benefit of predicting a post-antibiotic era: Is the alarm working?" *Annals of the New York Academy of Sciences*, Vol. 1323, p. 1-10 (September 2014)]

Conclusions The impact of a post-antibiotic era would be **enormous**. We would see the re-emergence of many infectious diseases and the risks of many conventional medical treatments would rise, increasing the potential morbidity and mortality from many disease processes. Costs of medical care and the social impact of caring for the sick and those with disabilities would be great. The likelihood of a post-antibiotic era and the characteristics of such a scenario will depend very much on the action that we take collectively over the next few decades. Without further action, the probability of this eventuality is high owing to the inexorable rise of antimicrobial resistance and the declining rate of discovery of new antimicrobial agents. The benefit of raising the alarm about this issue is twofold. First, it enables us to explore adaptation strategies should such a scenario arise through research into potential problems and effective solutions. It is essential that this process begins early to allow for timely responses. A move to more isolation facilities, for example, would require planning, funding, and construction time. Second, it enables us to more accurately assess the true costs of antimicrobial resistance and to consider the prioritization of mitigation strategies, such as the development of global programs for antibiotic stewardship and the negotiation of new business models for the development of new antibiotics. We might also want to prioritize research and development activities into alternative diagnostic, prevention, and treatment strategies for infectious diseases, for example, genomic sequencing and innovative immunization technology. Of course, these processes also take time. Concerns have been raised about antimicrobial resistance for many decades but the real possibility of a post-antibiotic era has **only emerged recently**, as the antibiotic development pipeline has begun to dry up. This factor seems to have elevated concerns internationally to a level where international collaboration and government/private sector partnerships are real possibilities. Many individual countries, the WHO, and other international communities are now prioritizing this issue as a key threat, and work is underway to mitigate the risk and adapt to the consequences. The alarm has been raised and there is clear evidence of response within individual healthcare systems, nationally and globally. However, experience shows that to truly confront this issue requires the leadership of health professionals and a concerted, unified, and **ongoing message** that ensures that the public and politicians know the potential **dangers of inaction**.

CLS

Reform Effective

Reformism is effective **and brings revolutionary change closer rather than pushing it away**

Delgado 9

(Richard Delgado 9, self-appointed Minority scholar, Chair of Law at the University of Alabama Law School, J.D. from the University of California, Berkeley, his books have won eight national book prizes, including six Gustavus Myers awards for outstanding book on human rights in North America, the American Library Association's Outstanding Academic Book, and a Pulitzer Prize nomination. Professor Delgado's teaching and writing focus on race, the legal profession, and social change, 2009, "Does Critical Legal Studies Have What Minorities Want, Arguing about Law", p. 588-590)

2. The CLS critique of piecemeal reform Critical scholars reject the idea of piecemeal reform. Incremental change, they argue, merely postpones the wholesale reformation that must occur to create a decent society. Even worse, an unfair social system survives by using piecemeal reform to disguise and legitimize oppression. Those who control the system weaken resistance by pointing to the occasional concession to, or periodic court victory of, a black plaintiff or worker as evidence that the system is fair and just. In fact, Crits believe that teaching the common law or using the case method in law school is a disguised means of preaching incrementalism and thereby maintaining the current power structure." To avoid this, CLS scholars urge law professors to abandon the case method, give up the effort to find rationality and order in the case law, and teach in an unabashedly political fashion. **The** CLS **critique of** piecemeal **reform is** familiar, **imperialistic and wrong**. Minorities know from bitter experience that occasional court victories do not mean the Promised Land is at hand. The critique is imperialistic in that it tells minorities and other oppressed peoples how they should interpret events affecting them. A court order directing a housing authority to disburse funds for heating in subsidized housing may postpone the revolution, **or it may not**. In the meantime, the order keeps a number of poor families warm. This may mean more to them than it does to a comfortable academic working in a warm office. It smacks of **paternalism** to assert that the possibility of revolution later outweighs the certainty of heat now, unless there is evidence for that possibility. The Crits do not offer such evidence. Indeed, some **incremental changes may bring revolutionary changes closer**, not push them further away. Not all small reforms induce complacency; some may whet the appetite for further combat. The welfare family may hold a tenants' union meeting in their heated living room. CLS scholars' critique of piecemeal reform often misses these possibilities, and neglects the question of whether total change, when it comes, will be what we want. 3. CLS Idealism The CLS program is also idealistic. CLS scholars' idealism transforms social reality into mental construct." Facts become intelligible only through the categories of thought that we bring to experience. Crits argue that the principal impediments to achieving an ideal society are intellectual. People are imprisoned by a destructive system of mental categories that blocks any vision of a better world." Liberal capitalist ideology so shackles individuals that they willingly accept a truncated existence and believe it to be the best available. Changing the world requires primarily that we begin to think about it differently." To help break the mental chains and clear the way for the creation of a new and better world, Crits practice "trashing"—a process by which law and social structures are shown to be contingent, inconsistent and irrationally supportive of the status qua without good reason. CLS scholars' idealism has a familiar ring to minority ears. We cannot help but be

reminded of those fundamentalist preachers who have assured us that our lot will only improve once we "see the light" and are "saved."

Misconstrues Law

CLS can't distinguish between rules and principles – over generalizes laws as rules and constructs false situations solely for liberal resolution

McCormick '99
(John P., Assistant Political Science Pf - Yale, American Political Science Review. v93, p. June 1999)//akim

For Habermas, the de facto strategy of reducing all¶ cases to "exceptions" leads CLS to the conclusion that¶ since there is no coherence to liberal-democratic law,¶ there is no justice. Because each law is capable of¶ contradicting another, a fact exacerbated by subjective¶ [footnotes] 418¶ judging, the whole legal order is suspect. But <u>Habermas</u>¶ (1996, 216-7) <u>argues</u> that at base <u>CLS confuses</u>¶ <u>legal rules with legal principles. Rules are norms specified</u>¶ <u>for application in particular cases</u>, such as stipulations¶ for drawing up wills or traffic laws. <u>Rules are</u>¶ <u>often preceded by an "if" clause</u>, which clearly identifies¶ the application situation: If circumstance X obtains,¶ then procedure Y is in order (p. 208). <u>Principles</u>¶ <u>are general legal standards</u> with far fewer prespecified¶ application guidelines. <u>The meaning of procedural</u>¶ <u>rights, human rights, or equal protection is ultimately</u>¶ <u>made specific in interpretation and application</u> (pp.¶ 172, 208).¶ Rules may collide in irreconcilable ways, but they do¶ not constitute the broader workings of justice as such,¶ as do principles. In fact, rules are supposed to conflict¶ because they are so finely specified for particular¶ situations that the legal system depends on their conflict.¶ This kind of conflict can be interpreted as facilitating¶ the determinacy of the system, rather than as¶ thrusting it into indeterminacy jeopardy (Habermas¶ 1996, 217). Rules are highly determinate because they¶ set the conditions of their own application. They are¶ what Habermas calls "self-executing" laws, whereas¶ such principles as equality or mutual recognition are¶ "implemented along administrative paths," where their¶ meaning is fully fleshed out (p. 172). Principles are¶ necessarily indeterminate, to some extent, because they¶ do not apply themselves but, rather, require "additional¶ specification" (p. 217). Unlike rules that virtually¶ apply themselves in appropriate circumstances, in jurisprudential¶ practice, a principle must be carefully¶ examined to see whether another better conforms to a¶ particular case.¶ There is, for Habermas, an intimate relationship¶ between <u>rules and principles,</u> but they <u>ought not to be</u>¶ <u>collapsed in the way that CLS and Schmitt collapse</u>¶ <u>them</u>.21 <u>Because Schmitt and CLS perceive all law as</u>¶ <u>rules</u> and, more important, caricature liberalism as¶ ultimately doing the same, <u>they set up a false either/or</u>¶ <u>dilemma for liberal adjudication.</u> Thus viewed, all legal¶ materials are potentially in chaotic disagreement with¶ one another. The conflating of rules and principles is at¶ the root of Schmitt's and CLS's exaggerated characterization¶ of formalism. <u>Since Schmitt and CLS group all</u>¶ <u>liberal law under the blanket term "formal" and do not</u>¶ <u>acknowledge that formal and substantive modes of law</u>¶ <u>can coexist in the liberal rule of law, they encourage the</u>¶ <u>appearance of arbitrary and conflicting practices that</u>¶ <u>may not actually exist upon more differentiated analy</u>-¶ [footnotes] [header] ¶ <u>sis.</u> In fact, it is precisely because <u>Schmitt,</u> like the¶ positivism he criticizes, <u>views the</u> whole <u>liberal legal</u>¶ <u>system as</u> <u>merely a set of rules that he can move</u>¶ effortlessly <u>from statutes to constitutions</u>, gaps to exceptions,¶ generally with malicious political intent.¶ Habermas (1996, 208) remarks that a traditional way of¶ avoiding rule conflict in the law in cases in which it¶ might be confusing rather than instructive is the recourse¶ to exception clauses. <u>Schmitt exploits</u> this <u>by</u>¶ <u>reading a built-in exception clause into the entire</u>¶ <u>statutory legal system</u> (understood as a collection of¶ exceptionable rules) <u>with disastrous results. If all laws</u>¶ <u>have exception conditions, then so does the legal order</u>¶ <u>it</u>self, which <u>is</u> therefore <u>suspendable in the name of a</u>¶ <u>sovereign popular will.</u>

CLS Flawed

CLS is flawed – contradictions

McCormick '99

(John P., Assistant Political Science Pf - Yale, American Political Science Review. v93, p. June 1999)//akim

CLS also misrepresents the formal quality of liberal legalism. In its caricature of formalism, CLS very often assails a straw man: Even the most stringent legal formalists acknowledge a necessary but not devastating lack of total determinacy in the liberal rule of law.22 For Habermas, the formalism of the law has a very precise meaning. Formalism pertains primarily to the law's construction; that is, it is logically correct and established through prearranged procedures. The decisive aspect of the adjudication of principles, however, is not necessarily an air-tight formalism but, rather, appropriateness for a particular case (1996, 218). According to Habermas, in the application of principles all suitable normative reasons must be collected and then the situation itself interpreted. From a high level of abstraction, the formal modes of law associated, for instance, with such principles of criminal justice as retribution, appear irreconcilable with the more concrete, or material, modes of law that actualize the principle of substantive equality through social welfare provisions. But each is appropriate to a vastly different set of cases. To illustrate this point, Rosenfeld and Weinrib have each used the distinction between corrective and distributive justice to clear up misunderstandings stemming from conflations of the two. The primarily backward-looking quality of corrective justice-redressing a wrong already perpetrated by means of procedures previously established-makes its workings appear relatively transparent. The future-directed quality of distributive justice deals with quantities not always known in advance-how much of what, to whom, and by what means? This seems terribly vague by contrast with criminal justice codes (Rosenfeld 1992; Weinrib 1988). CLS lumps the two modes together in an attack on "the law." Just because the conditions of principle adjudication cannot, and should not, be fully laid out in advance does not render them hemorrhaging wounds in the body legal. It is largely their open-endedness that gives the process a public and democratic quality. According to Habermas (1996, 172), in legal discourses of application competing parties and state authorities present arguments over what norms are most relevant to the facts of a case. There are two interpretive steps for [foot notes] . judges that are not preordained: the description of facts and the description of norms (p. 218). According to Habermas, "once the situational features of the case have been described as exhaustively as possible from all normatively relevant points of view," the appropriate principle can be selected (p. 260). When one norm is selected over another for application, it does not invalidate, nullify, or render irrational those not chosen. "Recessive principles," according to Habermas, those that are decided to be less relevant, do not lose validity for a case as do rules, but only their "contextual relevance" (p. 209). CLS does not distinguish between principles that contradict one another per se and those that collide in a particular case (p. 216). Because a particular principle was not applied does not render it at war with other principles or with the system as a whole. "A plausible connection [is maintained] between the pertinent norm and the norms that … do not prevail such that the coherence of the rule system as a whole remains unaffected" (p. 260). This is not an ideological weighing or privileging of one over the other but, rather, a logical selection.

State Resilient

Critical legal theorists ignore state resiliency to civil and social principles

McCormick '99

(John P., Assistant Political Science Pf - Yale, American Political Science Review. v93, p. June 1999)//akim

In the previous section, I sympathetically presented¶ Habermas's distinction between rules and principles in¶ adjudication, particularly how they relate to earlier¶ historical paradigms of law in a liberal-democratic¶ framework. It is precisely this distinction, however, that¶ at this juncture is especially problematic at the supranational¶ level. It is presently either too easy or too¶ difficult to delineate juridical principles in supranational¶ configurations, even one as relatively homogeneous¶ as the EU.34 If the governing principles of a¶ [foot notes] [header] ¶ juridical unit like the EU pertain merely to the regulation¶ of an economic free-trade zone, for instance,¶ then those principles will clearly be too thin to preserve¶ the gains of liberal or social democracy associated with¶ two or three centuries of expanding civil and social¶ rights. According to skeptics (Garrett, Keleman, and¶ Schulz 1998), appeals by European citizens or associations¶ to the ECJ on the grounds of more substantive¶ principles of justice, and attempts by the ECJ to¶ address them, will be resisted by nation-states. While¶ the autonomy of the ECJ is a hotly contested issue in¶ European studies, the court's activities are no doubt¶ constrained to a significant degree by the preemptive¶ and reactive pressure of EU member states.¶ Habermas asserts supranational legal protection as¶ the necessary response to the expanding transnational¶ power of economic and hence political actors. But¶ evidence suggests that this development is presently¶ stymied by the still quasi-sovereign nation-states. EU¶ members may have suffered some loss of sovereignty to¶ the extent that they participate in the process of¶ integration as compensation for economic losses that¶ many attribute to international developments. These¶ states are, however, still sufficiently strong, and jealous¶ of what sovereignty they still hold, to be able to block¶ the extension of civil and social principles of justice to¶ the adjudication processes of the ECJ (Garrett, Keleman,¶ and Schulz 1998). Habermas takes note of this¶ retrenchist behavior on the part of the member states¶ (1998, 124), but he does not construe it as a particularly¶ significant obstacle to the development of his prospective¶ communicatively and constitutionally democratic¶ European continental regime (p. 127). On the contrary,¶ he urges state actors to undertake the "heroic¶ effort" to promote actively the development of supranational¶ institutions that could replace the actors¶ themselves, or at least replicate themselves on a continental¶ level (p. 124): institutions such as "a European-wide,¶ integrated public sphere . . ., a civil society¶ encompassing interest associations, nongovernmental¶ organizations, citizens' movements, etc., and naturally¶ a party system appropriate to a European arena" (p.¶ 160).¶ On Habermas's own terms, however, within the gap¶ between the nation-state's declining ability to secure¶ and advance principles of social justice (as a result of¶ evaporating tax bases, increased environmental threats,¶ antiimmigrant and minority-unfriendly policies, and so¶ on) and their reluctance to accede fully these responsibilities¶ to fora like the ECJ, lies the abyss of the¶ supranational democratic possibilities of Habermas's¶ theoretical framework.35 If the ECJ is to adjudicate¶ [foot notes] 424¶ exclusively on the basis of market-related rules, and¶ merely make hortatory appeals to principles associated¶ with civil, social, and human rights, then the subtle¶ distinction and interplay of rules and principles upon¶ which Habermas bases his rationally democratic theory¶ of adjudication would appear virtually ineffectual in the¶ EU context for the conceivable future. There is obviously¶ significant debate on the extent to which pessimism¶ is warranted concerning social welfare in contemporary¶ Europe.36 But it is precisely the existence¶ and importance of such debates that renders problematic¶ their absence from Habermas's discourse theory of¶ law and reflections on European integration, especially¶ given his stated concern with "empirically grounded¶ arguments" as much as a "normative perspective"¶ (1998, 158).¶ At one point in the discussion of the reflexive theory¶ of law in Between Facts and Norms, Habermas highlights¶ the historical limitations of understanding law in¶ terms of paradigms. But he has in mind the traditional¶ resistance of the bourgeois formal law to materialized¶ welfare-state law, not the resistance of his own understanding¶ of the two paradigms to new, perhaps supranational,¶ paradigms: Paradigms harden into ideologies insofar as they systematically¶ close themselves off from the perception of radically¶ new situations and resist different interpretations of rights¶ and principles, interpretations that press for acknowledgment¶ in the light of radically new historical experiences¶ .... [They]

stabilize themselves through professionally¶ and judicially institutionalized monopolies on interpretation¶ and permit only internal revision according to their own¶ standards (1996, 221, emphasis added).¶ This could, ironically, be said of Habermas's framework¶ itself. His discourse theory of law has to some¶ extent closed off, resisted, and insulated itself against¶ reflections on the law's radically new historical situation.¶ To that extent, Habermas falls somewhat short of¶ the standards set in his early work and his own adoption¶ of the strictures of critical theory. Obviously, the¶ simple assertion of "history" or the injunction toward¶ the more fine-grained analysis of "context" will not¶ automatically or satisfactorily address the deficiencies¶ of liberal normative theory or its concrete-fixated assailants¶ (Shapiro 1990, 207-13). But, as I conclude¶ below, the combination of the concretely historical and¶ categorically universal method practiced in Habermas's¶ [foot notes] [header] ¶ early efforts, and even still alluded to in his later ones,¶ offers a viable provisional guide for thinking critically¶ about the law in the coming years.

Feminisms

F/W & Tech Discourse Good

Using technical discourse strategically is key to solve the K

Caprioli 4

(Mary, Dept. of Political Science @ the University of Tennessee, PhD from the University of Connecticut, "Feminist IR Theory and Quantitative Methodology: A Critical Analysis," International Studies Review, Vol. 6, No. 2 (Jun., 2004), pp. 253-269)

We should learn from the research of feminist scholars to engage in a dialogue **that can be understood**. Carol Cohn (1987), for example, found that one could not be understood or taken seriously within the national security arena without using a masculine-gendered language. In other words, a common language is necessary to understand and be understood. This insight could be applied to feminist research within international relations. Why not, as Charlotte Hooper (2001:10) suggests, **make "strategic use of [expert jargon]** to gain credibility for feminist arguments (or otherwise subvert it for feminist ends)." Little justification exists for abandoning the liberal empiricists who reason that "the problem of developing better knowledge lies not with the scientific method itself but with the biases in the ways in which our theories have been focused and developed" (Tickner 2001:13).

AT: excludes women in debate

The strength of feminist theory comes from the interface between theory and practical legal approaches. Their notion of law is that of a closed space—we must advance a model of informed engagement to turn law into a <u>site</u> of struggle rather than just a tool of struggle.

Bottomley and Conaghan 93

(ANNE BOTTOMLEY and JOANNE CONAGHAN, Kent Law School, University of Kent, Canterbury, Kent CT2 2NY, England) "Feminist Theory and Legal Strategy" 20 J.L. & Soc'y 1 1993

We have entitled this collection feminist theory and legal strategy. At one level, <u>this could be read as</u> no more than <u>an attempt to bracket together themes and issues developed in theoretical debate with concrete, specific examples</u> by way of application. Indeed some of the papers may be read this way: such a project has a recognized academic history with which we have all engaged at some stage in our own work. <u>Equally, the move from particularities to more general principles has frequently been employed</u> in (feminist) academic work; locating strategies within a broader theoretical context is a common approach and one which allows us to continually remind ourselves of the potential ramifications of our immediate project. Again, there are aspects of this in some of the papers which follow.' <u>Feminist work within law has been characterized by both of these trajectories</u>; it is in the very mode of our operation as lawyers that we are continually faced with specific instances. It is also in our lives as women that our feminism is informed by the particular operations and instances of our engagement with law. This collection, however, is premised on a rather different base. It is a base which we would assert has been the particular strength of feminist work within and on law; it is that <u>our work is not</u> so much <u>concerned with</u> the <u>application of 'theory' to 'law' or vice versa, but rather</u> that it is the <u>interface between the two which is the **very site of our theoretical work**.</u> What we are posing here is twofold. On the one hand, it is a model of theory which sees theory as simply that - a model; one which offers us ideas which we return to and use as a series of tools to raise questions, test insights, and find a language to bring together and communicate our ideas. It does not exist in and for itself, but only in relation to the use to which it is put. For this reason, <u>the strength of feminist jurisprudence is tested **not by claims to internal coherence**</u> but <u>rather by an ability to deliver.</u> This may sound harshly pragmatic but we firmly believe that <u>those aspects of theoretical work which have proven of value to us over the years are those which have enabled us to develop and access concrete material gains</u> in our work. There are undoubtedly those who would read this as an anti-theoretical stance. Carol Smart might, for instance, identify us with what she terms as 'resistance to theory': based on the argument that, because law is a practice which has actual material consequences for women, what is needed in response is counterpractice not theory. This constituency demands 'practical engagement' and continually renders (mere?) theoretical practice inadequate. This argument comes from certain feminist constituencies which may define 'doing' theory as male. These... elements present a major obstacle to proponents of feminist legal theory as they (we) meet with the frustrations of being ignored or seen as outmoded in and by law and are simultaneously moved to renounce theory by the moral imperative of doing something through or in law.' In our view, <u>it is not a question of whether different forms of theoretical practice are seen as male or not.</u> Equally, <u>it is not a question of demanding practical engagement at the expense of theory</u>. It is rather that <u>the mode and strength of feminist theory in law has been the interface between the use of abstract models and ideas to **interrogate the practices of law**</u>.' It may not have been articulated in quite this way before - in that sense it has not yet been 'theorized' - but if we examine our feminist academic heritage, it is the one point which consistently characterizes the work, in all its rich plurality and diverse perspectives. Thus, <u>our stance is not anti-theory, neither is it concerned simply with the application of theory. It is theory, but it is not one which traditionalists would recognize in their limited use of the term</u>. If the counterpoint to our approach is the idea that theory stands for theory's sake, then certainly our notion of theory will be too radical. If we need (and we are not convinced that we do need) to find parallels in the work of 'theorists' who would exemplify a similar approach it would be with, for instance, Braidotti5 or Deleuze.6 They exemplify a theoretical stance based on engagement, on what used to be called 'praxis'. <u>It is not so much a question of application but rather of movement between 'theory' and 'practice'. This theoretical stance allows</u>, perhaps reflects, <u>a pluralism within which there can be no one analytical model deployed but rather a **series of engagements and incursions**</u>. In a legal context, <u>**this precludes seeing 'law' as a closed model but rather recognizes it as a series of ideas, practices, and**</u>

engagements, all of which are loosely held together under the rubric of the term 'law'. We would be the first to acknowledge the experience of any marginal or disadvantaged group within our society which has (rightly) felt, and continues to feel, in many ways and in many instances, the oppressive (or in terms of their own needs, unresponsive) operation of law.7 But to then characterize law simply in these terms is to fly in the face of our experience of law in other ways. One of the most important insights to emerge from the critical legal studies movement has been to highlight the internal inconsistencies in law, the paradoxes, silences, and contingencies. This matches our experiences as women and feminists engaged with law. It is not an internally coherent system which operates smoothly to oppress us at all times and in all ways. The 'power' of law is certainly present but not undifferentiated. It is uneven and it allows us space: space to argue, to engage, and (in the active sense of the word) to ,resist'.' We have only to listen to our sisters in practice to learn this lesson in a very pragmatic way. The operation of law involves a continual use of strategies, in which one is constantly balancing the -possibilities against the probabilities.' Again, let us be clear - in general, it is a more than uneven fight. As law is constituted in a society which still privileges sections of that society in terms of gender, race, class, and socially defined standards of ability, so it is by no means a 'free space' for equal engagement. **But neither is it closed space which we must continually struggle against rather than within.** When Smart states that 'the entry of feminists into law has turned law into a **site of struggle** rather than being taken only as a **tool of struggle**"' we would agree, but we would add that it is a site within which we find tools; it was never a tool because it is not a single entity or practice. Indeed, one of our problems has been that (ironically) the sense of this is far more available in the practice of law than in the academy. It is in the academy that law has been (partly under the influence of the social sciences) most frequently presented as an internally coherent, undifferentiated model which leaves one only with the choice of submission or resistance in the narrow sense of the word. **In practice we experience law as more complex and hence more open to incursions.** The problem is that this experience of law must not only be placed against a context of generally negative expectations and experiences (in other words, we must keep a perspective), but also that it is difficult to record. We mean this in two ways. First, there is still (properly) a tendency to focus on those areas of law which operate most to women's detriment. This necessarily reinforces our sense of neglect and exclusion. Secondly, the interstices of practice - not merely the operation of substantive law but the elements of process in bargaining and negotiation - are less visible than the record of judgments in the higher courts or the passing of legislation. **Small (but significant) developments which we could characterize as victories go unnoticed but radically improve the position of particular women in particular ways**. We might think here of developments requiring the sharp thinking of women solicitors and barristers in helping to devise means by which rape victims might receive representation in criminal cases or strategies to protect the claims to ownership made by women who do not hold legal title to property. This low-profile lawyering, reflected neither in case material nor academic texts, is a rich tapestry of strategies which often cross conventional legal categories." Of course this must be read against a generally negative background but, importantly, it leads us to **dismiss an entirely negative stance** towards the tools of lawyering, whether in practice or within the academy. **Our stance** then **is a politics of engagement**, informed and considered, moving continually between the abstract and the specific. 2 The overwhelming tone of this particular collection is with the problems we encounter when we engage in this way, problems which go beyond substantive law, to issues of procedure and process and beyond that to the very languages with which we engage. 3 They also reflect issues relating to the diversity of women's position and needs, 4 and to the general problems encountered by taking abstract stances, reliant upon concepts such as equality or rights. 5 In this sense, read as a whole, the collection reflects the modus operandi of our claim to a particular type of theoretical work - the interface between the particular, concrete circumstance, and the general, abstract model. It is that interface that we understand as 'strategy'.

AT: ontological power

Ontologizing sexual power and identity as a lens for worldly phenomena reproduces binary discourses end elides difference, reproducing heteronormativity.

Prasad '12

(Ajnesh, Australian School of Business, "Beyond analytical dichotomies," Human Relations May 2012 vol. 65 no. 5 567-595)

A poststructuralist critique At the most rudimentary level, poststructuralism may be typified by what Lyotard (1984) famously expressed as its **incredulity towards metanarratives** (also see Alvesson and Deetz, 1999; Kilduff and Mehra, 1997), or what Fraser and Nicholson (1997) describe as grand theorizing of social macrostructures. Akin to other critical traditions, it is 'explicitly historical, attuned to the cultural specificity of different societies and periods and . . . inflected by temporality, with historically specific institutional categories' (Fraser and Nicholson, 1997: 143–4). The aim of the poststructuralist mandate is to critique metanarratives and, from there, to define human consciousness and social existence through engagements with contextualized subjectivity (Agger, 1991).11 To appreciate this idea, it is important to understand how metanarratives are problematically situated within, and are informed by, socially constructed identity binaries, be they along the fault lines of gender (e.g. Butler, 1990; Hird, 2000), race (e.g. Gilroy, 2000; Miles and Torres, 2007), or sexuality (e.g. Zita, 1994). Indeed, poststructuralist critique, such as Derrida's conjecture of difference (Mumby and Putnam, 1992), illustrates how the preservation of the privileged identity ('white', 'man', 'heterosexual') is existentially dependent upon a corresponding relegated identity ('black', 'woman', 'homosexual') (see Tyler and Cohen, 2008); or, to posit it in Butlerian (1991) phrasing, heterosexuality presumes the being of homosexuality. Working from the same current, Harding (2003) extends this idea through consideration of the central dyadic relationship in management; she notes that every individual in the western workforce is identified as a worker or as a manager and that the identity of the latter is **wholly contingent upon the binary existence of the former**. Elsewhere, again assuming a poststructuralist position, Harding (2008: 44; emphasis in original) explains that identities '**cannot be resolved into an essence or into a coherent whole'**; rather, they are 'post hoc impositions of a seemingly unified [label] upon a disparate and disconnected population'. As such, the central aim of the poststructuralist is to repudiate deterministic and binary logic by drawing attention to the discursive processes that culturally (re)produce social realities and the dichotomous modes of thinking embedded within them (Butler, 1990; Calas, 1993). [T]he ways in which sex was put into Western discourse from the end of the 16th century onwards, the proliferation of sex during the 18th century and the modern incitement to discuss sex in endless detail have simultaneously established heterosexuality as the unassailable norm and constituted other sexualities as abnormal. Tangentially related to the Foucauldian reading of sexuality, Katz (2004) offers a genealogical investigation into how heterosexuality was invented and came to be ideologically defined from the late 19th-century onwards. Katz writes that because 'the concept of heterosexuality is **only one particular historical way** of perceiving, categorizing, and imagining the social relations of the sexes', it ought to be studied with the purposeful aim to **dislocate its socio-cultural privilege** as being the 'normal' and the 'natural' form of sexual expression (p. 69). Given its socially manifest 'nature', Butler (1991, 1993) contends that heterosexuality is perpetually at risk and must continually engage in a set of repetitive, or what she calls parodic, practices – such as, heterosexual sex – which functions to stringently affirm the hegemonic ideals of femininity (passive) and masculinity (active). Incidentally, the very redundancy of these parodic practices function to consolidate the discursive authority and cultural stability of heterosexuality (Butler, 1991; see also Butler's [1993] writing on 'performativity'). A related stream of poststructuralist-inflected scholarship reveals how **sexual identities that are predicated on ontological sexual difference produce heteronormativity,** which can be described as the 'the normative idealization of heterosexuality' (Hird, 2004: 27) or '**the centrality of heterosexual norms in social relations**' (Pringle, 2008: S111). While feminists have long critiqued the tacit and the explicit claims of ontological sexual difference, essentialist definitions of 'female' and 'male' continue to prevail in popular culture and in certain academic disciplines (Frye, 1996).12 On this point, Hird (2004) adopts a position in feminist science studies to develop a substantive critique into how the ontology of sexual difference is often rendered concrete in research propagated by the 'natural' – and particularly the 'biological' – sciences (also see Martin, 1991). The influence of ontological sexual difference within and outside of academia, lends credence to Broadbridge and Hearn's (2008: S39) recent observation that, '[s]ex and sex differences are still often naturalized as fixed, or almost fixed, in biology'. It is equally important to note, here, that **the alchemy of ontological sexual difference is wholly dependent upon the patriarchal conflation of 'biological' sex and 'cultural' gender (**Hird, 2004). As Pringle (2008: S112; also see Borgerson and Rehn, 2004) notes, '[g]ender **[does] not avoid the oppositional duality**

embodied in the concept of sex, but reflect[s] the interdependent relationship of masculinity and femininity'. This reflection pivots on genital determinism, which declares that males naturally embrace masculinity while females naturally embrace femininity (Bornstein, 1994; Hird, 2000). This initial conflation of sex and gender leads to the conventional model of heterosexuality, which dictates that a man will 'desire-to-be' a male and will 'desire-for' a female, while a woman will 'desire-to-be' a female and will 'desire-for' a male (Sinfield, 2002: 126). It is precisely these corresponding relationships whereby the 'heterosexual matrix' is constructed (Butler, 1990). According to Butler, this matrix serves as the '**grid of cultural intelligibility through which bodies, gender, and desires are naturalized**' (see Ringrose, 2008: 511).13

Gender is not the "root cause" of environmental degradation—such claims are simplistic and wrong

Fox 98 – Center for Environmental Studies

Fellow @ Cent. Env Studies, "The Deep-Ecology-Ecofem debate," in "Environmental Philosophy" ed. Zimmerman, p 232-3

To begin with, deep ecologists completely agree with ecofeminists that men have been far more implicated in the history of ecological destruction than women. However, deep ecologists also agree with similar charges derived from other social perspectives: for example, that capitalists, whites, and Westerners have been far more implicated in the history of ecological destruction than pre-capitalist peoples, blacks, and non-Westerners .21 If ecofeminists also agree with these points, then the question arises as to why they do not also criticize deep ecology for being neutral with respect to issues concerning such significant social variables as socioeconomic class, race, and Westernization. There appears to be two reasons for this. First, to do so would detract from the priority that econfeminists wish to give to their own concern with androcentrism. Second, and more significantly, these charges could also be applied with equal force to the ecofeminist focus on androcentrism itself.14 How does one defend the ecofeminist charge against deep ecology (i.e., that androcentrism is "the real root" of ecological destruction) in the face of these charges?" For deep ecologists, it is simplistic on both empirical and logical grounds to think that one particular perspective on human society identifies the real root of ecological destruction. Empirically, such thinking is simplistic (and thus descriptively poor) because it fails to give due consideration to the multitude of interacting factors at work in any given situation. (While on a practical level it can be perfectly reasonable to devote most of one's energy to one particular 'cause-if only for straightforward reasons to do with time and energy-that, of course, is no excuse for simplistic social theorizing.) Such thinking fails, in other words, to adopt an ecological perspective with respect to the workings of human society itself. Logically, such thinking is simplistic (and thus facile) because it implies that the solution to our ecological problems is close at hand-all we have to do is remove "the real root" of the problem-when it is actually perfectly possible to conceive of a society that is nonandrocentric, socioeconomically egalitarian, nonracist, and nonimperialistic with respect to other human societies, but whose members nevertheless remain aggressively anthropocentric in collectively agreeing to exploit their environment for their collective benefit in ways that nonanthropocentrists would find thoroughly objectionable. Indeed, the "green" critique of socialism proceeds from precisely this recognition that a socially egalitarian society does not necessarily imply an ecologically benign society.

Deliberation/Gender Consistent

Deliberation doesn't exclude gendered analysis

Dahlberg 5

(Lincoln, The University of Queensland, Center for Critical and Cultural Studies, Visiting Fellow, The Habermasian public sphere: Taking difference seriously?, Theory and Society (2005) 34:111-126)

I believe this critique of power, transparency, and the subject is largely based upon a poor characterization of Habermas' position. There are three main misunderstandings that need to be cleared up here, to do with power as negative, as able to be easily removed, and as able to be clearly identified. First, Habermas does not define power as simply negative and as therefore needing to be summarily removed from the public sphere. The public sphere norm calls for "coercion-free communication" and not power-free communication. Habermas emphasizes the positive power of communicative interaction within the public sphere through which participants use words to do things and make things happen.60 Communicative rationality draws on the "**force of better argument**" to produce more democratic citizens, culture, and societies. Subjects are indeed molded through this constituting power, but their transformation is towards freedom and autonomy rather than towards subjugation and normalization. As Jeffrey Alexander points out, **to act according to a norm is not the same as to be normalized**.61 The public sphere norm provides a **structure through which critical reflection** on constraining or dominating social relations and possibilities for freedom **can take place.** As Chambers argues, rational discourse here is about "the endless questioning of codes," the reasoned questioning of normalization.62 This is the very type of questioning critics like Lyotard, Mouffe, and Villa are engaged in despite claiming the normalizing and repressive power of communicative rationality. These critics have yet to explain adequately how they escape this performative contradiction, although they may not be too concerned to escape it.63 The form of power that is to be excluded from discourse in the public sphere is that which limits and disables democratic participation and leads to **communicative inequalities**. Coercion and domination are (ideally) excluded from the public sphere, which includes forms of domination resulting from the maldistribution of material and authoritative resources that lead to **discursive inequalities**. This emphasis on the ideal exclusion of coercion introduces the second point of clari- fication, that the domination free public sphere is an idealization for the purposes of critique. Habermas is more than aware of the fact that, as Nancy Fraser, Mouffe, and Young remind us, coercive forms of power, including those that result from social inequality, can never be completely separated from the public sphere.64 Claims that such power has been removed from any really-existing deliberative arena can only be made by ignoring or hiding the operation of power. However, this does not mean that a reduction in coercion and domination cannot be achieved. Indeed, this is precisely what a democratic politics must do. To aid this project, the public sphere conception **sets a critical standard for evaluation of everyday communication**. Chambers puts this nicely: **Criticism requires a normative backdrop** against which we criticize. Crit-icizing the ways power and domination play themselves out in discourse presupposes a conception of discourse in which there is no [coercive] power and domination. In other words, to defend the position that there is a mean- ingful difference between talking and fighting, persuasion and coercion, and by extension, reason and power involves beginning with idealizations. That is, it involves drawing a picture of undominated discourse.65 However, this discussion of the idealizing status of the norm does notanswer claims that it invokes a transparency theory of knowledge. Iwould argue that such claims not only fall prey to another performa-tive contradiction – of presupposing that the use of rational discourse can establish the impossibility of rational discourse revealing truth and power – but are also based on a poor reading of Habermas' theory of communicative rationality. This is the third point of clarification. In contrast to the metaphysics of presence, the differentiation of persusion from coercion in the public sphere does not posit a naive theory of the transparency of power, and meaning more generally. The public sphere conception as based upon **communicative rationality does not assume a Cartesian (autonomous, disembodied, decontextualized) subject** who can clearly distinguish between persuasion and coercion, good and bad reasons, true and untrue claims, and then wholly re-move themselves and their communications from such influence. For Habermas, subjects are always situated within culture. The public sphere is posited

upon **intersubjective** rather than subject-centered **rationality.** It is through the process of communicative rationality, and not via a Cartesian subject, that manipulation, deception, poor reasoning, and so on, are identified and removed, and by which meanings can be understood and communicated. In other words, it is through rational-critical communication that discourse moves away from coercion or non-public reason towards greater rational communication and a stronger public sphere. The circularity here is not a problem, as it may seem, but is in fact the very essence of democratization: through the practice of democracy, democratic practice is advanced. This democratizing process can be further illustrated in the important and challenging case of social inequalities. Democratic theorists (both deliberative and difference) generally agree that social inequalities al-ways lead to some degree of inequalities in discourse. Thus, the ide-alized public sphere of full discursive inclusion and equality requires that social inequalities be eliminated. Yet how is social inequality to befullyidentified,letaloneeliminated? The idealization seems wholly in-adequate given contemporary capitalist systems and associated social inequality. **However, it is in the very process of argumentation, even if flawed, that the identification** and critique **of social inequality, and thus of communicative inequality, is able to develop.** I ndeed, public sphere deliberation often comes into existence when and where people become passionate about social injustice and publicly thematize problems of social inequality. Thus the "negative power" of social inequality – as with other forms of coercion – is brought to light and critique by the very discourse it is limiting. This is not to say that subjects are merely effects of discourse, that there are no critical social agents acting in the process. It is not to say that 125 subjects within discourse cannot themselves identify negative forms of power, cannot reflexively monitor their own arguments, cannot rationally criticize other positions, and so on. They can, and in practice do, **despite the instability of meaning**. The point is that this reasoning and understanding is **(provisionally) achieved** through the subject's situatedness in discourse rather than via a pre-discursive abstract subject. As Kenneth Baynes argues, it is through discourse that subjects achieve a degree of **reflective distance** (what we could call autonomy) from their situations, "enabling them to revise their conceptions of what is valuable or worthy of pursuit,[and]to **assess various courses of action** with respect to those ends." 66 Democratic discourse generates civic-oriented selves, inter-subjective meanings and understandings, and democratic agreements that can be seen as the basis of public sovereignty. How-ever, the idea of communicatively produced agreements, which in the public sphere are known as public opinions, has also come under ex-tensive criticism in terms of excluding difference, criticism that I wantto explore in the next section. The ends of discourse: Public opinion formation The starting point of discourse is disagreement over problematic validity claims. However, **a certain amount of agreement, or at least mutual understanding, is presupposed** when interlocutors engage in argumentation. **All communication** presupposes mutual understanding on the linguistic terms used – that interlocutors use the same terms in the same way.67 Furthermore, in undertaking rational-critical discourse, according to Habermas' formal pragmatic reconstruction, interlocutors also **presuppose the same formal conditions of argumentation**. These **shared presuppositions enable** rational-critical discourse to be undertaken. However, as seen above, meaning is never fixed and understanding is always partial. Understanding and agreement on the use of linguistic terms and of what it means to be reasonable, reflexive, sincere, inclusive, non-coercive, etc. takes place within discourse and is an ongoing political process.

Public sphere not inevitably gendered---debates about public policy can include embodied experience

Lincoln **Dahlberg 5**, The University of Queensland, Center for Critical and Cultural Studies, Visiting Fellow, The Habermasian public sphere: Taking difference seriously?, Theory and Society (2005) 34:111-126

I believe this critique of power, transparency, and the subject is largely based upon a poor characterization of Habermas' position. There are three main misunderstandings that need to be cleared up here, to do with power as negative, as able to be easily removed, and as able to be clearly identified. First, Habermas does not define power as simply negative and as therefore needing to be summarily removed from the public sphere. The public sphere norm calls for "coercion-free communication" and not power-free communication. Habermas emphasizes the positive power of communicative interaction within the public sphere

through which participants use words to do things and make things happen.60 Communicative rationality draws on the "**force of better argument**" to produce more democratic citizens, culture, and societies. Subjects are indeed molded through this constituting power, but their transformation is towards freedom and autonomy rather than towards subjugation and normalization. As Jeffrey Alexander points out, **to act according to a norm is not the same as to be normalized**.61 The public sphere norm provides a **structure through which critical reflection** on constraining or dominating social relations and possibilities for freedom **can take place.** As Chambers argues, rational discourse here is about "the endless questioning of codes," the reasoned questioning of normalization.62 This is the very type of questioning critics like Lyotard, Mouffe, and Villa are engaged in despite claiming the normalizing and repressive power of communicative rationality. In other words, to defend the position that there is a mean- ingful difference between talking and fighting, persuasion and coercion, and by extension, reason and power involves beginning with idealizations. That is, it involves drawing a picture of undominated discourse.65 However, this discussion of the idealizing status of the norm does not answer claims that it invokes a transparency theory of knowledge. I would argue that such claims not only fall prey to another performa-tive contradiction – of presupposing that the use of rational discourse can establish the impossibility of rational discourse revealing truth and power – but are also based on a poor reading of Habermas' theory of communicative rationality. This is the third point of clarification. In contrast to the metaphysics of presence, the differentiation of persusion from coercion in the public sphere does not posit a naive theory of the transparency of power, and meaning more generally. The public sphere conception as based upon **communicative rationality does not assume a Cartesian** (autonomous, disembodied, decontextualized) **subject** who can clearly distinguish between persuasion and coercion, good and bad reasons, true and untrue claims, and then wholly re-move themselves and their communications from such influence. For Habermas, subjects are always situated within culture. The public sphere is posited upon **intersubjective rather than subject-centered rationality.** It is through the process of communicative rationality, and not via a Cartesian subject, that manipulation, deception, poor reasoning, and so on, are identified and removed, and by which meanings can be understood and communicated. In other words, it is through rational-critical communication that discourse moves away from coercion or non-public reason towards greater rational communication and a stronger public sphere. The circularity here is not a problem, as it may seem, but is in fact the very essence of democratization: through the practice of democracy, democratic practice is advanced. This democratizing process can be further illustrated in the important and challenging case of social inequalities. Democratic theorists (both deliberative and difference) generally agree that social inequalities al-ways lead to some degree of inequalities in discourse. Thus, the ide-alized public sphere of full discursive inclusion and equality requires that social inequalities be eliminated. Yet how is social inequality to be fully identified, let alone eliminated? The idealization seems wholly in-adequate given contemporary capitalist systems and associated social inequality. **However, it is in the very process of argumentation, even if flawed, that the identification and critique of social inequality, and thus of communicative inequality, is able to develop.** Indeed, public sphere deliberation often comes into existence when and where people become passionate about social injustice and publicly thematize problems of social inequality. Thus the "negative power" of social inequality – as with other forms of coercion – is brought to light and critique by the very discourse it is limiting. This is not to say that subjects are merely effects of discourse, that there are no critical social agents acting in the process. It is not to say that 125 subjects within discourse cannot themselves identify negative forms of power, cannot reflexively monitor their own arguments, cannot rationally criticize other positions, and so on. They can, and in practice do, **despite the instability of meaning.** The point is that this reasoning and understanding is

(provisionally) achieved through the subject's situatedness in discourse rather than via a pre-discursive abstract subject. As Kenneth Baynes argues, it is through discourse that subjects achieve a degree of **reflective distance** (what we could call autonomy) from their situations, "enabling them to revise their conceptions of what is valuable or worthy of pursuit,[and]to **assess various courses of action** with respect to those ends." 66 Democratic discourse generates civic-oriented selves, inter-subjective meanings and understandings, and democratic agreements that can be seen as the basis of public sovereignty. How-ever, the idea of communicatively produced agreements, which in the public sphere are known as public opinions, has also come under ex-tensive criticism in terms of excluding difference, criticism that I want to explore in the next section. The ends of discourse: Public opinion formation **The starting point of discourse is disagreement over problematic validity claims.** However, **a certain amount of agreement, or at least mutual understanding, is presupposed** when interlocutors engage in argumentation. **All communication** presupposes mutual understanding on the linguistic terms used – that interlocutors use the same terms in the same way.67 Furthermore, in undertaking rational-critical discourse, according to Habermas' formal pragmatic reconstruction, interlocutors also **presuppose the same formal conditions of argumentation**. These **shared presuppositions enable** rational-critical discourse to be undertaken. However, as seen above, meaning is never fixed and understanding is always partial. Understanding and agreement on the use of linguistic terms and of what it means to be reasonable, reflexive, sincere, inclusive, non-coercive, etc. takes place within discourse and is an ongoing political process.

AT: Patriarchy R/C

Patriarchy's not the root cause

Bell '6

(Duncan, senior lecturer – Department of Politics and International Studies @ Cambridge University, "Beware of false prophets: biology, human nature and the future of International Relations theory," *International Affairs* 82, 3 p. 493–510)

Writing in *Foreign Aff airs* in 1998, Francis Fukuyama, tireless promulgator of the 'end of history' and now a member of the President's Council on Bioethics, employed EP reasoning to argue for the central role in world politics of 'masculine values', which are 'rooted in biology'. His argument starts with the claim that male and female chimps display asymmetric behaviour, with the males far more prone to violence and domination. 'Female chimps have relationships; male chimps practice realpolitik.' Moreover, the 'line from chimp to modern man is continuous' and this has signifi cant consequences for international politics.46 He argues that the world can be divided into two spheres, an increasingly peaceful and cooperative 'feminized' zone, centred on the advanced democracies, and the brutal world outside this insulated space, where the stark realities of power politics remain largely masculine. This bifurcation heralds dangers, as 'masculine policies' are essential in dealing with a masculine world: 'In anything but a totally feminized world, feminized policies could be a liability.' Fukuyama concludes the essay with the assertion that the form of politics best suited to human nature is—surprise, surprise—free-market capitalist democracy, and that other political forms, especially those promoted by feminists and socialists, do not correspond with our biological inheritance.47 Once again the authority of science is invoked in order to naturalize a particular political objective. This is a pattern that has been repeated across the history of modern biology and remains potent to this day.48 It is worth noting in brief that Fukuyama's argument is badly flawed even in its own terms. As anthropologist R. Brian Ferguson states, Fukuyama's claims about the animal world display 'a breathtaking leap over a mountain of contrary evidence'.49 Furthermore, Joshua Goldstein concludes in **the most detailed analysis of the data on war and gender** that although biological differences do play a **minor role,** focusing so heavily on them is **profoundly misleading.**50 The simplistic claims, crude stereotyping and casual use of evidence that characterize Fukuyama's essay unfortunately recur throughout the growing literature on the biology of international politics.

Relationships are complex and multiple types of feminism disproves their argument

Crenshaw2

(Carrie, PhD, Perspectives In Controversy: Selected Articles from CAD, Scholar)

Feminism is not dead. It is alive and well in intercollegiate debate. **Increasingly, students rely on feminist authors** to inform their analysis of resolutions. While I applaud these initial efforts to explore feminist thought, I am concerned that **such arguments** only **exemplify the general absence of sound causal reasoning** in debate rounds. Poor causal reasoning results from a debate practice that privileges empirical proof over rhetorical proof, fostering ignorance of the subject matter being debated. To illustrate my point, I claim that **debate arguments about feminists suffer from a reductionism that tends to marginalize** the **voices** of significant feminist authors. David Zarefsky made a persuasive case for the value of causal reasoning in intercollegiate debate as far back as 1979. He argued that **causal arguments are desirable** for four reasons. First, causal analysis increases the control of the arguer over events by promoting understanding of them. Second, the use of causal reasoning increases rigor of analysis and fairness in the decision-making process. Third, causal arguments promote understanding of the philosophical paradox that presumably good people tolerate the existence of evil. Finally, causal reasoning supplies good reasons for "commitments to policy choices or to systems of belief which transcend whim, caprice, or the non-reflexive "claims of immediacy**" (117-9). Rhetorical proof plays an important role in the analysis of causal relationships. This is true despite the common assumption that the identification of cause and effect relies solely upon empirical investigation. For Zarefsky, there are three types of causal reasoning. The first type of causal reasoning describes the application of a covering law to account for physical or material conditions

that cause a resulting event This type of causal reasoning requires empirical proof prominent in scientific investigation. A second type of causal reasoning requires the assignment of responsibility. Responsible human beings as agents cause certain events to happen; that is, causation resides in human beings (107-08). A third type of causal claim explains the existence of a causal relationship. It functions "to provide reasons to justify a belief that a causal connection exists" (108). The second and third types of causal arguments rely on rhetorical proof, the provision of "good reasons" to substantiate arguments about human responsibility or explanations for the existence of a causal relationship (108). I contend that the practice of intercollegiate debate privileges the first type of causal analysis. It reduces questions of human motivation and explanation to a level of empiricism appropriate only for causal questions concerning physical or material conditions. Arguments about feminism clearly illustrate this phenomenon. Substantive debates about feminism usually take one of two forms. First, on the affirmative, debaters argue that some aspect of the resolution is a manifestation of patriarchy. For example, given the spring 1992 resolution, "[rjesolved: That advertising degrades the quality of life," many affirmatives argued that the portrayal of women as beautiful objects for men's consumption is a manifestation of patriarchy that results in tangible harms to women such as rising rates of eating disorders. The fall 1992 topic, "(rjesolved: That the welfare system exacerbates the problems of the urban poor in the United States," also had its share of patri- archy cases. Affirmatives typically argued that women's dependence upon a patriarchal welfare system results in increasing rates of women's poverty. In addition to these concrete harms to individual women, most affirmatives on both topics, desiring "big impacts," argued that the effects of patriarchy include nightmarish totalitarianism and/or nuclear annihilation. On the negative, many debaters countered with arguments that the some aspect of the resolution in some way sustains or energizes the feminist movement in resistance to patriarchal harms. For example, some negatives argued that sexist advertising provides an impetus for the reinvigoration of the feminist movement and/or feminist consciousness, ultimately solving the threat of patriarchal nuclear annihilation. likewise, debaters negating the welfare topic argued that the state of the welfare system is the key issue around which the feminist movement is mobilizing or that the consequence of the welfare system - breakup of the patriarchal nuclear family -undermines patriarchy as a whole. **Such arguments** seem to **have two assumptions** in common. First, **there is a single feminism**. As a result, feminists are transformed into feminism. Debaters speak of feminism as **a single, monolithic, theoretical and pragmatic entity** and feminists as women with identical m otivations, methods, and goals. Second, **these arguments assume that patriarchy is the** single or **root cause of** all forms of **oppression**. Patriarchy not only is responsible for sexism and the consequent oppression of women, it also is the cause of totalitarianism, environmental degradation, nuclear war, racism, and capitalist exploitation. **These** reductionist **arguments reflect an** unwillingness to debate about the **complexities of human motivation and explanation**. They betray a reliance upon a framework of proof that can explain only material conditions and physical realities through empirical quantification. The transformation of feminists to feminism and the identification of patriarchy as the sole cause of all oppression is related in part to the current form of intercollegiate debate practice. By "form," I refer to Kenneth Burke's notion of form, defined as the "creation of appetite in the mind of the auditor, and the adequate satisfying of that appetite" (Counter-Statement 31). Though the framework for this understanding of form is found in literary and artistic criticism, it is appropriate in this context; as Burke notes, literature can be "equipment for living" (Biilosophy 293). He also suggests that form "is an arousing and fulfillment of desires. A work has form in so far as one part of it leads a reader to anticipate another part, to be gratified by the sequence" (Counter-Statement 124). Burke observes that there are several aspects to the concept of form. One of these aspects, conventional form, involves to some degree the appeal of form as form. Progressive, repetitive, and minor forms, may be effective even though the reader has no awareness of their formality. But when a form appeals as form, we designate it as conventional form. Any form can become conventional, and be sought for itself - whether it be as complex as the Greek tragedy or as compact as the sonnet (Counter-Statement 126). These concepts help to explain debaters' continuing reluctance to employ rhetorical proof in arguments about causality. **Debaters practice the convention of poor causal** reasoning as a result of judges' unexamined reliance upon conventional form. Convention is the practice of arguing single-cause links to monolithic impacts that arises out of custom or usage. Conventional form is the expectation of judges that an argument will take this form. Common practice or convention dictates that a case or disadvantage with nefarious impacts causally related to a single link will "outweigh" opposing claims in the mind of the judge. In this sense, debate arguments themselves are conventional. **Debaters practice the convention of establishing single-cause relationships to large monolithic impacts** in order to conform to audience expectation. Debaters practice poor causal reasoning because they are rewarded for it by judges. The convention of arguing single-cause links leads the judge to anticipate the certainty of the impact and to be gratified by the sequence. I suspect that the sequence is gratifying for judges because it relieves us from the responsibility and difficulties of evaluating rhetorical proofs. We are caught between our responsibility to evaluate rhetorical proofs and our reluctance to succumb to complete relativism and subjectivity. To take responsibility for evaluating rhetorical proof is to admit that not every question has an empirical answer. However, **when we abandon our responsibility to rhetorical proofs, we sacrifice our students' understanding of causal reasoning. The sacrifice has consequences for our students' knowledge of the subject matter they are debating.** For example, when feminism is defined as a single entity, not as a pluralized movement or theory, that single entity results in the **identification of patriarchy as the sole cause of oppression**. The result **is ignorance of the subject position of the particular feminist author,** for highlighting his or her subject position might draw attention to the incompleteness of the causal relationship between link and impact **Consequently, debaters do not challenge the basic assumptions of such argumentation and ignorance of feminists is perpetuated**. Feminists are not feminism. The topics of feminist inquiry are many and varied, as are the philosophical approaches to the study of these topics. Different authors have attempted categorization of various feminists in distinctive ways. For example, Alison Jaggar argues that feminists can be divided into four categories: liberal feminism, marxist feminism, radical feminism, and socialist feminism. While each of these feminists may share a common commitment to the improvement of women's situations, they differ from each other in very important ways and reflect divergent philosophical assumptions that make them each unique. Linda Alcoff presents an entirely different categorization of feminist theory based upon distinct understandings of the concept "woman," including cultural feminism and post-structural feminism. Karen Offen utilizes a comparative historical approach to examine two distinct modes of historical argumentation or discourse that have been used by women and their male allies on behalf of women's emancipation from male control in Western societies. These include relational feminism and individualist feminism. Elaine Marks and Isabelle de Courtivron describe a whole category of French feminists that contain many distinct versions of the feminist project by French authors. Women of color and third-world feminists have argued that even these broad categorizations of the various feminism have neglected the contributions of non-white, non-Western feminists (see, for example, hooks; Hull; Joseph and Lewis; Lorde; Moraga; Omolade; and Smith). In this literature, the very definition of feminism is contested. Some feminists argue that "all feminists are united by a commitment to improving the situation of women" (Jaggar and Rothenberg xii), while others have resisted the notion of a single definition of feminism, bell hooks observes, "a central problem within feminist discourse has been our inability to either arrive at a consensus of opinion about what feminism is (or accept definitions) that could serve as points of unification" (Feminist Theory 17). **The controversy over the very definition of feminism has political implications. The power to define is the power both to include and exclude people and ideas in and from that feminism**. As a result, [bjourgeois white women interested in women's rights issues have been satisfied with simple definitions for obvious reasons. Rhetorically placing themselves in the same social category as oppressed women, they were not anxious to call attention to race and class privilege (hooks. Feminist Wieory 18). Debate arguments that assume a singular conception of feminism include and empower the voices of race- and class-privileged women while excluding and silencing the voices of feminists marginalized by race and class status. This position becomes clearer **when we examine** the second assumption of arguments about feminism in intercollegiate debate **– patriarchy is the sole cause** of oppression. **Important feminist thought has resisted this assumption for good reason. Designating patriarchy as the sole cause of oppression allows the** subjugation of resistance to other forms of oppression **like racism and classism to the**

struggle against **sexism. Such subjugation has the effect of denigrating the legitimacy of resistance to racism and classism as struggles of equal importance**. "Within feminist movement in the West, **this led to the assumption that resisting patriarchal domination is a more legitimate feminist action than resisting racism and other forms of domination**" (hooks. Talking Back 19). The relegation of struggles against racism and class exploitation to offspring status is not the only implication of the "sole cause" argument In addition, **identifying patriarchy as the single source of oppression obscures women's perpetration of other forms of subjugation and domination**, bell hooks argues that we should not obscure the reality that women can and do partici- pate in politics of domination, as perpetrators as well as victims - that we dominate, that we are dominated. **If focus on patriarchal domination masks this reality** or becomes the means by which women deflect attention from the real conditions and circumstances of our lives, **then women cooperate in suppressing** and promoting **false consciousness, inhibiting our capacity to assume responsibility** for **transforming ourselves and society** (hooks. Talking Back 20). **Characterizing patriarchy as the sole cause of oppression allows mainstream feminists to abdicate responsibility for the exercise of class and race privilege**. It casts the struggle against class exploitation and racism as secondary concerns. Current debate practice promotes ignorance of these issues because debaters appeal to conventional for**m**, the expectation of judges that they will isolate a single link to a large impact Feminists become feminism and patriarchy becomes the sole cause of all evil. Poor causal arguments arouse and fulfill the expectation of judges by allowing us to surrender our responsibility to evaluate rhetorical proof for complex causal relationships. **The result is either the mar-ginalization or colonization of certain feminist voices**. Arguing feminism in debate rounds risks trivializing feminists. **Privileging the act of speaking about feminism over the content of speech "often turns the voices and beings of non-white women into commodity, spectacle"** (hooks, Talking Back 14). **Teaching sophisticated causal reasoning enables our students to learn more concerning the subject matter about which they argue. In this case, students would learn more about the multiplicity of feminists instead of reproducing the marginalization of many feminist voices in the debate itself**. The content of the speech of feminists must be investigated to subvert the colonization of exploited women. To do so, we must explore alternatives to the formal expectation of single-cause links to enormous impacts for appropriation of the marginal voice threatens the very core of self-determination and free self-expression for exploited and oppressed peoples. If the identified audience, those spoken to, is determined solely by ruling groups who control production and distribution, then it is easy for the marginal voice striving for a hearing to allow what is said to be overdetermined by the needs of that majority group who appears to be listening, to be tuned in (hooks, Talking Back 14). At this point, arguments about feminism in intercollegiate debate seem to be overdetermined by the expectation of common practice, the "game" that we play in assuming there is such a thing as a direct and sole causal link to a monolithic impact To play that game, we have gone along with the idea that there is a single feminism and the idea that patriarchal impacts can account for all oppression. In making this critique, I am by no means discounting the importance of arguments about feminism in intercollegiate debate. In fact, feminists contain the possibility of a transformational politic for two reasons. First, feminist concerns affect each individual intimately. We are most likely to encounter patriarchal domination "in an ongoing way in everyday life. Unlike other forms of domination, sexism directly shapes and determines relations of power in our private lives, in familiar social spaces..." (hooks. Talking Back 21). Second, the methodology of feminism, consciousness-raising, contains within it the possibility of real societal transformation. "[E]ducation for critical consciousness can be extended to include politicization of the self that focuses on creating understanding the ways sex, race, and class together determine our individual lot and our collective experience" (hooks, Talking Back 24). Observing the incongruity between advocacy of single-cause relationships and feminism does not discount the importance of feminists to individual or societal consciousness raising.

Perm

Their advocacy is not exclusive with the 1AC. The judge can endorse the affirmative and the negative's methods of resistance to oppression as two separate, worthwhile methods.

Kathleen **Higgins**, University of Texas-Austin, Philosophy Professor, Winter 20**13**, Post-Truth Pluralism: The Unlikely Political Wisdom of Friedrich Nietzche, Kindle

Progressives are right that we live increasingly in a post-truth era, but rather than rejecting it and pining nostalgically for a return to a more truthful time, we should learn to better navigate it. Where the New York Times and Walter Cronkite were once viewed as arbiters of public truths, today the Times competes with the Wall Street Journal, and CBS News with FOX News and MSNBC, in describing reality. The Internet multiplies the perspectives and truths available for public consumption. The diversity of viewpoints opened up by new media is not going away and is likely to intensify. This diversity of interpretations of reality is part of a longstanding trend. Democracy and modernization have brought a proliferation of worldviews and declining authority of traditional institutions to meanings. Citizens have more freedom to create new interpretations of facts. This proliferation of viewpoints makes the challenge of democratically addressing contemporary problems more complex. One consequence of all this is that our problems become more wicked and more subject to conflicting meanings and agendas. We can't agree on the nature of problems or their solutions because of **fundamentally unbridgeable values and worldviews**. In attempting to reduce political disagreement to black and white categories of fact and fiction, progressives themselves uniquely ill-equipped to address our current difficulties, or to advance liberal values in the culture. A new progressive politics should have a different understanding of the truth than the one suggested by the critics of conservative dishonesty. We should understand that human beings make meaning and apprehend truth from radically different standpoints and worldviews, and that our great wealth and freedom will likely lead to more, not fewer, disagreements about the world. Nietzsche was no democrat, but the pluralism he offers can be encouragement to today's political class, as well as the rest of us, to become more self-aware of, and honest about, how our standpoint, values, and power affect our determinations of what is true and what is false. In the post-truth era, **we should be able to articulate not one but many different perspectives.** Progressives seeking to govern and change society cannot be free of bias, interests, and passions, but they should strive to be aware of them so that they can adopt different eyes to see the world from the standpoint of their fiercest opponents. **Taking multiple perspectives into account** might alert us to more sites of possible intervention and prime us for **creative formulations** of **alternative possibilities for concerted responses** to our problems. Our era, in short, need not be an obstacle to taking common action. We might see today's divided expert class and fractions public not as temporary problems to be solved by more reason, science, and truth, but rather as permanent features of our developed democracy. We might even see this proliferation of belief systems and worldviews as an opportunity for human development. **We can agree to disagree and still engage in pragmatic action** in the World.

AT: Gender Monolithic

While gender has a large impact – it isn't monolithic, nor unified

Hooper 1

(Charlotte, University of Bristol research associate in politics, Manly States: Masculinities, International Relations, and Gender Politics pp 45-46.)

Spike Peterson and Anne Sisson Runyan (1993), in their discussion of gendered dichotomies, appear to drop Lacanian psychoanalytic discourse as an explanation for gendered dichotomies in favor of a more straightforward- ly political account.14Gendered dichotomies, rather than uniformly con- structing gendered social relations through universal psychoanalytic mecha- nisms, are seen more ambiguously, as playing a dual role. Where gendered dichotomies are used as an organizing principle of social life (such as in the gendered division of labor) they help to construct gender differences and in- equalities and thus are constitutive of social reality, but in positing a grid of polar opposites, they also serve to obscure more complex relationships, commonalties, overlaps, and intermediate positions (Peterson and Runyan 1993, 24–25). Elaborating on this view, it can be argued that gendered dichotomies are in part ideological tools that mystify, masking more complex social realities and reinforcing stereotypes. On one level, they do help to produce real gen- der differences and inequalities, when they are used as organizing principles that have practical effects commensurate with the extent that they become embedded in institutional practices, and through these, human bodies. They constitute one dimension in the triangular nexus out of which gender identities and the gender order are produced. But at the same time, institutional practices are not always completely or unambiguously informed by such dichotomies, which may then **operate to obscure more complex relationships**. It is a mistake to see the language of gendered dichotomies as a unified and totalizing discourse that dictates every aspect of social practice to the extent that we are coherently produced as subjects in its dualistic image. As well as the disruptions and discontinuities engendered by the intersections and interjections of other discourses (race, class, sexuality, and so on) **there is always room for evasion, reversal, resistance, and dissonance** between rhetoric, practice, and embodiment, as well as reproduction of the symbolic order, as identities are negotiated in relation to all three dimensions, in a variety of **complex and changing circumstances**. On the other hand, the symbolic gender order does inform practice, and our subjectivities are produced in relation to it, so to dismiss it as performing only an ideological or propagandistic role is also too simplistic.

State/Reform Good

Legal/State Key

Abdication of legal reformism makes concrete challenges to material barriers to feminism impossible

Crawford 7

(1-1-2007 Toward a Third-Wave Feminist Legal Theory: Young Women, Pornography and the Praxis of Pleasure Bridget J. Crawford Pace University School of Law, bcrawford@law.pace.edu)

CONCLUSION In spite of third-wave feminism's appeal, at this point in its development, third-wave feminism lacks an **overall theoretical view** of how the law functions Third-wave feminism is largely a **reactive critique** that fails to advance its own **positivistic view** of how certain **goals should be accomplished**. Third-wave feminists respond to incomplete and distorted images of second-wave feminism. Their indictment of second-wave feminism has led to a significant tension between older and younger feminists. Gloria Steinem, for one, has said that when reading third-wave feminist writings, she feels "like a sitting dog being told to sit."384 Women on the younger cusp of second-wave feminism, who demographically are not part of the third wave, report that they feel adrift between the competing "waves."385 And even some younger women, perhaps articulating the most decidedly third-wave stance of all, state that they do not want selfidentity as part of a "third-wave" of feminism, because that identification implies a group affiliation or branding that should be rejected in favor of a third-wave embrace of individualism. So one is left with the sense that third-wave feminism is a **helpful** elaboration of some of the issues first raised by earlier feminists, but that it is not so decidedly different from what has come before. Third-wave feminism's emphasis on personal pleasure, the fluidity of gender roles, the internet and coalition-building contribute to the feminist conversation, but third-wave feminists have not yet **altered the terms** and conditions **of that conversation.** It remains for lawyers and legal theorists **to take up the challenge** from this generation of young women to **develop laws that enhance women's** autonomy and **well-being.**

Feminist critiques of the state get coopted to justify neoliberal deregulation--- engagement is key

Gupta 12

(Rahila, freelance journalist and writer, Has neoliberalism knocked feminism sideways?, https://www.opendemocracy.net/5050/rahila-gupta/has-neoliberalism-knocked-feminism-sideways)

Feminism needs to recapture the state from the neoliberal project to which it is in hock in order to make it deliver for women. It must guard against atomisation and recover its transformative aspirations to shape the new social order that is hovering on the horizon, says Rahila Gupta¶ How should feminists read our current times? A major economic crisis rocks the developed world. While austerity measures don't appear to be working across Europe, the mildly Keynesian efforts of Obama to kick-start the US economy have had only a marginal effect. The Occupy movement has gone global and the public disorder in the summer, with more disorder being predicted by the police, are an indication of deep discontent with the system. Yet we have seen an enthusiastic and vibrant third wave of youthful feminism emerge in the past decade. At the rate at which these waves arise, it will be some time before the rock of patriarchy will be worn smooth.¶ The current phase of capitalism – neo-liberalism – which began with Thatcher and Reagan in the 1970s, promotes privatisation and deregulation in order to safeguard the freedom of the individual to compete and consume without interference from a bloated state. According to David Harvey, a Marxist academic, the world stumbled towards neo-liberalism in response to the last major recession in the 70s when 'the uneasy compact between capital and labour brokered by an interventionist state' broke down. The UK government, for example, was obliged by the International Monetary Fund to cut expenditure on the welfare state in order to balance the books. The post-war settlement had given labour more than its due, and it was time for the upper classes to claw these gains back. ¶

The fact that second wave feminism and neoliberalism flourished from the 1970s onwards has led some to argue, notably Nancy Fraser, that feminism 'served to legitimate a structural transformation of capitalist society'. I am with Nancy Fraser in so far as she says that there is a convergence, a coinciding of second wave feminism and neo-liberalism, even that feminism thrived in these conditions. It is well known that in an attempt to renew and survive, capitalism co-opts the opposition to its own ends. If part of the project of neoliberalism is to shrink the size of the state, it serves its purpose to co-opt the feminist critique that the state is both paternalistic and patriarchal. Critiques of the nanny state from the right may chime with feminist concerns. However, the right has little to say about patriarchy. What is left out of the co-option process is equally significant. The critique of the state mounted by feminists such as Elizabeth Wilson when state capitalism was at the height of its powers suited neoliberal capitalists seeking deregulation and a reduced role for the state. ¶ Fraser's analysis does not explain the current resurgence of feminism at a time when the shine of neoliberalism has faded. It is not so much that feminism legitimised

neoliberalism, but that neoliberal values created a space for a bright, brassy and ultimately fake feminism - the 'I really, really want' girl-power ushered in by the Spice Girls. This transitional period between second wave and the current wave of feminism (which some commentators characterised as post-feminist) represented the archetypal appropriation of the feminist agenda, shorn of its political context, by neoliberalism. Incidentally, many of us rejected the label post-feminist because it felt like an attempt to chuck feminism into the dustbin of history and to deny the continuing need for it. In hindsight, there was something different going on in that lull between the two waves in the 70s and 80s and today; the voice of feminism was being drowned out by its loud, brassy sisters.¶ If the culture of neoliberalism had something to offer women, it was the idea of agency, of choice freely exercised, free even of patriarchal restraints. It emphasised self-sufficiency of the individual while at the same time undermining those collective struggles or institutions which make self-sufficiency possible. The world was your oyster – all you needed to do was compete successfully in the marketplace. The flexible worker, in order to make herself acceptable to the world of work, may even go so far as to remodel herself through cosmetic surgery, all the while under the illusion that she was in control of her life. In her essay on 'Feminism' in a forthcoming book, Oxford Handbook of Political Ideologies, Clare Chambers argues that liberal capitalism is committed to what she calls the 'fetishism of choice'. If women choose things that disadvantage them and entrench differences, it legitimates inequality because the inequality arises from the choices they make. The few women who do well out of the sex industry do not believe that their work entrenches inequality because it is freely chosen, because prostitution is seen as a liberation from the drudgery of cleaning jobs. Choice is their weapon against feminist objections. In their so-called free expression of their sexuality, they are challenging nothing in the neoliberal schema because the work reduces women to the status of meat and commodity.

State Inevitable

State influence inevitable---only mobilizing focus on reforms can effectively challenge patriarchy

Connell 90

Because of its power to regulate and its power to create, the state is a major stake in gender politics; and the exercise of that power is a con- stant incitement to **claim the stake**. Thus the state becomes the **focus** of interest-group formation and mobilization in sexual politics. It is worth recalling just how wide the liberal state's activity in relation to gender is. This activity includes family policy, population policy, labor force and labor market management, housing policy, regulation of sexual behavior and expression, provision of child care, mass educa- tion, taxation and income redistribution, the creation and use of mili- tary forces - and that is not the whole of it. This is not a sideline; it is a major realm of state policy. Control of the machinery that conducts these activities is a **massive asset in gender politics**. In **many situations** it will be **tactically decisive**. The state is therefore a focus for the mobilization of interests that is **central to gender politics on the large scale**. Feminism's historical con- cern with the state, and attempts to capture a share of state power, appear in this light as a **necessary response to a historical reality** They are **not an error brought on by an overdose of liberalism or a capitula- tion to patriarchy**. As Franzway puts it, the state is **unavoidable** for feminism. The question is not whether feminism will deal with the state, but how: on what terms, with what tactics, toward what goals.[5] The same is true of the politics of homosexuality among men. The ear- liest attempts to agitate for toleration produced a half-illegal, half-aca- demic mode of organizing that reached its peak in Weimar Germany, and was smashed by the Nazis. (The Institute of Sexual Science was vandalized and its library burnt in 1933; later, gay men were sent to concentration camps or shot.) A long period of lobbying for legal reform followed, punctuated by bouts of state repression. (Homosexual men were, for instance, targeted in the McCarthyite period in the United States.) The gay liberation movement changed the methods and expanded the goals to include social revolution, but still dealt with the state over policing, de-criminalization, and anti-discrimination. Since the early 1970s gay politics has evolved a complex mixture of confron- tation, cooperation, and representation. In some cities, including San Francisco and Sydney, gay men as such have successfully run for public office. Around the AIDS crisis of the 1980s, in countries such as the United States and Australia, gay community based organizations and state health services have entered a close - if often tense - long-term relationship.' In a longer historical perspective, all these forms of politics are fairly new. Fantasies like Aristophanes's Lysistrata aside, the open mobiliza- tion of groups around demands or programs in sexual politics dates only from the mid-nineteenth century. The politics that characterized other patriarchal gender orders in history were constructed along other lines, for instance as a politics of kinship, or faction formation in agri- cultural villages. It can plausibly be argued that modern patterns re- sulted from a reconfiguration of gender politics around the growth of the liberal state. In particular its structure of legitimation through plebiscite or electoral democracy invited the response of popular mobilization

State influence is inevitable but depth of oppression matters---reform is effective and only way to solve---they exaggerate state's internal coherence

Connell 90

Appraisals Is the state patriarchal? Yes, beyond any argument, on the evidence dis- cussed above. It is **not "essentially patriarchal"** or "male"; even if one could speak of the "essence" of a social institution, this would **exaggerate the internal coherence of the state**. Rather the state is historically patriarchal, patriarchal as a matter of **concrete social practices**. State structures in recent history institutionalize the European equation be- tween authority and a dominating masculinity; they are effectively con- trolled by men; and they operate with a massive bias towards hetero- sexual men's interests. At the same time the pattern of state patriarchy changes. In terms of the depth of oppression and the historical possibilities of resistance and transformation, a fascist regime is **crucially different** from a liberal one, and a liberal one from a revolutionary one. The most favorable histori- cal circumstance for progressive sexual politics seems to be the early days of social-revolutionary regimes; but the later bureaucratization of these regimes is devastating. **Next best is a liberal state with a reformist government;** though reforms introduced under its aegis are vulnerable in periods of reaction. Though the state is patriarchal, progressive gender politics **cannot avoid it** The character of the state as the **central institutionalization of power**, and its historical trajectory in the regulation and constitution of gender relations, make it **unavoidably a major arena for challenges to patriarchy**. Here liberal feminism is on **strong ground** Becoming engaged in practical struggles for a share of state power requires tactical judgments about what developments within the state provide opportunities. In the 1980s certain **strategies of reform have had a higher relative pay- off** than they did before. In Australia, for instance, the creation of a network of "women's services" was a feature of the 1970s, and the momentum of this kind of action has died away. Reforms that have few budgetary implications but fit in with other state strategies, such as modernizing the bureaucracy, become more promi- nent. Equal employment opportunity and anti- discrimination legisla- tion have been highlighted; decriminalizing homosexuality is consistent with this.

Reform Better

State influence is inevitable but depth of oppression matters---reform is effective and only way to solve---they exaggerate state's internal coherence

Connell 90

(R. W. Connell 90, "The State, Gender, and Sexual Politics: Theory and Appraisal", Theory and Society, Vol. 19, No. 5, (Oct., 1990), pp. 507-544, http://www.jstor.org/stable/657562)

Our Strat Best

That's the best starting point – struggles for political power in the name of narrow goals <u>sanitizes the desire for dominance</u> and <u>arrest</u> radical potential. The thought experiment of recognizing the <u>interconnectedness</u> of political violence is key

Wang 14

(Hongyu, Ph.d., Professor, STCL - Curriculum Studies, 20, "A Nonviolent Perspective on Internationalizing Curriculum Studies," International Handbook of Curriculum Research, Ch. 5 Routledge)

In the first edition of this Handbook. William K Pinar (2003) discusses the importance of focusing on education and curriculum, rather than international political tensions, for the internationalization of curriculum studies. If we have scholars acting as if diplomatic representatives of their own countries, the intellectual and educational possibility will be lost in power struggles. Actually, <u>in political and social movements, the **egocentric pursuit of political authority** and control, either for an **individual or for a group,** can **hardly lead to any success**</u>, (Ihandi (1942/2007) specifically <u>points out that</u> the <u>nonviolence</u> movement <u>is "**not a program of seizure of power**" but "a program of **transformation of relationships**</u>" (p. 40). In the Liberian women's peace movement in 2003, they adopted the strategy of not criticizing the political policies of the dictatorship—even though there were more than plenty to criticize—but demanding of peace unyieldingly and wholeheartedly (Disney & Ritickcr, 2(108; Cibowce, 2011). <u>Paradoxically, the **key to winning social and political victories**</u> in nonviolence movements is to **abandon the politics of power struggle** and **instead to mobilize every participant in the powerful process of transforming the nature of relationships from dominating/being dominated to organic interconnectedness.** <u>If we cannot go beyond the confinement of national, group, or individual self-interest, there is **no possibility of achieving**</u> "heart <u>unity" with others who arc distant or/and different from us.</u> Here it is essential not only to dwell in international space, but also to move towards transnational space. <u>The inter-space and trans-space are both important</u> for creating nonviolent dynamics of the local, the national. and the global through transforming relationships<u>. The term "international" acknowledges the "in between" fluid spaces where multiplicity and differences are neither excluded nor self-contained</u>. Moreover, <u>internationalization</u> as a concept <u>supports the **decentering of both the national and the global**</u> through a <u>focus on interaction and relationship that lead to the **transformation of both locality and globalness**</u>. To borrow the language of chaos and complexity theory (Doll. 20121, the newness of the global comes from a dynamic interaction of local parts. Also as Peter Hershock (2009) argues, it is a fallacy lo assume that "whatever is good for each and every one of us (individually) will be good for all of us (communally or ecologically)" (p. 156) since what is good for the local may become detrimental to the ecological or the global. Therefore, the global us the whole is more than the addition of (he national or the local, but emerges from interactive dynamics and is marked by organic relationality. Noel Gough (2003) suggests that "<u>internationalizing</u> curriculum <u>inquiry might best be understood as a process of creating</u> transnational spaces <u>in which scholars from different localities collaborate in **reframing**</u> and decentering <u>their own knowledge traditions and negotiate trust in each other's contributions to their collective work"</u> (p. 6S). The very usage of "trans-"' indicates both an intense experiencing of (the boundary and an effort to go beyond that boundary. <u>Such transnational spaces</u> not only <u>sustain hybrid movements but **also support embodied work** to negotiate collaborative trust</u>. Nonviolence education must be an embodied process. Sherry B. Shapiro (2002) asserts that it is the joy and suffering of the human body that extends "beyond the boundaries of nationality, rice, ethnicity, gender, social class, or sexual or religious preference—all the ways of marking ourselves off from others" (p. I4U). <u>Peace and nonviolence education need to **sensitize us to the collective body**, and pedagogically we need to begin with the body as the connector between the public and the private, and between social identity and a wider shared experience</u>. <u>In such dynamics of international</u> and transnational <u>movements, identity is destabilized</u>, power <u>struggles are displaced into fluid modes of relationships,</u> <u>and nonviolent relationality across differences become multidimensional</u>— both horizontal (among the local) and vertical (between the local and the global l. and both top-down (from the global to the individual body) and bottom-up (from the local to the international)—to form a network of nonviolence. <u>Instead of **intensifying the fragmentation**</u> (due to dualism) that marks the fragility of the modern life we share, <u>the nonviolent modes of relationalily we choose to establish can contribute to the **integrative potential of the network**</u>. For the dynamics of intergroup relationships within the national, I reference the American field of curriculum studies as an example due to my familiarity with it. Pinar (2013) identifies "power, identity, and discourse" as the key concepts of the reconceptualized curriculum field in the United States, hut he suggests that these concepts

have become assumptions—due to their success—and that these newly taken-for-granted concepts have tendencies toward totalization and reductionism. Now the assumption that "power predominates, that identity is central, and that discourse is determinative (e.g. our research provides only narratives, never truth)—are widely shared" (p. 8). Accepted as given, they have become "abstractions split off from the concrete complexity of the historical moment" <p. S) and exhausted in self-referentiality. Ironically, the central emphasis of identity leads to the casually of individual agency and subjective specificity. As both an observer and participant of the American field of curriculum studies who came from China in 1996, I also would like to add another causality: organic relationality. The complexity and richness in the singularity of each individual or group coexists with the complicated and organic relationality of humanity and life, and when one side of the coin is undermined, ihe other side deteriorates as well. While Pinar (2013) discusses the proliferation of "uncertainty" and "dispersion" in post •structural dis-courses and their elicits. I also think ihe distance between self and other stretched by the post-structural discourses of otherness and the unknown Other may lead to the difficulty of nm being able to bring self and other back into the fabric of relationality (Wang, in press). In addressing "difference-centered politics of recognition and respect." drawing upon the Buddhist philosophy. Peter Hershock I20O9) argues for "a concerted shift from considerations of how much we are the same or different from each |sic | another to how we might best differ for one another" (p. 1611: emphasis in original). In a nondualistic. nonviolent view, subject and object, body and mind, and self and other exist interdependent!). Hershock's perception of differences as essential for mutual contribution and shared welfare, as something positive that should not be erased or elevated, but as a part of a relationship network, is a challenge not only to the liberal notion of the individual as autonomous, but also to the identity politics of static diversity or the postmodern radicalization of singularity. The nonviolent relational dynamics of "differing for" rather than "differing from" are particularly imperative under the context of a profoundly shared sense of crisis in American public education. While particular differences such as racial or gendered differences must he discussed, the discussions need to orient towards changing our ways of relating to others and addressing the root course of social violence, rather than fixing on any particular social identity. Nonviolence cannot exist without social justice, but social justice for one group at the expense of the welfare of others docs not do justice to the shared human struggle for the common good of all. Confronting the crisis in American public education, I suggest that challenging the violence of the conservative forces and working through the depressive position of educators in relation to the external attack from non-education sectors, we are called to form nonviolent relationships among different social groups and their affiliated scholarly camps. Identity-based struggles, when contextualized in the interconnected web of life, have played a progressive role in the field. However, without contextualizing and complicating one's own investment in a broader project of education for all, without taking a step back from one's own particular subjective positioning to see a bigger picture, any fixation upon one group's struggle—along or within the lines of cither nice, gender, class, sexuality, nation, or other social factors—at the expense of the collective good arrests democracy as an unfulfilled dream, If we can initiate and participate in nonviolent dynamics of "differing for" an educationally informed, compassion-ale community across local and national borders, we are also challenging the international domination of American politics, along with its domestically repressive educational "reform" demand for raising test scores and maintaining global control. This suggestion is certainly not about subsuming diversity into uniformity, as any network has room for breaks and fragmentations. The organic relationalty of nonviolence welcomes differences and does not avoid conflicts because it has the ability to stretch, transform, and rebuild. Moving from the national to the international level, the dualism of "us" versus "them" has played a violent role in global relationships, and the possibility of moving beyond such a fixed boundary depends upon our capacity for refusing to dehumanize the other, both the friendly other and the hostile other. Through the psychoanalytic notion of "the stranger to ourselves." Julia Kristeva (1993) invites us "to recognize ourselves as strange in order better to appreciate the foreigners outside us instead of striving to bend them to the norms of our own repression" (p. 29). If we are aware of our subconscious rather than repressing it. aliens are no longer a threat to us. Kristeva believes that a transnational or international position is situated at the crossing of boundaries, which simultaneously affirms and transcends national borders. The idea of nation "at the same time affirmed as a space of freedom and dissolved in its own identity" (p. 32) affirms both the protective function of identification and the necessity of border-crossing. Situated at the fluid border, "nations without nationalism" support nonviolent relationality.

AT Specific Strategies

Alt no solve

The alternative can't solve access but a focus on legalism does

Schwartz9

(Joseph, Poli Sci Prof @ Temple, "The Future of Democratic Equality," Routledge, pg 64-5)

'Discursive' performance is not the sole manner by which individuals deal with (and express) the material and cultural structural realities that both empower and constrain individuals. For example. **individuals cannot readily "discursively perform" themselves out of their socio-economic or class position.** There is a certain materiality to poverty or to being "bossed" that can't simply be "ironically" and "performatively" transformed. Class relations are structural, as well as discursive. The greater difficulty in forming unions in the United States- as compared to other advanced industrial democracies- has much to do with American legal, ideological, and political constraints and not simply with the rel- ative inefficacy of the "performative," "counter-hegemonic" behavior of (frag- mented) individuals. Even the "parodic" possibilities of "gender" reversal are constrained by the communities in which one resides. **Is the "reversal" of "drag" a viable public possibility in a violently homophobic community?** Were not the "performative" options of a Matthew Sheperd (extremely) more limited than those of a gay or lesbian student at a "progressive" residential liberal arts college (and unsafe-and even degrading and violent-social spaces confront gay and lesbian people and women and students of color in the most allegedly "cosmopolitan" of social spaces). Simply put, **distinct "social spaces" set differ- ential constraints on "performative" choices.** Of course, how individuals express class, race, gender, and sexuality does, in part, involve how we "perform" (or "racist") cultural and discursive "norms." Hence, the inevitable controversies over "authenticity" within racial, sexual, and ethnic communities, as well as criticism of people taking on the mores of a class different from those who share their "place" in the labor process, neighborhood, or income strata. But there are material constraints to **performative "choice": one can't "perform" one's way out of an under-funded inner city school** or out of being a **laid-off auto worker with dim prospects of finding a new job with comparable wages and benefits.** Traditional sociological theories of **"structuration"** provide **greater insight into how these individuals would deal with these social dilemmas** than do **micro-level theories of the discursive construction of subjectivity.** To her credit, Wendy Brown is more concerned with issues of class and political economy than are many post-structuralist political theorists. She expressly claims to bring class back into her political analysis and condemns identity poli- tics as a "phantasmagorical reflection of the 'middle-class' American dream." But there is little attention in her work to developing a political strategy that could promise a structural and material redistribution of power, rather than an alter- ation of how we think of epistemology, discourse, and politics." While ideology and culture play a relatively autonomous role in constituting subjectivity, both have a material structure that must be altered if society is to be democratized. Brown implies that radical social change does not as much involve democratiz- ing social structural relations as it does popularizing a radical epistemological approach to discourse. Brown argues that if we will ourselves to "surrender epis- temological foundations" and give up "specifically moral claims" we will all be able to engage in "the sheerly political: 'wars of position' and amoral contests about the just and good in which truth is always grasped as coterminous with power, as always already power, as the voice of power."""' Even if one resists asking whether democracy can rest on "amoral" principles, one can still ask whether Brown's Foucauldian assertation that power and truth are co-terminous can distinguish between more or less democratic forms of power? The post-structuralist hyper- emphasis on "discourse" and the agonal construction of the self also **overly devalues the state as an arena for political reform.** Brown's work makes a positive political contribution by warning social movements about fetishizing the struggle for group rights within the law as potential minefields of "reversed" power/knowledge formations. State regulation and technocratic control which claim to defend the interests of newly, legally- recognized identities may yield the perverse consequence of "domesticating" the identity of the insurgent social group (e.g. state micro-management of the work place in "comparable worth legislation," or enforcement of patriarchal values in regard to punitive workfare or "child support" regulation)?" Sometimes, as Brown contends, new-found rights may enhance separation and alienation between and within individuals and groups, as well as constitute new forms of state regulation in the name of the impersonal subject. But Brown rejects the possibility (and historical reality) that new "rights" can, in other contexts, con- tribute to human emancipation by enhancing individual choice and freedom. To deny this is to ignore the elective affinity between the struggle for "rights" and struggles to achieve political equality for formerly subordinate peoples. Not all new-found rights are "co-optative" and a "reinscribing of domination.""7 Nor will the conflict within the American polity over how we should interpret and defend

"rights" ever cease. One only has to witness contemporary political con- conflict over "abortion rights," "voting rights," "gun rights," etc. Rights are both politically contested and protective of certain forms of human choice and agency. Rights do not "fix" identities as intransigently as Brown and other post-structuralists claim. Do rights only serve, as Brown contends, to promote "the discursive denial of historically layered and institutionally secured bounds, by denying with words the effects of relatively wordless, politically invisible, yet material constraints"?"" Patri- cia Williams and other critical race theorists have argued that being included under the state's equal protection law helped limit violence against people of color." Despite legitimate fears about excessive state regulation of sexuality, would Brown reject the use of state force to limit domestic violence? How does her philosophical fear of the bureaucratic-regulatory powers of the state speak to the experience of hundreds of thousands of women who have been spared the "privatization" of domestic violence by the extension of the rights of state author- ity (e.g. the police) to act against violence within the household? Are such prac- tices solely evidence of the "reconstruction of domination by the regulation of the technocratic-bureaucratic state"? Of course, state regulation of domestic violence may, in Brown's language, produce a female subject "dependent upon the pater- nal state" for protection. But is this not preferable to the prior form of paternal state that let a man be the violent definer of "rights" in his home?

Alt Fails – Strategy Key

Alternative alone <u>can't solve</u> – focus on tactics and strategy key

Saloom 6

(Rachel, JD Univ of Georgia School of Law and M.A. in Middle Eastern Studies from U of Chicago, Fall 2006, A Feminist Inquiry into International Law and International Relations, 12 Roger Williams U. L. Rev. 159, Lexis)

Because patriarchy is embedded within society, it is no surprise that the theory and practice of both international law and international relations is also patriarchal. 98 <mark>Total critique</mark>, however, <mark>presents no method by which to challenge current hegemonic practices. Feminist scholars have yet to provide a coherent way in which total critique can be applied to change the nature of international law and international relations.</mark> Some [*178] feminist scholars are optimistic for the possibility of changing the way the current system is structured. For example, Whitworth believes that "sites of resistance are always available to those who oppose the status quo." 99 Enloe suggests that since the world of international politics has been made it can also be remade. 100 She posits that every time a woman speaks out about how the government controls her, new theories are being made. 101 <mark>All of these theorists highlight the manner in which gender criticisms can destabilize traditional theories. They provide **no mechanism**</mark>, however, <mark>for the actual implementation of their theories into practice.</mark> While in the abstract, resistance to hegemonic paradigms seems like a promising concept, gender theorists have made no attempt to make their resistance culminate in meaningful change. <mark>The notion of rethinking traditional approaches to</mark> international law and <mark>international relations does not go far enough in prescribing an alternative theoretical basis for understanding the international arena. Enloe's plea for women to speak out about international politics does not go nearly far enough in explaining how those acts could have the potential to **actually change the practice** of international relations. Either women are already speaking out now, and their voices alone are not an effective mechanism to challenge the system</mark>, or women are not even speaking out about world politics currently. Obviously it is absurd to assume that women remain silent about world politics. If that is the case, then one must question women's ability to speak up, challenge, and change the system.

AT: Negativity Alt

Optimism and solidarity are our only hope---their pessimism accepts the foundational premises of patriarchy/racism as its starting point for politics

Hooks 96

(bell hooks 96, Killing Rage: Ending Racism, Google Books, 269-272)

269More than ever before in our history, black Americans are succumbing to and internalizing the racist assumption that there can be no meaningful bonds of intimacy between blacks and whites. It is fascinating to explore why it is that black people trapped in the worst situation of racial oppres sion—enslavement—had the foresight to see that it would be disempowering for them to lose sight of the capacity of white people to transform themselves and divest of white supremacy, even as many black folks today who in no way suffer such extreme racist oppression and exploitation are convinced that white people will not repudiate racism. Con temporary black folks, like their white counterparts, have passively accepted the internalization of white supremacist assumptions. Organized white supremacists have always taught that there can never be trust and intimacy between the superior white race and the inferior black race. **When black people internalize these sentiments, no resistance to white supremacy is taking place; rather we become complicit in spreading racist notions.** It does not matter that so many black people feel white people will never repudiate racism because of being daily assaulted by white denial and refusal of accountability. We must not allow the actions of white folks who blindly endorse racism to determine the direction of our resistance. Like our white allies in struggle we must consistently keep the faith, by always sharing the truth that 270white people can be anti-racist, that racism is not some immutable character flaw. **Of course** many white people are comfortable with a rhetoric of race that suggests racism cannot be changed, that all white people are "inherently racist" simply because they are born and raised in this society. Such misguided thinking socializes white people both to remain ignorant of the way in which white supremacist attitudes are learned and to assume a posture of learned helplessness as though they have no agency—no capacity to resist this thinking. Luckily we have many autobiographies by white folks committed to anti-racist struggle that provide documentary testimony that many of these individuals repudiated racism when they were children. Far from passively accepting It as inherent, they instinctively felt it was wrong. Many of them witnessed bizarre acts of white racist aggression towards black folks in everyday life and responded to the injustice of the situation. Sadly, in our times so many white folks are easily convinced by racist whites and bLack folks who have internalized racism that they can never be really free of racism. These feelings aíso then obsc]re the reality of white privi lege. As long as white folks are taught to accept racism as 'natura]" then they do not have to see themselves as con sciously creating a racist society by their actions, by their political choices. This means as well that they do not have to face the way in which acting in a racist manner ensures the maintenance of white privilege. Indeed, denying their agency allows them to believe white privilege does not exist even as they daily exercise it. If the young white woman who had been raped had chosen to hold all black males account able for what happened, she would have been exercising white privilege and reinforcing the structure of racist thought which teaches that all black people are alike. Unfortunately, 271so many white people are eager to believe racism cannot be changed because internalizing that assumption downplays the issue of accountability. No responsibility need be taken for not changing something ¡fit is perceived as immutable. To accept racism as a system of domination that can be changed would demand that everyone who sees him- or herself as embracing a vision of radai social equality would be required to assert anti-racist habits of being. We know from histories both present and past that white people (and everyone else) who commit themselves to living in anti-racist ways need to make sacrifices, to courageously endure the uncomfortable to challenge and change. Whites, people of color, and black folks are reluctant to commit themselves fully and deeply to an anti-racist struggle that is ongoing because there is such a **pervasive feeling of hopelessness—a conviction that nothing will ever change.** How any of us can continue to hold those feelings when we study the history of racism in this society and see how much has changed makes no logical sense. Clearly we have not gone far enough. In the late sixties, Martin Luther King posed the question "Where do we go from here." To live in anti-racist society we must **collectively** renew our commitment to a democratic vision of racial justice and equality. Pursuing that vision we create a culture where beloved community flourishes and is sustained. Those of us who know the joy of being with folks from all walks of life, all races, who are fundamentalls' anti-racist in their habits of being. need to give public testimony. Ve need to share not only what we have experienced but the conditions of change that make such an experience possible. The interracial circle of love that I know can happen because each individual present in it has made his or her own commitment to living an anti- racist life and to furthering the struggle to end white supremacy 272 will become a reality for everyone only if those of us who have created these communities share how they emerge in our lives and the strategies we use to sustain them. Our devout commitment to building diverse communities is cen tral. These commitments to anti-racist living are just one expression of who we are and what we share with one an other but they form the foundation of that sharing. Like all beloved communities we affirm our differences. It is this generous spirit of affirmation that gives us the courage to challenge one another, to work through misunderstandings, especially those that have to do with race and racism. In a beloved community solidarity and trust are grounded in profound

==commitment to a shared vision==. Those of us who are always anti-racist long for a world in which evezyone can form a beloved community where borders can be crossed and cultural hybridity celebrated. Anyone can begin to make such a community by truly seeking to live in an anti-racist world. <u>If that longing guides our vision and our actions, the new culture will be born and anti-racist communities of resis tance will emerge everywhere. That is where we must go from here.</u>

AT: Individual Experience Method

They presume the purity of their experience in place of facts---we must examine multiple perspectives

Conway 97

(philosophy, Penn State, Daniel, *Nietzsche and the political*, 135-6)

This preference is clearly political in nature, and Haraway makes no pretense of aspiring to epistemic purity or foundational innocence. For Haraway, **any epistemic privilege** necessarily **implies a political (i.e., situated) preference** Her postmodern orientation elides the boundaries traditionally drawn between politics and epistemology, and thus renders otiose the ideal of epistemic purity. All perspectives are partial, all standpoints situated— including those of feminist theorists. It is absolutely crucial to Haraway's postmodern feminist project that we acknowledge her claims about situated knowledge as themselves situated within the political agenda she sets for postmodern feminism; feminist theorists must therefore accept and accommodate the self-referential implications of their own epistemic claims. ¶ The political agenda of postmodern feminism thus assigns to (some) subjugated standpoints a political preference or priority. Haraway, for example, believes that some subjugated standpoints may be more immediately revealing, especially since they have been discounted and excluded for so long. They may prove especially useful in coming to understand the political and psychological mechanisms whereby the patriarchy discounts the radically situated knowledges of others while claiming for its own (situated) knowledge an illicit epistemic privilege: ¶ The standpoints of the subjugated … are savvy to modes of denial through repression, forgetting, and disappearing acts— ways of being nowhere while claiming to sec comprehensively. The subjugated have a decent chance to be on to the god-trick and all its dazzling—and, therefore, blinding—illuminations.34 ¶ **But these subjugated standpoints do not afford** feminist theorists **an epistemically privileged view of the world,** independent of the political agendas they have established. Reprising elements of Nietzsche's psychological profile of the "slave" type, Haraway warns against the ¶ serious danger of romanticizing and/or **appropriating the vision of the less powerful** while claiming to see from their positions. To see from below is **neither easily learned nor unproblematic,** even if "we" "naturally" inhabit the great underground terrain of subjugated knowledges **The positionings of the subjugated are not exempt from critical re-examination**, decoding, deconstruction, and interpretation; that is, from both semiological and hermeneutic modes of critical enquiry. The standpoints of the subjugated are not "innocent" positions.35 ¶ A subjugated standpoint may shed new light on the ways of an oppressor, but it in no way renders superfluous or redundant the standpoint of the oppressor. Because **neither** standpoint fully **comprises the other** the **aggregation** of the two would move both **parties** (or a third party) **closer to a more objective understanding of the world** If some feminists have political reasons for disavowing this project of aggregation, or for adopting it selectively, **then they must pursue their** political **agenda at the expense of** the greater **objectivity that they might otherwise have gained**

Micro focus fails

Cuomo '11

(Chris Professor of Philosophy and Women's Studies, and an affiliate faculty member of the Environmental Ethics Certificate Program and the Institute for African-American Studies. The author and editor of many articles and several books in feminist, postcolonial, and environmental philosophy, Cuomo served as Director of the Institute for Women's Studies from 2006-2009. Her book, The Philosopher Queen, a reflection on post-9/11 anti-war feminist politics, was nominated for a Lambda Award and an APA book award, and her work in ecofeminist philosophy and creative interdiciplinary practice has been influential among those seeking to bring together social justice and environmental concerns, as well as theory and practice. She has been a recipient of research grants from the Rockefeller Foundation, the National Science Foundation, the Ms. Foundation, the National Council for Research on Women, and the Institute for Sustainability and Technology Policy, and she has been a visiting faculty member at Cornell University, Amherst College, and Murdoch University in Perth, Australia, "Climate Change, Vulnerability, and Responsibility," Hypatia 26 no4 Fall 2011 p. 690-714, AM)

Due to the scale of change that is needed, individual and household reductions in greenhouse-gas pollution will be effective **only if** they are deep and widespread, and only if they are accompanied by meta-level efforts, but meta-level policies and corporate practices seem unlikely to emerge without significant support from "below." Addressing climate change through mitigation and transnational funding for adaptation requires administrative action in the form of binding treaties, laws and regulations, taxes, incentives for technological development, and increased international aid, but such policies and practices require mass popular support. An unfair and possibly unmanageable degree of practical responsibility therefore falls on citizens and consumers, who may turn out to be ineffective as political actors because of the problems of insufficiency and disempowerment, among other things. Nonetheless, if national and corporate policies will not go in a more sustainable direction without a great swell of public support in places like the United States, then it is ethically and practically necessary that the significant minority who hopes to effectively address the problem of climate change find ways to build that support. It would be tragic if increasing disempowerment fueled by well-intentioned green messaging were to magnify **political ineffectiveness** among environmentalists and global human rights advocates by making it more attractive to focus on personal or private-sphere changes, rather than investing time or energy in work for change at higher levels. Perhaps money and energy otherwise spent on highpriced home retrofitting or demanding lifestyle changes should be aimed directly toward growing movements that increase "green" consciousness and political influence and that effectively demand full corporate responsibility for pollution. If such efforts were to result in a few very significant policy changes, such as a global moratorium on gas flaring or a greening of the military, the payoff in terms of long-term mitigation could be great. Such successes could in turn energize cultural shifts toward more effective alternative technologies. What can a well-organized collection of people who care accomplish through democratic politics and cultural transformation? Can advocates for environmental integrity and human rights better help us all to effectively reduce greenhouse gas emissions in due time? The problem of climate change provides opportunities to foster regenerating movements toward more sustainable and humane futures, and so inevitably some will step up and take responsibility for addressing the problem. Could they possibly succeed? Given the urgency created by the industrial greenhouse effect, an ethically motivated minority must effectively act on their caring while also making it contagious through the creation of a more effective political will. The insufficiency problem might be reduced if those who care about climate change and climate justice channel their mitigation efforts more effectively to influence decision-makers and policies at higher levels, where actions can be carried out with significant and immediate effects on emission levels and matters of social justice. If more corporate and governmental actors are pressured (or inspired) to take responsibility for the causes of climate change, their decisions and innovations can in turn create more options for carbon-free lifestyles, which will also help reduce the insufficiency and disempowerment problems for average consumers. The knowledge we need to avert a more extreme climate disaster already exists, in many places and in multiple forms. Those who care about humanity and Earth's green growing mantle of life need the power to turn dominant practices and policies toward better futures. Grand successes along those lines are needed very soon.

AT: Affirmation of Self

We have to extend politics beyond the realm of our immediate experience and the confines of the debate space---structural analysis key

Rob 14

(Carleton College, Robtheidealist, My Skinfolk Ain't All Kinfolk, www.orchestratedpulse.com/2014/03/problem-identity-politics/)

Some people look at these flaws and call for an end to "identity politics", but I think that's a mistake. At its most basic level, identity politics merely means political activity that caters to the interests of a particular social group. In a certain sense, all politics are identity politics. However, it's one thing to intentionally form a group around articulated interests; it's another matter entirely when group membership is socially imposed. Personal identities are socially defined through a combination of systemic rewards/marginalization plus actual and/or potential violence. We can't build politics from that foundation because these socially imposed identities don't necessarily tell us anything about someone's political interests. Successful identity politics requires shared interests, not shared personal identities I'm not here to tell you that personal identity doesn't matter; we rightfully point out that systemic power shapes people's lives. Simply put, my message is that personal identity is not the only thing that matters. We spend so much energy labeling people—privileged/marginalized, oppressor/oppressed—that we often **neglect to build spaces that antagonize the systems that cause our collective trauma** All You Blacks Want All the Same Things We assume that if a person is systemically marginalized, then they must have a vested interest in dismantling that system. Yet, that's not always the case. Take Orville Lloyd Douglas, who last summer wrote an article in the Guardian in which he admitted that he hates being Black. I can honestly say I hate being a black male… I just don't fit into a neat category of the stereotypical views people have of black men. I hate rap music, I hate most sports, and I like listening to rock music… I have nothing in common with the archetypes about the black male… I resent being compared to young black males (or young people of any race) who are lazy, not disciplined, or delinquent. Orville Lloyd Douglas, Why I Hate Being a Black Man As we can see from Douglas' cry for help, membership in a marginalized group is no guarantee that a person can understand and effectively combat systemic oppression Yet, we seem to treat all marginalized voices as equal, as if they are all insightful, as if there is no diversity of thought, as if—in the case of race– "All you Blacks want all the same things". Shared identity does not equal shared interests. John Ridley, the Oscar-winning screenplay writer of 12 Years a Slave, is a good example. He's written screenplays based on Jimi Hendrix, the L.A. riots, and other poignant moments and icons within Black history. He wants to see more Black people in Hollywood and he has a long history of successfully incorporating Black and Brown characters into comic book stories and franchises. However, in 2006, Ridley made waves with an essay in which he castigated Black people who did not live up to his standards; saying, "It's time for ascended blacks to wish niggers good luck." So I say this: It's time for ascended blacks to wish niggers good luck. Just as whites may be concerned with the good of all citizens but don't travel their days worrying specifically about the well-being of hillbillies from Appalachia, we need to send niggers on their way. We need to start extolling the most virtuous of ourselves. It is time to celebrate the New Black Americans—those who have sealed the Deal, who aren't beholden to liberal indulgence any more than they are to the disdain of the hard Right. It is time to praise blacks who are merely undeniable in their individuality and exemplary in their levels of achievement. The Manifesto of Ascendancy for the Modern American Nigger While Ridley and I share cultural affinity, and we both want to see Black people doing well, shared cultural affinity and common identity are not enough– which recent history makes abundantly clear. Barack Obama continues to deport record numbers of Brown immigrants here at home, while mercilessly bombing Brown folks abroad. Don Lemon, speaking in support of Bill O'Reilly, said that racism would be lessened if Black people pulled up their pants and stopped littering. Last fall, 40% of Black U.S. Americans supported airstrikes against Syria. My skinfolk ain't all kinfolk, and the Left needs to catch up. NO MORE ALLIES John Ridley, Barack Obama, myself, and Don Lemon are all Black males. We also have conflicting political positions and interests, but how can we decide which paths are valid if we only pay attention to personal identity? Instead of learning to recognize how the overarching systems maintain their power and then attacking those tools, we spend our energy finding an "other" to embody the systemic marginalization and legitimize our spaces and ideals. In some interracial spaces I feel like nothing more than an interchangeable token whose only purpose is to legitimize the politics of my White peers. If not me, then some other Black person would fill the slot. We use these "others" as authorities on various issues, and we use concepts like "privilege" to ensure that people stay in their lanes. People of color are the authorities on race, while LGBTQ people are the authorities on gender and sexuality, and so forth and so on. Yet, **experience is not** the same as **expertise, and privilege doesn't automatically make you clueless**. As I've discussed, these groups are not oriented around a singular set of political ideals and practices. Furthermore, as we see in Andrea Smith's work, there are often competing interests within these groups. **We mistake essentialism for intersectionality** as we look for the ideal subjects to embody the various forms of oppression; true intersectionality is a

description of systemic power, not a call for diversity. If we don't develop any **substantive analysis of systemic power** then it's impossible to know what our interests are, and aligning with one another according to shared interests is out of the question. In this climate all that remains is the ally, which requires no real knowledge or political effort, only the willingness to appear supportive of an "other". We can't build power that way. After having gathered to oppose organized White supremacy at the University of North Carolina, a group of organizers in Durham, North Carolina found that the Left's emphasis on personal identity and allyship was a major reason why their efforts collapsed. They proposed that we **adopt the practice of forming alliances rather than identifying allies** (h/t NinjaBikeSlut) Much of the discourse around being an ally seems to presume a relationship of one-sided support, with one person or group following another's leadership. While there are certainly times where this makes sense, it is misleading to use the term ally to describe this relationship. In an alliance, the two parties support each other while maintaining their own self-determination and autonomy, and are bound together not by the relationship of leader and follower but by a shared goal. In other words, one cannot actually be the ally of a group or individual with whom one has no political affinity – and this means that one cannot be an ally to an entire demographic group, like people of color, who do not share a singular cohesive political or personal desire. The Divorce of Thought From Deed While it's vital for me to learn the politics and history of marginalized experiences that differ from my own, listen to their voices, and respect their spaces and contributions – it's also important for me to understand the ways in which these same systems have shaped my own identity/history as well. Since we know that **oppression is systemic** and multidimensional, then **I'm going to have to step outside of personal experience and begin to develop political ideals and practices that actually antagonize those systems** I have to understand and articulate my interests, which will allow me to operate from a position of strength and form political alliances that advance those interests– **interests which speak to issues beyond just my own immediate experience**.

The alt essentializes identity – reproduces heteronormativity – that implicates every level of their argument

Prasad 12

(Ajnesh, York University's Schulich School of Business PhD candidate, "Beyond analytical dichotomies", Human Relations, 65.5, Sage)

A poststructuralist critique At the most rudimentary level, poststructuralism may be typified by what Lyotard (1984) famously expressed as its **incredulity towards metanarratives** (also see Alvesson and Deetz, 1999; Kilduff and Mehra, 1997), or what Fraser and Nicholson (1997) describe as grand theorizing of social macrostructures. Akin to other critical traditions, it is 'explicitly historical, attuned to the cultural specificity of different societies and periods and . . . inflected by temporality, with historically specific institutional categories' (Fraser and Nicholson, 1997: 143–4). The aim of the poststructuralist mandate is to critique metanarratives and, from there, to define human consciousness and social existence through engagements with contextualized subjectivity (Agger, 1991).11 To appreciate this idea, it is important to understand how metanarratives are problematically situated within, and are informed by, socially constructed identity binaries, be they along the fault lines of gender (e.g. Butler, 1990; Hird, 2000), race (e.g. Gilroy, 2000; Miles and Torres, 2007), or sexuality (e.g. Zita, 1994). Indeed, poststructuralist critique, such as Derrida's conjecture of difference (Mumby and Putnam, 1992), illustrates how the preservation of the privileged identity ('white', 'man', 'heterosexual') is existentially dependent upon a corresponding relegated identity ('black', 'woman', 'homosexual') (see Tyler and Cohen, 2008); or, to posit it in Butlerian (1991) phrasing, heterosexuality presumes the being of homosexuality. Working from the same current, Harding (2003) extends this idea through consideration of the central dyadic relationship in management; she notes that every individual in the western workforce is identified as a worker or as a manager and that the identity of the latter is **wholly contingent upon the binary existence of the former**. Elsewhere, again assuming a poststructuralist position, Harding (2008: 44; emphasis in original) explains that identities '**cannot be resolved into an essence or into a coherent whole'**; rather, they are 'post hoc impositions of a seemingly unified [label] upon a disparate and disconnected population'. As such, the central aim of the poststructuralist is to repudiate deterministic and binary logic by drawing attention to the discursive processes that culturally (re)produce social realities and the dichotomous modes of thinking embedded within them (Butler, 1990; Calas, 1993). [T]he ways in which sex was put into Western discourse from the end of the 16th century onwards, the proliferation of sex during the 18th century and the modern incitement to discuss sex in endless detail have simultaneously established heterosexuality as the unassailable norm and constituted other sexualities as abnormal. Tangentially related to the Foucauldian reading of sexuality, Katz (2004) offers a genealogical investigation into how heterosexuality was invented and came to be ideologically defined from the late 19th-century onwards. Katz writes that because 'the concept of heterosexuality is **only one particular historical way** of perceiving, categorizing, and imagining the social relations of the sexes', it ought to be studied with the purposeful aim to **dislocate its socio-cultural privilege** as being the 'normal' and the 'natural' form of sexual expression (p. 69). Given its socially manifest 'nature', Butler (1991, 1993) contends that heterosexuality is perpetually at risk and must continually engage in a set of repetitive, or what she calls parodic, practices – such as, heterosexual sex – which functions to stringently affirm the hegemonic ideals of femininity (passive) and masculinity (active). Incidentally, the very redundancy of these parodic practices function to consolidate the discursive authority and cultural stability of heterosexuality (Butler, 1991; see also Butler's [1993] writing on 'performativity'). A related stream of poststructuralist-inflected scholarship reveals how **sexual identities that are predicated on ontological sexual difference produce heteronormativity**, which can be described as the 'the normative idealization of heterosexuality' (Hird, 2004: 27) or '**the centrality of heterosexual norms in social relations**' (Pringle, 2008: S111). While feminists have long critiqued the tacit and the explicit claims of ontological sexual difference, essentialist definitions of 'female' and 'male' continue to prevail in popular culture and in certain academic disciplines (Frye, 1996).12 On this point, Hird (2004) adopts a position in feminist science studies to develop a substantive critique into how the ontology of sexual difference is often rendered concrete in research propagated by the 'natural' – and particularly, the 'biological' – sciences (also see Martin, 1991). The influence of ontological sexual difference within and outside of academia, lends credence to Broadbridge and Hearn's (2008: S39) recent observation that, '[s]ex and sex differences are still often **naturalized as fixed, or almost fixed, in biology'** It is equally important to note, here, that **the alchemy of ontological sexual difference** is **wholly dependent upon the patriarchal conflation of 'biological' sex and 'cultural' gender (**Hird, 2004). As Pringle (2008: S112; also see Borgerson and Rehn, 2004) notes, '[g]ender **[does] not avoid the oppositional duality embodied in the concept of sex**, but reflect[s] the interdependent relationship of masculinity and femininity. This reflection pivots on genital determinism, which declares that males naturally embrace masculinity while females naturally embrace femininity (Bornstein, 1994; Hird, 2000). This initial conflation of sex and gender leads to the conventional model of heterosexuality, which dictates that a man will 'desire-to-be' a male and will 'desire-for' a female, while a woman will 'desire-to-be' a female and will 'desire-for' a male (Sinfield, 2002: 126). It is precisely these corresponding relationships

whereby the 'heterosexual matrix' is constructed (Butler, 1990). According to Butler, this matrix serves as the 'grid of cultural intelligibility through which bodies, gender, and desires are naturalized' (see Ringrose, 2008: 511).13

AT: rage alt

The valorization of rage as a political leads to a vicious cycle of repetitive violence

Wenning '09

(Mario, Phd., Assistant professor of philosophy @ the University of Macau, "The Return of Rage," Parrhesia No. 8 pg. 89-99)

The valorization of erotic emotions and virtues over thymotic ones is as old as philosophy itself. Aristotle already insists that the virtuous person cultivates mildness of temper "the even tempered person confesses to be calm and not carried away by his feelings, but to be cross only in the way, at the things, and for the length of time that reason dictates." 15 <u>Compassion is introduced as an antidote to revenge. The virtuous character does not lose the control that is necessary to provide for a self-sufficient emotional economy,</u> which is the precondition for achieving a life that is marked by wisdom, even-temperedness, and justice. Seneca's influential work on rage, <u>De ira, which was immensely influential for Christian and humanist ethics, calls for a Stoic control of the dangerous affect</u>. The general suspicion against the destructive consequences of this aggressive emotion is not limited to the European tradition. <u>Confucius already warns his students "to let a sudden fit of anger make you forget the safety of your own person or even that of your parents, is that not misguided judgment?"</u> 16 Daoism and ZenBuddhism promote meditative practices and compassion to overcome our fixation on the need of being angry with ourselves and the world surrounding us. <u>More recently, Martha Nussbaum argued that we should aim to understand "how to channel emotional development in the direction of a more mature and inclusive and less ambivalent type of love."</u> 17 According to Nussbaum, anger should at best operate as a tool of compassion. <u>Acts of punishment are then seen as merciful rather than vindictive because they aim at the good of the victim</u>. These representative examples illustrate that <u>the erotization of the psyche replaced what is regarded as **archaic forms of militancy** that</u>, it is contended, <u>mistakenly suggest that honor, pride and craving for recognition (and the rage that results from the violation of these) has been considered to be more important than a concern for justice, equality and compassion</u>. We might think that the dislike of negative emotions in general and potentially aggressive ones in particular results from an insight into the misfortunes these emotions bring about. <u>Revenge, then, is undesirable because it tends to be too costly in producing long term damages</u>. <u>Hegel</u>, for example, <u>reminds us in the Philosophy of Right of the **infinite chain of violence**, the ec**onomy of pay-back that results from blind vengeance and selfadministered acts of justic**e</u>. 18 <u>The **excesses of rage** can easily lead to **tragic repetitions** of an **original act of violence** that might be **impossible to get out of**</u>. Honor killings often lead to new honor killings rather than the reestablishment of justice and the fight against terror breed more terrorists.

Utilize rage as a means to mobilize ati-surveillance movements---targeted rage is key

Lesage 85

(Julia, in Marxism and the Interpretation of Culture, ed. Nelson and Grossberg, http://pages.uoregon.edu/jlesage/Juliafolder/womensRage.html)

Feminism by itself is not the motor of change. Class, anti-imperialist, and antiracist struggles demand our participation. Yet how, specifically, does women's consciousness change? How do women move into action? How does change occur? What political strategies should feminists pursue? How, in our political work, can we constantly challenge sexual inequality when the very social construction of gender oppresses women? In 1981 I visited Nicaragua with the goal of finding out how and why change occurred there so quickly in women's lives. "The revolution has given us everything," I was told. "Before the revolution we were totally devalued. We weren't supposed to have a vision beyond home and children." In fact, many Nicaraguan women first achieved a fully human identity within the revolution. Now they are its most enthusiastic supporters. For example, they form over 50 percent of the popular militias, the mainstay of Nicaragua's defense against United States-sponsored invasions from Honduras and Costa Rica. In the block committees, they have virtually eliminated wife and child abuse. Yet in Nicaragua we still see maids, the double standard sexually, dissatisfaction in marriage, and inadequate childcare. Furthermore, all the women I talked to defined their participation in the revolution in terms of an extremely idealized notion of motherhood and could not understand the choice not to reproduce. I bring up this example of Nicaragua because Nicaraguan women are very conscious of the power of their own revolutionary example. They know they have been influenced by the Vietnamese and Cuban revolutions and are very much shaping how Salvadoran women militants are looking at women's role in the Salvadoran revolution. Because of the urgency and violence of the situation, unity between men and women was and is necessary for their survival, but the women also want to combat, in an organized and self-conscious way, specific aspects of male supremacy in the workplace, politics, and daily life. Both here and in Nicaragua, women's daily conversation is about the politics of daily life. They talk to each other often, complaining about men and about managing the domestic sphere. Women's talk also encompasses complaints about poor and unstable work conditions, and about the onerous double day. However, here in the United States that conversation usually circulates pessimistically, if supportively, around the same themes and may even serve to reconfirm women's stasis within these unpleasant situations. Here such conversation offers little sense of social change; yet in our recent political history, feminists have used this preexisting social form--women's conversation in the domestic sphere--to create consciousness-raising groups. But to what degree is consciousness raising sufficient to change women's behavior, including our self-conception and our own colonized minds? We do not live in a revolutionary situation in the United States. There is no leftist political organization here providing leadership and a cohesive strategy, and in particular the struggle against women's oppression is not genuinely integrated into leftist activity and theory. Within such a context, women need to work on another, intermediate level, both to shape our revolutionary consciousness and to empower us to act on our own strategic demands. That is, we need to promote self-conscious, collectively supported, and politically clear articulations of our anger and rage. Furthermore, we must understand the different structures behind different women's rage. Black women rage against poverty and racism at the same time that they rage against sexism. Lesbians rage against heterosexual privilege, including their denial of civil rights. Nicaraguan women rage against invasions and the aggressive intentions of the United States. If, in our political work, we know this anger and the structures that generate it, we can more genuinely encounter each other and more extensively acknowledge each other's needs, class position, and specific form of oppression. If we do not understand the unique social conditions shaping our sisters' rage, we run the risk of divisiveness, of fragmenting our potential solidarity. Such mutual understanding of the different structures behind different women's anger is the precondition of our finding a way to work together toward common goals. I think a lot about the phenomenon of the colonized mind. Everything that I am and want has been shaped within a social process marked by male dominance and female submission. How can women come to understand and collectively attack this sexist social order? We all face, and in various ways incorporate into ourselves, sexist representations, sexist modes of thought. Institutionally, such representations are propagated throughout culture, law, medicine, education, and so on. All families come up against and are socially measured by sexist concepts of what is "natural"--that is, the "natural" roles of mother, children, or the family as a whole. Of particular concern to me is the fact that I have lived with a man for fifteen years while I acutely understand the degree to which heterosexuality itself is socially constructed as sexist. That is, I love someone who has more social privilege than me, and he has that privilege because he is male. As an institution, heterosexuality projects relations of dominance and submission, and it leads to the consequent devaluation of women because of their sex. The institution of heterosexuality is the central shaping factor of many different social practices at many different levels--which range, for example, from the dependence of the mass media on manipulating sexuality to the division of labor, the split between the public and private spheres, and the relations of production under capitalism. Most painfully for women, heterosexuality is a major, a social and psychological mode of organizing, generating, focusing, and institutionalizing desire, both men's and women's. Literally, I am wedded to my own oppression. Furthermore, the very body of woman is not her own--it has been constructed by medicine, the law, visual culture, fashion, her mother, her household tasks, her reproductive capacity, and what Ti-Grace Atkinson has called "the institution of sexual intercourse." When I look in the mirror, I see my flaws; I evaluate the show I put on to others. How do I break through representations of the female body and gain a more just representation of my body for and of myself? My social interactions are shaped by nonverbal conventions which we all have learned unconsciously and which are, as it were, the glue of social life. As Nancy Henley describes it in Body Politics, women's nonverbal language is characterized by shrinking, by taking up as little space as possible. Woman is accessible to be touched. When she speaks in a mixed group, she is likely to be interrupted or not really listened to seriously, or she may be thought of as merely emotional. And it is clear that not only does the voyeuristic male look shape most film practice, but this male gaze, with all its power, has a social analog in the way eye contact functions to control and threaten women in public space, where women's freedom is constrained by the threat of rape. We need to articulate these levels of oppression so as to arrive at a collective, shared awareness of these aspects of women's lives. We also need to understand how we can and already do break through barriers between us. In our personal relations, we often overcome inequalities between us and establish intimacy. Originally, within the women's movement we approached the task of coming together both personally and politically through the strategy of the consciousness-raising group, where to articulate our experience as women itself became a collective, transformative experience. But these groups were often composed mostly of middle-class women, sometimes predominantly young, straight, single, and white. Now we need to think more clearly and theoretically about strategies for negotiating the very real power differences between us. It is not so impossible. Parents do this with children, and vice versa; lovers deal with inequalities all the time. The aged want to be in communion with the young, and third-world women have constantly extended themselves to their white sisters. However, when women come together in spite of power differences among them, they feel anxiety and perhaps openly express previously suppressed hostility. Most likely, such a coming together happens when women work together intensively on a mutual project so that there is time for trust to be established. Yet as we seek mutually to articulate the oppression that constrains us, we have found few conceptual or social structures through which we might authentically express our rage. Women's anger is pervasive, as pervasive as our oppression, but it frequently lurks underground. If we added up all of women's depression--all our compulsive smiling, ego-tending, and sacrifice; all our psychosomatic illness, and all our passivity--we could gauge our rage's unarticulated, negative force. In the sphere of cultural production there are few dominant ideological forms that allow us even to think "women's rage." As ideological constructs, these forms end up containing women. Women's rage is most often seen in the narratives that surround us. For example: Classically, Medea killed her children because she was betrayed by their father. Now, reverse-slasher movies let the raped woman pick up the gun and kill the male attacker. It is a similar posture of dead end vengeance. The news showed Patty Hearst standing in a bank with a gun embodying that manufactured concept "terrorist," and then we saw her marrying her FBI bodyguard long after her comrades went up in flames. In melodrama and film noir, as well as in pornography, women's anger is most commonly depicted through displacement onto images of female insanity or perversity, often onto a grotesque, fearful parody of lesbianism. These displacements allow reference to and masking of individual women's rage, and that masked rage is rarely collectively expressed by women or even fully felt. We have relatively few expressions of women's authentic rage even in women's art. Often on the news we will see a pained expression of injustice or the exploitative use of an image of a third- world woman's grief. Such images are manipulated purely for emotional effect without giving analysis or context. Some great feminist writers and speakers such as Mary Wollstonecraft, Virginia Woolf, Elizabeth Cady Stanton, and Harriet Tubman have provided models by which we can understand ourselves, but too often the very concept of "heroine" means that we hold up these women and their capacity for angry self-expression as the exception rather than the rule. In Illinois, women chained themselves together in the state house when it was clear that the ERA would not pass; the women sought to express our collective anger at our legislators' cowardice and to do so in a conspicuous, public way. But actions such as these often have little effect beyond their own time span. We need to think beyond such forms to more socially effective ones. It is a task open to all our creativity and skill--to tap our anger as a source of

energy and to focus it aesthetically and politically. We may have to combine images of anger with something else--say, images of how women can construct the collectivity as a whole. It is here that, by their example, our third-world sisters have often taken the lead. Rosa Parks refusing to sit in the back of the bus, Harriet Tubman leading slaves to the North, an Angolan mother in uniform carrying a baby and a rifle, a Vietnamese farmer tilling and defending her land, Nicaraguan women in their block committees turning in wife abusers to the police--these images let us see that women can gain more for themselves than merely negating the bad that exists. And it is in their constant need to attack both sexism and racism, as well as poverty and imperialist aggression, that third-world feminists now make us all see much more clearly both the urgent need for and the possibility of reconstructing the whole world on new terms. Artistically, emotionally, and politically women seem to need to glimpse dialectically the transcendence of our struggle against sexism before we can fully express sexism's total negation, that is, our own just rage. Sometimes our suppressed rage feels so immense that the open expression of it threatens to destroy us. So we often do not experience anger directly and consciously, nor do we accurately aim our rage at its appropriate target. To transcend negation and to build on it means that we have to see what is beyond our rage. An example of such transcendence was demonstrated by Nicaraguan mothers of "martyred" soldiers (those killed by U.S.-paid counterrevolutionaries) to Pope John Paul II when he visited Managua in April 1983. They stood in the rows closest to the podium where the Pope spoke and they all bore large photos of their dead children. As the events of the day unfolded, the women created an image that stirred the whole people, one that the Pope could not go beyond or even adequately respond to. Here is what happened: The Pope spoke on and on to the gathered crowd about obeying the hierarchy and not getting involved with the things of this world. In frustration and anger, the women began to shout, "We want peace," and their chant was taken up by the 400,000 others there. The women's rage at personal loss was valorized by the Nicaraguan people as a whole, as the grieving mother became a collective symbol of the demand for peace. The chant, "We want peace," referred simultaneously to national sovereignty, anti-imperialism, religion, and family life. The women spoke for the whole. This brings me back to my original question about women's political action in the United States today. One of the major areas of investigation and struggle in the women's movement has been the sphere of daily life. This struggle, represented by an early women's movement phrase--"the personal is the political"--derives from women's real material labor in the domestic sphere and in the sphere of social relations as a whole. Women have traditionally done the psychological labor that keeps social relations going. In offices, in neighborhoods, at home, they often seek to make the social environment safe and "better," or more pleasant. That such labor is invisible, particularly that it is ignored within leftist theory and practice, is one of the more precise indices of women's oppression. And it is feminists' sensitivity to and analysis of social process that clarifies for them the sexism on the Left. Often at a leftist conference or political meeting, many men continue to see women and women's concerns as "other," and they do not look at what the Left could gain from feminist theory or from women's subcultural experience or from an analysis of women's labor. Women who come to such an event have already made a commitment to learn and to contribute, so they make an effort to continue along with the group as a whole but are impeded by sexist speakers' intellectual poverty (e.g., use of the generic "he"), macho debating style, and distance from political activism. Furthermore, not only women feel this political invisibility at leftist events. When black labor and black subcultural experience in the United States is not dealt with, nor is imperialism, or when racism is theoretically subsumed under the rubric of "class oppression" and not accorded its specificity, then third-world participants face the same alienation. To demonstrate this process and analyze what divides us, I will describe an incident that occurred at the Teaching Institute on Marxist Cultural Theory in June 1983. It is worth discussing because it is the kind of incident that happens all too often among us on the Left. Early in that summer session, a coalition of students and the two women faculty members, Gayatri Spivak and me, formed to present a protest statement to the faculty. It was read in every class. Here is what it said: The Marxist-Feminist Caucus met on Friday June 17th and concluded that the "limits, frontiers and boundaries" of Marxist cultural theory as articulated by the Teaching Institute excluded and silenced crucial issues of sexism, racism and other forms of domination. We find ourselves reproducing in the classrooms of the Teaching Institute the very structures which are the object of our critique. The Marxist-Feminist Caucus therefore proposes that each class set aside an hour weekly to discuss strategic silences and structural exclusions. A Marxism that does not problematize issues of gender and race, or of class consciousness in its own ranks, cannot hope to be an adequate tool for either social criticism or social transformation. The institute had a format of having famous Marxist intellectuals lecture, specifically males with job security who have never incorporated a feminist analysis into their theoretical work. Both the format and the content of their lectures enraged some of us, but not others. In a sense, writing a protest statement divided the school's participants between the political ones and the consumers of Marxist theory. This is because critical theory itself has become a pathway for elitist advancement in the humanities and social sciences in universities where these areas are facing huge cutbacks. And the canon of that critical theory is based on Marx and Freud and their contemporary interpretants, Althusser and Lacan. Both at the Teaching Institute and at prestigious universities, young academics could get their quick fix of Marxism, the knowledge of which could help greatly in their academic career. This is a capitalist mode of consuming knowledge. Too many students, especially career-pressured graduate students, want only a well conceived lecture, a digest of Marxist theory and social analysis, something that can be written in a notebook, taken home, and quoted from in a future paper or journal article. Furthermore, we intellectuals fall into this capitalist competitive mode. We feel pressured inside ourselves to be the best. Students are told to buy the best. All the faculty at the Teaching Institute felt that they could not make a mistake, that they had to read and show they had read everything, that they had been challenged on their political practice, accused of being racist or sexist or undemocratic. Our control over the classroom and studied theoretical polish became a kind of professional hysteria and worked against the collective building of Marxist knowledge and theory that we have needed for more effective social change. Since the early 1970s women have come together in meetings like these, in feminist seminars, caucuses, and workshops, partly in resistance to a certain macho leftist or academic style and partly to build a new body of knowledge and feminist political practice. And we have been successful at doing this but it has meant double or triple work for us. Feminist scholarship does not usually lead to academic promotion for a woman. The knowledge women produce is easily marginalized, as was made painfully obvious at that summer school. Feminists and third-world students came to the Teaching Institute knowing how much they needed Marxist theory. They understood that abolishing capitalism and imperialism was the precondition for liberation. They came as political participants expecting to learn theoretical tools to use in fighting oppression. But sex and race were too often ignored--I would say stupidly ignored--as social determinants in the theories presented about social change. (Beyond that, students felt intimidated by name-dropping and teachers' and other students' failure to explain terms. They felt they had to give a polished rebuttal or a cohesive "strategic intervention" before they could speak to refute a lecturer's point.) And when students raised issues of sexism or racism, deflection became the all too frequent tactic used by teachers or some of the white male students in response. No wonder that women, with their sex-role socialization, were often too intimidated to speak. This is a sad analysis, but not an infrequent one in academia. It speaks about political theory and academic sexism and racism, and elitism and class privilege. The incident reveals much of what divides politically progressive people in the United States. These differences must be acknowledged in depth if we are to work together politically in a coalition form. In particular, I understand the texture of women's silence in a forum that demanded a highly rational and developed intervention. Many of the women students at the Teaching Institute already produced feminist theory, but the intimidating nature of this kind of aggressive public speaking made them seem like nonparticipants. And it often happens to me, too. I know that we watch and despair of our own colonized psyches which hold us back in silence precisely when we would choose to be political actors, especially in a Marxist forum. What we have seen in the 1970s and 1980s in North America and Europe is a supercession of political forms related to developments in radical consciousness. Conditions have evolved in the United States that make it impossible to conceive of a revolutionary organizing strategy that does not embrace a black and minority revolution and a feminist revolution. The lesson of the civil rights/black power movement was that blacks will organize autonomously. Now it is the offspring of that movement, Jesse Jackson's Rainbow Coalition, that has taken the lead in building an anti-imperialist coalition that addresses the specific struggles and organizing forms of blacks, Latinos, women, and gays. Such a coalition relates to the existence of the women's movement, the gay and lesbian movement, the anti-imperialist movement, by supporting these groups' autonomous organizing and granting new respect, not by subsuming or controlling them. Furthermore, at this point in U.S. history, issues of mass culture and mass communication have to be dealt with, so that minority figures such as Jesse Jackson or Harold Washington, Chicago's black major, have developed an ongoing analysis about racism in the press. As a feminist who has worked both in the cultural sphere and in anti-imperialist work, I have experienced this supercession of forms. In the early 1970s a politically active woman was either "on the Left" or "in the independent women's movement." Some socialist feminists within leftist organizations formed caucuses to try to influence their organizations. In the 1970s I chose to work mostly within the independent women's movement, especially in creating a women's studies program at an urban university. In developing feminist media now within the women's movement, I find many of my sisters addressing broader issues of imperialism, racism, class oppression, and the nuclear threat. Many of us are joining progressive coalitions around these issues. Within these coalitions we must be able openly to declare, "I am a feminist and our feminist position represents the most advanced stand. You men have to join us." Indeed, many men, often younger men, have. As feminists, we are the ones who are building a whole theoretical critique of mass culture and mass communication; we are the ones who are learning how to appropriate all of culture in an oppositional way. And because of our historical position in advanced capitalism, we are one of the first social movements to address cultural issues in such a thorough and complex way. Many feminists are eager to participate in coalitions, the major political strategy for us in the 1 980s. In Chicago, we saw the women's movement and the Left work to elect Harold Washington. In the San Francisco area, gays and lesbians have formed a Central America support group. Both in the United States and abroad, the antinuclear movement contains within it all-women's affinity groups. Latinos in various areas identify and organize as Puerto Rican or Mexican-American according to their ethnic origins and concentration, and also unite in Central American solidarity work. This great diversity of sectoral organizing enriches all of us who are working for social change. Some of the best aspects of current progressive organizing have, in fact, derived specifically from the development of the contemporary women's movement. I mentioned the consciousness-raising groups earlier. I think the women's movement has introduced into political discourse an open and direct critique of the macho style and political posturing of many male leaders. As feminist activists, we have created among ourselves new forms of discussion and a creative, collective pursuit of knowledge--in contrast to an older, more aggressive, male debating style. Particularly important for me, the women's movement has pursued and validated as politically important cultural and artistic work. In Chicago, where I live, I experience a strong continuum and network among community-based artists and women in the art world. We have built up intellectual ties between academic women and feminist film- and videomakers who have created an analysis of how sexuality is manipulated in the visual culture that surrounds us. As a consequence, feminist film criticism has developed a new theoretical framework for

analyzing ideology and the mass media. In fact, I think that our building of a feminist cultural theory has made a key contribution to the Left and to revolutionary movements throughout the world. When I want to consider how unleashing our anger might capacitate us to act for change, I reconsider Frantz Fanon's essay "Concerning Violence" in The Wretched of the Earth. In that essay he describes decolonization, particularly the process by which the native sheds the colonizer's values and the colonizer's ways. I understand that my black and Latina sisters in the United States experience a rage against the economic and racial violence perpetrated every day against them; in a way that is similar to what Fanon describes: this rage knows its resolution lies in a complete change of the economic order in which we live. At the same time, I must ask what kind of rage it would be that would effectively contest women's oppression--given all the levels at which gender inequality and women's oppression is articulated in social and personal life. What Fanon describes to us is a specific historical moment at which mental colonization can be and is surpassed. As I look at women's mental colonization, I see our internalized sense of powerlessness, our articulation into masochistic structures of desire, and our playing out of personae that on the surface seem "passive," "self-defeating," "irrational," "hesitant," "receptively feminine," or even "crazy." Much of this behavior stems from internalized and suppressed rage. Fanon describes such behavior in the colonized and posits active rage, the violent response to violence, as its cure. What would the overturning of male supremacy and women's colonization mean to women? How would it be accomplished? Fanon understands that a whole social structure and a new kind of person must come into being, and that those with privilege know, fear, and resist this. His call to armed struggle, based on the very clear demarcations and abuses of power that the native always sees, signals a survival struggle that does not characterize the war between the sexes. As I read Fanon for what he can teach me about women's resistance to oppression in nonrevolutionary society, I read him as a communist psychiatrist talking about how social movements can change the mentality of the oppressed. When I ask about revolution for women now, minimally I see that our contestation cannot be conducted in the mode of nice girls, of managing the egos of and patiently teaching those who oppress, which is a skill and duty we learned from our mothers in the domestic sphere. If we do so, once again we will be placed in that very role of "helpmate" that we are trying to overcome. Angry contestation may take us the extra step needed to overcome our own colonized behavior and tardy response. Let me now rewrite for you parts of Fanon's essay to show its power when discussing the relation between psychological and social change. The distance between the violence of colonization and its necessary response in armed struggle, and the emotional rage I am referring to here in combating sexism, marks the distance between the periphery and the center of international capitalism. By using Fanon in this way, I do not wish to co-opt him for the women's movement but to learn from him, just as I learned from the Nicaraguan women's courage and tenacity. If women must learn to be openly angry, we must learn to draw links between ourselves and those who are more oppressed, to learn new methods of struggle and courageous response. Combating women's oppression as we know it is a historical process: that is to say, it cannot become intelligible or clear to itself except in the exact measure that we can discern the movements that give it historical form and content. Combating women's oppression is the meeting of two intrinsically opposed forces, which in fact owe this originality to that sort of substantification that results from and is nourished by the social construction of gender. The husband is right when he speaks of knowing "them" well--for it is men who perpetuate the function of wife. Men owe the reproduction of their bodies and psyches to the family. Feminist revolution never takes place unnoticed, for it influences individuals and modifies them fundamentally. It transforms passive femininity crushed with inessentiality into privileged agency under the floodlights of history. A new kind of woman brings a new rhythm into existence with a new language and a new humanity; combating women's oppression means the veritable creation of new women who become fully human by the same process by which they freed themselves. Feminists who decide to put their program into practice and become its moving force are ready to be constantly enraged. They have collectively learned that this narrow world, strewn with prohibitions, can only be called into question by absolute contestation. The sex-gender system is a world divided into compartments. And if we examine closely this system of compartments, we will at last be able to reveal the lines of force it implies and to mark out the lines on which a nonoppressive society will be reorganized. At the level of individuals, anger is a cleansing force. It frees the woman from her inferiority complex and from despair and inaction; it makes her fearless and restores her self-respect. At this point I will stop citing from and reworking Fanon, deliberately at the point of individual rage. Now is a time when we need to work in coalitions, but we must be very honest about what divides us and what are the preconditions we need before we can work together. I have made the decision to work in leftist and feminist cultural work and in Latin American solidarity work. I think in all our strategies we must analyze the relation of that strategy to feminist, antiracist, and anti-imperialist demands. Women comprise over half the population; any class issues in the United States are intimately tied to the question of racism; we all live off the labor of workers, often underpaid women, in the Third World; and socialist revolution is being waged very near us. Personally, I know that it is by my contact with Nicaraguan women, who insist that men and women must struggle together for our mutual liberation, that I have been politically and emotionally renewed. The problems grow more acute. We know that the Right is racist, homophobic, and sexist. We in the women's movement must stop turning our anger against each other and learn the most effective ways to work together for social change. We can focus our anger and harness it, but to do that we must clearly analyze cause and effect. If theory accompanies anger, it will lead to effective solutions to the problems at hand. We have great emotional and social power to unleash when we set loose our all too often suppressed rage, but we may only feel free to do so when we know that we can use our anger in an astute and responsible way.

Their deployment of essentialism fails – it's rejected as a descriptive theory and can't achieve political ends

Stone '04 (Alison, Institute for Environment, Philosophy and Public Policy Lancaster University, "Essentialism and Anti-Essentialism in Feminist Philosophy," Journal of Moral Philosophy 1.2, 2004)

An objection immediately arises to this strategic essentialist position. Any political strategy is effective only inasmuch as it allows agents to recognize and intervene into the real social events, processes and forces which make up the social field. But it seems reasonable to think that a strategy can be effective, in this sense, only insofar as it embodies an accurate understanding of the character of social processes. This implies that a strategy of affirming fictitious commonalities among women will fail to facilitate effective action given a world where women do not really have any common social characteristics or locations. Rather, such a strategy appears

destined to mislead women into fighting against difficulties which are either non-existent or— more likely—really affect only some privileged subgroup of women. This objection can be resisted, however, as it (implicitly) is by Denise Riley in ' Am I That Name? '. Riley claims that **'it is compatible to suggest that "women" don't exist—while maintaining a politics of "as if they existed"** — since the world behaves as if they unambiguously did'. 15 In other words, for Riley, the fiction that women share a common social experience is politically effective because the social world actually does treat women as if they comprise a unitary group. Riley accepts that women are not a unitary group and that the socially prevalent idea that they are unified is false. Nevertheless, this false idea informs and organizes the practices and institutions that shape women's experiences, so that those—very different—experiences become structured by essentialist assumptions. A strategy of affirming fictitious commonalities therefore will be effective given this world in which (false) descriptive essentialist assumptions undergird women's social existence. Riley's argument has a problem, though: she **cannot consistently maintain** both that women's social experience is fully diverse and that this experience is uniformly structured by essentialist assumptions. If essentialism informs and organizes the structures that shape women's social experience, then this experience will be organized according to certain shared models and will acquire certain common patterns and features. More concretely, the idea that women are a homogeneous group will structure social institutions so that they position all women homogeneously, leading to (at least considerable areas of) shared experience. Thus, Riley (and other strategic essentialists)may be right that essentialist constructions are socially influential, but they cannot, consistently with this, also maintain that descriptive essentialism is false. Furthermore, it is not obviously true that any uniform set of essentialist constructions informs all social experience. These constructions may all identify women as a homogeneous group, but they vary widely in their account of the context of women's homogenous features. Consequently, these constructions will influence social structures in correspondingly varying directions, against which no counter-affirmation of common experience can be expected to be effective Strategic essentialists, then, have attempted to resuscitate essentialism by arguing that it can take a merely political and non-descriptive form. But this **attempt proves unsuccessful**, because one cannot defend essentialism on strategic grounds without first showing that there is a homogeneous set of essentialist assumptions that exerts a coherent influence on women's social experience—which amounts to defending essentialism on descriptive grounds(as well). Advocates of essentialism therefore need to show that it accurately describes social reality. Here, though, critics can retort that essentialism is descriptively false, since women do not even share any common mode of construction by essentialist discourses. Yet this retort reinstates the problem of anti-essentialism: its paralysing effect on social criticism and political activism. Strategic essentialism has not resolved this problem, for it has not stably demarcated any merely political form of essentialism from the descriptive essentialism which critics have plausibly condemned as false and oppressive.

Foucault Answers

General Foucault

Aff = Consistent

Their reading of Foucauldian philosophy is all wrong - the affirmative supports Foucault's idea to deconstruct power systems instead of their radical critique.

Ferguson '11

Professor of Anthropology at Stanford Univeristy (James, "Toward a left art of government: from 'Foucauldian critique' to Foucauldian politics," History of the Human Sciences 24(4), http://hhs.sagepub.com/content/24/4/61.full.pdf)//DWB

One of the founding premises of this special issue and the conference with which it began¶ is that Foucault has been read, and used, in different ways in different academic¶ disciplines. In this article I will discuss one common way of using Foucault's thought in my own discipline of anthropology. I will suggest that the strategy of using Foucauldian¶ modes of analysis to 'critique power' (as it is often put) has frequently led to a rather sterile¶ form of political engagement. Attention to some of Foucault's own remarks about politics¶ hints at a different political sensibility, in which empirical experimentation rather than¶ moralistic denunciation takes center place. I will reference some examples of such¶ experimentation that come out of my current research on the politics of social assistance¶ in southern Africa (though I do not have space here to give a full exposition of these).¶ The sort of use of Foucault that I have in mind is well represented in the anthropology¶ of development (and the related field of what is sometimes called critical development¶ studies). Here, the characteristic strategy is to use Foucauldian analysis to reveal the way¶ that interventions, projects, etc., which claim to be merely technical or benevolent, really¶ involve relations of power. This is a perfectly reasonable thing to do, but too often, in this¶ field, such a simple demonstration is apparently seen as the end of the exercise. Power¶ has been 'critiqued', an oppressive system has been exposed as such, and that seems to¶ be taken as a satisfactory end to the matter.¶ This impasse in development studies and anthropology is related, I think, to a wider¶ predicament that progressive or left politics seems to find itself in today. The predicament¶ is that the left seems increasingly to be defined by a series of gestures of refusal¶ – what I call 'the antis' (anti-globalization, anti-neo-liberalism, anti-privatization,¶ anti-Bush, sometimes even anti-capitalism – but always 'anti', never 'pro'). The current¶ world system, the politics of the 'anti-' points out, rests on inequality and exploitation.¶ The global poor are being screwed, while the rich are benefiting. The powerless are getting¶ the short end of the stick. This is all perfectly true, of course, if not terribly¶ illuminating. But such lines of argument typically have very little to propose by way of¶ an alternative 'art of government'. Governing is exercising power over others, which is¶ what the powerful do to the downtrodden. It appears as something to be resisted or¶ denounced, not improved or experimented with.¶ My first observation about this sort of analysis is that it rests on what seems to me a very¶ un-Foucauldian idea of the political. Foucault did, certainly, valorize certain forms of resistance,¶ and worked tirelessly to undermine and denaturalize taken-for-granted arrangements¶ of power. But he never suggested that power ought not be exercised, or that it was illegitimate¶ for some to seek to govern the conduct of others. On the contrary, he repeatedly insisted¶ that it made no sense (in his scheme of things) to wish for a world without power.1¶ Naive readings of Foucault turned his skeptical analytics of power into a simple¶ denunciation. Thus the question (once posed to him by an interviewer) of whether it¶ would be an intolerable use of power for a parent to prevent a child from scribbling¶ on the walls of a house. Foucault's instructive answer was:¶ If I accepted the picture of power that is frequently adopted – namely, that it's something¶ horrible and repressive for the individual – it's clear that preventing a child from scribbling¶ would be an unbearable tyranny. But that's not it. I say that power is a relation. A relation in¶ which one guides the behavior of others. And there's no reason why this manner of guiding¶ the behavior of others should not ultimately have results which are positive, valuable, interesting,¶ and so on. If I had a kid, I assure you he would not write on the walls – or if he did, it¶ would be against my will. The very idea! (Foucault, 1988a: 11–13) In the same interview, he complained of those who¶ ... think I'm a sort of radical anarchist who has an absolute hatred of power. No! What I'm¶ trying to do is to approach this extremely important and tangled phenomenon

in our society,¶the exercise of power, with the most reflective, and I would say prudent, attitude. … To¶ question the relations of power in the most scrupulous and attentive manner possible, looking¶ into all the domains of its exercise, that's not the same thing as constructing a mythology¶of power as the beast of the apocalypse. (ibid.: 11–13)

Alt = Inconsistent

Their static position of critique is exactly what Foucault opposed.

Ferguson '11 – Professor of Anthropology at Stanford Univeristy (James, "Toward a left art of government: from 'Foucauldian critique' to Foucauldian politics," History of the Human Sciences 24(4), http://hhs.sagepub.com/content/24/4/61.full.pdf)//DWB

Such a stance, I suggest, brings us much closer toward a truly Foucauldian politics. For¶ politics, for Foucault, was always more about experimentation than denunciation. In an¶ interview on social security, Foucault insisted that what was required for a progressive¶ rethinking of social policy was not a theoretically derived 'line', but, as he put it, 'a certain¶ empiricism'.¶ We have to transform the field of social institutions into a vast experimental field, in such a¶ way as to decide which taps need turning, which bolts need to be loosened here or there, to get¶ the desired change. ... What we have to do ... is to increase the experiments wherever possible¶ in this particularly interesting and important area of social life. (Foucault, 1988b: 165)¶ What this implies is a form of politics that has less to do with critique and denunciation¶ than with experimentation and assessment. It is a matter not of refusing power, but rather¶ exercising it in a way that would be provisional, reversible, and open to surprise. If we¶ are indeed to arrive at viable left 'arts of government', we will need to be open to the¶ unexpected, ready to 'increase the experiments wherever possible', and attentive to¶ the ways that governmental techniques originally deployed for nefarious purposes can¶ be appropriated toward other ends. To do this, we will need to forgo the pleasures of the easy, dismissive critique, and instead turn a keen and sympathetic eye toward the rich world¶ of **actual** social and **political** practice, the world of tap-turning and experimentation. That is¶ a world still full of invention and surprise, where the landscape of political possibility and¶ constraint that we have come to take for granted is being redrawn, even as we speak.

Liberalism Good

Lib k HR/Env

International Relations and Liberalism is key to solve human rights, environment, and poverty – constitutents provide a legitimate check.

Devitt '11 – Masters in International Relations (Sept. 1, Rebecca, "Liberal Institutionalism: An Alternative IR Theory or Just Maintaining the Status Quo?", E-International Relations Students, http://www.e-ir.info/2011/09/01/liberal-institutionalism-an-alternative-ir-theory-or-just-maintaining-the-status-quo/)//DWB

Domestic interests have had a major impact on cooperation in International Relations, public reactions to the deaths of US soldiers in Somalia led to the Clinton administration pulling out of a peacekeeping mission to the war torn country whilst public demand for action on Climate Change has led to member states such as Australia to sign up to the Kyoto Protocol. [15]¶ This reflects the fact that domestic issues and policies have a major influence on how states cooperate with other states on an international stage. If a state was to go into agreement with another on trade relations, but that state had a bad record on human rights, the government might reconsider doing a deal if its constituents elected them on the basis of a strong human rights stance. This reflects the need for greater development of the liberal institutionalists argument in terms of domestic influences on decision making at an international level.¶ Furthermore whilst Liberal institutionalists have acknowledged the influence non-state actors in world affairs such as transnational organizations and non-governmental organizations play, they have failed to recognize the role that global political advocacy networks have had in international relations. Advocacy work on human rights, the environment and poverty has had major effects on the way states are viewed and global movements have challenged the notion that sovereignty is sacrosanct. Technological advances and telecommunication networks have allowed for swifter mobilization and organization of groups that can lobby governments and organizations about issues such as human rights and questioned the liberal institutionalists argument that states remain the key actors in world affairs. As R.B.J Walker has stated:

Lib k Peace/Democ

Liberalism is key to democracy – that spills over to more peaceful societies.

Burchill '05 – Researcher of International Relations at Deakin University (Scott, Theories of International Relations Third edition, Chapter 3 "Liberalism", pp. 55-83)//DWB

At the beginning of this chapter, it was argued that liberalism was an¶ 'inside-out' approach to international relations, because liberals favour¶ a world in which the endogenous determines the exogenous. Their challenge¶ is to extend the legitimacy of domestic political arrangements¶ found within democratic states to the relationships between all nationstates.¶ To put it another way, liberals believe that democratic society, in¶ which civil liberties are protected and market relations prevail, can have¶ an international analogue in the form of a peaceful global order. The¶ domestic free market has its counterpart in the open, globalized world¶ economy. Parliamentary debate and accountability is reproduced in¶ international fora such as the United Nations. And the legal protection¶ of civil rights within liberal democracies is extended to the promotion of¶ human rights across the world. With the collapse of Communism as an¶ alternative political and economic order, the potential for continuity¶ between the domestic and the international became greater than in any¶ previous period.¶ Fukuyama had reason to be optimistic. The spread of liberal democracies¶ and the zone of peace was an encouraging development, as is the¶ realization by states that trade and commerce is more closely correlated¶ with economic success than territorial conquest. The number of governments¶ enjoying civilian rather than military rule is increasing, and there¶ are signs that ethical considerations and ideas of human justice have a¶ permanent place on the diplomatic agenda. The collapse of Marxism as¶ a legitimate alternative political order removes a substantial barrier to¶ the spread of liberal democracies, and there can be little doubt that the¶ great powers are now much less inclined to use force to resolve their¶ political differences with each other. It appears that **liberal democracies¶ are in the process of constructing a separate peace**.¶ The globalization of the world economy means that there are few¶ obstacles to international trade. Liberals want to remove the influence of¶ the state in commercial relations between businesses and individuals,¶ and the decline of national economic sovereignty is an indication that¶ the corrupting influence of the state is rapidly diminishing. TNCs and¶ capital markets wield significant influence over the shape of the world¶ economy, in the process homogenizing the political economies of every¶ member state of the international community.¶

Free Trade Solves War

Liberal free trade prevents war and fosters international dialogue.

Burchill '05 – Researcher of International Relations at Deakin University (Scott, Theories of International Relations Third edition, Chapter 3 "Liberalism", pp. 55-83)//DWB

Free trade, however, was a more peaceful means of achieving national¶ wealth because, according to the theory of comparative advantage, each¶ economy would be materially better off than if it had been pursuing¶ nationalism and self-sufficiency (autarky). Free trade would also break¶ down the divisions between states and unite individuals everywhere in one¶ community. Artificial barriers to commerce distorted perceptions and¶ relations between individuals, thereby causing international tension. Free¶ trade would expand the range of contacts and levels of understanding¶ between the peoples of the world and encourage international friendship¶ and understanding. According to Kant, unhindered commerce between¶ the peoples of the world would unite them in a common, peaceful enterprise.¶ ·Trade … would increase the wealth and power of the peaceloving,¶ productive sections of the population at the expense of the¶ war-orientated aristocracy, and … would bring men of different nations¶ into constant contact with one another; contact which would make clear¶ to all of them their fundamental community of interests' (Howard 1978:¶ 20; Walter 1996). Similarly Ricardo believed that free trade 'binds¶ together, by one common tie of interest and intercourse, the universal¶ society of nations throughout the civilised world' (Ricardo 1911: 114).¶ Conflicts were often caused by states erecting barriers which distorted¶ and concealed the natural harmony of interests commonly shared by¶ individuals across the world. The solution to the problem, argued Adam¶ Smith and Tom Paine, was the free movement of commodities, capital¶ and labour. 'If commerce were permitted to act to the universal extent it¶ is capable, it would extirpate the system of war and produce a revolution¶ in the uncivilised state of governments' (Howard 1978: 29). Writing¶ in 1848, John Stuart Mill also claimed that free trade was the means to¶ bring about the end of war: 'it is commerce which is rapidly rendering¶ war obsolete, by strengthening and multiplying the personal interests¶ which act in natural opposition to it' (Howard 1978: 37). The spread of¶ markets would place societies on an entirely new foundation. Instead of¶ conflicts over limited resources such as land, the industrial revolution¶ raised the prospect of unlimited and unprecedented prosperity for all:¶ material production, so long as it was freely exchanged, would bring¶ human progress. Trade would create relations of mutual dependence¶ which would foster understanding between peoples and reduce conflict.¶ Economic self-interest would then be a powerful disincentive for war. Liberals have always felt that unfettered commercial exchanges would¶ encourage links across frontiers and shift loyalties away from the nationstate.¶ Leaders would eventually come to recognize that the benefits of¶ free trade outweighed the costs of territorial conquest and colonial¶ expansion. The attraction of going to war to promote mercantilist interests¶ would be weakened as societies learn that war can only disrupt trade and therefore the prospects for economic prosperity. Interdependence¶ would replace national competition and defuse unilateral acts of aggression¶ and reciprocal retaliation.

Lib Solves War

Liberalism is key to solve war. All other solutions lead to chaos.

Burchill '05 – Researcher of International Relations at Deakin University (Scott, Theories of International Relations Third edition, Chapter 3 "Liberalism", pp. 55-83)//DWB

For liberals, peace is the normal state of affairs: in Kant's words, peace¶ can be perpetual. The laws of nature dictated harmony and cooperation¶ between peoples. War is therefore both unnatural and irrational, an artificial¶ contrivance and not a product of some peculiarity of human¶ nature. Liberals have a belief in progress and the perfectibility of the¶ human condition. Through their faith in the power of human reason and¶ the capacity of human beings to realize their inner potential, they remain¶ confident that the stain of war can be removed from human experience¶ (Gardner 1990: 23–39; Hoffmann 1995: 159–77; Zacher and Matthew¶ 1995: 107–50).¶ A common thread, from Rousseau, Kant and Cobden, to Schumpeter¶ and Doyle, is that **wars were created by militaristic and undemocratic¶ governments** for their own vested interests. Wars were engineered by¶ a 'warrior class' bent on extending their power and wealth through territorial conquest. According to Paine in The Rights of Man, the 'war¶ system' was contrived to preserve the power and the employment of¶ princes, statesmen, soldiers, diplomats and armaments manufacturers,¶ and to bind their tyranny ever more firmly upon the necks of the people'¶ (Howard 1978: 31). Wars provide governments with excuses to raise¶ taxes, expand their bureaucratic apparatus and increase their control over¶ their citizens. The people, on the other hand, were peace-loving by nature,¶ and plunged into conflict only by the whims of their unrepresentative¶ rulers.¶ War was a cancer on the body politic. But it was an ailment that¶ human beings, themselves, had the capacity to cure. The treatment which¶ liberals began prescribing in the eighteenth century had not changed: the¶ 'disease' of war could be successfully treated with the twin medicines of¶ democracy and free trade. Democratic processes and institutions would¶ break the power of the ruling elites and curb their propensity for violence.¶ Free trade and commerce would overcome the artificial barriers between¶ individuals and unite them everywhere into one community.¶ For liberals such as Schumpeter, war was the product of the aggressive¶ instincts of unrepresentative elites. The warlike disposition of these rulers¶ drove the reluctant masses into violent conflicts which, while profitable¶ for the arms industries and the military aristocrats, were disastrous for¶ those who did the fighting. For Kant, the establishment of republican¶ forms of government in which rulers were accountable and individual¶ rights were respected would lead to peaceful international relations¶ because the ultimate consent for war would rest with the citizens of the¶ state (Kant 1970: 100). For both Kant and Schumpeter, war was the¶ outcome of minority rule, though Kant was no champion of democratic¶ government (MacMillan 1995). Liberal states, founded on individual¶ rights such as equality before the law, free speech and civil liberty,¶ respect for private property and representative government, would not¶ have the same appetite for conflict and war. Peace was fundamentally a¶ question of establishing legitimate domestic orders throughout the world.¶ 'When the citizens who bear the burdens of war elect their governments,¶ wars become impossible' (Doyle 1986: 1151).¶

I/R = Global Stability

International relations guarantee global stability – even tense relations won't escalate

Shuja '01 - Adjunct Assistant Professor of International Relations at Bond University, Australia (January 1, Sharif, "The Historical Myopia of International Relations," Contemporary Review, Vol. 278, http://www.thefreelibrary.com/THE+HISTORICAL+MYOPIA+OF+INTERNATIONAL+RELATIONS.-a070396453)//DWB

ALL nations are members of the community of nations and part of the international political system; each needs to deal in some measure with the other members. No one can stop the world and get off. We have to share the planet with each other, and the way in which we share it is what foreign policy is all about. Some nations depend a great deal on the international community for their security, their economic development and their way of life. Others may flourish in a more self-reliant or autarchic way. ¶ The international system has been described by some writers as representing a billiard table, on which the 191 or so sovereign independent countries behave like balls which bounce off each other in an unpredictable fashion, seeking only their own national interests; much of the energy generated by these collisions gives rise to conflict and war. It is argued that there is no guiding hand, no predictable behaviour, no pattern or order; the key principle is survival of the fittest; violence and war are integral to the system. ¶ At one extreme is thus pure conflict. It occurs when the interests of actors, such as states, or non-state actors, such as multinational corporations, are diametrically opposed: if one actor realises its goal, the other cannot achieve its objective. For example, in a conflict over territory, one state will gain the territory and the other will lose it. ¶ At the other extreme, the system is painted as a cobweb of relationships in which states, in spite of their formal claims to sovereignty and to complete control over their own affairs, are in fact closely linked together in an interdependence they cannot escape. It is an interdependence based on common global needs of economic development, environmental protection, ideological convergence and the need to avoid war. In such a situation, actors have a common interest, and all benefit from the pursuit of this shared interest. Allies, for example, have a common interest in ensuring their common defence, or colonies often have a common interest in achieving independence, or trading partners have a common interest in maintaining beneficial trading relations.¶ For large and small states alike, survival and welfare depend on close cooperation. Violence and war are seen as aberrations, rather than the norm, since they destroy the fabric of the cobweb and everyone loses. Because of this, most states recognise that violence is more or less becoming counter-productive and that more and more of their sovereignty must be surrendered for the common goal. The cobweb represents an ordered framework of behaviour which the great majority of states adhere to for most of the time. ¶ Most international interaction contains elements of both conflict and cooperation. Even in situations of extreme conflict, there is often an element of co-operation. For example, despite the confrontation between the United States and the Soviet Union over placing missiles in Cuba in 1962, both superpowers' interest in preventing the escalation of these conflicts into nuclear war and holocaust led to co-operation as their resolution. ¶ Conversely, in situations involving high levels of co-operation, there is often an element of conflict; and even when actors share interests, there is usually conflict over specific interests and specific solutions. For example, all states may want to establish and maintain a stable international monetary system; but some of these states may prefer a particular type of monetary system, such as a fixed exchange rate or a floating exchange rate regime, which satisfies their more specific national interests. Thus, within a framework of common goals, as argued in 1992, in The Politics of International Economic Relations, by Joan Edelman Spero, states disagree over the best means to achieve their common end.

Institutions k Peace

International institutions are key to ensure a safe global political environment

Irrespective of the view we have of the international system, there are a number of major global issues with which policy makers of all nations grapple. These are the imminence of violence; the containing and resolving of international conflict; the development gap between the wealthy few and the underdeveloped many; the protection of the environment, and the protection of human rights. Greater levels of co-operation between nation states are needed in meeting these challenges. ¶ In domestic politics, goal-seeking behaviour is regulated by government, which has the authority to make decisions for a society and the power to enforce those decisions. The characteristic that distinguishes international politics from internal politics is the absence of government. In the international system, no legitimate body has the authority to manage conflict or achieve common goals by making and enforcing decisions for the system; instead, the decision-making authority is dispersed among many governmental, inter-governmental and non-governmental groups. ¶ Because there is no international government, the central problems of international politics are the adjustment or management of conflict and the achievement of co-operation. Over the years, actors have devised rules, institutions and procedures to manage international conflict and co-operation. These forms of managing international order have varied over time and issues. They range from balances of power to alliances and to international organisations, from hegemony to colonialism and to international law. Even during the Cold War period, efforts were made to contain and reduce armed conflict through several 'layers of management'. ¶ Firstly, the two superpowers - the USA and the USSR - established a loose duopoly, and between them they managed global strategy, more or less effectively, at the nuclear level and they controlled, to a considerable degree, the behaviour of their allies and clients at other levels, all according to a set of mostly tacit rules and understandings. ¶ Secondly, this superpower 'management' was codified and elaborated by a range of explicit bilateral and multilateral regional alliances between each superpower and its respective allies. This network of military arrangements, though sometimes brittle and unstable, has brought about a reasonably 'safe' distribution of military power.¶ At the third level, the international community has put in place the apparatus of global collective security in the United Nations. Many of the key provisions of the UN Charter, such as, the role of the Security Council, the establishment of peace-keeping forces, the process of the peaceful resolution of conflict, the International Court of Justice and so on, are all designed to prevent or limit the use of violence between nations. These different layers of management in practice merge into each other. Together they give us the relative degree of safety from violence that we currently enjoy.

N/L: Lib =/= Conflict Focus

Liberalism focuses on more than just political power – it recognizes the importance of "everyday" interactions instead of just conflicts

A leading exponent of realism is Hans Morgenthau. Realists focus on power and conflict as the dynamic elements of international politics and pay particular attention to the military dimensions of power. States are seen to be motivated by the pursuit of their national interests; in pursuing those interests, states are influenced by the prevailing 'balance of power'. Although the concept of 'balance of power' can be interpreted in various ways, it may be defined as the way in which power is distributed within international politics, particular among the major states. ¶ A more recent version of realism is 'neorealism'. Kenneth Waltz is often considered its leading exponent. Neorealism is not so much concerned with the alleged metaphysical dimensions of power as with the logical character of state behaviour in an anarchical world. This theory contends that a major influence on a state's behaviour is the fact that it has to look to its survival in a state of anarchy. Neorealists believe that the structure of the system enables them to predict the likelihood of a state's actions given that particular state's location in this anarchical world. ¶ On the other hand, one can consider liberalism or liberal institutionalism as an alternative to realism and neorealism. This approach puts more emphasis on the economic dimensions of power. The state remains important but less so than in the realist paradigm, and more attention is given to the ways in which states cooperate as well as compete. Interdependence is suggested as an alternative. The latter term points to the way in which the various actors in the world are linked in a variety of ways. Because liberalism emphasises the role of 'low politics', liberal theorists pay more attention to the 'everyday' character of these interactions and distinguish them from the more dramatic developments in the 'high politics' of realism.

Lib/Govt k Stability

Sovereign governments are key to ensure political stability – worth it even at a small violation of rights

These perspectives are helpful in understanding the dynamics of international politics. But the peculiarities of the international system insist that each nation state has a compulsion to strengthen its economy, to deepen its defence capability and to maximise its economic welfare, if necessary at the expense of other states. To achieve these objectives, each nation state maintains sovereign control over its resources and its people, and uses and disposes of both as it thinks fit. The system expects that each nation state play a self-interested game in order to survive. Where then is there a place for principles of humanity, compassion and morality in efforts to reduce the development gap? To what extent can Great Powers in the post-Cold War period participate in attempts to introduce more equity, peace and order into the international community? Despite hopes to the contrary, the post-Cold War world has not witnessed the end of international conflict. In Africa, Asia, Eastern Europe and the Middle East, issues of war and peace continue to present challenges to the international community. More than ever, world problems require careful thinking, creative research, fresh ideas, and practical approaches, if they are to be solved. ¶ These questions are relevant since the world now is becoming a global village. And we are all enmeshed in a 'cobweb of interdependence', and we all have to deal with these difficult global issues. These, along with other issues including globalisation and an expansion of information technology that have given rise to a new wave of changes in international relations, will be the focus of my next article.

Lib Fails

Liberalism fails through a litany of reasons – inconsistent theorists, unregulated political judging, no brightline to objective-subjective politics

McCormick '99

(John P., Assistant Political Science Pf - Yale, American Political Science Review. v93, p. June 1999)//akim

In the 1920s Schmitt criticized liberal legal theory for avoiding the reality of jurisprudence by denying the existence of gaps within the law: the fact that the formal rules of statutory law cannot possibly cover all instances of concrete reality. Liberalism (1) demotes judges to the status of mere vending machines that mechanically dispense the law upon cases, without intellectual reflection or active contribution, and (2) leaves the legal theorist inadequately equipped to analyze exactly how the law is applied. According to Schmitt's "decisionist" alternative to liberalism, only a person, not a rule within a larger system, can determine how to enforce or realize the law. Purely formal jurisprudence endangers the "personality" of judges, their ability to engage in the concrete particularity of a given case, by confining them to the mechanical application of a pre-given statute. For Schmitt, between the law and concrete reality there will always be a gap that must be mediated by a judge. This is the "humanity" or "life" of the law. According to Schmitt's account, liberal jurists refuse to acknowledge anything but formal imperatives in adjudication.6 Moreover, they pretend that the law is applied consistently and appropriately most or all of the time. CLS ultimately indicts postwar North American liberal adjudication on the same grounds. Less concerned with metaphysical assertions about juridical "reality" or "life" than Schmitt-indeed, questioning the very existence of such phenomena- CLS points primarily to the uncertain nature of meaning in language as the source of the indeterminacy of deciding cases. Legal rules are so far from clear regarding where and how they should be applied that there is no possibility of their being applied consistently or objectively. According to CLS, this shakes the very foundations of liberal formalist notions of efficiency and justice. As a result of this lack of determinacy, both Schmitt and CLS conclude that, to some extent, judges make the law. The difference is that CLS wishes to expose the subjective decision making that goes on behind the supposedly objective formal rule of law in order to undermine the generally conservative rulings of judges. Schmitt wants to emphasize the personal quality of decisions so that conservative rulings may be rendered with less liberal constraint. But the theories may converge in more fundamentally disconcerting ways, as will be seen below. The subjective-judging criticism also allows both [foot notes] 414 Schmitt and CLS to criticize legal liberalism for falsely separating politics from the law. For both there is no sharp distinction between objective law and subjectively biased politics. Such scholars as Tushnet (1984, 1986, 1988), Boyle (1985), Unger (1975), -and most recently and elaborately Kennedy (1997) argue that political value judgments infiltrate the law at every turn. The law embodies specific political and, especially, economic values, such as self-interest, individualism, and advantage, and it reflects the personal prejudices of particular judges. There is no consensus in the CLS literature on the exact nature of these judicial prejudices (see Tushnet 1981). Kennedy (1997, 1-5, 115) is perhaps most cynical in his assertion that judges generally pursue "ideological projects" of varying stripes but mostly decide cases so as to curry favor with, and secure the interests of, what he calls the "intelligentsia"- New York intellectuals and Beltway insiders. Moreover, judges deny such strategic political behavior, according to Kennedy (1997, 5), in deliberate "bad faith."7 CLS acknowledges the presence of more progressive countervalues in legal discourse, such as solidarity and altruism, which also constitute the human psyche, but these seem overwhelmed by the more conservative ones mentioned above (Tushnet 1985). Worse still for CLS, the very pervasiveness of contradictory values embedded in different laws and precedents makes manifest the incoherence of the whole system, a system in perpetual war with itself. For Schmitt as well, legal formalism is compromised politically, despite claims of being insulated from politics. The fact that the "personality" of judges interacts with the law makes for unacknowledged state action. The emphasis on "abstractly valid" principles, in particular, betrays liberalism's prejudice against Schmitt's preferred model; namely, the more subjective, personalist theories of judging associated with European absolutism. Yet, as a result of this denial and bias, liberalism allows such political judging to proliferate undetected, unmonitored, and unregulated.

Institutions K Solve Warm

Their call to reject all existing institutions guarantees warming happens

Monbiot 8

(George, English Writer and Environmental and Political Activist, 9-4, "Identity Politics in Climate Change Hell," http://www.celsias.com/article/identity-politics-climate-change-hell/)

If you want a glimpse of how the movement against climate change could crumble faster than a summer snowflake, read Ewa Jasiewicz's article , published on the Guardian's Comment is Free site. It is a fine example of the identity politics that plagued direct action movements during the 1990s, and from which the new generation of activists has so far been mercifully free. Ewa rightly celebrates the leaderless, autonomous model of organising that has made this movement so effective. The two climate camps I have attended – this year and last – were among the most inspiring events I've ever witnessed. I am awed by the people who organised them, who managed to create, under extraordinary pressure, safe, functioning, delightful spaces in which we could debate the issues and plan the actions which thrust Heathrow and Kingsnorth into the public eye. Climate camp is a tribute to the anarchist politics that Jasiewicz supports. But in seeking to extrapolate from this experience to a wider social plan, she makes two grave errors. The first is to confuse ends and means. She claims to want to stop global warming, but she makes that task 100 times harder by rejecting all state and corporate solutions. It seems to me that what she really wants to do is to create an anarchist utopia, and use climate change as an excuse to engineer it. Stopping runaway climate change must take precedence over every other aim. Everyone in this movement knows that there is very little time: the window of opportunity in which we can prevent two degrees of warming is closing fast. We have to use all the resources we can lay hands on, and these must include both governments and corporations. Or perhaps she intends to build the installations required to turn the energy economy around - wind farms, wave machines, solar thermal plants in the Sahara, new grid connections and public transport systems - herself? Her article is a terryifying example of the ability some people have to put politics first and facts second when confronting the greatest challenge humanity now faces. The facts are as follows. Runaway climate change is bearing down on us fast. We require a massive political and economic response to prevent it. Governments and corporations, whether we like it or not, currently control both money and power. Unless we manage to mobilise them, we stand a snowball's chance in climate hell of stopping the collapse of the biosphere. Jasiewicz would ignore all these inconvenient truths because they conflict with her politics. "Changing our sources of energy without changing our sources of economic and political power", she asserts, "will not make a difference. Neither coal nor nuclear are the "solution", we need a revolution." So before we are allowed to begin cutting greenhouse gas emissions, we must first overthrow all political structures and replace them with autonomous communities of happy campers. All this must take place within a couple of months, as there is so little time in which we could prevent two degrees of warming. This is magical thinking of the most desperate kind. If I were an executive of E.On or Exxon, I would be delighted by this political posturing, as it provides a marvellous distraction from our real aims. To support her argument, Jasiewicz misrepresents what I said at climate camp. She claims that I "confessed not knowing where to turn next to solve the issues of how to generate the changes necessary to shift our sources of energy, production and consumption". I confessed nothing of the kind. In my book Heat I spell out what is required to bring about a 90% cut in emissions by 2030. Instead I confessed that I don't know how to solve the problem of capitalism without resorting to totalitarianism. The issue is that capitalism involves lending money at interest. If you lend at 5%, then one of two things must happen. Either the money supply must increase by 5% or the velocity of circulation must increase by 5%. In either case, if this growth is not met by a concomitant increase in the supply of goods and services, it becomes inflationary and the system collapses. But a perpetual increase in the supply of goods and services will eventually destroy the biosphere. So how do we stall this process? Even when usurers were put to death and condemned to perpetual damnation, the practice couldn't be stamped out. Only the communist states managed it, through the extreme use of the state control Ewa professes to hate. I don't yet have an answer to this conundrum. Does she? Yes, let us fight both corporate power and the undemocratic tendencies of the state. Yes, let us try to crack the problem of capitalism and then fight for a different system. But let us not confuse this task with the immediate need to stop two degrees of warming, or allow it to interfere with the carbon cuts that have to begin now. Ewa's second grave error is to imagine that society could be turned into a giant climate camp. Anarchism is a great means of organising a self-elected community of like-minded people. It is a disastrous means of organising a planet. Most anarchists envisage their system as the everyone is to be free from the coercive power of the state, this must apply to the oppressors as well as the oppressed. The richest and most powerful communities on earth - be they geographical communities or communities of interest - will be as unrestrained by external forces as the poorest and weakest. As a friend of mine put it, "when the means by which the oppressed can free themselves from persecution. But if anarchist utopia arrives, the first thing that will happen is that every Daily Mail reader in the country will pick up a gun and go and kill the nearest hippy." This is why, though both sides furiously deny it, the outcome of both market fundamentalism and anarchism, if applied universally, is identical. The anarchists associate with the oppressed, the market fundamentalists with the oppressors. But by eliminating the state, both remove such restraints as prevent the strong from crushing the weak. Ours is not a choice between government and no government. It is a choice between government and the mafia. Over the past year I have been working with groups of climate protesters who have changed my view of what could be achieved. Most of them are under 30, and they bring to this issue a clear-headedness and pragmatism that I have never encountered in direct action movements before. They are prepared to take extraordinary risks to try to defend the biosphere from the corporations, governments and social trends which threaten to make it uninhabitable. They do so for one reason only: that they love the world and fear for its future. It would be a tragedy if, through the efforts of people like Ewa, they were to be diverted from this urgent task into the identity politics that have wrecked so many movements.

Institutions Inevitable

You can't just wish away institutions

McCormack 10

(Tara, Leicester international politics lecturer, Critique, Security and Power: The Political Limits to Emancipatory Approaches, pg 58)

Contemporary critical and emancipatory approaches reject the possibility of reaching an objective evaluation of the world or social reality because they reject the possibility of differentiating between facts and values. For the contemporary critical theorists, theory can only ever be for someone and for some purpose. As this is so then quite logically critical theorists elevate their own values to be the most important aspect of critical theory. As a result of the rejection of the fact/value distinction we see within the work of contemporary critical theorists a highly unreflective certainty about the power of their moral position. Critical theorists argue that all theory is normative, they offer in its place better norms: ones, as we have seen, that will lead to emancipation and will help the marginalised. The claims made for the central role of the values of the theorist reveal the theoretical limits of critical and emancipatory theory today. Yet even good or critical theory has no agency, and only political action can lead to change. Theory does of course play an important role in political change. This must be the first step towards a critical engagement with contemporary power structures and discourses. In this sense, we can see that it is critical theory that really has the potential to solve problems, unlike problem-solving theory which seeks only to ensure the smooth functioning of the existing order. Through substantive analysis the critical theorist can transcend the narrow and conservative boundaries of problem-solving theory by explaining how the problematic arises. Unlike problem-solving theory, critical theory makes claims to be able to explain why and how the social world functions as it does, it can go beyond the 'given framework for action'. The critical theorist must therefore be able to differentiate between facts (or social reality) and values, this ability is what marks the critical theorist apart from the traditional or problem-solving theorists, who cannot, because of their values and commitment to the existing social world, go beyond the 'given framework for action'. If we cannot differentiate between our desires or values or norms (or our perspective, to put it in Cox's terms) and actually occurring social and political and historical processes and relationships, it is hard to see how we can have a critical perspective (Jahn, 1998: 614). Rather, through abolishing this division we can no longer draw the line between what we would like and everything else, and thereby contemporary critical theories are as much of a dogma as problem-solving theories. Contemporary critical theorists are like modern-day alchemists, believing that they can transform the base metal of the unjust international order into a golden realm of equality and justice through their own words. For contemporary critical theorists, all that seems that the crucial step towards progress to a better world order is for the theorist to state that their theory is for the purposes of emancipation and a just world order.

Wilderson/Anti-Blackness

AT: structural antagonism

Antiblackness is not the foundational structure of violence – their analysis is overdetermined by discrete historical events that do not make sense together – their reading of black social life is ontological fatalism, this is based on social factors that are subject to change

Hudson 13

(Peter Hudson 13, Political Studies Department, University of the Witwatersrand, Johannesburg , South Africa, has been on the editorial board of the Africa Perspective: The South African Journal of Sociology and Theoria: A Journal of Political and Social Theory and Transformation, and is a member of the Johannesburg Workshop in Theory and Criticism, The state and the colonial unconscious, Social Dynamics: A journal of African studies, 2013)

Thus the self-same/other distinction is necessary for the possibility of identity itself. There always has to exist an outside, which is also inside, to the extent it is designated as the impossibility from which the possibility of the existence of the subject derives its rule (Badiou 2009, 220). But although the excluded place which isn't excluded insofar as it is necessary for the very possibility of inclusion and identity may be universal (may be considered "ontological"), its content (what fills it) – as well as the mode of this filling and its reproduction – are contingent. In other words, the meaning of the signifier of exclusion is **not determined** once and for all: the place of the place of exclusion, of death is itself over-determined, i.e. the very framework for deciding the other and the same, exclusion and inclusion, is **nowhere engraved in ontological stone** but is political and never terminally settled. Put differently, the "curvature of intersubjective space" (Critchley 2007, 61) and thus, the specific modes of the "othering" of "otherness" are nowhere decided in advance (as a certain ontological fatalism might have it) (see **Wilderson** 2008). **The social does not have to be divided into white and black**, and the meaning of these signifiers is never necessary – because they are signifiers. To be sure, colonialism institutes an ontological division, in that whites exist in a way barred to blacks – who are not. But this ontological relation is really on the side of the **ontic** – that is, of all contingently constructed identities, rather than the ontology of the social which refers to the ultimate unfixity, the indeterminacy or lack of the social. In this sense, then, the white man doesn't exist, the black man doesn't exist (Fanon 1968, 165); and neither does the colonial symbolic itself, including its most intimate structuring relations – division is constitutive of the social, not the colonial division. "Whiteness" may well be very deeply sediment in modernity itself, but respect for the "ontological difference" (see Heidegger 1962, 26; Watts 2011, 279) shows up its ontological status as ontic. It may be so deeply sedimented that it becomes difficult even to identify the very possibility of the separation of whiteness from the very possibility of order, but from this it does not follow that the "void" of "black being" functions as the ultimate substance the transcendental signified **on which all possible forms of sociality** are said to rest. What gets lost here, then, is the **specificity** of colonialism, of its constitutive axis, its "ontological" differential. A crucial feature of the colonial symbolic is that the real is not screened off by the imaginary in the way it is under capitalism. At the place of the colonised, the symbolic and the imaginary give way because non-identity (the real of the social) is immediately inscribed in the "lived experience" (vécu) of the colonised subject. The colonised is "traversing the fantasy" (Zizek 2006a, 40–60) all the time; the void of the verb "to be" is the very content of his interpellation. The colonised is, in other words, the subject of anxiety for whom the symbolic and the imaginary never work, who is left stranded by his very interpellation.4 "Fixed" into "non-fixity," he is eternally suspended between "element" and "moment"5 – he is where the colonial symbolic falters in the production of meaning and is thus the point of entry of the real into the texture itself of colonialism. Be this

as it may, whiteness and blackness are (sustained by) determinate and **contingent practices** of signification; the "structuring relation" of colonialism thus itself comprises a knot of significations which, no matter how tight, can always be undone. **Anti-colonial** – i.e., anti-"white" –modes of struggle are not (just) "psychic" 6 but involve the "**reactivation**" (or "de-sedimentation")7 of colonial objectivity itself. No matter how sedimented (or global), colonial objectivity is not ontologically immune to antagonism. Differentiality, as Zizek insists (see Zizek 2012, chapter 11, 771 n48), immanently entails antagonism in that differentiality both makes possible the existence of any identity whatsoever and at the same time – because it is the presence of one object in another – undermines any identity ever being (fully) itself. Each element in a differential relation is the condition of possibility and the condition of impossibility of each other. It is this dimension of antagonism that the Master Signifier covers over transforming its outside (Other) into an element of itself, reducing it to a condition of its possibility.8 All symbolisation produces an ineradicable excess over itself, something it can't totalise or make sense of, where its production of meaning falters. This is its internal limit point, its real:9 an errant "object" that has no place of its own, isn't recognised in the categories of the system but is produced by it – its "part of no part" or "object small a."10 Correlative to this object "a" is the subject "stricto sensu" – i.e., as the empty subject of the signifier without an identity that pins it down.11 That is the subject of antagonism in confrontation with the real of the social, as distinct from "subject" position based on a determinate identity.

Afro-pessimism's dogmatism reifies the failures of defining static identities—blackness is reduced to incapacity which recreates violence of universality by actively refusing to understand contingency

David **Marriott 12**, "Black Cultural Studies", Years Work Crit Cult Theory (2012) 20 (1): 37-66

However, this is also not the entire story of Red, White, and Black, as I hope to show. For example, in Chapter One ('The Structure of Antagonisms'), written as a theoretical introduction, and which opens explicitly on the Fanonian question of why ontology cannot understand the being of the Black, Wilderson is prepared to say that black suffering is not only beyond analogy, it also refigures the whole of being: 'the essence of being for the White and non-Black position' is non-niggerness, consequently, '[b]eing can thus be thought of, in the first ontological instance, as non-niggerness, and slavery then as niggerness' (p. 37). It is not hard when reading such sentences to suspect a kind of absolutism at work here, and one that manages to be **peculiarly and dispiritingly dogmatic**: throughout Red, White, and Black, despite variations in tone and emphasis, there is always the desire to have black lived experience **named as the worst** and the politics of such a desire inevitably collapses into a kind of **sentimental moralism**: for the claim that 'Blackness is incapacity in its most pure and unadulterated form' means merely that **the black has to embody this abjection** without reserve (p. 38). This logic—and the denial of any kind of 'ontological integrity' to the Black/Slave due to its endless traversal by force does seem **to reduce ontology to logic**, namely, a logic **of non-recuperability**—moves through the following points: (1) Black non-being is not capable of symbolic resistance and, as such, falls outside of any language of authenticity or reparation; (2) for such a subject, which Wilderson persists in calling 'death', the symbolic remains foreclosed (p. 43); (3) as such, Blackness is the record of an occlusion which remains ever present: 'White (Human) capacity, in advance of the event of discrimination or oppression, is parasitic on Black incapacity' (p. 45); (4) and, as an example of the institutions or discourses involving 'violence', 'antagonisms' and 'parasitism', Wilderson describes White (or non-Black) film theory and cultural studies as incapable of understanding the 'suffering of the Black—the Slave' (they cannot do so because they are erroneously wedded to humanism and to the psychoanalysis of Jacques Lacan, which Wilderson takes as two examples of what the Afro-pessimist should avoid) (p. 56); as a corrective, Wilderson calls for a new language of abstraction, and one centrally concerned with exposing 'the structure of antagonisms between Blacks and Humans' (p. 68). Reading seems to stop here, at a critique of Lacanian full speech: Wilderson wants to say that Lacan's notion of the originary (imaginary) alienation of the subject is still wedded to relationality as implied by the contrast between 'empty' and 'full' speech, and so apparently cannot grasp the trauma of 'absolute Otherness' that is the Black's relation to Whites, because psychoanalysis cannot fathom the 'structural, or absolute, violence' of Black life (pp. 74; 75). 'Whereas Lacan was aware of how language ''precedes and exceeds us'', he did not have Fanon's awareness of how violence also precedes and exceeds Blacks' (p. 76). The violence of such abjection—or incapacity—is therefore that it cannot be communicated or avowed, and is always already delimited by desubjectification and dereliction (p. 77). Whence the suspicion of an ontology reduced to a logic (of abjection). Leaving aside the fact that it is quite mistaken to limit Lacan's notion of full speech to the search for communication (the unconscious cannot be confined to parole), it is clear that, according to Wilderson's own 'logic', his description of the Black is working, via analogy, to Lacan's notion of the real but, in his insistence on the Black as an absolute outside Wilderson can only duly **reify this void at the heart of universality**. The Black is 'beyond the limit of contingency'—but it is worth saying immediately that this 'beyond' is indeed a foreclosure that defines a violence whose traces can only be thought violently (that is, analogically), and whose nonbeing returns as the theme for Wilderson's political thinking of a non-recuperable abjection. The Black is

nonbeing and, as such, is more real and primary than being per se: given how much is at stake, this insistence on a racial metaphysics of injury implies a fundamental irreconcilability between Blacks and Humans (there is really no debate to be had here: irreconcilability is the condition and possibility of what it means to be Black).

Sequencing question – immunity is the nexus of antagonism and gratuitous violence – recognizing the political bases of violence is key

Warren **Montag**, Brown Family Professor of European Literature at Occidental College, **'12**

("Between Interpellation and Immunization: Althusser, Balibar, Esposito," Postmodern Culture Volume 22, Number 3, May 2012)

The work of Roberto Esposito on immunity may well appear to be inscribed in a different register than that of Althusser and Balibar. As a response to some of the theoretical problems engendered by Foucault's work on biopower, particularly that "interval of meaning which remains open in Foucault's text between the constitutive poles of the concept of biopolitics, namely biology and politics," it would seem to address the question of the appropriation of life by politics that in a certain way would allow us to **sidestep or circumvent** the question of the subject altogether. Reading Esposito in the light of the foregoing discussion, however, we cannot escape the sense that the opposition between communitas and immunitas is another way to think the constitutive aporia of the subject and the **irreducible conflict** at the heart of the notion of citizen. As Esposito demonstrates, **the concept of immunity is political before it is biological.** Communitas or community is not only not "a property belonging to subjects that joins them together," the totality to which they would pertain before their separation into individuals; it is not even a thing (the res publica) that could be substantified as that which individuals "share" or possess (Communitas 8). If we can speak of a sharing, it would be the sharing of a munus, an obligation, a debt, a tax, even the paradox of an obligatory gift, the sharing of which Esposito describes as a **lack or void.** Communitas is thus not more than the individual, but less; it does not add but subtracts and is finally the experience of destitution and expropriation (depropriazione) (6-7). Such a subject is subject of and to debt and despoliation: an outside that marks its own limit is rediscovered within, as that which **separates each subject from itself**. It is here, in a gesture whose timing in relation to the argument concerning the subject's relation to communitas as well as whose content can only remind us of Althusser, that Esposito turns to Scripture and the example not of Moses but of Paul. Even fellowship, κοινότης, in the community of the faithful, the κοινωνία, is a "taking part in" that entails a loss and a diminution, a participation in a loss of freedom that is δούλεια or slavery in Christ, in whose death one must participate (11). These, of course, are the images of subjection so total that the subjected subject is threatened with extinction, a destitution that leaves no remainder. It is in relation to the "unacceptable" as well as "unbearable" munus, in which the subject is lost to itself at the heart of the Christian communitas, that the countermovement of immunization takes place. Immunity emerges as the demand for exemption from debt, obligation, service, and above all from the shared debt of communitas, which is now experienced at the extreme as a claim on one's life and therefore as the threat of death. Every social tie becomes a threat against which the subject must be immunized by as complete a separation as possible from others whose **claims on him can be ignored with impunity** (a term closely related to immunity). Immunity evacuates the void of the munus by **emptying the common: there is nothing in common**. But the subject thus free from obligation and from the **movement of alienation and exteriorization** represented by the munus, a subject therefore restored to the self-sovereignty and self-proprietorship that community had denied it--the subject, that is, in the modern sense—can only become and remain a subject in this sense **by virtue of its subjection** to **that which will protect or immunize it against the threats to its autonomy**. The subject thus can exercise sovereignty over itself (over its life, property, and liberty) only to the extent that it is subjected or **subjects itself to the sovereign power capable of assuring its immunity**. To translate this into Althusser's idiom, there is no subject except by and through subjection. It is, at least in part, on the terrain of Hobbes's philosophy that the **link between interpellation and immunization becomes intelligible**: "the Leviathan-state coincides with the breaking [la dissociazione] of every communitarian bond, with the squelching [l'abolizione] of every social relation that is foreign to the vertical exchange of protection-obedience" (14). As Esposito argues, this state is the denial of the very possibility of relation, not only of the cum, as if human beings are originally separated and unite only secondarily, but even of the entire transindividual dimension from which the juridical individual cannot be disentangled and extricated without violence and loss and without **being deprived of that part of himself** that is in common **with others and nevertheless proper to him.** In fact, taken to its logical conclusion, which is, as Esposito notes, paradoxically a remnant of irrationality, individuals are "preserved" and "protected" **only at the cost of the very sociality** that makes their existence in a material as well as cultural sense possible: "they live in and of their refusal to live together [convivere]" (14). Every possible combination, coagulation, and

confusion in which the juridical individual might become **lost or dispersed** - or, on the contrary, might become part of a composite singularity ranging from couples, in particular (the INSERT DESCRIPTION - inline graphic or "one flesh" of the first couple--a phrase establishing that their separation could only be a tearing or laceration of the composite but irreducible body they had become), to collectivities of all kinds, whether "natural" or "artificial"-is abolished and replaced by the relation between subject and Subject. In fact, politics itself becomes prevention, not only the prevention of war, but just as importantly a prophylaxis against any exposure to others that would automatically carry the danger of transindividual contagion and a weakening of the **vertical relation of subjection**. Hence the immunitary practice that both precedes and accompanies interpellation as its simultaneous condition and result.

AT: Affirmation of Self

Their deployment of identity/social location/privilege arguments shuts down effective collective action – this reifies racism and leads to endless squabbling about authenticity

Rob 13

(the Idealist, Carleton College, JD candidate, 10/1, Tim Wise & The Failure of Privilege Discourse, www.orchestratedpulse.com/2013/10/tim-wise-failure-privilege-discourse/)

I don't find it meaningful to criticize Tim Wise the person and judge whether he's living up to some anti-racist bona fides. Instead, I choose to focus on the paradigm of "White privilege" upon which his work is based, and its conceptual and practical limitations. Although the personal is political, not all politics is personal; we have to attack **systems**. To paraphrase the urban poet and philosopher Meek Mill: there are levels to this shit. How I Define Privilege There are power structures that shape individuals' lived experiences. Those structures provide and withhold resources to people based on factors like class, disability status, gender, and race. It's not a "benefit" to receive resources from an unjust order because ultimately, injustice is cannibalistic. Slavery binds the slave, but destroys the master. So, the point then becomes not to assimilate the "underprivileged", but to instead eradicate the power structures that create the privileges in the first place. The conventional wisdom on privilege often says that it's "benefits" are "unearned". However, this belief ignores the reality and history that privilege is earned and maintained through violence. Systemic advantages are allocated and secured as a class, and simply because an individual hasn't personally committed the acts, it does not render their class dominance unearned. The history and modern reality of violence is why Tim Wise' comparison between whiteness and tallness fails. White supremacy is not some natural evolution, nor did it occur by happenstance. White folks *murdered* people for this thing that we often call "White privilege"; it was bought and paid for by blood and terror. White supremacy is not some benign invisible knapsack. The same interplay between violence and advantage is true of any systemic hierarchy (class, gender, disability, etc). Being tall, irrespective of its advantages, does not follow that pattern of violence. Privilege is Failing Us Unfortunately, I think our use of the term "privilege" is no longer a productive way for us to gain a thorough understanding of systemic injustice, nor is it helping us to develop collective strategies to dismantle those systems. Basically, **I never want to hear the word "privilege" again** because **the term is so thoroughly misused at this point that it does more harm than good.** Andrea Smith, in the essay "The Problem with Privilege", outlines the pitfalls of misapplied privilege theory. Those who had little privilege did not have to confess and were in the position to be the judge of those who did have privilege. Consequently, people aspired to be oppressed. Inevitably, those with more privilege would develop new heretofore unknown forms of oppression from which they suffered... Consequently, the goal became not to actually end oppression but to be as oppressed as possible. These rituals often substituted confession for political movement-building. Andrea Smith, The Problem with Privilege Dr. Tommy Curry says it more bluntly, "It's not genius to say that in an oppressive society there are benefits to being in the superior class instead of the inferior one. That's true in any hierarchy, that's not an 'aha' moment." Conceptually, privilege is best used when narrowly focused on explaining how structures generally shape experiences. However, when we overly personalize the problem, then privilege becomes a tit-for-tat exercise in blame, shame, and guilt. In its worst manifestations, this dynamic becomes "oppression Olympics" and people tally perceived life advantages and identities in order to invalidate one another. At best, we treat structural injustice as a personal problem, and moralizing exercises like "privilege confessions" inadequately address the nexus between systemic power and individual behavior. The undoing of privilege occurs not by individuals confessing their privileges or trying to think themselves into a new subject position, but through the creation of collective structures that dismantle the systems that enable these privileges. The activist genealogies that produced this response to racism and settler colonialism were not initially focused on racism as a problem of individual prejudice. Rather, the purpose was for individuals to recognize how they were shaped by structural forms of oppression. Andrea Smith, The Problem with Privilege Bigger than Tim Wise However, the problem with White privilege isn't simply that Tim Wise, a white man, can build a career off of Black struggles. As I've already said, White people need to talk to White people about the historical and social construction of their racial identities and power, and the foundation for that conversation often comes from past Black theory and political projects. The problem for me is that privilege work has become a cottage industry of self-help

moralizing that **in no way attacks** the systemic ills that create the personal injustices in the first place. A **substantive critique of privilege requires us to get beyond identity politics**. It's not about good people and bad people; it's a bad system. It's not just White people that participate in the White privilege industry, although not everyone equally benefits/profits (see: Tim Wise). Dr. Tommy Curry takes elite Black academics to task for their role in profiting from the White privilege industry while offering no challenge to White supremacy. These conversations about White privilege are not conversations about race, and certainly not about racism; it's a business where Blacks market themselves as racial therapists for White people… The White privilege discourse became a bourgeois distraction. It's a tool that we use to morally condemn whites for not supporting the political goals of elite black academics that take the vantages of white notions of virtue and reformism and persuade departments, journals, and presses into making concessions for the benefit of a select species of Black intellectuals in the Ivory Tower, without seeing that the white racial vantages that these Black intellectuals claim they're really interested in need to be dissolved, need to be attacked all the way to the very bottom of American society. Dr. Tommy Curry, Radio Interview The truth is that a lot of people, marginalized groups included, simply want more access to existing systems of power. They don't want to challenge and push beyond these systems; they just want to participate. So if we continue to play identity politics and persist with a personal privilege view of power, then **we will lose the struggle**. Barack Obama is president, yet White supremacy marches on, and often with his help (record deportations, expanded a drone war based on profiling, fought on behalf of US corporations to repeal a Haitian law that raised the minimum wage). Adolph Reed, writing in 1996, predicted the quagmire of identity politics in the Age of Obama. In Chicago, for instance, we've gotten a foretaste of the new breed of foundation-hatched black communitarian voices; one of them, a smooth Harvard lawyer with impeccable do-good credentials and vacuous-to-repressive neoliberal politics, has won a state senate seat on a base mainly in the liberal foundation and development worlds. His fundamentally bootstrap line was softened by a patina of the rhetoric of authentic community, talk about meeting in kitchens, small-scale solutions to social problems, and the predictable elevation of process over program — the point where identity politics converges with old-fashioned middle-class reform in favoring form over substance. I suspect that his ilk is the wave of the future in U.S. black politics. Adolph Reed Jr., Class Notes: Posing As Politics and Other Thoughts on the American Scene Although it has always been the case, Obama's election and subsequent presidency has made it starkly clear that it's not just White people that can perpetuate White supremacy. Systems of oppression condition all members of society to accept systemic injustice, and there are (unequal) incentives for both marginalized and dominant groups to perpetuate these structures. Our approaches to injustice must reflect this reality. This isn't a naïve plea for "unity", nor am I saying that talking about identities/experiences is inherently "divisive". Many of these privilege discussions use empathy to build personal and collective character, and there certainly should be space for us to work together to improve/heal ourselves and one another. People will always make mistakes and our spaces have to be flexible enough to allow for reconciliation. Though we don't have to work with persistently abusive people who refuse to redirect their behavior, there's a difference between establishing boundaries and puritanism. Fighting systemic marginalization and exploitation requires more than good character, and **we cannot fetishize personal morals over collective action**.

Ethics B4 Ontology

Ethics/language precedes ontology---black body doesn't have any fixed meaning until it's constructed in a discursive community---we aren't <u>speaking from nowhere</u>---the body can reject the ontological fixity of the white gaze

Yancy 5

I write out of a personal existential context. This context is a profound source of knowledge connected to my "raced" body. Hence, I write from a place of lived embodied experience, a site of exposure. In philosophy, the only thing that we are taught to "expose" is a weak argument, a fallacy, or someone's "inferior" reasoning power. The embodied self is bracketed and deemed irrelevant to theory, superfluous and cumbersome in one's search for truth. It is best, or so we are told, to reason from nowhere. Hence, the white philosopher/author presumes to speak for all of "us" without the slightest mention of his or her "raced" identity. Self-consciously writing as a white male philosopher, Crispin Sartwell observes: Left to my own devices, I disappear as an author. That is the "whiteness" of my authorship. This whiteness of authorship is, for us, a form of authority; <u>to speak</u> (apparently) <u>from nowhere</u>, for everyone, <u>is empowering,</u> though one wields power here only by becoming lost to oneself. But <u>such an authorship</u> and authority <u>is also pleasurable</u>: it yields the pleasure of self-forgetting or [End Page 215] apparent transcendence of the mundane and the particular, and the pleasure of power expressed in the "comprehension" of a range of materials. (1998, 6) <u>To theorize the Black body one must "turn to the [Black] body as the radix for interpreting racial experience</u>" (Johnson [1993, 600]).1 It is important to note that this particular strategy also functions as a lens through which to theorize and critique whiteness; for the Black body's "racial" experience is fundamentally linked to the oppressive modalities of the "raced" white body. **However, there is no denying that my own "racial" experiences or the social performances of whiteness can become objects of critical reflection.** In this paper, <u>my objective is to describe and theorize situations where the Black body's subjectivity, its lived reality, is reduced to instantiations of the white imaginary, resulting in what I refer to as "the phenomenological return of the Black body.</u>"2 These instantiations are embedded within and evolve out of the complex social and historical interstices of whites' efforts at self-construction through complex acts of erasure vis-à-vis Black people. These acts of self-construction, however, are myths/ideological constructions predicated upon maintaining white power. As James Snead has noted, "Mythification is the replacement of history with a surrogate ideology of [white] elevation or [Black] demotion along a scale of human value" (Snead 1994, 4). <u>How I understand and theorize the body relates to the fact that the body</u>—in this case, the Black body—is **capable of undergoing a sociohistorical process of "phenomenological return" vis-à-vis white embodiment.** <u>The body's meaning</u>—whether phenotypically white or black— <u>its ontology,</u> its modalities of aesthetic performance, its comportment, <u>its "raciated" reproduction,</u> **is in constant contestation. The hermeneutics of the body, how it is understood,** how it is "seen," **its "truth,"** is partly <u>the result of a</u> profound historical, ideological <u>construction</u>. "<u>The body" is positioned by historical practices and discourses.</u> The body is codified as this or that in terms of meanings that are sanctioned, scripted, and constituted through processes of negotiation that are embedded within and serve various ideological interests that are grounded within further power-laden social processes. <u>The</u> **historical** <u>plasticity of the body,</u> <u>the fact that it is a site of contested meanings, speaks</u> to the <u>historicity</u> of its "being" <u>as lived</u> and meant within the interstices of social semiotics. Hence: a) **the body is less of a** thing/**being than a** shifting/**changing historical meaning that is subject to** cultural configuration/**reconfiguration. The point** here **is to** interrogate the "Black body" as a "**fixed** and material **truth" that preexists** "**its** relations with **the world and with** others"3 ; b) <u>the body's meaning is</u> fundamentally **symbolic** (McDowell 2001, 301), <u>and its meaning is</u> **congealed** through **symbolic repetition** and iteration that emits certain signs and presupposes <u>certain n</u>orms; and, c) <u>the body is a battlefield,</u> one **that is fought over again and again** across particular historical moments and within particular social spaces. "In other words, **the concept of the body provides only** <u>the illusion of</u> **self-evidence**, facticity, 'thereness' for something [End Page 216] <u>fundamentally</u> ephemeral, imaginary, something made in the image of particular social groups" (301). On this score, <u>it is not only</u> the "Black body" that **defies the ontic fixity projected upon it** through the white gaze, and, hence, <u>through the episteme of</u> whiteness, but <u>the white body is also fundamentally symbolic, requiring demystification of its status as norm,</u> the paragon of

beauty, order, innocence, purity, restraint, and nobility. In other words, given the three suppositions above, both the "Black body" and the "white body" lend themselves to processes of interpretive fracture and to strategies of interrogating and removing the veneer of their alleged objectivity.

Wilderson = Reductive

Wilderson is overly reductive---he has no way to explain historical resistance to anti-blackness because his theory pigeon holes all oppression into the non-falsifiable register of psychoanalysis

Bâ 11

(Saër Maty, prof of film at Portsmouth University, The US Decentred, http://epress.lib.uts.edu.au/journals/index.php/csrj/article/view/2304/2474)

As we shall see below, blacks in the US cannot and do not have ontology, or so Wilderson argues, denying with the same breath the workability of analogy as a method, because analogy can only be a ruse. Thus, what he calls 'the ruse of analogy' grants those who fall for it, for example, 'Black film theorists' or Black academics, an opportunity to reflect on (black) cinema only after some form of structural alteration. (38) Analogy does seem tricky if one follows Wilderson's line of thought, that is, the Holocaust/Jews and slavery/Africans. Jews entered and came out of Auschwitz as Jews whereas Africans emerged from the slave ships as Blacks.2 Two types of holocaust: the first

'Human', the second 'Human and metaphysical', something which leads to Wilderson saying that 'the Jews have the Dead ... among them; the Dead have the Black among them'. (38) It bears reiterating that for Wilderson, blacks are socially and ontologically dead in the sense that the black body has been violently turned into flesh, 'ripped apart literally and imaginatively', that

it is a body vulnerably open, 'an object made available (fungible) for any subject' and 'not in the world' or civil society the way white bodies are. (38)¶ Furthermore, Wilderson argues that differences between black and white ethical dilemmas separate them dialectically into incompatible zones. As illustration Wilderson reflects on black women suffering in US prisons in the 1970s and then juxtaposes the suffering with white women's concurrent public preoccupations in civil society. For example, the violence and neglect underwent by Safya Bukhari- Alston3 in solitary confinement at the Virginia Correctional Center for Women is linked to the similar plight of another black woman, Dorothy, in Haile Gerima's Bush Mama (1977) before Wilderson questions what both situations mean in relation to images of '[w]hite women burning bras in Harvard Square ... marching in ... Manhattan campaigning for equal rights'. (135) Wilderson's answer is that the images of female black pain and white

activism are irreconcilable precisely because they cannot be read against one another without such an exercise appearing intellectually sloppy. However, he does not develop this point preferring instead to examine suffering through 'a libidinal economy' (131) leading, predictably, to the conclusion that white radicalism, white political cinema and white supremacy are one and the same thing. Most unfortunate though inevitable is the reason Wilderson gives to justify this: a so-called 'anti-Blackness' that, ¶ [wilderson quote begins]¶ as opposed to white apathy, is necessary to White political radicalism and to White political cinema because it sutures affective, emotional, and even ethical solidarity between the ideological polar extremes of Whiteness. This necessary anti-Blackness erects a structural prohibition that one sees in White political discourse and in White political cinema. (131) [wilderson quote ends]¶ undamentally, the first three chapters of Red, White and Black are concerned with what it takes to think blackness and agency together ethically, or to permit ourselves intellectual mindful reflections upon the homicidal ontology of chattel slavery. Wilderson posits ways through which 'the dead' (blacks) reflect on how the living can be put 'out of the picture'. (143) There seems to be no let off or way out for blacks ('The Slave') in Wilderson's logic, an energetic and rigorous, if unforgiving and sustained, treadmill of damning analysis to which 'Indians'

('The "Savage"'/'The Red') will also be subjected, first through '"Savage" film' analysis.¶ <cont>¶ And yet Wilderson's highlighting is problematic because it overlooks the 'Diaspora' or 'African Diaspora', a key component in Yearwood's thesis that, crucially, neither navel-gazes (that is, at the US or black America) nor pretends to properly engage with black film. Furthermore, Wilderson separates the different waves of black film theory and approaches them, only, in terms of how a most recent one might challenge its precedent. Again, his approach is problematic because it does not mention or emphasise the inter-connectivity of/in black film theory. As a case in point, Wilderson does not link Tommy Lott's mobilisation of Third Cinema for black film theory to Yearwood's idea of African Diaspora. (64) Additionally, of course, Wilderson seems unaware that Third Cinema itself has been fundamentally questioned since Lott's 1990s' theory of black

film was formulated. Yet another consequence of ignoring the African Diaspora is that it exposes Wilderson's corpus of films as unable to carry the weight of the transnational argument he attempts to advance. Here, beyond the US-centricity or 'social and political specificity of [his] filmography', (95) I am talking about Wilderson's choice of films. For example, Antwone Fisher (dir. Denzel Washington, 2002) is attacked unfairly for failing to acknowledge 'a grid of captivity across spatial dimensions of the Black "body", the Black "home", and the Black "community"' (111) while films like Alan and Albert Hughes's Menace II Society (1993), overlooked, do acknowledge the same grid and, additionally, problematise Street Terrorism Enforcement and Prevention Act(STEP) policing. The above examples expose the fact of Wilderson's dubious and questionable conclusions on black film.¶ Red, White and Black is particularly undermined by

Wilderson's propensity for exaggeration and blinkeredness. In chapter nine, '"Savage" Negrophobia', he writes ¶ [wilderson quote begins]¶ The philosophical anxiety of Skins is all too aware that through the Middle Passage, African culture became Black 'style' ... Blackness can be placed and displaced with limitless frequency and across untold territories, by whoever so chooses. Most important, there is nothing real Black people can do to either check or direct this process ... Anyone can say 'nigger' because anyone can be a 'nigger'. (235)7¶ [wilderson quote ends] ¶ Similarly, in chapter ten, 'A Crisis in the Commons', Wilderson

addresses the issue of 'Black time'. Black is irredeemable, he argues, because, at no time in history had it been deemed, or deemed through the right historical moment and place. In other words, the black moment and place are not right because they are 'the ship hold of the Middle Passage': 'the most coherent temporality ever deemed as Black time' but also 'the "moment" of no time at all on the map of no place at all'. (279)¶ Not only does Pinho's more mature analysis expose this point as preposterous (see below), I also wonder what Wilderson makes of the countless historians' and sociologists' works on slave ships, shipboard insurrections and/during the Middle Passage,8 or of groundbreaking jazz-studies books on cross-cultural dialogue like The Other Side of Nowhere (2004). Nowhere has another side, but once Wilderson theorises blacks as socially and ontologically dead while dismissing jazz as 'belonging nowhere and to no one, simply there for the taking', (225) there seems to be no way back. It is therefore hardly surprising that Wilderson ducks the need to provide a solution or alternative to both his sustained bashing of blacks and anti- Blackness.9 Last but not least, Red, White and Black ends like a badly plugged announcement of a bad Hollywood film's badly planned sequel: 'How does one deconstruct life? Who would benefit from such an undertaking? The coffle approaches with its answers in tow.' (340)

AT: Libidinal Economy

Their insidious targeting arg relies on the libidinal economy which is wrong and cannot be the foundation for ethics or the political

Gordon 1

(Paul, psychotherapist living and working in London **Psychoanalysis and Racism**: The politics of defeat Race & Class v. 42, n. 4)

The postmodernists' problem is that they cannot live with disappointment. All the tragedies of the political project of emancipation ± the evils of Stalinism in particular ± are seen as the inevitable product of men and women trying to create a better society. But, rather than engage in a critical assessment of how, for instance, radical political movements go wrong, they discard the emancipatory project and impulse itself. The postmodernists, as Sivanandan puts it, blame modernity for having failed them: `the intellectuals and academics have fled into discourse and deconstruction and representation ± as though to interpret the world is more important than to change it, as though changing the interpretation is all we could do in a changing world'.58 To justify their flight from a politics holding out the prospect of radical change through self-activity, the disappointed intellectuals and abundant intellectual alibis for themselves in the very work they champion, including, in Cohen's case, psychoanalysis. What Marshall Berman says of Foucault seems true also of psychoanalysis; that it offers `a world-historical alibi' for the passivity and helplessness felt by many in the 1970s, and that it has nothing but contempt for those naive enough to imagine that it might be possible for modern human-kind to be free. At every turn for such theorists, as Berman argues, whether in sexuality, politics, even our imagination, we are nothing but prisoners: there is no freedom in Foucault's world, because his language forms a seamless web, a cage far more airtight than anything Weber ever dreamed of, into which no life can break . . . There is no point in trying to resist the oppressions and injustices of modern life, since even our dreams of freedom only add more links to our chains; however, once we grasp the futility of it all, at least we can relax.59 Cohen's political defeatism and his conviction in the explanatory power of his new faith of psychoanalysis lead him to be contemptuous and dismissive of any attempt at political solidarity or collective action. For him, `communities' are always `imagined', which, in his view, means based on fantasy, while different forms of working-class organisation, from the craft fraternity to the revolutionary group, are dismissed as `fantasies of self-sufficient combination'.60 In this scenario, the idea that people might come together, think together, analyse together and act together as rational beings is impossible. The idea of a genuine community of equals becomes a pure fantasy, a `symbolic retrieval' of something that never existed in the first place: `Community is a magical device for conjuring something apparently solidary out of the thin air of modern times, a mechanism of re-enchantment.' As for history, it is always false, since `We are always dealing with invented traditions.'61 Now, this is not only non- sense, but dangerous nonsense at that. Is history `always false'? Did the Judeocide happen or did it not? And did not some people even try to resist it? Did slavery exist or did it not, and did not people resist that too and, ultimately, bring it to an end? And are communities always `imagined'? Or, as Sivanandan states, are they beaten out on the smithy of a people's collective struggle? Furthermore, all attempts to legislate against ideology are bound to fail because they have to adopt `technologies of surveillance and control identical to those used by the state'. Note here the Foucauldian language to set up the notion that all `surveillance' is bad. But is it? No society can function without surveillance of some kind. The point, surely, is that there should be a public conversation about such moves and that those responsible for implementing them be at all times accountable. To equate, as Cohen does, a council poster about `Stamping out racism' with Orwell's horrendous prophecy in 1984 of a boot stamping on a human face is ludicrous and insulting. (Orwell's image was intensely personal and destructive; the other is about the need to challenge not individuals, but a collective evil.) Cohen reveals himself to be deeply ambivalent about punitive action against racists, as though punishment or other firrm action against them (or anyone else transgressing agreed social or legal norms) precluded `understand- ing' or even help through psychotherapy. It is indeed a strange kind of `anti-racism' that portrays active racists as the `victims', those who are in need of `help'. But this is where Cohen's argument ends up. In their move from politics to the academy and the world of `discourse', the postmodernists may have simply exchanged one grand narrative, historical materialism, for another, psychoanalysis.62 For psychoanalysis is a grand narrative, par excellence. It is a theory that seeks to account for the world and which recognises few limits on its explanatory potential. And the claimed radicalism of psycho- analysis, in the hands of the postmodernists at least, is not a radicalism at all but a prescription for a politics of quietism, fatalism and defeat. Those wanting to change the world, not just to interpret it, need to look elsewhere.

Impact Defense

AT: social death

Their politics is the wrong way to deal with social exclusion – resurrection from social death within soviereign spaces gets coopted and fails

Christopher **Peterson**, 20**07**, *Kindred Specters, Death, Mourning, and American Affinity*, University of Minnesota Press 2007

That Americanist literary criticism on the subject of mortality remains **implicated in the larger cultural disavowal** of dying suggests that we ought to reassess our critical energies, particularly as these powers are enlisted to address how American political ideology produces the "death" of racial and sexual others. Indeed, I would argue that such criticism **remains invested** - despite all claims to the contrary - **in an American exceptionalist project.** American exceptionalism names, in part, a **fetishization of novelty and futurity** that initially defined America against an ostensibly decaying and moribund Europe. As David Noble has argued, the doctrine of exceptionalism excluded America from "the human experience of birth, death, and rebirth" by figuring Europe in terms of time and America in terms of timeless space." If, as George Berkeley put it, America is "time's noblest offspring," history gives birth to its final progeny in order that the latter might escape time altogether. America thus becomes **eternally present** while "Europe breeds in her decay." If the "new world" qua new must deny mortality, then reanimating the excluded from within the terms of a dialectical reversal renews rather than dismantles the American exceptionalist project. Challenging the ideology of American exceptionalism is particularly crucial for a post-9/11 politics that aims to resist the transformation of American exposure to injury and death into a newly reconsolidated sense of innocence and immortality. As Donald Pease has argued, 9/11 transformed "virgin land" into "ground zero," effecting an ideological shift from a "secured innocent nation to a wounded, insecure emergency state."16 Drawing from the work of Giorgio Agamben. Pease describes the emergency state as a nation that - by exempting itself from its own democratic rules of free speech, due process, and above all, the rules of war - marks a division between those whom the state protects from injury and those whom the state is free to injure and kill with impunity (13). The reduction of the Arab other to that which cannot be killed because it is already dead works to cover over the wound that ground zero opens up under the surface of virgin land. The emergency state (or what Agamben calls the "state of exception") thus also names a nation that attempts to except itself from the universal condition of mortality. As Bauman notes, "if mortality and transience are the norm among humans, durability may be attained only as an exception" (67, his emphasis).

Their historical reading is wrong

Vincent **Brown**, Prof. of History and African and African-American Studies @ Harvard Univ., December 20**09**, "Social Death and Political Life in the Study of Slavery," American Historical Review, p. 1231-1249

THE PREMISE OF ORLANDO PATTERSON'S MAJOR WORK, that enslaved Africans were natally alienated and culturally isolated, was challenged even before he published his influential thesis, primarily by scholars concerned with "survivals" or "retentions" of African culture and by historians of slave resistance. In the early to mid-twentieth century, when Robert Park's view of "the Negro" predominated among scholars, it was generally assumed that the slave trade and slavery had denuded black people of any ancestral heritage from Africa. The historians Carter G. Woodson and W. E. B. Du Bois and the anthropologist Melville J. Herskovits argued the opposite. Their research supported the conclusion that while enslaved Africans could not have brought intact social, political, and religious institutions with them to the Americas, they did maintain significant aspects of their cultural backgrounds.32 Herskovits ex- amined "Africanisms"—any practices that seemed to be identifiably African—as useful symbols of cultural survival that would help him to analyze change and continuity in African American culture.33 He engaged in one of his most heated scholarly disputes with the sociologist E. Franklin Frazier, a student of Park's, who empha- sized the damage wrought by slavery on black families and folkways.34 More recently, a number of scholars have built on Herskovits's line of thought, enhancing our understanding of African history during the era of the slave trade. Their studies have evolved productively from assertions about general cultural heritage into more precise demonstrations

of the continuity of worldviews, categories of belonging, and social practices from Africa to America. For these scholars, the preservation of distinctive cultural forms has served as an index both of a resilient social personhood, or identity, and of resistance to slavery itself. 35 Scholars of slave resistance have never had much use for the concept of social death. The early efforts of writers such as Herbert Aptheker aimed to derail the popular notion that American slavery had been a civilizing institution threatened by "slave crime."36 Soon after, studies of slave revolts and conspiracies advocated the idea that resistance demonstrated the basic humanity and intractable will of the enslaved—indeed, they often equated acts of will with humanity itself. As these writ- ers turned toward more detailed analyses of the causes, strategies, and tactics of slave revolts in the context of the social relations of slavery, they had trouble squaring abstract characterizations of "the slave" with what they were learning about the en- slaved.37 Michael Craton, who authored Testing the Chains: Resistance to Slavery in the British West Indies, was an early critic of Slavery and Social Death, protesting that what was known about chattel bondage in the Americas did not confirm Patterson's definition of slavery. "If slaves were in fact 'generally dishonored,' " Craton asked, "how does he explain the degrees of rank found among all groups of slaves—that is, the scale of 'reputation' and authority accorded, or at least acknowledged, by slave and master alike?" How could they have formed the fragile families documented by social historians if they had been "natally alienated" by definition? Finally, and per- haps most tellingly, if slaves had been uniformly subjected to "permanent violent domination," they could not have revolted as often as they did or shown the "varied manifestations of their resistance" that so frustrated masters and compromised their power, sometimes "fatally."38 The dynamics of social control and slave resistance falsified Patterson's description of slavery even as the tenacity of African culture showed that enslaved men, women, and children had arrived in the Americas bearing much more than their "tropical temperament." The cultural continuity and resistance schools of thought come together pow- erfully in an important book by Walter C. Rucker, The River Flows On: Black Re- sistance, Culture, and Identity Formation in Early America. In Rucker's analysis of slave revolts, conspiracies, and daily recalcitrance, African concepts, values, and cul- tural metaphors play the central role. Unlike Smallwood and Hartman, for whom "the rupture was the story" of slavery, Rucker aims to reveal the "perseverance of African culture even among second, third, and fourth generation creoles."39 He looks again at some familiar events in North America—New York City's 1712 Coromantee revolt and 1741 conspiracy, the 1739 Stono rebellion in South Carolina, as well as the plots, schemes, and insurgencies of Gabriel Prosser, Denmark Vesey, and Nat Turner—deftly teasing out the African origins of many of the attitudes and actions of the black rebels. Rucker outlines how the transformation of a "shared cultural heritage" that shaped collective action against slavery corresponded to the "various steps Africans made in the process of becoming 'African American' in culture, orientation, and identity."40

Social death is an incorrect homogenization of the past AND reifies colonial power relations by placing European whiteness at the center of symbolic examination

Walker 12

(Tracey, Birkbeck University Masters in Psychosocial Studies, "The Future of Slavery: From Cultural Trauma to Ethical Remembrance", Graduate Journal of Social Science, 9.2, July, JSTOR)

To argue that there is more to the popular conception of slaves as victims who experienced social death within the abusive regime of transatlantic slavery is not to say that these subjectivities did not exist. When considering the institution of slavery we can quite confidently rely on the assumption that it did indeed destroy the self-hood and the lives of millions of Africans. Scholar Vincent Brown (2009) however, has criticised Orlando Patterson's (1982) seminal book Slavery and Social Death for positioning the slave as a subject without agency and maintains that those who managed to dislocate from the nightmare of plantation life 'were not in fact the living dead', but 'the mothers of gasping new societies' (Brown 2009, 1241). The Jamaican Maroons were one such disparate group of Africans who managed to band together and flee the Jamaican plantations in order to create a new mode of living under their own rule. These 'runaways' were in fact 'ferocious fighters and master strategists', building towns and military bases which enabled them to fight and successfully win the war against the British army after 200 years of battle (Gotlieb 2000,16). In addition, the story of the Windward Jamaican Maroons disrupts the phallocentricism inherent within the story of the slave 'hero' by the very revelation that their leader, 'Queen Nanny' was a woman (Gotlieb 2000). As a leader, she was often ignored by early white historians who dismissed her as an 'old hagg' or 'obeah' woman (possessor of evil magic powers) (Gotlieb 2000, xvi). Yet, despite these negative descriptors, Nanny presents an interesting image of an African woman in the time of slavery who cultivated an exceptional army and used psychological as well as military force against the English despite not owning sophisticated weapons (Gotlieb 2000). As an oral tale, her story speaks to post-slavery generations through its representation of a figure whose gender defying acts challenged the patriarchal fantasies of the Eurocentric imaginary and as such 'the study of her experiences might change the lives of people living under paternalistic, racist, classist and gender based oppression' (Gotlieb 2000, 84). The label of 'social death' is rejected here on the grounds that it is a narrative which is positioned from the vantage point of a European hegemonic ideology. Against the social symbolic and its gaze, black slaves were indeed regarded as non-humans since their lives were stunted, diminished and deemed less valuable in comparison to the Europeans.

However, Fanon's (1967) assertion that 'not only must the black man be black; he must be black in relation to the white man' (Fanon 1967, 110) helps us to understand that this classification can only have meaning relative to the symbolic which represents the aliveness of whiteness against the backdrop of the dead black slave (Dyer 1997). Butler (2005) makes it clear that the 'death' one suffers relative to the social symbolic is imbued with the fantasy that having constructed the Other and interpellated her into 'life', one now holds the sovereignty of determining the subject's right to live or die: this death, if it is a death, is only the death of a certain kind of subject, one that was never possible to begin with, the death of the fantasy of impossible mastery, and so a loss of what one never had, in other words it is a necessary grief (Butler 2005, 65). The point to make here is that although the concept of social death has proved useful for theorists to describe the metaphysical experience of those who live antagonistically in relation to the social symbolic, it is nevertheless a colonial narrative within which the slaves are confined to a one dimensional story of terror. In keeping with Gilroy's (1993b) argument that the memory of slavery must be constructed from the slaves' point of view, we might instead concentrate, not on the way in which the slaves are figured within the European social imaginary, but on how they negotiated their own ideas about self and identity. We might therefore find some value in studying a group like the Maroons who not only managed to create an autonomous world outside of the hegemonic discourse which negated them, but also, due to their unique circumstances, were forced to create new modes of communication which would include a myriad of African cultures, languages and creeds (Gottlieb 2000). This creative and resistive energy of slave subjectivity not only disrupts the colonial paradigm of socially dead slaves, but also implies the ethical tropes of creation, renewal and mutual recognition. In contrast, the passive slave proved to feature heavily in the 2007 bicentenary commemorations causing journalist Toyin Agbetu to interrupt the official speeches and exclaim that it had turned into a discourse of freedom engineered mostly by whites with stories of black agency excluded8.

Young's argument that 'one of the damaging side effects of the focus on white people's role in abolition is that Africans are represented as being passive in the face of oppression', appears to echo the behaviour in the UK today given that a recent research poll reveals that the black vote turnout is significantly lower than for the white majority electorate and that forty percent of second generation 'immigrants' believe that voting 'doesn't matter'.9 Yet, Gilroy (1993a) argues that this political passivity may not simply be a self fulfilling prophecy, but might allude to the 'lived contradiction' of being black and English which affects one's confidence about whether opinions will be validated in a society that, at its core, still holds on to the fantasy of European superiority (Gilroy 1993a). Without considering the slaves' capacity for survival and their fundamental role in overthrowing the European regime of slavery, we limit the use–value of the memory and risk becoming overly attached to singular slave subjectivities seeped in death and passivity. The Maroons story how-ever, enables slave consciousness to rise above the mire of slavery's abject victims and establishes an ethical relation with our ancestors who lived and survived in the time of slavery.

AT: Wilderson Humanism – Tuch

Blackness is not the experience of social death---their very articulation of their critique proves that the concept of humanity is malleable and not subject to closure

Steven A. **Tuch 7**, professor of sociology, GWU and * Yoku Shaw-Taylor. The Other African Americans: Contemporary African and Caribbean Immigrants in the United States

Accompanying the expansion of counmes whose consolidation became known as Europe were emerging differences in the order of knowledge through which human beings were classified. As scholars such as V. Y. Mudimbe (1988). Oyèrónké Oyewùmí (1997). and Cor nd West (2002) have shown, drawing upon the resources of archaeo logical and genealogical poststructuralism, the emergence of systematic forms of inquiry premised upon white supremacy as the basis of human normality resulted in notions of deviation that structured black people in a derivative relationship with whites. In other words, a link between the formation of knowledge and processes of inquiry, on the one hand, and mechanisms of power and the effecting of new and differentiating forms of life/identities, on the other, emerged with their correlative subjectivities. From aesthetic criteria for human beauty to measurements of intelligence, blacks became the comparison model of deviation instead of ever serving as the standard. Even worse, the very production of their classification—as blacks at the least. "niggers" at worst — was a function of a logic that was not their own: blacks are, in other words, as Franiz Fanon (1967) declared, white constructions.¶ The account suffers, however, in that it **simply declares the** conditions for the **emergence of certain** forms of **phenomena: it does not articulate the lived reality** of such phenomena, especially in terms of the consciousness that experiences them. For even such a consciousness would be subjected to discursive determinations of its emergence: it would, in other words, be accepted if, and only if, theorized from its outside, that is, in terms of what constitutes it as such. So meaning, form, definition, and determination cannot make sense inside of things. **Given the conceptual work brought to bear in making things meaningful, there is always an outside, public, hence social, dimension to the constitution of meaning. We should thus study not the essence of the thing but how such an essence is formed**. A problem is raised, however. by a thing that is capable of raising such questions, a thing that can raise the question of its own meaning and subjectivity. In effect, it subjects itself, or is able to raise the problem of its existence to itself. This means that it faces a paradox: in the face of the rejection of an inner logic of the self, it poses the question of itself as an external matter from inside of itself This rather complex development amounts to saying that the thing in question is not fully a thing. It is a human being.¶ **The human being poses a challenge to mechanisms of** discursive **closure**. This means that there is always a world of relations of subjectiv ities and intersubjectivities. of a shared experience of meanings that are both given and being made. This dialectical relationship of subjection and intersubjectivity is a manifestation of what is often called agency. That human beings are aware of. or have to interpret and even appre hend. their situations means that the archaeological and genealogical accounts of the constitution of racialized forms of life tell only a part of the story. Missing. as well, are the varieties of ways subjects of racism live in their historical and everyday social situations. That they live a constant struggle for the assertion of their humanity means that social lines are constantly challenged. expanded. and retracted, and in their course, a more dialectical story unfolds.¶ The DuBoisian concept of double consciousness is a case in point. In one instance. It is simply an effect of the system— blacks seeing them selves as seen by the dominating perspectives and resources of mean ing in an antiblack racist society. On the other hand. as Paget Henry (2005) points out, there is palentiated double consciousness, where there is realization of the false, universalistic claims of the system of oppression, where blacks realize that the reality of injustice posed as justice in a racist system hides the racism as racism by (as DuBois [1898. 19031 also observed) making black people into problems instead of engaging black people as people facing problems. The latter expec tation requires an admission of a social relationship between blacks and nonbiacks. in short, the reality of intersubjective or shared participation in the constitution of meaning in the world.¶ That black people have posed much difficulty for the modern world is a sign of a healthy consciousness. **It means a refusal to submit to at tempts of human erasure**. It is not that all black individuals subscribe to such resistance. It is simply sufficient that enough resistance has existed from the start of racialized slavery in the sixteenth century to **make the** anthropological **question of what it is to be a human being a constantly unfolding discourse and material praxis** of the modern age. For black people, the concrete formulation is the reduction of blacks to forms of inert labor, as labor without a point of view, as property. Even for many freed

blacks, the institutional imposition of labor with black ness mearn a constant struggle for the assertion of claimed freedom in a world that had no room for blacks to have leisure time: to be black and not laboring amounted to an illicit laziness. But even more, the plethora of lines drawn against human assertion meant a constant struggle against illegitimate being. Any category of social life becomes stained with indiscretion in black form; how does one "live" when one lacks a right to exist?

AT: Social Death/Contemporary Slavery Impact

Their ontological account of social death is wrong—the focus on gratuitous violence is ahistorical and equates all conditions

Nadine **Ehlers**, Professor, School of Social Sciences, Media, and Communication Faculty of Law, Humanities, and Arts University of Wollongong, **12** ["Racial Imperatives: Discipline, Performativity, and Struggles against Subjection," p. 9-12, footnote from p. 145]

While I deploy these terms for analytic convenience, the study pivots on the desire to make dear tbe false homogeneity of subjects that are denoted by these terms and the arbitrariness of race per se. In the same moment that I employ these terms as critical tools of analysis, then, I hope to expose the mechanisms of their production and mark possibilities for their rearticulation. The final portion of this study is concerned with examining what forms of agency and resistance are possible within the context of this binary construction of black and white identities. Guiding this analysis is the question of how individuals struggle against subjection and how racial norms might be recited in new directions, given that the coercive demands of discipline and performative constraints make it seem like race is an insurmountable limit or closed system. **That race operates as a limit appears particularly so for black subjects.** For despite the fact that all subjects are produced and positioned within and by the discursive formations of race, the impact of that positioning and what it means for experience is markedly different. Black subjects are situated within an antiblack context where the black body/self continues to be torn asunder within the relations of civil society. This means that, as Yancy (2008, 134 n. n) insists, " the capacity to imagine otherwise is seriously truncated by ideological and material forces that are systematically linked to the history of white racism!' A number of scholars have examined these realities and advanced critical accounts of what they identify as the resulting condition of black existence. David Marriot, for instance, argues that "the occult presence of racial slavery" continues to haunt our political and social imagination: "nowhere, but nevertheless everywhere, a dead time which never arrives and does not stop arriving" (2007, xxi). Saidiya Hartman, in her provocative Lose Your Mother: A journey Along the Atlantic Slave Route (2007) refers to this haunting as slavery's afterlife. She insists that we do not live with the residue or legacy of slavery but, rather, that slavery lives on. It 'survives' (Sexton 2010, 15), through what Loic Wacquant (2002, 41) has identified as slavery's fu nctional surrogates: Jim Crow, the ghetto, and the prison. For Hartman, as echoed by other scholars, slavery has yet to be undone: Black lives are still imperiled and devalued by a racial calculus and a political arithmetic that were entrenched centuries ago. This is the afterlife of slavery- skewed life chances, limited access to health and education, premature death, incarceration, and impoverishment. I, too, am the afterlife of slavery. (2007, 6) Frank B. **Wilderson** III, in his Red, White, and Black: Cinema and the Structures of U.S. Antagonisms (2009), powerfully frames slavery's afterlife as resulting in a form of **social death** for black subjects and, more than this, he argues that black subjectivity is constituted as **ontological death**. For Wilderson, " the Black [is] a subject who is always already positioned as Slave" (2009, 7) in the United States, while everyone else exists as "Masters" (2009, 10).8 Studies of slavery's afterlife and the concept of social death have inarguably made essential contributions to understandings of race.9 The strengths of such analyses lie in the salient ways they have theorized broad social systems of racism and how they have demanded the foregrounding of suffering, pain, violence, and death. Much of this scholarship can be put or is productively in conversation with Foucault's account ofbiopolitics that, as I noted earlier, regulates at the level of the population. Where sovereignty 'took life and let live,' in the contemporary sphere biopolitics works to 'make live.' However, certain bodies are not in the zone of protected life, are indeed expendable and subjected to strategic deployments of sovereign power that 'make die.' It is here that Foucault positions the function of racism. It is, he argues, "primarily a way of introducing a break into the domain of life that is under power's control: the break between what must live and what must die" (2003b, 254). Thus, certain bodies/subjects are killed - or subjected to sovereign power and social death- so that others might prosper. 10 In Scenes of Subjection: Terror, Slavery, and Self-Making in Nineteenth-Century America (1997), Hartman examines the 'must die' imperative of social death understood broadly as a lack of social being-but she also illuminates how, within such a context, slave "performance and other modes of practice . .. exploit[ed), and exceed[ed] the constraints of domination" (1997, 54, my emphasis). Hartman analyzes quotidian enactments of slave agency to highlight practices of "(counter)investment" (1997, 73) that produced "a reconstructed self that negates the dominant terms of identity and existence" (1997, 72). 11 She thus argues that a form of agency is possible and that, while "the conditions of domination and subjugation determine what kinds of actions are possible or effective" (1997, 54), **agency is not reducible to these conditions** (1997, 55).'2 The questions that I ask in this analysis travel in this direction, and aim to build on this aspect of Hartman's work. In doing so I make two key claims: first, that despite undeniable historical continuities and structural d)'namics, race is also marked by discontinuity; and second, race is constantly reworked and transformed within relations of power **by subjects**. 13 **For Vincent**

Brown, a historian of slavery, "violence, dislocation, and death actually generate politics, and consequential action by the enslaved" (2009, 1239) . He warns that focusing on an overarching condition or state potentially **obscures seeing these politics**. More than this, however, **it risks positioning relations of power as totalizing and transhistorical**, and it risks essentializing experience or the lived realities of individuals. **14** I scale down to the level of the subject to analyze both (a) how subjects are formed, and (b) how subjects – black and white alike – have struggled against conditions in ways that refuse totalizing, immutable understandings of race. This book does not seek to mark a condition or situa tion then, but instead takes up Brown's challenge (made within the context of studies of slavery) to pay attention to efforts to remake condition. Looking to those efforts to remake condition and identity grapples with the microphysics of power and the practices of daily life, enacted by individuals and i11 collective politics, to consider what people do with situations: those dynamic, innovative contestations of (a never totalizing) power. Echoing the call raised by Brown (2009, 1239), my work focuses then on "examining ... social and political lives **rather than assuming** … **lack of social being**" in order to think about how subjects can and have "made a social world out of death itself" (Brown 2009, 1233) or how, more generally, race can be reconfigured within the broader workings of what I am calling racial discipline and performative imperatives. But in addressing the quotidian and those efforts to remake condition and identity, this study insists on a shift in perspective in terms of how power is thought about. As I have remarked, I am not focused on biopolitics or what can be seen as solely sovereign forms of power that are deployed to condition who will live and who will die. Instead, I am concerned with disciplinary power, which is articulated simultaneously but at a different level to biopolitics (and despi te the exercise of sovereign forms of power} (Foucault 2003a, 250). For Foucault, this form of **power is not absolute**, nor does it exist in opposition to resistance. Rather, power is seen as always fragmentary and incoherent, and power and resistance are seen as mutually constitutive. Disciplinary power is productive, in that it generates particular capacities and forms of subjectivity (and, necessarily, agency). And finally, **though subjects are formed in power, they are not reducible to it, not determined by power**. [BEGIN ENDNOTE] 14. Historian Vincent Brown, in his "Social Death and Political Life in the Study of Slavery" (2009), has examined a number of scholars who seemingly take up such a viewpoint, in that they broadly position blackness as a totalizing state that, historically and in the present, renders slavery synonymous with social death and blackness/// as always already synonymous with slavery. Brown focuses specifically on the academic uptake and what he sees as the problematic distillation and extension of Orlando Patterson's (1981) concept of"slavery as social death;' where social death indicates a lack of social being. As a scholar of slavery, Brown is most concerned with examining the limitations of this idea in relation to the enslaved, but he is also interested in how the idea is used in relation to the present. For Brown, **Patterson's "slavery as social death," and contemporary usages of this concept to account for the present, advance a troubling transhistorical characterization of slavery** He argues in line with I-Ierman Bennett (quoted in Brown 1009, 1133), who has observed: As the narrative of the slave experience, soclardeath assumes a uniform African, slave, and ultimately black subject rooted in a static New World history whose logic originated in being property and remains confined to slavery. It absorbs and renders exceptional evidence that underscores the contingent nature of experience and consciousness. Thus, normative assumptions about the experiences of peoples of African descent assert a timeless, ahistorical, epiphenomenal "black" cultural experience.

[END ENDNOTE]

Sexual Power/ID = Heteronorm

Ontologizing sexual power and identity as a lens for worldly phenomena reproduces binary discourses end elides difference, reproducing heteronormativity.

Prasad '12

(Ajnesh, Australian School of Business, "Beyond analytical dichotomies," Human Relations May 2012 vol. 65 no. 5 567-595)

A poststructuralist critique At the most rudimentary level, poststructuralism may be typified by what Lyotard (1984) famously expressed as its **incredulity towards metanarratives** (also see Alvesson and Deetz, 1999; Kilduff and Mehra, 1997), or what Fraser and Nicholson (1997) describe as grand theorizing of social macrostructures. Akin to other critical traditions, it is 'explicitly historical, attuned to the cultural specificity of different societies and periods and . . . inflected by temporality, with historically specific institutional categories' (Fraser and Nicholson, 1997: 143–4). The aim of the poststructuralist mandate is to critique metanarratives and, from there, to define human consciousness and social existence through engagements with contextualized subjectivity (Agger, 1991).11 To appreciate this idea, it is important to understand how metanarratives are problematically situated within, and are informed by, socially constructed identity binaries, be they along the fault lines of gender (e.g. Butler, 1990; Hird, 2000), race (e.g. Gilroy, 2000; Miles and Torres, 2007), or sexuality (e.g. Zita, 1994). Indeed, poststructuralist critique, such as Derrida's conjecture of difference (Mumby and Putnam, 1992), illustrates how the preservation of the privileged identity ('white', 'man', 'heterosexual') is existentially dependent upon a corresponding relegated identity ('black', 'woman', 'homosexual') (see Tyler and Cohen, 2008); or, to posit it in Butlerian (1991) phrasing, heterosexuality presumes the being of homosexuality. Working from the same current, Harding (2003) extends this idea through consideration of the central dyadic relationship in management; she notes that every individual in the western workforce is identified as a worker or as a manager and that the identity of the latter is **wholly contingent upon the binary existence of the former**. Elsewhere, again assuming a poststructuralist position, Harding (2008: 44; emphasis in original) explains that identities '**cannot be resolved into an essence or into a coherent whole'**; rather, they are 'post hoc impositions of a seemingly unified [label] upon a disparate and disconnected popul-ation'. As such, the central aim of the poststructuralist is to repudiate deterministic and binary logic by drawing attention to the discursive processes that culturally (re)produce social realities and the dichotomous modes of thinking embedded within them (Butler, 1990; Calas, 1993). [T]he ways in which sex was put into Western discourse from the end of the 16th century onwards, the proliferation of sex during the 18th century and the modern incitement to discuss sex in endless detail have simultaneously established heterosexuality as the unassailable norm and constituted other sexualities as abnormal. Tangentially related to the Foucauldian reading of sexuality, Katz (2004) offers a genealogical investigation into how heterosexuality was invented and came to be ideologically defined from the late 19th-century onwards. Katz writes that because 'the concept of heterosexuality is **only one particular historical way** of perceiving, categorizing, and imagining the social relations of the sexes', it ought to be studied with the purposeful aim to **dislocate its socio-cultural privilege** as being the 'normal' and the 'natural' form of sexual expression (p. 69). Given its socially manifest 'nature', Butler (1991, 1993) contends that heterosexuality is perpetually at risk and must continually engage in a set of repetitive, or what she calls parodic, practices – such as, heterosexual sex – which functions to stringently affirm the hegemonic ideals of femininity (passive) and masculinity (active). Incidentally, the very redundancy of these parodic practices function to consolidate the discursive authority and cultural stability of heterosexuality (Butler, 1991; see also Butler's [1993] writing on 'performativity'). A related stream of poststructuralist-inflected scholarship reveals how **sexual identities that are predicated on ontological sexual difference produce heteronormativity**, which can be described as the 'the normative idealization of heterosexuality' (Hird, 2004: 27) or '**the centrality of heterosexual norms in social relations**' (Pringle, 2008: S111). While feminists have long critiqued the tacit and the explicit claims of ontological sexual difference, essentialist definitions of 'female' and 'male' continue to prevail in popular culture and in certain academic disciplines (Frye, 1996).12 On this point, Hird (2004) adopts a position in feminist science studies to develop a substantive critique into how the ontology of sexual difference is often rendered concrete in research propagated by the 'natural' – and particularly, the 'biological' – sciences (also see Martin, 1991). The influence of ontological sexual difference within and outside of academia, lends credence to Broadbridge and Hearn's (2008: S39) recent observation that, '[s]ex and sex differences are still often **naturalized as fixed, or almost**

fixed, in biology'. It is equally important to note, here, that **the alchemy of ontological sexual difference is wholly dependent upon the patriarchal conflation of 'biological' sex and 'cultural' gender (**Hird, 2004). As Pringle (2008: S112; also see Borgerson and Rehn, 2004) notes, '[g]ender **[does] not avoid the oppositional duality embodied in the concept of sex**, but reflect[s] the interdependent relationship of masculinity and femininity'. This reflection pivots on genital determinism, which declares that males naturally embrace masculinity while females naturally embrace femininity (Bornstein, 1994; Hird, 2000). This initial conflation of sex and gender leads to the conventional model of heterosexuality, which dictates that a man will 'desire-to-be' a male and will 'desire-for' a female, while a woman will 'desire-to-be' a female and will 'desire-for' a male (Sinfield, 2002: 126). It is precisely these corresponding relationships whereby the 'heterosexual matrix' is constructed (Butler, 1990). According to Butler, this matrix serves as the '**grid of cultural intelligibility through which bodies, gender, and desires are naturalized**' (see Ringrose, 2008: 511).13

Their politics – which produces nostalgia for non-engagement – casting movement as stasis makes theorizing for the future impossible

Rosalind C. **Morris**, Professor of Anthropology @ Columbia, **'10**

(*Can the Subaltern Speak?: Reflections on the History of an Idea*, pg. 8)

Subalternity is not that which could, if given a ventriloquist, speak the truth of its oppression or disclose the plenitude of its being. The hundreds of shelves of well-intentioned books claiming to speak for or give voice to the subaltern **cannot ultimately escape the problem of translation** in ii> full sense. **Subalternity is less an identity than what we might call a predicament**, but this is true in very odd sense. For, in Spivak's definition, it is the structured place from which the capacity to access power is radically obstructed. To the extent that anyone escapes the muting of subalternity, she ceases being a subaltern. Spivak says this is to be desired. And who could disagree? There is neither authenticity nor virtue in the position of the oppressed. There is simply (or not so simply) oppression. Even so, we are moved to wonder, in this context, what burden this places on memory work in the aftermath of education. What kind of representation becomes available to the one who, having partially escaped the silence of subalternity, is nonetheless possessed by the consciousness of having been obstructed, contained, or simply misread for so much of her life? Is there any alternative to either the positivist euphoria that would claim to have recovered the truth of her past or the conflation of historiography with therapeutic adaptation by which ideology finally makes the silence of subalternity seem normal?

Today in the halls of the academy it is possible to discern a certain displacement of the critique of power and class, and hence of history, by the cultural analysis of memory. If the latter offers itself as an alternative to the positivism of empiricist historiography, and as a critique of the teleologies implicit in so much Marxist theory, it nonetheless tends to **surrender uto-pianism only to embrace nostalgia**. Nostalgia, in this sense, is but the inverse of utopianism, a **utopianism without futurity**. Ironically, this nostalgia often bears a secret valorization and **hypostatization of subalternity** as an identity—**to be recalled, renarrated, reclaimed, and revalidated. We need to resist the narcissism implicit in this gesture**—which ultimately demands a whole image as the mirror of ourselves, not merely as the basis for misrecognition (and hence our own subject formation) but also **as the alibi for a politics that imagines the project of emancipation to be over**. A quick survey of the contemporary social landscape demands the recognition that it is not.

Affirming difference as the starting point for revolution is a failed strategy that ends in ambivalence – maroonage collapses into aescthetic boundary drawing – makes the skill building necessary for radical politics inevitable

Thomas **Nail**, Post-doctoral Lecturer in European Philosophy at the University of Denver, 20**13**, Deleuze, Occupy, and the Actuality of Revolution, Theory & Event Volume 16, Issue 1

(1) Political Ambivalence

"Affirming Difference in the state of permanent revolution [affirmer la Différence dans l'état de révolution permanente]," as Deleuze says in Difference and Repetition (75/53),8 may escape the previous problems of vanguardism and the party-state, **but it also poses a new danger: that the "pure affirmation of Difference" will be ultimately ambivalent**. Revolution may provide a new non-representational space of liberty, or it may provide a ruptured "open" domain for a new discourse of rights and military occupation by the state, or it may merely reproduce a complicity with the processes of capitalist deterritorialization necessary for new capitalist reterritorializations. Slavoj Žižek, in particular, frequently attributes this capitalist ambivalence to Deleuze and Guattari's politics (2004, 184). But to say, with Alain Badiou, that **affirming the potentiality for transformation as such is to affirm a "purely ideological radicality" that "inevitably changes over into its opposite**: **once the mass festivals of democracy and discourse are over, things make place for the modernist restoration of order** among workers and bosses," would be to overstate the problem (Badiou and Balmès 1976, 83).

Rather, it would be much more appropriate to say, with Paolo Virno, that "[t]he multitude is a form of being that can give birth to one thing but also to the other: ambivalence" (Virno 2003, 131). Accordingly, the affirmation of this ambivalence as a political commitment, and the "politico-ontological optimism and unapologetic vitalism" it assumes in Hardt, Negri, and Deleuze's work, according to Bruno Bosteels, **remains radically insufficient** (2004, 95). While the purely creative power of the multitude may be the condition for global liberation from Empire, it is also the productive condition for Empire as well. With no clear political consistency to organize or motivate any particular political transformation "vitalist optimism" is politically ambivalent, speculative, and spontaneous. Showing the non-foundational or ungrounded nature of politics provides no more of a contribution for organized politics than does the creative potentiality of desire. "A subject's intervention," Bosteels suggests, "cannot consist merely in showing or recognizing the traumatic impossibility, void, or antagonism around which the situation as a whole is structured" (2004, 104). Rather, following Badiou, a "political organization is necessary in order for the intervention, as wager, to make a process out of the trajectory that goes from an interruption to a fidelity. In this sense, organization is nothing but the consistency of politics" (Badiou 1985, 12). And in so far as Deleuze and Guattari, and those inspired by their work, do not offer developed concepts of political consistency and organization that would bring differential multiplicities into specific political interventions and distributions, they remain, at most, ambivalent toward revolutionary politics.

 (2) Virtual Hierarchy

In addition to this first danger of revolutionary ambivalence, Deleuze's concept of revolution, according to Badiou and Hallward, risks a second danger; namely, that of creating a political hierarchy of virtual potential. Badiou argues at length in The Clamor of Being that,

… contrary to all egalitarian or "communitarian" norms, Deleuze's conception of thought is profoundly aristocratic. Thought only exists in a hierarchized space. This is because, for individuals to attain the point where they are seized by their preindividual determination and, thus, by the power of the One-All—of which they are, at the start, only meager local configurations—they have to go beyond their limits and endure the transfixion and disintegration of their actuality by infinite virtuality, which is actuality's veritable being. And individuals are not equally capable of this. Admittedly, Being is itself neutral, equal, outside all evaluation … But 'things reside unequally in this equal being' (Deleuze 1994, 60/37). And, as a result, it is essential to think according to 'a hierarchy which considers things and beings from the point of view of power'

(Deleuze 1994, 60/37; Badiou 1999, 12–13).

The political thrust of this argument is that, if we understand revolutionary change as the pure potential for change as such, and not actual change for or against certain forms, **then, contrary to any kind of egalitarianism, there will instead be a hierarchy** of actual political beings that more or less participate in this degree of pure potential transformation. The more actual political beings renounce their specific and local determinations and affirm their participation in the larger processes of difference-in-itself, the more powerful they become. Thus, if the point of examining any local political intervention is in every case to show to what degree it renounces its concrete determinations and might "become other than it is" (as a virtuality or potentiality), there is, according to Badiou, a risk of "**asceticism" and hierarchy** in such a relationship of potential (Badiou 1999, 13).

Similarly, Peter Hallward has argued that Deleuze's political philosophy is "indifferent to the politics of this world" (2006, 162). Hallward claims that "once a social field is defined less by its conflicts and contradictions than by the lines of flight running through it" any distinctive space for political action can only be subsumed within the more general dynamics of creation, life, and potential transformation (2006, 62n16). And since these dynamics are "themselves anti-dialectical if not anti-relational, there can be little room in Deleuze's philosophy for relations of conflict and solidarity" (2006, 162). If each concrete, localized, actual political being is important only in so far as it realizes a degree of pure potentiality of a virtual event, "and every mortal event in a single Event" (Deleuze 1990, 178/152), then the processional "telos" of absolute political deterritorialization is completely indifferent to the actual politics of this world (2006, 97). By valorizing this pure potentiality for transformation as such against all actual political determinations, Hallward argues, Deleuze is guilty of **affirming an impossible utopianism**. "By posing the question of politics in the starkly dualistic terms of war machine or state," Hallward argues, "by posing it, in the end, in the apocalyptic terms of a new people and a new earth or else no people and no earth—the political aspect of Deleuze's philosophy amounts to little more than **utopian distraction**" (2006, 162).

(3) Subjective Paralysis

The differential reading of Deleuze and Guattari's concept of revolution may be able to avoid the problem of representational subjectivity—that it can reject or affirm particular desires but never change the nature of the "self that desires"—but it does so only at the risk of diffusing the self into an endless

multiplicity of impersonal drives: a self in perpetual transformation. This leads to the third danger, that of subjective paralysis. Firstly, to read Deleuze and Guattari's theory of revolutionary subjectivity as the "simple fact of one's own existence as possibility or potentiality" (Agamben 1993, 43), or as Paul Patton calls it, one's "critical freedom" ("the freedom to transgress the limits of what one is presently capable of being or doing, rather than just the freedom to be or do those things" (2000, 85) suggests an ambivalence of action. What are the conditions and factors by which one might decide to take an action or not? Emancipation and enslavement in this sense are merely just different things to be done.

Secondly, without a pre-given unity of subjectivity, how do agents qua multiplicities deliberate between and distinguish (in themselves) different political decisions? Without the representational screen of reason, or the state-guaranteed grounds of political discourse, what might something like a dispute or agreement look like? If "becoming other is not a capacity liberated individuals possess to constitute themselves as autonomous singularities," but "what defines 'autonomy' itself" (2006, 146), as Simon Tormey argues, then the political danger, according to Hallward, is that the subject is simply replaced by the larger impersonal process of transformation as such: "pure autonomy." **The radical affirmation of the ambivalent** and unlocalizable processes of subjective potentiality (qua pure multiplicities) **seems then to have nothing to contribute to an analysis of the basic function of participatory democracy and collective decision-making, which remains at the core of** many of **today's radical political struggles** (See Starr, Martinez-Torres, and Rosset 2011). Insofar as a theory of subjectivity is defined only by its potential for transformation, it is stuck in a kind of paralysis of endless potential change no less disempowering than subjective stasis. Or, as Hallward frames this criticism, Deleuze "abandons the decisive subject in favor of our more immediate subjection to the imperative of creative life or thought" (2006, 163).

AT: Ballot/Strategy

AT: white suicide

Instead of focusing politics on the personal, we should take collectivize action against social ills—a personality litmus test dooms political projects

Rob the Idealist, Carleton College, 10/1/**13**, Tim Wise & The Failure of Privilege Discourse, www.orchestratedpulse.com/2013/10/tim-wise-failure-privilege-discourse/

I don't find it meaningful to criticize Tim Wise the person and judge whether he's living up to some anti-racist bona fides. Instead, I choose to focus on the paradigm of "White privilege" upon which his work is based, and its conceptual and practical limitations. Although the personal is political, not all politics is personal; we have to attack systems. To paraphrase the urban poet and philosopher Meek Mill: there are levels to this shit. How I Define Privilege There are power structures that shape individuals' lived experiences. Those structures provide and withhold resources to people based on factors like class, disability status, gender, and race. It's not a "benefit" to receive resources from an unjust order because ultimately, injustice is cannibalistic. Slavery binds the slave, but destroys the master. So, the point then becomes not to assimilate the "underprivileged", but to instead eradicate the power structures that create the privileges in the first place. The conventional wisdom on privilege often says that it's "benefits" are "unearned". However, this belief ignores the reality and history that privilege is earned and maintained through violence. Systemic advantages are allocated and secured as a class, and simply because an individual hasn't personally committed the acts, it does not render their class dominance unearned. The history and modern reality of violence is why Tim Wise' comparison between whiteness and tallness fails. White supremacy is not some natural evolution, nor did it occur by happenstance. White folks *murdered* people for this thing that we often call "White privilege"; it was bought and paid for by blood and terror. White supremacy is not some benign invisible knapsack. The same interplay between violence and advantage is true of any systemic hierarchy (class, gender, disability, etc). Being tall, irrespective of its advantages, does not follow that pattern of violence. Privilege is Failing Us Unfortunately, I think our use of the term "privilege" is no longer a productive way for us to gain a thorough understanding of systemic injustice, nor is it helping us to develop collective strategies to dismantle those systems. Basically**, I never want to hear the word "privilege" again** because **the term is so thoroughly misused at this point that it does more harm than goo**d. Andrea Smith, in the essay "The Problem with Privilege", outlines the pitfalls of misapplied privilege theory. Those who had little privilege did not have to confess and were in the position to be the judge of those who did have privilege. Consequently, people aspired to be oppressed. Inevitably, those with more privilege would develop new heretofore unknown forms of oppression from which they suffered… Consequently, the goal became not to actually end oppression but to be as oppressed as possible. These rituals often substituted confession for political movement-building. Andrea Smith, The Problem with Privilege Dr. Tommy Curry says it more bluntly, "It's not genius to say that in an oppressive society there are benefits to being in the superior class instead of the inferior one. That's true in any hierarchy, that's not an 'aha' moment." Conceptually, privilege is best used when narrowly focused on explaining how structures generally shape experiences. However, when we overly personalize the problem, then privilege becomes a tit-for-tat exercise in blame, shame, and guilt. In its worst manifestations, this dynamic becomes "oppression Olympics" and people tally perceived life advantages and identities in order to invalidate one another. At best, we treat structural injustice as a personal problem, and moralizing exercises like "privilege confessions" inadequately address the nexus between systemic power and individual behavior. The undoing of privilege occurs not by individuals confessing their privileges or trying to think themselves into a new subject position, but through the creation of collective structures that dismantle the systems that enable these privileges. The activist genealogies that produced this response to racism and settler colonialism were not initially focused on racism as a problem of individual prejudice. Rather, the purpose was for individuals to recognize how they were shaped by structural forms of oppression. Andrea Smith, The Problem with Privilege Bigger than Tim Wise However, the problem with White privilege isn't simply that Tim Wise, a white man, can build a career off of Black struggles. As I've already said, White people need to talk to White people about the historical and social construction of their racial identities and power, and the foundation for that conversation often comes from past Black theory and political projects. The problem for me is that privilege work has become a cottage industry of self-help moralizing that in no way attacks the systemic ills that create the personal injustices in the first place. A **substantive critique of**

privilege requires us to get beyond identity politics. It's not about good people and bad people; it's a bad system. It's not just White people that participate in the White privilege industry, although not everyone equally benefits/profits (see: Tim Wise). Dr. Tommy Curry takes elite Black academics to task for their role in profiting from the White privilege industry while offering no challenge to White supremacy. These conversations about White privilege are not conversations about race, and certainly not about racism; it's a business where Blacks market themselves as racial therapists for White people… The White privilege discourse became a bourgeois distraction. It's a tool that we use to morally condemn whites for not supporting the political goals of elite black academics that take the vantages of white notions of virtue and reformism and persuade departments, journals, and presses into making concessions for the benefit of a select species of Black intellectuals in the Ivory Tower, without seeing that the white racial vantages that these Black intellectuals claim they're really interested in need to be dissolved, need to be attacked all the way to the very bottom of American society. Dr. Tommy Curry, Radio Interview The truth is that a lot of people, marginalized groups included, simply want more access to existing systems of power. They don't want to challenge and push beyond these systems; they just want to participate. So if we continue to play identity politics and persist with a personal privilege view of power, then we will lose the struggle. Barack Obama is president, yet White supremacy marches on, and often with his help (record deportations, expanded a drone war based on profiling, fought on behalf of US corporations to repeal a Haitian law that raised the minimum wage). Adolph Reed, writing in 1996, predicted the quagmire of identity politics in the Age of Obama. In Chicago, for instance, we've gotten a foretaste of the new breed of foundation-hatched black communitarian voices; one of them, a smooth Harvard lawyer with impeccable do-good credentials and vacuous-to-repressive neoliberal politics, has won a state senate seat on a base mainly in the liberal foundation and development worlds. His fundamentally bootstrap line was softened by a patina of the rhetoric of authentic community, talk about meeting in kitchens, small-scale solutions to social problems, and the predictable elevation of process over program — the point where identity politics converges with old-fashioned middle-class reform in favoring form over substance. I suspect that his ilk is the wave of the future in U.S. black politics. Adolph Reed Jr., Class Notes: Posing As Politics and Other Thoughts on the American Scene Although it has always been the case, Obama's election and subsequent presidency has made it starkly clear that it's not just White people that can perpetuate White supremacy. Systems of oppression condition all members of society to accept systemic injustice, and there are (unequal) incentives for both marginalized and dominant groups to perpetuate these structures. Our approaches to injustice must reflect this reality. This isn't a naïve plea for "unity", nor am I saying that talking about identities/experiences is inherently "divisive". Many of these privilege discussions use empathy to build personal and collective character, and there certainly should be space for us to work together to improve/heal ourselves and one another. People will always make mistakes and our spaces have to be flexible enough to allow for reconciliation. Though we don't have to work with persistently abusive people who refuse to redirect their behavior, there's a difference between establishing boundaries and puritanism. Fighting systemic marginalization and exploitation requires more than good character, and **we cannot fetishize personal morals over collective action**.

The alt aestheticizes violence – the position of the master is not produced by violent interactions – stubborn endorsement of violence leads to a self-fulfilling prophecy of opposition rather than focusing on the factors that produce the need for radical politics

Simon **Swift**, Ph.d., Senior Lecturer in Critical and Cultural Theory, University of Leeds, 20**13** "Hannah Arendt, violence and vitality," European Journal of Social Theory 16(3) 357–376

A key aspect of Arendt's critique of modern political life as it increasingly embodies violence that has emerged throughout this article has been the ways in which political ideologies and philosophical ideas **fail to keep pace with the flux of events that they try to understand and control.** This insight, and the important role played by violence within it, are taken further in Arendt's account of the 'global phenomenon' of the student protest movement in 1968 in her late essay On Violence (Arendt, 1972: 117). Arendt claims that the **students misrecognize the sources for their own turn to violence**, which she repeatedly associates with the rise of technology, and which she frames especially in the context of

the nuclear standoff or what she calls the 'weird suicidal development of modern weapons' (Arendt, 1972: 116). The general context that Arendt defines for the growing commitment to violence on the New Left is **uncertainty about the future.** In the context of nuclear armament, **the means of violence overwhelm the ends of politics** in a particularly dramatic way, as society's technological development is continually geared towards preparation for a thermonuclear war that never happens. The students' aesthetic critique of society, which takes the form of a growing commitment to violence as a furthering and enhancement of the life force, **misrecognizes its continuity with this wider political abandonment of the instrumentality of violence.** Both the Cold War powers and the students, in other words, pass beyond an instrumental model of violence, to a view of violence as an end in itself. But Arendt also asks why it is that the students '**cling with such stubborn tenacity to concepts and doctrines that have not only been refuted by factual developments** but are **clearly inconsistent with their own politics'** (Arendt, 1972: 124). The disconnect with reality and what she thinks of as the outmodedness of their ideas are in fact part and **parcel of the same phenomenon.** The students cling tenaciously to an ideology of creativity in the face of the fact that an increasingly consumerist, technology-driven society has done away with any notion of work. Behind their critique of consumerism, she argues, 'stands the illusion of Marx's society of free producers, the liberation of the productive forces of society'; a revolution which has in fact been accomplished, Arendt thinks, by science and technology (Arendt, 1972: 117). Like the life philosophy that, in Arendt's account, inspires it, the student protest movement's **aestheticization of violence** blocks out the technological **context that determines it and that it reproduces in its radical abandonment of an instrumental view of violenc**e. As Benjamin remarked in his essay 'On Some Motifs in Baudelaire', Bergson's philosophy, in his earlier Matter and Memory, manages above all to stay clear of that experience from which his own philosophy evolved or, rather, in reaction to which it arose. It was the inhospitable, blinding age of big-scale industrialism. In shutting out this experience the eye perceives an experience of a complementary nature in the form of its spontaneous afterimage, as it were. (Benjamin, 1992: 154) But while the students are guilty of misapprehending, like Marx before them, **the real process-character of modern life** and labour because they cling to an **outmoded, humanistic idea of man as a creator-producer,** a figure who, **in the work of Sartre and Fanon**, is seen to **produce himself through violence**, their expression of this doctrine of creativity is also, for Arendt, **internally inconsistent**. Unlike Marx, who proposes that man reproduces himself through labour, the students turn to the Nietzschean thesis that 'the joy of destruction is a creative joy' (Arendt, 1972: 117). They at once inhabit and depart from a Marxist humanism, and in doing so they make contact, **in their 'seemingly so novel biological justification of violence' with 'the most pernicious elements in our oldest traditions of political thought**' (Arendt, 1972: 171). **These elements enable a thinking of power in biological terms as violence**. Specifically, violence is understood as creative in its expressing of what Bertrand de Jouvenel calls 'an inner urge to grow' (Arendt, 1972: 171). 'Just as in the realm of organic life everything either grows or declines or dies,' this theory runs as Arendt rehearses it, 'so in the realm of human affairs power supposedly can sustain itself only through expansion; otherwise it shrinks and dies.' The endpoint of this biological theory of power is found in the view that kings are killed 'not because of their tyranny but because of their weakness' and that the people erect scaffolds as a 'biological penalty for weakness' (p. 171). In fact, Arendt had herself employed such an organicist theory of power in her effort to understand the agency of anti-Semitism in The Origins of Totalitarianism, where she had compared the Jews to aristocrats in pre-Revolutionary France. When the aristocrats lost their privileges, 'among others the privilege to exploit and oppress, the people felt them to be parasites, without any function in the rule of the country'. Comparably, '[a]ntisemitism reached its climax when Jews had similarly lost

their public functions and their influence, and finally were left with nothing but their wealth' (Arendt, 1968: 4).

The alt amounts to an arbitrary targeting mechanism based on the presumed knowledge and charictarization of others bodies which is a double turn with their first strategy, but also creates infinite culpability for action – they can't solve until everyone who is not them is symbolically dead

<u>**Butler 2**</u> Paul Butler, Professor of Law, George Washington University BA Yale JD Harvard By Any Means Necessary: Using Violence and Subversion to Change Unjust Law UCLA Law Review 50 2002-2003 761-762

<u>**Just war doctrine**</u>, applied to insurgents, <u>**would limit violence more than it would authorize it**</u>. <u>**Jus in bello requires that there be no injury to civilians.**</u> If the usual definitions of "terrorism" and "civilians" are invoked, this requirement seems to rule out virtually all terrorism, for terrorism is commonly thought of as politically motivated violence against civilians. <u>**Sometimes terrorists argue**</u> that, in their particular conflict, <u>**there are no "noncomba-tants."**</u> An example of this argument is the claim that even nonmilitary citizens of Israel arc permissible targets for Palestinian protestors because all Israelis benefit from and help maintain the subordination of Palestinians.101 <u>**The problem with this argument is**</u> the same as the problem with most terrorism: <u>**It is indiscriminate**</u>. <u>**It grants insufficient weight to the value of human life when it does not acknowledge that there are degrees of culpability.**</u> Surely, for example, <u>**children are not as responsible as adults, and surely a poor laborer is not as responsible as a high government official.**</u> On the other hand, it is possible to defend a construct of "combatants," that is, permissible targets of violence, that includes nonmilitary actors. <u>The objective of just war is to change the regime, or the way that it operates. To attack the foot soldiers, but to ignore the authorities responsible for creating and implementing the oppressive policies, seems inefficient.</u> The suggestion that <u>**insurgents should distinguish among civilians and limit their targets**</u> to "well-known officials, notorious collaborators, and bo on," seems reasonable,"" Thus, just war applied to insurgents would not eliminate the "combatant" restriction but would broaden the concept, in the manner described by Professor Walzer. "Combatant" could be defined as any person directly responsible for creating, administering, or defending the human rights violations, including genocide or race discrimination, that are the subject of the conflict. As discussed below, <u>**in the context of the "war" against race-based capital punishment, combatants would include those directly responsible for creating and implementing it. These people are culpable in a way that the ordinary civilian is not.**</u> Even then, <u>**violence against them is not necessarily moral**</u>: The other conditions of just war must also be satisfied. I want to emphasize the purpose of applying just war doctrine to insurgents, because I understand that any moral construct that tolerates political violence by nongovernmental entities is controversial. Just war doctrine accepts that violence—killing people—can be morally justified, if certain conditions are satisfied. One of the necessary conditions is that the targets must be military. This condition seems inconsistent with other common constructs of morality, including those found in criminal and international law, and in popular culture. The heroic status that many now accord those who led slave revolts is evidence of that view of morality. Yet <u>**definitions of combatants proffered by**</u>

terrorists are overly broad when they include those who are not directly responsible for the oppression of others (even if they benefit from that oppression). **This view of combarants discounts the sanity of human life that must underlie any construct of morality** (even if that construct allows for the taking of life in certain cases). The proposed application of just war doctrine to "terrorists" assumes that they, like nation-states, are open to persuasion about their methods. Their embrace of violence does not mean they have abandoned their claim to morality. If just war doctrine is to remain relevant in the twenty-first century, it should be applied to every actor—not just governments—that uses violence to accomplish political objectives.

AT: give us the ballot

"Confessing" ballot just reinstates domination

Andrea **Smith**, Ph.D., co-founder of Incite! Women of Color Against Violence, UC Riverside Associate Professor, 20**13**, Geographies of Privilege, Unsettling the Privilege of Self-Reflexivity, Kindle

In my experience working with a multitude of anti-racist organizing projects over the years, I frequently found myself participating in various workshops in which participants were asked to reflect on their gender/race/sexuality/class/etc. privilege. These workshops had a bit of a self-help orientation to them: "I am so and so, and I have x privilege." It was never quite clear what the point of these confessions were. It was not as if other participants did not know the confessor in question had her/his proclaimed privilege. It did not appear that these individual confessions actually led to any political projects to dismantle the structures of domination that enabled their privilege. Rather, the confessions became the political project themselves. The benefits of these confessions seemed to be ephemeral. For the instant the confession took place, those who do not have that privilege in daily life would have a temporary position of power as the hearer of the confession who could grant absolution and forgiveness. The sayer of the confession could then be granted temporary forgiveness for her/his abuses of power and relief from white/male/heterosexual/etc guilt. Because of the perceived benefits of this ritual, there was generally little critique of the fact that in the end, it primarily served to reinstantiate the structures of domination it was supposed to resist. One of the reasons there was little critique of this practice is that it bestowed cultural capital to those who seemed to be the "most oppressed." Those who had little privilege did not have to confess and were in the position to be the judge of those who did have privilege. Consequently, people aspired to be oppressed. Inevitably, those with more privilege would develop new heretofore unknown forms of oppression from which they suffered. "I may be white, but my best friend was a person of color, which caused me to be oppressed when we played together." Consequently, the goal became not to actually end oppression but to be as oppressed as possible. These rituals often substituted confession for political movement-building. And despite the cultural capital that was, at least temporarily, bestowed to those who seemed to be the most oppressed, these rituals ultimately reinstantiated the white majority subject as the subject capable of self-reflexivity and the colonREized/racialized subject as the occasion for self-reflexivity. These rituals around self-reflexivity in the academy and in activist circles are not without merit. They are informed by key insights into how the logics of domination that structure the world also constitute who we are as subjects. Political projects of transformation necessarily involve a fundamental reconstitution of ourselves as well. However, for this process to work, individual transformation must occur concurrently with social and political transformation. That is, the undoing of privilege occurs not by individuals confessing their privileges or trying to think themselves into a new subject position, but through the creation of collective structures that dismantle the systems that enable these privileges. The activist genealogies that produced this response to racism and settler colonialism were not initially focused on racism as a problem of individual prejudice. Rather, the purpose was for individuals to recognize how they were shaped by structural forms of oppression. However, the response to structural racism became an individual one – individual confession at the expense of collective action. Thus the question becomes, how would one collectivize individual transformation? Many organizing projects attempt and have attempted to do precisely this, such Sisters in Action for Power, Sista II Sista, Incite! Women of Color Against Violence, and Communities Against Rape and Abuse, among many others. Rather than focus simply on one's individual privilege, they address privilege on an organizational level. For instance, they might assess – is everyone who is invited to speak a college graduate? Are certain peoples always in the limelight? Based on this assessment, they develop structures to address how privilege is exercised collectively. For instance, anytime a person with a college degree is invited to speak, they bring with them a co-speaker who does not have that education level. They might develop mentoring and skills-sharing programs within the group. To quote one of my activist mentors, Judy Vaughn, "You don't think your way into a different way of acting; you act your way into a different way of thinking." Essentially, the current social structure conditions us to exercise what privileges we may have. If we want to undermine those privileges, we must change the structures within which we live so that we become different peoples in the process.

Don't take self-understanding as an incontrovertible truth – we don't perfectly know ourselves and have a lot to gain by making our beliefs subject to external criticism

McBride 3 –Professor of Government @ London School of Economics

(Cillian, "Self-transparency and the possibility of deliberative politics," Journal of Political Ideologies, 8.3)

ABSTRACT I argue against the notion of self-transparency which underwrites the politics of presence. This connects situation, identity, and perspective in such a way as to be **incompatible** with deliberative politics and treats self-understand- ing as authoritative, rendering it **insensitive** to the possibility that our self-under- standings may be **distorted**. I propose a hermeneutic, narrative, conception of selfhood on which we **relate** to our lives as authors, constructing our identities by employing the linguistic and narrative resources which our respective situations make available to us. This admits the possibility that **others may provide us with superior interpretations of our lives**, which is a **precondition** of deliberative politics. Given the possibility that our self-understandings may be distorted, deliberative citizens have a **duty** to challenge **problematic self-under- standings**. Anchoring criticism to public deliberation, together with the her- meneutic premise that a measure of self-opacity is universal, secures such challenges against the charge of authoritarianism levelled at traditional ideol- ogy-critique.¶ I want to focus here on the challenge posed to dialogue-centred politics by a particular discourse connecting situation, identity and politics, which Anne Phillips has termed the 'politics of presence'.1 While apparently providing a particularly firm basis for arguments for the inclusion of hitherto marginalized groups within the democratic process, this discourse embodies highly problem- atic views about political dialogue and the nature of the self. I hope to build on an analysis of these flaws to clarify the ontological preconditions of deliberative politics and, furthermore, to draw some conclusions about the nature of the obligations of parties to deliberation.¶ The politics of presence rests on a model of the self as transparent to itself, but not to others, with the consequence that a person's self-understanding, at the very least, must be acknowledged to be authoritative, or incorrigible. This model of the self cannot, however, be made to cohere with a plausible account of communication, and consequently it **must be discarded** in favour of a broadly hermeneutic model of selfhood as situated in and constituted through a network of language and interpretative traditions. While this self is inevitably opaque to itself in certain respects, reflection on this opacity lends a point to dialogue which it cannot have on the assumption of self-transparency. A dialogic politics, which is sensitive to the possibility of distorted self-understanding and aims at facilitating the transformation of perspectives and self-interpretations, must acknowledge as a fundamental premise the **provisional character** of self-under- standing. This, in turn, provides a basis for viewing deliberative citizens as having obligations, in certain circumstances, to **challenge rather than defer to the self-understandings of others**.

ROB

Our permutation frees us from the demand of immediacy in "the debate space." Imperfect, aspirational performatives are crucial for democratic agency means you should prioritize our impacts

Leela **GANDHI** English @ Chicago **'14** *The Common Cause: Postcolonial Ethics and the Practice of Democracy* p. 164-166

4. To speak an ordinary language, that is, to be ordinary in the sense of being-in-common or being-with-others (in a word, democratic), is an art of the possible.

"Our investigation," Wittgenstein famously notes in Philosophical Investigations, "is directed not toward phenomena, but, as one might say, toward the "possibilities" of phenomena."48 The clearest tenets for the potentiality of shared meanings, thus conceived, occur in Austin's oeuvre. The performative utterances that he distinguishes as bringing something about rather than referring to something already in place do not themselves need to be sui generis and original. 49 Thus the words that launch a marriage or a ship, or cause an arrest to be made are, indeed, coded, iterable, and therefore citational. 50 So too, their powers of conjuration have a great deal to do with the institutional and modular nature of the things they bring about (marriage, prison, journeys). Nonetheless, performative meanings are always subject to creative deviation, deferral, and/or variation. A behabitive commendation may fail to make the person being commended feel commended. An apology may take years to have effect, or it may communicate way more or less regret than intended. Likewise, an expositive utterance plainly announcing or explaining what we are about to do may falter mid-route. Famously (and very likely apocryphally), when training as a barrister in London, the young M.K. Gandhi once failed entirely to give birth to the speech he was signaling repeatedly with the words "I conceive-," "I conceive-". It is this type of synapse or interval between utterance and signification-or, indeed, between utterance, signification, and resignification –that Judith Butler so eloquently describes as the "open temporality of the speech act."51 Performativity, she helps us understand, is not then, the certainty of effect so much as a "possibility of agency," which need not conform to spatial and temporal specificities, and which, we might add, may also remain unrealized. 52 To summarize, at the admittedly minor scene (though one embedded in the first half of the twentieth century) of an academic spat between Cambridge English and Oxford ordinary-language philosophy, we find another variant on the binary of perfectionism/imperfectionism. Where Leavisite English studies took up the cause of humanistic elevation against the threat of egalitarianism, OLP committed to disciplinary dethronement in its name. Both forms proclaimed their own wider application in the world beyond academe, in different ways. But the special-case, ahimsaic path not taken by Cambridge English, and, perhaps, not fully appreciated in the descent of Western philosophy, either, is as yet available for recuperation. Very clearly, if aphoristically, it reformulates ordinariness as the basis for a democratic exegetics, which consists in cultivating our most unremarkable faculties, being suspicious of the facts, and taking something like mere possibility very seriously as a form of politics and of knowledge. This sometimes entails giving free play to the fictionality of any given text situation, by which, in turn, we must mean its socially critical or reparative-because-unfinished impulse. There is apt transcription of OLP principles into an ethico-political hermeneutic by William Empson, the antiprovincial critic-poet admired by Wittgenstein, who spent many years between and after the first two world wars teaching in China. 53 In terms especially resonant with the "possibility" thematic in OLP, Empson draws attention to the principle of ambiguity encoded within all literary experience. A poem may be fully steeped in its context-a social work, as it were-yet there will come a point when its language begins to venture beyond the grammar of its own graspable world. Add to this the muddy business of reading, and what you often get besides the inaugural "faint and separate judgments of probability," is the random surprise of a wildly autonomous final meaning. 54 These ambiguities are a measure of the plurality of likely assumptions secreted within the work and up for grabs to anybody. In context, the democratic critic's proper terrain is to exacerbate ambiguity. She must prevent the foreclosure of collective sense that comes from dealing conclusively or expertly with the material, or from forcing people to attend to "what is really there" in a text or situation. 55 Much better, Empson advises, to leave the understanding ultimately unsatisfied and the text or literary experience ongoingly sociable. Complex permutations obtain from such recommendations. For instance, we have all encountered textual situations the meanings of which simply cannot be brought into view no matter how hard we try because they seem too insignificant or unintelligible in relation to the grammar and moment of their prevailing circumstances. Yet, a la M. K. Gandhi, such textual situations can be hypothesized, precisely in their semantic failure, as aspirational-as bearing the strictly groundless character of a hoping and wishing that is either at odds with its ambient circumstance or that seeks to be circumstance-altering: as in, "I wish x could be otherwise," or, "I hope against hope that y."56 Guessing at this aspirational content or, rather, gleaning insignificance, failure, and unintelligibility as aspirational modes is, thus, an exigent critical task. Similarly, we can also simply refuse to disclose the meanings of a textual situation by pointing to what it actually achieves or references in the world to which it

belongs. In other words, we can enforce its failure. When meanings are thus actively retracted from realization, that is, with the disappearance of a fixed or sole referent/object/ objective, a galactic if inchoate relational field often comes into view. This comprises the textual situation's "implication threads," "contiguous fields" and "neighboring worlds" (to borrow some themes from Gilbert Ryle); or, ala Wittgenstein, its sympathetic resemblance and kinship to other not even necessarily coeval textual situations .57 It goes without saying that such close-up readings will be indistinct and blurry. 58 But they may well be proportionally more inclusive, cosmopolitan, and global. This is but another low-key wager in the spirit of imperfection. In all such cases the risks of self-reduction are finally negligible. If democracy is already here, we win. If it is yet to come, it is still well worth the price. We can gamble thus from a range of venues and in the midst of miscellaneous activities: in Makkali Gosala's cowshed; in Diogenes' bathtub; during a peace protest; as we chat with a friend; in a naval mess hall; during wartime; in the rituals of Kant's complicated couture; even in a library.

AT: pedagogy k/subjectivity

Pedagogy is not a new-found mode of educational inculturation, but rather a means for achieving consciousness by foregrounding teaching moments AGAINST power, and not just OUTSIDE power – that distinction is crucial and proves the alt can never solve

Henry **Giroux 13**, Chair of Secondary education at Pennsylvania State University, Henry Giroux on the Militarization of Public Pedagogy, http://www.counterpunch.org/2013/09/27/teaching-and-learning-with-henry-giroux/

HG: This is an important issue and symptomatic of a much larger problem. Public schools are not simply being corporatized, they are also subjected increasingly to a militarizing logic that disciplines the bodies of young people, especially low income and poor minorities, and shapes their desires and identities in the service of military values and social relations. For a lot of these young people, there are only a few choices here: you can be unemployed and hopefully be able to participate in some way in the social safety net, you can take a low-income job, you can end up in prison or you can go into the military. And it seems to me that increasingly the military is becoming the best option of all of those. So you have a whole generation which – by virtue of this massive inequality – really has very limited choices. But also you have these institutions that are basically there to socialize kids, telling them the only way to succeed is to join the military-industrial complex, and that there really are no other options, at least for them. Moreover, as these young people are subject to the warring logics of a militarized society, a society in which life itself is increasingly absorbed into a war machine, it becomes difficult for them to imagine a social order that can be otherwise, one that is organized around democratic values. SK: Like this program I've been following: it's called STARBASE. This is a Defense Department program that every year reaches around 70,000 students in over one-thousand schools – the majority of them in fifth grade. Pitched as a way to supplement school curriculum in the STEM (science, technology, engineering, mathematics) fields, there's an insidious element of military marketing at work: soldiers "mentor" students enrolled in this program and most of the instruction takes place at military installations. As part of the program students are given plenty of time to horse around on "cool" military hardware. HG: It's mind-blowing. I think what we often forget – and this is something that you and others like yourself are trying to make clear – is that when you talk about the militarization of American society you're not just talking about increasing the military budget or arming the police with military-style weapons and so forth. You're also talking about the militarization of a culture in which military values and relationships permeate every aspect of what C. Wright Mills called the cultural apparatus – schools, fashion, movies and screen culture. Violence becomes the only shared relationship that we have to each other, the only mediating form through which people can now solve problems. More insidiously, it defines our sense of identity and personal liberation through violence both as a mediating force and as a source of pleasure and entertainment. It's one of the reasons why the majority of people in the U.S. support state-sanctioned torture. How do you explain that? It's really a culture that's become so saturated in this military/violent mindset that it has lost any sense of critical thought and ethical responsibility and has little understanding of what a democratic society might look like. SK: Militarism in the schools is of course just one aspect of a larger culture of militarism in the U.S. And this gets at your notion of public pedagogy, doesn't it? HG: I may be terribly wrong but I think the central issue here is that first of all you have to realize that the educational force of the culture represents the most important pedagogical force at work in the United States, Canada, and in many other countries. This is not to suggest that schools are not involved in the process of teaching and learning. But I think we commit a grave mistake when we assume that schools are the only place where learning goes on. I would be willing to argue – and I have argued – that the most powerful educational force in the US is not the schools, it's outside the schools. Young people are awash in a public pedagogy that is

distributed across numerous sites that extend from movies and the Internet, readily amplified through a range of digital apparatuses that include cell phones, computers and other electronic registers of the new and expanded cultural flows. When schools fail to make a connection between knowledge and everyday life – between knowledge and these ever expanding cultural apparatuses – they fail to understand, interrogate, and question the educational forces that are having an enormous influence on children. The ongoing commercial carpet-bombing of kids through a range of ever expanding technologies–that make possible new social networks and information flows–is aggressively commodifying every aspect of their lives. Not to address this and make it pedagogically problematic, not to interrogate the massive violence kids are exposed to through screen culture and the new digital technologies is to do an enormous disservice to the way in which young people are being educated by the wider culture. SK: But young people are resisting, in various ways. You were obviously inspired to write your latest book because you believe youth have a role to play in fighting and changing the system. HG: As someone from the generation of the '60s, I'm enormously inspired by what they're doing. Right now they may be the only chance that we have. Consider their courage: the bravery of these young kids in Occupy Wall Street fighting against state-sanctioned violence in the form of police pepper spray, police dragging them off to jail and arresting them en masse. They've become a model for what it is to stand up to this one percent that has turned the US into an authoritarian society. I think that what these kids are doing is not only producing a new language to talk about inequality and power relations in the US but they're actually trying to create public spaces where new forms of social relationships inspired by democratic and cooperative values are really becoming meaningful. These young people are rethinking the very nature of politics and asking serious questions about what democracy is and why it no longer exists in many capitalist countries across the globe. They have been written out of the discourses of justice, equality, and democracy and are not only resisting how neoliberalism has made them expendable, but they are also arguing for a collective future very different from the one that is on display in the current political and economic systems in which they feel trapped. That's important. But they face enormous challenges. They don't have access to the dominant media. They're trying to use new media to create new modes of communication. They're trying to understand what democratic processes might mean in terms of sustaining collective struggles, and all of this takes time. I think that rather than saying that Occupy Wall Street has died, we can say that they're in the process of understanding what the long march through alternative institutions might mean. As conditions get worse in the U.S. this movement will grow and take on an international significance. Hopefully they'll join with young people in other countries to figure out how to address the biggest problem that the global community faces – politics is local and power is global. Nation-states can't control the flow of capital; it's outside the boundaries of nation-states. So, we need a politics that's global to be able to deal with that. SK: In reflecting on my own research I've seen examples of school administrators treating student activists in two distinctly different ways. In my area, Western Massachusetts, for example, there are high school students who are very heavily involved in organizing around issues of ecology and sustainability. They lobby for locally grown foods to be served in the cafeteria, install small garden plots for community members, school officials give them land on school property to grow vegetables, and so on. But then you have the students in San Diego that I mentioned before. Because they were fighting against the military presence in their schools they were seen as agitators. School administrators and police would conduct video surveillance of the students' marches, and one of their leaders was prevented from taking part in the graduation ceremony with the rest of his class. What might explain the differential response here? HG: As long as these modes of resistance don't challenge relations of power, that's fine with school officials and others in a position of authority. As long as they're focused on students finding a happy spot in themselves, positive thinking, that's fine. But as soon as they start talking about power, militarization, inequality, racism – all those things that point to deep structural problems—student resistance and dissent is viewed as exceeding its possibilities and limits. Just look at what happened in places like Arizona, where these racist educators and politicians succeeded in banning ethnic studies. When young people protested against their history, culture, and forms of witnessing being excluded from the curriculum, they were labeled as criminals, communists, and agitators. What is most important in terms of these youth movements is that you have a lot of young people making connections, saying "Look you can't talk about the rise in tuition unless you talk about the attack on the social state and social protections. You can't talk about what's happening in education unless you talk about the rise of the punishing state." In a place like California where more is spent on prisons than on education clearly those connections are what give force to a generation of students who are simply refusing to isolate these issues. It no longer makes sense to say that these are spoiled kids who don't want to spend much for their education. These young people are developing a conversation about society at large, calling into question its most fundamentally oppressive economic, political, and educational structures. Also, young people are recognizing that they're not going to find their voice in the Democratic Party or in the existing labor unions. What they really need to fight for are new mass and collective organizations that can call the entirety of society into question and mobilize so as to develop the policies and institutions that make a new and radically democratic society possible. SK: Here's a paradox for you: How do you teach social change or resistance to authority within public schools – institutions that many have criticized for being authoritarian and resistant to change? HG: You can't do it if you believe these institutions are so authoritarian that there's simply no room for resistance. That's a mistake. Power is never so overwhelming that there's no room for resistance. Power and the forms it takes are always contradictory in different ways and there is always

some room for resistance. What needs to be understood is the intensity of dominant power in different contexts and how it can be named, understood, and fought. The issue here is to seize upon the contradictions at work in these institutions and to develop them in ways that make a difference. During the sixties, the term for this was the long march through institutions and the reference had little to do with reform but with massive restructuring of the instruments of democracy. And we also need to impose a certain kind of responsibility upon adults in the schools – whether they be social workers, university professors, or high school teachers. Clearly it's not enough to say they operate under terrible burdens that make them voiceless. I understand those structural conditions but it doesn't mean they shouldn't resist either. That means they not only have to promote particular kinds of pedagogies in their classrooms but they also have to join social movements that give them the force of a collective voice that can bear down on these problems and create change. The greatest battle that we're facing in the U.S. today is around the question of consciousness. If people don't have an understanding of the nature of the problems they face they're going to succumb to the right-wing educational populist machine. This is a challenge that the Left has never taken seriously because it really doesn't understand that at the center of politics is the question of pedagogy. Pedagogy is not marginal, it is not something that can be reduced to a method, limited to what happens in high schools, or to what college professors say in their classes. Pedagogy is fundamental not only to the struggle over culture but also, if not more importantly, the struggle over meaning and identity. It's a struggle for consciousness, a struggle over the gist of agency, if not the future itself – a struggle to convince people that society is more than what it is, that the future doesn't simply have to mimic the present. SK: What would this look like in practice? One encouraging experiment I had the privilege of observing up close is taking place at the Emiliano Zapata Street Academy in Oakland. There, in an "alternative high school" within the Oakland Unified School District, student interns working with a group called BAY-Peace lead youth in interactive workshops on topics relevant to their lives: street violence, the school-to-prison pipeline, military recruiters in their schools, and so on. HG: I think two things have to go on here, and you just mentioned one of them. We've got to talk about alternative institutions. There has to be some way to build institutions that provide a different model of education. On the Left, we had this in the '20s and '30s: socialists had Sunday schools, they had camps; they found alternative ways to educate a generation of young people to give them a different understanding of history, of struggle. We need to reclaim that legacy, update it for the twenty-first century, and join the fight over the creation of new modes of thinking, acting, and engaging ourselves and our relations to others. On the second level is what Rudi Dutschke called what I referred to earlier as the "long march through the institutions." It's a model that makes a tactical claim to having one foot in and one foot out. You can't turn these established institutions over to the Right. You can't simply dismiss them by saying they're nothing more than hegemonic institutions that oppress people. That's a retreat from politics. You have to fight within these institutions. Not only that, you have to create new public spheres. SK: Henry, we've covered a lot of territory. Is there anything we haven't addressed that you would like to bring up before closing? HG: We need both a language of critique and a language of hope. Critique is essential to what we do but it can never become so overwhelming that all we become are critics and nothing else. It is counterproductive for the left to engage in declarations of powerlessness, without creating as Jacques Rancière argues "new objects, forms, and spaces that thwart official expectations." What we need to do is theorize, understand and fight for a society that is very different from the one in which we now live. That means taking seriously the question of pedagogy as central to any notion of viable progressive politics; it means working collectively with others to build social movements that address a broader language of our society – questions of inequality and power (basically the two most important issues we can talk about now.) And I think that we need to find ways to support young people because the most damage that's going to be done is going to be heaped upon the next generations. So what we're really fighting for is not just democracy; we're fighting for the future. And so critique is not enough; we need a language of critique and we need a language of possibility to be able to go forward with this.

AT: Negativity Alt

Optimism and solidarity are our only hope---their strategy of negativity accepts the foundational premises of racism as its starting point for politics

Hooks '96

(Bell hooks 96, Killing Rage: Ending Racism, Google Books, 269-272)

269More than ever before in our history, black Americans are succumbing to and internalizing the racist assumption that there can be no meaningful bonds of intimacy between blacks and whites. It is fascinating to explore why it is that black people trapped in the worst situation of racial oppres sion—enslavement—had the foresight to see that it would be disempowering for them to lose sight of the capacity of white people to transform themselves and divest of white supremacy, even as many black folks today who in no way suffer such extreme racist oppression and exploitation are convinced that white people will not repudiate racism. Con temporary black folks, like their white counterparts, have passively accepted the internalization of white supremacist assumptions. Organized white supremacists have always taught that there can never be trust and intimacy between the superior white race and the inferior black race. **When black people internalize these sentiments, no resistance to white supremacy is taking place; rather we become complicit in spreading racist notions.** It does not matter that so many black people feel white people will never repudiate racism because of being daily assaulted by white denial and refusal of accountability. We must not allow the actions of white folks who blindly endorse racism to determine the direction of our resistance. Like our white allies in struggle we must consistently keep the faith, by always sharing the truth that 270white people can be anti-racist, that racism is not some immutable character flaw. **Of course** many white people are comfortable with a rhetoric of race that suggests racism cannot be changed, that all white people are "inherently racist" simply because they are born and raised in this society. Such misguided thinking socializes white people both to remain ignorant of the way in which white supremacist attitudes are learned and to assume a posture of learned helplessness as though they have no agency—no capacity to resist this thinking. Luckily we have many autobiographies by white folks committed to anti-racist struggle that provide documentary testimony that many of these individuals repudiated racism when they were children. Far from passively accepting It as inherent, they instinctively felt it was wrong. Many of them witnessed bizarre acts of white racist aggression towards black folks in everyday life and responded to the injustice of the situation. Sadly, in our times so many white folks are easily convinced by racist whites and bLack folks who have internalized racism that they can never be really free of racism. These feelings aíso then obsc]re the reality of white privi lege. As long as white folks are taught to accept racism as 'natura]" then they do not have to see themselves as con sciously creating a racist society by their actions, by their political choices. This means as well that they do not have to face the way in which acting in a racist manner ensures the maintenance of white privilege. Indeed, denying their agency allows them to believe white privilege does not exist even as they daily exercise it. If the young white woman who had been raped had chosen to hold all black males account able for what happened, she would have been exercising white privilege and reinforcing the structure of racist thought which teaches that all black people are alike. Unfortunately, 271so many white people are eager to believe racism cannot be changed because internalizing that assumption downplays the issue of accountability. No responsibility need be taken for not changing something ¡fit is perceived as immutable. To accept racism as a system of domination that can be changed would demand that everyone who sees him- or herself as embracing a vision of radai social equality would be required to assert anti-racist habits of being. We know from histories both present and past that white people (and everyone else) who commit themselves to living in anti-racist ways need to make sacrifices, to courageously endure the uncomfortable to challenge and change. Whites, people of color, and black folks are reluctant to commit themselves fully and deeply to an anti-racist struggle that is ongoing because there is such a **pervasive feeling of hopelessness—a conviction that nothing will ever change. How any of us can continue to hold those feelings when we study the history of racism in this society and see how much has changed makes no logical sense.** Clearly we have not gone far enough. In the late sixties, Martin Luther King posed the question "Where do we go from here." To live in anti-racist society we must **collectively** renew our commitment to a democratic vision of racial justice and equality. Pursuing that vision we create a culture where beloved community flourishes and is sustained. Those of us who know the joy of being with folks from all walks of life, all races, who are fundamentalls' anti-racist in their habits of being. need to give public testimony. Ve need to share not only what we have experienced but the conditions of change that make such an experience possible. The interracial circle of love that I know can happen because each individual present in it has made his or her own commitment to living an anti- racist life and to furthering the struggle to end white supremacy 272 will become a reality for everyone only if those of us who have created these communities share how they emerge in our lives and the strategies we use to sustain them. Our devout commitment to building diverse communities is cen tral. These commitments to anti-racist living are just one expression of who we are and what we share with one an other but they form the foundation of that sharing. Like all beloved communities we affirm our differences. It is this generous spirit of affirmation that gives us the courage to challenge one another, to work through misunderstandings, especially those that have to do with race and racism. In a beloved community solidarity and trust are grounded in profound commitment to a shared vision. Those of us who are always anti-racist long for a world in which evezyone can form a beloved community where borders can be crossed and cultural hybridity celebrated. Anyone can begin to make such a community by truly seeking to live in an anti-racist world. If that longing guides our vision and our actions, the new culture will be born and anti-racist communities of resis tance will emerge everywhere. That is where we must go from here.

impossible demands bad

Žižek 7

(Slavoj, 11/15, Resistance Is Surrender, http://www.lrb.co.uk/v29/n22/print/zize01_.html)

The response of some critics on the postmodern Left to this predicament is to call for a new politics of resistance. Those who still insist on fighting state power, let alone seizing it, are accused of remaining stuck within the 'old paradigm': the task today, their critics say, is to resist state power by withdrawing from its terrain and creating new spaces outside its control. **This is, of course, the obverse of accepting the triumph of capitalism**. The politics of resistance is nothing but the moralising supplement to a Third Way Left. Simon Critchley's recent book, Infinitely Demanding, is an almost perfect embodiment of this position.[*] For Critchley, the liberal-democratic state is here to stay. Attempts to abolish the state failed miserably; consequently, the new politics has to be located at a distance from it: anti-war movements, ecological organisations, groups protesting against racist or sexist abuses, and other forms of local self-organisation. It must be a politics of resistance to the state, of bombarding the state with impossible demands, of denouncing the limitations of state mechanisms. The main argument for conducting the politics of resistance at a distance from the state hinges on the ethical dimension of the 'infinitely demanding' call for justice: no state can heed this call, since its ultimate goal is the 'real-political' one of ensuring its own reproduction (its economic growth, public safety, etc). 'Of course,' Critchley writes, history is habitually written by the people with the guns and sticks and one cannot expect to defeat them with mocking satire and feather dusters. Yet, as the history of ultra-leftist active nihilism eloquently shows, one is lost the moment one picks up the guns and sticks. Anarchic political resistance should not seek to mimic and mirror the archic violent sovereignty it opposes. So what should, say, the US Democrats do? Stop competing for state power and withdraw to the interstices of the state, leaving state power to the Republicans and start a campaign of anarchic resistance to it? And what would Critchley do if he were facing an adversary like Hitler? Surely in such a case one should 'mimic and mirror the archic violent sovereignty' one opposes? Shouldn't the Left draw a distinction between the circumstances in which one would resort to violence in confronting the state, and those in which all one can and should do is use 'mocking satire and feather dusters'? The ambiguity of Critchley's position resides in a strange non sequitur: if the state is here to stay, if it is impossible to abolish it (or capitalism), why retreat from it? Why not act with(in) the state? Why not accept the basic premise of the Third Way? Why limit oneself to a politics which, as Critchley puts it, 'calls the state into question and calls the established order to account, not in order to do away with the state, desirable though that might well be in some utopian sense, but in order to better it or attenuate its malicious effect'? These words simply demonstrate that today's liberal-democratic state and the dream of an 'infinitely demanding' anarchic politics exist in a relationship of mutual parasitism: **anarchic agents do the ethical thinking, and the state does the work of running and regulating society**. Critchley's anarchic ethico-political agent acts like a superego, comfortably bombarding the state with demands; and the more the state tries to satisfy these demands, the more guilty it is seen to be. In compliance with this logic, the anarchic agents focus their protest not on open dictatorships, but on the hypocrisy of liberal democracies, who are accused of betraying their own professed principles. The big demonstrations in London and Washington against the US attack on Iraq a few years ago offer an exemplary case of this strange symbiotic relationship between power and resistance. Their paradoxical outcome was that both sides were satisfied. The protesters saved their beautiful souls: they made it clear that they don't agree with the government's policy on Iraq. Those in power calmly accepted it, even profited from it: not only did the protests in no way prevent the already-made decision to attack Iraq; they also served to legitimise it. Thus George Bush's reaction to mass demonstrations protesting his visit to London, in effect: 'You see, this is what we are fighting for, so that what people are doing here – protesting against their government policy – will be possible also in Iraq!' It is striking that the course on which Hugo Chávez has embarked since 2006 is the exact opposite of the one chosen by the postmodern Left: far from resisting state power, he grabbed it (first by an attempted coup, then democratically), ruthlessly using the Venezuelan state apparatuses to promote his goals. Furthermore, he is militarising the barrios, and organising the training of armed units there. And, the ultimate scare: now that he is feeling the economic effects of capital's 'resistance' to his rule (temporary shortages of some goods in the state-subsidised supermarkets), he has announced plans to consolidate the 24 parties that support him into a single party. Even some of his allies are sceptical about this move: will it come at the expense of the popular movements that have given the Venezuelan revolution its élan? However, this choice, though risky, should be fully endorsed: the task is to make the new party function not as a typical state socialist (or Peronist) party, but as a vehicle for the mobilisation of new forms of politics (like the grass roots slum committees). What should we say to someone like Chávez? 'No, do not grab state power, just withdraw, leave the state and the current situation in place'? Chávez is often dismissed as a clown – but wouldn't such a withdrawal just reduce him to a version of Subcomandante Marcos, whom many Mexican leftists now refer to as 'Subcomediante Marcos'? Today, it is the great capitalists – Bill Gates, corporate polluters, fox hunters – who 'resist' the state. The lesson here is that the truly subversive thing is not to insist on 'infinite' demands we know those in power cannot fulfil. Since they know that we know it, such an 'infinitely demanding' attitude presents no problem for those in power 'So wonderful that, with your critical demands, you remind us what kind of world we would all like to live in. Unfortunately, we live in the real world, where we have to make do with what is possible.' The thing to do is, on the contrary, to bombard those in power with strategically well-selected, precise, finite demands, which can't be met with the same excuse.

Gilbert

No one method can achieve social change – cultural and representational experiments should be supplemented by collaboration with existing institutions.

Jeremy **GILBERT** Cultural and Political Theory @ East London **'14** *Common Ground: Democracy and Collectivity in an Age of Individualism* p. 200-206

Having said this, it would be problematic simply to dismiss projects such as Burning Man or even the Boom festival for their failure to exhibit these qualities: to some extent their lack of self-doubt and political ambition are conditions of possibility for their success as sites of relatively safe affective and symbolic experimentation. If they lack effective connections with wider political movements then the fault lies as much with those movements, or with all of us who might have built new ones but haven't yet. Although it is right to try to catalyse processes of democratic self-questioning and the interrogation of internal hierarchies in all social situations, it remains the case that in the face of neoliberalism's attempt to privatise every aspect of existence, it becomes politically crucial to defend every such possible site of' collective joy' (Ehrenreich 2007). It is also important to note, of course, that raves and festivals are very far indeed from exhausting the possible forms of such sites. I have referred to them consistently here because they constitute an easy illustration of what such a site can look like, and they have been through interesting processes of radicalisation and reterritorialisation over recent decades. There are many other such sites which are arguably much more important, however. Given its importance to the cultural life of millions, for example, the commercialisation and celebritisation of sport in recent years is arguably a far greater cause for concern. 16 And instances in which physical crowds gather are not of course the only significant potential sites of shared joyous affect. Social networking protocols are just the latest manifestation of the inherent capacity of advanced communications technologies to manifest this potential, at an extraordinary level of distribution and complexity, enabling all kinds of empowering connections to occur between disparate elements of human experience; and it is clearly a potential which companies such as Facebook wish to contain, delimit, and exploit carefully: ensuring, for example, that users maintain a single .individual profile, identifying themselves as easily trackableconsumers, and do not engage in any kind of activity which cannot be profitably data-mined. But I want to take this complexification of the idea of a 'site of collective joy' even further. I would suggest, in fact, that this kind of joy need not have anything to do with the physical proximity of bodies or the noise of the electronic crowd. Even an activity as superficially solitary as reading in a library can be understood as an experience of such a site, to the extent that it involves a creative and productive interaction between singularities: those elements of the reader's conscious and unconscious attention which are engaged in reading; the multiple ideas and possible uses thereof which are partially expressed in the books they read; the elements of the physical, architectural, economic, social, cultural and political assemblage which make the very existence of a library possible; and so on. A library can only exist - can only be individuated - as the consequence of a complex process of social interactions, and can only function well to the extent to which it works as a commons to increase the capacities of its users, while remaining sufficiently flexible and open in form and function to accommodate the invention of multiple and changing uses. Perhaps most importantly for our purposes, a library is not simply a public space or a private space, but must be at the same time both and neither, enabling a diverse population to share resources while also enabling each person, if necessary, to do so relatively undisturbed. This, just as much as the raving crowd (Gilbert 1997), incarnates the ideal of the multitude as a collectivity which empowers but does not suppress the singularity of its constituent elements; and it is possible to experience the democratic sublime in a moment of exemplary clarity or exhilarating confusion (or to experience the disempowerment of bored frustration} at least as much in the one place as the other. What such spaces have in common is that they are all, in a certain sense, spaces of decision, within and from which new individuations and new becomings can emerge. This is not to say they are necessarily spaces within which actual conscious choices are made (although they might be). In fact they are spaces within which we can only experience the ultimate impossibility of making a 'decision' or 'choice' according to the classical liberal model of the rational, intentional, autonomous and autochthonous subject: a decision which is final, which is ours alone, and which is an expression of only our rational interests. But it is by virtue of this fact that they are spaces conducive to the expansion of a field of potentiality and possibility, without which no new decisions, no new individuations, no collective joy, and hence no democracy are ever possible. Problems of Strategy and Government The arguments presented in this chapter so far invite some obvious reactions: How far is it possible to construct systems and institutions which facilitate the emergence of the kind of hetero-affective collective decisions described earlier in the chapter, not just at the level of political organisation, but also at the level of government? At the same time, at the level of political organisation itself: what happens when waiting for such events of collective individuation to emerge simply will not do, when circumstances demand that determinate, conscious choices have to be made here and now? One answer to this question is to observe that social change is of course not ultimately possible without determined efforts by broad-based aggregations of political forces co-ordinated by a viable political strategy: without, in other words, hegemonic projects. The democratic potential of the Latin

American multitude would not have reached any kind of realisation without the strategic co-ordination enabled by the political parties led by Chavez, Morales and Lula. The women's movement only secured significant results by successfully transforming the common sense of a majority of the public in many countries in the world and implementing consequent legislative change. The inability of, for example, the rave and festival movements in the United Kingdom to defend themselves from criminalisation and commercialisation is testament to how far being 'an affective process without a subject' gets you in the long term, if your enemies are stronger and better organised than you are (McKay 1996, Gilbert and Pearson 1999). One of the characteristics that all of the most successful political and cultural projects for democratisation share including but not limited to those already discussed in this chapter- is what I have called a 'strategic orientation' (Gilbert 2008b). By this I mean not a determinate strategy, but merely an awareness of the complexity and specificity of their strategic situation: their strengths, limitations, threats, opportunities and opponents in the broader field of political forces. However, if this sounds like a rather minimal concept, then so it should, because it is important not to have unreasonable expectations of those types of political and cultural intervention which necessarily operate on a 'molecular' scale. No single project, organisation, tendency or process can be expected to deliver radical social change; such change can only ever come about as the result of a complex distribution and aggregation of forces. The gains (and failures) of the women's movement, for example, have always been a product of relationships between interventions in the domains of affective relations, symbolic culture (for example, involving questions of the representation of women in print and broadcast media), political organisation (for example, involving questions of women's representation within political and governmental institutions), and institutional management (Fraser 2013). To put it crudely: the upshot of this observation is that the necessary task of hard political strategising should not be understood as falling on every group who wants to make social change happen: under conditions of advanced neoliberal post-democracy, it may well have to fall to established and well-resourced mainstream political organisations: the unions and the social-democratic parties, in particular, or those intermediary organisations which seek to mediate between them and a range of other social actorsY Conversely, professional political organisers and leaders may have to accept that they cannot bring about the cultural change which would make their political projects viable, and instead be on the lookout for sympathetic and potentially important tendencies as they emerge within wider culture. The complex interdependence between the 'molar' and 'molecular' dimensions of politics is not, of course, a new phenomenon and does not work in only one direction. For example, the efflorescence of radical democratic demands in the 1960s was itself partly a product of the successes of the social-democratic governmental projects from the 1930s onwards, which freed large populations from the immediate fear of poverty for the first time since the industrial revolution, so enabling a profounder imaginative challenge amongst many of them to existing social relations than would otherwise have been possible;18 this social-democratic success was itself made possible in part by the 'molecular' cultural changes of the inter-war period: in particular the diffusion of' modernism', in both its avant-garde and popular variants (Williams 1989). It is therefore obviously a mistake to imagine that either the strategic, molar and hegemonic or the molecular, affective and experimental dimensions of political struggle can ever be ignored. Nor can any one of them be expected to bear the full weight of hopes and demands for social change. In most contemporary contexts, it is to be expected that the multiple tasks required to make change possible are likely to be borne by quite different kinds of agent: from art movements to think tanks to university departments to civil society organisations to political parties. Such tasks include generating new modes of thought and perception which might contribute to cultural change; crystallising those affective changes into meaningful political demands; strategically co-ordinating a range of demands and constituencies into a viable political coalition; delivering a coherent programme for government which instantiates some of those changes; recruiting and mobilising a cadre of professional politicians who can implement this programme; sustaining the affective and semiotic potency of those demands to the point that such realisation becomes likely; and many others. Because such tasks require quite different dispositions and competences, it is not surprising that their agents often dislike each other and find mutual comprehension difficult; but it is probably necessary for any kind of democratic progress that there should exist a degree of what we might call 'molecular sympathy' between them. Arguably one of the most debilitating features of the political Left - mainstream and radical - in recent decades has been its inability to connect or even resonate at all with sites of radical cultural experimentation. 19 This raises once again the issue of what kinds of political organisation and institutional innovation might make radical democratic hopes concretely realisable. This is an issue addressed by Erik Olin Wright and Archon Fung in their co-edited book Deepening Democracy: Institutional Innm,ations in Empowered Participat01y Gwernance (Wright and Fung 2003). This work is largely a collection of studies of localised experiments in participatory and deliberative democracy, such as the famous Porto Alegre participatory budgeting process, or the decentralised planning process deployed by the leftist government of Kerala.20 In itself the collection stands as evidence for the viabilityof participatory democratic forms in wildly varying contexts; but what is particularly interesting for us here is the conclusion reached by the editors in their epilogue. Wright and Fung argue that such experiments in participatory democracy, at least under present socio-political conditions, are always in danger of degeneration into democratic inefficacy, or co-option, or neutralisation by more powerful political and commercial forces. They argue that these outcomes are only avoidable where there exists sufficient 'countervailing power' - in other words, sufficiently well-organised and mobilised political

constituencies- to defend their democratic status. Going further, they suggest that this countervailing power must be deployed by forces which are strong and well-organised, but whose relationship to government is **not habitually adversarial**, but instead **collaborative**: engaging in complex tactical problem-solving, and constructive institutional engagement, but from a position of strategic strength. Wright and Fung underscore, with a justified degree of pessimism, the difficulty of mobilising on such terms movements and organisations whose identities and practices are grounded in adversarial relationships to existing power structures. A number of the conceptual distinctions we have encountered in this study are relevant to understanding this argument. In Laclau's terms, Wright and Fung can be read as suggesting that such radical democratic innovation requires an 'institutionalist' (or perhaps we might coin the term 'counter-institutionalist'21) practice on the part of movements formed on a populist basis. Following Deleuze and Guattari, we could say that the difficulty they highlight is that of enacting a molecular deterritorialisation of existing institutions from the position of a molar collectivity. And yet the great value of the schizoanalytic perspective is that it demonstrates the extent to which every such molarity is already an assemblage, constituted by its lines of flight and its molecular processes, and so would suggest that such a transition need not be understood simply as the reversal of a group's constituted nature, but as an activation and intensification of its most dynamic constituent tendencies. This last phrase of mine deliberately echoes a key distinction made by Antonio Negri between 'constituent power' (the creative power of the multitude of which all true democracy is an expression) and 'constituted power' (actually existing institutions of government) (Negri 1999). In fact what seems to be at stake here is a generalised extension of Gramsci's concept of political struggle as a 'war of position', a sort of ongoing trench or siege warfare which is distinguished from the full-frontal revolutionary assault of the classic 'war of manoeuvre' or 'war of movement'. The same thing happens in the art of politics as happens in military art: war of movement increasingly becomes war of position, and it can be said that a State will win a war in so far as it prepares for it minutely and technically in peacetime. The massive structures of the modem democracies, both as State organisations, and as complexes of associations in civil society, constitute for the art of politics as it were the 'trenches' and the permanent fortifications of the front in the war of position. (Gramsci 1971: 243) Wright and Fung's formulation develops an element which is already implicit in Gramsci's: even while it is strategising against its opponents and inventing institutions of its own, a radical force must have a constructive, creative dimension. The implication of the foregoing argument is that this creative dimension cannot be expressed only through the positive, ex nihilo construction of new institutions it also requires processes of molecular, transformative engagement with existing systems.

Permutation Stuff

Perm – Negativity Combined with Positivity

Their insistence on negativity as the starting point and generating competition is problematic—only our inclusive approach can create movements and tangible change

(Kai Frithjof, is founder and Director of the Peace Action, Training and Research Institute of Romania (PATRIR) and Co-Director of TRANSCEND, and is on the Executive Board of the TRANSCEND Peace University (TPU) where he is Course Director for the courses Peacebuilding and Empowerment and War to Peace Transitions. He has worked in Afghanistan, India, Pakistan, Nepal, Russia, South Eastern Europe, North America, Colombia, Somalia, Cambodia, Aceh-Indonesia and the Middle East at the invitation of governments, inter-governmental organisations, UN agencies, and local organisations and communities. He has written and published widely, and is author of The Struggle Continues: The Political Economy of Globalisation and People's Struggles for Peace (Pluto, forthcoming), co-author, together with Johan Galtung and Carl Jacobsen, of Searching for Peace: The Road to TRANSCEND (Pluto, 2000 & 2002) and Editor of the TRANSCEND book series published together with Pluto Press, Constructive Peace Studies: Peace by Peaceful Means. He is a member of the Executive Board of the Journal of Peace and Development and the Executive Board of the Centre for Peace and Conflict Resolution. In 1999 he was founder and Director of the Coalition for Global Solidarity and Social Development, and in 2000, together with Johan Galtung, he was founder of the Nordic Institute for Peace Research (NIFF). Since 1996 he has provided more than 250 training programmes in peacebuilding, development, and constructive conflict transformation to more than 4000 participants in 30 countries. http://www.globalsolidarity.org/articles/peace_means_kai.html)

Peace by Peaceful Means Dear Friends, The discussions which have taken place over e-mail over the past few days have been extremely interesting. I have just returned from Oslo where the 100th anniversary of the Nobel Peace Prize was being celebrated. The obvious contrast between the rather elite 'suit' dominated celebrations in Oslo and the realities of what is occurring in the world today was stark. Questions of strategy, tactics and visions for how we work to bring about change, to transform all forms of violent conflict -- direct, structural, and cultural -- and to empower, mobilise, and involve people in a mass, broad-based movement for peace and to build the alternatives we are looking for, are vital. In Norway alone, to take one example, perhaps 80% of people think what is happening now in and over Afghanistan is wrong, either completely or at least in part, and yet all they hear from the media, academics and politicians is constant support and acclaim for the 'justness' of this war (or indeed, any war in which it is 'we' against 'them'). Small groups of people and 'NGOs', in Norway as in every single country, are trying to bring forward alternatives, to raise their voices, and to protest/oppose what they think is wrong. While these organisations are in every case much smaller than our governments and militaries going to war, they often represent the social majority. A major challenge they face, however, is how to reach out to people, how to involve people, and how to develop alternatives which make sense to people tired of war and violence (whether of the kind we are seeing in Afghanistan, or of a global economic system killing 100,000 a day). Negative slogans and opposition to what is wrong is not enough however. It is not enough, but it is necessary. 'Basta!', 'Enough!' was perhaps the most 'revolutionary' cry of the last decade, and still is in many parts of the world. The simple, courageous act, of standing up when we see that something is wrong, and stating that it is wrong, not cooperating with it, can be a powerful and evocative symbol. When we are having our conferences, discussions and meetings in whichever city, town or village of the world we may be found, we should always remember that the vast majority of people in our own city, town or village, as well as the entire rest of the world, have no idea that we are there, meeting. The vision, hope and ideas which bring people to these conferences are, in the vast majority of cases, kept marginalised, on the periphery Yet that is also part of our own responsibility, technique and methods. Basta! became a cry to inspire millions, because those who said it lived it, refusing to cooperate any longer with what they know to be wrong. While Basta! may be the most revolutionary cry or word today, transforming all forms of direct, structural, and cultural violence is the greatest challenge The two are inclusive and complementary, not exclusive. We need to state clearly our opposition to violence, war, injustice and exploitation (the 'peace movement' has often been willing to do the first two, not always as willing on the last two), and we need also to build a constructive, positive programme It is not only a question of what we are against, but what we are for. When we criticize what we think is wrong, people will also want to know what we think could be done instead. In these cases, our answers must seem real and viable to people. The 'anti-globalisation' movement is therefore also a social justice movement; 'non-governmental organisations' should also be people's organisations or people's movements; and one of our challenges today will be to build upon the growing 'anti-war' movement, transforming it also into a peace movement. A step further, as many social and peace activists have recognised, will be to link the peace and social justice movements. Slogans and messages are important, as are practice and vision. It will not be possible today to unite broad numbers of people around issues which they feel are too abstract and divorced from them. The 'abolish the debt' campaign/movement was successful because people were able to see the clear linkages between debt and the effective colonisation and enslavement of countries and

people across the south, as well as the incredible suffering and destruction it brought. The Jubilee 2000 'campaign' however, unlike the Jubilee South movement which continues today, did not reach its objective of having the debt cancelled. Instead, while many people around the world believe the problem has been solved, the debt-system and the burden it places upon countries has become even more extreme. Going from 'campaigns' to movements will also be important, though even here it is not a question of 'either/or' but 'both/and' with individual campaigns extremely useful and effective at times for involving people, raising awareness and mobilising around specific issues, strengthening further the broader movements of which they may be a part. Today, a movement for demos kratos is necessary and vital for any movement or work towards peace. To speak about the United States or any government in the world today as a 'democracy' is a ridiculous farce. They are highly elite dominated systems built upon massive structures and cultures of violence, and willing to use overwhelming (Powel Doctrine) violence when necessary to enforce their needs and/or interests. At best they may be demagogia's, where elites maintain power by promising the people what they will do for them (we call this 'elections'), but they are not system's or societies built upon people's power, demos kratos. Decisions to go to war are made by tiny numbers of people. Our economic and political policies are constructed for us, often to the detriment of the social majorities who are told to 'leave well enough alone' and trust in the experts. This is sometimes as true of politicians as it is of non-governmental organisations who themselves frequently prefer the conference halls and well-funded projects to actually working democratically with people as part of the people themselves. An alternative today, what Johan Galtung has called for, with 10,000 dialogues, meetings, discussions at every level, focussing not only on what is wrong, but also on what we want therapy, ideas, alternatives. In one form or another many of these dialogues are taking place. In a way they are therapy for the massive amounts of violence we are all being exposed to today, in our cultures, in our world, on our television sets or in the speeches of our 'democratically elected' rulers (the question, for those who do not support their policies, should not be 'who put them in power' -- though this is also important -- but why haven't we removed them from power yet_). They are also empowering, if we take the step beyond saying what is wrong to what **could be done** , what should be done_, and then go further to discussing what I/we can do about it. Mobilising people for peace today is not simply about a slogan (though coming up with clearly expressed messages in a few words will of course help us to link people together and raise awareness). What is necessary, beyond any single issue or top-level strategy for how to change the world, is the **process**. The way is the goal. Perhaps the greatest achievement of the social justice/anti-globalisation movement is that it has mobilised, involved, and empowered millions of people around the world in discussing, thinking about, and acting upon the realities around them. On the streets of Seattle, Praha, Okinawa, Melbourne, Gotheburg, Washington, Quebec, Genoa, Ottawa, people, many of whom refuse to vote, have been discussing foreign policy, domestic politics, people to people movements, and all the issues which politicians and well-established NGOs are not able and often not willing to discuss with people. We have our 'manifestos', our policies and plans which we wish to put forward in the name of people, often addressing them to 'politicians' and 'elites' believing, in a fundamentally undemocratic way, that they will be the ones to bring about and implement change for us. This is not to say that that is not an important level which we also need to work at. The broader vision here is both/and, not either or, in terms of strategy as well often of vision. We also need, however, to be willing to take part in the much slower, more timely, and more empowering process of tens of thousands of dialogues together with people, communities, and organisations at every level. Solidarity today is **being built** upon and carried further into alliances not just supporting people in their struggles for social justice, peace and freedom, but carrying forward those struggles ourselves in our own communities, our own towns, cities and villages. If we wish to change the injustices taking place in the world today we must of course work on a global level, but we must also work, just as importantly, within our communities. Again, **both/and** rather than either or **We should also be wary when we say 'we must begin here', or 'this must be done first**!', even when the message is very positive and constructive. 'We must begin with the individual!'. 'We must begin by changing society!'. 'We must begin with a culture of peace!'. 'We must begin by ending the debt!'. **All of these**, and the **many others** put forward, are extremely important issues. **They are also all linked together**. Again, both/and. Exclusive and elitist visions will only serve to **further fragment** our efforts, creating division and separation where what is needed is dialogue, solidarity, cooperation and alliances between movements/organisations which often take diverse strategies and approaches to addressing deeply interlinking injustices and structures and cultures of violence. Conscientisation (raising awareness, often political awareness -- but also social, cultural, economic), organisation (we can do more together than we can apart, and it is necessary to organise -- though in many different ways -- to be able to bring about changes, both against what we think is wrong and for what we think is right), mobilisation (bringing in more and more people, involving people in dialogues, discussion, action, and work for change/transformation), and empowerment (I/we can, rather than 'I/we can't'; also important recognising the power we have to bring about change, rather than simply accepting existing, often extremely violent, power structures and believing that change can/should/must be implemented by those 'in power', whether slave owners, men, politicians, or fuhrers) are **all necessary**.

Institutions KT Solve Anti-Blackness

the law is obviously problematic, but that's a reason we should hold it accountable to live up to its ideals

Crenshaw 88

(Kimberle, Law @ UCLA, "RACE, REFORM, AND RETRENCHMENT: TRANSFORMATION AND LEGITIMATION IN ANTIDISCRIMINATION LAW", 101 Harv. L. Rev. 1331, lexis)

Questioning the Transformative View: Some Doubts About Trashing The Critics' product is of limited utility to Blacks in its present form. The implications for Blacks of trashing liberal legal ideology are troubling, even though it may be proper to assail belief structures that obscure liberating possibilities. Trashing legal ideology seems to tell us repeatedly what has already been established -- that legal discourse is unstable and relatively indeterminate. Furthermore, trashing offers **no idea of how to avoid the negative consequences of engaging in reformist discourse** or how to work around such consequences. Even if we imagine the wrong world when we think in terms of legal discourse, **we must nevertheless exist in a present world** where legal protection has at times been a blessing -- albeit a mixed one. The fundamental problem is that, although Critics criticize law because it functions to legitimate existing institutional arrangements, it is precisely this legitimating function that has made law **receptive to** certain demands in this area. The Critical emphasis on deconstruction as the vehicle for liberation leads to the conclusion that engaging in legal discourse should be avoided because it reinforces not only the discourse itself but also the society and the world that it embodies. Yet Critics offer little beyond this observation. Their focus on delegitimating rights rhetoric seems to suggest that, once rights rhetoric has been discarded, there exists a more productive strategy for change, one which does not reinforce existing patterns of domination. Unfortunately, **no such strategy has yet been articulated**, and it is difficult to imagine that racial minorities will ever be able to discover one. As Frances Fox Piven and Richard Cloward point out in their [*1367] excellent account of the civil rights movement, popular struggles are a reflection of institutionally determined logic and a challenge to that logic. 137 **People can only demand change in ways that reflect the logic of the institutions that they are challenging**. 138 Demands for change that do not reflect the institutional logic -- that is, demands that do not engage and subsequently reinforce the dominant ideology -- will probably be **ineffective.** 139 The possibility for ideological change is created through the very process of legitimation, which is triggered by crisis. Powerless people can sometimes trigger such a crisis by challenging an institution internally, that is, by using its own logic against it. 140 Such crisis occurs when powerless people force open and politicize a contradiction between the dominant ideology and their reality. The political consequences [*1368] of maintaining the contradictions may sometimes force an adjustment -- an attempt to close the gap or to make things appear fair. 141 Yet, because the adjustment is triggered by the political consequences of the contradiction, circumstances will be adjusted only to the extent necessary to close the apparent contradiction. This approach to understanding legitimation and change is applicable to the civil rights movement. Because Blacks were challenging their exclusion from political society, the only claims that were likely to achieve recognition were those that reflected American society's institutional logic: legal rights ideology. Articulating their formal demands through legal rights ideology, civil rights protestors exposed a series of contradictions -- the most important being the promised privileges of American citizenship and the practice of absolute racial subordination. Rather than using the contradictions to suggest that American citizenship was itself illegitimate or false, civil rights protestors proceeded as if American citizenship were real, and demanded to exercise the "rights" that citizenship entailed. By seeking to restructure reality to reflect American mythology, Blacks relied upon and ultimately benefited from politically inspired efforts to resolve the contradictions by granting formal rights. Although it is the need to maintain legitimacy that presents powerless groups with the opportunity to wrest concessions from the dominant order, it is the very accomplishment of legitimacy that forecloses greater possibilities. In sum, the potential for change is both created and limited by legitimation. 139 The possibility for ideological change is created through the very process of legitimation, which is triggered by crisis. Powerless people can sometimes trigger such a crisis by challenging an institution internally, that is, by using its own logic against it. 140 Such crisis occurs when powerless people force open and politicize a contradiction between the dominant ideology and their reality. The political consequences [*1368] of maintaining the contradictions may sometimes force an adjustment -- an attempt to close the gap or to make things appear fair. 141 Yet, because the adjustment is triggered by the political consequences of the contradiction, circumstances will be adjusted only to the extent necessary to close the apparent contradiction. This approach to understanding legitimation and change is applicable to the civil rights movement. Because Blacks were challenging their exclusion from political society, the only claims that were likely to achieve recognition were those that reflected American society's institutional logic: legal rights ideology. Articulating their formal demands through legal

rights ideology, civil rights protestors exposed a series of contradictions -- the most important being the promised privileges of American citizenship and the practice of absolute racial subordination. Rather than using the contradictions to suggest that American citizenship was itself illegitimate or false, civil rights protestors proceeded as if American citizenship were real, and demanded to exercise the "rights" that citizenship entailed. By seeking to restructure reality to reflect American mythology, Blacks relied upon and ultimately benefited from politically inspired efforts to resolve the contradictions by granting formal rights. Although it is the need to maintain legitimacy that presents powerless groups with the opportunity to wrest concessions from the dominant order, it is the very accomplishment of legitimacy that forecloses greater possibilities. In sum, the potential for change is both created and limited by legitimation.

Must take action---pessimism doesn't necessitate passivity

Seidman 11

(Louis Michael Seidman 11, Professor of Constitutional Law at Georgetown, Hyper-Incarceration and Strategies of Disruption: Is There a Way Out?, moritzlaw.osu.edu/osjcl/Articles/Volume9_1/Seidman.pdf)

<u>My worry</u> about myself <u>is not that I would make a wrong choice</u> between these alternatives, <u>but that I would **avoid the necessity of choice by adopting a stance of world-weary passivity or complacent indifference**</u>. <u>There is no good way to deal with overwhelming evil, but there is surely a way not to deal with it</u>. <u>Willful blindness</u>, craven apologetics, <u>and</u> flaccid <u>acquiescence are not options when millions of our fellow inhabitants are behind bars</u>. Like the people of good will trapped in Nazi Europe, <u>we</u> opponents of hyper-incarceration <u>need to</u> confront the truth of our situation and <u>be honest about how bleak the prospects are</u>. **But pessimism should not be confused with passivity.** <u>Even if our efforts accomplish nothing at all, and whatever form our politics take, we must do what we can to stop the horror.</u> ¶ Our personal dignity demands no less.

Reforms Work – Pyle

Pure resistance entrenches the status quo---must be willing to propose imperfect reforms

Pyle 99

(Jefferey, Boston College Law School, J.D., magna cum laude Race, Equality and the Rule of Law: Critical Race Theory's Attack on the Promises of Liberalism, 40 B.C.L. Rev. 787)

For all their talk of "realism,"'" race-crits are strangely unrealistic in their proposals for reform. 1 m7 Most probably realize that radical measures like racial or ethnic reparations are not likely to be granted, especially by a court. But even unrealistic proposals are rare, because race-crits generally prefer not to suggest solutions, but to "resist" the dominant legal thought, doctrine and policy, whatever that happens to be.'" As Derrick Bell has put it, "most critical race theorists are committed to a program of scholarly resistance, and most hope scholarly resistance will lay the groundwork for wide-scale resistance."'" How this ivory tower oppositionalism would foment grassroots revolt is unclear, because CRT professors rarely suggest anything practical. Rather, their exhortations are meant, as Bell says, to "harass white folks" and • thereby "make life bearable in a society where blacks are a permanent, subordinate class."'" One of the race-erns' few practical programs of "resistance" is Paul Butler's proposal that inner-city juries practice racially-based jury nullification.'91 jurors of color, Butler argues, have the "moral responsibility" not to apply the criminal law to blacks and whites equally, but to "etnancipate some guilty black outlaws" because "the black community" would be "better off" if there were fewer black men in prison.'" If enough juries were hung or not-guilty verdicts rendered, he imagines, the white-dominated government would change its excessive reliance on incarceration.'" Butler rejects the ordinary democratic process of legal reform.' Democracy, he says, ensures a "permanent, homogenous majority" of whites that "dominat[es]" African Ainericans.w5 Butler is probably correct that occasional acts of jury nullification might well express the resentment that many African Americans justifiably feel towards discriminatory law enforcement.'"`' As Randall Kennedy has pointed out, however, black Americans are disproportionately the victims of crimes,'97 and therefore tend to favor more, not less, criminal prosecution and punishment. 1 "8 The race-crits' preference for "resistance"''99 over democratic participation seems to flow from a fear of losing their status as "oppositional scholars] "200 to the game of mainstream law and politics, which they regard as "an inevitably co-optive process?"' Better to be radically opposed to the "doniinant political discourse""2 and remain an out than to work within the current system and lose one's "authenticity?" In rejecting the realistic for the "authentic," however, race-crits begin to look like academic poseurs—ideological purists striking the correct radical stance, but doing little within the confines of the real world, so sure are they that nothing much can be done."

Coalitions Key

Perm's best---the alt alone causes imperialistic domination

Churchill 3

(Ward, former professor of ethnic studies at the University of Colorado at Boulder Acts of Rebellion: The Ward Churchill Reader pg 106)

It is in this last connection that the greatest current potential may be found, not only for the Newes in their struggle to retain (or regain) their homeland, but for (re)assertion of indigenous land rights more generally, and for the struggles of nonindians who seek genuinely positive alternatives to the North American status quo. In the combination of forces presently coalescing in the Nevada desert lie the seeds of a new sort of communication, understanding, respect, and the growing promise of mutually beneficial joint action between native and nonnative peoples in this hemisphere.294 For the Shoshones, the attraction of a broad—and broadening—base of popular support for their rights offers far and away the best possibility of bringing to bear the kind and degree of pressure necessary to compel the federal government to restore all, or at least some sizable portion, of their territory. For the nonindian individuals and organizations involved, the incipient unity they have achieved with the Newes represents both a conceptual breakthrough and a seminal practical experience of the fact that active support of native land rights can tangibly further their own interests and agendas.295 For many American Indians, particularly those of traditionalist persuasion, the emerging collaboration of nonindian groups in the defense of Western Shoshone lands has come to symbolize the possibility that there are elements of the dominant population that have finally arrived at a position in which native rights are not automatically discounted as irrelevancies or presumed to be subordinate to their own.296 On such bases, bona fide alliances can be built. Herein lies what may be the most important lesson to be learned by those attempting to forge a truly American radical vision, and what may ultimately translate that vision into concrete reality: Native Americans cannot hope to achieve restoration of the lands and liberty which are legitimately theirs without the support and assistance of nonindians, while nonindian activists cannot hope to effect any transformation of the existing social order which is not fundamentally imperialistic, and thus doomed to replicate some of the most negative aspects of the present system, unless they accept the necessity of liberating indigenous land and lives as a matter of first priority.297 Both sides of the equation are at this point bound together in all but symbiotic fashion by virtue of a shared continental habitat, a common oppressor, and an increasingly interactive history. There is thus no viable option but to go forward together, figuratively joining hands to ensure our collective well-being, and that of our children, and our children's children.

AT: Coalition Link

Critique of the racial state shouldn't preclude appeals to state-based politics.

Lipsitz 4 George Black Studies @ UC SB "Abolition democracy and global justice" *Comparative American Studies* 2 (3) p. 271-276

Abstract As new social relations produce new kinds of social subjects, scholars in American Studies and Area Studies experience anxieties about disciplinary as well as geographic borders. The Civil Rights tradition of the 14th Amendment plays an important role within progressive American Studies scholarship, but in the course of seeking equality and exclusion within the USA, this tradition runs the risk of occluding the role of the nation in the world and its central role in creating and preserving inequality and injustice in other nations. An emerging emphasis on struggles for social justice without seeking state power encapsulates many of the most progressive impulses within Area Studies and transnational studies, yet this perspective runs the risk of occluding the enduring importance of the nation-state in inflecting global developments with local histories and concerns. The present moment challenges us to draw on both traditions, and to use each to critique the shortcomings of the other, while at the same time promoting an inclusionary, nonsectarian, and mutually supportive dialogue about our differences. Keywords American Studies ● Area Studies ● inequality ● transnationalism In Jack Conroy's 1935 short story 'The Weed King', a stubborn Missouri farmer wages a one person war against the weeds that spring up in his fields. Believing that farming would be an easy job if it were not for the weeds, he dedicates himself to their eradication with a zeal that astounds his fellow workers. The 'weed king' embraces his war against weeds as his reason for being. 'His only vanity,' Conroy tells us, is his belief that he has 'put the quietus to more weeds than any man, woman, child or beast west of the Mississippi' (Conroy, 1985: 101). Even in the winter time when snow covers the ground, the zealot worries night and day about the tiny seeds waiting to bloom in the spring. One of his neighbors points out that weeds have their uses too, that many of them have greatly-needed medicinal powers. However, the weed king is not deterred. He soon succeeds in suppressing most of the weeds on his property. His singleminded zealotry has its costs, however. The measures he takes to kill the weeds prove fatal to his crops as well. At the present moment of tumultuous transformation and change, scholars in American Studies and Area Studies might be tempted to emulate the weed king, to keep a keen eye on our fields to protect what we have been cultivating for so many years, to view each other's work with trepidation and counter-insurgent zeal. American Studies scholars worry that the growing enthusiasm for transnational studies threatens to focus too much on exchanges across national boundaries, in the process occluding the unique, particular, and specific inflections given to those processes by distinct national histories, cultures, and politics. Area Studies specialists, many of whom have been part of a decades-long tradition dedicated to constructing epistemologies and ontologies that resist the hegemony of the monolingual, monocultural, and nationalist scholarship of the US academy, rightly fear that a transnational or postnational American Studies might simply project American Exceptionalism onto a broader geographic terrain. Outside the USA, specialists in both American Studies and Area Studies have reason to fear that (wittingly or unwittingly) scholars from the USA will use the power of US capital, communications media, and commerce to substitute a US-centric monologue masquerading as a dialogue for the greatly needed polylateral communication and collaboration that a transnational world requires. At a time when substantive changes in social structures, technology, and politics are radically reconfiguring the relations linking culture, time, and place, policing the boundaries of disciplines speaks to deep desires for continuity and certainty. It is possible to look at the current ferment in our fields and see only what is being lost, to become subsumed with melancholy about lost conversations and conventions. Yet scholarly research should be conducted out of conviction, rather than out of habit. If we are not careful, our work can come to resemble Swedish anthropologist Ulf Hannerz's definition of Scandinavian cooking – something passed down from generation to generation for no apparent reason (Hannerz, 1992: 42). Like the weed king, we can worry night and day about the purity of our fields. As new social relations throw forth fundamentally new social subjects with new epistemologies, ontologies, archives, and imaginaries, new patterns of scholarly inquiry will inevitably emerge. Will shallow forms of cultural and ideological critique eclipse the grounded insights produced by ethnography or social history? Will the fetishes of archival and ethnographic research methods produce empiricist and myopic work lacking in self-reflexivity? Will comparative work lack the cultural and linguistic depth traditionally produced by primarily national studies? Will national studies ignore the ways in which nationalism itself is a transnational project? Will the proliferation of new social subjects and new objects of study come at the expense of marginalizing aggrieved social groups or will it teach us how social identities become conflated with power in richly generative and productive ways? It is understandable that these kinds of questions arise when we try to do our work. Anything worth doing can nonetheless be done badly, and principled questions from colleagues protect our interests as well as theirs. Yet counter-insurgency is a poor model for scholarly work, and too much attention to pulling out weeds can kill the crops. Even more important, weeds can have

curative powers if we learn to use them correctly. The author of 'The Weed King' confided to his biographer that his mother believed that 'weeds' were simply plants for which no use had yet been found (Wixon, 1994: 32). The 'weeds' that invade a field can also inform it in crucially important ways if we learn to recognize their curative powers. Within American Studies, the tradition of 14th Amendment Americanism may seem like the quintessential expression of American exceptionalism. Forged from the freedom dreams and collective struggles of an enslaved people, the 14th Amendment stands as an enduring symbol of the accomplishments of the abolition democracy that ended slavery in the wake of the Civil War. More than a specific Constitutional provision promising equal treatment under law, the 14th Amendment has functioned as a widely shared social warrant authoring and authorizing new ways of knowing and new ways of being. In his indispensable work, Black Reconstruction in America, W.E.B. Du Bois demonstrated how slaves fighting for their freedom soon realized that it would not be enough to be merely 'free' in a society premised on their exclusion. In the course of staging a general strike in the fields, running away from slavery to swell the ranks of the Union army, and joining together to work land liberated by military force, they formulated a political perspective that Du Bois named 'abolition democracy' (Du Bois, 1995). They fought for the 13th, 14th, and 15th Amendments to the Constitution. At the Charleston Black Convention in 1865 they called for more than nominal freedom, for the development of their full being as humans. Between 1865 and 1877 they fashioned alliances with poor whites to elect progressive majorities to office, and their successes led to the first universal public education systems in the South, to governments that subsidized the general economic infrastructure rather than just the privileges and property of the elite. Although betrayed by the Compromise of 1877, by the removal of federal troops from the South, by the legal consolidation of the combination of sharecropping and Jim Crow Segregation, and by Supreme Court decisions that took protections away from black people and extended them to corporations, abolition democracy and the 14th Amendment successfully challenged the hegemony of white male Protestant propertied power. It opened the door for subsequent claims for social justice by immigrants and their children, religious minorities, women, workers and people with disabilities. From voting rights to affirmative action, from fair housing to fair hiring, the 14th Amendment is an enduring and abiding force for social justice in US society. Yet American Studies scholarship that subsumes social justice under the rubric of the 14th Amendment runs the risk of ignoring the position of the USA in the world. Celebrating struggles for citizenship inside the USA can work to strengthen the distinctions between citizens and aliens, providing legitimation for nationalist and nativist policies that impose enormous suffering on humans precisely because they are not US citizens. The legacy of the 14th Amendment has not prevented women and blacks in contemporary California from supporting anti-immigrant nativism through Proposition 187, aimed at denying immigrants and their children needed state services, or through Proposition 227, banning bilingual education in the state's classrooms. Post-1965 immigrants from Asia, who owe their entry into to the USA to the civil rights movement and its exposure of previous national origin quotas as racist, have not been immune to pursuing the privileges of whiteness for themselves by opposing affirmative action and school desegregation policies vital to the well-being of blacks and Latinos. At the same time, the power inequalities that separate even the most aggrieved US citizens from the masses of poor and working people around the world can render struggles for full 14th Amendment rights by US citizens to be little more than what Martin Luther King, Jr used to describe as 'an equal right to do wrong'. Certainly the prominence of Colin Powell and Condoleeza Rice in forging the rationale for the 2003 invasion and occupation of Iraq demonstrates the limits of this form of inclusion. If abolition democracy emblematizes the emancipatory tradition within American Studies, the idea of collective and linked struggles for change without aiming for control over any one state expresses the uniquely generative stance within transnational social movements and transnational scholarship. Articulated in the form of a manifesto in John Holloway's Change the World Without Taking Power, this sensibility has taken on activist form in the work of the EZLN in Mexico, the Gabriela Network in the Philippines, and the Okinawan Women Act Against Military Violence in that Japanese prefecture (Holloway, 2002). These movements make demands on the state and recognize the specificity of national histories, cultures and politics, but their aspirations and activities cannot be contained with any single national context. The activities of the Okinawan Women Act Against Military Violence (OWAAMV) demonstrate the importance of a transnational perspective that goes beyond the history, culture, and politics of any single nation state (Fukumura and Matsuoka, 2002). Coming from a country that has been serially colonized since the 17th century and occupied militarily by both the USA and Japan, OWAAMV activists cannot solve their problems within a single national context. Disadvantaged by colonial status, race, and gender, they cannot turn to national liberation, anti-racism or feminism as their sole context for struggle. Coming from a small island with a limited population in a corner of the world far removed from metropolitan centers of power, they must forge alliances with outsiders based on political affinities and identifications, rather than counting on the solidarities of sameness that sustain most social movements. As eyewitnesses to brutal combat on the island in 1945 that killed more than 130,000 Okinawan civilians (one-third of the local population) and tens of thousands of Japanese and US military personnel, they find it impossible to celebrate organized violence and masculinist militarism (Hein and Selden, 2003: 13). As women confronted with the pervasive presence of commercial sex establishments, sex tourism and rapes of civilian women and girls by military personnel, they see gender as a central axis of power and struggle. The complicated history that brought the OWAAMV into existence, and which vexes them in so many ways, has produced new ways of being and new ways of knowing that contain enormous generative power for scholars in Ethnic Studies and American Studies. They do not seek to make their nation militarily superior to others. Instead, they argue that massive preparation for war increases rather than decreases the likelihood of violence. Moreover, they argue that military spending creates security for states and financial institutions but not for people. They charge that expenditures on war serve to contain and control people like themselves who oppose the global economic system, who challenge neoliberal policies designed to privatize state assets, lower barriers to trade and limit the power of local entities to regulate the environment. Perhaps most important, they call for a new definition of 'security', one that places the security of women, children and ordinary people before the security of the state and financial institutions. They 'queer' the nation – not because they take an explicit position on the rights of gays and lesbians, but because they interrupt and contest the narrative of patriarchal protection upon which the nation-state so often rests. By necessity, the OWAAMV go beyond the categories and cognitive mappings of area studies. They are citizens of Japan, but also victims of Japanese and US colonialism. On most issues, they feel more in solidarity with the indigenous Sovereignty Movement in Hawai'i or the Gabriela network mobilizing against sex tourism and sex work near military bases than they do with their fellow citizens of Japan. The nature of US imperialism forces them to seek alliances with pacifists and feminists in the USA, with Puerto Rican activists fighting against US military exercises on the island of Vieques, and with the Okinawans transported to

Bolivia during the Cold War era when the Japanese and US governments relocated them in that South American nation so their land could be appropriated for military uses. They feel solidarity with witnesses to war and empire everywhere, recognizing that the things that have happened in their part of the Pacific cannot be contained within any one 'area' of study. Transnational organizing of mobilizations for change, without directly seeking to take state power, speak directly to the new circuits and networks of power emerging from new forms of production, consumption, communication and repression. They often display brilliant ingenuity in fashioning seemingly unlikely short-term alliances, affinities and identifications with people across class, gender, race and national lines. Yet this very tactical dexterity makes it difficult to turn temporary victories into long-term institutional changes. Strategies that manifest the mobility and dynamism required for challenging transnational corporations and financial institutions often lack the concentrated power needed to challenge the enduring power of the state and its control over the prisons, armies and police agencies deployed in support of private power everywhere. Even more important, flexible, fluid and dynamic coalitions often lack both the organic solidarity and the connecting ideology that make movements successful. Groups engaged in this kind of struggle can become unexpected allies in each other's struggles, but they can also easily be manipulated into fighting against each other if they do not develop a systemic analysis of global power. Scholars can be pitted against each other as easily as aggrieved communities can. In an era of carefully orchestrated challenges to public education, scholarly independence and critical thinking, it is likely in the near future that every department, discipline and field will be encouraged to defend its own worth by belittling others, to compete for scarce and declining resources by inflating its own achievements at the expense of others. A losing proposition in politics, this 'race to the bottom' would be even more disastrous for scholarship because it encourages parochialism and defensive localism at precisely the moment when we most need dialogue, generosity and cosmopolitanism. It is important in this context to identify and learn from scholarly works that offer models of principled and productive synthesis between American Studies and Area Studies. Fortunately, both well established classics and promising new work in both American Studies and Area Studies contain this generative potential. The scholarly works of W.E.B. Du Bois and Walter Rodney provide especially useful and generative models from the past, while recent studies by Melani McAlister, Lise Waxer, Roderick Ferguson and Clyde Woods pose bold and exciting challenges in the present (Ferguson, 2004; McAlister, 2001; Waxer, 2002; Woods, 1998).

AT: Anti-blackness link

Their use of the black-white binary accords no power to other non-white groups to contest the racial landscape. This undermines their analysis of race

Michael **OMI**, Associate Professor at UC Berkeley, **AND** Howard **WINANT**, Sociology at the University of California, Santa Barbara, **13** ["Resistance is futile?: a response to Feagin and Elias," Ethnic and Racial Studies, Vol. 36, Issue 6, 2013]

In the USA today it is important not to frame race in a bipolar manner. The black/white paradigm made more sense in the past than it does in the twenty-first century. The racial make-up of the nation has now changed dramatically. Since the passage of the Immigration Reform Act of 1965, the USA has become more 'coloured'. A 'majority–minority' national demographic shift is well underway. Predicted to arrive by the mid-twenty-first century, the numerical eclipse of the white population is already in evidence locally and regionally. In California, for example, non-Hispanic whites constitute only 39.7 per cent of the state's population. While the decline in the white population cannot be correlated with any decline of white racial dominance, the dawning and deepening of racial multipolarity calls into question a sometimes implicit and sometimes explicit black/white racial framework that is evident in Feagin and Elias's essay. Shifting racial demographics and identities also raise general questions of race and racism in new ways that the 'systemic racism' approach is not prepared to explain.3 Class questions and issues of panethnicizing trends, for example, call into question what we mean by race, racial identity and race consciousness. No racially defined group is even remotely uniform; groups that we so glibly refer to as Asian American or Latino are particularly heterogeneous. Some have achieved or exceeded socio-economic parity with whites, while others are subject to what we might call 'engineered poverty' in sweatshops, dirty and dangerous labour settings, or prisons. Tensions within panethnicized racial groups are notably present, and conflicts between racially defined groups ('black/brown' conflict, for example) are evident in both urban and rural settings. A substantial current of social scientific analysis now argues that Asians and Latinos are the 'new white ethnics', able to 'work toward whiteness'4 at least in part, and that the black/white bipolarity retains its distinct and foundational qualities as the mainstay of US racism (Alba and Nee 2005; Perlmann 2005; Portes and Rumbaut 2006; Waters, Ueda and Marrow 2007). We question that argument in light of the massive demographic shifts taking place in the USA. Globalization, climate change and above all neoliberalism on a global scale, all drive migration. The country's economic capacity to absorb enormous numbers of immigrants, low-wage workers and their families (including a new, globally based and very female, servant class) without generating the sort of established subaltern groups we associate with the terms race and racism, may be more limited than it was when the 'whitening' of Europeans took place in the nineteenth and twentieth centuries. In other words this argument's key precedent, the absorption of white immigrants 'of a different color' (Jacobson 1998), may no longer apply. Indeed, we might think of the assimilationist model itself as a general theory of immigrant incorporation that was based on a historically specific case study – one that might not hold for, or be replicated by, subsequent big waves of immigration. Feagin and Elias's systemic racism model, while offering numerous important insights, does not inform concrete analysis of these issues. It is important going forward to understand how groups are differentially racialized and relatively positioned in the US racial hierarchy: once again racism must be seen as a shifting racial project. This has **important consequences**, not only with respect to emerging patterns of inequality, but also in regard to the **degree of power available** to different racial actors to define, shape or **contest the existing racial landscape** Attention to such matters is largely absent in Feagin and Elias's account. In their view racially identified groups are located in strict reference to the dominant 'white racial frame', hammered into place, so to speak. As a consequence, they fail to examine how racially subordinate groups interact and influence each others' boundaries, conditions and practices. Because they offer so little specific analysis of Asian American, Latino or Native American racial issues, the reader finds her/himself once again in the land (real or imaginary, depending on your racial politics) of bipolar US racial

dynamics, in which whites and blacks play the leading roles, and other racially identified groups – as well as those ambiguously identified, such as Middle Eastern and South Asian Americans (MEASA) – play at best supporting roles, and are sometimes cast as extras or left out of the picture entirely.

AT: Contingency Link

The 1ac combines radical critique and reform, holding them in productive tension to remake common understandings surrounding incarceration – this creates medium-term steps towards complete abolition

Sudbury 8, Professor of Ethnic Studies

[2008, Julia Sudbury is Metz Professor of Ethnic Studies at Mills College. She is a leading activist scholar in the prison abolitionist movement. She was a co-founder of Critical Resistance, a national abolitionist organization. "Rethinking Global Justice: Black Women Resist the Transnational Prison-Industrial Complex", Souls: A Critical Journal of Black Politics, Culture, and Society, Volume 10, Issue 4]

Chronic overcrowding has led to worsening conditions for prisoners. As a result of the unprecedented growth in sentenced populations, prison authorities have packed three or four prisoners into cells designed for two, and have taken over recreation rooms, gyms, and rooms designed for programming and turned them into cells, housing prisoners on bunk beds or on the floor. These new conditions have created challenges for activists, who have found themselves expending time and resources in pressuring prison authorities to provide every prisoner a bed, or to provide access to basic education programs. As prison populations continue to swell, anti-prison activists are faced with the limitations of reformist strategies. Gains temporarily won are swiftly undermined, new "women-centered" prison regimes are replaced with a focus on cost-efficiency and minimal programming and even changes enforced by legal cases like Shumate vs. Wilson are subject to backlash and resistance. 19 Of even greater concern is the well-documented tendency of prison regimes to co-opt reforms and respond to demands for changes in conditions by further expanding prison budgets. The vulnerability of prison reform efforts to cooption has led Angela Y. Davis to **call for "non-reformist reforms," reforms that do not lead to bigger and "better" prisons**. 20 Despite the limited long-term impact of human rights advocacy and reforms, building bridges between prisoners, activists, and family members is **an important step toward challenging the racialized dehumanization that undergirds the logic of incarceration**. In this way, human rights advocacy carried out in solidarity with prisoner activists is **an important component of a radical anti-prison agenda**. Ultimately, however, anti-prison activists aim not to create more humane, culturally sensitive, women-centered prisons, but **to dismantle prisons** and enable formerly criminalized people to access services and resources outside the penal system. After three decades of prison expansion, more and more people are living with criminal convictions and histories of incarceration. In the U.S., nearly 650,000 people are released from state and federal prisons to the community each year. 21 Organizations of formerly incarcerated people focus on creating opportunities for former prisoners to survive after release, and on eliminating barriers to reentry, including extensive discrimination against former felons. The wide array of "post-incarceration sentences" that felons are subjected to has led activists to declare a "new civil rights movement." 22 As a class, former prisoners can legally be disenfranchised and denied rights available to other citizens. While reentry has garnered official attention, with President Bush proposing a $300 million reentry initiative in his 2004 State of the Union address, anti-prison activists have critiqued this initiative for focusing on faith-based mentoring, job training, and housing without addressing the endemic discrimination against former prisoners or addressing the conditions in the communities which receive former prisoners, including racism, poverty, and gender violence. Organizations of ex-prisoners working to oppose discrimination against former prisoners and felons include All of Us Or None, the Nu Policy Leadership Group, Sister Outsider and the National Network for Women Prisoners in the U.S., and Justice 4 Women in Canada. All of Us Or None is described by members as "a national organizing initiative of prisoners, former prisoners and felons, to combat the many forms of discrimination that we face as the result of felony convictions." 23 Founded by anti-imperialist and former political prisoner Linda Evans, and former prisoner and anti-prison activist Dorsey Nunn, and sponsored by the Northern California–based Legal Services for Prisoners with Children, All of Us Or None works to mobilize former prisoners nationwide and in Toronto, Canada. The organization's name, from a poem by Marxist playwright Bertold Brecht, invokes the need for solidarity across racial, class, and gender lines in creating a unified movement of former prisoners. Black women play a leading role in the organization, alongside other people of color. All of Us Or None focuses its lobbying and campaign work at city, county, and state levels, calling on local authorities to end discrimination based on felony convictions in public housing, benefits, and employment, to opt out of lifetime welfare and food stamp bans for felons, and to "ban the box" requiring disclosure of past convictions on applications for public employment. In addition, the organization calls for guaranteed housing, job training, drug and alcohol treatment, and public assistance for all newly released prisoners. 24 In the context of the war on drugs, many people with

felony convictions also struggle with addictions. The recovery movement, which is made up of 12-step programs, treatment programs, community recovery centers, and indigenous healing programs run by and for people in recovery from addiction, offers an alternative response to problem drug use through programs focusing on spirituality, healing, and fellowship. However, the recovery movement's focus on individual transformation and accountability for past acts diverges from many anti-prison activists' focus on the harms done to criminalized communities by interlocking systems of dominance. As a result, anti-prison spaces seldom engage with the recovery movement, or tap the radical potential of its membership. Breaking with this trend, All of Us Or None has initiated a grassroots organizing effort to reach out to people in 12-step programs with felony convictions. This work is part of their wider organizing efforts that aim to mobilize former prisoners as agents of social change. Building on the strengths of identity politics, these organizations suggest that those who have experienced the prison-industrial complex first-hand may be best placed to provide leadership in dismantling it. As former prisoners have taken on a wide range of leadership positions across the movement, there has been a shift away from leadership by white middle-class progressives, and a move to promote the voices of those directly affected by the prison-industrial complex. Politicians who promote punitive "tough-on-crime" policies rely on racialized controlling images of "the criminal" to inspire fear and induce compliance among voters. Once dehumanized and depicted as dangerous and beyond rehabilitation, removing people from communities appears the only logical means of creating safety. Activists who pursue decarceration challenge stereotypical images of the "criminal" by making visible the human stories of prisoners, with the goal of demonstrating **the inadequacy of incarceration as a response to the complex interaction of factors** that produce harmful acts. Decarceration usually involves targeting a specific prison population that the public sees as low-risk and **arguing for an end to** the use of imprisonment **for this population.** Decarcerative strategies often involve the promotion of alternatives to incarceration that are less expensive and more effective than prison and jail. For example, Proposition 36, the Substance Abuse and Crime Prevention Act, which passed in California in 2000 and allowed first- and second-time non-violent drug offenders charged with possession to receive substance abuse treatment instead of prison, channels approximately 35,000 people into treatment annually. 25 **Drug law reform is a key area of decarcerative work**. Organizations and campaigns that promote drug law reform include Drop the Rock, a coalition of youth, former prisoners, criminal justice reformers, artists, civil and labor leaders working to repeal New York's Rockefeller Drug Laws. The campaign **combines racial justice, economic, and public safety arguments by demonstrating that the laws have created a pipeline of prisoners of color** from New York City to newly built prisons in rural, mainly white areas represented Republican senators, resulting in a transfer of funding and electoral influence from communities of color to upstate rural communities. 26 Ultimately, the campaign calls for an end to mandatory minimum sentencing and the reinstatement of judges' sentencing discretion, a reduction in sentence lengths for drug-related offenses and the expansion of alternatives, including drug treatment, job training, and education. Former drug war prisoners play a leadership role in decarcerative efforts in the field of drug policy reform. Kemba Smith, an African–American woman who was sentenced to serve 24.5 years as a result of her relationship with an abusive partner who was involved in the drug industry, is one potent voice in opposition to the war on drugs. While she was incarcerated, Smith became an active advocate for herself and other victims of the war on drugs, securing interviews and feature articles in national media. Ultimately, Smith's case came to represent the failure of mandatory minimums, and in 2000, following a nation-wide campaign, she and fellow drug war prisoner Dorothy Gaines were granted clemency by outgoing President Clinton. After her release, Smith founded the Justice for People of Color Project (JPCP), which aims to empower young people of color to participate in drug policy reform and to promote a reallocation of public expenditures from incarceration to education. While women like Kemba Smith and Dorothy Gaines have become the human face of the drug war, prison invisibilizes and renders anonymous hundreds of thousands of drug war prisoners. The organization Families Against Mandatory Minimums (FAMM) challenges this process of erasure and dehumanization through its "Faces of FAMM" project. The project invites people in federal and state prisons serving mandatory minimum sentences to submit their cases to a database and provides online access to their stories and photographs. 27 The "Faces of FAMM" project highlights cases where sentencing injustices are particularly visible in order to galvanize public support for sentencing reform. At the same time, it dismantles popular representations of the war on drugs as a necessary protection against dangerous drug dealers and traffickers, demonstrating that most drug war prisoners are serving long sentences for low-level, non-violent drug-related activities or for being intimately connected to someone involved in these activities. Decarcerative work is not limited to drug law reform. Free Battered Women's (FBW) campaign for the release of incarcerated survivors is another example of decarcerative work. The organization supports women and transgender prisoners incarcerated for killing or assaulting an abuser in challenging their convictions by demonstrating that they acted in self-defense. Most recently, FBW secured the release of Flozelle Woodmore, an African–American woman serving a life sentence at CCWF for shooting her violent partner as an 18 year old. Released in August 2007, after five parole board recommendations for her release were rejected by Governors Davis and then Schwarzenegger, Woodmore's determined pursuit of justice made visible and ultimately challenged the racialized politics of gubernatorial parole releases. 28 While the number of women imprisoned for killing or assaulting an abuser is small—FBW submitted 34 petitions for clemency at its inception in 1991, and continues to fight 23 cases—FBW's campaign for the release of all incarcerated survivors challenges the mass incarceration of gender-oppressed prisoners on a far larger scale. FBW argues that experiences of intimate partner violence and abuse contribute to the criminalized activities that lead many women and transgender people into conflict with the law, including those imprisoned on drug or property charges, and calls for the release of all incarcerated survivors. Starting with a population generally viewed with sympathy—survivors of intimate partner violence—FBW generates a

radical critique of both state and interpersonal violence, arguing that "the violence and control used by the state against people in prison mirrors the dynamics of battering that many incarcerated survivors have experienced in their intimate relationships and/or as children." 29 In theorizing the intersections of racialized state violence and gendered interpersonal violence, FBW lays the groundwork for a broader abolitionist agenda that refutes the legitimacy of incarceration as a response to deep-rooted social inequalities based on interlocking systems of oppression. By gradually shrinking the prison system, Black women activists involved in decarcerative work hope to erode the public's reliance on the idea of imprisonment as a commonsense response to a wide range of social ills. At the other end of anti-expansionist work are activists who take a more confrontational approach. By starving correctional budgets of funds to continue building more prisons and jails, they hope to force politicians to embrace less expensive and more effective alternatives to incarceration. Prison moratorium organizing aims to stop construction of new prisons and jails. Unlike campaigns against prison privatization, which oppose prison-profiteering by private corporations, and seek to return imprisonment to the public sector, prison moratorium work opposes all new prison construction, public or private. In New York, the Brooklyn-based Prison Moratorium Project (PMP), co-founded by former prisoner Eddie Ellis and led by young women and gender non-conforming people of color, does this work through popular education and mass campaigns against prison expansion. Focusing on youth as a force for social change, New York's PMP uses compilations of progressive hip hop and rap artists to spread a critical analysis of the prison-industrial complex and its impact on people of color. PMP's strategies have been effective; for example, in 2002 the organization, as part of the Justice 4 Youth Coalition, succeeded in lobbying the New York Department of Juvenile Justice to redirect $53 million designated for expansion in Brooklyn and the Bronx. 30 PMP has also worked to make visible the connections between underfunding, policing of schools, and youth incarceration through their campaign "Stop the School-to-Prison Pipeline." By demonstrating how zero tolerance policies and increased policing and use of surveillance technology in schools, combined with underfunded classrooms and overstretched teachers, has led to the criminalization of young people of color and the production of adult prisoners, PMP argues for a reprioritization of public spending from the criminal justice system to schools and alternatives to incarceration. 31 Moratorium work often involves campaigns to prevent the construction of a specific prison or jail. In Toronto, for example, the Prisoner Justice Action Committee formed the "81 Reasons" campaign, a multiracial collaboration of experienced anti-prison activists, youth and student organizers, in response to proposals to build a youth "superjail" in Brampton, a suburb of Toronto. 32 The campaign combined popular education on injustices in the juvenile system, including the disproportionate incarceration of Black and Aboriginal youth, with an exercise in popular democracy that invited young people to decide themselves how they would spend the $81 million slated for the jail. Campaigners mobilized public concerns about spending cuts in other areas, including health care and education, to create pressure on the provincial government to look into less expensive and less punitive alternatives to incarceration for youth. While this campaign did not ultimately prevent the construction of the youth jail, the size of the proposed facility was reduced. More importantly, the campaign built a grassroots multiracial antiprison youth movement and raised public awareness of the social and economic costs of incarceration. Moratorium campaigns face tough opposition from advocates who believe that building prisons stimulates economic development for struggling rural towns. Prisons are "sold" to rural towns that have suffered economic decline in the face of global competition, closures of local factories, and decline of small farms. In the context of economic stagnation, prisons are touted as providing stable, well-paying, unionized jobs, providing property and sales taxes and boosting real estate markets. The California Prison Moratorium Project has worked to challenge these assertions by documenting the actual economic, environmental, and social impact of prison construction in California's Central Valley prison towns. According to California PMP: We consider prisons to be a form of environmental injustice. They are normally built in economically depressed communities that eagerly anticipate economic prosperity. Like any toxic industry, prisons affect the quality of local schools, roads, water, air, land, and natural habitats. 33 California PMP opposes prison construction at a local level by building multiracial coalitions of local residents, farm workers, labor organizers, anti-prison activists, and former prisoners and their families to reject the visions of prison as a panacea for economic decline. 34 In the Californian context, where most new prisons are built in predominantly Latino/a communities and absorb land and water previously used for agriculture, PMP facilitates communication and solidarity between Latino/a farm worker communities, and urban Black and Latino/a prisoners in promoting alternative forms of economic development that do not rely on mass incarceration. Scholar-activist Ruth Wilson Gilmore's research on the political economy of prisons in California has been critical in providing evidence of the detrimental impact of prisons on local residents and the environment. 35 As an active member of CPMP, Gilmore's work is deeply rooted in anti-prison activism and in turn informs the work of other activists, demonstrating the important relationship between Black women's activist scholarship and the anti-prison movement. 36 Many anti-prison activists view campaigns for decarceration or moratorium as building blocks toward the ultimate goal of abolition. These practical actions promise short and medium-term successes that are essential markers on the road to long-term transformation. However, abolitionists believe that like slavery, the prison-industrial complex is a system of racialized state violence that cannot be "fixed." The contemporary prison abolitionist movement in the U.S. and Canada dates to the 1970s, when political

prisoners like Angela Y. Davis and Assata Shakur, in conjunction with other radical activists and scholars in the U.S., Canada, and Europe, began to call for the dismantling of prisons. 38 The explosion in political prisoners, fuelled by the FBI's Counter Intelligence Program (COINTELPRO) and targeting of Black liberation, American Indian and Puerto Rican independence movements in the U.S. and First Nations resistance in Canada as "threats" to national security, fed into an understanding of the role of the prison in perpetuating state repression against insurgent communities. 39 The new anti-prison politics were also shaped by a decade of prisoner litigation and radical prison uprisings, including the brutally crushed Attica Rebellion. These "common" prisoners, predominantly working-class people of color imprisoned for everyday acts of survival, challenged the state's legitimacy by declaring imprisonment a form of cruel and unusual punishment and confronting the brute force of state power. 40 By adopting the term "abolition" activists drew deliberate links between the dismantling of prisons and the abolition of slavery. Through historical excavations, the "new abolitionists" identified the abolition of prisons as the logical completion of the unfinished liberation marked by the 13th Amendment to the United States Constitution, which regulated, rather than ended, slavery. 41 Organizations that actively promote dialogue about what abolition means and how it can translate into concrete action include Critical Resistance (CR), New York's Prison Moratorium Project, Justice Now, California Coalition for Women Prisoners, Free Battered Women, and the Prison Activist Resource Center in the U.S. and the Prisoner Justice Action Committee (Toronto), the Prisoners' Justice Day Committee (Vancouver) and Joint Action in Canada. CR was founded in 1998 by a group of Bay Area activists including former political prisoner and scholar-activist Angela Y. Davis. Initially, CR focused on popular education and movement building, coordinating large conferences where diverse organizations could generate collective alternatives to the prison-industrial complex. Later work has included campaigns against prison construction in California's Central Valley and solidarity work with imprisoned Katrina survivors. CR describes abolition as: [A] political vision that seeks to eliminate the need for prisons, policing, and surveillance by creating sustainable alternatives to punishment and imprisonment … . An abolitionist vision means that we must build models today that can represent how we want to live in the future. It means developing practical strategies for taking small steps that move us toward making our dreams real and that lead the average person to believe that things really could be different. It means living this vision in our daily lives. 42 In this sense, prison abolitionists are tasked with a dual burden: first, transforming people's consciousness so that they can believe that a world without prisons is possible, and second, taking practical steps to oppose the prison-industrial complex. Making abolition more than a utopian vision requires practical steps toward this long-term goal. CR describes four steps that activists can get involved in: shrinking the system, creating alternatives, shifting public opinion and public policy, and building leadership among those directly impacted by the prison-industrial complex. 43 Since its inception in the San Francisco Bay Area, Critical Resistance has become a national organization with chapters in Baltimore, Chicago, Gainesville, Los Angeles, New Orleans, New York, Tampa/St. Petersburg, and Washington, D.C. As such, CR has played a critical role in re-invigorating abolitionist politics in the U.S. This work is rooted in the radical praxis of Black women and transgender activists.

Neolib

War Turns Structural Violence

War turns structural violence

<u>**Bulloch 8**</u>

Douglas Bulloch, IR Department, London School of Economics and Political Science.

He is currently completing his PhD in International Relations at the London School of Economics, during which time he spent a year editing Millennium: Journal of International Studies

But <u>the idea that poverty and peace are directly related presupposes that wealth inequalities are</u> – in and of themselves – <u>unjust, and that the solution to the problem of war is to alleviate</u> the injustice that inspires conflict, namely <u>poverty.</u> However, it also suggests that poverty is a legitimate inspiration for violence, otherwise there would be no reason to alleviate it in the interests of peace. It has become such a commonplace to suggest that poverty and conflict are linked that **it rarely suffers any examination**. To suggest <u>that war causes poverty is</u> to utter **an obvious truth,** but to suggest <u>the opposite is</u> – on reflection – <u>quite **hard to believe.** War is</u> an <u>expensive</u> business in the twenty-first century, <u>even asymmetrically.</u> And just to examine Bangladesh for a moment is enough at least to raise the question concerning the actual connection between peace and poverty. The government of Bangladesh is a threat only to itself, and despite 30 years of the Grameen Bank, Bangladesh remains in a state of incipient civil strife. So although Muhammad Yunus should be applauded for his work in demonstrating the efficacy of micro-credit strategies in a context of development, it is not at all clear that this has anything to do with resolving the social and political crisis in Bangladesh, nor is it clear that this has anything to do with resolving <u>the problem of peace and war</u> in our times. It does speak to the Western liberal mindset – as Geir Lundestad acknowledges – but then perhaps this exposes the extent to which <u>the Peace Prize itself has simply become</u> an award that reflects a degree of <u>Western liberal wish-fulfilment</u>. <u>It is</u> perhaps <u>comforting to believe that **poverty causes violence,**</u> as it serves <u>to endorse</u> a particular kind of concern for the developing world that in turn regards <u>all problems as</u> fundamentally <u>economic rather than</u> deeply – and potentially radically – <u>political</u>.

Neolib Sustainable

Neolib is sustainable and the alt is a useless political abstraction

Arvidsson 13

(Adam, teaches sociology at the University of Milano"Thinking beyond neo-liberalism: A response to Detlev Zwick", ephemera: theory & politics in organization 13(2): 407-412)

This makes it trickier to do critical theory. We can of course still criticize the actual state of things. We can point to the precarious relations that prevail among creative knowledge workers; show how exploitative and unjust conditions are intensified by the very forces that drive the globalization of communicative capitalism, like the outsourcing of design work; or lament the fact that a triumphant neoliberal regime subsumes and appropriates aspects of subjectivity and social life that we think should have been left alone. To produce such critiques remains useful intellectual work – I have done it in other contexts (Arvidsson et al., 2010; Arvidsson, 2007), as has Detlev Zwick (2008), and many others. To the extent that such critiques reach a mass audience, they can become a progressive impulse to action and reflection – as in the case of Naomi Klein's work inspiring the 'no global' movement (to use an inadequate name coined by the mainstream press). But such a critique without an alternative remains unsatisfactory for at least three reasons. First, and most superficially, since everyone else is doing it, the marginal utility of yet another piece of critical theory rapidly diminishes, as does the intellectual satisfaction that can be derived form producing it. Second, and more seriously, the absence of a realistic alternative, or even of a historical subject in the name of which such a critique can be pronounced, risks rendering critical theory moralistic and rather toothless. We might agree with Zwick when he suggests that the outsourcing of design work from Toronto to the Philippines is somehow wrong, but it is difficult to understand exactly why this would be the case. (Why shouldn't Philippine designers be allowed to compete with Canadian designers? Can the 'creative class' claim an exemption from the global economy? Perhaps the answer is 'yes', but I do not know of any viable alternative vision of society that is able to substantiate that 'yes'.) Third, and most importantly, in the absence of an alternative vision, critical theory remains rather unconvincing to the people in the name of whom it proposes to speak. I can assure you – and I've tried! – that you won't become an organic intellectual among social entrepreneurs or precarious creative workers by telling them that they are exploited, that they sell out their subjectivity, or that the system in which they operate is unjust. Pure critique is simply not attractive enough to make the multitude of new productive subjects, fragmented by neoliberalism, cohere into a historical subject. To do that you need at least the myth of an alternative, as agitators from Sorel via Lenin to Subcomandante Marcos could tell you. Don't get me wrong. I am not proposing that it is wrong to point to the precarious conditions of knowledge work, or that we should not do this as academics and researchers. This is still an important task. But it is not enough. Critical theory must do this, but it must also do more. It must also engage with the question of what a realistic alternative to neoliberalism could be, and it must elaborate a realistic political vision in the name of which a critique that is productive and progressive, and not simply moralistic, can be articulated. By realistic, I mean that such an alternative must be sought in the actual relations of production that characterize the contemporary information economy. Zwick's suggestion that we imagine a commonism of productive consumption as collaborative sharing in the absence of private property and combined with an inclusive model of political determination, collective sovereignty, belonging and justice – and so on – is simply unproductive to my mind. We might all agree that an economy of commons that has done away with capitalism might be more desirable, but the reality is that hybrid forms, like the game modders that Zwick cites, where a an economy of commons co-exists with a capitalist value logic, in some form, are indeed becoming the norm. At that point the interesting thing to do is not so much to criticize the enduring capitalist nature of these hybrid forms, but rather to investigate the new forms of politics that they might give rise to. This in no way implies that one does away with conflict and politics. Rather, it implies investigating and understanding the new spaces and discourses through which such a new type of politics can be articulated. In order to do this we must start with what the actors involved in these processes actually think themselves. It is quite useless to simply deploy existing philosophical perspectives, or to compare the reality of communicative capitalism to utopian projections of the political visions of last century. Instead we must start with the 'empirical metaphysics', to use Bruno Latour's term, that actually prevail among people engaged in such hybrid

practices. We might all want to do away with neoliberalism and the forms of life that it has promoted. But at the same time, we all recognize that the neoliberal project has been one of **the most successful projects** of governmentality since, perhaps, the very project of disciplinary power that Foucault himself described. Rebus sic stantibus **we cannot simply wish it away**. We need to recognize that people have changed, that competitive individualism, self-branding and an entrepreneurial mentality **are,** by now, normal features of life. The same thing goes for the popular political myths that prevail among advanced knowledge workers, what Zwick calls 'cyber-utopianism'. We need to recognize that notions like peer-to-peer production, high-tech gift economies and the like have the power to mobilize the energies of the subjects that are most likely to become the pioneers of a new political vision – today's version of the skilled workers that have taken the lead in most modern political movements. Even though the social theory that they produce might be shallow and imperfect, and even though they might not have read Marx and Foucault as well as we have, we cannot simply dismiss this vision as a mere ideology to be replaced by our theoretically more refined ideology. Like the relations of production that are emerging in communicative capitalism and the subjectivity of knowledge workers, these myths are part of the raw material with which the Gramscian intellectual must engage in order to articulate new understandings of common sense that are both politically progressive and intuitively attractive to the people that they are supposed to mobilize. In other words, in order to articulate an alternative, we cannot simply dismiss the reality of communicative capitalism and fall back on what remains of the political utopias of last century. We need to **engage with the reality** of neoliberal communicative capitalism and try to push its dialectic beyond its apolitical present state. We must investigate what the real conditions of production and imagination are and ask ourselves where they might lead. Critical theory needs to become an **empirical**, and not simply a philosophical, enterprise.

Permutation Stuff

Reform Perm

Perm do the plan and all non-mutually exclusive parts of the alt --- policy analysis key

James **Ferguson 11**, Professor of Anthropology at Stanford, "The Uses of Neoliberalism", Antipode, Vol. 41, No. S1, pp 166–184

If we are seeking, as this special issue of Antipode aspires to do, to link our critical analyses to the world of grounded political struggle—not only to interpret the world in various ways, but also to change it—then there is much to be said for focusing, as I have here, on mundane, real- world debates around policy and politics, even if doing so inevitably puts us on the compromised and reformist terrain of the possible, rather than the seductive high ground of revolutionary ideals and utopian desires. But I would also insist that there is more at stake in the examples I have discussed here than simply a slightly better way to ameliorate the miseries of the chronically poor, or a technically superior method for relieving the suffering of famine victims.¶ My point in discussing the South African BIG campaign, for instance, is not really to argue for its implementation. There is much in the campaign that is appealing, to be sure. But one can just as easily identify a series of worries that would bring the whole proposal into doubt. Does not, for instance, the decoupling of the question of assistance from the issue of labor, and the associated valorization of the "informal", help provide a kind of alibi for the failures of the South African regime to pursue policies that would do more to create jobs? Would not the creation of a basic income benefit tied to national citizenship simply exacerbate the vicious xenophobia that already divides the South African poor,¶ in a context where many of the poorest are not citizens, and would thus not be eligible for the BIG? Perhaps even more fundamentally, is the idea of basic income really capable of commanding the mass support that alone could make it a central pillar of a new approach to distribution? The record to date gives powerful reasons to doubt it. So far, the technocrats' dreams of relieving poverty through efficient cash transfers have attracted little support from actual poor people, who seem to find that vision a bit pale and washed out, compared with the vivid (if vague) populist promises of jobs and personalistic social inclusion long offered by the ANC patronage machine, and lately personified by Jacob Zuma (Ferguson forthcoming).¶ My real interest in the policy proposals discussed here, in fact, has little to do with the narrow policy questions to which they seek to provide answers. For what is most significant, for my purposes, is not whether or not these are good policies, but the way that they illustrate a process through which specific governmental devices and modes of reasoning that we have become used to associating with a very particular (and conservative) political agenda ("neoliberalism") may be in the process of being peeled away from that agenda, and put to very different uses. Any progressive who takes seriously the challenge I pointed to at the start of this essay, the challenge of developing new progressive arts of government, ought to find this turn of events of considerable interest.¶ As Steven Collier (2005) has recently pointed out, it is important to question the assumption that there is, or must be, a neat or automatic fit between a hegemonic "neoliberal" political-economic project (however that might be characterized), on the one hand, and specific "neoliberal" techniques, on the other. Close attention to particular techniques (such as the use of quantitative calculation, free choice, and price driven by supply and demand) in particular settings (in Collier's case, fiscal and budgetary reform in post-Soviet Russia) shows that the relationship between the technical and the political-economic "is much more polymorphous and unstable than is assumed in much critical geographical work", and that neoliberal technical mechanisms are in fact "deployed in relation to diverse political projects and social norms" (2005:2).¶ As I suggested in referencing the role of statistics and techniques for pooling risk in the creation of social democratic welfare states, social technologies need not have any essential or eternal loyalty to the political formations within which they were first developed. Insurance rationality at the end of the nineteenth century had no essential vocation to provide security and solidarity to the working class; it was turned to that purpose (in some substantial measure) because it was available, in the right place at the right time, to be appropriated for that use. Specific ways of solving or posing governmental problems, specific institutional and intellectual mechanisms, can be combined in an almost infinite variety of ways, to accomplish different social ends. With social, as with any other sort of technology, it is not the machines or the mechanisms that decide what they will be used to do.¶ Foucault (2008:94) concluded his discussion of socialist government- ality by insisting that the answers to the Left's governmental problems require not yet another search through our sacred texts, but a process of conceptual and institutional innovation. "[I]f there is a really socialist governmentality, then it is not hidden within socialism and its texts. It cannot be deduced from them. It must be invented". But invention in the domain of governmental technique is rarely something worked up out of whole cloth. More often, it involves a kind of bricolage (Lévi- Strauss 1966), a piecing together of something new out of scavenged parts originally intended for some other purpose. As we pursue such a process of improvisatory invention, we might begin by making an inventory of the parts available for such tinkering, keeping all the while an open mind about how different mechanisms might be put to work, and what kinds of purposes they might serve. If we can go beyond seeing in "neoliberalism" an evil essence or an automatic unity, and instead learn to see a field of specific governmental techniques, we may be surprised to find that some of them can be repurposed, and put to work in the service of political projects very different from those usually associated with that word. If so, we may find that the cabinet of governmental arts available to us is a

bit <mark>less bare than first appeared</mark>, and that some rather useful little mechanisms may be nearer to hand than we thought.

2AC Perm (Barry)

Only the perm solves—proposing alternative non-capitalist economics out of nowhere is of *zero value*. Environmental reform of capitalism is key.

John **BARRY** Reader in Politics @ Belfast **'7** ["Towards a model of green political economy: from ecological modernisation to economic security" *Int. J. Green Economics*, Vol. 1, Nos. 3/4, 2007 p. 447-448]

Economic analysis has been one of the weakest and least developed areas of broadly green/sustainable development thinking. For example, whatever analysis there is within the green political canon is largely utopian – usually based on an argument for the complete transformation of modern society and economy as the only way to deal with ecological catastrophe, an often linked to a critique of the socioeconomic failings of capitalism that echoed a broadly radical Marxist/socialist or anarchist analysis; or underdeveloped – due, in part, to the need to outline and develop other aspects of green political theory. However, this gap within green thinking has recently been filled by a number of scholars, activists, think tanks, and environmental NGOs who have outlined various models of green political economy to underpin sustainable development political aims, principles and objectives. The aim of this article is to offer a draft of a realistic, but critical, version of green political economy to underpin the economic dimensions of radical views about sustainable development. It is written explicitly with a view to encouraging others to think through this aspect of sustainable development in a collaborative manner. Combined realism and radicalism marks this article, which starts with the point that we cannot build or seek to create a sustainable economy ab nihlo, but must begin from where we are, with the structures, institutions, modes of production, laws and regulations that we already have. Of course, this does not mean simply accepting these as immutable or set in stone; after all, some of the current institutions, principles and structures underpinning the dominant economic model are the very causes of unsustainable development. We do need to recognise, however, that we must work with (and 'through' – in the terms of the original German Green Party's slogan of 'marching through the institutions') these existing structures, as well as change and reform and in some cases, abandon them as either unnecessary or positively harmful to the creation and maintenance of a sustainable economy and society. Equally, this article also recognises that an alternative economy and society must be based in the reality that most people (in the West) will not democratically vote for a completely different type of society and economy. That reality must also accept that a 'green economy' is one that is recognisable to most people and that indeed safeguards and guarantees not just their basic needs but also aspirations (within limits). The realistic character of the thinking behind this article accepts that consumption and materialistic lifestyles are here to stay (so long as they do not transgress any of the critical thresholds of the triple bottom line) and indeed there is little to be gained by proposing alternative economic systems, which start from a complete rejection of consumption and materialism. The appeal to realism is in part an attempt to correct the common misperception (and self-perception) of green politics and economics requiring an excessive degree of self-denial and a puritanical asceticism (Goodin, 1992, p.18; Allison, 1991, p.170–178). While rejecting the claim that green political theory calls for the complete disavowal of materialistic lifestyles, it is true that green politics does require the collective reassessment of such lifestyles, and does require a degree of shared sacrifice. It does not mean, however, that we necessarily require the complete and across-the-board rejection of materialistic lifestyles. There must be room and tolerance in a green economy for people to live 'ungreen lives' so long as they do not 'harm' others, threaten long-term ecological sustainability or create unjust levels of socioeconomic inequalities. Thus, realism in this context is in part another name for the acceptance of a broadly 'liberal' or 'post-liberal' (but certainly not anti-liberal) green perspective.[1]

Thus, realism in this context is in part another name for the acceptance of a broadly 'liberal' or 'post-liberal' (but certainly not anti-liberal) green perspective.[1]

AT: Growth Link

Case is a pre-requisite to changes in the direction of consumption. Without growth and minimizing conflict resources get devoted to competition.

Rasmus **KARLSSON** Poli Sci @ Lund **'9** "A global Fordian compromise?—And what it would mean for the transition to sustainability" *Envt'l Science and Policy* 12 p. 190-191

Though these caricatures may still hold true to a certain extent, I would argue that the last years have challenged this impasse. On one hand, the general public has grown increasingly aware of how serious our current predicament has become. On the other hand, a string of promising academic work, both in the sciences (Hoffert et al., 2002) and in green political theory (Nordhaus and Shellenberger, 2007), has finally taken up what otherwise has been a dormant position ever since the 1970s. I am referring to those who accept the gravity of the present environmental crisis yet believe that the solution can never be found in the traditional green mantra of **reduction**, conservation and **self-denial**. Instead these authors have attempted to **reconcile** the politics of **scarcity** with **technological optimism**, to tap into the spirit that once made grand projects like the Apollo program possible and, on this basis, move towards a politics of radical engagement. Nowhere does the need for such new politics appear more urgent than on the global level. With parts of the world (mostly in Asia) rapidly industrializing while others remaining trapped in the direst poverty, the planetary perspective goes to the heart of the sustainable transition. Not only does it show the terrible human cost of the present status-quo but also the irreversibility in the move towards modernization. Billions are now impatiently aspiring for the material living standard of the West, and given the limited ecological space of the planet (Andreasson, 2005; Rist, 1997, pp. 44–45), it is hard to see how these needs can be met without radical technological innovation. However, there are reasons to doubt the feasibility of any advanced technological paths to sustainability. Only in a climate of high and **sustained economic growth** would it be possible for states to set aside the vast resources necessary to bring success to long-term projects on nuclear fusion, nanotechnology and other converging technologies (Malsch, 2008). Such benign economic conditions are, just as the prospects of sustainable development more generally (Blinc et al., 2007), unlikely to come about in times of international tension, unplanned mass-migration and growing resource scarcity. This should warrant a new kind of sobering realism, an acceptance that the future of modernity is now a planetary enterprise and that we are all into this as one common human civilization.

Perm: Movements Reinforcing

Top-down and bottom-up movements are <u>mutually reinforcing</u> but the alt alone causes <u>worse forms of trade</u> and <u>global wars</u>

Brecher 2k

Jeremy Brecher is a historian and the author of numerous books on labor and social movements, co-founded Global Labor Strategies, Tim Costello is one of Australia's most recognised voices on social justice, leadership and ethics, Brendan Smith, social activist, co-founder of Global Labor Strategies, Globalization from Below, 2000, google books

The apparent <u>opposition among strengthening</u> local, national, and <u>global institutions is</u> <u>based on a false premise: that more power at one level</u> of governance <u>is</u> necessarily <u>disempowering to people at others.</u> But today **the exact opposite is the case**. The <u>empowerment of local</u> and national <u>communities</u> and polities today <u>requires a degree of global</u> regulation and <u>governance.</u> Far from being dichotomous, **they are interdependent.** Globalization from below requires a framework that recognizes that interdependence. <u>Global capital has usurped powers that rightfully belong to people</u> and to their representatives in government. <u>The challenge is for people to establish greater control over their economic lives by</u> establishing greater control over global capital. To do so requires a stronger governmental role and increased <u>organization</u> in civil society at every level from local to global. <u>These various levels of action</u> far from being in competition, <u>can actually be **mutually supportive**.</u> Indeed, the <u>programs needed at each level are **unlikely to work for long**</u> unless complemented by supportive policies and <u>structures at the other levels</u>. Consider for example the issue of local empowerment. In the United States, ironically, <u>local empowerment has been major theme of that part of the right</u> that is <u>most favorable to global capitalism</u>. Newt <u>Gingrich</u>, as conservative Republican speaker of the US House of Representatives, <u>campaigned to eliminate</u> federal <u>regulations that "interfered" with</u> states and <u>municipalities</u>. Of course, <u>the real purpose of this</u> faux localism <u>was to break down regulations that</u> establish minimum wages and labor standards, <u>preserve the environment</u>, reduce poverty, and protect the rights of women, oppressed minorities, the disabled, and trade unions. <u>"Empowering local communities" meant</u> <u>putting them at the mercy of powerful corporations</u> and financiers. It also meant <u>pitting them against each other in a race to the bottom.</u> Clearly, national <u>regulation</u> that protects minimum standards and <u>limits the race to the bottom</u> actually <u>strengthens, rather than undermines</u>, the ability of people in <u>local communities</u> to control their own lives. <u>The same can be true **globally**</u>. While the rules and policies currently imposed by the IMF, World Bank, and WTO empower corporations and disempowers people at every level, that doesn't mean that different global institutions and policies couldn't have the opposite effect. For example, international agreements that reduce gases that destroy the ozone layer and produce global warming can protect local communities and countries against environmental destruction. Global economic institutions that regulate global demand and international currency flows would strengthen the ability of national governments to regulate their own economies. Environmental and labor conditions in international trade agreements could put limits on the race to the bottom. So could trade union agreements with corporations specifying minimum conditions worldwide. Enforceable international code of conduct for corporations could reduce their ability to dictate

conditions to countries and communities. In fact, such higher-level regulation is essential if the forces of globalization are to be tamed. This point is missed by those who see globalization simply as a matter of greater power for international economic institutions. **Globalization was not caused** (even though it was accelerated) **by the WTO** or NAFTA. And globalization will continue even if such institutions are abolished. Indeed, the likely result of completely eliminating supranational economic regulation is not genuine national self-determination but an **economic war of all-against-all**. As each nation pursues policies of economic nationalism, others will follow suit in **escalating trade wars**. And without means for regulating demand, global depression is more than likely to follow.

And without means for regulating demand, global depression is more than likely to follow.

Liberal Norms Good

Shocks to the system are the ONLY propensity for conflict—liberal norms have eradicated warfare and structural violence—every field study proves

Horgan 09

JOHN HORGAN is Director of the Center for Science at Stevens Institute of Technology, former senior writer at Scientific American, B.A. from Columbia and an M.S. from Columbia, Newsweek, "The End of the Age of War," Dec 7, 2009, http://www.newsweek.com/id/225616/page/1

The economic crisis was supposed to increase violence around the world. The truth is that we are now living in one of the **most peaceful periods** since war first arose 10 or 12 millennia ago. The relative calm of our era, say scientists who study warfare in history and even prehistory, belies the popular, pessimistic notion that war is so deeply rooted in our nature that we can never abolish it. In fact, war seems to be a largely cultural phenomenon, which culture is now helping us eradicate. Some scholars now even cautiously speculate that the era of traditional war—fought by two uniformed, state-sponsored armies—might be drawing to a close. "War could be on the verge of ceasing to exist as a substantial phenomenon," says John Mueller, a political scientist at Ohio State University.¶ That might sound crazy, but consider: if war is defined as a conflict between two or more nations resulting in at least 1,000 deaths in a year, there have been no wars since the U.S. invasion of Iraq in 2003 and no wars between major industrialized powers since World War II. Civil wars have also declined from their peak in the early 1990s, when fighting tore apart Rwanda, the Balkans, and other regions. Most armed conflicts now consist of low-level guerrilla campaigns, insurgencies, and terrorism—what Mueller calls the "remnants of war."¶ These facts would provide little comfort if war's remnants were nonetheless killing millions of people—but they're not. Recent studies reveal a clear downward trend. In 2008, 25,600 combatants and civilians were killed as a direct result of armed conflicts, according to the University of Uppsala Conflict Data Program in Sweden. Two thirds of these deaths took place in just three trouble spots: Sri Lanka (8,400), Afghanistan (4,600), and Iraq (4,000).¶ Uppsala's figures exclude deaths from "one-sided conflict," in which combatants deliberately kill unarmed civilians, and "indirect" deaths from war-related disease and famine, but even when these casualties are included, annual war-related deaths from 2004 to 2007 are still low by historical standards. Acts of terrorism, like the 9/11 attacks or the 2004 bombing of Spanish trains, account for less than 1 percent of fatalities. In contrast, car accidents kill more than 1 million people a year.¶ The contrast between our century and the previous one is striking. In the second half of the 20th century, war killed as many as 40 million people, both directly and indirectly, or 800,000 people a year, according to Milton Leitenberg of the University of Maryland. He estimates that 190 million people, or 3.8 million a year, died as a result of wars and state--sponsored genocides during the cataclysmic first half of the century. Considered as a percentage of population, the body count of the 20th century is comparable to that of blood-soaked earlier cultures, such as the Aztecs, the Romans, and the Greeks.¶ By far the most warlike societies are those that preceded civilization. War killed as many as 25 percent of all pre-state people, a rate 10 times higher than that of the 20th century, estimates anthropologist Lawrence Keeley of the University of Illinois. Our ancestors were not always so bellicose, however: there is virtually no clear-cut evidence of lethal group aggression by humans prior to 12,000 years ago. Then, "warfare appeared in the evolutionary trajectory of an increasing number of societies around the world," says anthropologist Jonathan Haas of Chicago's Field Museum of Natural History. He attributes the emergence of warfare to several factors: growing population density, environmental stresses that diminished food sources, and the separation of people into culturally distinct groups. "It is only after the cultural foundations have been laid for distinguishing 'us' from 'them,' " he says, "that raiding, killing, and burning appear as a complex response to the external stress of environmental problems."¶ Early civilizations, such as those founded in Mesopotamia and Egypt 6,000 years ago, were extremely warlike. They assembled large armies and began inventing new techniques and technologies for killing, from horse-drawn chariots and catapults to bombs. But nation-states also developed laws and institutions for resolving disputes nonviolently, at least within their borders. These cultural innovations helped reduce the endless, tit-for-tat feuding that plagued pre-state societies.¶ A host of other cultural factors may explain the more recent drop-off in international war and other forms of social violence. One is a surge in democratic rather than totalitarian governance. Over the past two centuries democracies such as the U.S. have rarely if ever fought each other. Democracy is also associated with

low levels of violence within nations. Only 20 democratic nations existed at the end of World War II; the number has since more than quadrupled. Yale historian Bruce Russett contends that international institutions such as the United Nations and the European Union also contribute to this "democratic peace" phenomenon by fostering economic interdependence. Advances in civil rights for women may also be making us more peaceful. As women's education and economic opportunities rise, birthrates fall, decreasing demands on governmental and medical services and depletion of natural resources, which can otherwise lead to social unrest.¶ Better public health is another contributing factor. Over the past century, average life spans have almost doubled, which could make us less willing to risk our lives by engaging in war and other forms of violence, proposes Harvard psychologist Steven Pinker. At the same time, he points out, globalization and communications have made us increasingly interdependent on, and empathetic toward, others outside of our immediate "tribes."¶ Of course, the world remains a dangerous place, vulnerable to disruptive, unpredictable events like terrorist attacks. Other looming threats to peace include climate change, which could produce droughts and endanger our food supplies; overpopulation; and the spread of violent religious extremism, as embodied by Al Qaeda. A global financial meltdown or ecological catastrophe could plunge us back into the kind of violent, Hobbesian chaos that plagued many pre--state societies thousands of years ago. "War is not intrinsic to human nature, but neither is peace," warns the political scientist Nils Petter Gleditsch of the International Peace Research Institute in Oslo.¶ So far the trends are positive. If they continue, who knows? World peace—the dream of countless visionaries and -beauty--pageant -contestants—or something like it may finally come to pass.

Devp/Globalization Good

Anything else leads to system degradation a system of trade that results in inevitable conflict

Thompson 02

[Grahame, Professor of Political Economy at the Open University of Britain, "Wither the 'Washington Consensus,' the 'Developmental State,' and the 'Seattle Protests,' can Managed Free Trade and Investment' become an Alternative Development Model," Vol. 33, no. 131, x-xii, 2002 Problemas del Desarrollo]

Thus <u>although the anti-globalization movement could mount a critique of both these models, its main weakness in the development debate is its</u> <u>failure to construct a more sensible, attractive and realistic alternative vision for development</u> than provided by the two models outlined so far. <u>The anti-globalization movement remains **essentially negative**</u>. It provides a worthy and sometimes telling critique of many of the excesses of the international economy but that is about it (Thompson 2003b). <u>It does not have a positive alternative model of development. In fact the anti-globalization movement is a **disparate amalgam of many mutually contradictory elements** and positions.</u> It can 'unite' the extreme Marxist left with the far Right, along with disaffected environmentalist, human rights campaigners and debt-forgivers in between. <u>This is not a recipe for a **coherent** alternative position.</u> In fact, <u>as far as any consistent position from this quarter can be discerned it amounts to little more than the **call for a 'new protectionism'**. The desire to break up the international agencies of economic management like the IMF, The World Bank and the WTO, would **inevitably lead to this result**</u>. Whilst <u>these agencies have their pernicious aspects and</u> are not to be simply endorsed in their present form, they at <u>least have the virtue of preventing a devastating destruction of international trade and investment, and the likely formation of antagonistically poised trade blocks as arose in the inter-War period.</u>

Env Up

Environment improving globally

Bailey 14

Ronald Bailey is a science correspondent at Reason magazine and author of Liberation Biology, Reason Magazine, August 1, 2014, "Predictions of a Man-Made Sixth Mass Extinction May Be Exaggerated", http://reason.com/archives/2014/08/01/predictions-of-a-man-made-sixth-mass-ext

Meanwhile, some countervailing trends suggest the future of animal species may not be so grim. These trends include urbanization, slowing deforestation, the global increase in protected areas, and the advent of peak farmland. Transforming hundreds of millions of hardscrabble subsistence farmers scattered across the landscape into urban dwellers would greatly reduce the pressure on wildlife and their habitats. The good news is that that process is happening. According to the United Nations Population Division's World Urbanization Prospects 2014 report, 54 percent of people live in cities—up from 30 percent in 1950. The U.N. demographers forecast that proportion will rise to 66 percent by 2050. If world population follows the medium fertility trend, rising to 9.5 billion by 2050, that means that 3.2 billion people will still live in rural areas, down slightly from 3.4 billion today. In that scenario, population pressure will not be pushing the expansion of the human frontier into more wildlands. And if population growth traverses along the U.N.'s low fertility trend, the year 2050 will see human numbers peaking at 8.3 billion people. If 66 percent live in cities, only 2.8 billion people will be living on the landscape. Looking further into the future, the U.N. expects that 80 percent of people will be urbanites by 2100. Medium and low fertility population projections suggest that would mean that only 2.2 to 1.3 billion rural dwellers. Since most species live in forests, chiefly tropical forests, we should take a look at global forest cover trends. Happily, the deforestation rate is slowing. The Food and Agriculture Organization's State of the World's Forests 2012 report notes that the global rate of deforestation slowed from 0.2 percent per year between 1990 and 2000 to 0.14 percent between 2005 and 2010. Between 2000 and 2010, a total of 130 million hectares were cut, but 78 million hectares returned to forests. So globally, forests declined on average by 5.2 million hectares per year—at which rate, the report notes, "It will take 775 years to lose all of the world's forests." It adds, "This would seem to provide enough time for actions to slow or stop global deforestation." And indeed, researchers in 2006 found that more and more countries are passing through a "forest transition" in which their forest area starts expanding. Roger Sedjo, a forest ecologist at Resources for the Future, predicts that by 2050 most of the world's industrial wood will be grown on forest plantations covering only 5 to 10 percent of the extent of today's global forests. One dark blot on forest restoration trends is biofuel mandates in rich countries, which have spurred tropical countries to chop down forests to grow palm oil to produce biodiesel. By one estimate, 87 percent of the deforestation in Malaysia and 118 percent in Indonesia occurred as result of expanding palm oil plantations. Another beneficial trend is that protected areas such as parks and marine preserves are expanding at a remarkably fast pace. The World Bank notes that protected areas have nearly doubled from 8.5 percent of the world's total land area in 1990 to 14.3 percent in 2012. That's an area twice the size of the entire United States. Marine protected areas have increased from 4.7 percent of territorial waters in 1990 to 10 percent in 2012. Under the Convention on Biological Diversity, governments of the world have committed to protecting 17 percent of terrestrial and inland water areas and 10 per cent of coastal and marine areas by 2020. Considering that agriculture is the most expansive and intensive way in which people transform natural landscapes, the really good news is that the amount of land globally devoted to food production may be falling as population growth slows and agricultural productivity increases. "We believe that projecting conservative values for population, affluence, consumers, and technology shows humanity peaking in the use of farmland," concludes Jesse Ausubel, the director of the Human Environment Program at the Rockefeller University. In a 2013 article titled "Peak Farmland and the Prospect for Land Sparing," Ausubel and his colleagues write: "Global arable land and permanent crops spanned 1,371 million hectares in 1961 and 1,533 million hectares in 2009, and we project a return to 1,385 million hectares in 2060." As a result of these trends, humanity will likely restore at least 146 million hectares of land, an area two and a half times that of France, or ten Iowas—and possibly much more. Relaxing those biofuel mandates would spare an additional 256 million hectares from the plow, the researchers estimate. That mean nearly 400 million hectares—an area nearly double the size of the United

States east of the Mississippi River—could be restored to nature by 2060. The late 20th century's predictions of imminent mass extinction happily proved wrong. The positive trends cited above provide good grounds to believe that the new ones will also turn out to be exaggerated.

AT: Sustainability Impacts

Sustainability impacts are bad science – no basis for running into tech barriers

Matt **Ridley**, visiting professor at Cold Spring Harbor Laboratory, former science editor of *The Economist*, and award-winning science writer, **'14**

("The World's Resources Aren't Running Out," April 25, 2014, http://online.wsj.com/news/articles/SB10001424052702304279904579517862612287156?mg=reno64-wsj&url=http%3A%2F%2Fonline.wsj.com%2Farticle%2FSB10001424052702304279904579517862612287156.html)

"We are using 50% more resources than the Earth can sustainably produce, and unless we change course, that number will grow fast—by 2030, even two planets will not be enough," says Jim Leape, director general of the World Wide Fund for Nature International (formerly the World Wildlife Fund). But here's a peculiar feature of human history: **We burst through such limits again and again**. After all, as a Saudi oil minister once said, **the Stone Age didn't end for lack of stone.** Ecologists call **this "niche construction"**—that people (and indeed some other animals) can create new opportunities for themselves by making their habitats more productive in some way. Agriculture is the classic example of niche construction: We stopped relying on nature's bounty and substituted an artificial and much larger bounty. Economists call the same phenomenon innovation. What frustrates them about ecologists is the latter's tendency to think in terms of static limits. Ecologists can't seem to see that when whale oil starts to run out, petroleum is discovered, or that when farm yields flatten, **fertilizer comes along,** or that when glass fiber is invented, demand for copper falls. **That frustration is heartily reciprocated**. Ecologists think that economists espouse a sort of **superstitious magic** called "markets" or "prices" to avoid confronting the reality of limits to growth. The easiest way to raise a cheer in a conference of ecologists is to make a rude joke about economists. **I have lived among both tribes**. I studied various forms of ecology in an academic setting for seven years and then worked at the Economist magazine for eight years. When I was an ecologist (in the academic sense of the word, not the political one, though I also had antinuclear stickers on my car), I very much espoused the carrying-capacity viewpoint—that there were limits to growth. I nowadays lean to the view that there are no limits because we can invent new ways of doing more with less. This disagreement goes to the heart of many current political issues and explains much about why people disagree about environmental policy. In the climate debate, for example, pessimists see a limit to the atmosphere's capacity to cope with extra carbon dioxide without rapid warming. So a continuing increase in emissions if economic growth continues will eventually accelerate warming to dangerous rates. But optimists see economic growth leading to **technological change that would result in the use of lower-carbon energy**. That would allow warming to level off **long before it does much harm.** It is striking, for example, that the Intergovernmental Panel on Climate Change's recent forecast that temperatures would rise by 3.7 to 4.8 degrees Celsius compared with preindustrial levels by 2100 was based on several assumptions: little technological change, an end to the 50-year fall in population growth rates, a tripling (only) of per capita income and not much improvement in the energy efficiency of the economy. Basically, that would mean a world much like today's but with lots more people burning lots more coal and oil, leading to an increase in emissions. Most economists expect a five- or tenfold increase in income, huge changes in technology and an end to population growth by 2100: not so many more people needing much less carbon. In 1679, Antonie van Leeuwenhoek, the great Dutch microscopist, estimated that the planet could hold **13.4 billion people**, a number that most demographers think we may never reach. Since then, estimates have bounced around between 1 billion and 100 billion, with no sign of converging on an agreed figure. Economists point out that **we keep improving the productivity of each acre of land by applying fertilizer, mechanization, pesticides and irrigation.** Further innovation is bound to shift the ceiling upward. Jesse Ausubel at Rockefeller University calculates that the amount of land required to grow a given quantity of food has fallen by 65% over the past 50 years, world-wide. Ecologists object that these innovations rely on nonrenewable resources, such as oil and gas, or renewable ones that are being used up **faster than they are replenished**, such as aquifers. So current yields cannot be maintained, let alone improved. In his recent book "The View

from Lazy Point," the ecologist Carl Safina estimates that if everybody had the living standards of Americans, we would need 2.5 Earths because the world's agricultural land just couldn't grow enough food for more than 2.5 billion people at that level of consumption. Harvard emeritus professor E.O. Wilson, one of ecology's patriarchs, reckoned that only if we all turned vegetarian could the world's farms grow enough food to support 10 billion people. Economists respond by saying that since large parts of the world, especially in Africa, have yet to gain access to fertilizer and modern farming techniques, there is no reason to think that the global land requirements for a given amount of food will cease shrinking any time soon. Indeed, Mr. Ausubel, together with his colleagues Iddo Wernick and Paul Waggoner, came to the startling conclusion that, even with generous assumptions about population growth and growing affluence leading to greater demand for meat and other luxuries, and with ungenerous assumptions about future global yield improvements, we will need less farmland in 2050 than we needed in 2000.

(So long, that is, as we don't grow more biofuels on land that could be growing food.) But surely intensification of yields depends on inputs that may run out? Take water, a commodity that limits the production of food in many places. Estimates made in the 1960s and 1970s of water demand by the year 2000 proved grossly overestimated: The world used half as much water as experts had projected 30 years before. The reason was greater economy in the use of water by **new irrigation techniques**. Some countries, such as Israel and Cyprus, have cut water use for irrigation through the use of drip irrigation. Combine these improvements with solar-driven desalination of seawater world-wide, and it is **highly unlikely that fresh water will limit human population.** The best-selling book "Limits to Growth," published in 1972 by the Club of Rome (an influential global think tank), argued that we would have **bumped our heads against all sorts of ceilings by now, running short of various metals, fuels, minerals and space. Why did it not happen? In a word, technology: better mining techniques, more frugal use of materials**, and if scarcity causes price increases, substitution by cheaper material. We use 100 times thinner gold plating on computer connectors than we did 40 years ago. The steel content of cars and buildings keeps on falling. Until about 10 years ago, it was reasonable to expect that natural gas might run out in a few short decades and oil soon thereafter. If that were to happen, agricultural yields would plummet, and the world would be faced with a stark dilemma: Plow up all the remaining rain forest to grow food, or starve. But thanks to fracking and the shale revolution, **peak oil and gas have been postponed**. They will run out one day, **but only in the sense that you will run out of Atlantic Ocean one day if you take a rowboat west out of a harbor in Ireland**. Just as you are likely to stop rowing long **before you bump into Newfoundland**, so **we may well find cheap substitutes for fossil fuels long before they run out**.

I nowadays lean to the view that there are no limits because we can invent new ways of doing more with less. <u>This disagreement goes to the heart of many current political issues</u> and explains much about why people disagree about environmental policy. <u>In the climate debate, for example, pessimists see a limit to the atmosphere's capacity</u> to cope with extra carbon dioxide without rapid warming. So a continuing increase in emissions if economic growth continues will eventually accelerate warming to dangerous rates. <u>But optimists see economic growth leading to</u> **technological change that would result in the use of lower-carbon energy**<u>. That would allow warming to level off</u> **long before it does much harm.** <u>It is striking</u>, for example, <u>that the Intergovernmental Panel</u> on Climate Change's recent forecast that temperatures would rise by 3.7 to 4.8 degrees Celsius compared with preindustrial levels by 2100 was based on several assumptions: little technological change, <u>an end to the 50-year fall in population growth rates, a tripling (only) of per capita income and not much improvement in the energy efficiency of the economy.</u> Basically, that would mean a world much like today's but with lots more people burning lots more coal and oil, leading to an increase in emissions. <u>Most economists expect a five- or tenfold increase in income</u>, huge changes in technology and an end to population growth by 2100: not so many more people needing much less carbon. In 1679, Antonie van <u>Leeuwenhoek, the great Dutch microscopist, estimated that the planet could hold **13.4 billion people**</u>, a number that most demographers think we may never reach. Since then, estimates have bounced around between 1 billion and 100 billion, with no sign of converging on an agreed figure. Economists point out that <u>**we keep improving the productivity of each acre of land by applying fertilizer, mechanization, pesticides and irrigation.**</u> Further innovation is bound to shift the ceiling upward.

Jesse Ausubel at Rockefeller University calculates that the amount of land required to grow a given quantity of food has fallen by 65% over the past 50 years, world-wide. <u>Ecologists object that these innovations rely on nonrenewable resources, such as oil and gas, or renewable ones that are being used up **faster than they are replenished**</u>, such as aquifers. So current yields cannot be maintained, let alone improved. In his recent book "The View from Lazy Point," the ecologist Carl Safina estimates that if everybody had the living standards of Americans, we would need 2.5 Earths because the world's agricultural land just couldn't grow enough food for more than 2.5 billion people at that level of consumption. Harvard emeritus professor E.O. Wilson, one of ecology's patriarchs, reckoned that only if we all turned vegetarian could the world's farms grow enough food to support 10 billion people. Economists respond by saying that since large parts of the world, especially in Africa, have yet to gain access to fertilizer and modern farming techniques, there is no reason to think that the global land requirements for a given amount of food will cease shrinking any time soon. Indeed,

Mr. Ausubel, together with his colleagues Iddo Wernick and Paul Waggoner, came to the startling conclusion that, even with generous assumptions about population growth and growing affluence leading to greater demand for meat and other luxuries, and with ungenerous assumptions about future global yield improvements, we will need less farmland in 2050 than we needed in 2000. (So long, that is, as we don't grow more biofuels on land that could be growing food.) But surely intensification of yields depends on inputs that may run out? Take water, a commodity that limits the production of food in many places. Estimates made in the 1960s and 1970s of water demand by the year 2000 proved grossly overestimated: The world used half as much water as experts had projected 30 years before. The reason was greater economy in the use of water by new irrigation techniques. Some countries, such as Israel and Cyprus, have cut water use for irrigation through the use of drip irrigation. Combine these improvements with solar-driven desalination of seawater world-wide, and it is highly unlikely that fresh water will limit human population. The best-selling book "Limits to Growth," published in 1972 by the Club of Rome (an influential global think tank), argued that we would have bumped our heads against all sorts of ceilings by now, running short of various metals, fuels, minerals and space. Why did it not happen? In a word, technology: better mining techniques, more frugal use of materials, and if scarcity causes price increases, substitution by cheaper material. We use 100 times thinner gold plating on computer connectors than we did 40 years ago. The steel content of cars and buildings keeps on falling. Until about 10 years ago, it was reasonable to expect that natural gas might run out in a few short decades and oil soon thereafter. If that were to happen, agricultural yields would plummet, and the world would be faced with a stark dilemma: Plow up all the remaining rain forest to grow food, or starve. But thanks to fracking and the shale revolution, peak oil and gas have been postponed. They will run out one day, but only in the sense that you will run out of Atlantic Ocean one day if you take a rowboat west out of a harbor in Ireland. Just as you are likely to stop rowing long before you bump into Newfoundland, so we may well find cheap substitutes for fossil fuels long before they run out.

Alt's orientation away from WTO is impacted in the 1ac with trade wars and GATS collapse their politics leads to apathy – can't transition from theory to political change

John **Gibson**, Postdoctoral Fellow, University of Kent, **'08**

("The Myth of the Multitude: The Endogenous Demise of Alter-globalist Politics," Global Society, Vol. 22, No. 2, April, 2008)

Crucially, such assessments view the rhizomatic structures and reflexive capacities of alter-globalist agents as also negating the internal antagonism and factionalism often associated with social movements. Hardt understands the World Social Forum as fulfilling the promise of anti-hierarchical politics—an infinitesimally open-ended collection of struggles converging around a basic commitment to resist neoliberalism, in which ideological differences cease to produce significant schisms.16 Stephen Gill has argued that alter-globalist practices counter long-standing differences between "new" and "old" social movements, creating a radically fluid "postmodern Prince" in the process.17 Similarly, Jackie Smith has argued that the demand for "democracy", functioning as an open signifier for the desire for greater personal control over biopolitics, is the sole commonality in otherwise plural alter-globalist spaces.18 Such claims resemble Laclau and Mouffe's model of a Logic of Equivalence, in which a vast collection of particular social movements and political demands resonate in accordance with one another through the use of a central empty signifier (in this case, "democracy") as an open point for infinite re-inscriptions, and whose ontological closure is permanently resisted.19 In such interpretations, the pronoun "we" in alterglobalist contexts is devoid of any fixed subjective content and is radically democratic. The political moment is defined within such discourses by Kingsnorth's "one no". Unity is structured around a shared rejection of transnational neoliberal capitalism, facilitating cross-cultural forms of identification and epistemic exchange, resisting any fixed meaning of the collective subject that undertakes activism. The central dilemma for activist life becomes whether the "many yeses" arising in its wake can exert counter-hegemonic power in a long-term war of position.20 However, although such accounts appear to present sources of optimism that dominant technocratic and individualist frames of global politics can be countered successfully, there are reasons to doubt their claims. After reaching an early apogee of 250,000 protesters at the Genoa G8 meeting in 2001, in the wake of 11 September 2001 summit protests have declined significantly, both in terms of frequency and attendees. The protest in Miami against the Free Trade Area of the Americas (FTAA) agreement in November 2003, advertised within movement circles as an event that would exceed the importance of Seattle, drew a crowd of below 10,000, and failed to generate any significant media coverage.21 The 2004 G8 summit in Georgia was met by hundreds, rather than thousands of protesters, and planned

solidarity actions elsewhere failed to materialise.22 Likewise, the 2004 London May Day gathering was cancelled after poorly attended planning meetings, and in 2005 fewer than two dozen self-declared anti-capitalists played cricket on the lawn south of the House of Commons.23 The direct action protests conducted around the Gleneagles G8 summit were undertaken by only a few thousand, and controversial protest tactics, including acts of vandalism in Auchterarder, generated considerable internal schisms.24 Social Forums have also become beset by difficulties. Intra-movement concerns reflect a growing atrophy; the absence of a venue for the prospective fifth European Social Forum reflects a scenario in which "there is no more cooperation between our forces than there was before Florence [in 2002]".25 To compound matters, some activists have complained that such events are becoming dominated by resource-heavy NGOs.26 The World Social Forum has become frequented by political elites. Gerhard Schro¨der and Jacques Chirac both attended the 2003 event, transgressing its Charter of Principles, in which the WSF exists in "opposition to a process of globalisation commanded by the large multinational corporations and by the governments and international institutions at the service of those corporations' interests, with the complicity of national governments".27 Activists often assert that the current impasse is temporary, that as new ways of pushing forward are imagined there will be a corresponding resurgence of antineoliberal politics. However, rather than the current lull representing a temporary period of torpor for alter-globalist politics, a number of entrenched weaknesses within the dominant myths of alter-globalist networks stymie its capacity to embody radical democracy. Caution is required against the hubris evident in the prevailing accounts of a fluid subject, conscious of its counter-hegemonic potential as a source of the dissolution of the neoliberal world order. Such mythology is ridden with inherent deficiencies that are rarely addressed by participants. Rather than a global multitude taking shape, in many respects we see only the phantasm of such a polis, and one that depends upon the active repression of contradictions and flaws in order to maintain the idealised image of the multitude presented by such prominent movement commentators as Klein and Kingsnorth.

Corporate influence is exaggerated

Jones 04

(Kent Jones is Professor of Economics at Babson College, Who's Afraid of the WTO?, 2004, pg. 174-5)

For their most severe critics, such measures will hardly be enough.6 Yet domestic political channels in the MNC's home country are still the best way to raise the issues and exert influence. In contrast, trying to attack MNCs by attacking the WTO misses the target. For one thing, MNC influence on the WTO has often been exaggerated. The largest of the MNCs certainly wield a great deal of political influence, but mainly through domestic channels. The first is through lobbying efforts in their home countries, where they play a large role in setting national agendas for trade negotiations and also have access to unilateral trade protection through antidumping and countervailing duty laws.7 The second channel lies in their relationships with the governments of the countries hosting MNC foreign operations. It is important to keep in mind that many countries, and indeed localities even within the developed countries, have been courting FDI for the economic benefits it brings. Most governments have come to view FDI as an overwhelmingly positive contribution to the recipient country's economic development and growth. This view is based on the underlying economics of international capital mobility and related activities. Such bilateral relationships always carry the danger of abuse, as special deals may be struck to bypass taxes or regulations, for example. In addition, many governments, especially in developing countries, want to retain as much control as possible over the terms of FDI, which is why they also have a strong interest in TRIMs. Yet this issue is being sorted out in the WTO as a matter of negotiation among sovereign states, not as the result of MNCs dictating the rules to helpless governments. Within the WTO, the MNCs can indeed exert strong influence, but it is typically tempered through the mediating factor of governmental representation. In the years before the conclusion of the Uruguay Round, U.S. multinationals (and other U.S. firms), for example, could—and did—lobby their home government directly for unilateral action under various forms of section 301 of U.S. trade law. Together, these provisions allowed unilateral actions by the United States to "pry" open foreign markets and to retaliate against any foreign trade practices deemed "unreasonable."8 By bringing investment and intellectual property issues into the WTO through the TRIMs and TRIPs agreements, and by strengthening the dispute settlement system, trade policy issues of concern to MNCs were channeled into a multilateral forum. Under the WTO system, only governments have standing, and a government must therefore decide whether to bring a case before the Dispute Settlement Body, based on national interests and an associated

assessment of trade-offs in commercial diplomacy. This does not eliminate the influence of MNCs on the trading system; active lobbying; aggressive, unfair trade-law enforcement; and accommodating domestic trade officials still give them considerable clout. Yet the elimination of unilateral measures tends to moderate the influence of the MNCs and of domestic business in general on trade policy. One sign of the restraint on political influence is that many MNCs advocate WTO reform that would allow them to file dispute cases directly, without governmental intermediaries (see Julius 1994). Such proposals cast serious doubt on claims that MNCs somehow control the WTO or dictate trade rules or dispute settlement decisions. In addition, MNC activities are subject to increased public scrutiny, providing another channel of influence for NGOs. In general, stakeholders in trade issues, whether they are NGOs, MNCs, or other interest groups, have their most direct influence on trade policy through their national political institutions. For those concerned abut MNC political power, the best institutional arrangement is one in which governments can negotiate agreements and represent the broader interests of their domestic constituents in the WTO, keeping all interest groups involved at the domestic level of the policy debate. Other channels of influence for nontrade issues can also be developed in new international institutions.

Impact causality is backwards---violence is significantly declining---be skeptical of their doomsaying

Steven **Pinker**, Johnstone Family professor of psychology at Harvard and the author of The Better Angels of Our Nature: Why Violence Has Declined, **and** Andrew **Mack**, fellow at the One Earth Future Foundation and director of the Human Security Report Project at Simon Fraser University, "The World Is Not Falling Apart," **12/22**/'14, http://www.slate.com/articles/news_and_politics/foreigners/2014/12/the_world_is_not_falling_apart_the_trend_lines_reveal_an_increasingly_peaceful.single.html

The world is not falling apart. The kinds of violence to which most people are vulnerable—homicide, rape, battering, child abuse—have been in **steady decline** in most of the world. Autocracy is giving way to democracy. **Wars between states**—**by far** **the most destructive** of all conflicts—**are** all but **obsolete**. The increase in the number and deadliness of civil wars since 2010 is **circumscribed**, **puny in comparison with** **the decline** **that preceded it,** and **unlikely to escalate.** We have been told of impending doom before: a Soviet invasion of Western Europe, a line of dominoes in Southeast Asia, revanchism in a reunified Germany, a rising sun in Japan, cities overrun by teenage superpredators, a coming anarchy that would fracture the major nation-states, and weekly 9/11-scale attacks that would pose an existential threat to civilization. Why is the world **always "more dangerous than** it has **ever** been"— **even as a greater and greater majority** of humanity **lives in peace and dies of old age**? Too much of our impression of the world comes from a **misleading** formula of **journalistic narration.** Reporters give lavish coverage to gun bursts, explosions, and viral videos, oblivious to how representative they are and apparently innocent of the fact that many were contrived as journalist bait. Then come sound bites from "**experts" with vested interests** in maximizing **the impression of mayhem:** generals, politicians, security officials, moral activists. The talking heads on cable news filibuster about the event, desperately hoping to avoid dead air. Newspaper columnists instruct their readers on what emotions to feel. **There is a better way to understand the world.** Commentators can brush up their history—not by rummaging through Bartlett's for a quote from Clausewitz, but by recounting the events of the recent past that put the events of the present in an intelligible context. And they could consult the analyses of quantitative datasets on violence that are now just a few clicks away. An evidence-based mindset on the state of the

world would bring many benefits. It would calibrate our national and international responses to the magnitude of the dangers that face us. It would limit the influence of terrorists, school shooters, decapitation cinematographers, and other violence impresarios. It might even dispel foreboding and embody, again, the hope of the world.

AT: Neoliberalism/Cap Impact

Reject their lens of neoliberalism. Starting with "neoliberalism" encourages fake radicalism, oversimplification, and greater levels of cooptation than positive and pragmatic politics.

-Ad hoc policies of neoliberalism also originate from Leftist movements for greater autonomy

-Sustainability politics also emerged during this time, but the neolib K ignores those and lumps them all together

-Ignores positive action that doesn't conform to a romantic view of rebellion (i.e. the plan)

Clive **BARNETT** Faculty of the Social Sciences @ Open University (UK) **'5** ["The Consolations of 'Neoliberalism'" *Geoforum* 36 (1) p. Science Direct]

3. There is no such thing as neoliberalism! The blind-spot in theories of neoliberalism—whether neo-Marxist and Foucauldian—comes with trying to account for how top-down initiatives 'take' in everyday situations. So perhaps **the best thing to do is to stop thinking of "neoliberalism" as a coherent "hegemonic" project** altogether. For all its apparent critical force, the vocabulary of "neoliberalism" and "neoliberalization" in fact provides a double consolation for leftist academics: it supplies us with plentiful opportunities for unveiling the real workings of hegemonic ideologies in a characteristic gesture of revelation; and in so doing, it invites us to align our own professional roles with the activities of various actors "out there", who are **always framed as engaging in resistance** or contestation. The conceptualization of "neoliberalism" as a "hegemonic" project does not need refining by adding a splash of Foucault. Perhaps we should try to do without the concept of "neoliberalism" altogether, because it might actually compound rather than aid in the task of figuring out how the world works and how it changes. One reason for this is that, between an overly economistic derivation of political economy and an overly statist rendition of governmentality, stories about "neoliberalism" manage to reduce the understanding of social relations to a residual effect of hegemonic projects and/or governmental programmes of rule (see Clarke, 2004a). Stories about "neoliberalism" pay little attention to the pro-active role of socio-cultural processes in provoking changes in modes of governance, policy, and regulation. Consider the example of the restructuring of public services such as health care, education, and criminal justice in the UK over the last two or three decades. This can easily be thought of in terms of a "hegemonic" project of "neoliberalization", and certainly one dimension of this process has been a form of anti-statism that has rhetorically contrasted market provision against the rigidities of the state. But in fact these ongoing changes in the terms of public-policy debate involve a combination of different factors that add up to a much more dispersed populist reorientation in policy, politics, and culture. These factors include changing consumer expectations, involving shifts in expectations towards public entitlements which follow from the generalization of consumerism; the decline of deference, involving shifts in conventions and hierarchies of taste, trust, access, and expertise; and the refusals of the subordinated, referring to the emergence of anti-paternalist attitudes found in, for example, women's health movements or anti-psychiatry movements. They include also the development of the politics of difference, involving the emergence of discourses of institutional discrimination based on gender, sexuality, race, and disability. This has disrupted the ways in which welfare agencies think about inequality, helping to generate the emergence of contested inequalities, in which policies aimed at addressing inequalities of class and income develop an ever more expansive dynamic of expectation that public services should address other kinds of inequality as well (see Clarke, 2004b J. Clark, Dissolving the public realm? The logics and limits of neo-liberalism, Journal of Social Policy 33 (2004), pp. 27–48.Clarke, 2004b). None of these populist tendencies is simply an expression of a singular "hegemonic" project of "neoliberalization".

They are effects of much longer rhythms of socio-cultural change that emanate from the bottom-up. It seems just as plausible to suppose that what we have come to recognise as "hegemonic neoliberalism" is a muddled set of ad hoc, opportunistic accommodations to these unstable dynamics of social change as it is to think of it as the outcome of highly coherent political-ideological projects. Processes of **privatization, market liberalization**, and de-regulation have often followed an **ironic pattern** in so far as they have **been triggered by citizens' movements arguing from the left** of the political spectrum **against the rigidities of statist** forms of **social policy** and welfare provision in the name of greater autonomy, equality, and participation (e.g. Horwitz, 1989). The political re-alignments of the last three or four

decades cannot therefore be adequately understood in terms of a straightforward shift from the left to the right, from values of collectivism to values of individualism, or as a re-imposition of class power. The emergence and generalization of this populist ethos has much longer, deeper, and wider roots than those ascribed to "hegemonic neoliberalism". And it also points towards the extent to which easily the most widely resonant political rationality in the world today is not right-wing market liberalism at all, but is, rather, the polyvalent discourse of "democracy" (see Barnett and Low, 2004). Recent theories of "neoliberalism" have retreated from the appreciation of the long-term rhythms of socio-cultural change, which Stuart Hall once developed in his influential account of Thatcherism as a variant of authoritarian populism. Instead, they favour elite-focused analyses of state bureaucracies, policy networks, and the like. One consequence of the residualization of the social is that theories of "neoliberalism" have great difficulty accounting for, or indeed even in recognizing, new forms of "individualized collective-action" (Marchetti, 2003) that have emerged in tandem with the apparent ascendancy of "neoliberal hegemony": **environmental politics and the politics of sustainability**; new forms of consumer activism oriented by an ethics of assistance and global solidarity; the identity politics of sexuality related to demands for changes in modes of health care provision, and so on (see Norris, 2002). All of these might be thought of as variants of what we might want to call bottom-up governmentality. This refers to the notion that non-state and non-corporate actors are also engaged in trying to govern various fields of activity, both by acting on the conduct and contexts of ordinary everyday life, but also by acting on the conduct of state and corporate actors as well. Rose (1999, pp. 281–284) hints at the outlines of such an analysis, at the very end of his paradigmatic account of governmentality, but investigation of this phenomenon is poorly developed at present. Instead, the trouble-free amalgamation of Foucault's ideas into the Marxist narrative of "neoliberalism" sets up a simplistic image of the world divided between the forces of hegemony and the spirits of subversion (see Sedgwick, 2003, pp. 11–12). And **clinging to this image only makes it all the more difficult to acknowledge the possibility of positive political action** that does not conform to a **romanticized picture of rebellion**,//

contestation, or protest against domination (see Touraine, 2001). Theories of "neoliberalism" are unable to recognize the emergence of new and innovative forms of individualized collective action because their critical imagination turns on a simple evaluative opposition between individualism and collectivism, the private and the public. The radical academic discourse of "neoliberalism" frames the relationship between collective action and individualism simplistically as an opposition between the good and the bad. In confirming a narrow account of liberalism, understood primarily as an economic doctrine of free markets and individual choice, there is a peculiar convergence between the radical academic left and the right-wing interpretation of liberal thought exemplified by Hayekian conservatism. By obliterating the political origins of modern liberalism—understood as answering the problem of how to live freely in societies divided by interminable conflicts of value, interest, and faith—the discourse of "neoliberalism" reiterates a longer problem for radical academic theory of being unable to account for its own normative priorities in a compelling way. And by denigrating the value of individualism as just an ideological ploy by the right, the pejorative vocabulary of "neoliberalism" invites us to take solace in an image of collective decision-making as a practically and normatively unproblematic procedure. The recurrent problem for theories of "neoliberalism" and "neoliberalization" is their two-dimensional view of both political power and of geographical space. They can only account for the relationship between top-down initiatives and bottom-up developments by recourse to the language of centres, peripheries, diffusion, and contingent realizations; and by displacing the conceptualization of social relations with a flurry of implied subject-effects. The turn to an overly systematized theory of governmentality, derived from Foucault, only compounds the theoretical limitations of economistic conceptualizations of "neoliberalism". The task for social theory today remains a quite classical one, namely to try to specify "the recurrent causal processes that govern the intersections between abstract, centrally promoted plans and social life on the small scale" (Tilly, 2003, p. 345). Neither neoliberalism-as-hegemony nor neoliberalism-as-governmentality is really able to help in this task, not least because both invest in a deeply embedded picture of subject-formation as a process of "getting-at" ordinary people in order to make them believe in things against their best interests. With respect to the problem of accounting for how "hegemonic" projects of "neoliberalism" win wider consensual legitimacy, Foucault's ideas on governmentality seem to promise an account of how people come to acquire what Ivison (1997) calls the "freedom to be formed and normed". Over time, Foucault's own work moved steadily away from an emphasis on the forming-and-norming end of this formulation towards an emphasis on the freedom end. This shift was itself a reflection of the realization that the circularities of poststructuralist theories of subjectivity can only be broken by developing an account of the active receptivity of people to being directed. But, in the last instance, neither the story of neoliberalism-as-hegemony or of neoliberalism-as-governmentality can account for the forms of receptivity, pro-activity, and generativity that might help to explain how the rhythms of the everyday are able to produce effects on macro-scale processes, and vice versa. So, rather than finding convenient synergies between what are already closely related theoretical traditions, perhaps it is better to keep open those tiresome debates about the degree of coherence between them, at the same time as trying to broaden the horizons of our theoretical curiosity a little more widely.

Alt/Strategy Answers

Specify Alt Key

Failure to specify how the alternative, or event, can solve existing problems of economic decision-making—empirically resulted in tyranny and economic catastrophe

Andrew **SAYER** Reader in Political Economy @ Lancaster **'95** *Radical Political Economy: A Critique* p. 13-14

Yet while the 'velvet' character of the revolutions was remarkable enough, there was little else that the Left could celebrate about them. As Habermas points out, they were also singularly depressing in that they were devoid of 'ideas that are either innovative or orientated to the future' (1991, p. 27). Whether Habermas meant it or not, I would add that it was Western Marxists as well as people in the former socialist states who lacked ideas about alternatives. In this context, market triumphalism could divert attention from the continued failings of capitalism, as if the 'victory' of capitalism meant that no one had any right to criticize it. Again, as Habermas put it, 'it is not as though the collapse of the Berlin Wall solved a single one of the problems specific to our system' (Habermas, 1991, p. xii). While the latter statement is surely correct it could be read as implying that it was 'business-as-usual' for the Left. It is my view that this kind of interpretation, together with those of Jameson and Callinicos, are complacent and hopelessly inad- equate. One can agree with Jameson that Marxism is primarily a theory of capitalism, but this position is nevertheless all too smug, for it begs the question of whether its account of capitalism is at all adequate.' Similarly, Callinicos implies that there are no lessons to be learned from the demise of state socialism, save that it wasn't real socialism, and there are certainly no lessons for the critique of capitalism.

This book is motivated by the view that such complacency is **entirely unwarranted**. The **totalitarian** character of state socialism and its problems of economic motivation and coordination are not historical aber- rations but are presaged by Marxism's lack of a sufficiently materialist understanding of the social division of labour and its associated division and dispersion of knowledge in advanced economies. This failing not only explains the inadequacies of state socialism's attempt to plan such an economy centrally, but is the **major unresolved flaw** in Marxist theory of capitalism. The reluctance of the Left to think through alternatives (for fear of producing 'blueprints' which might pre-empt future struggles) meant not only that radical political movements had little idea of **feasible and desirable objectives**, but that the standpoints from which capitalism and its problems were explained and criticized were unexamined and often **incoherent** or undesirable. There is no way the Left can reply to market triumphalism and the lack of alternatives without giving some consideration to the old problems of political economy.

AT: pedagogy

Their insistence on pedagogy being 'first' reifies extremism and fragmentation in the academy – only the perm avoids scholarship shutdown

David **Lake 11**, political science prof at UC-San Diego, Why "isms" Are Evil: Theory, Epistemology, and Academic Sects as Impediments to Understanding and Progress, International Studies Quarterly (2011) 55, 465-480

My critique of our profession is a common one, but one worth repeating. Most generally, we organize ourselves into academic "sects" that engage in self-affirming research and then wage theological debates between academic religions. This occurs at both the level of theory and epistemology. In turn, we reward those who stake out extreme positions within each sect. Unfortunately, this academic sectarianism, a product of our own internal political struggles, produces less understanding rather than more. Some reasonably fear intellectual "monocultures," as McNamara (2009) has called the possible hegemony of rationalism. But the current cacophony is not a sign of productive intellectual ferment in the pursuit of meaningful knowledge." Rather, we have produced a clash of competing theologies each claiming its own explanatory "miracles" and asserting its universal truth and virtue. Instead, a large measure of intellectual humility Is in order. Theoretically, we are far from the holy grail of a universal theory of international politics—if indeed such a grail even exists. We should focus instead on developing contingent, mid-level theories of specific phenomena. This analytical eclecticism is likely to be more productive (Sil and Katzenstein 2010). But we aLso need a lexicon for translating otherwise incommensurable theories and making them mutually intelligible. In the following section, I outline the problems with theoretical sects and affirm the case for analytic eclecticism. I then end with one possible "Rosetta stone" that aims to facilitate conversation across research traditions by suggesting that all theories of international studies can be disaggregated into the basic and common concepts of interests, interactions, and institutions. Epistemologically, there is perhaps an even deeper divide that is, unfortunately, not so easily bridged. The nomothetic vs narrative divide cuts through all of the social sciences and possibly beyond. This divide endures because scholars—either innately or through socialization—find one form of explanation more intellectually satisfying than the other. Yet, in international studies, we have reified this divide and, as with our theories, have formed mutually exclusive churches. Rather than claiming one or the other epistemology Is always and everywhere superior, we should recognize that both are valid and perhaps even complementary paths to understanding. The question is not which approach is inherently superior, but which yieIds greater insights under what circumstances. The second major section below takes up epistemology and its consequences for professional practice and knowledge.

AT: Silly Alt

Failure to specify how the alternative can solve existing problems of economic decision-making that create subsidies and overproduction will produce either tyranny or ineffectiveness.

Andrew **SAYER** Reader in Political Economy @ Lancaster **'95** *Radical Political Economy: A Critique* p. 13-14

Yet while the 'velvet' character of the revolutions was remarkable enough, there was little else that the Left could celebrate about them. As Habermas points out, they were also singularly depressing in that they were devoid of 'ideas that are either innovative or orientated to the future' (1991, p. 27). The **totalitarian** character of state socialism and its problems of economic motivation and coordination are not historical aber- rations but are presaged by Marxism's lack of a sufficiently materialist understanding of the social division of labour and its associated division and dispersion of knowledge in advanced economies. This failing not only explains the inadequacies of state socialism's attempt to plan such an economy centrally, but is the **major unresolved flaw** in Marxist theory of capitalism. The reluctance of the Left to think through alternatives (for fear of producing 'blueprints' which might pre-empt future struggles) meant not only that radical political movements had little idea of **feasible and desirable objectives**, but that the standpoints from which capitalism and its problems were explained and criticized were unexamined and often **incoherent** or undesirable. There is no way the Left can reply to market triumphalism and the lack of alternatives without giving some consideration to the old problems of political economy.

Neolib Alt

Reject their lens of neoliberalism. Starting with "neoliberalism" encourages fake radicalism, oversimplification, and greater levels of cooptation than positive and pragmatic politics.

-Ad hoc policies of neoliberalism also originate from Leftist movements for greater autonomy

-Sustainability politics also emerged during this time, but the neolib K ignores those and lumps them all together

-Ignores positive action that doesn't conform to a romantic view of rebellion (i.e. the plan)

["The Consolations of 'Neoliberalism'" *Geoforum* 36 (1) p. Science Direct]

3. There is no such thing as neoliberalism! The blind-spot in theories of neoliberalism—whether neo-Marxist and Foucauldian—comes with trying to account for how top-down initiatives 'take' in everyday situations. So perhaps **the best thing to do is to stop thinking of "neoliberalism" as a coherent "hegemonic" project** altogether. For all its apparent critical force, the vocabulary of "neoliberalism" and "neoliberalization" in fact provides a double consolation for leftist academics: it supplies us with plentiful opportunities for unveiling the real workings of hegemonic ideologies in a characteristic gesture of revelation; and in so doing, it invites us to align our own professional roles with the activities of various actors "out there", who are **always framed as engaging in resistance** or contestation. The conceptualization of "neoliberalism" as a "hegemonic" project does not need refining by adding a splash of Foucault. Perhaps we should try to do without the concept of "neoliberalism" altogether, because it might actually compound rather than aid in the task of figuring out how the world works and how it changes. One reason for this is that, between an overly economistic derivation of political economy and an overly statist rendition of governmentality, stories about "neoliberalism" manage to reduce the understanding of social relations to a residual effect of hegemonic projects and/or governmental programmes of rule (see Clarke, 2004a). Stories about "neoliberalism" pay little attention to the pro-active role of socio-cultural processes in provoking changes in modes of governance, policy, and regulation. Consider the example of the restructuring of public services such as health care, education, and criminal justice in the UK over the last two or three decades. This can easily be thought of in terms of a "hegemonic" project of "neoliberalization", and certainly one dimension of this process has been a form of anti-statism that has rhetorically contrasted market provision against the rigidities of the state. But in fact these ongoing changes in the terms of public-policy debate involve a combination of different factors that add up to a much more dispersed populist reorientation in policy, politics, and culture. These factors include changing consumer expectations, involving shifts in expectations towards public entitlements which follow from the generalization of consumerism; the decline of deference, involving shifts in conventions and hierarchies of taste, trust, access, and expertise; and the refusals of the subordinated, referring to the emergence of anti-paternalist attitudes found in, for example, women's health movements or anti-psychiatry movements. They include also the development of the politics of difference, involving the emergence of discourses of institutional discrimination based on gender, sexuality, race, and disability. This has disrupted the ways in which welfare agencies think about inequality, helping to generate the emergence of contested inequalities, in which policies aimed at addressing inequalities of class and income develop an ever more expansive dynamic of expectation that public services should address other kinds of inequality as well (see Clarke, 2004b J. Clark, Dissolving the public realm? The logics and limits of neo-liberalism, Journal of Social Policy 33 (2004), pp. 27–48.Clarke, 2004b). None of these populist tendencies is simply an expression of a singular "hegemonic" project of "neoliberalization". They are effects of much longer rhythms of socio-cultural change that emanate from the bottom-up. It seems just as plausible to suppose that what we have come to recognise as "hegemonic neoliberalism" is a muddled set of ad hoc, opportunistic accommodations to these unstable dynamics of social change as it is to think of it as the outcome of highly coherent political-ideological projects. Processes of **privatization, market liberalization**, and de-regulation have often followed an **ironic pattern** in so far as they have **been triggered by citizens' movements arguing from the left** of the political spectrum **against the rigidities of statist forms of social policy** and welfare provision in the name of greater autonomy, equality, and participation (e.g. Horwitz, 1989). The political re-alignments of the last three or four decades cannot therefore be adequately understood in terms of a straightforward shift from the left to the right, from values of collectivism to values of individualism, or as a re-imposition of class power. The emergence and generalization of this populist ethos has much longer, deeper, and wider roots than those ascribed to "hegemonic neoliberalism". And it also points towards the extent to which easily the most widely resonant political rationality in the world today is not right-wing market liberalism at all, but is, rather, the

polyvalent discourse of "democracy" (see Barnett and Low, 2004). Recent theories of "neoliberalism" have retreated from the appreciation of the long-term rhythms of socio-cultural change, which Stuart Hall once developed in his influential account of Thatcherism as a variant of authoritarian populism. Instead, they favour elite-focused analyses of state bureaucracies, policy networks, and the like. One consequence of the residualization of the social is that theories of "neoliberalism" have great difficulty accounting for, or indeed even in recognizing, new forms of "individualized collective-action" (Marchetti, 2003) that have emerged in tandem with the apparent ascendancy of "neoliberal hegemony": environmental politics and the politics of sustainability; new forms of consumer activism oriented by an ethics of assistance and global solidarity; the identity politics of sexuality related to demands for changes in modes of health care provision, and so on (see Norris, 2002). All of these might be thought of as variants of what we might want to call bottom-up governmentality. This refers to the notion that non-state and non-corporate actors are also engaged in trying to govern various fields of activity, both by acting on the conduct and contexts of ordinary everyday life, but also by acting on the conduct of state and corporate actors as well. Rose (1999, pp. 281–284) hints at the outlines of such an analysis, at the very end of his paradigmatic account of governmentality, but investigation of this phenomenon is poorly developed at present. Instead, the trouble-free amalgamation of Foucault's ideas into the Marxist narrative of "neoliberalism" sets up a simplistic image of the world divided between the forces of hegemony and the spirits of subversion (see Sedgwick, 2003, pp. 11–12). And clinging to this image only makes it all the more difficult to acknowledge the possibility of positive political action that does not conform to a romanticized picture of rebellion, contestation, or protest against domination (see Touraine, 2001). Theories of "neoliberalism" are unable to recognize the emergence of new and innovative forms of individualized collective action because their critical imagination turns on a simple evaluative opposition between individualism and collectivism, the private and the public. The radical academic discourse of "neoliberalism" frames the relationship between collective action and individualism simplistically as an opposition between the good and the bad. In confirming a narrow account of liberalism, understood primarily as an economic doctrine of free markets and individual choice, there is a peculiar convergence between the radical academic left and the right-wing interpretation of liberal thought exemplified by Hayekian conservatism. By obliterating the political origins of modern liberalism—understood as answering the problem of how to live freely in societies divided by interminable conflicts of value, interest, and faith—the discourse of "neoliberalism" reiterates a longer problem for radical academic theory of being unable to account for its own normative priorities in a compelling way. And by denigrating the value of individualism as just an ideological ploy by the right, the pejorative vocabulary of "neoliberalism" invites us to take solace in an image of collective decision-making as a practically and normatively unproblematic procedure. The recurrent problem for theories of "neoliberalism" and "neoliberalization" is their two-dimensional view of both political power and of geographical space. They can only account for the relationship between top-down initiatives and bottom-up developments by recourse to the language of centres, peripheries, diffusion, and contingent realizations; and by displacing the conceptualization of social relations with a flurry of implied subject-effects. The turn to an overly systematized theory of governmentality, derived from Foucault, only compounds the theoretical limitations of economistic conceptualizations of "neoliberalism". The task for social theory today remains a quite classical one, namely to try to specify "the recurrent causal processes that govern the intersections between abstract, centrally promoted plans and social life on the small scale" (Tilly, 2003, p. 345). Neither neoliberalism-as-hegemony nor neoliberalism-as-governmentality is really able to help in this task, not least because both invest in a deeply embedded picture of subject-formation as a process of "getting-at" ordinary people in order to make them believe in things against their best interests. With respect to the problem of accounting for how "hegemonic" projects of "neoliberalism" win wider consensual legitimacy, Foucault's ideas on governmentality seem to promise an account of how people come to acquire what Ivison (1997) calls the "freedom to be formed and normed". Over time, Foucault's own work moved steadily away from an emphasis on the forming-and-norming end of this formulation towards an emphasis on the freedom end. This shift was itself a reflection of the realization that the circularities of poststructuralist theories of subjectivity can only be broken by developing an account of the active receptivity of people to being directed. But, in the last instance, neither the story of neoliberalism-as-hegemony or of neoliberalism-as-governmentality can account for the forms of receptivity, pro-activity, and generativity that might help to explain how the rhythms of the everyday are able to produce effects on macro-scale processes, and vice versa. So, rather than finding convenient synergies between what are already closely related theoretical traditions, perhaps it is better to keep open those tiresome debates about the degree of coherence between them, at the same time as trying to broaden the horizons of our theoretical curiosity a little more widely.

AT: Bifo

Bifo Alt Fails

Bifo's alternative <u>fails</u> at disrupting capital---a simple withdrawal from the system <u>evacuates politics</u> and <u>cedes it to the Right</u>---turns the K.

Lear 12

(Ben is an underemployed researcher living in Manchester, UK. He recently co-authored an article in Occupy Everything! Reflections on Why it's Kicking off Everywhere, and is a member of Plan C., "Lifeboat Communism – A Review of Franco "Bifo" Berardi's After the Future," 5-18-2012, Viewpoint Magazine, http://viewpointmag.com/2012/05/18/lifeboat-communism-a-review-of-franco-bifo-berardis-after-the-future/)

What does the end of the future mean for **radical politics**? It is at this point that **Bifo's argument becomes problematic**. In an argument that intersects with groups such as Tiqqun, Bifo argues that we must see "Communism as a necessity in **the collapse of capital**." Distant from the voluntarism of previous forms of Communist politics, this "post-growth Communism" will be best understood as a necessary response to capital's refusal of labour. Cut adrift from the "opportunity" to work, with welfare systems dismantled, Bifo argues that we will witness the proliferation of zones of autonomy responding to the needs of an increasingly precarious and superfluous social body. Communist politics will emerge from an exodus, both voluntary and compulsory, from a stagnating and increasingly predatory state-capital nexus. This exodus is both social, in the development of an alternative infrastructure, and personal, in the withdrawal from the hyper-stimulation of the semiotic economy. Bifo abandons hope in collective contestation at the level of the political. **Bifo's politics could be described as a** kind of "**lifeboat communism**." As the crisis ripples, mutates, and deepens, Bifo sees the role of communism as the creation of spaces of solidarity to blunt the worst effects of the crisis of social reproduction. **Gone is the demand for a better world for all**, the liberation of our **collective social wealth,** or the unlocking of the **social potentials of technology**. Rather, Bifo's politics are based around **insulating** a necessarily small portion of society from the dictates of capital. By **withdrawing** from the **political sphere**, we accept the likelihood of losing the final scraps of the welfare state and **concede the terrain of the political to zombie politics** and **predatory capital**. Rather than seeking **new forms of organization** to re-enter the political stage, Bifo seems to suggest that we seek **shelter** beneath it as best we can. This **shying away** from the political stage is the weakness at the heart of the book. Recent eruptions of **political struggle** have captured the collective-imagination because they demonstrate that **political contestation is** still **possible** today, in spite of the obstacles Bifo has described. The Occupy movement and the uprisings in the **M**iddle **E**ast and **N**orth **A**frica have resonated with all those who still have hope in collective struggle. Although these movements have encountered varying problems, to which we must **develop solutions**, they dispel the idea of an unchangeable present. The current blockages to successful organising have been shown to be **strategic** and **tactical**, not terminal. Misdiagnosing the current **inertia of post-political public life** as a terminal condition leads the left towards **an evacuation of the political**, while we should instead reassert its primacy. If we abandon any hope of fighting in, against, and beyond the existing architecture of the state and capital, **and** instead seek refuge in **small communes**, and go-slow practices, we abandon all real hope of a generalized, or generalizable, **emancipatory politics**. Although Bifo's analysis of the difficulties of collective action resonates with all of us who have attempted to organize struggles in the past few decades, the proposal for a simple withdrawal from capitalism is **a bleak politics** indeed – which, at its most optimistic, calls for an orderly default by portions of the proletariat. The horizons of communist politics appear much narrower when capitalism is no longer seen as the repository of a vast store of social wealth awaiting collective redistribution, but rather redefined as an unassailable site of universal and permanent austerity combined with widening social redundancy. It is hard to imagine a network of self-organized projects and systems supporting the majority of the population in the context of an increasingly predatory capitalism. Emerging from the and isolated leftist scenes, this lifeboat communism will by its very nature have **a limited carrying capacity,** as the anarchist experience in post-Katrina New Orleans attests. The lifeboats that Bifo

calls for will undoubtedly be too small and makeshift to harbor us all. The crisis is twofold. It is a crisis of capitalist profitability, and of an increasingly precarious and surplus global proletariat whose reproduction (as both labour and body) is under threat. It is unlikely that the proliferation of communes, squats, food co-ops, file sharers, urban gardeners, and voluntary health services will bring forth a new, better world. But while the current seemingly post-political situation throws up massive obstacles to organizing, there is still a potential for collective contestation. The capitalist state, racked by its own legitimacy crisis and weekly political scandals, is more vulnerable than it appears. We need only recall the period of unexpected hope built by students in Britain, occupiers in Oakland, and vast swathes of North Africa and the Middle East during the past two years. These movements were mobilised through the betrayal of a vision of the future – but alongside their rage, they put forth a hope which can guide our politics. The task at hand is to unlearn old behaviour and to forge new tactical and organisational weapons for struggle. Bifo's contribution is a timely and challenging one, but it ultimately leads us back towards a DIY culture and "outreach" politics. As our movements come to terms with these limits, we must also hold onto the belief that luxury for all is possible. The social potential of unfilled blocks of flats, emerging technologies like 3D-printing, and the desires of the millions of underemployed, should remind us of this. This will not be possible without a collective struggle against the state and the demands of capital, one which simultaneously defends what we have and attempts to move beyond it. A retreat to lifeboat politics is both **premature** and **a self-fulfilling prophecy**. While Bifo correctly analyses the current conjuncture – clearly identifying the post-political state, the weakness of the Left, the crisis of profitability and new forms of labour, and their impact on the subject – his political prescriptions lead us in the wrong direction. Just as Bifo does, we place the struggle against work at the center; but we can also seek to liberate social wealth, rather than insulate a lucky few from the ravages of capital. Rather than "No Future," we must raise a different banner: "The future's here, it just needs reorganizing."

Cap K

Specific Adv k Env

Advocacy for specific policy reform is key to environmental justice movements--- refusal of policy relevance ensures marginalization

Noonan 5

(Douglas S., Assistant Professor, School of Public Policy, Georgia Institute of Technology, 2005, "DEFINING ENVIRONMENTAL JUSTICE: POLICY DESIGN LESSONS FROM THE PRACTICE OF EJ RESEARCH," http://www.prism.gatech.edu/~dn56/EJ.APPAM.pdf)

The negotiated nature of environmental policymaking holds some stark lessons for policymakers and analysts alike. Even if there were no uncertainty – and all of the useful scientific evidence was available – the heterogeneous interests of affected parties would persist. When policies ultimately seek to reconcile these competing interests, essentially answering questions of social choice (for which optimal solutions may not be available either in theory or due to practical limits to policy), only rarely or never would a policy process be such that selfish advocacy by interest groups yields both individually and socially optimal outcomes. In the environmental policy arena, the disconnect between the pursuit of individual interests and the pursuit of collective goals is paramount. In this sense, the acrimony surrounding many environmental policy debates is both undersandable and inevitable. ¶ Although this preface might apply equally well to discussions of "climate change policy" or "species/wilderness preservation policy," the application to environmental justice (EJ) provides an opportune arena in which to observe the interplay between environmental policymaking and the (allegedly) relevant research. Environmental justice is a major theme in environmental and social policy. Its researchers are legion. Their output is voluminous. A debate about the empirical evidence and about appropriate policies continues among academics. In more public forums, interest groups routinely cite environmental justice in advocating for policy reforms. As is typical in policy debates, advocates select evidence to cite in support of their position. **The influence of scholarly EJ research on policymakers**, however, **is less than straightforward**. If the mounting evidence provides only partial answers or, as is common, **answers to questions only marginally relevant to policymakers**, then **even hundreds of books** 1 on the subject may **do little to sway public policy**. Or, conversely, the evidence's influence may far outstrip its limited relevance. Regardless, like many other environmental policy topics, the role of scholarly research in policy design is inevitably contentious and complex. ¶ The purpose of this paper is to offer some insight about policy design from the scholarly literature on EJ. After scaling this mountain of literature, what are the important lessons to be learned for **making EJ policy?** From this vantage, this paper **critiques the field of EJ research**. It also offers some suggestions for a more policy-relevant research agenda. The conclusion returns to the broad assessment of EJ policy and suggests some future directions for designing policy and framing the discourse.

AT: Epistemology Flawed

Pragmatic, limited correction of our epistemology by testing *environmental* solutions is better than trying fullscale

epistemological or ontological shift. They stop us from developing *better* forms of management.

Norton 2

(Bryan, Philosophy @ Georgia Tech '2 in Pragmatist Ethics for a Technological Culture ed. Keulartz p. 179-182)

The positivist sociologist, Otto Neurath, provided a useful simile - one that has become very popular with pragmatists today - that illustrates the pragmatist search for truth (discussed in Quine, 1960). Improving our knowledge and understanding, Ncnnth said, is most like repairing a ship while on the high seas. Imagine a ship that is kept in service indefinitely, with no opportunity to be pulled into dry dock for repairs, As particular planks weaken from weather and heavy use, we replace them, standing on the strongest remaining planks while replacing the weakest ones. In principle, it would be possible to replace every plank, resulting in a "new" ship in the physical sense that every plank is new, but the -ship" remains itself, with no need to be re-christened. The analogy captures perfectly the pragmatists' approach to epistemology. First, the pursuit of epistemological renewal - for the pragmatists, unlike Descartes – does not start by tearing down every plank of knowledge, necessitating a completely new construction. Rather the task of renewal begins for pragmatists by identifying the most problematic "planks" of knowledge. Since we must keep the boat afloat as we do our repairs identifying the problematic planks is not just a matter of identifying what beliefs we have the least evidence for. In the ship analogy, this might mean that we fix a moderately rotted plank below the water level before replacing a badly rotted one in a little-used area of the deck; in pragmatist epistemology, this kind of decision involves identifying uncertainties that am particularly relevant to community survival and to other chosen social goals The assessment is furthermore relative to appropriate values, not simply to a mechanical application of a test of physical strength of the particular "planks" of knowledge. The analogy also illustrates the idea of piecemeal improvement of a belief system in which no belief is ultimately privileged, even though some beliefs am accepted, in context, as unquestioned for very long periods of time. So the analogy, by noting that the entire ship is subject to the ravages of time and wear, and will eventually be replaced with new wood. illustrates also the pragmatists idea that every belief is up for re- evaluation as necessary. If we am imagine our sailors continuing their back and forth passages indefinitely, each and every belief will eventually be submitted to the test of experience and experiment. Its time will come when it is relevant to an important disagreement regarding what needs to be done and how it must be done. Each plank of knowledge will thus eventually be vt-evaluated and its strength at any given point will be the extent to which it has held up to observation and experiential tests in past cases in which it was called into question. ¶ The ship analogy also illustrates in simple tams a way out of the quandaries of subjectivism, anti-realism, and relativism. Some readers, reasoning as follows, might think that Neurath's analogy pushes us closer to relativism. Since the decision which 'plank to stand on and which to fix is a matter of judgment. surely affected by the - and values of the am (survival, at least), it might be argued that different people, including different scientists, will lake different things to be "given" and unquestioned at any particular time. Accepting that our society is made up of people with different values and different assumptions - paradigms and worldviews - it could be argued that we must expect different people with different perspectives to "Mm different goals, values, and to put different scientific hypotheses up for t. Not only will people cite very different beliefs in support of policy choices, communication across perspectives may become impossible, because the choice of linguistic categories and meanings depends also on individual's values and This undermines appeals to any particular linguistic vocabulary as privileged. as valid pre-experientially (Quint, l%l) we must give up, as Dewey saw, appeals to fixed and eternal categories and to fixed and eternal maths The ways in which we identify, characterize, individuate, and aggregate objects of the senses are deeply affected by our goals and values as well as our perspective and worldview. Through language, we construct reality; and different languages reflect, it would seem, different wont inhabited by different tens from different perspectives. If we apply Neurath's analogy to language, we find that a kind of linguistic relativity - perhaps better called, linguistic conventionalism- is unavoidable. Despite this form of conventionalism, which plays havoc with our ability to match specific sentences with particular bits of reality, there is still an element of realism in Neurath's AM. The - analogy avoids a skeptical and relativist conclusion about beliefs and knowledge, because the decisions made do not escape the test of experience. Over time, staying afloat depends on realistic assessments of damage to the ship and realistic models of what will happen if a particular plank fails. If the repair crew constantly repairs the easiest planks to access. ignoring the ones under deep water, a disaster will eventually occur. Similarly, if the crew replica the bar in the Officers' galley every time it is scratched, while ignoring severe rot below the water line. the whole crew will be selected out of the pool of sailors and a new ship will have to be launched. Further, while languages may suggest different and relative ontologies for individuals who speak different languages, language is not an individual matter. Just as the repair crew on the ship must communicate if they arc to collectively decide what to do next, a seeker alter the truth will be a member of an intellectual community, Some form of shared language or linguistic communication is presupposed in the designation of a group sa a 'community. Similarly, - as the repair crew's decisions will affect the whole crew, giving crew members an incentive to oversee the repairmen's decisions and work, the progression of the scientific endeavor will bring larger and larger communities - and their collective and individual experiences - into discourse about what to do to protect the environment. The key point here is that Neurath's analogy shows clearly how we can adopt a position of limited realism by pushing the level at which we judge truth and falsity from the sentential level to the action level at which we act on our total belief system in particular situations. We can recognize. in the face of unexpected experiences and surprising outcomes of experiments, that our set of beliefs is inadequate; we cannot, however, on the basis of one or a few such experiences, unambiguously identify where the problem in our belief system lies, and there is no algorithm for deciding the best way to repair problems as they arise. Because, in any given situation, what we expect is determined not simply by one or a few beliefs our expectations arc supported by our entire system of beliefs, including background knowledge, that is (temporarily) not doubted in the given situation. If expectations are not born out by experience, y solution requires a creative reconstruction (Quine. 1960). Direct experience, to extend Neurath's analogy, can

tell us that we have a leak" in our system of knowledge. Determining how best to fix the leak may require that we reconsider some of out background beliefs. Limited realism accepts the fact that no substantive knowledge of the external world is knowable a priori; we must correct our system of beliefs without benefit of prior principles to guide us. It also accepts the apparently unavoidable conclusion that our varied linguistic forms, designed to function in many different situations, yield no common underlying structure for all experience. If categories we find in the world are of our own making; they we not given in reality independent of us For these reasons realism must be limited. But 11 remains realism in the one important sense. It retains a method of selection and is thus self-correcting on the basis of broader experience and open deliberation. One cannot believe anything one wishes and still survive -this is a necessity imposed upon us by our environment; it is not volitional, it is imposed upon us. The crew on Neurath's ship either stays afloat or they die. For the pragmatist. it is not so important to separate the hypotheses acted upon from the attitudes and values that bring them to the fore in real situations requiring inquiry; what is important is that we observe and experiment, that there be an external check on claims and counterclaims There is, after all, an experience that will tell the repair crew they made a mistake, given their shared goals. The experience begins with the sensation of sinking into wetness.

The action contexts, and certain unavoidable experiences, correct us when we have wrong beliefs and inappropriate goals. Adaptive Managers can thus adopt limited realism as a working epistemology. Since environmental management is clearly a cultural and social endeavor. it can be hoped that (a) many belief systems, perspectives , and viewpoints will be proposed and tried out, but that (b) this initial relativity will be gradually reduced as proposals, the belief systems that =MM them, and even the perspectives taken, we subjected to the ultimate teet do they work in real situations? Hopefully, as time goes on, we an learn new methods and techniques whereby proposals and beliefs can be tested through pilot projects, experiments, and so forth, avoiding the necessity of having a cultural collapse to disprove every errant hypothesis. This hope is represented, in pragmatist thought, in the emphasis pragmatists place on devising techniques and methods that help to winnow truth from falsehood without catastrophic cultural failure. If indeed such methods an be devised and gradually improved, it would appear that the optimism of Adoptive Managers - who, we admitted at the outset, must have some reason to believe that observation and experiment will provide some advantage in an open-ended pros of eavironinental management - are provided intellectual support by a pragmatist epistemology. Our cxcursion So limited new and pragmatist epistemology suggests tint, given many diverse voices engaged in dialogue triut what we ought to do to protect the environment a general method cmcrg from our accvunL The method an, at its best, help us to pick winning from losing strategies by use of s studies, observations, and experiments, and a diligent recording of what works and what doesn't work in particular situations. There is thus reason to believe that Adeptive Management an provide a self-corrective method for pursuing environmental protection.

Envt O/W's Ontology

Prioritize environmental existence over framing and ontology.

Wapner 3

(Paul Prf. And Director of the Global Environmental Policy Program @ American '3 "Leftist Criticism of 'Nature'," *Dissent*, Winter, p. 74-75)

The third response to eco-criticism would require critics to acknowledge the ways in which they themselves silence nature and then to respect the sheer otherness of the nonhuman world. Postmodernism prides itself on criticizing the urge toward mastery that characterizes modernity. But isn't mastery exactly what postmodernism is exerting as it captures the nonhuman world within its own conceptual domain? Doesn't postmodern cultural criticism deepen the modernist urge toward mastery by eliminating the ontological weight of the nonhuman world? What else could it mean to assert that there is no such thing as nature? I have already suggested the postmodernist response: yes, recognizing the social construction of "nature" *does* deny the self-expression of the nonhuman world, but how would we know what such self-expression means? Indeed, nature doesn't speak; rather, some person always speaks on nature's behalf, and whatever that person says is, as we all know, a social construction. All attempts to listen to nature are social constructions—except one. Even the most radical postmodernist must acknowledge the distinction between physical existence and nonexistence. As I have said, postmodernists accept that there is a physical substratum to the phenomenal world even if they argue about the different meanings we ascribe to it. This acknowledgment of physical existence is crucial. We can't ascribe meaning to that which doesn't appear. What doesn't exist can manifest no character. Put differently, yes, the postmodernist should rightly worry about interpreting nature's expressions. And all of us should be wary of those who claim to speak on nature's behalf (including environmentalists who do that). But we need not doubt the simple idea that a prerequisite of expression is existence. This in turn suggests that preserving the nonhuman world—in all its diverse embodiments—must be seen by eco-critics as a fundamental good. Eco-critics must be supporters, in some fashion, of environmental preservation. Postmodernists reject the idea of a universal good. They rightly acknowledge the difficulty of identifying a common value given the multiple contexts of our value-producing activity. In fact, if there is one thing they vehemently scorn, it is the idea that there can be a value that stands above the individual contexts of human experience. Such a value would present itself as a metanarrative and, as Jean- François Lyotard has explained, postmodernism is characterized fundamentally by its "incredulity toward meta-narratives." Nonetheless, I can't see how postmodern critics can do otherwise than accept the value of preserving the nonhuman world. The nonhuman is the extreme "other"; it stands in contradistinction to humans as a species. In understanding the constructed quality of human experience and the dangers of reification, postmodernism inherently advances an ethic of respecting the "other." At the very least, respect must involve ensuring that the "other" actually continues to exist. In our day and age, this requires us to take responsibility for protecting the actuality of the nonhuman. Instead, however, we are running roughshod over the earth's diversity of plants, animals, and ecosystems. Postmodern critics should find this particularly disturbing. If they don't, they deny their own intellectual insights and compromise their fundamental moral commitment. Now, what does this mean for politics and policy, and the future of the environmental movement? Society is constantly being asked to address questions of environmental quality for which there are no easy answers. As we wrestle with challenges of global climate change, ozone depletion, loss of biological diversity, and so forth, we need to consider the economic, political, cultural, and aesthetic values at stake. These considerations have traditionally marked the politics of environmental protection. A sensitivity to eco-criticism requires that we go further and include an ethic of otherness in our deliberations. That is, we need to be moved by our concern to make room for the "other" and hence fold a commitment to the nonhuman world into our policy discussions. I don't mean that this argument should drive all our actions or that respect for the "other" should always carry the day. But it must be a central part of our reflections and calculations. For example, as we estimate the number of people that a certain area can sustain, consider what to do about climate change, debate restrictions on ocean fishing, or otherwise assess the effects of a particular course of action, we must think about the lives of other creatures on the earth—and also the continued existence of the nonliving physical world. We must do so not because we wish to maintain what is "natural" but because we wish to act in a morally respectable manner. I have been using postmodern cultural criticism against itself. Yes, the postmodernists are right: we can do what we want with the nonhuman world. There is nothing essential about the realm of rocks, trees, fish, and climate that calls for a certain type of action. But postmodernists are also right that the only ethical way to act in a world that is socially constructed is to respect the voices of the others— of those with whom we share the planet but with whom we may not share a common language or outlook. There is, in other words, a limit or guiding principle to our actions. As political theorist Leslie Thiele puts it, "One can't argue for the diversity of views of 'nature' without taking a stand for the diversity of nature."

Timeframe Key

Timeframe of solvency is the key issue: Administrative environmental discourse is key to the effectiveness of short-term policy.

Jenneth **PARKER** Co-Director of the MSc in Environmental and Developmental Education @ South Bank Univ. **'3** [*Realism Discourse and Deconstruction* eds. Jonathan Joseph and John Michael Roberts p. 82]

In this way the social action represented by 'Green Romanticism' is of a more semiotic nature than is the social action represented by 'Administrative rationalism which has more immediate concrete outcomes in terms of policies and material practices. 'these discourses may actually be complementary when seen from the perspective of a diverse and wide- ranging movement, which seeks to raise issues and effect social change in a variety of different ways, One key consideration is the time-frame in which discourses seek to operate. If you seek to gain short-term results, you will need a discourse that is clearly related to dominant discourses; less so for medium-term results; and long-term results may require the subversion of the dominant discourse itself in conjunction with changing certain key social structures and material practices. I would argue that effective movements typically work with all these time-scales in addition to working at different scales from micro to macro politics.

AT: Ethics O/W

Preventing death is the first ethical priority – it's the only impact you can't recover from.

Bauman 95 Zygmunt Bauman, University of Leeds Professor Emeritus of Sociology, 1995, Life In Fragments: Essays In Postmodern Morality, p. 66-71

The being-for is like living towards-the-future: a being filled with anticipation, a being aware of the abyss between future foretold and future that will eventually be; it is this gap which, like a magnet, draws the self towards the Other,as it draws life towards the future, making life into an activity of overcoming, transcending, leaving behind. The self stretches towards the Other, as life stretches towards the future; neither can grasp what it stretches toward, but it is in this hopeful and desperate, never conclusive and never abandoned stretching-toward that the self is ever anew created and life ever anew lived. In the words of M. M. Bakhtin, it is only in this not-yet accomplished world of anticipation and trial, leaning toward stubbornly an-other Other, that life can be lived - not in the world of the `events that occurred'; in the latter world, `it is impossible to live, to act responsibly; in it, I am not needed, in principle I am not there at all." Art, the Other, the future: what unites them, what makes them into three words vainly trying to grasp the same mystery, is the modality of possibility. A curious modality, at home neither in ontology nor epistemology; itself, like that which it tries to catch in its net, `always outside', forever `otherwise than being'. The possibility we are talking about here is not the all-too-familiar unsure-of-itself, and through that uncertainty flawed, inferior and incomplete being, disdainfully dismissed by triumphant existence as `mere possibility', `just a possibility'; possibility is instead `plus que la reahte' - both the origin and the foundation of being. The hope, says Blanchot, proclaims the possibility of that which evades the possible; `in its limit, this is the hope of the bond recaptured where it is now lost."' The hope is always the hope of *being fu filled,* but what keeps the hope alive and so keeps the being open and on the move is precisely its *unfu filment.* One may say that the paradox *of hope* (and the paradox of possibility founded in hope) is that it may pursue its destination solely through betraying its nature; the most exuberant of energies expends itself in the urge towards rest. Possibility uses up its openness in search of closure. Its image of the better being is its own impoverishment . . . The togetherness of the being-for is cut out of the same block; it shares in the paradoxical lot of all possibility. It lasts as long as it is unfulfilled, yet it uses itself up in never ending effort of fulfilment, of recapturing the bond, making it tight and immune to all future temptations. In an important, perhaps decisive sense, it is selfdestructive and self-defeating: its triumph is its death. The Other, like restless and unpredictable art, like the future itself, is a *mystery.* And being-for-the-Other, going towards the Other through the twisted and rocky gorge of affection, brings that mystery into view - makes it into a challenge. That mystery is what has triggered the sentiment in the first place - but cracking that mystery is what the resulting movement is about. The mystery must be unpacked so that the being-for may focus on the Other: one needs to know what to focus on. (The `demand' is *unspoken,* the responsibility undertaken is *unconditional;* it is up to him or her who follows the demand and takes up the responsibility to decide what the following of that demand and carrying out of that responsibility means in practical terms.) Mystery - noted Max Frisch - (and the Other is a mystery), is an exciting puzzle, but one tends to get tired of that excitement. `And so one creates for oneself an image. This is a loveless act, the betrayal." Creating an image of the Other leads to the substitution of the image for the Other; the Other is now fixed - soothingly and comfortingly. There is nothing to be excited about anymore. I know what the Other needs, I know where my responsibility starts and ends. Whatever the Other may now do will be taken down and used against him. What used to be received as an exciting surprise now looks more like perversion; what used to be adored as exhilarating creativity now feels like wicked levity. Thanatos has taken over from Eros, and the excitement of the ungraspable turned into the dullness and tedium of the grasped. But, as Gyorgy Lukacs observed, `everything one person may know about another is only expectation, only potentiality, only wish or fear, acquiring reality only as a result of what happens later, and this reality, too, dissolves straightaway into potentialities'. Only death, with its finality and irreversibility, puts an end to the musical-chairs game of the real and the potential - it once and for all closes the embrace of togetherness which was before invitingly open and tempted the lonely self." `Creating an image' is the dress rehearsal of that death. But creating an image is the inner urge, the constant temptation, the *must* of all affection . . . It is the loneliness of being abandoned to an unresolvable ambivalence and an unanchored and formless sentiment which sets in motion the togetherness of being-for. But what loneliness seeks in togetherness is an end to its present condition - an end to itself. Without knowing - without being capable of knowing - that the hope to replace the vexing loneliness with togetherness is founded solely on its own unfulfilment, and that once loneliness is no more, the togetherness (the being-for togetherness) must also collapse, as it cannot survive its own completion. What the loneliness seeks in togetherness (suicidally for its own cravings) is the foreclosing and pre-empting of the future, cancelling the future before it comes, robbing it of mystery but also of the possibility with which it is pregnant. Unknowingly yet necessarily, it seeks it all to its own detriment, since the success (if there is a success) may only bring it back to where it started and to the condition which prompted it to start on the journey in the first place. The togetherness of being-for is always in the future, and nowhere else. It is no more once the self proclaims: `I have arrived', `I have done it', `I fulfilled my duty.' The being-for starts from the realization of the bottomlessness of the task, and ends with the declaration that the infinity has been exhausted. This is the tragedy of being-for - the reason why it cannot but be death-bound while simultaneously remaining an undying attraction. In this tragedy, there are many happy moments, but no happy end. Death is always the foreclosure of possibilities, and it comes eventually in its own time, even if not brought forward by the impatience of love. The catch is to direct the affection to staving off the end, and to do this against the affection's nature. What follows is that, if moral relationship is grounded in the being-for togetherness (as it is), then it can exist as a project, and guide the self's conduct only as long as its nature of a project (a not yet-completed project) is not denied. Morality, like the future itself, is forever not-yet. (And this is why the ethical code, any ethical code, the more so the more perfect it is by its own standards, supports morality the way the rope supports the hanged man.) It is because of our loneliness that we crave togetherness. It is because of our loneliness that we open up to the Other and allow the Other to open up to us. It is because of our loneliness (which is only belied, not overcome, by the hubbub of the being-with) that we turn into moral selves. And it is only through allowing the togetherness its possibilities which only the future can disclose that we stand a chance of acting morally, and sometimes even of being good, in the present.

Alt Specificity k

Failure to specify how the alternative, or event, can solve existing problems of economic decision-making—empirically resulted in tyranny and economic catastrophe

Andrew **SAYER** Reader in Political Economy @ Lancaster **'95** *Radical Political Economy: A Critique* p. 13-14

Yet while the 'velvet' character of the revolutions was remarkable enough, there was little else that the Left could celebrate about them. As Habermas points out, they were also singularly depressing in that they were devoid of 'ideas that are either innovative or orientated to the future' (1991, p. 27). Whether Habermas meant it or not, I would add that it was Western Marxists as well as people in the former socialist states who lacked ideas about alternatives. In this context, market triumphalism could divert attention from the continued failings of capitalism, as if the 'victory' of capitalism meant that no one had any right to criticize it. Again, as Habermas put it, 'it is not as though the collapse of the Berlin Wall solved a single one of the problems specific to our system' (Habermas, 1991, p. xii). While the latter statement is surely correct it could be read as implying that it was 'business-as-usual' for the Left. It is my view that this kind of interpretation, together with those of Jameson and Callinicos, are complacent and hopelessly inad- equate. One can agree with Jameson that Marxism is primarily a theory of capitalism, but this position is nevertheless all too smug, for it begs the question of whether its account of capitalism is at all adequate.' Similarly, Callinicos implies that there are no lessons to be learned from the demise of state socialism, save that it wasn't real socialism, and there are certainly no lessons for the critique of capitalism. This book is motivated by the view that such complacency is **entirely unwarranted**. The **totalitarian** character of state socialism and its problems of economic motivation and coordination are not historical aber- rations but are presaged by Marxism's lack of a sufficiently materialist understanding of the social division of labour and its associated division and dispersion of knowledge in advanced economies. This failing not only explains the inadequacies of state socialism's attempt to plan such an economy centrally, but is the **major unresolved flaw** in Marxist theory of capitalism. The reluctance of the Left to think through alternatives (for fear of producing 'blueprints' which might pre-empt future struggles) meant not only that radical political movements had little idea of **feasible and desirable objectives**, but that the standpoints from which capitalism and its problems were explained and criticized were unexamined and often **incoherent** or undesirable. There is no way the Left can reply to market triumphalism and the lack of alternatives without giving some consideration to the old problems of political economy.

Movements Fail/Perm Key

Movements/the alternative can't address immediate problems—they are multigenerational, educational ventures. Working within the system is necessary to solve particular instances of the climate problem—there's no guarantee their revolution will solve

-Working within existing political institutions is key

-It's too late to solve the whole environmental crisis, but can work to mitigate the damage

-No guarantee the alternative's regression to socialism wont' have same environmental problems

Christian **PARENTI**, professor of sustainable development at the School for International Training, Graduate Institute, **13** ["A Radical Approach to the Climate Crisis," *Dissent*, Summer 2013, http://www.dissentmagazine.org/article/a-radical-approach-to-the-climate-crisis]

Several strands of green thinking maintain that capitalism is incapable of a sustainable relationship with non-human nature because, as an economic system, capitalism has a growth imperative while the earth is finite. One finds versions of this argument in the literature of eco-socialism, deep ecology, eco-anarchism, and even among many mainstream greens who, though typically declining to actually name the economic system, are fixated on the dangers of "growth."

All this may be true. Capitalism, a system in which privately owned firms must continuously out-produce and out-sell their competitors, may be incapable of accommodating itself to the limits of the natural world. However, that is not the same question as whether capitalism can solve the more immediate climate crisis.

Because of its magnitude, the climate crisis can appear as the sum total of all environmental problems—deforestation, over-fishing, freshwater depletion, soil erosion, loss of biodiversity, chemical contamination. But halting greenhouse gas emissions is a much more specific problem, the **most pressing subset** of the **larger apocalyptic panorama**.

And the very bad news is, time has run out. As I write this, news arrives of an ice-free arctic summer by 2050. Scientists once assumed that would not happen for hundreds of years.

Dealing with climate change by first achieving radical social transformation—be it a socialist or anarchist or deep-ecological/neo-primitive revolution, or a nostalgia-based localista conversion back to a mythical small-town capitalism—would be a very **long and drawn-out**, maybe even **multigenerational, struggle**. It would be marked by years of mass education and organizing of a scale and intensity not seen in most core capitalist states since the 1960s or even the 1930s.

Nor is there any guarantee that the new system would not also degrade the soil, lay waste to the forests, despoil bodies of water, and find itself still addicted to coal and oil. Look at the history of "actually existing socialism" before its collapse in 1991. To put it mildly, the economy was not at peace with nature. Or consider the vexing complexities facing the left social democracies of Latin America. Bolivia, and Ecuador, states run by socialists who are beholden to very powerful, autonomous grassroots movements, are still very dependent on petroleum revenue.

A more radical approach to the crisis of climate change begins **not with a long-term vision** of an alternate society but with an honest engagement with the very compressed timeframe that current climate science implies. In the age of climate change, **these are the real parameters of politics**.

AT: Rejection (Warming)

Advocacy for specific policy reform is key to environmental justice movements---refusal of policy relevance ensures marginalization

Douglas S. **Noonan 5**, Assistant Professor, School of Public Policy, Georgia Institute of Technology, 2005, "DEFINING ENVIRONMENTAL JUSTICE: POLICY DESIGN LESSONS FROM THE PRACTICE OF EJ RESEARCH," http://www.prism.gatech.edu/~dn56/EJ.APPAM.pdf

The negotiated nature of environmental policymaking holds some stark lessons for policymakers and analysts alike. Even if there were no uncertainty – and all of the useful scientific evidence was available – the heterogeneous interests of affected parties would persist. When policies ultimately seek to reconcile these competing interests, essentially answering questions of social choice (for which optimal solutions may not be available either in theory or due to practical limits to policy), only rarely or never would a policy process be such that selfish advocacy by interest groups yields both individually and socially optimal outcomes. In the environmental policy arena, the disconnect between the pursuit of individual interests and the pursuit of collective goals is paramount. In this sense, the acrimony surrounding many environmental policy debates is both undersandable and inevitable. ¶ Although this preface might apply equally well to discussions of "climate change policy" or "species/wilderness preservation policy," the application to environmental justice (EJ) provides an opportune arena in which to observe the interplay between environmental policymaking and the (allegedly) relevant research. Environmental justice is a major theme in environmental and social policy. Its researchers are legion. Their output is voluminous. A debate about the empirical evidence and about appropriate policies continues among academics. In more public forums interest groups routinely cite environmental justice in advocating for policy reforms. As is typical in policy debates, advocates select evidence to cite in support of their position. **The influence of scholarly EJ research on policymakers**, however, **is less than straightforward**. If the mounting evidence provides only partial answers or, as is common, **answers to questions only marginally relevant to policymakers**, then **even hundreds of books** 1 on the subject may **do little to sway public policy**. Or, conversely, the evidence's influence may far outstrip its limited relevance. Regardless, like many other environmental policy topics, the role of scholarly research in policy design is inevitably contentious and complex. ¶ The purpose of this paper is to offer some insight about policy design from the scholarly literature on EJ. After scaling this mountain of literature, what are the important lessons to be learned for **making EJ policy?** From this vantage, this paper **critiques the field of EJ research**. It also offers some suggestions for a more policy-relevant research agenda. The conclusion returns to the broad assessment of EJ policy and suggests some future directions for designing policy and framing the discourse.

AT: Zizek (rev/act)

Their proposal is just empty radicalism. Risking everything for revolution creates Stalinist totalitarianism.

Julia **HELL** German Studies @ Michigan **'6** "Remnants of Totalitarianism" *Telos* Fall Vol. 136 p. 96-103

This brings us to the present and the form of political actions that are thinkable, or unthinkable, in a condition allegedly dominated by the opposition between totalitarianism and democracy. What is needed is a "freedom fighter with an inhuman face." In Zizek's Revolution at the Gates, Antigone is such a model, her defiance an example of ==an act that "intervenes in the very rational order of the Real, changing-restructuring its co-ordinates==-an act is not irrational; rather, it creates its own (new) rationality.""' This event "cannot be planned in advance-we have to take a risk, a step into the open, with no Big Other to return our true message to us"-and ==its consequences might well be **Stalinist terror**==, that is one of the risks."' A freedom fighter with an inhuman face-the phrase resonates with Benjamin's early thoughts on the Angel of History as a figure that embod- ies the creativity of destruction. iek discusses Benjamin's "Theses on the Philosophy of History" in the context of "revolutionary violence" as "the transformation of the oppressed victim into an active agent. "6 To make the argument for the ethical nature of the revolutionary act, 2iiek turns to Eric Santner's reading of Benjamin. "[A] present revolutionary interven- tion repeats/redeems past failed attempts," Zizek writes."' He uses Eric Santner's notion of "symptoms" as "past traces which are retroactively redeemed through the 'miracle' of the revolutionary intervention": they are, Santner writes, "not so much forgotten deeds, but rather forgotten failures to act, failures to suspend the force of the social bond inhibiting acts of solidarity with society's 'others.'"" Santner's political claims are more modest: these symptoms register not only past failed revolutionary attempts, but past "failures to respond to calls for action, or even for empa- thy" on behalf of the suffering."" Santner uses Christa Wolf's reflections on the Nazi pogroms of 1938, not on the events of 1917. But Zizek is not concerned with modest ethical acts; for him, the excessive violence of the 1938 pogroms is a symptom that testifies to the "possibility of the authen- tic proletarian revolution.""'

This was an outburst of violence that covered "the void of the failure to intervene effectively in the social crisis."" ==As the Stalinist purges contained a redemptive kernel, so does==, apparently, ==right-wing violence==. At stake is a contemporary politics of authentic acts that redeems these voids and creates a revolutionary future from a revolu- tionary past. IV "A Crazy Wager on the Impossible": Eaek 's New (Post)Democratic Post-Politics If we read Zizek and Muffler with reference to Arendt's Origins of Totali- tarianism, we discover two different, but complementary stories that express a familiar dilemma of the left. **In Zizek's writings, the** entire ==mur- derous history of Stalinism is erased in favor of a== still ==unrealized future==: the realization of the redemptive dimension----one that we find even at the heart of Stalinism. In MUller's texts, the GULAG is reified into a concept of history as catastrophe, the history of an eternal cycle of violence. The future only exists as the repetition of that violence. Both iek and Muller draw on Benjamin's "Theses on the Philosophy of History," which were written at the moment of the Hitler-Stalin Pact. The opposition between Muller's melancholic paralysis and iek's revolutionary decisionism raises again a problematic that Yves de Maes- seneer discusses apropos of Benjamin's angel. Maesseneer argues that the figure of the angel represents a "terrifying amalgam of redemption and destruction," because it implies the "end of politics," either leading to res- ignation, or (state) terror .... If we appeal to Benjamin's angel, Maesseneer submits, ==we either risk "an endorsement of the posture of a powerless witnessing of catastrophe==," because the angel is "too immaterial to make a difference," ==or else we are endorsing radical destruction.==" Whether this assessment is valid for Benjamin's angel might be debatable; as a warning, it certainly applies to 2iek's and MUller's readings of it."' I am not arguing that .iek revived Benjamin's angel with a bomb in one hand and a copy of the Koran in the other. I do however agree with Geoff Boucher's analysis that iek's recent theorizing of the act as an "exit from the symbolic network, a dissolution of social bonds" indicates a tension between democratic politics (as the formation of a hegeinonic project) and "quasi-religious militarism,"" ==Boucher criticizes Zizek's notion of a foundational act as a leftover from "Cultural-Revolution-period Maoism" and ultimately a retreat from politics, because it seems to privi- lege individual over collective action and reduces politics and economics to ideological struggles==."' I have traced this new politics of "repeating Lenin" and the Bolsheviks' refusal of evolutionary history to two different contexts. The first is the Eastern European context, i.e., the de-politicizing connection between petrified (post)totalitarian conditions and the volun- tarist fantasies of Eastern Europe's dissident Marxists. The second is the context discussed by Boucher, i.e., the politics of the 1970s. However, I propose to comprehend iek's re-invention of radical politics as a return not to Maoism, but to the abstract radicalism of the RAE. In 1972, Ulrike Meinhof wrote a manifesto about Black September's role in the anti-imperialist struggle. Meinhof argued that Germany was imperialism's fascist center, that Israel's conflict with the Palestinians had turned that country into "Nazi-Faschismus," and that the bloody kidnappings in Munich constituted an "anti-imperialist, anti-fascist" intervention."' Again, I am not arguing that iek is re-inventing the Angel of History as Islamic fundamentalist, Palestinian freedom fighter, or the reincarnation of Ulrike Meinhof. But Meinhof's ghost does haunt his "freedom fighter with an inhuman face." Anti-imperialist struggle, she wrote, aims at the "[m]aterial destruction of imperialist domination" and the "myth" of its omnipotence."" This sounds familiar: we could be reading a Maoist pamphlet. Meinhof's reflections on the symbolic core of militant actions are more intriguing: "Propagandistic action as part of the

material attack: the act of liberation in the act of annihilation. "`9 Libera- tion through destruction: in this statement we find remnants of Hegel's master-slave dialectic and its echoes in Fanon and Sartre--and we find a crude foreshadowing of Zizek's conception of the authentic revolutionary act as one that changes the symbolic itself. This raises again the question of which kinds of acts Ziek has in mind. Reading Zizek unfortunately does not help to clarify this issue. What we do learn is that Zizek attempts to theorize politics beyond "democracy." Discussing the challenge that Carl Schmitt's theory of the political poses to the left, Chantal Mouffe insists that radical democracy be understood as a critique of parliamentary democracy, not as its dismissal. Radical democracy politicizes liberal democracy by introducing Schmitt's agonistic definition of politics, which deliberative models of democracy exclude; and it introduces agonistic pluralism into Schmitt's ineradicable 2onfiictuality by transforming antagonistic confrontations into agonistic Dries, "enemies" into legitimate "adversaries" with whom "there exists a common ground.""' That parliamentary democracy provides the space for the elaboration of this common symbolic ground has been the cornerstone of the post-Stalinist left and its reinvention of democratic politics. In his essay on Schmitt's "decisionist formalism," Zizek argues that Schmitt asserts "the independence of the abyssal act of free decision from its positive content "3' Like Mouffe, Zizek welcomes Schmitt's definition of the political as antagonistic, but criticizes him for not properly articu- lating "the logic of political antagonism.""' Schmitt's move to limit the friend/enemy distinction to external politics disavows the internal struggle that traverses society, while "a leftist position," hek writes, insists on "the unconditional primacy of the inherent antagonism as constitutive of the political.""' Zizek then provides "positive content" to Schmitt's formalism by defining the political as a struggle for democracy: "The political struggle proper is. never simply a rational debate between mul- tiple interests, but simultaneously the struggle for one's voice to be heard and recognized as the voice of a legitimate partner.""' The "protests of the 'excluded" always involve their right to be recognized."' Yet is Zizek's new radical act really more than just another kind of empty, formalist decisionism? Granted, he gives it a more material con- tent by insisting on the continuing relevance of class antagonism, i.e., the "notion of a radical antagonistic gap that affects the entire social body.""' In Welcome to the Desert of the Real, this gap is exposed by the attacks on the World Trade Center, because, iek argues, these attacks represented the eruption of the real into our symbolic order: they signaled the gap between the First and the Third Worlds, iek unequivocally distances himself from these attacks. Nevertheless, this militant gesture does pose a problem. I see Zizek's recent involvement with theology as an attempt to differentiate his messianic-militant politics from this kind of terrorism. And the hermeneutic pirouettes performed in the service of the "redemptive kernel" of Stalinism serve the same function: to delineate the boundaries of what this act is and is not. The "freedom fighter with the inhuman face" is no terrorist, Islamic or Stalinist-but is she anything more than a rev- enant from another desperate age? To answer this question, we need to return to Ulrike Meinhof, In Welcome to the Desert of the Real, iiek compares the attacks on the World Trade Center to those of the RAF. Meinhof's concept of the revolution- ary act, Zizek writes, is driven by the twentieth-century "passion for the Real," a belief that violent transgression bombs people out of their numbed state."' However, this kind of act, 2iek argues, paradoxically produces only the "pure semblance of the effect of the Real.""' But does this analysis (which I read as a kind of anticipatory rebuttal) really exhaust Meinhof's theory of the authentic act? What the RAF aimed for were three things: the existential effect, the shock effect, and, finally, a kind of "rev- elation": the act's power to lay bare the (fascist) essence of the (German) state. As 1 mentioned above, we find traces of Fanon's existentialism, but point two and three also hint at the legacy of surrealism, of Debord and the Situatjonjst International, And it is here that we can locate Ziek's debt to the RAF. For we can read the RAF's desire to "unveil" the true nature of the state in two ways: as the production of mere spectacle, a "thrill of the Real," or as a desire to radically intervene on the level of the symbolic. '39 Like iek's authentic revolutionary act, Meinhof's theory of revolutionary acts contained a symbolic dimension; they were aimed at a rearrangement of the very pre-conditions of politics. Zizek is thus in the process of rethinking radical democracy through Meinhof, substituting the work of hegemonic articulation with a new strat- egy, the authentic revolutionary act. And Zizek takes Mouffe's Gramscian rearticulation of the symbolic outside the space of liberal parliamentary democracy. For, as Zizek points out in his response to Boucher, the time of optimism is over: "we effectively live in dark times for democratic politics."40 Far from advocating a "crazy messianic politics of a radical violent Act," Zizek writes, in this age of global capitalism he is concerned with finding ways to re-think radical change (which, he argues, Mouffe and Laclau abandoned by limiting their anti-globalization strategy to "multiple local practices of resistance"). 141 Ultimately, Zizek writes, "we cannot formulate a clear project of global change."" Zizek's angel is thus really not much more than an intriguing, but ultimately empty, cipher-a remnant from a bygone era. Where does this leave us? Curiously, in a position similar to that of Arendt in 1945: the conditions of both political analysis and politics itself have fundamentally changed, Zizek argues, and therefore need to be radi- cally re-thought. While Arendt takes recourse to the miracle of birth, Zizek conjures the miracle of the authentic act. What distinguishes Zizek from Arendt is his willingness to take the ultimate risk: to sever the connection to liberal parliamentary democracy. In his recent writings, Zizek comes "perilously close to an ultra-left refusal of the difference between capital- ist democracy and military dictatorship." 143 Like Arendt, Zizek situates his recent work in the shadow of catastrophe ("dark times" is a transparent allusion to Brecht and National Socialism). Unlike Arendt, Ziek does not escape this catastrophic imaginary but repeats its antinomies." Zizek's new politics thus constitutes a curious double repetition: first, of Arendt's attempt to liberate politics from the catastrophic imagi- nary; and second, of the RAF. iek himself analyzes 1970s terrorism as a response to the New Left's realization that the revolution will not happen-neither in Berlin, nor Prague, nor Belgrade. '45 As the New Left disintegrated, groups like the RAP and Red Brigades slowly slid into their suicidal politics. Muller fell for this messianic politics at a moment when the petrified conditions of the GDR appeared to be its eternal future. Ziek seems to fall for it now, his empty repetition of the RAP nothing but a symptom-albeit apparently not a very enjoyable one. Zizek is certainly not the only one conceiving of a new politics in rather empty tenns. Giorgio Agamben argues that modernity's murderous biopolitics has been accompanied by the state of exception as a norm leading to the United States as its ultimate totalitarian instantiation. While Againben's view of (contemporary) modernity is best described by Arendt's "law of ruin," his new politics comes down to nothing but a metaphysical desire to experience genuine Being, a kind of Heideg- gerian great leap forward-or rather, a leap into the beyond."'

Radical democracy worked through the "shock of experience" that its theorists shared--however belatedly-with Arendt, and they heeded her advice to think the unprecedented. Its strategies might need re-inventing (and Zizek's materialist re-centering of the social around its basic antagonism is a productive first step). But its basic tenets-that politics takes place within the framework of parliamentary democracy and that it transforms the friend/enemy antagonism into a friend/adversary agonism-still seems the adequate answer to U.S. Republican politics and their own brand of catastrophic scenarios.

Neolib Alt Fails

Starting with "neoliberalism" encourages fake radicalism, oversimplification, and greater levels of cooptation than positive and pragmatic politics.

-Ad hoc policies of neoliberalism also originate from Leftist movements for greater autonomy

-Sustainability politics also emerged during this time, but the neolib K ignores those and lumps them all together

-Ignores positive action that doesn't conform to a romantic view of rebellion (i.e. the plan)

BARNETT '5

(CliveFaculty of the Social Sciences @ Open University (UK) "The Consolations of 'Neoliberalism'" *Geoforum* 36 (1) p. Science Direct)

3. There is no such thing as neoliberalism! The blind-spot in theories of neoliberalism—whether neo-Marxist and Foucauldian—comes with trying to account for how top-down initiatives 'take' in everyday situations. So perhaps **the best thing to do is to stop thinking of "neoliberalism" as a coherent "hegemonic" project** altogether. For all its apparent critical force, the vocabulary of "neoliberalism" and "neoliberalization" in fact provides a double consolation for leftist academics: it supplies us with plentiful opportunities for unveiling the real workings of hegemonic ideologies in a characteristic gesture of revelation; and in so doing, it invites us to align our own professional roles with the activities of various actors "out there", who are **always framed as engaging in resistance** or contestation. The conceptualization of "neoliberalism" as a "hegemonic" project does not need refining by adding a splash of Foucault. Perhaps we should try to do without the concept of "neoliberalism" altogether, because it might actually compound rather than aid in the task of figuring out how the world works and how it changes. One reason for this is that, between an overly economistic derivation of political economy and an overly statist rendition of governmentality, stories about "neoliberalism" manage to reduce the understanding of social relations to a residual effect of hegemonic projects and/or governmental programmes of rule (see Clarke, 2004a). Stories about "neoliberalism" pay little attention to the pro-active role of socio-cultural processes in provoking changes in modes of governance, policy, and regulation. Consider the example of the restructuring of public services such as health care, education, and criminal justice in the UK over the last two or three decades. This can easily be thought of in terms of a "hegemonic" project of "neoliberalization", and certainly one dimension of this process has been a form of anti-statism that has rhetorically contrasted market provision against the rigidities of the state. But in fact these ongoing changes in the terms of public-policy debate involve a combination of different factors that add up to a much more dispersed populist reorientation in policy, politics, and culture. These factors include changing consumer expectations, involving shifts in expectations towards public entitlements which follow from the generalization of consumerism; the decline of deference, involving shifts in conventions and hierarchies of taste, trust, access, and expertise; and the refusals of the subordinated, referring to the emergence of anti-paternalist attitudes found in, for example, women's health movements or anti-psychiatry movements. They include also the development of the politics of difference, involving the emergence of discourses of institutional discrimination based on gender, sexuality, race, and disability. This has disrupted the ways in which welfare agencies think about inequality, helping to generate the emergence of contested inequalities, in which policies aimed at addressing inequalities of class and income develop an ever more expansive dynamic of expectation that public services should address other kinds of inequality as well (see Clarke, 2004b J. Clark, Dissolving the public realm? The logics and limits of neo-liberalism, Journal of Social Policy 33 (2004), pp. 27–48.Clarke, 2004b). None of these populist tendencies is simply an expression of a singular "hegemonic" project of "neoliberalization".

They are effects of much longer rhythms of socio-cultural change that emanate from the bottom-up. It seems just as plausible to suppose that what we have come to recognise as "hegemonic neoliberalism" is a muddled set of ad hoc, opportunistic accommodations to these unstable dynamics of social change as it is to think of it as the outcome of highly coherent political-ideological projects. Processes of privatization, market liberalization, and de-regulation have often followed an **ironic pattern** in so far as they have **been triggered by citizens' movements arguing from the left** of the political spectrum against the rigidities of statist forms of social policy and welfare provision in the name of greater autonomy, equality, and participation (e.g. Horwitz, 1989). The political re-alignments of the last three or four decades cannot therefore be adequately understood in terms of a straightforward shift from the left to the right, from values of collectivism to values of individualism, or as a re-imposition of class power. The emergence and generalization of

this populist ethos has much longer, deeper, and wider roots than those ascribed to "hegemonic neoliberalism". And it also points towards the extent to which easily the most widely resonant political rationality in the world today is not right-wing market liberalism at all, but is, rather, the polyvalent discourse of "democracy" (see Barnett and Low, 2004). Recent theories of "neoliberalism" have retreated from the appreciation of the long-term rhythms of socio-cultural change, which Stuart Hall once developed in his influential account of Thatcherism as a variant of authoritarian populism. Instead, they favour elite-focused analyses of state bureaucracies, policy networks, and the like. One consequence of the residualization of the social is that theories of "neoliberalism" have great difficulty accounting for, or indeed even in recognizing, new forms of "individualized collective-action" (Marchetti, 2003) that have emerged in tandem with the apparent ascendancy of "neoliberal hegemony": environmental politics and the politics of sustainability; new forms of consumer activism oriented by an ethics of assistance and global solidarity; the identity politics of sexuality related to demands for changes in modes of health care provision, and so on (see Norris, 2002). All of these might be thought of as variants of what we might want to call bottom-up governmentality. This refers to the notion that non-state and non-corporate actors are also engaged in trying to govern various fields of activity, both by acting on the conduct and contexts of ordinary everyday life, but also by acting on the conduct of state and corporate actors as well. Rose (1999, pp. 281–284) hints at the outlines of such an analysis, at the very end of his paradigmatic account of governmentality, but investigation of this phenomenon is poorly developed at present. Instead, the trouble-free amalgamation of Foucault's ideas into the Marxist narrative of "neoliberalism" sets up a simplistic image of the world divided between the forces of hegemony and the spirits of subversion (see Sedgwick, 2003, pp. 11–12). And clinging to this image only makes it all the more difficult to acknowledge the possibility of positive political action that does not conform to a romanticized picture of rebellion, contestation, or protest against domination (see Touraine, 2001). Theories of "neoliberalism" are unable to recognize the emergence of new and innovative forms of individualized collective action because their critical imagination turns on a simple evaluative opposition between individualism and collectivism, the private and the public. The radical academic discourse of "neoliberalism" frames the relationship between collective action and individualism simplistically as an opposition between the good and the bad. In confirming a narrow account of liberalism, understood primarily as an economic doctrine of free markets and individual choice, there is a peculiar convergence between the radical academic left and the right-wing interpretation of liberal thought exemplified by Hayekian conservatism. By obliterating the political origins of modern liberalism—understood as answering the problem of how to live freely in societies divided by interminable conflicts of value, interest, and faith—the discourse of "neoliberalism" reiterates a longer problem for radical academic theory of being unable to account for its own normative priorities in a compelling way. And by denigrating the value of individualism as just an ideological ploy by the right, the pejorative vocabulary of "neoliberalism" invites us to take solace in an image of collective decision-making as a practically and normatively unproblematic procedure. The recurrent problem for theories of "neoliberalism" and "neoliberalization" is their two-dimensional view of both political power and of geographical space. They can only account for the relationship between top-down initiatives and bottom-up developments by recourse to the language of centres, peripheries, diffusion, and contingent realizations; and by displacing the conceptualization of social relations with a flurry of implied subject-effects. The turn to an overly systematized theory of governmentality, derived from Foucault, only compounds the theoretical limitations of economistic conceptualizations of "neoliberalism". The task for social theory today remains a quite classical one, namely to try to specify "the recurrent causal processes that govern the intersections between abstract, centrally promoted plans and social life on the small scale" (Tilly, 2003, p. 345). Neither neoliberalism-as-hegemony nor neoliberalism-as-governmentality is really able to help in this task, not least because both invest in a deeply embedded picture of subject-formation as a process of "getting-at" ordinary people in order to make them believe in things against their best interests. With respect to the problem of accounting for how "hegemonic" projects of "neoliberalism" win wider consensual legitimacy, Foucault's ideas on governmentality seem to promise an account of how people come to acquire what Ivison (1997) calls the "freedom to be formed and normed". Over time, Foucault's own work moved steadily away from an emphasis on the forming-and-norming end of this formulation towards an emphasis on the freedom end. This shift was itself a reflection of the realization that the circularities of poststructuralist theories of subjectivity can only be broken by developing an account of the active receptivity of people to being directed. But, in the last instance, neither the story of neoliberalism-as-hegemony or of neoliberalism-as-governmentality can account for the forms of receptivity, pro-activity, and generativity that might help to explain how the rhythms of the everyday are able to produce effects on macro-scale processes, and vice versa. So, rather than finding convenient synergies between what are already closely related theoretical traditions, perhaps it is better to keep open those tiresome debates about the degree of coherence between them, at the same time as trying to broaden the horizons of our theoretical curiosity a little more widely.

Perm/Link Stuff

Envt Reform Cap k

Only the perm solves—proposing alternative non-capitalist economics out of nowhere is of *zero value*. Environmental reform of capitalism is key.

Barry '7

(John BARRY Reader in Politics @ Belfast '7 ["Towards a model of green political economy: from ecological modernisation to economic security" Int. J. Green Economics, Vol. 1, Nos. 3/4, 2007 p. 447-448)

Economic analysis has been one of the weakest and least developed areas of broadly green/sustainable development thinking. For example, whatever analysis there is within the green political canon is largely utopian – usually based on an argument for the complete transformation of modern society and economy as the only way to deal with ecological catastrophe, an often linked to a critique of the socioeconomic failings of capitalism that echoed a broadly radical Marxist/socialist or anarchist analysis; or underdeveloped – due, in part, to the need to outline and develop other aspects of green political theory. However, this gap within green thinking has recently been filled by a number of scholars, activists, think tanks, and environmental NGOs who have outlined various models of green political economy to underpin sustainable development political aims, principles and objectives. The aim of this article is to offer a draft of a realistic, but critical, version of green political economy to underpin the economic dimensions of radical views about sustainable development. It is written explicitly with a view to encouraging others to think through this aspect of sustainable development in a collaborative manner. Combined realism and radicalism marks this article, which starts with the point that we cannot build or seek to create a sustainable economy ab nihlo, but must begin from where we are, with the structures, institutions, modes of production, laws and regulations that we already have Of course, this does not mean simply accepting these as immutable or set in stone; after all, some of the current institutions, principles and structures underpinning the dominant economic model are the very causes of unsustainable development. We do need to recognise, however, that we must work with (and 'through' – in the terms of the original German Green Party's slogan of 'marching through the institutions') these existing structures, as well as change and reform and in some cases, abandon them as either unnecessary or positively harmful to the creation and maintenance of a sustainable economy and society. Equally, this article also recognises that an alternative economy and society must be based in the reality that most people (in the West) will not democratically vote for a completely different type of society and economy. That reality must also accept that a 'green economy' is one that is recognisable to most people and that indeed safeguards and guarantees not just their basic needs but also aspirations (within limits). The realistic character of the thinking behind this article accepts that consumption and materialistic lifestyles are here to stay (so long as they do not transgress any of the critical thresholds of the triple bottom line) and indeed there is little to be gained by proposing alternative economic systems, which start from a complete rejection of consumption and materialism. The appeal to realism is in part an attempt to correct the common misperception (and self-perception) of green politics and economics requiring an excessive degree of self-denial and a puritanical asceticism (Goodin, 1992, p.18; Allison, 1991, p.170–178). While rejecting the claim that green political theory calls for the complete disavowal of materialistic lifestyles, it is true that green politics does require the collective reassessment of such lifestyles, and does require a degree of shared sacrifice. It does not mean, however, that we necessarily require the complete and across-the-board rejection of materialistic lifestyles. There must be room and tolerance in a green economy for people to live 'ungreen lives' so long as they do not 'harm' others, threaten long-term ecological sustainability or create unjust levels of socioeconomic inequalities. Thus, realism in this context is in part another name for the acceptance of a broadly 'liberal' or 'post-liberal' (but certainly not anti-liberal) green perspective.[1]

Perm/ideology 1st Fails

Their insistence on ideology being 'first' reifies extremism and fragmentation in the academy – only the perm avoids scholarship shutdown

David **Lake 11**, political science prof at UC-San Diego, Why "isms" Are Evil: Theory, Epistemology, and Academic Sects as Impediments to Understanding and Progress, International Studies Quarterly (2011) 55, 465-480

My critique of our profession is a common one, but one worth repeating. Most generally, we organize ourselves into academic "sects" that engage in self-affirming research and then wage theological debates between academic religions. This occurs at both the level of theory and epistemology. In turn, we reward those who stake out extreme positions within each sect. Unfortunately, this academic sectarianism, a product of our own internal political struggles, produces less understanding rather than more. Some reasonably fear intellectual "monocultures," as McNamara (2009) has called the possible hegemony of rationalism. But the current cacophony is not a sign of productive intellectual ferment in the pursuit of meaningful knowledge." Rather, we have produced a clash of competing theologies each claiming its own explanatory "miracles" and asserting its universal truth and virtue. Instead, a large measure of intellectual humility Is in order. Theoretically, we are far from the holy grail of a universal theory of international politics—if indeed such a grail even exists. We should focus instead on developing contingent, mid-level theories of specific phenomena. This analytical eclecticism is likely to be more productive (Sil and Katzenstein 2010). But we aLso need a lexicon for translating otherwise incommensurable theories and making them mutually intelligible. In the following section, I outline the problems with theoretical sects and affirm the case for analytic eclecticism. I then end with one possible "Rosetta stone" that aims to facilitate conversation across research traditions by suggesting that all theories of international studies can be disaggregated into the basic and common concepts of interests, interactions, and institutions. Epistemologically, there is perhaps an even deeper divide that is, unfortunately, not so easily bridged. The nomothetic vs narrative divide cuts through all of the social sciences and possibly beyond. This divide endures because scholars—either innately or through socialization—find one form of explanation more intellectually satisfying than the other. Yet, in international studies, we have reified this divide and, as with our theories, have formed mutually exclusive churches. Rather than claiming one or the other epistemology Is always and everywhere superior, we should recognize that both are valid and perhaps even complementary paths to understanding. The question is not which approach is inherently superior, but which yields greater insights under what circumstances. The second major section below takes up epistemology and its consequences for professional practice and knowledge.

AT: Vampiristic Consumption

Not vampiristic consumption

Braidotti 6

(Rosi, contemporary philosopher and feminist theoretician, Transpositions: On Nomadic Ethics, 76)

I beg to differ from Spivak's assessment. The charge of **vampiristic** or consumerist **consumption** of others is an ill-informed way of approaching the issue, in that it ignores the rigorous anti-humanistic, cartographic and materialistic roots of poststructuralism. It specifically rests on a misreading of what is involved in the poststructuralist critique of representation and on what is at stake in the task of redefining alternative subject positions. Spivak attempts to rescue Derrida, whom she credits with far more self-reflexivity and political integrity than she is prepared to grant to Foucault and Deleuze. The grounds for this preferential treatment are highly debatable. Nomadic thinking challenges the semiotic approach that is crucial to the 'linguistic turn' and also to deconstruction. Both Deleuze and Foucault engage in a critical dialogue with it and work towards an alternative model of political and ethical practice. It seems paradoxical that thinkers who are committed to an analytics of contemporary subject-positions get accused of actually having caused the events which they account for; as if they were single-handedly responsible for, or even profiting from, the accounts they offer as cartographies. **Naming the networks of power-relations** in late postmodernity, however, **is not as simple as metaphorizing and therefore consuming them**. In my view **there is no vampiristic approach towards 'otherness'** on the part of the poststructuralists. Moreover, I find that approach compatible with the emerging subjectivities of the former 'others' of Western reason. Late postmodernity has seen the proliferation of many and potentially contradictory discourses and practices of difference, which have dislocated the classical axis of distinction between Self or Same/Other or Different. The point of coalition between different critical voices and the poststructuralists is the process of elaborating the spaces in-between self and other, which means the **practice of the Relation**. They stress the need to elaborate forms of **social and political implementation** of non-pejorative and nondualistic notions of 'others'.

Disease

AT: Apoc Disease

Presenting the impact as the worst-case scenario is best to motivate action—these messages are unique because new antibiotics aren't being developed

-Past warnings were during a time when new antibiotics were coming out

Tom **FOWLER ET AL. 14**, Public Health, Epidemiology and Biostatistics @ University of Birmingham, United Kingdom, Sally C. Davies, Chief Medical Officer for England, and David Walker, Deputy Chief Medical Officer for England ["The risk/benefit of predicting a post-antibiotic era: Is the alarm working?" *Annals of the New York Academy of Sciences*, Vol. 1323, p. 1-10 (September 2014)]

Is the alarm working? It can therefore be argued that the main potential criticism of predicting a post-antibiotic era can be answered thus: 1. there is a need for such predictions to help inform the response to the issue, particularly if we are going to require societal as well as healthcare responses; 2. there is a need for such predictions to provide an appropriate evidence base for the need for resources to address the issue; 3. it is reasonable to make such predictions **as a worst-case scenario** if action is not taken. This still leaves the question of whether this is the most effective way to lever action. Given that Mary Barber was warning as early as 1958 of the growth of antimicrobial resistance, particularly in staphylococci, and introduced a hospital-wide antibiotics reduction policy in Hammersmith Hospital (London),[31] why are we in the current situation? It must be remembered that when these historical warnings were made (arguably correct as they were) it was against a backdrop of discovery of new antibiotics. Many believed that the introduction of methicillin in 1960 marked the end of penicillin-resistant staphylococci. Ernst Chain (who shared the Noble Prize in Physiology or Medicine for penicillin with Alexander Flemming and Howard Florey) is reported to have said "no more resistance problems, methicillin is the answer."[6] It is therefore **unsurprising** that these warnings did not elicit political action. At the turn of the millennium, there was a flurry of activity around antimicrobial resistance,[4, 32-34] including a World Health Organization Resolution, which led to the UK Antimicrobial Resistance Strategy and Action Plan.[35] Even this was at a time where new classes of antibiotics had been discovered in the recent past. Perhaps reflecting this in the first UK action plan, research on new antibiotics was the 16th and last objective, though more detail was then given later in the document. This compares to the recent UK Five-Year Antimicrobial Resistance Strategy 2013–2018,[36] where one of the three strategic aims is to simulate the development of new antibiotics, diagnostics, and novel therapies. This suggests that previous warnings around the potential for a post-antibiotic era have been ineffective. Yet, if we look at **recent activity** we see a **change in** the high-level policy focus on the Biomedical Advanced Research and Development Authority (BARDA). The recent Chief Medical Officer for England's Annual Report,[2] the CDC report,[13] the World Economic Forum's Global Risks 2013 report,[7] and the Chennai Declaration[37] in India are all examples of this. In a keynote address at the conference "Combating Antimicrobial Resistance: Time for Action" held in Copenhagen, Denmark on March 14, 2012, Margaret Chan, Director-General of the World Health Organization stated, "If current trends continue unabated, the future is easy to predict. Some experts say we are moving back to the pre-antibiotic era. No. This will be a post-antibiotic era. In terms of new replacement antibiotics, the pipeline is virtually dry, especially for Gram-negative bacteria. The cupboard is nearly bare. A post-antibiotic era means, in effect, an end to modern medicine as we know it. Things as common as strep throat or a child's scratched knee could once again kill."[38] Importantly, **these calls to action are being responded to**. In the United Kingdom, through the UK government scheme Biomedical Catayst UK,[39] two small- and medium-size enterprises (SMEs), Cantab Anti-infectives and Discuva, are pioneering ways to tackle drug resistance in Gram-negative bacteria. The National Institute for Health Research in the United Kingdom has recently announced a research funding call in this area. In Europe, the Innovative Medicines Initiative, a program specifically aimed at promoting public and private partnerships between academia and SMEs, has had a specific topic call around the discovery and development of new drugs that combat Gram-negative infections. This call has the specific aim to create a European Drug Discovery Centre of Excellence for antibiotic resistance.[40] The Joint Programming Initiative on Antimicrobial Resistance consists of 18 EU member states that have joined forces to address the issue of fragmented research in this area.[41] Their strategic research agenda is currently being consulted, but the first area topic in the consultation document is the development of novel antibiotics and novel alternatives to antibiotics. In the United States, there is active lobbying to

seek legislation based on the concept of a new regulatory approval pathway for limited population antibacterial drugs, which would encourage the development of antibiotics that address the greatest unmet needs of patients by making the approval pathway more feasible.[42] The U.S. BARDA,[43] within the Office of the Assistant Secretary for Preparedness and Response, develops and procures medical countermeasures against a broad array of public health threats (natural and intentional in origin), including vaccines, therapeutics, diagnostics, and nonpharmaceutical countermeasures. BARDA has recently funded a collaboration with GlaxoSmithKline (GSK) to develop several antibiotics, taking a novel approach that allows for funding to move around GSK's antibacterial portfolio and for medicines to be studied for the potential treatment of both conventional and biothreat pathogens, that is, to develop a response to the potential threats from both antimicrobial resistance and bioterrorism.[44] While it remains to be seen if these initiatives do address the issue of market failure, (which will be the true test of whether the alarm is working), it can certainly be said that ==the alarm has led to unprecedented action==.

Baudrillard

AT: Baudrillard/Info Overload

Politics is possible---debate solves info overload

Bleiker 2

(Roland, professor of international relations at the University of Queensland, Politics After Seattle: Dilemmas of the Anti-Globalisation Movement, conflits.revues.org/1057)

Any protest action that draws sufficient media attention has the potential to engender a political process that transcends its immediate spatial environment. It competes for the attention of global television audiences and thus interferes with the struggle over values that ultimately shapes the world we live in. "A world united by Benetton slogans, Nike sweatshops and McDonald's jobs might not be anyone's utopian global village," says Naomi Klein, "but its fibre-optic cables and shared cultural references are nonetheless laying the foundations for the first truly international people's movement.31 But the recent wave of global protests is hardly the first international movement of its kind. Nor is it as unproblematic as Klein suggests. For some the revolution of speed is too random to allow for critical interference and, indeed, for human agency. Jean Baudrillard, for instance, believes that the distinctions between reality and virtuality, political practice and simulation are blurred to the extent that they are no longer recognisable.32 Our media culture, he says, has annihilated reality in stages, such that in the end its simulating image « bears no relation to any reality whatever : it is its own pure simulacrum. » Television, the unproblematic transmission of the hyperreal, has conditioned our mind such that we have lost the ability to penetrate beneath the manifest levels of surface.33¶ ¶ 24 **Patterns of global protest do not confirm the pessimistic views that Baudrillard and others espouse. The blurring of reality and virtuality has not annihilated dissent**. The fact that televised images are hyperreal does not necessarily diminish their influence. Independently of how instantaneous, distorted and simulated images of a protest action may be, they still influence our perceptions of issues, and thus also our political responses to them. To accept the logic of speed, then, is not to render political influence obsolete, but to acknowledge multiple and overlapping spatial and temporal spheres within which **political practices are constantly being shaped and reshaped.**

2ac ballot

The plan's method a <u>particular</u> response is a useful template for solving transnational problems, without prescribing a formula for all action – outweighs co-option risks

Daniel **Bray**, The University of Melbourne International Politics and Political Theory Lecturer, Ph.D., 20**09**, Pragmatic Cosmopolitanism: A Deweyan Approach to Democracy beyond the Nation-State, Millennium, 37.3

<u>In keeping with pragmatist tenets, my approach to the problem</u> of practical institutionalisation <u>is a **context-sensitive** one that does not impose an a priori 'direct</u>' or 'representative' <u>template for the political institutionalisation of democracy</u>, <u>which may require more or less degrees of mediation</u> and delegation depending <u>on the particular problematic situation</u>. As Saward points out, <u>different</u> democratic <u>mechanisms may be called for depending on whether they require permanent</u> structures <u>or temporary measures</u> and on <u>whether they are undertaken by governments or by non-governmental actors</u>.103 Thus, <u>one may have a normative preference for minimising</u> the degree of mediation and delegation in <u>any democratic regime</u>, <u>but</u> these <u>features</u> of democratic practice <u>should not be viewed as inherent bads</u>. Indeed, <u>given the scale and complexity of modern politics, transnational democratic publics are likely to require significant levels of mediation</u> and delegation <u>if they are to be effective actors in global politics</u>. <u>The key response</u> of pragmatic cosmopolitanism here <u>is to see</u> transnational <u>publics as institutions of critical inquiry that are formed when</u> associated <u>individuals work collectively to address problems presented by transnational consequences</u>. As Molly Cochran points out, in Deweyan terms these publics exist on a continuum from 'weak' publics that are understood to involve associated activity that is only informally organised (like a neighbourhood group) or narrowly focused on a single issue (like the control and prevention of AIDS104), to stronger publics that have political agencies invested with public authority that are capable of issuing binding decisions for a societal group (an international regime, say, or a more densely articulated public we commonly regard as a political 'state').105 <u>Today, in the absence of adequately responsive global institutions, most transnational associations take contestation</u> rather than popular control as <u>their fundamental political purpose</u>.106 <u>When they seek to provide alternative sites for deliberation where dominators are not present they form</u> what Nancy Fraser calls '<u>subaltern counterpublics</u>' that attempt to indirectly influence formal organisations by mobilising broader public opinion.107 <u>These oppositional networks and movements can only be conceived</u> as transnational public institutions, however, <u>when their efforts are directed at shifting authority away from states</u> and their agents <u>by making their own concerns authoritative in the decisionmaking that takes place where</u> international <u>public authority exists in global politics</u> – international law, regimes, the United Nations and in the broader bilateral and multilateral relations between states.108 <u>In the view of pragmatic cosmopolitanism, this process constitutes the core dynamic of democratic reconstruction in international institutions</u>. It is this perspective that highlights the key difference between the pragmatist and deliberative approaches to the institutionalisation of transnational democracy. <u>Instead of seeing publics as constituted by responsible citizens who reason</u> publicly on the basis of a distinctive form of communication, <u>pragmatists see responsible action as emerging from publics constituted by persons who recognise a need for social cooperation in resolving common problematic situations</u>. In the pragmatist view, publics are developing 'the traits of a state' when they develop strong organisational and decision-making capabilities and seek to make their concerns authoritative in global politics. <u>Pragmatism therefore does not hold to the strict state–civil society separation</u> that fundamentally shapes the deliberative approach. Beyond nation-states with sharply defined constitutional structures, the <u>desire to maintain a strict separation between **opinion-formation in the public sphere** and will-formation in formal representative institutions seems to neglect the requirement for some kind of **connective tissue between them**</u>, or at least <u>assumes that the translation of opinions into decision-making will occur through an underlying</u> discursive <u>shift that changes the context in which formal decisions are reached</u>. Deliberative <u>democrats</u> thus <u>privilege informal procedures of truth-seeking</u> (that are never power-free or completely non-

strategic) over political voice in formal institutions. Dryzek is obviously concerned about the co-option of oppositional civil society – which is certainly an ever-present threat and one to be taken seriously – but in many global and transnational contexts this threat tends to be overstated and fails to acknowledge the strategic character of 'publics' themselves. As Cochran points out, despite the blurring of the state–society divide, co-option is unlikely to be ever fixed or complete.109 Additionally, not all weak publics seek permanent or even minimal levels of inclusion in existing formal institutions, preferring to focus on contestation or developing alternative forums. Ultimately, pragmatic cosmopolitanism argues that in many contexts of contemporary global politics the need to realise change through **access to formal decision-making outweighs the risk of co-option**. One such context I discussed earlier centres on the contemporary climate change negotiations, where a wide variety of nongovernmental actors attempt to influence states in formal institutions by 'channelling up' the concerns of excluded publics, while at the same time monitoring the negotiations and 'channelling down' information to broader transnational and domestic constituencies.110

Fawver, 8

[Kurt, Master of Arts Engilsh – Cleveland State University, " DESTRUCTION IN SEARCH OF HOPE: BAUDRILLARD, SIMULATION, AND CHUCK PALAHNIUK'S CHOKE," August 2008, http://etd.ohiolink.edu/send-pdf.cgi/Fawver%20Kurt%20D.pdf?csu1219269969]

If Palahniuk's Choke was merely an excellent resource for understanding Baudrillardian theory, it would still be a valuable text. As it stands, however, Choke expands on the ideas of simulation and mediation and struggles to free itself from the snares of Baudrillard's ultimate unreality. Through a regime of breakdown and disorder, the text fights to emerge from "the end or disappearance of… the real, the social, history, and other key features of modernity" (Best 133). It attempts to create a meaningful correspondence between signifiers and signifieds, between images and meanings. **While Baudrillard posits that "everything can and has been done, and all we can do is to assemble the… pieces of our culture and proceed to its extremitie**s," **Choke resists such reasoning and,** in fact, runs **through stages of assembly and extremism to demonstrate how utterly futile and pointless they are** (Best 137). Choke seeks to blow apart those very reproductions that Baudrillard claims cause the implosion of meaning. Essentially, **the text advocates a clean sweep of communication, a discarding of all mediated reality**. In Choke, as in many other Palahniuk novels, **the flow of true meaning can only return to society and individuals once all mediated, simulated, reproduced "meanings" are razed.** Thus, the text does glorify destruction, but it is destruction in search of hope, destruction that will, presumably, lead to creation. Victor's eventual identity collapse, and his subsequent rebuilding, is paradigmatic of Choke's anti-Baudrillardian philosophy. Victor begins by compiling the persona of a dysfunctional, perpetually orphaned child-cum-adult from mediated symbols of "dysfunction." His sex addiction and his compulsion to simulate choking in restaurants are symptoms of this poor attempt at constructing a workable identity. When the "traumatized child-now-in-adulthood" simulation fails, Victor turns to new mediated identities: Christ and Antichrist. These personas also lack any depth or connection to Victor's core being and are, subsequently, discarded. As the text progresses, Victor drops all attempts at creating his identity from the palette of society's mass-produced conceptions. He pleads for someone to "just show me one thing in this world that is what you'd think" (Choke 205). But, as no inherent realness exists in contemporary society, no one can show Victor a thing or an individual with inherent meaning. Therefore, his only option is to extricate himself from the culture of simulation by cutting himself off from his own history and other individuals' mediated perceptions of his past. In a moment of clarity, Victor realizes **that he must reduce his identity to its simplest, most immediate terms because "There's no way you can get the past right**. You can pretend. You can delude yourself, but you can't re-create what's over" (Choke 273). Thus, by the end of the novel, Victor is more a blank page than a fully fleshed character. Rather than continuing to allow his identity to be an ever-evolving reactive simulation that forms in reference to external mediation, he becomes a clean slate on which he can write his own self-generated identity. He slakes off most of the factors that traditionally 26 inform self; familial expectation, personal history, and even conventional emotion are all missing from his identity at the text's close. As Victor explains, "For the first time in longer than I can remember, I feel peaceful. Not happy. Not sad. Not anxious. Not horny. Just all the higher parts of my brain closing up shop…. I'm simplifying myself" (Choke 282). The implication is that, in order to escape simulation, Victor must revert to a more primitive state. **His thoughts are of an essentially basic order; he no longer seeks out "deeper" meanings or alternate referential**s. Instead, **events, feelings, people, and things simply are what they appear to be, without connection to external mediation**. For Victor, **the universe of multiple signified meanings for any given signifier is no longer relevant**. **He has destroyed his perception** of alternate reference **and**, therefore, has **limited his field of meaning to exclusively intrinsic values**. Such perception comes at a price, however. Victor has to sacrifice a world of possibility, of variable signification, for concrete meaning. He can no longer ponder whether an image means one thing or another; rather, an image will, to Victor, always be fixed to one referent. In a sense, then, he has given up the parts of his "higher brain," namely a rigorous intellect and boundless creativity, in order to gain a foothold into solid reality and flee Baudrillard's infinite simulatory spiral. Whereas Baudrillard "critiques… representational thought which is confident that it is describing reality as it is," Victor embraces such thoughts with open arms (Best 140). Victor is intelligent enough to understand that **choosing a path of selfimposed communicative primitivism is the only measure of prevention against accruing a new body of simulacra. The polar opposite** of Victor **is Tracy**, the woman to whom he loses his virginity. She is **the prime example of an individual forever lost in Baudrillardian pos**t27 **structuralism,** representing everything that Victor, or any person, may become when nihilistic acceptance of simulation has infiltrated every aspect of self. Victor meets her on an airplane, in an unlocked bathroom. She takes flights, enters the restroom, leaves the door unlocked, then waits until someone walks in on her and attempts to engage them in a sexual encounter. When Victor questions her aberrant behavior, she replies that "the answer is there is no answer… when you think about it, there's no good reason to do anything. There is no point… people… don't want an orgasm as much as they just want to forget. Everything." (Choke 256-7). Clearly, life in the Baudrillardian void has taken its toll on this woman. Tracy ponders "Why do I do anything? …I'm educated enough to talk myself out of any plan. To deconstruct any fantasy. Explain away any goal. I'm so smart I can negate any dream." (Choke 257). She is the essence of Baudrillard's postconstructionist theory; in her, the text introduces an embodiment of hyper-intellectualism that has cut away all the joy, fulfillment, and meaning from life and reality and, subsequently, sees only a vacuum underlying all existence. Her nihilism leads into a quest for extrication from the ultimate emptiness and, thus, works as the catalyst for her sexual addiction. **She wants to find meaning and absolute reality but will always be forced, due to her intelligence and her deconstructive ability, to undermine the very goal she is trying to achieve**. For Tracy, **meaning is impossible not because it has objectively disappeared, but because she cannot accept simple truths or non-multiplicitous signifiers**. She thrives on the complexity of reality and, therefore, will never be satisfied by a simplistic interpretation, even if the simplistic interpretation is that for which she yearns. Through Tracy's unsatisfied, perpetually-wandering nature, the text puts forth the implication that 28 **maintaining such an unflinching post-constructionist mindset has no future other than disappointment, dysfunction, and existential despair**. Indeed, Choke implicitly attacks Baudrillard's

blasé acceptance of simulation and attempts to show the ramifications of such acceptance. Hence, **while the critical perspective from which Baudrillard's theory stems is akin to a scalpel, cutting deeper and deeper into the body of reality to reveal unending layers of nothingness, Choke advocates a return to a bandaged surface**; **it strives toward the revitalization of easily accessible signifieds,** and, thus, shuns Tracy's (see also Baudrillard's) system of thought that only seeks to forever prove the disappearance of meaning. Therefore, **the text is ultimately moving beyond Baudrillard by "emphasizing creation over destruction" and promoting the deemphasization of post-constructionist critical inquiry as a means of understanding reality** (Kavadlo 12). To further illustrate the resurrection of meaningful signifiers and images, the text introduces Denny, Victor's best friend. Denny is a recovering sex addict who, throughout the text, earnestly seeks rehabilitation. **As sex addictions in Choke seem to be symptomatic of a fatalistic surrender to the simulatory world, Denny is the one character who consistently seeks out a means of resistance**. Strangely enough, **this resistance takes the form of thousands of rocks**. As the novel progresses, Denny builds an enormous rock collection and, with those rocks, embarks on the construction of a mystery structure in an empty field. He enlists Victor's help and, when a local reporter comes to interview Victor and Denny about the construction project, Victor's responses are veiled in a haze of ignorance. Victor recalls the dialogue between himself and the reporter, saying that she asked: "'This structure you're building, is it a house?' And I say we don't know. 29 'Is it a church of some kind?' We don't know. …'What are you building, then?' We won't know until the very last rock is set. 'But when will that be?' We don't know." (Choke 263-4). Victor's reticence with the reporter is not due to any particular stigma or grudge against the media. Rather, his unforthcoming answers are a result of a new (or perhaps ancient) mode of perception and, thus, communication. Instead of focusing on the possibilities of the stone structure or its eventual outcome, Denny instructs Victor to focus on the process of building, alone. He says that "the longer we can keep building, the longer we can keep creating, the more will be possible. The longer we can tolerate being incomplete," the better (Choke 264). Initially, this statement appears to echo Baudrillard's sentiments, with a perpetual process of building that leads nowhere and creation that actually creates nothing. Yet, precisely the opposite is true. **By compelling the rock structure to remain a work-in-progress without a definitive end, Denny has squashed any simulatory nature the building may possess. He and Victor are not putting stones atop one another to create any of the long-mediated structures of society. The stone building is not a house or a church or any other structure of convention and, therefore, is not founded upon any previous referent.** Denny's rock building is not trying to simulate any other structure; **it is simply allowed to rise and become whatever it eventually becomes. With the stone structure, Denny is attempting to introduce a product that holds inherent, unmediated meaning**. **As soon as Denny or Victor would conclude that the building is a house or a church, then it would, necessarily, begin to take on aspects of those structures. It would begin to simulate a house or a church. But, by allowing the structure to grow almost organically, Denny has set the 30 groundwork for a signifier that may finally be connected with an inherent meaning, with a concrete undeniable reality**. The price for cultivating an unmediated, unsimulatory reality is high, however. Both Denny and Victor must discard the realm of speculation and conjecture. In order to maintain a sense of the real, all possibility outside a thing's readily apparent meaning must vanish. Denny and Victor do not know what the stone building will be because they don't want to know until it is finished. They choose a path of ignorance so that realness may reassert itself within the structure without being crushed by external mediated "reality." Basically, **Denny and Victor must become simple, single-minded individuals who have no need for multiplicitous signs and no desire for a constant outgrowth of discourse. Theirs is a reality that requires no mediation, no simulation, and, hence, no emptiness**. Such a lifestyle choice flies in the face of our contemporary world, where formulating variable meanings for signifiers and expanding the possible field of referentials for images is second-nature. **The very fiber of critical theory**, or of practically any academic discipline**, hinges on increased speculation, on infinitely sprawling discourses,** and on the complication of texts, signifiers, and reality itself. **Choke's solution for escaping Baudrillard's simulation is to escape that same incisively critical manner of thinking.** In doing so, Denny and Victor become primitive postpostmodern men. The duo simultaneously evolve and devolve communication; they usher reality back into a signifier but cause the collapse of complexity. Indeed, "many of the seemingly random transgressive acts perpetrated by the characters in Palahniuk's fiction," such as Denny and Victor's intentional ignorance, "fall within an understanding of entropy as a force for renewal and meaning" (Sartain 32). Thus, while Denny may 31 have set society on a course for a neo-stone age, his rock structure may actually be something that simply "is what it is." Victor's mother, Ida, is an individual who also manages to cut ties with simulation, but in a much different, and arguably more destructive, manner. Her perspective on reality, like the neo-primitivism of Victor and Denny, strives to attain communion with a long-lost realness. However, Ida takes a much more direct and assertive approach. She uses drugs to "simplify" her state of mind. As Ida explains, "Trichloroethane… All my extensive testing has shown this to be the best treatment for a dangerous excess of human knowledge" (Choke 148). She is attempting to clear away the debris of contemporary society's all-consuming media (and with it mediation and simulation) by chemically altering her consciousness, thus allowing her to ignore its multiplicity of disembodied voices and images that would, otherwise, crush her unmediated, individual perception of reality. Ida claims that she can see things as they truly are when she is on drugs. She says that the trichloroethane makes the world appear "without the framework of language. Without the cage of associations… without looking through the lens of everything she knew was true…" (Choke 149). Through her druginduced highs, Ida is stripping away mediation and, therefore, making simulation impossible. Without a vast body of mediated meanings to draw upon, Ida is forced to view the world as it actually is, in its simplest terms. She has rid herself of simulation and allowed realness to seep back into images. However, the reality is fleeting and dissipates back into the cacophony of Baudrillard's simulatory universe as soon as Ida is clean once more. Even worse, the constant drug use takes its toll on Ida; over the course of the text, she ends up with a perpetual bloody nose and, ultimately, is reduced to a 32 feeble, emaciated skeleton. Idea proves that, while escaping Baudrillard's simulation may be possible in a number of ways, the return to reality can come at an indescribably steep price. Ida is also critical to understanding Choke's postulation on the manner in which society may be galvanized into forsaking simulation. It is "Ida's ideology of adventure, her belief in the restorative power of chaos [that] serves to unbalance comfortable homogeneity. She… seeks to create meaning and potential for change through random chaotic acts" (Sartain 33). Ida vandalizes merchandise in stores, kidnaps children, and causes public disturbances all in the service of disrupting complacent adherence to mediated reality. She knows that "a fire alarm is never about a fire, anymore" and tries to disseminate this knowledge across society, albeit obliquely and illegally (Choke 161). **Ida challenges simulation by creating real panic and real**

excitement. **Her acts of destruction are aimed squarely at bringing a sense of reality back into a populace that, normally, experiences events and emotions in a heavily mediated environment**. Ida causes people to feel true fear, to experience events that are precisely what they appear to be: actual, unsimulated danger. However, there is no proof that Ida's regime of philosophy-based crime alters the perception or behavior of anyone but Victor over the long term. **For a brief moment, the victims of Ida's crimes may experience a true, unmediated, unsimulated event, but as soon as the danger has been resolved, the contemporary culture of mass media creeps back in and continues to suffocate with its hollow signifiers**. Therefore, **Ida's attempts to empower society may be entirely pointless**. **While her personal freedom from Baudrillard's simulatory world is assured, she cannot force others to choose the same path of informed, intelligible ignorance**. 33 Indeed, Ida's failure to enact social change exhibits the textual implication that **release from simulation must begin in the most intensely personal and introspective realms and radiate outward**. Perhaps meaning can be reconnected with images, but, as Choke demonstrates, **such reconnection must be instituted at the individual level long before it can solidify into an absolute reality upon which everyone agrees**. If Choke's resolution to the Baudrillardian dilemma seems somewhat perfunctory or abrupt, it would be in keeping with the theoretical concerns of the text. **In a simulatory reality, where all information is produced and mediated to individuals at a hyperkinetic speed, it would be logical for a solution or paradigmatic rebellion to arise just as quickly, given that this solution would still, necessarily, have a point of emergence within a system that is unable to slow the production of information, images, and signifiers**. Thus, the text's resolution – an idea that works as a competing perception of reality – appears as quickly and as suddenly as any other random image or information structure; the system of mindless, endless generation has unwittingly generated its own demise. That Choke ends without much exploration of its resolution to simulatory reality is also reasonable, given that such an open-ended future is antithetical to the very principle of Baudrillardian nihilism. **The text fights despair and a defeated acceptance of missing reality with unabashed romanticism.** With the novel ending shortly after the characters have lain in place their newfound adherence to knowing ignorance, the future is uncertain. Anything could happen to reality following the close of the text; **a reunion of images and meaning is as possible as the continuation of hollow simulation**. Victor and Denny's plan for identity-formation and reality-perception may lead to the eventual destruction of all simulacra or it may be entirely useless. The reader is left in a state of 34 unknowing, of hope for meaning-filled future. **Such a conclusion is impossible in a Baudrillardian scheme of reality. Under Baudrillard's critical eye, the world has reached a point where struggle against the forces of simulation is impossible. In Baudrillardian theory, there is no hope for the retrieval of meaning; rather, the process of simulacra will continue**, unabated. In answer to this bleak nihilistic view, Choke presents an open space, an ending that is more the beginning of a competing discourse than a summation of all that has come before it. **There is no definite success at the end of the text, nor is there assured defeat. The text's concluding indeterminacy, its allowance for hope, separates it from Baudrillard's nihilism and reinforces the supposition that escape from simulation is, in fact, possible**.

AT: plan = fear

Attributing causality to self-loathing is the worst 19th century biologism

Michael **Ure 12** – date inferred, political and social theory prof at Monash University, Resentment/Ressentiment, http://www.academia.edu/2434176/Resentment_Ressentiment

On the other hand, Nietzsche conceives **ressentiment** as symptomatic of **evolutionary degeneration, a widespread physiological disease**. For the sake of the species' health, he argues, we should eliminate the physiological disorders that underpin and explain the emergence of ressentiment If ressentiment is not eliminated, he claims, the species will continue its evolutionary degeneration. From our vantage-point Smith's Enlightenment faith in the ultimate compatibility between humanity's natural constitution and its moral and political progress may seem to carry too many traces of a now discredited faith in nature's purposiveness or teleology.24 Nietzsche famously identified himself as the first European thinker to properly de-deify nature, eliminating from his account of nature all teleological assumptions or explanations as metaphysical hangovers. He aimed to conceive humanity in strictly naturalistic terms. However, his alternative **naturalism is bound to an idiosyncratic version of nineteenth century Social Darwinism**. In the past decade there has been a renaissance of scholarly interest in Nietzsche's relationship to Darwinism and other contemporary evolutionary theories.25 This research has successfully challenged Heidegger's attempt to purge Nietzsche's philosophy of its "alleged biologism".26 In the recent debate most scholars agree that Nietzsche is a naturalist of one stripe or another, and the main interest lies in identifying his particular shading of nineteenth century naturalism.27 In this context Nietzsche's concept of the will to power has been conceived as neo Darwinian or as anti-Darwinian.2* I share the latter view that **Nietzsche** explicitly **targeted Darwin with his own purely speculative, if not blatantly fanciful biology**. Against Darwin **Nietzsche held** first that **healthy biological types seek to maximize** or expand **their power even at the cost of self-preservation** and that only sick biological types seek to preserve themselves; and secondly that the weak and sick preserve themselves far more effectively than the powerful largely because they emasculate or moralise the latter and in doing so prevent them from threatening their existence. Through the morality of ressentiment the weak become parasites sapping the vitality of the strong. If Nietzsche's view is true, then Darwin's notion of nature as a struggle for existence is merely a symptom of distressed life rather than a scientific account of nature.29 The point I wish to draw attention to here is that **this anti-Darwinian conception of nature only reinforced Nietzsche's idiosyncratic and extreme version of the social** Darwinist political view **we should exploit the weak, sick and dying so that higher types have the opportunity to** squander themselves or eliminate the weak if they threaten to impinge on these higher types' capacity for maximal self-expression. Arguably, Nietzsche's physiological theories and explanations do not de-deify nature, but demonise it with the "born misfit[s]", "cellar-rats" and "maggot' men of ressentiment. These two philosophical traditions confront us with the problem of how to distinguish between resentment and ressentiment Are they different shadings and evaluations of the same basic "unsocial passion" or are they concepts deriving from incommensurable conceptual orders? The primary aim of this paper is to clarify the nature of a now widely deployed distinction between resentment and ressentiment Since most defenders of resentment find Nietzsche's physiologically-based aristocratic radicalism disturbing and/or untenable they usually attempt to short-circuit any possible association between resentment and its Nietzschean incarnation, ressentiment? Often with the aid of moral sentiment theory they applaud resentment as a 'moral' emotion and condemn ressentiment as morally pernicious. By the same token, however, even its defenders concede that the 'virtue' of resentment may have the potential to become a pathological vice that undermines justice. The shadow of Nietzschean ressentiment still hovers over moral defences of resentment. "Resentment" as Margaret Walker acknowledges "embodies a sense of iault that can be difficult to dislodge, and one gripped by resentment may be far too disposed to find fault in others than to question whether his or her own resentment might be misplaced".31 Its defenders often reach for 'diabolical' metaphors to express resentment's tendency to exceed the agent's volition and remain impervious to apologies and other symbolic reparations.33 Once in resentment's grip we are sorely tempted to groundlessly blame others for our suffering and unjustly make them the objects of resentment. Resentment also carries the danger that agents see themselves as victims and identify the good with powerlessness, weakness and incapacity. The resentful are in danger of entrapping themselves in a victim-identity and enviously spoiling all forms of good fortune and human flourishing.34 If we can no longer rest content with Smith's natural theology to justify our confidence that ultimately resentment is a gift of providence that naturally tends towards justice and moral order, we need to carefully examine the social and psychological basis of these socalled 'pathological' expressions of resentment. How can we explain, for example, the compelling desire to unjustly and irrationally blame others for one's suffering? Why does such ressentiment continue to haunt resentment? **We require an account of reactive emotions that does not** hinge on Smith's natural theological faith in the moral sentiments or **fall into** Nietzsche's idiosyncratic and insupportable theory of **evolutionary degeneration**. **We do not want** our defence of resentment to rest on a hidden or implicit teleological assumptions or **our rejection of ressentiment to be based on insupportable physiological theories of moral judgement and action**. This paper addresses these issues by examining Nietzsche's concept of ressentiment It suggests that **under the rubric of ressentiment Nietzsche identifies** two distinct phenomena: **a physiological disease that finds alleviation through the mechanism of blaming others** and a form of

radical envy or envious hatred that deploys moral concepts and judgments in order to spoil others' good fortune and happiness.[35] Nietzsche's physiology of **ressentiment rests on untenable speculations and assumptions** he draws **from** his interpretation of contemporary theories of **evolution**. For the purposes of this essay Nietzsche's second concept of envious hatred is more promising for understanding of how resentment can become politically toxic.

AT: Speed K

Reject their theory of acceleration – we should pursue politics <u>in spite of speed</u> affirming the power of the citizen to reclaim the political

McIvor,**'11**

(David, Kettering Foundation, "The Politics of Speed: Connolly, Wolin, and the Prospects for Democratic Citizenship in an Accelerated Polity," Polity Vol. 43 No. 1)

In order to develop these habits, Wolin wants to direct attention away from the state and towards localities with their particularities, peculiarities, and irregularities. <u>On Wolin's reading, national politics is little more than a spectacle, and the citizen's role within **that spectacle is often only as "a rooter limited to choosing sides."88**</u> Localities, <u>on the other hand, remain venues that promise robust participation.</u> As individuals slowly develop the habits related to participation— interpreting and coming to know one's environment and its other inhabitants, its multiple histories and overlapping concerns—their very being changes. "<u>Politicalness" marks our capacity "to develop . . . into beings who know and value what it means to participate in and be responsible for the care and improvement of our common and collective life."89 By nurturing this politicalness we begin to feel a tug of loyalty towards a common reality that had</u> not heretofore existed. Wolin, in describing the early stages of the Free Speech Movement, referred to this experience as the "revival of a sense of shared destiny, of some common fate which can bind us into a people we have never been."90 Of course, these assemblages are subject to the same "thousand natural shocks" to which all flesh is heir. <u>Publics rise and fall; democratic moments remain momentary. Yet those who are honed by these experiences and who are dedicated to their recovery become what Wolin calls a "multiple civic self . . . **one who is required to act the citizen in diverse settings: national, state, city or town, neighborhood, and voluntary association."**</u>91 This is "perhaps the most complex conception of citizenship ever devised" yet "we have no coherent conception of it."91 The multiple civic self is not modeled along republican or representative lines, which reduce participation to occasional ratification or refusal, and which filter popular power through elite-managed institutions. Nor, however, is it based on the radical democratic conception of citizenship as direct sharing in power. <u>The complexities of what Wolin calls "the megastate" and the sheer size of the United States exceed what an Athens-styled radical democracy could manage. The multiple civic self is one capable of participating not simply in his/her locality but "intellectually and passionately in the controversies surrounding the megastate" in order to **"reclaim" public space and insist upon "widened debate."**</u>92 Wolin is not (only) a localist. Rather, <u>he thinks that the **skills** and habits best acquired by consistent participation in our particular localities lay the groundwork for a form of citizenship attuned to the plural layers of political action and struggle in late-modern America</u>. Moreover, the multiple civic self promotes the dispersal of power between local, state, and national bodies.93 Such diffusion re-establishes a separation of powers that forces slow-time negotiations upon the impatient megastate.94 <u>The slowly developed habits of participation make possible a more robust form of democratic citizenship and, perhaps, fugitive democratic moments</u>. These moments, in turn, can help to slow the world down. <u>Political theorists and social actors inspired by Wolin's example and worried about the inegalitarian consequences of social acceleration</u> should look to start from his (so far underdeveloped) idea of the multiple civic self. <u>Instead of refurbishing federal institutions or romanticizing the consequences of speed, we ought to attend primarily to what Wolin calls the "recurrent aspiration"</u> of democracy**: "to find room in which people can join freely with others to take responsibility for solving their common problems** and **thereby sharing the modest fate that is the lot of all mortals."**95 By **pursuing solutions to mutual problems through concerted action, we as citizens can hone the craft of democratic participation—broadening our notions of self and learning to honor the differences we encounter within a shared space.**96

at: politics is dead / depressing uq claim

Politics is still possible, they are just too stubborn to see it

Feit '12

(Mario, Assistant Professor of Political Science at Georgia State University, "Wolin, Time, and the Democratic Temperament," Theory & Event Volume 15, Issue 4, 2012)

But what if we reframed Wolin's problematic?4 Wolin asks an important question, namely, he invites us to think about the temporality of democracy and political theory. However, his question emerges in response—if not in reaction—to changing social facts, namely the faster pace of contemporary culture, economy, and perhaps even theory. Thus, Wolin proceeds from a negation, and is, as shall become clearer, delimited by this origin. Instead, I propose that the temporal orientations of democratic politics and political theory are better understood if we pursue the following questions: Why and how is democracy patient or impatient? Can and should political theory replicate democratic impatience? These questions are, I think, implicit in Wolin's essay on social acceleration. Wolin himself does not raise them, due to his focus on repudiating social acceleration and because his approach to political time does not distinguish between the world's pace—which may be expressed with the language of slowness or speed—and our temporal expectations about this world. This essay's conceptual language of patience and impatience is better suited to describing temporal expectations about the possibilities for political action. Indeed, to make patience and impatience front and center provides an opportunity to theorize democratic temporality in a positive fashion. Furthermore, this conceptual shift opens up Wolin's overall approach to democracy to considerations of democratic temporality. In fact, I argue that Wolin's conception of the demotic offers a democratic temporality that is fundamentally in tension with the one Wolin contemplates in his rejection of social acceleration. For patience emerges as an implicit temporal virtue in "What Time Is It?" and impatience as the corresponding vice, nurtured in part by social acceleration.5 I show that the demotic, on the other hand, would recommend impatience as a democratic virtue, that is, the demotic entails speeding up, not slowing down, politics. Returning to Wolin's problematic, social acceleration may in fact reshape contemporary politics in part because it is alluring to democratic citizens. Social acceleration may partially bring democracy in temporal sync with itself, even as it may complicate democratic politics in some of the ways sketched by Wolin.6 In recuperating democratic impatience, my argument disentangles the close temporal fit that Wolin posits between political theory and democracy. Patience may very well be critical for political theory—and philosophy, overall, as Wittgenstein might add. Wolin calls for such patience. That said, I show that his thinking about political temporality initially does not approach its subject matter with sufficient patience. He only develops the necessary patience as a result of interlocutors, who put critical pressure on his ideas. In other words, in part my argument illustrates that deliberative patience is still possible for political theory in the present, and that Wolin eventually displays such patience in his thinking about political temporality. Still, I also detect an impatience in parts of Wolin's argument, which is quite distinct from his rashness in his critique of social acceleration. I argue that Wolin's frustration with the Iraq war reflects a bubbling up of valuable demotic impatience. In other words, I distinguish more closely than Wolin between necessary theoretical patience, troubling theoretical impatience and beneficial demotic impatience that manifests itself within his political thinking.

Everything is awesome

Quality of life is skyrocketing worldwide by all measures

Ridley, visiting professor at Cold Spring Harbor Laboratory, former science editor of *The Economist*, and award-winning science writer, **2010**

(Matt, *The Rational Optimist*, pg. 13-15)

If my fictional family is not to your taste, perhaps you prefer statistics. Since 1800, the population of the world has multiplied six times, yet **average life expectancy has more than doubled and real income has risen more than nine times**. Taking a shorter perspective, in 2005, compared with 1955, the average human being on Planet Earth earned nearly three times as much money (corrected for inflation), ate one-third more calories of food, buried one-third as many of her children and could expect to live one-third longer. She was less likely to die as a result of war, murder, childbirth, accidents, tornadoes, flooding, famine, whooping cough, tuberculosis, malaria, diphtheria, typhus, typhoid, measles, smallpox, scurvy or polio. She was less likely, at any given age, to get cancer, heart disease or stroke. She was more likely to be literate and to have finished school. She was more likely to own a telephone, a flush toilet, a refrigerator and a bicycle. All this during a half-century when the world population has more than doubled, so that far from being rationed by population pressure, the goods and services available to the people of the world have expanded. It is, by any standard, an astonishing human achievement. Averages conceal a lot. **But even if you break down the world into bits**, **it is hard to find any region that was worse off in 2005 than it was in 1955**. Over that half-century, real income per head ended a little lower in only six countries (Afghanistan, Haiti, Congo, Liberia, Sierra Leone and Somalia), life expectancy in three (Russia, Swaziland and Zimbabwe), and infant survival in none. In the rest they have rocketed upward. Africa's rate of improvement has been distressingly slow and patchy compared with the rest of the world, and many southern African countries saw life expectancy plunge in the 1990s as the AIDS epidemic took hold (before recovering in recent years). There were also moments in the half-century when you could have caught countries in episodes of dreadful deterioration of living standards or life chances – China in the 1960s, Cambodia in the 1970s, Ethiopia in the 1980s, Rwanda in the 1990s, Congo in the 2000s, North Korea throughout. Argentina had a disappointingly stagnant twentieth century. But overall, after fifty years, **the outcome for the world is** remarkably, astonishingly, **dramatically positive**. The average South Korean lives twenty-six more years and earns fifteen times as much income each year as he did in 1955 (and earns fifteen times as much as his North Korean counter part). The average Mexican lives longer now than the average Briton did in 1955. The average Botswanan earns more than the average Finn did in 1955. **Infant mortality is lower today in Nepal than it was in Italy in 1951**. The proportion of Vietnamese living on less than $2 a day has dropped from 90 per cent to 30 per cent in twenty years. The rich have got richer, but the poor have done even better. **The poor in the developing world grew their consumption twice as fast as the world as a whole between 1980 and 2000**. The Chinese are ten times as rich, one-third as fecund and twenty-eight years longer-lived than they were fifty years ago. Even Nigerians are twice as rich, 25 per cent less fecund and nine years longer-lived than they were in 1955. **Despite a doubling of the world population**, even **the raw number of people living in absolute poverty** (defined as less than a 1985 dollar a day) **has fallen since the 1950s**. The percentage living in such absolute poverty has dropped by more than half – to less than 18 per cent. That number is, of course, still all too horribly high, but the trend is hardly a cause for despair: at the current rate of decline, it would hit zero around 2035 – though it probably won't. The United Nations estimates that poverty was reduced more in the last fifty years than in the previous 500.

Death & Suffering K's

AT: Relation to Death

they can't just wish this away modernity or how we relate to death --- multiplying the ways to relate to death makes people freak out more.

Mellor, 1992

(Phillip, Leeds Professor of Religion and Social Theory Head of School, "Death in high modernity: the contemporary presence and absence of death", The Sociological Review, May, ebsco)

The fundamentally discontinuist impulse of modernity is expressed in high modernity in the pervasiveness of 'reflexivity', the systematic and critical examination, monitoring and revision of all beliefs and practices in the light of changing circumstances (Giddens, 1990, 1991). Helmuth Schelsky created the term Dauerreflexion, meaning 'permanent reflection', to characterise the continuous examination of meaning and values which he observed in the modern consciousness (Schelsky 1965). Giddens's usage of the term 'reflexivity' is consistent with Schelsky's earlier conceptualisation of the systematically-questioning character of modernity. Dauerreflexion, or reflexivity, is chronic: it is a never-ending process of systematic and potentially radical reappraisals and reassessments of all aspects of modem life, calling everything into question, and undermining any certainty of knowledge so that it can be said that a major feature of high modernity is the pervasiveness of 'radical doubt' (Giddens, 1991:21). **Giddens argues that 'We are abroad in a world which is thoroughly constituted through reflexively applied knowledge, but where at the same time we can never be sure that any given element of that knowledge will not be revised** . (Giddens, 1990:39). Gehlen has also written of the constant scrutiny of, and reflection on, motives for action which are no longer located in transpersonal traditions, but in the isolated individual consciousness (Gehlen, 1956, 1957), signaling the same tendency towards insecurity which is at the heart of modernity. Despite Gehlen's generally pessimistic interpretation of the implications of modem reflexivity for the continuance of the social order as a whole, and for the psychological stability of the individual, a more positive interpretation is possible. A person's experience of this pervasive reflexivity, and its attendant risks, can be profoundly liberating and empowering, since there are considerable areas of opportunity available to her/him which would not have been so in the past. Lasch, for example, discusses the ways in which self-development programmes in the United States have encouraged older people to cut their ties with the past and embark upon new marriages, new careers and new hobbies (Lasch, 1991:214). Lasch offers a characteristically bleak interpretation of these activities, which he relates to the 'narcissistic' personality type (Mellor and Shilling, 1993), but it must be acknowledged that the people experiencing such changes in their lives may often find them profoundly empowering, and are often no doubt prepared to accept the so-called 'loss of community' which Lasch, and others such as Sennett (1974), envisage as the price for such empowenment of the individual. Nevertheless, it is hard to see how this reflexivity can ultimately help individuals deal with the phenomenon of death, since this is a universal parameter within which reflexivity occurs, rather than an object to which reflexivity can be convincingly applied. Although it could be argued that modem societies are culturally diverse, and exhibit a degree of flexibility which allows people to draw upon a variety of cultural resources in order to deal with death**, it could also be argued that this diversity compounds the difficulties individuals experience when death is encountered: reflexivity may be increasingly applied to death in a multitude of ways, but this multiplicity of particular approaches to death accentuates the reality-threatening potential of death in general**, i.e. as an unavoidable biological constraint upon various attempts at its cultural containment. **The more diverse are the approaches to death in modern societies, the more difficult it becomes to contain it within a communally-accepted framework, and thus limit the existential anxiety it potentially offers to the individual**. The apparent cultural diversity and flexibility in modern approaches to death can therefore be explained as being consistent with the sequestration of death from public space into the realm of the personal.4 This difficulty of reconciling the dominant reflexivity of high modernity with the brute fact of human finitude is particularly apparent if we relate them both to issues centred on questions of self-identity. These issues are of central significance in contemporary society because modernity has purchased increased control over life at the expense of communally constructed values (Weber, 1948), values being sequestrated from public space into the fragile sphere of the private (Gehlen, 1956, 1957; Bauman, 1989; Giddens, 1991). The concern for issues of self-identity apparent in high modernity is

the result of individuals, left alone to construct meaning in their lives, searching for meaning through the creation of a viable and stable sense of self (Sennett, 1974; Rose, 1989). Nevertheless, self-identity is also subject to the pervasive reflexivity of high modernity, so that it is created and maintained through the continual reflexive reordering of self-narratives (Giddens, 1991). Berger argues that 'the individual's own biography is objectively real only insofar as it may be comprehended within the structures of the social world' (Berger, 1967: 13), but he prioritises the idea that society assigns an identity to the individual. As Abercrombie notes, those critics who accuse Berger of neglecting social structure are wrong, since the conversation between the individual and social structure is entirely one-sided (Abercrombie, 1986:30). In high modernity, individuals must create their own identities, drawing upon the reflexive mechanisms and socio-cultural resources available to them, but ultimately having to take individual responsibility for the construction of meaning as well as the construction of identity. **In this context, death is particularly disturbing because it signals a threatened 'irreality' of the self-projects which modernity encourages individuals to embark upon, an ultimate absence of meaning, the presence of death bringing home to them the existential isolation of the individual in high modernity.** This idea of the privatisation of meaning, and the difficulties it creates for modem individuals attempting to deal with death, is borne out by a consideration of what are generally acknowledged to be the considerable changes in how people in Europe and North America have approached the phenomenon of death (Aries, 1974, 1981; Vouvelle, 1980; Turner, 1991). Death has gradually been removed from public space, where it was contained in communal, religious beliefs and practices (Aries, 1981), into the seclusion of the hospital (Illich, 1976; Huntington and Metcalf, 1979; Elias, 1985), where it has become a technical matter for medical professionals (Glaser and Strauss, 1968; Giddens, 1991). Funeral rites have similarly ceased to be a concern for the community as a whole, becoming a private matter for the family and friends of the dead person, again organised by a professional group of funeral specialists (Huntington and Metcalf, 1979). The reflexive deconstruction of communal frameworks for the containment of death has been so extensive that even when persons find themselves at funerals they are often unsure how to act or speak, because prescribed rites of mourning are often no longer available to them (Turner, 1991). As Elias expresses it, 'The task of finding the right word or the right gesture therefore falls back on the individual' (Elias, 1985:26). This point demonstrates how the sequestration of death from public space makes its presence in the personal sphere potentially commanding and threatening. Individuals are likely to experience the tension between the public absence and private presence particularly strongly when they find themselves alone with the task of not merely constructing meaning, but of even knowing how to act, when they are faced with the deaths of those they care about. Gehlen has coined the term Hand/ungsver/ust, the decline of the capacity to act, which he associates with the retreat into subjectivism attendent upon the deconstruction of tradition. Together with this deconstruction there is an increase in behavioural insecurity, psychological confusion, and a loss of the capacity to construct socially meaningful human reality (Gehlen, 1957; Zijderweld, 1986). The difficulties modem persons face when confronted with death otTer particularly strong supports for this aspect of Gehlen's conceptualisation of modernity. Nevertheless, the aloneness individuals experience when having to cope with the death of others, is perhaps even more intense when they themselves begin to die. As a result of the reality threatening power of death, and the increased vulnerability to this threat because of the reflexively-induced disorientations of high modernity, modem persons are increasingly reluctant to come into close contact with those who are dying (Elias, 1985). Since the maintenance of their self-identities is potentially undermined by the presence of death in others, this means that there is a tendency for all persons now to die in situations of unparalleled isolation. Death finds no easy, or generally accepted, place in the conceptions of reality generated by high modernity, and which individuals appropriate in their reflexive constructions of self-identity. Consequently, when death becomes startlingly real in the people around them, their desires for self-preservation encourage them to shut themselves off from those people who are dying; both spatially, sequestrating them in hospitals away from the public gaze, and emotionally, shunning physical contact and denying people the emotional interaction and support just when they are likely to need these things most. Thus, Elias's conception of the loneliness of the dying, the way modem social conditions foster feelings of solitude in those who are dying (Elias, 1985:85), can be extended to include a more general existential isolation encouraged by the reflexivity of modernity. The absence of death from public space makes its presence in private space an intense and potentially threatening one. **Because meaning has been so privatised, any attempts to construct meaning around death are now inherently fragile**. Even in the case of the hospice movement, whose development has clearly been part of an attempt to counter certain aspects of these trends, many of the features noted above are still evident. The hospice, like the hospital, remains an institutional expression of the modem desire to sequestrate death away from the public gaze, and individuals in them are still subject to the technical expertise of the medical profession in much the same way, despite the religious patronage of many hospices. Similarly, the location of the dying in a hospice rather than a hospital is unlikely to alter the discomfort of family and friends in the face of the reality of death which the dying temporarily embody. Death may be present in the hospice in a way that it is not in the hospital, but its presence remains a predominantly personally-located one. It is notable that the strategies for dying associated with the hospice movement, such as Kubler-Ross's (1970) various 'stages' in the psychological preparation for death, are directed towards individuals, encouraging them to construct some sort of individual awareness of the meaningfulness of their lives and deaths. They therefore offer nothing to counteract the widespread privatisation of meaning in high modernity which is the major source of many persons' contemporary difficulties in dealing with death.

Suffering kills Reflection

The aff turns the critiques impact and alternative – our impacts create intense suffering that kills reflective interpretations of death

(Richard White is associate professor of philosophy Creighton University "Levinas, the Philosophy of Suffering, and the Ethics of Compassion" The Heythrop Journal Volume 53, Issue 1, pages 111–123, Published online esept 27 2011, official publication date: January 2012, Wiley)

What is suffering? Suffering includes the extremity of physical pain, as well as the emotional anguish and spiritual despair which **every individual is bound to experience** at some point in her life. It has been suggested that **there is a significant difference between 'pain' and 'suffering'**, since the first is primarily 'physical' while the latter is basically 'mental'. As Eliot Deutsch comments: 'One has a pain or "that is painful", but "I am suffering". Where there is no ego there is no suffering – although there might be pain'.[9] Against this, however, the language of physical experience is often used to describe what Deutsch would regard as purely 'mental' aspects of suffering: This is why we express emotional suffering in physical terms; when we say that we are tortured by guilt, or burning with shame; or our heart aches because of something that happened. Indeed, it would not be surprising if every form of suffering, including those which are primarily 'spiritual' or 'emotional' had a physical correlate in the body itself – fear is both physical and mental, for example, and depression always has a somatic aspect. The upshot of all this is that it may be possible to understand the nature of suffering by **focusing on physical pain** as its most direct and unmediated form. – In suffering, we experience the **limits of self-assertion**, and the most extreme form of this is physical anguish, in which **the self is rendered passive and impotent** by the torment that ruins it as a subject. Herbert Fingarette puts this point succinctly when he notes that: '**To suffer is to be compelled to endure**, undergo, and experience the humbled will, rather than to be able to impose one's will'.[10] This means that the experience of suffering is the opposite of self-assertion and is **shot through with the will's experience** of impotence and limitation. Something like this is also the starting-point for Levinas's own account of what it is to suffer. In the course of several books and numerous articles, Emmanuel Levinas sketches the outlines of a phenomenology of suffering. Suffering is not always a central concern of his philosophy, but it is possible to reconstruct his basic view of suffering by examining comments drawn from several different texts. In Time and the Other, for example, Levinas announces that he will focus his remarks on 'the pain lightly called physical', for 'in it engagement in existence is without any equivocation'.[11] Once again, the point here is that physical suffering is the purest form of suffering since it completely overwhelms the sovereignty of the self and as such it is an experience without mediation. As Steven Tudor notes in his account of compassion and remorse: 'Many physical pains intrude so forcefully into one's consciousness that they impose their own significance which **no stoic attitude can alter** – that significance possibly being a pure sense of raging chaos that **obliterates all other matters of significance, so rupturing, so consuming is the pain'**.[12] Levinas also notes that in spiritual suffering it is still possible to preserve an attitude of dignity and distance from whatever affects one, and in this respect one remains independent and 'free'. Indeed, it can be argued that spiritual suffering is itself a kind of luxury that can only exist for as long as we are not disturbed by physical pain. As Levinas comments, from one perspective (which he refers to as 'socialism'), 'solitude and its anxieties are an ostrichlike position in a world that solicits solidarity and lucidity; they are epiphenomena – phenomena of luxury or waste – of a period of social transformation, the senseless dream of an eccentric individual, a luxation in the collective body'.[13] By contrast, physical suffering in its most extreme form **effaces subjectivity and all subjective attitudes**. For Levinas, physical suffering involves the 'irremissibility' of being and the absence of all refuge; in such pain we are backed up against being with no possibility of escape, and for this reason it provides the clearest, most unambiguous model for suffering in general. As Levinas notes, **significant suffering corrodes all the structures of meaning** that we project into the world; **it overwhelms all 'virility' – or the effort to be masters of our own fate** – until finally one is reduced to a state resembling helpless infancy: 'Where suffering attains its purity, where there is no longer anything between us and it, the supreme responsibility of this extreme assumption turns into supreme irresponsibility, into infancy. Sobbing is this, and precisely through this it announces death. To die is to return to this state of irresponsibility, to be the infantile shaking of sobbing'.[14] In her own account of torture in The Body in Pain, Elaine Scarry confirms this point, when she argues that more than resisting language, suffering and pain actively destroy language and all other meaningful projects, so that the subject reverts to 'a state anterior to language, to the sounds and cries a human being makes before language is learned'.[15] In this way, suffering is world-destroying. Indeed, to suffer greatly is to have one's world reduced to the content of one's pain. In the passage cited above, Levinas notes a connection between suffering and death. According to Levinas, the one announces the other: There is

not only the feeling and the knowledge that suffering can end in death. Pain of itself includes it like a paroxysm, as if there were something about to be produced even more rending than suffering, as if despite the entire absence of a dimension of withdrawal that constitutes suffering, it still had some free space for an event, as if it must still get uneasy about something, as if we were on the verge of an event beyond what is revealed to the end in suffering.[16] Extreme suffering involves complete passivity. In suffering we are subject to something which does not come from ourselves and which tends to undermine all meaningful structures of subjectivity. In this respect, suffering is the anticipation of death as the encounter with something that cannot be avoided or held at arm's length. Both suffering and death involve the end of mastery, and with each, the contents of consciousness are destroyed. In his collection of essays, At the Mind's Limits, Jean Amery, who was tortured by the Nazis, also seeks to articulate the strong sense of a connection between acute physical suffering and death. Speculating on the meaning of his own experience, he comments that Pain … is the most extreme intensification imaginable of our bodily being. But maybe it is even more, that is: death. No road that can be travelled by logic leads us to death, but perhaps the thought is permissible that through pain a path of feeling and premonition can be paved to it for us. In the end, we would be faced with the equation: Body = Pain = Death, and in our case this could be reduced to the hypothesis that torture, through which we are turned into body by the

other, blots out the contradiction of death and allows us to experience it personally.[17] In extreme physical suffering, such as the torment that Amery describes, the individual becomes purely a body, 'and nothing else besides that'. For as long as it continues there is no space for reflection; and this violent reduction to physical being is the most intense form of negation which seems to parallel the negation of death. Elaine Scarry agrees: death and suffering are 'the purest expressions of the anti-human, of annihilation, of total aversiveness, though one is an absence and the other a felt presence, one occurring in the cessation of sentience, the other expressing itself in grotesque overload'.[18]

Death = Social Meaning

Death has social meaning now—they over generalize-prefer this evidence because she actually talked to people for 10 years unlike Baudrillard and Bataille who never spoke to another person.

Bradbury, 1999

(Mary, London School of Economics social psychology PhD, Representations of Death : A Social Psychological Perspective, 189-197)

It is commonly accepted that contemporary death practices are perfunctory, empty and without old-style customary and ritual power. **I disagree. It is simply that we fail to see where our customs and death rituals are flourishing**. It appears that we are blind to our own cultural ingenuity, while **remaining locked into a collective nostalgia**. The following acts are significant social customs in contemporary Loudon: certifying and registering the cause of death, the viewing and embalming of the corpse, placing notices in papers, the funeral cortege, the cremation ceremony (when non-religious), the use of cards and letters of condolence and the sending of flowers. The following would appear to fit the description of ritual acts, although what makes a ritual authentic relies on the meaning extracted by the participants, not on the objects which are used as props: the funeral service, certain burial and cremation rites, some wakes and memorial services and personal rites centring on memorial objects. For many people in Britain today, death rituals do have an existential dimension. Indeed, for a lucky few the participation in ritual can afford the opportunity to transcend death altogether. The structure and lay-out of the funeral parlour and the crematorium, the black hearse, the show-room full of coffins and the touching epithets to be found in the book of remembrance all could be viewed as objectifications. expressed as part of the ritual process, of our representations of death as rebirth. However, as Moscovici (1984a) most certainly did not have custom and ritual in mind when he described the processes of objectification and anchoring it is possible that another process is at work, such as symbolization. Indeed, Joffe (1999) has noted that there is a great deal of overlap between objectification and symbohzation. Douglas (1966) states that, the modem Western world does not utilize or display neat patterns of pollution fears as the fabric of our society is too complex. However, it is possible to identify strange systems of belief that cluster around areas of ambiguity. These unfamiliar terrains are a source of ritual power. We have some less-than- fully rational feelings about the dead body, which is subject to strong pollution taboos. Precisely because of its decomposing and inert condition it is a singularly rich source for symbols. The things that we do to the body, such as dressing it, embalming it, en-coffining it, viewing it, cremating and/or burying it cannot be explained in purely rationalist terms. Harnessing our fears of pollution we make the corpse express our representations of life and death. So, **contemporary mortuary practices cannot be dismissed as some kind of ritual shadows**. We all race questions of mortality, whatever our culture. British representations of death are not only to be found in medical practice (science) or films, documentaries and newspapers (media), they also exist in our death customs and rituals. These customary and ritual acts are replete with meaning. They express our representations of death, serving as both vehicles of traditional representations and the means of effecting change. Like those of other cultures, the customs and rituals of our society are almost invisible and. for many, taking part in them can be a comfortable, almost mundane, experience. The purpose of all representations is to make something unfamiliar. or unfamiliarity itself familiar. (Moscovici 1984a: 25) The study of death would appear to provide an excellent opportunity for observing the processes whereby people make the unfamiliar familiar. What is unfamiliar about death is relatively obvious: the inert state of the body of a relative or patient: the body's remorseless change from human corpse to rotting carcass; the strange and unpredictable behavior of the grieving relative; the loss of family or friend or work roles. The list goes on. Almost everything about death seems unfamiliar. Probably this is true for all cultures. However, in the industrialized West, unfamiliarity is increased by two further factors. First, as I mentioned in Chapter 6, large numbers of the urban population are alienated from the natural world and do not often, if ever, see dying or dead animals. Second, the social organization of death is in the hands of a small group of professionals who guard their activities as jealously as the members of a medieval guild ever did. The representations we fabricate - of a scientific theory, a nation, an artefact, etc. - are always the result of a constant effort to make usual and actual something which is unfamiliar or which gives us a feeling of unfamilianty. And through them we overcome it and integrate it into our mental and physical world which is thus enriched and transformed. (Moscovici 1984a: 27) Moscovici also considered those things that are 'like us, and yet not like us*, such as the mentally ill and those from another culture. Moscovici suggested that those things that fail to become familiar are pushed aside and are likely to be endowed with imaginary, often negative- characteristics. This is typical of the 'unfamiliar'. Thus, the corpse and those who deal with it are marginalized and subject to negative and quite erroneous characterizations. Both the death work professionals and the next of kin are contaminated by their contact with the polluting corpse. Moscovici (1984a) dismissed three other 'traditional* explanations of why we create representations, one of which is that groups create representations to filter information from the environment and thus control individual behavior. While he acknowledges that mere may be a certain amount of truth in this, his dismissal of this extremely significant explanation may have been over-hasty. After all, it would appear to be one of the implicit working hypotheses of many anthropological texts. For example, Bloch and Parry (1982) argue that

the ritual celebration of death may be used to further those in power. This is doing more than just make the unfamiliar familiar. This theme of control can be seen to operate in modern society too. It is possible, for example, that the representation of the good medical death as painless was first created by doctors involved in a power struggle with the clergy at death beds during the nineteenth century. Medical practitioners continue to be involved in the promotion of the good medical death. This is to do with control, rather than with familiarization. As we would expect the dominant system into which the unfamiliar corpse and the recently bereaved are both integrated is that of the medical model. The unfamiliar corpse is anchored in medical knowledge. The dead body is treated much like a patient, the bereaved like the mentally ill. The classification and naming which is a sign mat anchoring has taken place is centred on medical descriptions of the cause of death. This in turn feeds into a discourse about whether the death was good or bad. There are other systems of classification. We also make use of age-old concepts of the sacred good death and the rebirth of the dying. When Moscovici first formulated the processes of anchoring and objectification he still had in mind the split between the reified world of science and the consensual world of common sense. Objectification, in particular, was envisaged as the process whereby intellectual ideas are made more concrete and physically accessible. Fortunately, the process of objectification still seems to make sense if we consensualize science. Once we have anchored a death into the context of medical science then we can objectify the death by delaying decomposition. To give another example: if we wish to construct the image of the medically controlled death it is possible to make this a physical reality by the application of fatal doses of opiates. Thus embalming and euthanasia become objectifications of our representations of the medical good death. Moscovici noted how we also objectify by means of language. The use of euphemisms and various labels peculiar to the funeral trade appear to fit this description. Embalming, for example, becomes 'hygienic treatment*. While I set out to discover our current social representations of death, at the outset I was not sure what form these representations would assume. However, the anthropological and historical literature had provided me with some ideas, namely, that societies tend to shape deaths into those that are good. bad. natural and unnatural. It appears that Bloch and Parry's (1982) prediction that ideas of regeneration and rebirth are more weakly stressed in an industrialized, individualistic society is correct. However, we still need to anchor unfamiliar death and in this book I have tried to show how age-old representations of the good. bad. natural and unnatural death continue to be utilized by professionals and bereaved alike. During the eighteenth and nineteenth century representations of dying changed along with medical innovations. Dying was increasingly viewed as a process that could be made painless through the application of powerful painkillers. Willi the development of a secular climate of opinion, however, not only did the manner of the good death change but also its meaning. In brief for many people it became profane. The good death was no longer concerned with the fate of the soul; it was concerned only with the character of the physical event. The medical notion of good death continues to be the dominant representation of good deaths and the hospital environment appears to provide the optimal degree of control. We can manipulate the lime, location and expression of death. So, with the exception of self-sacrifice or murder, medical science provides the best conditions for the human control and manipulation of the process of dying. Bloch and Parry (1982) suggest that the key to a good death is a sense of control. As it happens, the illusion of human control over life and death can be enjoyed from within the medical model and deaths that require some kind of medical intervention and/or hospitalization seem good candidates for becoming good deaths, as I found to be the case. The cause of death is of crucial importance to any type of good death because the type of disease has an impact on such factors as awareness, preparation and consciousness of the dying person. Managing to orchestrate a medical good death has become the concern of medical practitioners. However, as I mentioned earlier, this does not just influence the behaviour of medical personnel in the hospital, home or hospice. It has also influenced the behaviour of those deathwork professionals who deal with the corpse. The coroner, registrar and funeral director are all involved in a medical discourse about death that is partly concerned with presenting the image of the painless, sleep-like death. Deaths that do not conform to this stereotype - the bad medical deaths and particularly those that do not produce a reposeful corpse (Prior 1989: 160) - galvanize the death-work professional into hiding or disguising the facts of the death (Bradbury 1996). This professional good practice is justified as being a way of protecting the bereaved. The professional's image of the bereaved, whose grief is potentially 'pathological", is engendered by the application of a medical model to grief as well as to the medical good and bad deaths. In a reaction against a perceived excess of medical intervention in the process of dying, the term 'natural death" has recently enjoyed a comeback. While coroners" courts have been using the expression for some time, talk about dying 'naturally* was unfashionable during the modem era. With increasing longevity and changing death trajectories our conceptions of a good way of dying are being revolutionized. Rejecting scenarios that seem depersonalizing and over-medicalized. people are now exploring 'new* ways of dying. From the start the natural death movement cannily anchored itself in people's consciousness by affiliating itself with a very successful representation (and movement): the natural birth movement. There are many differences between giving birth and dying and the affinity between the two does not stand close scrutiny. Yet the use of the title worked and everyone, particularly the media, knew exactly what the movement's leaders were saying. Moscovici described two roles of representations. The first is that they 'conventualise the objects, persons and events we encounter" (1984a: 7). The grouping of these objects, persons and events into models helps to structure an otherwise chaotic universe. So death is conventualized by the representations we have formed about the dead body and the grieving relative. The second is that they are prescriptive, 'that is, they impose themselves upon us with an irresistible force" (1984a: 9). Examples of the prescriptive nature of our representations of death abound. In our moment of deepest grief we warmly thank the doctor and are meticulously careful to be compliant, polite and composed. We find ourselves describing the deaths of our loved ones as good, although we are hard put to find a reason. Thus calling a death good or bad may not be about believing it is either good or bad, but simply gives the survivors a socially acceptable handle on tins most taboo of topics. As Moscovici notes: By setting a conventional sign of reality on the one hand, and, on the other, by prescribing through tradition and age-old structures, what we perceive and imagine, these creatures of thought, which are representations, end up by constituting an actual environment. (Moscovici 1984a: 12, original italics) Thus the anchoring of death as good or bad in sacred, medical or natural terms confines the participants to a pattern of behaviour and rules. Clearly the representation of the good or bad death is the concern of the living, yet it constrains those same people when it is their turn to die. I do not wish to suggest that this representation of death is used cynically by the professionals. They genuinely believe they are making life easier for the bereaved. Discussions by death-workers of their own experiences of bereavement suggest that they use the same representations of the good death when they lose someone they love. Significantly. I found that they appear just as vulnerable to conflict with those in control as the non-professional bereaved (Goffinan 1959). We also compete and argue. I agree with Billig (1986) in his call for the merging of the theatre and game metaphors. As I hope will have become apparent in Chapter 6. The discourse about the good and bad death is 'argumentative'. As Moscovici (1984a) notes, when one person's classification of an object or an event is imposed on another's they convey a bundle of expectations as to how the other person should respond. There is no guarantee that the other person will agree. I found that the bereaved kin were not at all passive about classifying their partner's death as good or bad and they certainly do not always share the same representation as the deathwork professional. We can observe a tussle for power in those instances where the bereaved's representations of death are not in accordance with those of the professionals". We might imagine that the outcome of such negotiations or arguments would be predictable, given that the professional is usually in a position of power over their bereaved client. Yet I found that despite their distress, families stubbornly resist the constraints imposed by the professionals and the professionals" personal representation of the death, and still manage to win the day by reinstating their own personal representations after the disposal of the body. We should be wary of constructing 'definitions" of the good death. Given the popularity of the good death in literature of the social sciences (Aries 1974,1933; Beier 1989; Bradbury 1993a. 1996; Kellehear 1990; Sanierel 1995; Small 1993; Walter 1994) it ts possible that the lay population will appropriate, and in the process distort, mis 'scientific knowledge" about the good and bad ways of doing a death. Re-presenting the healthy grief Just as the medical model dominates our representations of the good and bad death, I have argued that grief has been similarly medicalized. For decades psychologists have viewed grief as the archetypal individual experience. Counsellors, therapists, journalists and the bereaved themselves have been looking for symptoms, stages and outcomes which they believe to be concrete phenomena, like a tumour or a fracture, rather than a social representation of loss. The anchoring of bereavement in the grief reaction simultaneously constrains the sorrowful person and reassures the observer about all those chaotic and unknown becomes the known, belonging to a category and with a familiar set of characteristics. The psychiatric and psychological research into grief lias failed to appreciate the social nature of grief as mourning individuals battle to rebuild their damaged selves. I found mat my respondents had a notion of grief as something mat might turn into a life-tlireatenmg disease. These women did not have to be apprenticed into knowing about this representation, for it permeates our popular culture. So just as I tapped into the representations of good and bad deaths as salient features in the interviews themselves, the psychiatric and psychological research into the grief reaction, discussed in the last chapter, tapped not the reality of grief as a disease but social representations of grief as a disease. Representations, however, have a habit of becoming realities. These studies remain fascinating and important, even though the psychiatrists and psychologists conducting them did not discover what they thought they had. The use of quantitative research tools, in which the researcher sets the agenda, may have obscured the process of re-presentation. It has been argued that the postmodern era, which has been developing at some pace over the last few decades, represents a chance for the re-enchantment of society, a welcome return of the 'subject* (Bauman 1992b). However, there are problems associated with this. As Bauman notes 'the post-modem mind seems to condemn everything, propose nothing'

(1992b: 9). The wholescale demolition and deconstruction of our modem and objective view of the world can engender fear of the void. Thus we attack the medical model and dismantle the safe, reassuring descriptions of the stages of dying, the good medical death and healthy grief and in their place seem **to leave nothing but variety and choice**. Incoherence seems to be postmodernism s distinctive feature. **Bauman would argue that we are tearing down the power- supported structure of the modem era, the false truths that were constructed out of a desperate search for structure and order that followed on the heels of the Renaissance**. **But this does not lessen those private fears which are expressed in the contemporary mania for the DIY solutions** poignantly illustrated by the natural death movement, in which dying individuals are encouraged to 'take on' their own deaths and to draw comfort from the imagined community of fellow natural death supporters. Death is a physical event that turns the subjective self into an objective other and for this reason represents something of a challenge to our conception of this brave new world. My exploration of contemporary deathways revealed them to be both traditional and innovative. With apparent ease we seem to be able to accept both continuity and change, that fine balance which enables us to draw an embalmed corpse on a horse-drawn hearse to the local crematorium for a service with a priest. Despite the rapid rate of change over the past couple of centuries there seems little sign that our belief in immortality has been genuinely deconstructed, thus causing an over-emphasis of the here and now which is so often described as a sign of postmodernisni's holdover us (Bauman 1992b). There is little that is either 'ephemeral* or 'evanescent* about planting a tree or erecting a headstone (Bauman 1992b). Many of the social representations of death and the customs and rituals which express them do act as a balm to the survivors. These funerals are rites of passage which send our loved ones to the other world. There is symbolism to gather by the arrnful if we only know where to look: the floral tribute that shouts' FOREVER"; the kitsch condolence card bedecked with doves; the visit to the funeral director's chapel to see a corpse pumped full of formaldehyde; the poem recited on a favourite hilltop as the wind catches the ashes as they are poured from their urn; the dedicated bench in the park**. The British way of death cannot be explained away in terms of mindless tradition, the dominance of the medical profession or the seductive force of consumerism. These acts are full of the meanings of love, life and the hereafter.**

AT: Symbolic Value

No link---death's symbolic value <u>does not deny the value of life</u>---the option to continue living should always be available

Kacou 8

I. What we mean (in more detail) Regardless of whether or not we find that it is the "fundamental question" of philosophy,[8] we can see that judging whether life is or is not worth living is, in one sense at least, when understood with a general character, a fundamentally philosophical question. The question calls on the living individual to make a value judgment (which seems of the most serious extent) about the condition it most basically, most generally, and in a sense most intimately, "finds itself" in—and in this sense, the question must be seen as a "personal" one.[9] But the judgment called for only becomes especially interesting for philosophical exercise once we attempt to make it "objective," so to speak. On the one hand, from a "subjective" point of view, the question whether life is or is not worth living reduces simply to the question whether or not—or how—we the living already in fact, in our variable situations, desire or not to live. Its answer is a function of descriptions of motivational dispositions as they may vary from individual to individual and circumstance to circumstance. (For instance, some may find certain cases of euthanasia justified, or find certain forms of suicide honorable.) In other words, from a subjective point of view, the answer would simply be that life is worth living to the extent that, while we could have a different attitude, we just happen to want it (to be disposed towards it), perhaps in light of circumstantial considerations. And, thus, the question could be quickly addressed in some cases, without much need for philosophical inquiry—except perhaps on collateral issues. Similarly, typical answers referring simply to how "fun" or "beautiful" life is, or (perhaps the contemporary scientist's favorite) how "fascinating" or "mysterious"—these answers are, as stated, inadequate for our purposes, to the extent that they are primitive (uncritical) generalizations expressing our preexisting desire for (or infatuation with) life. On the other hand, from a point of view that purports to be "objective," we must have a more complex approach. We must "problematize" the value of life in general. The question is not simply whether (or how, or even why in the broad sense of an explanation) we happen to desire or not to live, but rather whether (or why in the narrow sense of a justification) we should or should not ever desire to live in the first place. a. The objective approach In seeking a justification, we must look, beyond the mere "freedom" (or given-ness) of any primitive desire, for something like a final "authority" that we could show through some fact or logical inference[10] to make us "right" (i.e., as a matter of reasoning) to have such a desire. In other words, we must try to present life as being instrumental or not to some uncontested value (or purpose)—and, thus, as either "useful" or "futile." In this sense, the word "meaningful" (pertaining to life) would be basically synonymous with the word "useful"—a relation between objects and moments, on the one hand, and how what we value can be served, on the other hand. In addition, we do not look for conditions that would sustain or increase the value of a proposed venture; we look for a demonstration that the venture can have any value. Accordingly, in order to find the objective position, we must avoid in our picture of life or death any variable circumstance that could be taken to make either one of them arbitrarily more or less attractive or pursuable. Furthermore, any description of how we desire to live

may well entail conditions under which we would not prefer to live. But **even if such conditions exist**, it does not necessarily follow that life is without value when those conditions prevail. Indeed, by analogy, that we would prefer ten dollars to five dollars if we could choose does not mean at all that the five dollars would then have no value. Other example: that we would happily accept an ice cream cone if it were free but refuse it if we had to pay for it does not mean at all that ice cream has no value to us. The distinction can be expressed as follows: the value of ice cream in light of its cost, we call its a posteriori value; the value of ice cream irrespective of its cost, we call its a priori value. What we seek in this inquiry is the **a priori value of life-as-such**—the value that subsists in, or is essential to, or is the initial value in, **any life**, **irrespective of its circumstances**, including, to any extent possible, any explanation for its existence.[11] (The objective question calls for an a priori answer.) In contrast, we are not interested in questions such as whether seppuku is honorable or how end-of-life decisions should be made. (The subjective question, the question of circumstances and the a posteriori answer coincide.)

Life = Pre-requisite

Life is a pre-requisite to death's symbolic value---fearing death doesn't preclude recognizing life's finitude and its inevitability---we can still create provisional value in life---individuals should have the option to live

Kalnow 9

(Cara Kalnow 9 A Thesis Submitted for the Degree of MPhil at the University of St. Andrews "WHY DEATH CAN BE BAD AND IMMORTALITY IS WORSE" https://research-repository.st-andrews.ac.uk/bitstream/10023/724/3/Cara%20Kalnow%20MPhil%20thesis.PDF)

(PA) also provided us with good reason to reject the Epicurean claim that the finitude of life cannot be bad for us. With (PA), we saw that our lives could accumulate value through the satisfaction of our desires beyond the boundaries of the natural termination of life. But Chapter Four determined that the finitude of life is a necessary condition for the value of life as such and that many of our human values rely on the finite temporal structure of life. I therefore argued that an indefinite life cannot present a desirable alternative to our finite life, because life as such would not be recognized as valuable. In this chapter, I have argued that the finitude of life is instrumentally good as it provides the recognition that life itself is valuable. Although I ultimately agree with the Epicureans that the finitude of life cannot be an evil, this conclusion was not reached from the Epicurean arguments against the badness of death, and I maintain that (HA) and (EA) are insufficient to justify changing our attitudes towards our future deaths and the finitude of life. Nonetheless, the instrumental good of the finitude of life that we arrived at through the consideration of immortality should make us realize that the finitude of life cannot be an evil; it is a necessary condition for the recognition that life as such is valuable. Although my arguments pertaining to the nature of death and its moral implications have yielded several of the Epicurean conclusions, my position still negotiates a middle ground between the Epicureans and Williams, as (PA) accounts for the intuition that it is rational to fear death and regard it as an evil to be avoided. I have therefore reached three of the Epicurean conclusions pertaining to the moral worth of the nature of death: (1) that the state of being dead is nothing to us, (2) death simpliciter is nothing to us, and (3) the finitude of life is a matter for contentment. But against the Epicureans, I have argued that we can rationally fear our future deaths, as categorical desires provide a disutility by which the prospect of death is rationally held as an evil to be avoided. Finally, I also claimed against the Epicureans, that the prospect of death can rationally be regarded as morally good for one if one no longer desires to continue living. 5.3 Conclusion I began this thesis with the suggestion that in part, the Epicureans were right: death—when it occurs—is nothing to us. I went on to defend the Epicurean position against the objections raised by the deprivation theorists and Williams. I argued that the state of being dead, and death simpliciter, cannot be an evil of deprivation or prevention for the person who dies because (once dead), the person—and the grounds for any misfortune—cease to exist. I accounted for the anti-Epicurean intuition 115 that it is rational to fear death and to regard death as an evil to be avoided, not because death simpliciter is bad, but rather because the prospect of our deaths may be presented to us as bad for us if our deaths would prevent the satisfaction of our categorical desires. Though we have good reasons to rationally regard the prospect of our own death as an evil for us, the fact that life is finite cannot be an evil and is in fact instrumentally good, because it takes the threat of losing life to recognize that life as such is valuable. In this chapter, I concluded that even though death cannot be of any moral worth for us once it occurs, we can attach two distinct values to death while we are alive: we can attach a value of disutility (or utility) to the prospect of our own individual deaths, and we must attach an instrumentally good value to the fact of death as such. How to decide on the balance of those values is a matter for psychological judgment.

Maintaining the conditions of possibility for life is a prerequisite to ongoing experiences with death

Lawtoo 5

(Nidesh Lawtoo 5, Dept of Comparative Lit, U Washington, Bataille and the Suspension of Being, linguaromana.byu.edu/Lawtoo4.html)

Bataille's notion of communication involves a dialectic with two positives (hence a non-dialectic) where two sovereigns confront death not in view of an end but as an end in itself: "confronting death," in fact, "puts the subjects at stake-"l'être en eux-mêmes [est] mis en jeu" (Sur Nietzsche 61). Further, Bataille affirms that "[p]ersonne n'est-un instant-souverain qui ne se perde" (OC VIII 429). It is the Nietzschean self-forgetfulness that is here evoked; a self-forgetfulness which implies a transgression of the limits of both communicating subjects. Again, for Bataille "[l]a 'communication' n'a lieu qu'entre deux êtres mis en jeu-déchirés, suspendus, l'un et l'autre penchés au-dessus de leur néant" (Sur Nietzsche 62). However, if according to Nietzsche, self-forgetfulness takes place in solitude, for Bataille it **necessitates the presence of an "other."**(5) Communication in fact, asks for "deux êtres mis en jeu" who participate in what he defines as "une fête immotivée" (Sur Nietzsche 31). There the sovereign loses himself (se perde) with the other, through the other, in the other, in a process of "mutual laceration" (Essential 105) which is simultaneously tragic and ludic. The emphasis on the other is Hegelian, but unlike dialectics, communication does not confront the subject with an object (Gegen-stand, something that stands against the subject). As Bataille puts it (apparently echoing Baudelaire), communication takes place with "un semblable," "mon frère" (OC VIII 289). And he adds: "Cela suppose la communication de sujet à sujet" (OC VIII 288). Bataille's notion of communication is not based upon a "violent hierarchy" (Derrida's term) but rather upon egalitarianism. Moreover, transgressing the limits of the subject implies that the two subjects already possess (in potential) the characteristics of sovereignty. Hence, **the status of sovereign is not achieved as a result of a fight to the death, but requires the subject to be open to an other** who is outside the limits of the self.

Derrida speaks of the "trembling" to which Bataille submits Hegelian concepts (253). This trembling, I would argue, has its source in Nietzsche (6): "The figs fall from the trees" says Zarathustra, "they are good and sweet, and when they fall, their red skins are rent. A north wind am I unto ripe figs" (qtd. in Philosophy 135). If we apply this passage to Bataille's philosophy, we could say that inherent in this "fall" is an explosion of Hegelian concepts, and in particular, as we have seen, the notion of Herrshaft. Further, communication, for Bataille, involves a similar "fall" which rents (déchire) the skin of the subjects (their limits) exposing the red flesh which lies beneath the skin. According to the French philosopher, Nietzsche's critique of the subject is more radical than Hegel's, since, as he puts it in "Hegel, la mort et le sacrifice," Hegel's philosophy, and I would add Kojève's interpretation of it, is "une théologie, où l'homme aurait pris la place de Dieu" (OC XII 329). Hegel's "theology" preserves the identity of the subject. Now, Bataille makes his position to this "theology" clear as he writes: "I don't believe in God-from the inability to believe in self" (Essential 10). By establishing a direct link between the death of the subject and the death of God, Bataille extends his critique of "beings" into the larger, ontological, critique of "Being." Implicit in this theoretical move is the articulation of the ontology of sovereignty. Bataille's philosophy is Nietzschean insofar as it is grounded in experience and in the immanence of the body. Communication, for Bataille is first and foremost a bodily affair. Hence the interrogation of the limits of the subject starts from an interrogation of what we could call the "gates," or openings of the body: the mouth, the vagina, the anus and the eyes are for Bataille central places for philosophical investigation because at these gates, the integrity of the subject is questioned; its limits can be transgressed. They are spaces of transition where a "glissement hors de soi" (OC VIII 246) can take place. These bodily openings, which Bataille also defines as "blessures," (Sur Nietzsche 64) found his conception of the sovereign subject. In fact, each "blessure" can be linked to a specific dimension of communication which obsesses Bataille. His central themes match different bodily openings: the mouth connects to laughter; the vagina to eroticism; the eyes to tears; the anus to the excrements which he links to death. Through these openings the subject is traversed by different fluxes and its integrity, totality and stability is challenged. They allow for the possibility of a glissement of the subject's being. The same could be said of Bataille's corpus: it is a unitary entity, which, like a body, escapes the totalizing temptation of closure. Despite the fact that Bataille defines sovereignty in terms of the Kojèvian/Hegelian "nothingness" (Bataille's Rien), his conception of communication is built upon the Nietzschean ontological distinction between the Dionysian and the Apollonian. In fact, the ontological movement that takes place in communication "exige que l'on glisse" (OC VI 158) from an "insufficient" and "discontinuous" being to a reality of "continuity" that transcends binary oppositions (Erotism 13-14). To put it more simply, communication introduces a movement from the "many" to the "One"; from a "discontinuity of being" to a "continuity of being;" from separate "beings" to a common ontological ground ("Being"). The source of Bataille's ontology is clear: it stems from Nietzsche's The Birth of Tragedy which in turn, is construed upon Schopenhauer's distinction between will and representation. "As a sailor sits in a small boat in a boundless raging sea," writes Schopenhauer," surrounded on all sides by heaving mountainous waves, trusting to his frail vessel; so does the individual man sit calmly in the middle of a world of torment, trusting to the principium individuationis" (Birth 21) .(7) Communication, for Bataille, as the Dionysian for Nietzsche, involves the shattering of the principium individuationis, a tearing down of the veil of Maya which constitutes, what Bataille calls, with a blink of the eye to Schopenhauer, the "illusion of a being which is isolated" (Essential 10; my emphasis). Communication, thus, involves an opening of the subject to the larger ground of Being. The sovereign's boat is constantly leaking. Yet, in order for communication to take place, the boat needs to keep floating. That is to say that **for transgression to take place, the limits of the subject need to be preserved** (Erotism 63; Foucault 34). The being of the sovereign subject is suspended upon the abîme-what Bataille also calls "une réalité plus vaste" (OC II 246)-which means that the subject neither dwells safely within the limits of the "small, insufficient boat" of individuation, nor within the depth of the undifferentiated "raging sea," but in the space of contact in-between the two spheres. This precision is key in order to delineate the originality of Bataille's ontology of sovereignty. Bataille's conception of the communicating subject (i.e., of sovereignty) walks a thin line between its self-dissolution and its self-preservation. **Hence the idea that he is above all a thinker of limits** or borders. The sovereign's being, in fact, is "suspended" on the "bord de l'abîme" (Coupable V 355) **but never actually falls**, except, of course, in death. Hence, for Bataille, "[i]l s'agit d'approcher la mort" [it is approaching death] that is to say, the abîme, or the continuity of being, "d'aussi près qu'on peut l'endurer" [as close as one can endure] (337-338). The sovereign subject **confronts death while preserving his life.** His being is placed at the border between life and death. Hence, if Bataille defines philosophy as "existence striving to reach its limits" (Essential 146), it should

be specified that the being of the subject is not found beyond its limits, as his use of "existence" seems to suggest (Ek-sistenz) since that would imply a total dissolution of the subject. Bataille's philosophy of **transgression implies the preservation of the limits of the subject so that the sovereign can experience and endure death in life** The tension between self-expenditure (Nietzsche's Verschwendung) and self-preservation (linked to Hegel's Anerkennung) is analogous to the movement of a moth that is first attracted by the fire of a candle and subsequently distances itself from the fire in order to preserve its life.(8) This repeated back and forth movement recapitulates the movement of communication and is responsible for the underlying tension which traverses Bataille's philosophy. It is an inner (bodily) drive that attracts the moth to death and not, as it is the case for Hegel's master, a reasoned project in view of an end (recognition). The moth's self-sacrifice, in fact, is perfectly useless (it serves no purpose) and hence is truly sovereign. Bataille would call it "une négativité sans emploi." Or, as he says with respect to eroticism in his first and last interview before he died, "it is purely squandering, an expenditure of energy for itself" (in Essential 220). This movement forwards, towards the flame of self-dissolution (which takes place in death, eroticism, laughter...) and its retreat backwards, towards life and the limits it involves, epitomizes Bataille's notion of communication. A practice which for Bataille seems to have the characteristic of a fort-da game in which the subject is not in control of the movement. This movement, Bataille writes in the Preface to Madame Edwarda, happens "malgré nous" (III 11). Thus conceived the sovereign accepts the place of a toy in the hands of a child playing-a definition similar to Heraclitus' vision of life, which he defines as "a child at play, moving pieces in a game (Fragment 52, in GM 149). This view of communication is both tragic and joyful; violent and useless. A joyful tragedy, which challenges the limits of the subject; that puts the subject's being en jeu. If Bataille is deeply fascinated by death, decay and the dissolution of the subject in a continuity of being, **he escapes the temptation to embrace death at the expense of life**. His definition of eroticism sums up this fundamental tension: "Eroticism," he writes, "is assenting to life up to the point of death" (Erotism11). This applies not only to eroticism but also to all communicating activities such as laughter, play, tears, and ultimately to the ethos that sustains the totality of Bataille's philosophy. If Kojève defines dialectics as a "negating-negativity" (5), Bataille's communication can be read as an affirmative negativity. In fact, death is confronted and even invoked**, but what is found in death is the ultimate affirmation of life.** Negation of the integrity (the limits) of the subject leads to a **radical affirmation of life.** And if in the Preface to Madame Edwarda, Bataille can affirme "l'identité de l'être et de la mort" (OC III 10), let us also note that **the identity of being and death is realized in life.** Faithful to Nietzsche, Bataille does not become a negator of the will; a negator of life; a pessimist, a Buddhist or worse, a nihilist (some of the derogatory terms used by Nietzsche to retrospectively define his first and last master). **Bataille remains truthful to life**. While the ontological premises grounding sovereignty are taken from Schopenhauer (via Nietzsche), Bataille's conclusions are diametrically opposed to Nietzsche's first master. In fact, Bataille's philosophy can be seen as an affirmation of the will (he operates an inversion of values) through Dionysian practices (included sexuality which Schopenhauer condemned) that put the subject in touch with the ultimate ground of being, **without dissolving him/her in it**

Alt = Obsession

Trying to find the truth in death causes eternal obsession – it's not productive criticism

Dollimore, Sussex sociology professor, 1998

(Jonathan, Death, Desire and Loss in Western Culture, pg. 221)

Occasionally one wonders if the advocates of the denial-of-death argument are not themselves in denial. They speak about death endlessly yet indirectly, analyzing not death so much as our culture's attitude towards it. To that extent it is not the truth of death but the truth of our culture that they seek. But, **even as** they make death signify in this indirect way, it is still death that is compelling them to speak. And those like Baudrillard and Bauman speak urgently, performing intellectually a desperate mimicry of the omniscience which death denies. One sense that the entire modern enterprise of relativizing death, of understanding it culturally and socially, may be an attempt to disavow it in the very act of analyzing and demystifying it. Ironically then, for all its rejection of the Enlightenment's arrogant belief in the power of rationality, this analysis of death remains indebred to a fundamental Enlightenment aspiration to mastery through knowledge. Nothing could be more 'Enlightenment', in the pejorative sense that Baudrillard describes, than his own almost megalomaniac wish to penetrate the truth of death, and the masterful controlling intellectual subject, which that attempt presupposes. And this may be true to an extent for all of us, more or less involved in the anthropological or quasi-anthropological accounts of death which assume that, by looking at how a culture handles death, we disclose things bout a culture which it does not know about itself. So what has been said of sex in the nineteenth century may also be true of death in the twentieth: it has not been repressed so much as resignified in new, complex, and productive ways which then legitimate a never-ending analysis of it.

Survivalism First

Survivalism must be unconditional—it's a prerequisite to all ethics and values

Hägglund 8

(Martin, Fellow in Comparative Literature at Cornell University, "Radical Atheism: Derrida and the Time of Life" google books)

In the preceding chapters I have demonstrated how Derrida's work offers powerful resources to think life as survival and the desire for life as a desire for survival. I have argued that every moment of life is a matter of survival because it depends on what Derrida calls the structure of the trace. The structure of the trace follows from the constitutive division of time. Given that every moment of life passes away as soon as it comes to be, it must be inscribed as a trace in order to be at all. The tracing of time enables the past to be retained and thus to resist death in a movement of survival. However, the survival of the trace that makes life possible must be left for a future that may erase it. The movement of survival protects life, but it also exposes life to death, since every trace is absolutely destructible. I have argued that such radical finitude is not a lack of being that it is desirable to overcome. Rather, the finitude of survival **opens the possibility** of everything we desire and the peril of everything we fear. The affirmation of survival is thus not a value in itself; it is rather the **unconditional condition** for **all values.** Whatever one may posit as a value, one has to affirm the time of survival, since without the time of survival the value could never live on and be posited as a value in the first place.

In this final chapter I want to elaborate how **the unconditional affirmation of survival** allows us to rethink the condition of political responsibility and especially the desire that drives political struggle. I will argue that **the radical finitude of survival** is not something that inhibits responsibility and political struggle; **it is rather what gives rise to the**m. If we were not exposed to the coming of a future that could violate and erase us there would be nothing to take responsibility for, since nothing could happen to us. It is thus the finitude of survival—**and the affirmation of such survival**—that raises the demand of responsibility. If I did not desire the survival of someone or something, there would be nothing that precipitated me to take action. Even if I sacrifice my own life for another, this act is still motivated by the desire for survival, since I would not do anything for the other if 1 did not desire the survival of him or her or it.

AT: Ressentiment

Ressentiment not First

Ressentiment doesn't come first – extinction and material impacts do

Torbjörn **Tännsjö 11**, the Kristian Claëson Professor of Practical Philosophy at Stockholm University, 2011, "Shalt Thou Sometimes Murder? On the Ethics of Killing," online: http://people.su.se/~jolso/HS-texter/shaltthou.pdf

I suppose it is correct to say that, if Schopenhauer is right, if life is never worth living, then according to utilitarianism we should all commit suicide and put an end to humanity. But this does not mean that, each of us should commit suicide. I commented on this in chapter two when I presented the idea that utilitarianism should be applied, not only to individual actions, but to collective actions as well.¶ It is a well-known fact that people rarely commit suicide. Some even claim that no one who is mentally sound commits suicide. Could that be taken as evidence for the claim that people live lives worth living? That would be rash. Many people are not utilitarians. They may avoid suicide because they believe that it is morally wrong to kill oneself. It is also a possibility that, even if people lead lives not worth living, they believe they do. And even if some may believe that their lives, up to now, have not been worth living, their future lives will be better. They may be mistaken about this. They may hold false expectations about the future.¶ From the point of view of evolutionary biology, it is natural to assume that people should rarely commit suicide. If we set old age to one side, it has poor survival value (of one's genes) to kill oneself. So it should be expected that it is difficult for ordinary people to kill themselves. But then theories about cognitive dissonance, known from psychology, should warn us that we may come to believe that we live better lives than we do.¶ My strong belief is that most of us live lives worth living. However, I do believe that our lives are close to the point where they stop being worth living. But then it is at least not very far-fetched to think that they may be worth not living, after all. My assessment may be too optimistic.¶ Let us just for the sake of the argument assume that our lives are not worth living, and let us accept that, if this is so, we should all kill ourselves. As I noted above, this does not answer the question what we should do, each one of us. My conjecture is that we should not commit suicide. The explanation is simple. If I kill myself, many people will suffer. Here is a rough explanation of how this will happen: ¶ ... suicide "survivors" confront a complex array of feelings. Various forms of guilt are quite common, such as that arising from (a) the belief that one contributed to the suicidal person's anguish, or (b) the failure to recognize that anguish, or (c) the inability to prevent the suicidal act itself. Suicide also leads to rage, loneliness, and awareness of vulnerability in those left behind. Indeed, the sense that suicide is an essentially selfish act dominates many popular perceptions of suicide. ¶ The fact that all our lives lack meaning, if they do, does not mean that others will follow my example. They will go on with their lives and their false expectations — at least for a while devastated because of my suicide. But then I have an obligation, for their sake, to go on with my life. It is highly likely that, by committing suicide, I create more suffering (in their lives) than I avoid (in my life).

Ressentiment Productive

Ressentiment is productive—inseparable for some freedom and their crusade against it links just as much

Stefan P. **Dolger 10**, Brock University, "In Praise of Ressentiment: Or, How I Learned to Stop Worrying and Love Glenn Beck", APSA 2010 Annual Meeting Paper, papers.ssrn.com/sol3/papers.cfm?abstract_id=1642232&download=yes

After Ressentiment ¶ In closing I would suggest that my praise of ressentiment is also in line with the more deliberatively conceived multiculturalism of the Left than is the current puritanical disdain. As Monique Deveaux argues, it is a failure of political imagination when we fixate on liberal principles as preconditions lo multicultural dialogue, and in particular it is necessary to move toward a deeper level of intercultural respect rather than mere toleration (Deveaux 2000).10 But if it is appropriate to go beyond simply tolerating non- liberal peoples abroad and in immigrant communities, if we must go beyond toleration to do justice to the rich tradition of cultural pluralism, then perhaps we can also open our hearts and minds to the possibility that the ressentiment-suffused need to be heard out as well. Perhaps rather than demonizing ressentiment as a toxin to politics, as the worst of the worst for subjects whom we purport to free, we must accept that ressentiment is for many inseparable from their conception of their own freedom. Perhaps rather than pitying these poor fools, in ways that we would never pity a plural wife in the global South, we should ponder whether ressentiment as a precondition of subjectivity is as much a gift as a curse.¶ And are we so sure, after all, we late Nietzscheans, that our crusade against ressentiment is not itself suffused with ressentiment? Is not itself fully in the grips of it? How would we know if it were or weren't? Perhaps we are, in our own way, as spiteful, vain, petty, weak, subjected, enraged against the past, capitalized, consumerized, unfree, as those we purport to want to free from the chains of slave morality. Perhaps it is ourselves that we need to give a break to, that we need to get over, when we first look to purge the other of ressentiment. Perhaps we all swim in this current, perhaps we are all Ressentiment's children, and perhaps that is OK – even to the extreme of the using ressentiment unconsciously in the effort to rid the world of ressentiment. Though just in saying so I wouldn't expect that to do much to overturn Ressentiment's reign. No, she is far too puissant for that. But we do not need to rage against the weakness in others because we fear the dependence and weakness in ourselves. ¶ As Vetlesen puts it, defending Amery: "Against Nietzsche, who despised victims because he saw them as weak, as losers in life's struggles, Amery upholds the dignity of having been forced by circumstances beyond one's control into that position, thus reminding Nietzsche that as humans we are essentially relational beings, dependent, not self-sufficient. In hailing the strong and despising the weak, in denying that vulnerability is a basic ineluctably given human condition, a condition from which not only the role of victim springs but that of the morally responsible agent too, Nietzsche fails to be the provocateur he loves to believe he is: He sides with the complacent majority and so helps reinforce the existential and moral loneliness felt by Amery, the individual victim who speaks up precisely in that capacity" (Vetlesen 2006, 43). Perhaps we can begin to see how we have been using the weak, the viewers of Glenn Beck and others, as the targets for our need to find blameworthy agents. And that too is fine. The trouble comes when we think we've gone beyond Ressentiment when in fact we're just listening to her whisperings without realizing it. We think that we can well and truly look down on the Rush Limbaughs, these destroyers of civilization, because they are possessed by something that we are above. And far be it from me to suggest that we should not resent, should not blame; I merely suggest we direct our blame toward more useful ends than where it is currently located.

AT: Ressentiment = Extinction

Ressentiment doesn't cause extinction

Bernard N. **Meltzer 2**, and Gil Richard Musolf, profs of sociology at Central Michigan University, "Resentment and Ressentiment," Sociological Inquiry, V72 N2, Spring, 240-55

Given this negative characterization—a prevailing evaluation—of ressentiment, it is not surprising to learn that Sartre (1965, p. 14) describes those who experience the emotion as individuals who ''establish their human personality as a perpetual negation.'' Augmenting the negative view of this emotion is a widely held view among scholars that both resentment and ressentiment tend to be base, dastardly emotions resorted to by thin-skinned individuals and seekers after excuses for failure, that these emotions are often felt irrationally, on occasions in which one has not been morally wronged. Thus, Solomon (1995) refers to a ''vindictive'' emotion, frequently a personal, petty, disproportionate reaction to a slight; Ortony, Clore, and Collins (1988) write of a ''distasteful'' emotion; and Adam Smith [1759] (1969) designates a ''disagreeable'' passion.7 On the other hand, Solomon (1994), elsewhere, takes a more positive view of ressentiment, pointing out that it often entails compassion for others in the same situation, and its implicit sense of injustice may lead to corrective action; thus, ressentiment can be seen as an expression of ''the socially responsible insistence of the community on justice and justification'' (p. 124). Similarly, Haber (1991) argues that resentment can be a form of personal protest that expresses regard for oneself, for others, and for the normative order (p. 48). Moreover, Haber (1991, p. 82) holds that a display of resentment may serve as an instrument of individual or social change. In fact, the historian Hippolyte Taine (cited in Jameson 1976, p. 131) sought to explain revolutions in terms of underlying ressentiment, and Jameson (1976) contends that this emotion is the very content of revolutions. In the same vein, various scholars have asserted that ''the individual of ressentiment is a potential revolutionary'' (Vaneigem 1979, p. 9) and that ''our revolutionaries are men and women of resentment''(Solomon 1995, p. 266).8 Thus, Merton (1957, p. 155) maintains that **''organized rebellion may draw upon a vast reservoir of the resentful and discontented as institutional dislocations become acute**.'' In the light of such characterizations, the role of the political agitator is readily recognized as that of raising consciousness of unjust treatment (where such consciousness is absent), inducing ressentiment (where the emotion is absent), and organizing resistance to the recurrence or continuation of unjust treatment. Moreover, Folger (1987) claims that revolutionary ideologies can help to create ressentiment. **That ressentiment can be used to initiate** (and sustain) **revolution argues against the more passive—and contemptuous—conceptions held by Nietzsche,** Scheler, and their many followers.

AT: Ressentiment – Productive/K Links

Ressentiment is productive—inseparable for some freedom and their crusade against it links just as much

Dolger 10

After Ressentiment ¶ In closing I would suggest that my praise of ressentiment is also in line with the more deliberatively conceived multiculturalism of the Left than is the current puritanical disdain. As Monique Deveaux argues, it is a failure of political imagination when we fixate on liberal principles as preconditions lo multicultural dialogue, and in particular it is necessary to move toward a deeper level of intercultural respect rather than mere toleration (Deveaux 2000).10 But if it is appropriate to go beyond simply tolerating non- liberal peoples abroad and in immigrant communities, if we must go beyond toleration to do justice to the rich tradition of cultural pluralism, then perhaps we can also open our hearts and minds to the possibility that the ressentiment-suffused need to be heard out as well. Perhaps rather than demonizing ressentiment as a toxin to politics, as the worst of the worst for subjects whom we purport to free, we must accept that ressentiment is for many inseparable from their conception of their own freedom. Perhaps rather than pitying these poor fools, in ways that we would never pity a plural wife in the global South, we should ponder whether ressentiment as a precondition of subjectivity is as much a gift as a curse.¶ And are we so sure, after all, we late Nietzscheans, that our crusade against ressentiment is not itself suffused with ressentiment? Is not itself fully in the grips of it? How would we know if it were or weren't? Perhaps we are, in our own way, as spiteful, vain, petty, weak, subjected, enraged against the past, capitalized, consumerized, unfree, as those we purport to want to free from the chains of slave morality. Perhaps it is ourselves that we need to give a break to, that we need to get over, when we first look to purge the other of ressentiment. Perhaps we all swim in this current, perhaps we are all Ressentiment's children, and perhaps that is OK – even to the extreme of the using ressentiment unconsciously in the effort to rid the world of ressentiment. Though just in saying so I wouldn't expect that to do much to overturn Ressentiment's reign. No, she is far too puissant for that. But we do not need to rage against the weakness in others because we fear the dependence and weakness in ourselves. ¶ As Vetlesen puts it, defending Amery: "Against Nietzsche, who despised victims because he saw them as weak, as losers in life's struggles, Amery upholds the dignity of having been forced by circumstances beyond one's control into that position, thus reminding Nietzsche that as humans we are essentially relational beings, dependent, not self-sufficient. In hailing the strong and despising the weak, in denying that vulnerability is a basic ineluctably given human condition, a condition from which not only the role of victim springs but that of the morally responsible agent too, Nietzsche fails to be the provocateur he loves to believe he is: He sides with the complacent majority and so helps reinforce the existential and moral loneliness felt by Amery, the individual victim who speaks up precisely in that capacity" (Vetlesen 2006, 43). Perhaps we can begin to see how we have been using the weak, the viewers of Glenn Beck and others, as the targets for our need to find blameworthy agents. And that too is fine. The trouble comes when we think we've gone beyond Ressentiment when in fact we're just listening to her whisperings without realizing it. We think that we can well and truly look down on the Rush Limbaughs, these destroyers of civilization, because they are possessed by something that we are above. And far be it from me to suggest that we should not resent, should not blame; I merely suggest we direct our blame toward more useful ends than where it is currently located.

AT: Ressentiment – Perm Solves/KT Justice

Perm solves – ressentiment may often be destructive, but it is necessary for a baseline of social justice

Soloman 94

(Robert Soloman 94, Philosophy @ UT Austin, Nietzsche, Genealogy, Morality p. 123-124)

Nietzsche separates what he calls "justice" from the "reactive emotions," defending justice as a rare and unusually noble sentiment while attacking such emotions as resentment for their impotence. This is no less questionable. But we need not therefore disagree when he objects to the abuse of justice as a façade for the defense of one's own interests, whether in the name of "rights" or equality and we need not endorse the consequent "leveling" effect of enforced modernity. In the name of "justice," for example, one may adopt an egalitarian standpoint, but look only in one direction. The French bourgeoisie during the French Revolution only looked up at the aristocrats they wanted to replace, but they never looked down at the rest of the "third estate" who were **much worse off**. The hard question is whether there is any "neutral" social position (other than our position as outside observers) that would provide the proper standpoint for making such evaluations. Justice always begins as situated with the self and its personal passions: **but it need not therefore be selfish, and resentment need not be** petty or **opposed to** a noble sense of generosity and compassion. Indeed, given that we are not Nietzsche's fantasized Ubermenschen, wholly satisfied and in charge of our world, **it is hard to even imagine what justice**—and for that matter morality—**would be without resentment and** the modicum of **selfishness that makes it possible**. Perhaps Duhring was right: the home of justice is to be sought in the "sphere of the reactive feelings."

AT: Suffering

Injustice/Suffering Reps Good

Our critique of structural injustice turns vampirism. Contextualizing vulnerability, and the background of injustice balances emphasizing with material suffering and avoiding sentimentality

Michalinos **Zembylas 13**, Education @ Open (Cyprus), "The 'Crisis of Pity" and the Radicalization of Solidarity: Toward Critical Pedagogies of Compassion", *Educational Studies* 49, p. 512-516

First of all, a politics of compassion that takes into consideration the possible dangers of compassion fatigue, desensitization, and self-victimization has to begin from acknowledging common human vulnerability and its influence in **inspiring meaningful actions that avoid presumptuous paternalism** (Porter 2006; Whitebrook 2002). The recognition of one's own vulnerability can constitute a powerful point of departure for developing compassion and solidarity with the other's vulnerability (Butler 2004). As Butler asserts: "Each of us is constituted politically in part by virtue of the social vulnerability of our bodies. ... We cannot ... will away this vulnerability. We must attend to it" (2004, p. 29). Butler's description of the vulnerable body and self refers to the way we perform and are performed upon, and part of what we fear in the other is a projection of our own selves. Hence, Butler suggests that recognition of our own vulnerability opens up the potential for recognition of all humanity as vulnerable. Vulnerability may therefore, be a more appropriate term than suffering to ground the political applications of compassion, because **the focus is not merely on the alleviation of material suffering and hence a slide from compassion to benevolence and sentimentality** (Porter 2006; Whitebook 2002). Suggesting this epistemological shift of focus does not imply, however, **that a narrative that focuses on the alleviation of material suffering will necessarily result in a slide into sentimentality**. Undoubtedly, the political applications of compassion cannot be completely separated from questions of material suffering. Thus, it needs to be acknowledged that although the move away from suffering may be theoretically useful, the shift to a narrative of common human vulnerability is not completely unproblematic. 8 The idea of common vulnerability enables us—teachers and **students** in the classroom, for instance—to explore how we might move beyond dichotomies that single out the self or the other as victims, and therefore as deserving someone else's pity. That is, the idea of common vulnerability puts in perspective the notion of all of us as vulnerable, rather than the individual-other who needs our compassion. This notion addresses the concerns of **students**, for example, who **seem to be stuck in self-victimization claims and refuse to acknowledge that others also suffer**. Although the idea of common vulnerability does not guarantee any departure from such claims, it opens some space to problematize moralistic positioning. In addition, the notion of common vulnerability attacks a major emotional ideology grounded in the view that it is natural or normal to be fearful of the other, especially if it involves racial differences. This is one of the most common and pernicious emotional ideologies underlying resistance (especially among White, middle-class students) to identifying with the other. However, if vulnerability concerns everyone and yet compassion is assigned differently (i.e., students think that some deserve compassion but others do not), then it is important to explore what it would take for students to begin imagining themselves as objects of lesser compassion in an unsuspected vulnerable moment. Through addressing this issue in ways that do not reify stereotypes or promote essentialism, it is possible to respond to some of the desensitization concerns outlined earlier, because the dichotomies between we and they will become meaningless and unproductive. Second, **compassion serves to reinforce a strong connection between the personal and the political** and accentuates the interpersonal and the interrelational (Whitebrook 2002). **Empathetic identification with the plight of others**, then, **is not a sentimental recognition of potential sameness**—you are in pain and so am I, so we both suffer the same—**but a realization of our own common humanity, while acknowledging asymmetries of suffering**, inequality, and injustice. A discourse of vulnerability neither eschews questions of material suffering nor obscures issues of inequality and injustice; on the contrary, it highlights both the symmetries and the asymmetries of vulnerability. That is, although the experience of vulnerability may be more or less universal, the discourse of common vulnerability raises important critical questions such as "vulnerable to what? to whom?" to dismiss the possibility of sliding into a sentimental recognition of potential sameness—which is exactly what a politics of compassion ardently seeks to avoid. Without this double realization—that is, we are all vulnerable but not in the same manner—

our actions run the danger of being a form of charity and condescension toward those who are systematically and institutionally oppressed (Bunch 2002). If properly recognized in schools, this double realization can potentially address both the concern about the desensitization of students and that of their self-victimization, because the distance between spectator and sufferer will not be taken for granted any more, but rather its multiple complexities will be acknowledged and interrogated. In a sense then, the kind of compassion that is explored here requires a simultaneous identification and disidentification with the suffering of the other. The simultaneous recognition of symmetry and asymmetry with the other removes the arrogance of claiming that we know and feel their pain and suffering. This emotional ambivalence of simultaneous identification and disidentification is needed to focus attention on the other's suffering, but not becoming too identified with it—a point raised earlier in Nelson's (2004) reading of Arendt's reporting on Eichmann's trial. Students who already endure forms of suffering, of course, do not need a pedagogy to enlighten them how to disidentify with their own suffering. This does not imply, however, that pedagogies that interrogate pity and encourage critical compassion are not for them; on the contrary, the critical awareness that others are vulnerable, too, is important in the struggle for action-oriented solidarity and the avoidance of egocentricity and cultural narcissism. Finally, the third element of a politics of compassion is attentiveness to how the ethics of compassion questions injustice and inequality. 9 In particular, an important component of a politics of compassion that is critical and justice-oriented is how it deals with anger at injustice (Hoggett 2006). A politics of compassion does not intentionally seek to cause anger, however, but rather encourages students and teachers to develop a critical analysis of anger, as it is likely that they will experience such feelings, when they begin questioning long-held assumptions and beliefs about other people and social events (Zembylas 2007). Anger may call attention to demands for recognition, but also emphasize inequalities (Holmes 2004) and injustices at the civic level (Silber 2011). Anger at injustice can be a positive and powerful source of personal and political insight in education (Lorde 1984), because it helps to move teachers and students out of a cycle of self-pity, blame, or guilt into a mode of action that somehow responds to injustice. For example, civic anger can be promoted in the classroom as a form of cultivating individual and collective political consciousness and social resistance to injustices in the students' community, although anger is not inevitably emancipatory. However, recognizing the positive power of anger and its link to the struggle against injustice in one's own community is valuable, if teachers want to promote options for action that may change the conditions of others' vulnerability. The pedagogical challenge for critical pedagogues is how to encourage students to become active participants with a nuanced understanding of the emotional complexities involved in histories of injustice and oppression.

Alt Bad – Black Suffering

Alt silences black suffering

Rebecca **Wanzo 9**, Associate Professor, Women, Gender, and Sexuality Studies Program, Washington U in St. Louis. The Suffering Will Not Be Televised, 180-3

Recognizing the political valence of pain—of **speaking pain—is essential to black survival**. Given the poorer health status of African Americans in the United States, the fact that pain is often ignored or borne silently before seeking care, and undertreated once care is sought, those who work with African Americans need to emphasize the right to tell stories of pain. Obstacles to black storytelling not only come from white institutional sources, but they also come from self-perceptions that if African Americans can claim nothing else, they can claim strength. The strong-black-woman stereotype, John Henry, the brave and stoic kids integrating the store, and other models of black strength fill the U.S. imaginary. **Reinterpreting the naming and speaking of pain can be an act of power, not an act of powerlessness.** One person who recognized the power in speaking about pain was Audre Lorde. In The Cancer Journals she described how she wanted people to respond to her cancer in a way that was atten- tive her identity, to the fact that she was black and feminist and a lesbian. After her mastectomy, she journaled, "I want to write about the pain."74 She wanted to write about the pain because she would "willingly pay whatever price in pain was needed, to savor the weight of completion; to be utterly fi lled, not with conviction nor with ¶ 181¶ faith, but with experience—knowledge, direct and different from all other certainties." Writing about the pain, speaking about the pain imparts knowledge, a different kind of knowledge than that validated by the allegedly objective methodologies of medicine and science, but knowledge nonetheless. The example of medical storytelling is a visceral example of how black pain has been dismissed or reframed in relationship to various political agendas. **Sentimental political storytelling, for all its faults, provides an important intervention**. ¶ A Coda on Moving from Spectator/ Spectacle to Agents in Our Own Care¶ This intervention can be, as in the best examples of sentimental political storytelling, both public and private, both therapeutic and a political call to arms. When I saw a call for papers for the "Anarcha Symposium," The Anarcha Project's Michigan workshop, I applied with both public and private work. I shared academic scholarship I had written about Anarcha as well as creative nonfi ction about my surgery, fi nding the rare space in the academy that made space for both. Called together in 2007, many of us engaged in scholarship who did not see ourselves as scholars, in creative performance when we did not see ourselves as performers. The group who came together to discuss Anarcha, J. Marion Sims, and the issues the history raised were eclectic: undergraduates taking classes in disability studies, scholars and performers who focused on African American culture, dancers, singers, those who had movement constraints, and those of us who had constraints that were less visible. Over the course of a few days we performed physical and mental exercises, bonding in both small and large groups in order to shape a performance at the end of our time together. We were transformed from spectators into spectacle, but it was a process of constructing a spectacle that was by no means one way—we looked back in history and looked out to those who could engage with us. While minimalist in presentation, it contained the excesses of our emotional response to Anarcha's history and our presents. ¶ If a problem with sentimental political storytelling is the conflation with other kinds of oppressed bodies, the productively messy conflations pushed us to think about a broader nexus of institutional oppression. We were divided into small performance groups, and we ¶ 182¶ struggled to fi nd a collective response that refl ected all of our readings of Anarcha's, Lucy's, and Betsey's histories, as well as the histories of other unnamed women. On a stark stage, with our bodies, micro- phones, and lights shaping the space, my group produced a short choreo-piece after two days of work in which the group collectively prompted individual stories with the refrain, "This is Anarcha's story, and . . ." it was the story of all of us. One of us challenged the his- torical record that Anarcha "willingly consented" in Sims's narrative while also addressing the issue of her relatives' lack of consent to medical experimentation during the Nazi Holocaust. Another of us without the use of her legs told the story of being sexually molested by a medical caregiver, describing "histories and futures lost . . . one black, one white, one slave, one not . . . neither touched by request, both silenced by circumstance." In drawing a comparison between the invisible stories—Anarcha's and her own—she explored how the broader issue of nonconsent and voicelessness in medical care can be read across history and identity. One of us discussed the lack of choices and resistance when fi ghting "medical men"; another discussed fear shaped by history. Drawing on my history, I added to the chorus with a recognition of my difference from Anarcha as well as my sense of connection to her: "I am not Anarcha," but see her story as my story, "not because my issues are hers, but because I need someone to hear her pain . . . and alleviate it." And as we moved in and out of our individual and collective refrains shaped by our specific stories, the chorus built community, acknowledging the differences between our histories and our similar investments at the same time. We learned, as Boal suggests in Theater of the Oppressed, to "practice theater as a language that is living and present, not as a finished product displaying images from the past."75 ¶ I fi nd telling my own story diffi cult; in some ways, telling the story of pain management after my surgery and telling of the Anarcha Symposium performance are equally diffi cult. Two spaces of judgment are possible—judgment of my tolerance for pain and judgment of my creative work, both of which are linked to what it means to make myself vulnerable. I was advised to cut my personal story from this chapter because of the danger of exposing myself. But if we take sentimental political storytelling seriously as an opportunity to treat affect and the story of pain as essential to political progress, what example would I set if I remained continually in a space of academic distance when I believe in the political efficacy ¶ 183¶ of the sentimental narrative? As a subject who has been raced and pained in the United States, I must don the mantle of articulating my affective investment in recognizing the relationship between race and pain without shame. ¶ As I say that it is hard to talk about pain—broadly—in the U.S. without talking about race, I recognize that the claim can be read as hyperbolic, and inadequately supported. The charge of hyperbole is often leveled against sentimental rhetoric. But a review of history, rhetoric, and social and medical discourse reveals that these concepts are often linked in the United States. When we recognize that we can be subjects of various discourses about race and pain, and not only subject to a specialized language, such a shift in understand- ing **may empower people**, as health-care advocates encourage, to be agents in their own care. Silence, as Audre Lorde, famously wrote, will not protect you.76 Allowing stories of pain to be silenced, dismissed, or obscured, however, will surely kill you. We must speak pain to power.

Sentiment w/ Political Action Solves

Their sentiment K is totally wrong---stories of pain combined with political action avoid vampiristic consumption and motivate effective harm-reduction

Rebecca **Wanzo 9**, Associate Professor, Women, Gender, and Sexuality Studies Program, Washington U in St. Louis. The Suffering Will Not Be Televised, 228-232

Despite my disappointment in these films and frequent annoyance with the narrative trajectory of many of their productions, I admit that I have a bit of a soft spot for the Lifetime network. I, too, used to automatically criticize made-for-television movies "inspired by a true story" about women at risk. I found them exploitative, as any film can be that makes entertainment out of a personal tragedy. Lifetime Television has been called "television for victims," in a criticism of its seemingly endless capacity to show fi lms about the victimization of women.5 One of the questions that this moniker raises is what kind of storylines about people have the most dramatic impact. Popular fi lms with high dramatic impact depict violence, stories of surviv- ing some atypical traumatic event, or struggling with some more powerful person or entity. One aspect of the criticisms of Lifetime is the objection to formulaic melodrama in itself, framed within the gendered derision of women's victimization narratives or, on the other side of the political spectrum, discomfort with such narratives as demeaning, reductive, and trite. The fi lms shown on the network, some produced by Lifetime but most produced elsewhere, vary in quality, but the criticisms of Lifetime raise a question that I have explored throughout this book: What is the best way to represent a story of suffering? ¶ 229¶ Simply crying at a Lifetime film clearly cannot sustain any sub- stantive political work— but what if the crying citizen is directed to, at the very least, awareness, and in the best case scenario, action, after their emotional catharsis? Sorrow produced at the sight of a dead or wounded woman may not accomplish anything **unless the representation is framed in relationship to** some political action, but tears in relation to abolition and child abduction did produce action. However, a major ethical problem with using sympathy and compassion as the primary mechanism for political change is that sentimental politics depends on the cultural feelings of those in power, and the disempowered must depend on patronage. Hannah Arendt argues that compassion cannot embrace a larger population, but pity can, and pity is a dangerous affect because it cannot exist without misfortune, thus "it has just as much vested interest in the existence of the unhappy as thirst for power has a vested interest in the existence of the weak . . . by being a virtue of sentiment, pity can be enjoyed for its own sake, and this will almost automatically lead to a glorifi cation of its cause, which is the suffering of others."6 ¶ Following Arendt, the charge against Lifetime could be that it thus encourages sadism because watchers could take pleasure in pity. Or, as literary critic Marianne Noble has suggested in her study of sentimentality, the network might embrace masochism because watchers would identify with the sufferer and might begin to take pleasure in these fantasies of subjection.7 **However, these readings of the pleasures of consuming stories of subjection are too narrow**. In the case of Lifetime, casting these films as only narratives of victimization is too limited a reading. After watching several fi lms, I began to be compelled by stories I had not heard before about women interven- ing when the state fails to protect them. The stories were clearly not only about victimization, but also about survival. The movies negotiate a balance between structural critique and stories of individual heroism, and I am often disappointed, as with the fi lms discussed above, with how much weight is placed on the side of individual transformation. Nonetheless I later began defending the network out of political principle, as part of a broader effort to challenge the ¶ 230¶ facile denunciation of the word "victim." Lifetime's fi lms are often poor in terms of artistic merit, but the network is contributing to a national conversation about what agency can look like. ¶ My argument may seem as if I am looking for politics in all the wrong places, relying on sentimentality when I should focus on politically rational arguments that eschew the appeals of emotional response. I am not asking for radical progressivism from popular culture. Instead, I am arguing that politics is often accomplished through the popular and conventional work of emotional appeals, as many activists throughout history have demonstrated. The question facing activists for African American women—or, for that matter, advocates for any identity group outside the national imaginary of ideal citizenship—is not only how to expose discrimination, but also how to make use of existing rhetoric so that attacks on their bodies can be read as pressing concerns for all U.S. citizens. Affect and popular culture can be easily criticized as tools of anti-intellectual conservative machines. As Max Horkheimer and Theodor Adorno rightly argue, popular culture focuses on producing narratives of comfort or affects that can ultimately serve the state's purposes.8 Totally escaping the political storytelling of the status quo elicited by mass-produced texts is indeed impossible. However, the impossibility of total escape does not preclude the possibility of making use of tools produced by ideology. Mobilizing affect demands use of proven rhetorical tools, but this use need not forestall a criticism of the need to employ the structures in the first place. Negotiating the relationship between challenging the "master's tools" and making use of them to garner financial support and political power is not an easy project, but it is a necessary one. ¶The book's title is inspired by this very tension between see- ing popular

cultural productions as inevitably politically ineffi cacious and recognizing the possibilities offered by making use of widely circulated genres and media. When Gil Scott-Heron produced his famous choreo-poem, "The Revolution Will Not Be Televised," in 1974, he called attention to the disconnect between radical action and violent struggles taking place in the streets and the pleasures of oblivion offered by scripted television and commercials.9 Television stood in for mass-produced media that would not show what was really occurring in the streets, like "pigs shooting down brothers in instant replay." Scott-Heron pointed to the need for his audience to take to the streets and participate, live, in the revolution. Indeed, a ¶ 231¶ rue revolution requires "live" political action and organizing, and television and many cultural productions neglect a multitude of issues that are politically urgent. However, it is clearly no longer the case that "pigs shooting down brothers in the street is left off of instant replay." Important events are depicted on the news, in scripted tele- vision shows, in genre fi ction, in magazines, in movies, and on the Internet. You can even catch the occasional social message in a television commercial. Rather than reject various media wholesale, we are left with a set of questions about what to do with contemporary media realities. How and why are certain kinds of traditionally neglected issues represented? Once represented, how are they interpreted, and can activists play a role in that interpretation? What do activists do about the complexities lost when they make use of certain kinds of mass-marketed discourses? ¶ Octavia Butler perhaps best articulated this problem in her science-fi ction novel Parable of the Talents. The novel exemplifi es what Lauren Berlant calls the postsentimental text—one that exhibits longing for the unconfl icted intimacy and political promise senti- mentality offers but is skeptical of the ultimate political effi cacy of making feeling central to political change. Her heroine, Olamina, suffers from "hyperempathy" syndrome, which allows her to feel the emotions of others, but Butler is careful to argue that being able to feel the pain of others is not the means for liberation—it is a "delusional disorder." Thus Olamina focuses on other modes of political change, and struggles to gain followers for her politi- cal and spiritual project for survival, Earthseed, in a United States devastated by environmental destruction and the domination of a repressive fusion of government and a religious right organiza- tion called Christian America. Through Olamina's struggle, Butler addresses the intellectual discomfort with consumption by having a character explicitly argue that only strategic commodifi cation will result in successful dissemination of radical ideas. Olamina struggles with the means by which she can circulate Earthseed, until someone suggests to her that she must use the marketing tools she slightly disparages to compel people to her project. Her companion, Len, argues that Olamina must "focus on what people want and tell them how your system will help them get it." She resists the call to "preach" the way her Christian American enemy Jarret does, rejecting "preaching," "telling folksy stories," emphasizing a profi t motive, and self-consciously using her charismatic persona to sell Earthseed. ¶ 232¶ Len argues that her resistance to using the tools of commodifi cation "leaves the fi eld to people who are demagogues—to the Jarrets of the world."10 Butler ultimately presents the moral that the project of producing populist texts for mass consumption cannot be left to those with unproductive or dangerous dreams, abandoned by a Left that desires not only revolution but also political change resulting in real material gains.¶ Clearly, the productions of mass-culture are not the only way to move people to action, but they are no doubt a tool. The dismissiveness accompanying the label of the sentimental in contemporary culture is because academic critics claim that it does not do anything, it is the antithesis of action. However, this book is about how sentimentality is doing things all the time. For better or worse, it teaches people to identify "proper" objects of sympathy. It teaches people how to relate to each other. It teaches people how to make compelling arguments about their pain. The circulation of sentimental political storytelling often depends on media to which many progressives have a schizophrenic relationship. News media and television are often tools of the state, but citizens depend on the news for the free circulation of information and often look for progressive politics in television shows. Others disavow the "idiot box" altogether and have faith only in alternative news sources. However, the dichotomy between the popular and other spaces in which people tell stories about suffering is a false one. Sentimental political storytelling is omnipresent in U.S. culture. While the discourse has many short-comings, people interested in political change are taking a perilous road if they ignore the possibilities of imperfect stories told about citizens in pain.

Perm Solves

That's best --- sentimentality is politically effective when it is recognized as part of a larger project

Rebecca **Wanzo 9**, Associate Professor, Women, Gender, and Sexuality Studies Program, Washington U in St. Louis. The Suffering Will Not Be Televised, p. 9

However, sentimentality cannot easily be understood as progressive or conservative. When theorists criticize producers of sentimentality for conservative politics, they sometimes attack a rhetoric that is reactionary or designed to serve the status quo. At other times, such critics express disappointment at a text's possibly radical revolutionary or otherwise progressive potential having been short-circuited in favor of feel-good closure offered by the sentimental narrative. World Trade Center provoked exactly this response from movie critic David Edelstein, who wanted the fi lm about the event of 9/11 to be "more political," because the "heartwarming conclusion" to the fi lm is "unrepresentative—to the point where it almost seems like a denial of the deeper and more enduring horror."22 Sentimental texts present themselves frequently as progressive about social justice issues while they eventually preserve the status quo. Indeed, that is an overlying tendency of most sentimental texts. However, the binaries of good and bad, Left and Right are insufficient to categorize sentimentality as it does, by its nature, have a progressive political thrust. It addresses the suffering of the politically disadvantaged but utilizes conventional narratives and practices that will not fundamentally disrupt power. Rather than characterizing U.S. sentimentality as "good" or "bad" politics, a more precise characterization—albeit more of a mouthful and less dramatic—is to call it a **politically effective** but insufficient means of political change.

Agamben

AT: 'Becoming 1ˢᵗ'

Flux Kills Institutions

Openness to flux and constant becoming destroys the foundations for political institutions necessary to sustain radical democratic life---some universal, "fixed" guarantees of equality are crucial to politics

Joseph **Schwartz 8**, Professor of Political Science at Temple University, The Future of Democratic Equality, 56-61

Butler, Brown, and Connolly reject the essentialism of "narrow" identity politics as an inverted "ressentiment" of the Enlightenment desire for a universal, homogenized identity. They judge identity politics to be a politics of "wounding, resentment, and victimization" that only can yield bad-faith moralization Wendy Brown takes to task identity politics for "essentializing" conceptions of group identity. For example, she critiques the work of Catherine MacKinnon as epitomizing "identity" political theory, accusing MacKinnon of denying women agency by depicting them purely as victims.38 Brown also remains wary of the patriarchal, conformist nature of traditional left conceptions of solidarity and citizenship. Brown's implicit concept of radical democratic citizenship rests upon the recognition that political identity is continually in flux and is socially constituted through "agonal" political struggle. Brown celebrates an Arendtian conception of a polity in which both shared and particular identities are continually open to reconstruction. In this "left Nietzschean" view of an "everyperson's" will to power, there can be no cultural certainties or political givens, as such "givens" would repress difference and fluidity.39 But, if the human condition is a world of permanent flux, then we must postulate a human capability of living with constant insecurity, for in this world there can be no stable political institutions or political identities.40 An ability to calculate the probabilities of political actions or public policies would disappear in this world of infinite liminality. By assuming that the pre-eminent democratic value is that of leaving all issues as permanently open to question, post-structuralist "democratic theory" eschews the theoretical and political struggle over what established institutions and consensual values are needed to underpin a democratic society. ¶ Post-structuralist analysis has contributed to a healthy suspicion of narrow and "essentializing" identity politics. But a self-identified feminist, African- American, or lesbian activist is likely to value the shared historical narratives that partly constitute such group identities. Of course, if one is a democrat and a pluralist, one would reject the oppressive homogenization and potentially authoritarian aspects of ethnic or racial chauvinism and of "essentializing" types of identity politics. The democratic political home should be open, fluid, and self-reflective; but if participation is to be open to all, then such a society also needs to reproduce a shared democratic culture and the institutional guarantee of democratic rights. That is, contrary to post-structuralist analysis, not all issues can be open to "agonal struggle" in a democratic society. The traditional radical democratic critique of democratic capitalism remains valid; the equal worth of the individual is devalued by rampant social inequality within and between groups. Thus, a radical democrat, whether post-structuralist or not, must not only be committed to institutional protections of political and civil rights, but also to social rights—the equal access to the basic goods of citizenship (education, health care, housing, child care). Of course, the precise nature and extent of these rights will be politically contested and constructed. But a democratic society cannot leave as totally "open" the minimal institutional basis of democracy— a democratic society cannot be agnostic as to the value of freedom of speech, association, and universal suffrage.¶ Social movements fighting for an expansion of civil, political, and social rights, rarely, if ever, rest their arguments on appeals to epistemological truths— whether "foundational" or "anti-foundational." To remain democratic, their policy goals cannot be so specific that they preclude political argument about both their worth and how best to institutionalize them. If social movements in a 58 democratic society deemed that every policy defeat meant a betrayal of basic democratic principles, there would be no give-and-take or winners and losers within democratic politics. But if a government were to abolish freedom of speech and competitive elections, or deny a social group basic rights, it would be reasonable for an observer to judge that democratic principles had been violated. Democratic political movements and coalitions struggle to construct shared meanings about those political, civil, and social rights that should be guaranteed to all citizens—and they often work to expand the types of persons to be recognized as citizens (such as excluded immigrants). Such arguments are inevitably grounded in normative arguments that go beyond merely asserting the import of "flux," "difference," and "anti-essentialism." The civil rights movement did not demand equal rights for all solely as an "agonal" assertion of the will of the excluded; they desired to gain for persons of color an established set of civil and political rights that had been granted to some citizens and denied to others. The movement correctly assumed that the exclusion of citizens from full political and civil rights violated the basic norms of a democratic society. Thus, postmodern epistemological commitments to "flux" and "openness" cannot in-and-of-themselves sustain the "fixed" moral positions needed to sustain a radical democracy.¶ Post-structuralist theorists openly proclaim their hostility to all philosophical "meta-narratives." They reject comprehensive conceptions of how society operates and the type of society that would best instantiate human freedom. But post-structuralists go beyond rejecting "meta-narratives"; they insist that only an "anti-foundational" epistemology can ground a politics of emancipation. For Butler, Brown, and Connolly, not only do "meta-discourses" invariably fail in their efforts to ground moral positions in a theory of human nature or human reason. They also assert that an

agonal politics of democratic "we" formation can alone sustain democratic society. This agonal politics, they claim, can only be sustained by a recognition of the inconstant signification of discourse and the ineluctable flux of personal and group identity.41 Rejecting the authoritarian, celebration of the "ubermensch" by Nietzsche, they offer a post-Nietzschean, "amoral" conception of democracy as an open-ended project of defining a self and community that is constantly open to the desires of "others." These theorists constantly reiterate the definitiveness (dare we say "foundational truth") of this grounding of democracy, despite the historical reality that social movements often contest dominant narratives in the name of a stable alternative narrative of a democratic and pluralist community.¶ One might well contend that the post-structuralist political stance is guilty of a new meta-narrative of "bad faith," that of "anti-foundationalism." According to this anti-foundational politics, a true democrat must reject any and all a priori truths allegedly grounded upon the nature of human reason or human nature. A committed democrat may well be skeptical of such neo-Kantian or neo-Hegelian conceptions of freedom; but, many committed democrats justify their moral commitments using these philosophical methods. A democrat might also reject (or accept) the arguments of a Jurgen Habermas or Hans Georg Gadamer that the structure of human linguistic communication contains within it the potential for a society based on reasoned argument rather than manipulation and domination. But there are numerous other philosophically "pragmatic" ways to justify democracy, even utilitarian ones. Political democrats may well disagree about the best philosophical defense of democracy. But, invariably, "practicing democrats" will defend the belief (however philosophically "proved" or "justified") that democratic regimes best fulfill the moral commitment to the equal worth of persons and to the equal potential of human beings to freely develop and pursue their life plans.¶ To contend that only an anti-foundationalist, anti-realist epistemology can sustain democracy is to argue precisely for a foundational metaphysical grounding for the democratic project. It is to contend that one's epistemology determines one's politics. Hence, Brown and Butler both spoke at a spring 1998 academic conference at the University of California at Santa Cruz where some attributed "reactionary" and "left cultural conservatism" to belief in "reactionary" "foundationalist humanism."42 Post-structuralism cannot escape its own essentialist conception of identity. For example, Butler contends in Feminist Contentions that democratic feminists must embrace the post-structuralist "nondefinability of woman" as best suited to open democratic constitution of what it is to be a "woman."43 But this is itself a "closed" position and runs counter to the practices of many democratic feminist activists who have tried to develop a pluralist, yet collective identity around the shared experiences of being a woman in a patriarchal society (of course, realizing that working-class women and women of color experience patriarchy in some ways that are distinct from the patriarchy experienced by middle-class white women).¶ One query that post-structuralist theorists might ask themselves: has there ever existed a mass social movement that defined its primary "ethical" values as being those of "instability and flux"? Certainly many sexual politics activists are cognizant of the fluid nature of sexuality and sexual and gender identity. But only a small (disproportionately university educated) segment of the women's and gay and lesbian movement would subscribe to (or even be aware of) the core principles of post-structuralist "anti-essentialist epistemology." Nor would they be agnostic as to whether the state should protect their rights to express their sexuality. Post-structuralist theorists cannot avoid justificatory arguments for why some identities should be considered open and democratic and others exclusionary and anti-democratic. That is, how could post-structuralist political theorists argue that Nazi or Klan "ethics" are antithetical to a democratic society—and that a democratic society can rightfully ban certain forms of "agonal" (e.g. harassing forms of behavior against minorities) struggle on the part of such anti-democratic groups.

Alt Fails

The alt fails---deriding all attempts at action as "freezing becoming" no way to deal with difficult political choices---we also control terminal uniqueness because they can't convince <u>others</u> to abandon liberal subjectivity

Schartz 8

(Joseph Schwartz 8, Professor of Political Science at Temple University, The Future of Democratic Equality, 56-62)

A <u>politics of radical democratic pluralism cannot be securely grounded by a</u> whole-hearted <u>epistemological critique of "enlightenment rationality." For implicit to any radical democratic project is a belief in the equal moral worth of persons; to embrace such a position renders one at least a "critical defender" of enlightenment values of equality and justice,</u> even if one rejects "enlightenment metaphysics" and believes that such values are often embraced by non-Western cultures. Of course, **democratic norms are developed by political practice and** 60 **struggle** rather than **by** abstract **philosophical argument**. But this is a sociological and historical reality rather than a trumping philosophical proof. <u>Liberal democratic publics rarely ground their politics in coherent ontologies and epistemologies; and even among trained philosophers there is no necessary connection between one's metaphysics and one's politics.</u> There have, are, and will be Kantian conservatives (Nozick), liberals (Rawls), and radicals (Joshua Cohen; Susan Okin); teleologists, left, center, and right (Michael Sandel, Alasdair McIntyre, or Leo Strauss); anti-universalist feminists (Judith Butler, Wendy Brown) and quasi-universalist, Habermasian feminists (Seyla Benhabib, Nancy Fraser).¶ Post-structuralists try to read off from an epistemology or ontology a politics; such attempts simply replace enlightenment meta-narratives with postmodern (allegedly anti) meta-narratives. Such efforts represent an idealist version of the materialist effort—which post-structuralists explicitly condemn—to read social consciousness off of the structural position of "the agent." A <u>democratic political theory must offer both a</u> theory of <u>social structure and</u> of the <u>social agents capable of building such a society</u>. In exchanging the gods of Weber and Marx for Nietzsche and Heidegger (or their epigones Foucault and Derrida), <u>poststructuralist theory</u> has <u>abandoned</u> the <u>institutional analysis</u> of social theory <u>for the **idealism** of abstract philosophy.</u> ¶ Connolly, Brown, and Butler reject explicit moral deliberation as a bad faith Nietzschean attempt at "ressentiment." Instead, they celebrate the amoral, yet ethical strivings of a Machiavellian or Gramscian realist "war of position."44 Sheldon Wolin, however, has written convincingly of how Machiavelli can be read as an ethical realist, a theorist of moral utilitarianism.45 Even a Machiavellian or Gramscian political "realist" must depend upon moral argument to justify the social utility of hard political choices. That is, if one reads both as ethical utilitarians who believe that, at times, one must "dirty" one's hands in order to act ethically in politics, then they embrace a utilitarian, "just war" theory of ethical choice. According to this consequentialist moral logic, "bad means" are only justifiable if they are the only, unavoidable way to achieve a greater ethical good—and if the use of such "bad means" are absolutely minimized. Such **"hard" political choices yield** social **policies** and political outcomes **that fix identities as well as transform them**. ¶ Not only in regard to epistemological questions has post-structuralist theory created a new political "metaphysics" which misconstrues the nature of democratic political practice; <u>the post-structuralist analysis of</u> "the death of man" and "**the death of the subject**" also **radically preclude meaningful political agency**. As with Michel Foucault, Butler conceives of "subjects" as "produced" by powerknowledge discourses. In Butler's view, the modernist concept of an autonomous subject is a "fictive construct"; and the very act of adhering to a belief in autonomous human choice is to engage in "exclusion and differentiations, perhaps a repression, that is subsequently concealed, covered over, by the effect of autonomy."46 That is, the power of discourse, of language and the unconscious, "produces subjects." <u>If those "subjects" conceive of themselves as having the capacity for conscious choice, they are guilty of "repressing" the manner in which their own "subjectivity" is itself produced by discursive</u> 61 exclusion: "if we agree that politics and a power exist already at the level at which the subject and its agency are articulated and made possible, then agency can be presumed only at the cost of refusing to inquire into its construction."47 Susan Bickford pithily summarizes the post-structuralist rejection of the modernist subject: "power is not wielded by autonomous subjects; rather through power, subjectivity is crafted."48 Bickford grants that post-structuralism provides some insight into how group and individual identity is "culturally constructed." But Bickford goes on to contend that after post-structuralism exposes the "lie of the natural" (that there are no natural human identities), "socially constructed" modern **individuals still wish to act in consort** with others **and to use** human **communication to influence others**: "**people generally understand themselves as culturally constituted and capable of agency**."49¶ For if there is no

"doer behind the deed," but only "performative" acts that constitute the subject, how can the theorist (or activist) assign agency or moral responsibility to actors who are "constituted by discursive practices." ("Discursive practices" engaged in by whom, the observer may ask?) Butler insists that not only is the subject "socially constituted" by power/knowledge discourses, but so too is the "ontologically reflexive self" of the enlightenment. Now if this claim is simply that all social critics are socially-situated, then this view of agency is no more radical a claim than that made by Michael Walzer in his conception of the social critic (or agent). Walzer argues that even the most radical dissident must rely upon the critical resources embedded within his own culture (often in the almost-hidden interstices of that culture).

Effective critical agency cannot depend on some abstract universal, external logic.50 Asserting that critical capacities are themselves socially constructed provides the reader with no means by which to judge whether forms of "resistance" are democratic and which are not. That is, no matter how hard one tries to substitute an aesthetic, "ironic," "amoral ethical sensibility" for morality, the social critic and political activist cannot escape engaging in moral argument and justification with fellow citizens.¶ Butler astutely notes that "resistance" often mirrors the very powerknowledge discourses it rejects—resisting hegemonic norms without offering alternative conceptions of a common political life. But Butler seems to affirm the possibility (by whom?) of effective rejection of such "norming" by "performative resignification." But the "resignification" of "performative" discursive constructions provides no criteria by which to judge whether a given "resignification" is emancipatory or repressive.51 And just who (if not a relatively coherent, choosing human subject) is "performing" the resignification. Furthermore, if all forms of identity and social meaning are predicated upon "exclusion," then the democratic theorist needs to distinguish among those identities which "exclude" in a democratic way and those which exclude in an anti-humanist, racist, and sexist manner. Some social "identities" are democratic and pluralist, such as those created by voluntary affiliations. But other "identities," such as structural, involuntary class differences and racial and sexual hierarchies, must be transformed, even eliminated, if democracy is to be furthered. And how we behave—or "perform"—can subvert (or reinforce) such undemocratic social structures. But if these social structures are immutably inscribed by62 "performative practices," then there can be no democratic resistance. In her call for an ironic politics of "performative resistance," Butler seems to imply that human beings have the capacity to choose which "performative practices" to engage in—and from which to abstain. If this is the case, then a modernist conception of agency and moral responsibility has covertly snuck its way back into Butler's political strategy.52

AT: Change us = Change Institutions

The alternative's emphasis on self-artistry is <u>anti-democratic</u> and has no hope of effectuating political change

Myers 13

(Ella Myers 13, Assistant Professor of Political Science and Gender Studies at the University of Utah, 2013, Worldly Ethics: Democratic Politics and Care for the World, p. 44-45)

Unfortunately, Connolly is inconsistent in this regard, for he also positions Foucauldian self- artistry as an "essential preliminary to," and even the necessary "condition of," change at the macropolitical level.104 That is, although Connolly claims that micropolitics and political movements work "in tandem," each producing effects on the other,105 he sometimes privileges "action by the self on itself" as a starting point and necessary prelude to macropolitical change. This approach not only avoids the question of the genesis of such reflexive action and its possible harmful effects but also indicates that collective efforts to alter social conditions actually await proper techniques of the self. For example, in a rich discussion of criminal punishment in the United States, Connolly contends that "today the micropolitics of desire in the domain of criminal violence has become a condition for a macropolitics that reconfigures existing relations between class, race, crime and punishment."106 Here and elsewhere in Connolly's writing the sequencing renders these activities primary and secondary rather than mutually inspiring and reinforcing.107¶ It is a mistake to grant chronological primacy to ethical self-intervention, however. How, after all, is such intervention, credited with producing salient effects at the macropolitical level, going to get off the ground, so to speak, or assuredly move in the direction of democratic engagement (rather than withdrawal, for example) if it is not tethered, from the beginning, to public claims that direct attention to a specific problem, defined as publicly significant and changeable? How and why would an individual take up reflexive work on the desire to punish if she were not already attuned, at least partially, to problems afflicting current criminal punishment practices? And that attunement is fostered, crucially, by the macropolitical efforts of democratic actors who define a public matter of concern and elicit the attention of other citizens.108¶ For reflexive self- care to be democratically significant, it must be inspired by and continually connected to larger political mobilizations. Connolly sometimes acknowledges that the arts of the self he celebrates are not themselves the starting point of collaborative action but instead exist in a dynamic, reciprocal relation with cooperative and antagonistic efforts to shape collective arrangements. Yet the self's relation with itself is also treated as a privileged site, the very source of democratic spirit and action.¶ This tendency to prioritize the self's reflexive relationship over other modes of relation defines the therapeutic ethics that ultimately emerges out of Foucault's and, to a lesser degree, Connolly's work. This ethics not only elides differences between caring for oneself and caring for conditions but also celebrates the former as primary or, as Foucault says, "ontologically prior." An ethics centered on the self's engagement with itself may have value, but it is not an ethics fit for democracy.

Fails

The alt fails and locks in the status quo approach to surveillance ---the embrace of \<contingency, radical democracy, alterity\> discounts the role of political institutions in modern life and reduces politics to an individualistic project of ethical self-improvement and becoming

Lavin 6

(Chad, teaches political theory at Tulane University, Fear, Radical Democracy, and Ontological Methadone, Polity (2006) 38, 254-275

While liberalism exhorts us to take comfort in the promises and assurances of a fixed identity, radical democracy suggests revealing this identity for the reification that it is so that we can move beyond a tolerant modus vivendi and toward an ethical comportment of generosity and meaningful democracy. They prescribe, as a cure for postmodern agency panic, an enthusiastic embrace of the contingency of everyday life, a series of practices of the self that force an examination of the existential resentment felt by subjects of liberal capitalism: Don't adhere to a manufactured map! Learn to be at home in homelessness! The problem of fear, they suggest, resides in a dogmatic clinging to an untenable and disintegrating myth of subjectivity with an unrealizable promise of control. Their response to the fear of homelessness runs directly counter to the conspiracy theorist: with a model of contingency rather than conspiracy, there are no villains, thus no reservoir for depositing and segregating one's fear. Rather than depositing this fear at the feet of a scapegoat, face it; overcome it.¶ While challenging the liberal fetish for reifying a historical production and thus closing the door on possibilities for alternative subjects to emerge, radical democrats also acknowledge the work done by liberalism to remove metaphysical obstacles to the expression of agency. As such, their claim is not antiliberal so much as it is postliberal, interrogating the limits of the liberal subject in pursuit of a more open approach to identity and difference. For the identities and attachments that have been forged through liberalism are anything but fetters to the unhindered exercise of democracy and production of difference. They are not only productive of many of the freedoms that we enjoy today in the liberal world (e.g., civil rights and liberties, relative government accountability), they also offer valuable solace from a hostile and increasingly unpredictable existence. But because the prescription for those suffering from agency panic tends to be found in the capitalist myths of merit, autonomy, and authenticity, we might look at liberalism as the opiate of the people, easing our pain, but preventing us from doing the work necessary to attend to the source of our ills. Perhaps liberalism, then, for all its value and appeal, is a habit we need to kick. Radical democrats recommend sobering up and facing our fears head-on. But where's the Betty Ford Center for radical democracy?¶ If the fundamentalist drive to reify assumptions and the democratic drive to challenge them are two responses to the same panic that results from social pluralization (as Connolly convincingly claims), the question remains: why do some subjects flee from this fear (through fundamentalism), while others draw from it strength and forbearance (through radical democracy)? What resources allow some subjects to respond to revealed inadequacies of their foundational beliefs with a gracious humility while others respond by desperately clinging to and fundamentalizing the contested position?¶ The short answer is that the democratic move is not an easy one to make. While liberal cognitive maps respond to the complexity of contemporary power networks with a promise of predictability and stability through the claims to fixed identity, rational control, and market efficiency, radical democracy promises precisely what subjects of liberalism fear: enduring instability. The ethos of forbearance asks subjects not only to accept social and political instability today, but ontological instability forever after (whereas the fundamentalizing moves promise order not only in the future, but now). By introducing contingency into the very substance of being, this approach leaves us in indeterminacy without even a promise of finding answers; it is "tentative, experimental," emphasizing the need for perpetual work of "cultivation" without the promise of attaining a stable system;41 it is "a risky and ambiguous enterprise" always threatening to destroy self-confidence as soon as it is built;42 it offers "no necessary political consequences," but only possible gains in freedom.43¶ Going back to Hobbes, radical democrats suggest that we should embrace rather than run from or even merely tolerate the very conditions we fear: unknowability, instability, and discord. Further, Connolly and Butler insinuate unmistakably that liberal authenticity has been thoroughly debunked, still adhered to only by potential or actual fascists who (at best) have been thoroughly colonized by the culture industry and the ideological apparatuses of the state or (at worst) have no sympathy for the contemporary movements interested in expanding the democratic web to include currently disenfranchised populations. They thus imply that it is the social critic who bears the mantle of democracy, and that it is not fear but a stubborn authoritarian desire that obliges resistors to slap the table to illustrate its non-discursiveness and pound their chests to prove their individuated, corporeal, nonporous existence. (A spectre is haunting criticism—the spectre of Leninism.) We can almost hear radical democrats responding that liberal individualists have nothing to lose but their chains.¶ But if the reigning paradigms of identity

and order offer solace from an increasingly indeterminate and unpredictable world (complete with massive layoffs, abandonment of traditional gender norms, declining national sovereignty, and other existential disintegrations), then by what standard can radical democrats call upon the subjects of liberal capitalism to reject the myths that make lives livable? These calls might be the ontological counterpart of ham-fisted approaches to drug abuse, exhorting addicts to take responsibility for themselves and quit cold turkey, with little attention to the social and psychological dynamics that lead millions of users to abuse narcotics, hallucinogens, opiates, and amphetamines—be they consumers of heroin, religious fervor, Xanax, or extreme corn chips and suburban assault vehicles.¶ The sales pitch for radical democracy rarely accounts for the degree to which citizens are interpellated as subjects of fear. Connolly is more than aware of the interpellations that subjects of capitalism receive; large sections of The Ethos of Pluralization are dedicated to the relationship between economic anxiety and the drive to fundamentalism, and Why I Am Not a Secularist is largely an indictment of secularism (and much of American liberalism) for failing to account for the habits inscribed on the body that rational argumentation cannot erase.44 His attention to what he calls "the visceral register," and his recommendation that the left take a lesson from William Bennett on how to appeal to this register is both compelling and timely.45 Unfortunately, Connolly's intellectual trajectory has shifted away from the social and political apparatuses which inculcate these habits and toward the level of neurology to explain the inward mechanisms of habits and ethics;46 while he never denies the relevance of social and political institutions (he merely argues that "too many cultural theorists" ignore the biological components of thinking and ethics), his trajectory has led him to speak more about what practices of the self might lead to more democracy and less about the institutional production of subjects who actually fear democracy.47 As White convincingly argued well before this latest turn toward biological studies, Connolly takes attitudes to have primacy over issues of justice, leading him to prematurely curtail pursuit of the obviously compatible institutional dimension of criticism.48¶ The common scoundrel in such critiques of liberalism, the prototypical antidemocratic citizen, is typified by Archie Bunker and his white working-class buddies. Resentful, socially and economically conservative, and easily seduced by reactionary propagandists, this was the face of fundamentalism before 9/11. Notably, this is a population whose economic viability and (therefore) ability to live up to conventional norms of masculinity have been taking it in the gut in recent decades. Identifying the threats that have constituted this subject, Connolly notes the familiar targets: civil rights, Vietnam, feminism, dismantling of the welfare state, environmentalism, and a decline in the availability of industrial jobs.49 Along with these transformations in established relations of power, we can also add to this list (which Connolly may or may not have intended to be exhaustive) the supposed death of grand narratives declared by critical intellectuals. Traditional cognitive maps are not only becoming obsolete in the wake of shifting terrain, but they are being criticized for being defective from the get-go. Given this, is the rise in public fear a surprise? As Jameson's, Melley's, and Furedi's attention to the paucity of concepts suggests, isn't the declining availability of cognitive maps to those threatened by shifting networks of power a prime candidate for Connolly's list?50¶ If fundamentalisms feed on the anxieties endemic to late capitalist (dis)order; if market ideology, conspiracy theories, and aggressive nostalgia are degraded attempts to construct cognitive maps that might provide threatened subjects with a sense of agency; what does radical democracy offer in their stead? Traditional fundamentalisms are popular precisely because they treat the agency panic and existential angst accelerated by global capitalism and postmodern culture. Again, Connolly recognizes the absence of viable democratic supplements to the decline of grand narratives, and he laments that the world's most zealous moralizers have effectively filled that void. But claims that rethinking liberalism's ontological commitments cannot be an afterthought of political emancipation (but must be coterminous with or preliminary to it), betray an inattention to how a postmodern ethos is intimately tied to the various psychological, economic, and political securities that cognitive maps often provide. While Connolly's diagnosis of fundamentalist epidemics clearly highlights their social and economic roots, he presents a postmodern sensibility as a treatment for the anxieties of identity without considering the role that this move may have played in actually producing those anxieties by threatening the cherished existence of those perhaps most in need of their help.51 My concern is not the diagnosis, but the prescription, as it is for a regimen that few have any interest in adopting.¶ Radical democracy is premised on the idea that its ontology and ethics are necessary to an enactment of the pluralism that liberalism purports to offer, transcending mere tolerance toward a generous fostering of otherness and a meaningfully democratic way of life. At the same time, however, it is insensitive to the profound threat that genealogy poses to those who receive their only respite from a truly tenuous existence from their myths. While its pitch suggests that it is ontologically more defensible, ethically more admirable, and practically more conducive to a generous ethical-political comportment (contentions with which I agree, incidentally), it does not consider the sheer difficulty (and often terror) in adopting such a position. Certainly, it does not speak to the members of society who are

the most economically, politically, and/or socially disadvantaged, whose daily survival is so tenuous as to not provide the luxury for the practices of self-cultivation which it advocates.¶ I am far from the first to call attention to the dangers of and aversions to genealogy. The aristocratic baggage of Nietzscheanism, from which radical democrats have vigorously sought to distance themselves, stems largely from Nietzsche's acknowledgement of the difficulties of abandoning foundations. No friend of pity, Nietzsche nevertheless prescribes revaluing our constitutive values only to a privileged class, maintaining that we cannot ask lambs to be birds of prey.52 Similarly, William James discusses the differential capacities of modern subjects to be at home in homelessness, expressing concern for those who might not be ready or able to make such a move. He argues (with unfortunate terminology) that the "healthy" has a responsibility to attend to the "sick" soul, and that some are not ready, willing, or able to abandon their most cherished myths: "Some constitutions need them too much."53 Returning to our liberal fundamentalist, Rorty emphasizes that "most people" are not interested in facing the contingency of their identities, and that "there is something very cruel about" revealing their contestability and groundlessness.54¶ While these arguably elitist arguments might sit uncomfortably with the radically democratic impulses of Connolly and Butler, which is more democratic: Throwing everybody into the same pool? Or realizing that not everybody knows how to swim? Or realizing that some citizens, having seen their parents devoured by sharks, might think the waters unsafe? Connolly reads Rorty's courteous capitulation to fear as an abandonment of irony precisely where it is most important. Whereas Rorty coddles subjects of fear, Connolly scolds them for their cowardice.55¶ I do not mean to suggest that consistency would oblige radical democrats to respect discourses hostile to pluralization (Connolly addresses this issue repeatedly). Nor do I want to imply that we should refrain from attacking the antidemocratic presumptions of various fundamentalisms. But I am concerned that the approach to fundamentalism in this literature is something much closer to hostility than sympathy (to say nothing of empathy). For all of its talk of generosity, radical democracy remains quite stingy with regard to this issue. Accepting that there remains a compatibility between foundational thought and undemocratic or authoritarian politics, the apparent expectation that the articulation of this compatibility might convince any lingering fundamentalists of their error **is distressing**. In fact, Connolly effectively labels those lacking in the material, philosophical, or psychological resources necessary for the move he recommends latent brownshirts, thus betraying not only a commitment to liberal voluntarism, but also a striking lack of generosity toward those still in need of comforting maps.56¶ Radical democrats clearly recognize the material conditions that may not provide the comfort necessary to develop an ethos of generosity. As diagnosticians, they are certainly attuned to the tactics applied by institutions (markets, ideologies, militaries) to subjects and the constant interpellation of subjects of fear. Nevertheless, the prescribed micropolitics of desire summons a heroic capacity to respond generously to the myriad threats we encounter. Recommending that subjects abandon the cognitive maps (Christianity, conspiracy theories, market fundamentalism) that allow them to find their bearings in increasingly complicated and vast networks of power, they ultimately reduce liberal fundamentalism to a problem of individual priorities and ethical failures rather than a medical condition requiring professional treatment or (better) a **public health issue** not easily or appropriately tied to any individual's preferences. **As in contemporary U.S. drug policy** rhetoric, **the addiction is** all-**too-easily reduced to an issue of personal responsibility, taking focus away from the institutions** responsible for the daily interpellation of subjects of fear.¶ Conclusion¶ Despite a relatively mature Constitution, Americans are no strangers to instability. In recent decades, the assurances of job security and the welfare state have fallen victim to a vicious market ideology; traditional codes of masculinity and femininity have become increasingly unrealizable with Martha Stewart and J. Lo doing their best to humiliate the ladies, Bill Gates and Vin Diesel the gentlemen; and illusions of effective agency have been ravaged by unprecedented technological and geopolitical transformations. In this condition, though radical democrats denounce the comforting liberal myth of the autonomous individual as a ruse of antidemocratic power, its ideology of identity, authenticity, and responsibility provides relief from the ontological homelessness endemic to a world with ever fewer uncontested narratives. Liberalism allows us to personalize and segregate various anonymous hostilities, facilitating displacements of general anxieties onto welfare moms, homosexual teachers, professional women, non-white street criminals, Zionist Occupied Governments, and Islamic fundamentalists.¶ While the reactionary grasp at liberal fundamentalism certainly constitutes an obstacle to a democratic politics of difference, it is also the case that subjects of late capitalism are interpellated as subjects of fear, reared to understand every component of society with suspicion. Navigating the breathtaking and impersonal forces of bureaucratic capitalism with categories which emphasize (indeed, almost exclusively mention) the powers of isolated individuals, we are led to an ever more hopeless situation. As history moves on and our cognitive maps seem less and less relevant for helping us chart networks of power, we feel an overwhelming sense of powerlessness. The ideology of autonomy, authenticity, and responsibility seems an entirely logical aid for coping with this agency panic. Indeed, liberalism both creates and then assuages the fears of late capitalism.¶ In this age of Panic, in which our surroundings appear at least comparably if not more alive and efficacious than our selves, radical democrats trenchantly reveal liberal ideology as an addictive and distorting source of relief. But in prescribing a micropolitics of desire to kickstart the stalled project of democratization, they locate the work of politics in the contested site of the individual and discount the degree to which these individuals actually fear the unpredictable and radically democratic order being promised. Contesting the validity of the cognitive maps most commonly used to steer a course through institutions of social and political power, they ask subjects to

abandon the anesthetizing components of liberal fundamentalism for a world composed of unstable identities and provisional reconciliations that are grounded in a set of ontological commitments that are weak at best. But as all but the most steadfast purveyors of simplification in the so-called war on drugs realize, addiction is inscribed on the body, and requires both desire and treatment to be overcome. Radical democrats realize why we are identity junkies. But where, oh where, are the ontological treatment centers and methadone clinics?

Queerness

Law Good

K Challenge Heteronorm

Even if the law isn't perfect, sexual activists have been able to strategically use traditional political areas in queer ways to challenge heteronormativity.

Lind 10

(Amy Lind 10, Mary Ellen Heintz Endowed Chair and Professor of Women's, Gender, and Sexuality Studies at the University of Cincinatti, Development, Sexual Rights and Global Governance, p 17-18)

In Chapter 8, Sangeeta Budhiraja, Susana T. Fried and Alexandra Teixeira address tensions among identity-based organizing and sexual rights advocacy. On one hand, activists around the world have addressed "lesbian and gay," and later, "lesbian, gay and bisexual (LGB)," then "lesbian, gay, bisexual and transgender (LGBT)" or "lesbian, gay, bisexual, transgender and questioning and or queer" (LGBTQ)" rights, the "alphabet soup" approach, as a way to make sexual and gender minorities visible in national and international political and development arenas. Yet, more recently, scholars and activists have turned toward a sexual rights framework as a way to **overcome essentialisms** in positing individuals as singular identities that are often homogenized and universalized in development discourse and practice. Drawing upon their former advocacy work at the International Gay and Lesbian Human Rights Commission, the authors demonstrate the difficulties of naming and finding a common ground on a global level as well as the useful- ness of utilizing a broad-based sexual rights framework for thinking about sexual identity, gender identity, human rights, and development. They argue that a sexual rights framework allows for greater cross-movement organizing, gives deference to local activists' preferred ways of thinking of and **expressing any gender which falls outside of social and cultural norms,** and encourages modes of organizing that **do not reify gender and sexual binaries.** Yet activists must necessarily use, perhaps strategically, normative categories of gender and sexuality in order to achieve their concrete goals for legal and policy reform, a dilemma that they highlight through- out their chapter. In Chapter 9, Petra Doan discusses how increasing the visibility of gender-variant individuals in the Middle East, a region often characterized in development dis- course in orientalist terms as patriarchal and oppressive to women, might actually "queer" the development process and stimulate change on a broader scale. For Doan, genderqueerness does not begin or end in the West; rather, it has always been part of Middle Eastern societies, but it has been through powerful modern dis- courses such as that of development which have problematized these identities as abnormal or deviant. Despite colonialist legacies, it has been through the **strategic utilization of these modern discourses** that gender-variant individuals in the region have found **creative ways to organize collectively and fight for their rights**.

Other

Alt Cedes Politics

The alt cedes politics to the right and reinscribes gender roles

McCluskey 8

(Professor of Law and William J. Magavern Faculty Scholar @ SUNY Buffalo Law (Martha, How Queer Theory Makes Neoliberalism Sexy, Buffalo Legal Studies Research Paper No. 2008-15)

Queer theory's anti-moralism works together with its anti-statism to advance not simply "politics," but a specific vision of good "politics" seemingly defined in opposition to progressive law and morality. This anti-statist focus distinguishes queer theory from other critical legal theories that bring questions of power to bear on moral ideals of justice. Kendall Thomas (2002), for example, articulates a critical political model that sees justice as a problem of "power, antagonism, and interest," (p. 86) involving questions of how to constitute and support individuals as citizens with interests and actions that count as alternative visions of the public. Thomas contrasts this political model of justice with a moral justice aimed at discovering principles of fairness or institutional processes based in rational consensus and on personal feelings of respect and dignity. Rather than evaluating the moral costs and benefits of a particular policy by analyzing its impact in terms of harm or pleasure, Thomas suggests that a political vision of justice would focus on analyzing how policies produce and enhance the collective power of particular "publics" and "counterpublics" (pp. 91—5). From this political perspective of justice, neoliberal economic ideology is distinctly moral, even though it appears to be anti-moralist and to reduce moral principles to competition between self-interested power. Free-market economics rejects a political vision of justice, in this sense, in part because of its expressed anti-statism; it turns contested normative questions of public power into objective rational calculations of private individual sensibilities. Queer theory's similar tendency to romanticize power as the pursuit of individualistic pleasure free from public control risks disengaging from and disdaining the collective efforts to build and advance normative visions of the state that arguably define effective politics. Brown and Halley (2002), for instance, cite the Montgomery bus boycott as a classic example of the left's problematic march into legalistic and moralistic identity politics. In contrast, Thomas (2002) analyzes the Montgomery bus boycott as a positive example of a political effort to constitute a black civic public, even though the boycott campaign relied on moral language to advance its cause, because it also emphasized and challenged normative ideas of citizenship (p. 100, note 14). By glorifying rather than deconstructing the neoliberal dichotomy between public and private, between individual interest and group identity, and between demands for power and demands for protection, queer theory's anti-statism and anti-moralism plays into a right-wing double bind. In the current conservative political context, the left appears weak both because its efforts to use state power get constructed as excessively moralistic (the feminist thought police, or the naively paternalistic welfare state) and also because its efforts to resist state power get constructed as excessively relativist (promoting elitism and materialism instead of family values and community well-being). The right, on the other hand, has it both ways, asserting its moralism as inherent private authority transcending human subjectivity (as efficient market forces, the sacred family, or divine will) and defending its cultivation of self-interested power as the ideally virtuous state and market (bringing freedom, democracy, equality to the world by exercising economic and military authoritarianism). From Egalitarian Politics to Renewed Conservative Identity Queer theory's anti-statism and anti-moralism risks not only reinforcing right-wing ideology, but also infusing that ideology with energy from renewed identity politics. Susan Fraiman (2003) analyzes how queer theory (along with other prominent developments in left academics and culture) tends to construct left resistance as a radical individualism modeled on the male "teen rebel, defined above all by his strenuous alienation from the maternal" (p. xii). Fraiman observes that this left vision relies on "a posture of flamboyant unconventionality [that] coexists with highly conventional views of gender [and] is, indeed, articulated through them" (p. xiii). Fraiman links recent left contempt for feminism to a romantic vision of "coolness … epitomized by the modern adolescent boy in his anxious, self-conscious and theatricalized will to separate from the mother" who is by definition uncool—controlling, moralistic, sentimental and not sexy. (p. xii). Even though queer theory distinguishes itself from feminism by

repudiating dualistic ideas of gender, its anti-foundationalism **covertly promotes an essentialist "binary that puts femininity, reproduction, and normativity on the one hand, and masculinity, sexuality, and queer resistance on the other"** (p. 147). This binary permeates queer theory's condemnation of "governance feminism." (Brown and Halley, 2002; Wiegman, 2004) a vague category mobilizing images of the frumpy, overbearing, unexciting, unfunny, and not-so-smart "schoolmarm" (Halley, 2002) whose authority will naturally be undermined when real "men" appear on the scene. Suggesting the importance of gender conventions to the term's power, similar phrases do not seem to have gained comparable academic currency as a way to deride the complex regulatory impact of other specific uses of state authority -for instance postmodernists do not seem to widely denounce "governance anti-racism," "governance socialism," "governance populism," "governance environmentalism" or "governance masculinism" (though Brown and Halley do criticize progressive law reform more generally with the term "governance legalism" (p. 11)). Queer attraction to an adolescent masculinist idea of the "cool' dovetails smoothly with the identity politics of the right. Right-wing politics and culture similarly condemn progressive and feminist policies with the term "nanny state" (McCluskey, 2000; 2005a). The "nanny state" epithet enlists femaleness or femininity as shorthand to make some government authority feel bad to those comfortable with or excited by a masculinist moral order, it adds to this sentimental power by coding the maternal authority to be resisted as a "nanny" (rather than simply a "mommy"), enlisting identities of class, age—and perhaps race and nationality—to enhance uncritical suspicions of disorder and illegitimacy. The "nanny state" slur tells us that a rougher and tougher neoliberal state, market, and family will bring the grown-up pleasures, freedom, and power that are the mark and privilege of ideal manhood. The "nanny state" is not an isolated example of the use of gender identity to disparage progressive or even centrist policies that are not explicitly identified as feminist or gender-related. For example, "girlie-man" gained currency in the 2004 presidential election to disparage opposition to George W. Bush's right-wing economic and national security policies (Grossman and McClain, 2004), and in 2008 critics of presidential candidate Barack Obama similarly linked him to disparaging images of femininity (Campanile 2008; Faludi 2008). These terms open a window into the connections between economic libertarianism and moral fundamentalism. Libertarianism's anti-statism and anti-moralism requires sharp distinctions between public and private, morality and power, individual freedom and social coercion. The problem, if we assume these distinctions are not self-evident facts, is that libertarianism must refer covertly to some external value system to draw its lines. Identity conventions have long helped to do this work, albeit in complex and sometimes contradictory ways. Power appears weak, deceptive, illegitimate, manipulative, controlling, undisciplined, oppressive, exceptional, or naive if it is feminized; but strong, self-satisfying, public-serving, protective, orderly, rational, and a normal exercise of individual freedom if it is masculinized. Conventional political theory and culture identifies legitimate authority with an idea of a masculine power aimed at policing supposedly weaker or subordinate others. A state that publicly depends on and promotes such power enhances rather than usurps private freedom and security in citizenship, market, and family, according to the traditional theory of the patriarchal household as model for the state (see Dubber, 2005). Queer theory updates this pre-modern political ideology into smart postmodernism and transgressive politics by **re-casting its idealized masculine power in the image of a youthful and sexy disdain for feminized concerns about social, bodily, or material limits and support**. In her challenge to this queer romanticization of "coolness," Fraiman (2003) instead urges a feminism that will "question a masculinity overinvested in youth, fearful of the mutable flesh, and on the run from intimacy ... [to] claim, in its place, the jouissance of a body that is aging, pulpy, no longer intact... a subject who is tender-hearted ... who is neither too hard nor too fluid for attachment; who does the banal, scarcely narratable, but helpful things that moms' do" (p. 158). Feminist legal theory concerned with economic politics adds to this alternative vision an ideal that advances and rewards the pleasure, power, and public value of the things done by some of those moms' nannies (McCluskey, 2005a)—or by the many others engaged in the work (both paid and unpaid) that sustains and enhances others' pleasure and power in and out of the home (McCluskey, 2003a; Young, 2001). One means toward that end would be to make the domestic work (and its play and pleasure) conventionally treated as both banal or spiritual (see Roberts, 1997b) deserving of a greater share of state and market material rewards and resources on a more egalitarian basis, as Fineman's (2004) vision would do.

Security

Alt Answers

Security Alt Fails

Have to transform systems from the inside out-otherwise rhetoric changes but not policies.

McCormack 10

(Tara, PhD in International Relations from the University of Westminster, Critique, Security and Power: The political limits to emancipatory approaches, pg 59-61)

In chapter 7 I engaged with the human security framework and some of the problematic implications of 'emancipatory' security policy frameworks. In this chapter I argued that the shift away from the pluralist security framework and the elevation of cosmopolitan and emancipatory goals has served to enforce international power inequalities rather than lessen them. Weak or unstable states are subjected to greater international scrutiny and international institutions and other states have greater freedom to intervene, but the citizens of these states have no way of controlling or influencing these international institutions or powerful states. This shift away from the pluralist security framework has not challenged the status quo, which may help to explain why major international institutions and states can easily adopt a more cosmopolitan rhetoric in their security policies. As we have seen, the shift away from the pluralist security framework has entailed a shift towards a more openly hierarchical international system, in which states are differentiated according to, for example, their ability to provide human security for their citizens or their supposed democratic commitments. In this shift, the old pluralist international norms of (formal) international sovereign equality, non-intervention and 'blindness' to the content of a state are overturned. Instead, international institutions and states have more freedom to intervene in weak or unstable states in order to 'protect' and emancipate individuals globally. Critical and emancipatory security theorists argue that the goal of the emancipation of the individual means that security must be reconceptualised away from the state. As the domestic sphere is understood to be the sphere of insecurity and disorder, the international sphere represents greater emancipatory possibilities, as Tickner argues, 'if security is to start with the individual, its ties to state sovereignty must be severed' (1995: 189). For critical and emancipatory theorists there must be a shift towards a 'cosmopolitan' legal framework, for example Mary Kaldor (2001: 10), Martin Shaw (2003: 104) and Andrew Linklater (2005). For critical theorists, one of the fundamental problems with Realism is that it is unrealistic. Because it prioritises order and the existing status quo, Realism attempts to impose a particular security framework onto a complex world, ignoring the myriad threats to people emerging from their own governments and societies. Moreover, traditional international theory serves to obscure power relations and omits a study of why the system is as it is: [O]mitting myriad strands of power amounts to exaggerating the simplicity of the entire political system. Today's conventional portrait of international politics thus too often ends up looking like a Superman comic strip, whereas it probably should resemble a Jackson Pollock. (Enloe, 2002 [1996]: 189) Yet as I have argued, contemporary critical security theorists seem to show a marked lack of engagement with their problematic (whether the international security context, or the Yugoslav break-up and wars). Without concrete engagement and analysis however, the critical project is undermined and critical theory becomes nothing more than a request that people behave in a nicer way to each other. Furthermore, whilst contemporary critical security theorists argue that they present a more realistic image of the world, through exposing power relations, for example, their lack of concrete analysis of the problematic considered renders them actually unable to engage with existing power structures and the way in which power is being exercised in the contemporary international system. For critical and emancipatory theorists the central place of the values of the theorist mean that it cannot fulfil its promise to critically engage with contemporary power relations and emancipatory possibilities. Values must be joined with engagement with the material circumstances of the time.

Alt Fails

The alt fails—the system's too sticky to simply wish away

Georg **SORENSEN**, British International Studies Association, **98**

[*IR Theory after the cold war*, p. 87-88]

What, then, are the more general problems with the extreme versions of the postpositivist position? The first problem is that they tend to overlook, or downplay, the actual insights produced by non-post-positivists, such as, for example, neorealism. It is entirely true that anarchy is no given, ahistorical, natural condition to which the only possible reaction is adaptation. But the fact that anarchy is a historically specific, socially constructed product of human practice does not make it less real. In a world of sovereign states, anarchy is in fact out there in the real world in some form. In other words, it is not the acceptance of the real existence of social phenomena which produces objectivist reification. Reification is produced by the transformation of historically specific social phenomena into given, ahistorical, natural conditions.21 Despite their shortcomings, neorealism and other positivist theories have produced valuable insights about anarchy, including the factors in play in balance-of-power dynamics and in patterns of cooperation and conflict. Such insights are downplayed and even sometimes dismissed in adopting the notion of 'regimes of truth'. It is, of course, possible to appreciate the shortcomings of neorealism while also recognizing that it has merits. One way of doing so is set forth by Robert Cox. He considers neorealism to be a 'problem-solving theory' which 'takes the world as it finds it, with the prevailing social and power relationships . . . as the given framework for action . . . . The strength of the problem-solving approach lies in its ability to fix limits or parameters to a problem area and to reduce the statement of a particular problem to a limited number of variables which are amenable to relatively close and precise examination'.22 At the same time, this 'assumption of fixity' is 'also an ideological bias . . . Problem-solving theories (serve) . . . particular national, sectional or class interests, which are comfortable within the given order'.23 In sum, objectivist theory such as neorealism contains a bias, but that does not mean that it is without merit in analysing particular aspects of international relations from a particular point of view. The second problem with post-positivism is the danger of extreme relativism which it contains. If there are no neutral grounds for deciding about truth claims so that each theory will define what counts as the facts, then the door is, at least in principle, open to anything goes . Steve Smith has confronted this problem in an exchange with Øyvind Østerud. Smith notes that he has never 'met a postmodernist who would accept that "the earth is flat if you say so". Nor has any postmodernist I have read argued or implied that "any narrative is as good as any other"'.24 But the problem remains that if we cannot find a minimum of common standards for deciding about truth claims a post-modernist position appears unable to come up with a metatheoretically substantiated critique of the claim that the earth is flat. In the absence of at least some common standards it appears difficult to reject that any narrative is as good as any other.25 The final problem with extreme post-positivism I wish to address here concerns change. We noted the post-modern critique of neorealism's difficulties with embracing change; their emphasis is on 'continuity and repetition'. But extreme post-positivists have their own problem with change, which follows from their metatheoretical position. In short, how can post-positivist ideas and projects of change be distinguished from pure utopianism and wishful thinking? Post-positivist radical subjectivism leaves no common ground for choosing between different change projects. A brief comparison with a classical Marxist idea of change will demonstrate the point I am trying to make. In Marxism, social change (e.g. revolution) is, of course, possible. But that possibility is tied in with the historically specific social structures (material and non-material) of the world. Revolution is possible under certain social conditions but not under any conditions. Humans can change the world, but they are enabled and constrained by the social structures in which they live. There is a dialectic between social structure and human behaviour.26 The understanding of 'change' in the Marxist tradition is thus closely related to an appreciation of the historically specific social conditions under which people live; any change project is not possible at any time. Robert Cox makes a similar point in writing about critical theory: 'Critical theory allows for a normative choice in favor of a social and political order different from the prevailing order, but it limits the range of choice to alternative orders which are feasible transformations of the existing world . . . Critical theory thus contains an element of utopianism in the sense that it can represent a coherent picture of an alternative order, but its utopianism is constrained by its comprehension of historical processes. It must reject improbable alternatives just as it rejects the

permanency of the existing order'.27 That constraint appears to be absent in post-positivist thinking about change, because radical post-positivism is epistemologically and ontologically cut off from evaluating the relative merit of different change projects. Anything goes, or so it seems. That view is hard to distinguish from utopianism and wishful thinking. If neorealism denies change in its overemphasis on continuity and repetition, then radical post-positivism is

Re-Thinking Fails

Individual rethinking fails -governments' obey institutional logics that exist independently of individuals and constrain decision making

Wight 6

(Colin, Sydney IR professor, Agents, Structures and International Relations: Politics as Ontology, pg 48-50)

One important aspect of this relational ontology is that these relations constitute our identity as social actors. According to this relational model of societies, one is what one is, by virtue of the relations within which one is embedded. A worker is only a worker by virtue of his/her relationship to his/her employer and vice versa. 'Our social being is constituted by relations and our social acts presuppose them.' At any particular moment in time an individual may be implicated in all manner of relations, each exerting its own peculiar causal effects. This 'lattice-work' of relations constitutes the structure of particular societies and endures despite changes in the individuals occupying them. Thus, the relations, the structures, are ontologically distinct from the individuals who enter into them. At a minimum, the social sciences are concerned with two distinct, although mutually interdependent, strata. There is an ontological difference between people and structures: 'people are not relations, societies are not conscious agents'. Any attempt to explain one in terms of the other should be rejected. If there is an ontological difference between society and people, however, we need to elaborate on the relationship between them. Bhaskar argues that we need a system of mediating concepts, encompassing both aspects of the duality of praxis into which active subjects must fit in order to reproduce: that is, a system of concepts designating the 'point of contact' between human agency and social structures. This is known as a 'positioned practice' system. In many respects, the idea of 'positioned practice' is very similar to Pierre Bourdieu's notion of *habitus*. Bourdieu is primarily concerned with what individuals do in their daily lives. He is keen to refute the idea that social activity can be **understood solely in terms of individual decision-making,** or as determined by surpa-individual objective structures. Bourdieu's notion of the *habitus* can be viewed as a bridge-building exercise across the explanatory gap between two extremes. Importantly, the notion of a habitus can only be understood in relation to the concept of a 'social field'. According to Bourdieu, a social field is 'a network, or a configuration, of objective relations between positions objectively defined'. A social field, then, refers to a structured system of social positions occupied by individuals and/or institutions – the nature of which defines the situation for their occupants. This is a social field whose form is constituted in terms of the relations which define it as a field of a certain type. A habitus (positioned practices) is a mediating link between individuals' subjective worlds and the socio-cultural world into which they are born and which they share with others. The power of the habitus derives from the thoughtlessness of habit and habituation, rather than consciously learned rules. The habitus is imprinted and encoded in a socializing process that commences during early childhood. It is inculcated more by experience than by explicit teaching Socially competent performances are produced as a matter of routine, without explicit reference to a body of codified knowledge, and without the actors necessarily knowing what they are doing (in the sense of being able adequately to explain what they are doing). As such, the *habitus* can be seen as the site of 'internalization of reality and the externalization of internality.' Thus social practices are produced in, and by, the encounter between: (1) the habitus and its dispositions; (2) the constraints and demands of the socio-cultural field to which the habitus is appropriate or within; and (3) the dispositions of the individual agents located within both the socio-cultural field and the habitus. When placed within Bhaskar's stratified complex social ontology the model we have is as depicted in Figure 1. The explanation of practices will require all three levels. Society, as field of relations, exists prior to, and is independent of, individual and collective understandings at any particular moment in time; that is, social action requires the conditions for action. Likewise, given that behavior is seemingly recurrent, patterned, ordered, institutionalised, and displays a degree of stability over time, there must be sets of relations and rules that govern it. Contrary to individualist theory, these relations, rules and roles are not dependent upon either knowledge of them by particular individuals, or the existence of actions by particular individuals; that is, **their explanation cannot be reduced to consciousness** or to the attributes **of individuals**. These emergent social forms must possess emergent powers. This leads on to arguments for the reality of society based on a causal criterion.

Society, as opposed to the individuals that constitute it, is as Foucault has put it, 'a complex and independent reality that has its own laws and mechanisms of reaction, its regulations as well as its possibility of disturbance. This new reality is society…It becomes necessary to reflect upon it, upon its specific characteristics, its constants and its variables'.

Liberal Int'l Good

We have a defense of the way we view international relations---game-theory proves that liberal internationalism is effective

Recchia and Doyle 11

(Stefano, Assistant Professor in International Relations at the University of Cambridge, and Michael, Harold Brown Professor of International Affairs, Law and Political Science at Columbia University, "Liberalism in International Relations", In: Bertrand Badie, Dirk Berg-Schlosser, and Leonardo Morlino, eds., International Encyclopedia of Political Science (Sage, 2011), pp. 1434-1439)

Relying on new insights from game theory, scholars during the 1980s and 1990s emphasized that so-called international regimes, consisting of agreed-on international norms, rules, and decision-making procedures, can help states **effectively coordinate** their policies and collaborate in the production of international public goods, such as free trade, arms control, and environmental protection. Especially, if embedded in formal multilateral institutions, such as the World Trade Organization (WTO) or North American Free Trade Agreement (NAFT A), regimes crucially improve the availability of information among states in a given issue area, thereby promoting reciprocity and enhancing the reputational costs of noncompliance. As noted by Robert Keohane, institutionalized multilateralism also reduces strategic competition over relative gains and thus further advances international cooperation. Most international regime theorists accepted Kenneth Waltz's (1979) neorealist assurription of states as black boxes-that is, unitary and rational actors with given interests. Little or no attention was paid to the impact on international cooperation of domestic political processes and dynamics. Likewise, regime scholarship largely disregarded the arguably crucial question of whether prolonged interaction in an institutionalized international setting can fundamentally change states' interests or preferences over outcomes (as opposed to preferences over strategies), thus engendering positive feedback loops of increased overall cooperation. For these reasons, international regime theory is not, properly speaking, liberal, and the term neoliberal institutionalism frequently used to identify it is somewhat misleading. It is only over the past decade or so that liberal international relations theorists have begun to systematically study the relationship between domestic politics and institutionalized international cooperation or global governance. This new scholarship seeks to explain in particular the close interna tional cooperation among liberal democracies as well as higher-than-average levels of delegation b)' democracies to complex multilateral bodies, such as the \ Liberalism in International Relations 1437 European Union (EU), North Atlantic Treaty Organization (NATO), NAFTA, and the WTO (see, e.g., John Ikenberry, 2001; Helen Milner & Andrew Moravcsik, 2009). The reasons that make liberal democracies particularly enthusiastic about international cooperation are manifold: First, transnational actors such as nongovernmental organizations and private corporations thrive in liberal democracies, and they frequently advocate increased international cooperation; second, elected democratic officials rely on delegation to multilateral bodies such as the WTO or the EU to commit to a stable policy line and to internationally lock in fragile domestic policies and constitutional arrangements; and finally, powerful liberal democracies, such as the United States and its allies, voluntarily bind themselves into complex global governance arrangements to demonstrate strategic restraint and create incentives for other states to cooperate, thereby reducing the costs for maintaining international order. Recent scholarship, such as that of Charles Boehmer and colleagues, has also confirmed the classical liberal intuition that formal international institutions, such as the United Nations (UN) or NATO, independently contribute to peace, especially when they are endowed with sophisticated administrative structures and information-gathering capacities. In short, research on global governance and especially on the relationship between democracy and international cooperation is thriving, and it usefully complements liberal scholarship on the democratic peace.

Scenario Planning Good

Bernstein concludes aff---scenario planning is good

Bernstein 2

(Steven, Richard Ned Lebow, Janice Gross Stein and Steven Weber, University of Toronto, The Ohio State University, University of Toronto and University of California at Berkeley. "God Gave Physics the Easy Problems" European Journal of International Relations 2000; 6; 43

One useful alternative approach is the development of **scenarios**, or narratives with plot lines that map a set of causes and trends in future time. This forward reasoning strategy is based on a notion of **contingent causal mechanisms, in opposition to the standard**, neo-positivist focus on efficient causes, but with no clear parallel in evolutionary biology. It should not be confused with efforts by some to develop social scientific concepts directly analogous to evolutionary mechanisms (such as variation or selection) in biology to explain, for example, transfor~ations in the international system or institutions, or conditions for optimum performance in the international political economy.9¶ **Scenarios** are not **predictions**. rather, they start with the assumption that the future is unpredictable and tell alternative stories of how the future may unfold. Scenarios are generally constructed by distinguishing what we believe is relatively certain from what we think is uncertain. The most important 'certainties' are common to all scenarios that address the same problem or trend, while the most important perceived uncertainties differentiate one scenario from another.¶ This approach differs significantly from a forecasting tournament or competition, where advocates of different theoretical perspectives generate differential perspectives on a single outcome in the hope of subsequently identifYing the 'best' or most accurate performer. Rather, by constructing scenarios, or plausible stories of paths to the future, we can identifY different driving forces (a term that we prefer to independent variable, since it implies a force pushing in a certain direction rather than what is known on one side of an 'equals' sign) and then attempt to combine these forces in logical chains that generate a range of outcomes, rather than single futures. Scenarios make contingent claims rather than point predictions They reinsert a sensible notion of contingency into theoretical arguments that would otherwise tend toward determinism. Scholars in international relations tend to privilege arguments that reach back into the past and parse out one or two causal variables that are then posited to be the major driving forces of past and future outcomes. The field also favors variables that are structural or otherwise parametric, thus downplaying the role of both agency and accident. **Forward reasoning undercuts structural determinism** by raising the possibility and plausibility of multiple futures.¶ Scenarios are impressionistic pictures that build on different combinations of causal variables that may also take on different values in different scenarios. Thus **it is possible to construct scenarios without pre-existing firm proof of theoretical claims** that meet strict positivist standards. The foundation for scenarios is made up of provisional assumptions and causal claims. These become the subject of revision and updating more than testing. A set of scenarios often contains competing or at least contrasting assumptions. It is less important where people start, than it is where they end up through frequent revisions, and how they got there. **A good scenario is an internally consistent hypothesis about how the future might unfold**; it is **a chain of logic** that connects 'drivers' to outcomes (Rosell, 1999: 126). Consider as an example one plausible scenario at the level of a 'global future' where power continues to shift away from the state and towards international institutions, transnational actors and local communities.¶ The state loses its monopoly on the provision of security and basic characteristics of the Westphalian system as we have known it are fundamentally altered. In this setting, key decisions about security, economics and culture will be made by non-state actors. Security may become a commodity that can be bought like other commodities in the global marketplace. A detailed scenario about this transformation would specify the range of changes that are expected to occur and how they are connected to one another. It would also identify what kinds of evidence might support the scenario as these or other processes unfold over the next decade, and what kind of evidence would count against the scenario. This is simply a form of process tracing, or increasing the number of observable implications of an argument, in future rather than past time. Eventually, as in the heuristics of evolutionary biology, future history becomes data. But instead of thinking of data as something that can falsify any particular hypothesis, one should think of it as something capable of distinguishing or selecting the story that was from the stories that might have been.

One Speech =/= Link

One speech act doesn't cause securitization

Ghughunishvili 10

(Irina, "Securitization of Migration in the United States after 9/11: Constructing Muslims and Arabs as Enemies", Submitted to Central European University Department of International Relations European Studies In partial fulfillment of the requirements for the degree of Master of Arts Supervisor: Professor Paul Roe http://www.etd.ceu.hu/2010/ghughunishvili_irina.pdf)

As provided by the Copenhagen School securitization theory is comprised by speech act, acceptance of the audience and facilitating conditions or other non-securitizing actors contribute to a successful securitization. The causality or a one-way relationship between the speech act, the audience and securitizing actor, where politicians use the speech act first to justify exceptional measures, has been criticized by scholars, such as Balzacq. According to him, the one-directional relationship between the three factors, or some of them, is not the best approach. To fully grasp the dynamics, it will be more beneficial to "rather than looking for a one-directional relationship between some or all of the three factors highlighted, it could be profitable to focus on the degree of congruence between them. 26 Among other aspects of the Copenhagen School's theoretical framework, which he criticizes, the thesis will rely on the criticism of the lack of context and the rejection of a 'one-way causal' relationship between the audience and the actor. The process of threat construction, according to him, can be clearer if external context, which stands independently from use of language, can be considered. 27 Balzacq opts for more context-oriented approach when it comes down to securitization through the speech act, where **a single speech does not create** the **discourse**, but it is created through a long process, where context is vital. 28 He indicates: In reality, the speech act itself, i.e. literally a single security articulation at a particular point in time, will at best only very rarely explain the entire social process that follows from it. In most cases a security scholar will rather be confronted with a process of articulations creating sequentially a threat text which turns sequentially into a securitization. 29 This type of approach seems more plausible in an empirical study, as it is more likely that a single speech will not be able to securitize an issue, but it is a lengthy process, where a the audience speaks the same language as the securitizing actors and can relate to their speeches.

No War Impact – 2AC

They have it backwards—wars aren't a byproduct of western desire for control—but ambiguous strategic calculations—preventing shocks is better than radical critique.

Chandler 9

(David, Westminster IR professor, "War Without End(s): Grounding the Discourse of `Global War'", Security Dialogue, 40.3, SAGE)

Western governments appear to portray some of the distinctive characteristics that Schmitt attributed to 'motorized partisans', in that the shift from narrowly strategic concepts of security to more abstract concerns reflects the fact that Western states have tended to fight free-floating and non-strategic wars of aggression without real enemies at the same time as professing to have the highest values and the absolute enmity that accompanies these. The government policy documents and critical frameworks of 'global war' have been so accepted that it is assumed that it is the strategic interests of Western actors that lie behind the often irrational policy responses, with 'global war' thereby being understood as merely the extension of instrumental struggles for control. **This perspective seems unable to contemplate the possibility that it is the lack of a strategic desire for control that drives and defines 'global' war today.** Very few studies of the 'war on terror' start from a study of the Western actors themselves rather than from their declarations of intent with regard to the international sphere itself. This methodological framing inevitably makes assumptions about strategic interactions and grounded interests of domestic or international regulation and control, which are then revealed to explain the proliferation of enemies and the abstract and metaphysical discourse of the 'war on terror' (Chandler, 2009a). For its radical critics, the abstract, global discourse merely reveals the global intent of the hegemonizing designs of biopower or neoliberal empire, as critiques of liberal projections of power are 'scaled up' from the international to the global. Radical critics working within a broadly Foucauldian problematic have no problem grounding global war in the needs of neoliberal or biopolitical governance or US hegemonic designs. These critics have produced numerous frameworks, which seek to assert that global war is somehow inevitable, based on their view of the needs of late capitalism, late modernity, neoliberalism or biopolitical frameworks of rule or domination. From the declarations of global war and practices of military intervention, rationality, instrumentality and strategic interests are read in a variety of ways (Chandler, 2007). Global war is taken very much on its own terms, with the declarations of Western governments explaining and giving power to radical abstract theories of the global power and regulatory might of the new global order of domination, hegemony or empire The alternative reading of 'global war' rendered here seeks to clarify that the declarations of global war are a sign of the **lack of political stakes** and strategic structuring of the international sphere **rather than frameworks for asserting global domination**. We increasingly see Western diplomatic and military interventions presented as justified on the basis of value-based declarations, rather than in traditional terms of interest-based outcomes. This was as apparent in the wars of humanitarian intervention in Bosnia, Somalia and Kosovo – where there was no clarity of objectives and therefore little possibility of strategic planning in terms of the military intervention or the post-conflict political outcomes – as it is in the 'war on terror' campaigns, still ongoing, in Afghanistan and Iraq. There would appear to be a **direct relationship between the lack of strategic clarity shaping and structuring interventions and the lack of political stakes involved in their outcome.** In fact, the globalization of security discourses seems to reflect the **lack of political stakes rather than the urgency of the security threat** or of the intervention. Since the end of the Cold War, the central problematic could well be grasped as one of withdrawal and the emptying of contestation from the international sphere rather than as intervention and the contestation for control. The disengagement of the USA and Russia from sub-Saharan Africa and the Balkans forms the backdrop to the policy debates about sharing responsibility for stability and the management of failed or failing states (see, for example, Deng et al., 1996). It is the lack of political stakes in the international sphere that has meant that the latter has become more open to ad hoc and **arbitrary interventions** as states and international institutions use the **lack of strategic**

imperatives to **construct their own meaning through intervention** As Zaki Laïdi (1998: 95) explains: war is not waged necessarily to achieve predefined objectives, and it is in waging war that the motivation needed to continue it is found. In these cases – of which there are very many – war is no longer a continuation of politics by other means, as in Clausewitz's classic model – but sometimes the initial expression of forms of activity or organization in search of meaning. … War becomes not the ultimate means to achieve an objective, but the most 'efficient' way of finding one. **The lack of political stakes in the international sphere would appear to be the precondition for the globalization of security discourses and the ad hoc and often arbitrary decisions to go to 'war'.** In this sense, global wars reflect the fact that the international sphere has been reduced to little more than a vanity mirror for globalized actors who are **freed from strategic necessities** and **whose concerns are no longer structured in the form of political struggles against 'real enemies'.** The mainstream critical approaches to global wars, with their heavy reliance on recycling the work of Foucault, Schmitt and Agamben, appear to invert this reality, portraying the use of military firepower and the implosion of international law as a product of the high stakes involved in global struggle, rather than the lack of clear contestation involving the **strategic accommodation of diverse powers and interests**.

AT: PAN K

Pan is reductionist and the alt fails

Jones 14

David Martin Jones, Professor of Politics at University of Glasgow, PhD from LSE, Australian Journal of Political Science, February 21, 2014, 49:1, "Managing the China Dream: Communist Party politics after the Tiananmen incident ", Taylor and Francis Online

Notwithstanding this Western fascination with China and the positive response of former Marxists, such as Jacques, to the new China, Pan discerns an Orientalist ideology distorting Western commentary on the party state, and especially its international relations (6). Following Edward Said, Pan claims that such Western Orientalism reveals 'not something concrete about the orient, but something about the orientalists themselves, their recurring latent desire of fears and fantasies about the orient' (16). In order to unmask the limits of Western representations of China's rise, Pan employs a critical 'methodology' that 'draws on constructivist and deconstructivist approaches' (9). Whereas the 'former questions the underlying dichotomy of reality/knowledge in Western study of China's international relations', the latter shows how paradigmatic representations of China 'condition the way we give meaning to that country' and 'are socially constitutive of it' (9). Pan maintains that the two paradigms of 'China threat' and 'China opportunity' in Western discourse shape China's reality for Western 'China watchers' (3). These discourses, Pan claims, are 'ambivalent' (65). He contends that this 'bifocal representation of China, like Western discourses of China more generally, tell us a great deal about the west itself, its self -imagination, its torn, anxious, subjectivity, as well as its discursive effects of othering' (65). This is a large claim. Interestingly, Pan fails to note that after the Tiananmen incident in 1989, Chinese new left scholarship also embraced Said's critique of Orientalism in order to reinforce both the party state and a burgeoning sense of Chinese nationalism. To counter Western liberal discourse, academics associated with the Central Party School promoted an ideology of Occidentalism to deflect domestic and international pressure to democratise China. In this, they drew not only upon Said, but also upon Foucault and the post-1968 school of French radical thought that, as Richard Wolin has demonstrated, was itself initiated in an appreciation of Mao's cultural revolution. In other words, the critical and deconstructive methodologies that came to influence American and European social science from the 1980s had a Maoist inspiration (Wolin 2010: 12–18). Subsequently, in the changed circumstances of the 1990s, as American sinologist Fewsmith has shown, young Chinese scholars 'adopted a variety of postmodernist and critical methodologies' (2008: 125). Paradoxically, these scholars, such as Wang Hui and Zhang Kuan (Wang 2011), had been educated in the USA and were familiar with fashionable academic criticism of a postmodern and deconstructionist hue that 'demythified' the West (Fewsmith 2008: 125–29). This approach, promulgated in the academic journal Dushu (Readings), deconstructed, via Said and Foucault, Western narratives about China. Zhang Kuan, in particular, rejected Enlightenment values and saw postmodern critical theory as a method to build up a national 'discourse of resistance' and counter Western demands regarding issues such as human rights and intellectual property. It is through its affinity with this self-strengthening, Occidentalist lens, that Pan's critical study should perhaps be critically read. Simply put, Pan identifies a political economy of fear and desire that informs and complicates Western foreign policy and, Pan asserts, tells us more about the West's 'self-imagination' than it does about Chinese reality. Pan attempts to sustain this claim via an analysis, in Chapter 5, of the self-fulfilling prophecy of the China threat, followed, in Chapters 6 and 7, by exposure of the false promises and premises of the China 'opportunity'. Pan certainly offers a provocative insight into Western attitudes to China and their impact on Chinese political thinking. In particular, he demonstrates that China's foreign policy-makers react negatively to what they view as a hostile American strategy of containment (101). In this context, Pan contends, accurately, that Sino–US relations are mutually constitutive and the USA must take some responsibility for the rise of China threat (107). This latter point, however, is one that Australian **realists** like Owen Harries, whom Pan cites approvingly, **have made consistently since the late** 19**90s.** In other words, not all Western analysis uncritically endorses the view that China's rise is threatening. Nor is all Western perception of this rise reducible to the threat scenario advanced by recent US administrations. Pan's subsequent argument that the China opportunity thesis leads to inevitable disappointment and subtly reinforces the China

threat paradigm is, also, somewhat misleading. On the one hand, Pan notes that Western anticipation of 'China's transformation and democratization' has 'become a burgeoning cottage industry' (111). Yet, on the other hand, Pan observes that Western commentators, such as Jacques, demonstrate a growing awareness that the democratisation thesis is a fantasy. That is, Pan, like Jacques, argues that China 'will neither democratize nor collapse, but may instead remain politically authoritarian and economically stable at the same time' (132). To merge, as Pan does, the democratisation thesis into its authoritarian antithesis in order to evoke 'present Western disillusionment' (132) with China is somewhat reductionist. Pan's contention that we need a new paradigm shift 'to free ourselves from the positivist aspiration to grand theory or transcendental scientific paradigm itself' (157) might be admirable, but this will not be achieved by a constructivism that would ultimately meet with the approval of what Brady terms China's thought managers (Brady: 6).

Identity

Debate B4 Identity

Don't take <u>self-understanding</u> as an <u>incontrovertible truth</u> – we don't perfectly know ourselves and have a lot to gain by making our beliefs <u>subject</u> to external criticism

McBride 3

(Cillian, Professor of Government @ London School of Economics "Self-transparency and the possibility of deliberative politics," Journal of Political Ideologies, 8.3)

ABSTRACT <u>I argue against the notion of self-transparency which underwrites the politics of presence. This connects situation, identity, and perspective in such a way as to be **incompatible** with deliberative politics and treats self-understand- ing as authoritative, rendering it **insensitive** to the possibility that our self-under- standings may be **distorted**. I propose a hermeneutic, narrative, conception of selfhood on which we **relate** to our lives as authors, constructing our identities by employing the linguistic and narrative resources which our respective situations make available to us. This admits the possibility that **others may provide us with superior interpretations of our lives**, which is a **precondition** of deliberative politics. Given the possibility that our self- understandings may be distorted, deliberative citizens have a **duty** to challenge **problematic self-under- standings**. Anchoring criticism to public deliberation, together with the her- meneutic premise that a measure of self-opacity is universal, secures such challenges against the charge of authoritarianism levelled at traditional ideol- ogy-critique.</u> <u>I want to focus here on the challenge posed to dialogue-centred politics by a particular discourse connecting situation, identity and politics, which Anne Phillips has termed the 'politics of presence'.1 While apparently providing a particularly firm basis for arguments for the inclusion of hitherto marginalized groups within the democratic process, this discourse embodies highly problem- atic views about political dialogue and the nature of the self. I hope to build on an analysis of these flaws to clarify the ontological preconditions of deliberative politics and, furthermore, to draw some conclusions about the nature of the obligations of parties to deliberation.</u> <u>The politics of presence rests on a model of the self as transparent to itself, but not to others, with the consequence that a person's self-understanding, at the very least, must be acknowledged to be authoritative, or incorrigible. This model of the self cannot, however, be made to cohere with a plausible account of communication, and consequently it **must be discarded** in favour of a broadly hermeneutic model of selfhood as situated in and constituted through a network of language and interpretative traditions. While this self is inevitably opaque to itself in certain respects, reflection on this opacity lends a point to dialogue which it cannot have on the assumption of self-transparency. A dialogic politics, which is sensitive to the possibility of distorted self-understanding and aims at facilitating the transformation of perspectives and self- interpretations, must acknowledge as a fundamental premise the **provisional character** of self- under- standing. This, in turn, provides a basis for viewing deliberative citizens as having obligations, in certain circumstances, to **challenge rather than defer to the self-understandings of others**.</u>

AT: Affirmation of Self

Their deployment of identity/social location/privilege arguments shuts down effective collective action – this reifies racism and leads to endless squabbling about authenticity

Rob 13

(the Idealist, Carleton College, JD candidate, 10/1, Tim Wise & The Failure of Privilege Discourse, www.orchestratedpulse.com/2013/10/tim-wise-failure-privilege-discourse/)

I don't find it meaningful to criticize Tim Wise the person and judge whether he's living up to some anti-racist bona fides. Instead, I choose to focus on the paradigm of "White privilege" upon which his work is based, and its conceptual and practical limitations. Although the personal is political, not all politics is personal; we have to attack **systems**. To paraphrase the urban poet and philosopher Meek Mill: there are levels to this shit. How I Define Privilege There are power structures that shape individuals' lived experiences. Those structures provide and withhold resources to people based on factors like class, disability status, gender, and race. It's not a "benefit" to receive resources from an unjust order because ultimately, injustice is cannibalistic. Slavery binds the slave, but destroys the master. So, the point then becomes not to assimilate the "underprivileged", but to instead eradicate the power structures that create the privileges in the first place. The conventional wisdom on privilege often says that it's "benefits" are "unearned". However, this belief ignores the reality and history that privilege is earned and maintained through violence. Systemic advantages are allocated and secured as a class, and simply because an individual hasn't personally committed the acts, it does not render their class dominance unearned. The history and modern reality of violence is why Tim Wise' comparison between whiteness and tallness fails. White supremacy is not some natural evolution, nor did it occur by happenstance. White folks *murdered* people for this thing that we often call "White privilege"; it was bought and paid for by blood and terror. White supremacy is not some benign invisible knapsack. The same interplay between violence and advantage is true of any systemic hierarchy (class, gender, disability, etc). Being tall, irrespective of its advantages, does not follow that pattern of violence. Privilege is Failing Us Unfortunately, I think our use of the term "privilege" is no longer a productive way for us to gain a thorough understanding of systemic injustice, nor is it helping us to develop collective strategies to dismantle those systems. Basically**, I never want to hear the word "privilege" again** because **the term is so thoroughly misused at this point that it does more harm than good.** Andrea Smith, in the essay "The Problem with Privilege", outlines the pitfalls of misapplied privilege theory. Those who had little privilege did not have to confess and were in the position to be the judge of those who did have privilege. Consequently, people aspired to be oppressed. Inevitably, those with more privilege would develop new heretofore unknown forms of oppression from which they suffered… Consequently, the goal became not to actually end oppression but to be as oppressed as possible. These rituals often substituted confession for political movement-building. Andrea Smith, The Problem with Privilege Dr. Tommy Curry says it more bluntly, "It's not genius to say that in an oppressive society there are benefits to being in the superior class instead of the inferior one. That's true in any hierarchy, that's not an 'aha' moment." Conceptually, privilege is best used when narrowly focused on explaining how structures generally shape experiences. However, when we overly personalize the problem, then privilege becomes a tit-for-tat exercise in blame, shame, and guilt. In its worst manifestations, this dynamic becomes "oppression Olympics" and people tally perceived life advantages and identities in order to invalidate one another. At best, we treat structural injustice as a personal problem, and moralizing exercises like "privilege confessions" inadequately address the nexus between systemic power and individual behavior. The undoing of privilege occurs not by individuals confessing their privileges or trying to think themselves into a new subject position, but through the creation of collective structures that dismantle the systems that enable these privileges. The activist genealogies that produced this response to racism and settler colonialism were not initially focused on racism as a problem of individual prejudice. Rather, the purpose was for individuals to recognize how they were shaped by structural forms of oppression. Andrea Smith, The Problem with Privilege Bigger than Tim Wise However, the problem with White privilege isn't simply that Tim Wise, a white man, can build a career off of Black struggles. As I've already said, White people need to talk to White people about the historical and social construction of their racial identities and power, and the foundation for that conversation often comes from past Black theory and political projects. The problem for me is that privilege work has become a cottage industry of self-help

moralizing that **in no way attacks** the systemic ills that create the personal injustices in the first place. A **substantive critique of privilege requires us to get beyond identity politics**. It's not about good people and bad people; it's a bad system. It's not just White people that participate in the White privilege industry, although not everyone equally benefits/profits (see: Tim Wise). Dr. Tommy Curry takes elite Black academics to task for their role in profiting from the White privilege industry while offering no challenge to White supremacy. These conversations about White privilege are not conversations about race, and certainly not about racism; it's a business where Blacks market themselves as racial therapists for White people… The White privilege discourse became a bourgeois distraction. It's a tool that we use to morally condemn whites for not supporting the political goals of elite black academics that take the vantages of white notions of virtue and reformism and persuade departments, journals, and presses into making concessions for the benefit of a select species of Black intellectuals in the Ivory Tower, without seeing that the white racial vantages that these Black intellectuals claim they're really interested in need to be dissolved, need to be attacked all the way to the very bottom of American society. Dr. Tommy Curry, Radio Interview The truth is that a lot of people, marginalized groups included, simply want more access to existing systems of power. They don't want to challenge and push beyond these systems; they just want to participate. So if we continue to play identity politics and persist with a personal privilege view of power, then **we will lose the struggle**. Barack Obama is president, yet White supremacy marches on, and often with his help (record deportations, expanded a drone war based on profiling, fought on behalf of US corporations to repeal a Haitian law that raised the minimum wage). Adolph Reed, writing in 1996, predicted the quagmire of identity politics in the Age of Obama. In Chicago, for instance, we've gotten a foretaste of the new breed of foundation-hatched black communitarian voices; one of them, a smooth Harvard lawyer with impeccable do-good credentials and vacuous-to-repressive neoliberal politics, has won a state senate seat on a base mainly in the liberal foundation and development worlds. His fundamentally bootstrap line was softened by a patina of the rhetoric of authentic community, talk about meeting in kitchens, small-scale solutions to social problems, and the predictable elevation of process over program — the point where identity politics converges with old-fashioned middle-class reform in favoring form over substance. I suspect that his ilk is the wave of the future in U.S. black politics. Adolph Reed Jr., Class Notes: Posing As Politics and Other Thoughts on the American Scene Although it has always been the case, Obama's election and subsequent presidency has made it starkly clear that it's not just White people that can perpetuate White supremacy. Systems of oppression condition all members of society to accept systemic injustice, and there are (unequal) incentives for both marginalized and dominant groups to perpetuate these structures. Our approaches to injustice must reflect this reality. This isn't a naïve plea for "unity", nor am I saying that talking about identities/experiences is inherently "divisive". Many of these privilege discussions use empathy to build personal and collective character, and there certainly should be space for us to work together to improve/heal ourselves and one another. People will always make mistakes and our spaces have to be flexible enough to allow for reconciliation. Though we don't have to work with persistently abusive people who refuse to redirect their behavior, there's a difference between establishing boundaries and puritanism. Fighting systemic marginalization and exploitation requires more than good character, and **we cannot fetishize personal morals over collective action**.

2015 NDI 6WS – Defending Apocalyptic Reps

Climate

Generic

Even if our representations aren't completely accurate- Our framing drives action

Schatz 12 (Jul. 2012. Dr. JL Schatz is the director of speech and debate at Binghamton University. He has written several pieces focusing on environmental issues. "The Importance of Apocalypse: The Value of End-of-the-World Politics While Advancing Ecocriticism" *The Journal of Ecocriticism.* A peer reviewed journal. http://ojs.unbc.ca/index.php/joe/article/viewFile/394/382 //HS)

It is no longer a question that human interaction with the world is destroying the very ecosystems that sustain life[1] . Nevertheless, within academic communities people are divided over which discursive tactic, ontological position, or strategy for activism should be adopted. I contend that regardless of an ecocritic's particular orientation that ecocriticism most effectively produces change when it doesn't neglect the tangible reality that surrounds any discussion of the environment. **This demands including human-induced ecocidal violence within all our accounts**. **Retreating from images of ecological collapse** to speak purely **within** inner-**academic or policymaking circles isolates our conversations** away **from the** rest of the **world—as it dies before our eyes**. * J.L. Schatz (debate@binghamton.edu) Journal of Ecocriticism 4(2) July 2012 The Importance of the Apocalypse (1-20) 21 This is not to argue that interrogating people's discourse, tactics, ontological orientation, or anything else lacks merit. Timothy Luke, Chair and Distinguished Professor of Political Science at the Virginia Polytechnic Institute, explains that Because nothing in Nature simply is given within society, such terms must be assigned significance by every social group that mobilizes them[.] … Many styles of ecologically grounded criticism circulate in present-day American mass culture, partisan debate, consumer society, academic discourse, and electoral politics as episodes of ecocritique, contesting our politics of nature, economy, and culture in the contemporary global system of capitalist production and consumption. (1997: xi) Luke reminds us that regardless of how ecocritics advance their agenda they always impact our environmental awareness and therefore alter our surrounding ecology. In doing so he shows that both literal governmental policies and the symbolic universe they take place within reconstruct the discourses utilized to justify policy and criticism in the first place. This is why films like The Day After Tomorrow and 2012 can put forth realistic depictions of government response to environmental apocalypse. And despite being fictional, these films in turn can influence the reality of governmental policy. Even the science-fiction of weather-controlling weapons are now only steps away from becoming reality[2] . Oftentimes **it takes images of planetary annihilation to motivate people into action** after years of sitting idly by watching things slowly decay. **In reality it takes awareness of impending disaster to compel policymakers to enact even piecemeal reform.** On the screen it takes the actual appearance of ecological apocalypse to set the plot in motion. What is constant is that "as these debates unfold, visions of what is the good or bad life … find many of their most compelling articulations as ecocritiques … [that are] mobilized for and against various projects of power and economy in the organization of our everyday existence" (Luke 1997: xi). We cannot motivate people to change the ecological conditions that give rise to thoughts of theorization without reference to the concrete environmental destruction ongoing in reality. This means that, **even when our images of apocalypse aren't fully accurate, our use of elements of scientifically-established reality reconstructs** the surrounding power **structures in beneficial ways**. When we ignore either ecological metaphors or environmental reality we only get part of the picture.`

Their critique of rhetoric creates procrastination- ensures endless climate change and extinction

Schatz 12 (Jul. 2012. Dr. JL Schatz is the director of speech and debate at Binghamton University. He has written several pieces focusing on environmental issues. "The Importance of Apocalypse: The Value of End-of-the-World Politics While Advancing Ecocriticism" *The Journal of Ecocriticism.* A peer reviewed journal. http://ojs.unbc.ca/index.php/joe/article/viewFile/394/382 //HS)

In recent years, many ecocritics have shied away from the very metaphors that compel a sense of urgency. They have largely done so out of the fear that its deployment will get co-opted by hegemonic institutions. Such critics ignore how **what we advocate alters our understanding of ourselves to the surrounding ecology.** In doing so, our advocacies render such co-optation meaningless because of the possibility to redeploy our

metaphors in the future. In the upcoming sections, I will provide an overview of how <u>poststructuralist thinkers like Michel Foucault and Martin Heidegger influence some ecocritics to retreat from omnicidal rhetoric. **This retreat minimizes the main objectives of their ecocriticism**</u>. I argue that **<u>rather than withdrawing from images of apocalypse that we should utilize them in subversive ways to disrupt the current relationship people have to their ecology</u>**. Professor of Sociology at York University, Fuyuki Kurasawa argues that "<u>instead of bemoaning the contemporary preeminence of a **dystopian imaginary** … it **can enable** a novel form of transnational **socio-political action** … that can be termed preventive foresight. … [I]t is a mode of ethico-political practice enacted by participants in the Journal of Ecocriticism</u> 4(2) July 2012 The Importance of the Apocalypse (1-20) 22 emerging realm of global civil society <u>**…** [by] putting into practice a sense of responsibility for the future by attempting to prevent global catastrophes</u>" (454-455). By <u>understanding how metaphors around the environment operate we can better utilize discourse to steer us away from the brink of apocalypse</u>. <u>The alternative of abandoning apocalyptic deployments is far worse.</u> Put simply, "<u>by minimizing the urgency or gravity of potential threats, procrastination appears legitimate"</u> (Kurasawa 462). In the final section of my essay, I outline how ecocritics can utilize images of omnicide to motivate the evolution of successful tactics that can slow the pace of environmental destruction.

Our rhetoric sparks concern for the climate- spurs action

Hinsliff 06 (Oct. 28, 2006. Gaby Hinsliff is a columnist for The Guardian and is a former political editor of The Observer. "£3.68 trillion: The price of failing to act on climate change" *The Guardian.* http://www.theguardian.com/money/2006/oct/29/greenpolitics.politics //HS)

Britons face the prospect of a welter of new green taxes to tackle climate change, as <u>the most authoritative report on global warming warns it will cost the world up to £3.68 trillion unless it is tackled within a decade. The review by Sir Nicholas Stern</u>, commissioned by the Chancellor of the Exchequer and published tomorrow, **<u>marks a crucial point in the debate by underlining how failure to act would trigger a catastrophic global recession.</u>** Unchecked climate change would turn 200 million people into refugees, the largest migration in modern history, as their homes succumbed to drought or flood. Stern also warns that a successor to the Kyoto agreement on cutting greenhouse gas emissions should be signed next year, not by 2010/11 as planned. He forecasts that the world needs to spend 1 per cent of global GDP - equivalent to about £184bn - dealing with climate change now, or face a bill between five and 20 times higher for damage caused by letting it continue. Unchecked climate change could thus cost as much as £566 for every man, woman and child now on the planet - roughly 6.5 billion people. <u>The 700-page report argues that an international framework on climate change covering the globe will be necessary</u>, and that different countries may opt to reduce emissions differently. Options range from many more green taxes to carbon trading. **<u>Stern's verdict will create</u>** fierce <u>political debate, with **a growing belief in government that taxes on activities such as driving or flying will have to rise.**</u> A leaked letter from the Environment Secretary, David Miliband, to the Chancellor, in the Mail on Sunday, proposes a range of 'green' tax increases. Stephen Byers, the former cabinet minister and <u>member of an expert panel of international politicians on climate change, is</u> meanwhile <u>urging new taxes to help change behaviour</u>, including a 'global warming premium' on exotic fruit, vegetables and flowers flown thousands of miles across the world. **<u>'There will</u>** need to **<u>be a global response [to Stern],</u>** but it must also filter down to change at domestic level,' he told an audience of businessmen in China this weekend. 'For the Labour party there must be no no-go areas for policy debate. The politics of taxation is changing and we need to be leading the debate, not playing catch-up. We should consider how we can change the structure of our tax system in a way which benefits the lowest-paid and penalises environmentally damaging activity.' Byers is the first of several senior Labour figures expected to go public over green taxes, reflecting views within Downing Street that the public now fears climate change sufficiently to pay more for gas-guzzling activities. Charles Clarke, the former Home Secretary, is expected to join the debate, while Alan Milburn raised the issue in a recent speech. Such interventions will irritate the Chancellor, who regards taxation as his turf, particularly in advance of his autumn pre-budget report. Air freight is one of the most lightly taxed areas of transport since aviation fuel is tax-free and there are no passengers to pay duty. Yet green campaigners say the planet can ill afford the thousands of 'food miles' travelled by exotic produce. One kilo of kiwi fruit flown from New Zealand to Europe discharges 5kg of carbon into the atmosphere. Other options include hiking car tax on fuel-inefficient vehicles and cutting stamp duty on the purchase of energy-efficient houses. Byers will argue tax rises should be offset by cuts elsewhere. <u>The Stern report will advocate extending the European 'cap and trade' system</u> - under which carbon emissions are capped at a certain level, with businesses

which need to emit more forced to buy spare emissions quotas from low-polluting businesses around the world, **encouraging industry to find cleaner and cheaper ways of operating.** He will also urge a doubling of investment in energy research and a speedier Kyoto process - meaning that negotiations with the US will have to be undertaken while George Bush is still president. International governments had hoped to deal with a more sympathetic successor after 2008. **Downing Street and the Treasury believe that the report marks a decisive moment in international politics.** Stern's is the first heavyweight contribution by an economist rather than a scientist and senior officials believe he <u>will make what might seem a hopelessly ambitious timetable credible.</u> 'This will give us an argument to make,' said a Whitehall source. **'I think we are at a tipping point in terms of the debate,** as we were at a tipping point in 2004/05 in terms of the science.' Stern's forecast cost of 1 per cent of global GDP is roughly the same amount as is spent worldwide on advertising, and half what the World Bank estimates a full-blown flu pandemic would cost. Without early intervention, he estimates the cost would be 5-20 per cent of GDP, some paid by governments, some by the private sector. But he stresses that unilateral action will not be enough - if Britain shut down all its power stations tomorrow, the reduction in global emissions would be cancelled out within 13 months by rising emissions from China. Stern will advocate new funds to help Africa and developing nations adapt, but will argue the key challenge is from emerging nations such as China and India. Emissions from China are nearly level with the US and likely to increase as the Chinese get more cars and electrical goods - up to 30 million households are likely to get digital TVs alone in the next few years. Britain will push this week for more energy-efficient consumer goods. The Tory environment spokesman, Peter Ainsworth, who has argued green tax should rise as a proportion of overall taxation, said he hoped **the Stern report 'spurs the government into being much more proactive than it has been'.**

AT: Biopolitics

Kritiks are irrelevant- even if we get coopted by institutions, we bring attention to climate change and catalyze solvency

Schatz 12 (Jul. 2012. Dr. JL Schatz is the director of speech and debate at Binghamton University. He has written several pieces focusing on environmental issues. "The Importance of Apocalypse: The Value of End-of-the-World Politics While Advancing Ecocriticism" *The Journal of Ecocriticism.* A peer reviewed journal. http://ojs.unbc.ca/index.php/joe/article/viewFile/394/382 //HS)

Any hesitancy to deploy images of apocalypse out of the risk of acting in a biopolitical manner ignores how any particular metaphor—apocalyptic or not—always risks getting co-opted. It **does not excuse inaction**. Clearly hegemonic forces have already assumed control of determining environmental practices when one looks at the debates surrounding off-shore drilling, climate change, and biodiversity within the halls of Congress. "As this ideological quagmire worsens, urgent problems … will go unsolved … only to fester more ominously into the future. … [E]cological crisis … cannot be understood outside the larger social and global context … of internationalized markets, finance, and communications" (Boggs 774). If it weren't for people such as Watson connecting things like whaling to the end of the world it wouldn't get the needed coverage to enter into public discourse. It takes big news to make headlines and hold attention spans in the electronic age. Sometimes it even takes a reality TV show on Animal Planet. As Luke reminds us, "Those who dominate the world exploit their positions to their advantage by defining how the world is known. Unless they also face resistance, questioning, and challenge from those who are dominated, they certainly will remain the dominant forces" (2003: 413). **Merely sitting back and theorizing over metaphorical deployments does a grave injustice to the gains activists are making on the ground**. **It** also **allows** hegemonic institutions to continually define the debate over the environment by **framing out any attempt for significant change,** whether it be radical or reformist. Only by jumping on every opportunity for resistance can ecocriticism have the hopes of combatting the current ecological reality. This means we must recognize that we cannot fully escape the master's house since the surrounding environment always shapes any form of resistance. Therefore, **we ought to act even if we may get co-opted**. As Foucault himself reminds us, "instead of radial ruptures more often one is dealing with mobile and transitory points of resistance, producing cleavages in a society that shift about[.] … And it is doubtless the strategic codification of these points of resistance that makes a revolution possible, somewhat similar to the way in which the state relies on the institutional Journal of Ecocriticism 4(2) July 2012 The Importance of the Apocalypse (1-20) 25 integration of power relationships. It is in this sphere of force relations that we must try to analyze the mechanisms of power" (96-97). Here Foucault "asks us to think about resistance differently, as not anterior to power, but a component of it. If we take seriously these notions on the exercise and circulation of power, then we … open … up the field of possibility to talk about particular kinds of environmentalism" (Rutherford 296). This is **not** to say that **all actions are resistant**. Rather, the revolutionary actions that are truly resistant oftentimes appear mundane since it is more about altering the intelligibility that frames discussions around the environment than any specific policy change. Again, this is why people like Watson use one issue as a jumping off point to talk about wider politics of ecological awareness. **Campaigns that look to the government or a single policy but for a moment**, and **then go on to challenge hegemonic interactions with the environment through other tactics, allows us to codify strategic points of resistance in numerous places at once.** Again, this does not mean we must agree with every tactic. It does mean that even failed attempts are meaningful. For example, while PETA's ad campaigns have drawn criticism for comparing factory farms to the Holocaust, and featuring naked women who'd rather go naked than wear fur, their importance extends beyond the ads alone[6] . By bringing the issues to the forefront they draw upon known metaphors and reframe the way people talk about animals despite their potentially anti-Semitic and misogynist underpinnings. Michael Hardt and Antonio Negri's theorization of the multitude serves as an excellent illustration of how utilizing the power of the master's biopolitical tools can become powerful enough to deconstruct its house despite the risk of co-

<u>optation or backlash.</u> For them, the multitude is defined by the growing global force of people around the world who are linked together by their common struggles without being formally organized in a hierarchal way. While Hardt and Negri mostly talk about the multitude in relation to global capitalism, their understanding of the commons and analysis of resistance is useful for any ecocritic. They explain, [T]he multitude has matured to such an extent that it is becoming able, through its networks of communication and cooperation … [and] its production of the common, to sustain an alternative democratic society on its own. … Revolutionary politics must grasp, in the movement of the multitudes and through the accumulation of common and cooperative decisions, the moment of rupture … that can create a new world. In the face of the destructive state of exception of biopower, then, there is also a constituent state of exception of democratic biopolitics[,] … creating … a new constitutive temporality. (357) <u>Once one understands the world as interconnected— instead of constructed by different nation-states and single environments—conditions in one area of the globe couldn't be conceptually severed from any other.</u> In short, we'd all have a stake in the global commons. <u>Ecocritics can then utilize biopolitics to shape discourse and fight against governmental biopower by waking people up to the pressing need to inaugurate a new future for there to be any future.</u> **Influencing other people through argument and end-of-the-world tactics is not the same biopower of the state** so long as it doesn't singularize itself but for temporary moments. Therefore, "it is not unreasonable to hope that in a biopolitical future (after the defeat of biopower) war will no longer be possible, and the intensity of the cooperation and communication among singularities … will destroy its [very] possibility" (Hardt & Negri 347). In the Journal of Ecocriticism 4(2) July 2012 The Importance of the Apocalypse (1-20) 26 context of capitalism, when wealth fails to trickle down it would be seen as a problem for the top since it would stand testament to their failure to equitably distribute wealth. <u>In the context of environmentalism, not-in-my-backyard reasoning that displaces ecological destruction elsewhere</u> would be <u>exposed for</u> the <u>failure</u> that it is. **There is no backyard that is not one's own**. Ultimately, <u>images of planetary doom demonstrate how we are all interconnected and in doing so inaugurate a new world where multitudes, and not governments, guide the fate of the planet.</u>

AT: Ontology

Ontological thinking is not exclusive with striving for environmental protection- the perm solves

Schatz 12 (Jul. 2012. Dr. JL Schatz is the director of speech and debate at Binghamton University. He has written several pieces focusing on environmental issues. "The Importance of Apocalypse: The Value of End-of-the-World Politics While Advancing Ecocriticism" *The Journal of Ecocriticism.* A peer reviewed journal. http://ojs.unbc.ca/index.php/joe/article/viewFile/394/382 //HS)

Beyond the question of discourse, some ecocritics place ontology at the forefront of their analysis. This approach criticizes those who call for action because of how the desire to fix the environment shapes one's Being in managerial ways7 . Here the issue is not fixing certain environmental practices. Instead the focus is on the way people enframe their sense of self to claim the transcendental authority to regulate life. As Ladelle McWhorter, Professor of Philosophy at Northeast Missouri State University, points out, We are inundated by predictions of ecological catastrophe and omnicidal doom. … Our usual response to such prophecies of doom is to … scramble to find some way to manage our problems[.] … But over and over again new resource management techniques … disrupt delicate systems even further, doing still more damage to a planet already dangerously out of ecological balance. Our ceaseless interventions seem only to make things worse[.] … In fact, it would appear that our trying to do things, change things, fix things cannot be the solution, because it is part of the problem itself. (7-8) **The foundation behind ontological approaches such as McWhorter's is that we should refrain from acting even when we are met with the possibility of extinction**. To clarify, it is not that current practices aren't destructive from this perspective. For such critics, acting to overcome such destruction participates is the same kind of violence because it causes us to forget our relationship with the environment as we become actors over it. "Heidegger speaks of what he sees as the danger of dangers … [in this] kind of forgetfulness, a forgetfulness that Heidegger thought could result not only in nuclear disaster or environmental catastrophe, but in the loss of what makes us the kind of beings we are, beings who can think and who can stand in thoughtful relationship to things" (McWhorter 10). Once we forget that we are also part of the environment we empty our Being of any meaning and deprive ourselves of the very relationships that give us value in the first place. **The question arises, if we can't act then how can we prevent environmental destruction?** The answer for thinkers that center their criticism on ontology is to rethink the very basis of how we think in the first place. For instance, William Spanos, one of the world's leading experts on Heideggerian thought, argues that there is an urgency of retrieving the unfinished post-structuralist ontological project to rethink thinking itself. By this I mean the need to dis-close, to open up, to think that which the triumphant metaphysical/calculative-technological-disciplinary logic of the imperial West has closed off and accommodated or repressed. To rethink thinking means, in short, to liberate Journal of Ecocriticism 4(2) July 2012 The Importance of the Apocalypse (1-20) 27 precisely that relay of differential forces that the structuralizing and disciplinary imperatives of the ontotheological tradition has colonized in its final "anthropological" phase. (22) Once again, **even for people like Spanos, placing ontology prior to politics does not deny that present actions are unquestionably destructive.** Such an approach also acknowledges that acting is always inevitable because one is already situated within an environment. In this context even thinking is action since engaging in ontological examination produces new forms of thought that alters our will to act. Spanos elaborates that this project is important "not simply … for the sake of rethinking the question of being as such, but also to instigate a rethinking of the uneven relay of practical historical imperatives … [and] to make visible … the West's perennial global imperial project" (29). He contends that, once we rethink the way we think, our actions will evolve because focusing on the way ontology grounds our representations alters the way we be-in-the-world. However, **for this strategy to work one's rethinking of thinking must still thoughtfully envision a positive future** for us to evolve toward. We will be powerless to do anything besides produce new enframings of the world if our discussions only exist at the level of abstraction. For both Heidegger and revolutionary environmentalists, there exist possibilities for transformation despite the destructiveness of Enframing. In the midst of technological peril … there emerges a sense of solidarity of human with nonhuman beings. … It is precisely the experience of this solidarity which must be constantly rearticulated … in order to provide a historically and ontologically authentic break with the metaphysics of technical control and capitalist exploitation. Action will only be truly revolutionary if it revolves around engagement in solidarity with nature, where liberation is always seen both as human liberation from the confines of Enframing and simultaneously as liberation of animal nations and eco-regions from human technics. Anything less will always lapse back into … disciplinary control over humans, nonhumans, and the Earth. (Best and Nocella 82) As a result, the problem lies in the way one enframes other creatures as a standing reserve

when they relate to politics, and not in action itself. A deep ecological perspective that recognizes the interconnectedness of all life could enable the possibility of acting without enframing. People like Ric O'Barry, who was Flipper's trainer, serve as excellent examples of how to act while inhabiting such a perspective. Ric used his popularity to make an award-winning documentary, titled The Cove, which brought awareness to the horrors of dolphin killing and the similarities we share with these sentient creatures. It was even powerful enough to stir up debate in Japan about the practice of eating dolphin meat (Becker). It is not that Ric doesn't use his notoriety to push for legislative change at the national and international level. He certainly does. However, he does so without giving up his personal commitment to directly change things in the same way as Watson does. This willingness to act directly alters the ontological representations around which such debates take place by reframing the metaphors policymakers use to justify their legislative initiatives. **Despite the merits of ontological ecocriticism, using it to prohibit ecocritical appeals for concrete action fractures a movement that should work in coalition.** We should not approach our choices as an either/or situation. Strategies of direct action can be compatible with Heideggerian thought so long as we understand such action as always already inevitable and not a way to enframe others. Deploying Journal of Ecocriticism 4(2) July 2012 The Importance of the Apocalypse (1-20) 28 apocalyptic threats can challenge hegemonic systems since they serve as a catalyst for evolving change instead of legislating it. In fact, "the pervasiveness of a dystopian imaginary can help notions of historical contingency and fallibilism gain traction against their determinist and absolutist counterparts. Once we recognize that the future is uncertain and that any course of action produces both unintended and unexpected consequences, the responsibility to face up to potential disasters … can act as catalysts for public debate and socio-political action, spurring citizens' involvement in the work of preventive foresight" (Kurasawa 458). Put plainly, we must understand any action in both its social and political dimensions. As the way we confront environmental challenges change so too does the conditions surrounding ecocriticism. To alter conditions in the political or social realm is always already to impact the other. This allows us to redeploy even problematic deployments in order to reshape the public debates surrounding ecological awareness. Just as discourse can serve governmental biopower or civic biopolitics, our ontological connections can at any moment serve both as an avenue for repression or a venue for resistance. It is not the ecocritics' task to proscribe how other people should interact with the environment. Instead they should act within their environment in a way that makes the necessary actions to save our planet beneficial. Our eco-orientation to the world will evolve our Being's very possibility to act in the same way language, technology, and species evolve based upon their interactions with living and social organisms. No doubt, "the power that is inherent in language is thus not something that is centralized, emanating from a pre-given subject. Rather, like the discursive practices in which it inheres, power is dispersed and, most important, is productive of subjects and their worlds" (Doty, 1993: 302-303). In large part the current environmental destruction exists because democratic capitalism has been able to wield its hegemonic influence to exploit the niche of technological production. Sadly, this niche rewards increased GDP over the planet's ecological well-being. The belief that these conditions cannot be unthought is not merely misplaced but also serves to support the hegemonic myth of the inevitability of capitalism. **It is up to each of us to directly act upon this world only after we approach the question of acting differently.** Only then can we see past the current imperial enframing and inspire true collective action.

China

China Aggressive/Action Key

China is aggressive – action is key to preventing conflict

Auslin 12 Michael Auslin is a resident scholar and the director of Japan studies at the American Enterprise Institute (AEI), where he specializes in Asian regional security and political issues, "Beijing Proves its Aggressive Intentions", 7/27/12, http://www.nationalreview.com/corner/312448/beijing-proves-its-aggressive-intentions-michael-auslin//OF

We now have proof of China's intention to assert its territorial claims with military strength. This week, Beijing set up a new provincial-level city government to administer all its island claims in the South China Sea, as well as administer all the waters in the Sea, and "elected" a mayor for its insta-city of Sansha. The new governing council will represent approximately 1,100 Chinese residents of three island groups, all of which are claimed by multiple countries, including Taiwan, the Philippines, and Vietnam, in addition to China. The real news, however, is that Beijing is also setting up a military garrison on Yongxing Island, which is also claimed by Vietnam. The garrison will serve "self-defense" purposes and carry out military operations, according to Chinese news reports. While it is unclear now how large the garrison will be, it is a game-changing political decision by Beijing. It essentially reveals Beijing's plan for controlling disputed territory, which was the concern of those of us who feared what the growth of China's military would mean for how nations acted in Asia. **It makes power politics the reality**, not just the possibility, **in the South China Sea**, and it forces smaller nations to decide if they can in any realistic way continue to oppose China's claims. If accepted by other nations, this week's moves will signal the beginning of true Chinese hegemony in Asia, and the creation of a new norm of regional politics based on might. Beijing's announcement should put enormous pressure on Washington. There are times for quiet diplomacy and behind-closed-doors talk, and **there are times to clearly draw a line in the sand**. This is not a casus belli, of course; but neither can it be overlooked, for one garrison can lead to another and then another. It may not happen this year or next, but if the Sansha garrison becomes an effective power, and is allowed to stand, then it will inexorably spread. **Washington must make clear to Beijing that this course will result in some response from America**, such as enhanced military aid to Southeast Asian nations, the end of military-to-military discussions between China and the U.S., or a refusal to ease export restrictions targeting China. If we do nothing, and hope it's yet another boast from a "paper dragon," we will wake up to a South China Sea that is de facto controlled by China. **That may well lead to an environment in which we will find ourselves pulled into conflict between China and its neighbors,** or one in which we pull up stakes due to the desire to avoid confrontation, and thereby announce the end of our influence in Asia.

China already views the US as a threat – bilateral coop on equal footing is the only way to maintain balance of power – its try or die for the aff

*This card is really long so I kept it broken up in paragraphs so that you can just use what you need

Nathan and Scobell 12 Andrew J. Nathan is a Professor of Political Science at Columbia University Andrew Scobell is a Senior Political Scientist at the RAND Corporation, "How China Sees America", September/October 2012, https://www.foreignaffairs.com/articles/china/2012-08-16/how-china-sees-america//OF

Americans sometimes view the Chinese state as inscrutable. But given the way that power is divided in the U.S. political system and the frequent power turnovers between the two main parties in the United States, **the Chinese also have a hard time determining U.S. intentions**. Nevertheless, over recent decades, a long-term U.S. strategy seems to have emerged out of a series of American actions toward China. So it is not a hopeless exercise -- indeed, it is necessary -- for the Chinese to try to analyze the United States.

Most Americans would be surprised to learn the degree to which **the Chinese believe the United States is a revisionist power that seeks to curtail China's political influence and harm China's interests.** This view is shaped not only by Beijing's understanding of Washington but also by the broader Chinese view of the international system and China's place in it, a view determined in large part by China's acute sense of its own vulnerability.

THE FOUR RINGS

The world as seen from Beijing is a terrain of hazards, beginning with the streets outside the policymaker's window, to land borders and sea-lanes thousands of miles away, to the mines and oil fields of distant continents. These threats can be described in four concentric rings. In the first ring, the entire territory that China administers or claims, **Beijing believes that China's political stability and territorial integrity are threatened by foreign actors and forces.** Compared with other large countries, China must deal with an unparalleled number of outside actors trying to influence its evolution, often in ways the regime considers detrimental to its survival. Foreign investors, development advisers, tourists, and students swarm the country, all with their own ideas about how China should change. Foreign foundations and governments give financial and technical support to Chinese groups promoting civil society. Dissidents in Tibet and Xinjiang receive moral and diplomatic support and sometimes material assistance from ethnic diasporas and sympathetic governments abroad. Along the coast, neighbors contest maritime territories that Beijing claims. Taiwan is ruled by its own government, which enjoys diplomatic recognition from 23 states and a security guarantee from the United States.

At China's borders, policymakers face a second ring of security concerns, involving China's relations with 14 adjacent countries. No other country except Russia has as many contiguous neighbors. They include five countries with which China has fought wars in the past 70 years (India, Japan, Russia, South Korea, and Vietnam) and a number of states ruled by unstable regimes. None of China's neighbors perceives its core national interests as congruent with Beijing's.

But China seldom has the luxury of dealing with any of its neighbors in a purely bilateral context. The third ring of Chinese security concerns consists of the politics of the six distinct geopolitical regions that surround China: Northeast Asia, Oceania, continental Southeast Asia, maritime Southeast Asia, South Asia, and Central Asia. Each of these areas presents complex regional diplomatic and security problems.

Finally, there is the fourth ring: the world far beyond China's immediate neighborhood. China has truly entered this farthest circle only since the late 1990s and so far for limited purposes: to secure sources of commodities, such as petroleum; to gain access to markets and investments; to get diplomatic support for isolating Taiwan and Tibet's Dalai Lama; and to recruit allies for China's positions on international norms and legal regimes.

INSCRUTABLE AMERICA

In each of China's four security rings, the United States is omnipresent. It is the most intrusive outside actor in China's internal affairs, the guarantor of the status quo in Taiwan, the largest naval presence in the East China and South China seas, the formal or informal military ally of many of China's neighbors, and the primary framer and defender of existing international legal regimes. This omnipresence means that **China's understanding of American motives determines how the Chinese deal with most of their security issues.**

Beginning with President Richard Nixon, who visited China in 1972, a succession of American leaders have assured China of their goodwill. Every U.S. presidential administration says that China's prosperity and stability are in the interest of the United States. And in practice, the United States has done more than any other power to contribute to China's modernization. It has drawn China into the global economy; given the Chinese access to markets, capital, and technology; trained Chinese experts in science, technology, and international law; prevented the full remilitarization of Japan; maintained the peace on the Korean Peninsula; and helped avoid a war over Taiwan.

Yet **Chinese policymakers are more impressed by policies and behaviors that they perceive as less benevolent.** The American military is deployed all around China's periphery, and the United States maintains a wide network of defense relationships with China's neighbors. Washington continues to frustrate

Beijing's efforts to gain control over Taiwan. The United States constantly pressures China over its economic policies and maintains a host of government and private programs that seek to influence Chinese civil society and politics.

Beijing views this seemingly contradictory set of American actions through three reinforcing perspectives. First, Chinese analysts see their country as heir to an agrarian, eastern strategic tradition that is pacifistic, defense-minded, nonexpansionist, and ethical. In contrast, **they see Western strategic culture -- especially that of the United States -- as militaristic, offense-minded, expansionist, and selfish.**

Second, although China has embraced state capitalism with vigor, the Chinese view of the United States is still informed by Marxist political thought, which posits that capitalist powers seek to exploit the rest of the world. China expects Western powers to resist Chinese competition for resources and higher-value-added markets. And although China runs trade surpluses with the United States and holds a large amount of U.S. debt, China's leading political analysts believe the Americans get the better end of the deal by using cheap Chinese labor and credit to live beyond their means.

Third, American theories of international relations have become popular among younger Chinese policy analysts, many of whom have earned advanced degrees in the United States. The most influential body of international relations theory in China is so-called offensive realism, which holds that a country will try to control its security environment to the full extent that its capabilities permit. According to this theory, the United States cannot be satisfied with the existence of a powerful China and therefore seeks to make the ruling regime there weaker and more pro-American. Chinese analysts see evidence of this intent in Washington's calls for democracy and its support for what China sees as separatist movements in Taiwan, Tibet, and Xinjiang.

Whether they see the United States primarily through a culturalist, Marxist, or realist lens, **most Chinese strategists assume that a country as powerful as the United States will use its power to preserve and enhance its privileges and will treat efforts by other countries to protect their interests as threats to its own security.** This assumption leads to a pessimistic conclusion: as China rises, the United States will resist. The United States uses soothing words; casts its actions as a search for peace, human rights, and a level playing field; and sometimes offers China genuine assistance. But the United States is two-faced. It intends to remain the global hegemon and prevent China from growing strong enough to challenge it. In a 2011 interview with Liaowang, a state-run Chinese newsmagazine, Ni Feng, the deputy director of the Chinese Academy of Social Sciences' Institute of American Studies, summed up this view. "On the one hand, the United States realizes that it needs China's help on many regional and global issues," he said. "On the other hand, the United States is worried about a more powerful China and uses multiple means to delay its development and to remake China with U.S. values."

A small group of mostly younger Chinese analysts who have closely studied the United States argues that Chinese and American interests are not totally at odds. In their view, the two countries are sufficiently remote from each other that their core security interests need not clash. They can gain mutual benefit from trade and other common interests.

But those holding such views are outnumbered by strategists on the other side of the spectrum, mostly personnel from the military and security agencies, who take a dim view of U.S. policy and have more confrontational ideas about how China should respond to it. They believe that China must stand up to the United States militarily and that it can win a conflict, should one occur, by outpacing U.S. military technology and taking advantage of what they believe to be superior morale within China's armed forces. Their views are usually kept out of sight to avoid frightening both China's rivals and its friends.

WHO IS THE REVISIONIST?

To peer more deeply into the logic of the United States' China strategy, Chinese analysts, like analysts everywhere, look at capabilities and intentions. Although U.S. intentions might be subject to

interpretation, U.S. military, economic, ideological, and diplomatic capabilities are relatively easy to discover -- and from the Chinese point of view, they are potentially devastating.

U.S. military forces are globally deployed and technologically advanced, with massive concentrations of firepower all around the Chinese rim. The U.S. Pacific Command (PACOM) is the largest of the United States' six regional combatant commands in terms of its geographic scope and nonwartime manpower. PACOM's assets include about 325,000 military and civilian personnel, along with some 180 ships and 1,900 aircraft. To the west, PACOM gives way to the U.S. Central Command (CENTCOM), which is responsible for an area stretching from Central Asia to Egypt. Before September 11, 2001, CENTCOM had no forces stationed directly on China's borders except for its training and supply missions in Pakistan. But with the beginning of the "war on terror," CENTCOM placed tens of thousands of troops in Afghanistan and gained extended access to an air base in Kyrgyzstan.

The operational capabilities of U.S. forces in the Asia-Pacific are magnified by bilateral defense treaties with Australia, Japan, New Zealand, the Philippines, and South Korea and cooperative arrangements with other partners. And to top it off, the United States possesses some 5,200 nuclear warheads deployed in an invulnerable sea, land, and air triad. Taken together, this **U.S. defense posture creates what Qian Wenrong of the Xinhua News Agency's Research Center for International Issue Studies has called a "strategic ring of encirclement."**

Chinese security analysts also take note of **the United States' extensive capability to damage Chinese economic interests.** The United States is still China's single most important market, unless one counts the European Union as a single entity. And the United States is one of China's largest sources of foreign direct investment and advanced technology. From time to time, Washington has entertained the idea of wielding its economic power coercively. After the 1989 Tiananmen Square crackdown, the United States imposed some limited diplomatic and economic sanctions on China, including an embargo, which is still in effect, on the sale of advanced arms. For several years after that, Congress debated whether to punish China further for human rights violations by canceling the low most-favored-nation tariff rates enjoyed by Chinese imports, although proponents of the plan could never muster a majority. More recently, U.S. legislators have proposed sanctioning China for artificially keeping the value of the yuan low to the benefit of Chinese exporters, and the Republican presidential candidate Mitt Romney has promised that if elected, he will label China a currency manipulator on "day one" of his presidency.

Although trade hawks in Washington seldom prevail, flare-ups such as these remind Beijing how vulnerable China would be if the United States decided to punish it economically. Chinese strategists believe that the United States and its allies would deny supplies of oil and metal ores to China during a military or economic crisis and that the U.S. Navy could block China's access to strategically crucial sea-lanes. The ubiquity of the dollar in international trade and finance also gives the United States the ability to damage Chinese interests, either on purpose or as a result of attempts by the U.S. government to address its fiscal problems by printing dollars and increasing borrowing, acts that drive down the value of China's dollar-denominated exports and foreign exchange reserves.

Chinese analysts also believe that the United States possesses potent ideological weapons and the willingness to use them. After World War II, the United States took advantage of its position as the dominant power to enshrine American principles in the Universal Declaration of Human Rights and other international human rights instruments and to install what China sees as Western-style democracies in Japan and, eventually, South Korea, Taiwan, and other countries. Chinese officials contend that the United States uses the ideas of democracy and human rights to delegitimize and destabilize regimes that espouse alternative values, such as socialism and Asian-style developmental authoritarianism. In the words of Li Qun, a member of the Shandong Provincial Party Committee and a rising star in the Communist Party, the Americans' "real purpose is not to protect so-called human rights but to use this pretext to influence and limit China's healthy economic growth and to prevent China's wealth and power from threatening [their] world hegemony."

In the eyes of many Chinese analysts, since the end of the Cold War the United States has revealed itself to be a revisionist power that tries to reshape the global environment even further in its favor. They see evidence of this reality everywhere: in the expansion of NATO; the U.S. interventions in Panama, Haiti, Bosnia, and Kosovo; the Gulf War; the war in Afghanistan; and the invasion of Iraq. In the economic realm, the United States has tried to enhance its advantages by pushing for free trade, running down the value of the dollar while forcing other countries to use it as a reserve currency, and trying to make developing countries bear an unfair share of the cost of mitigating global climate change.

And perhaps most disturbing to the Chinese, the United States has shown its aggressive designs by promoting so-called color revolutions in Georgia, Ukraine, and Kyrgyzstan. As Liu Jianfei, director of the foreign affairs division of the Central Party School of the Chinese Communist Party, wrote in 2005, "The U.S. has always opposed communist 'red revolutions' and hates the 'green revolutions' in Iran and other Islamic states. What it cares about is not 'revolution' but 'color.' It supported the 'rose,' 'orange', and 'tulip' revolutions because they served its democracy promotion strategy." As Liu and other top Chinese analysts see it, the United States hopes "to spread democracy further and turn the whole globe 'blue.'"

EXPLOITING TAIWAN

Although American scholars and commentators typically see U.S.-Chinese relations in the postwar period as a long, slow thaw, in Beijing's view, the United States has always treated China harshly. From 1950 to 1972, the United States tried to contain and isolate China. Among other actions, it prevailed on most of its allies to withhold diplomatic recognition of mainland China, organized a trade embargo against the mainland, built up the Japanese military, intervened in the Korean War, propped up the rival regime in Taiwan, supported Tibetan guerillas fighting Chinese control, and even threatened to use nuclear weapons during both the Korean War and the 1958 Taiwan Strait crisis. Chinese analysts concede that the United States' China policy changed after 1972. But they assert that the change was purely the result of an effort to counter the Soviet Union and, later, to gain economic benefits by doing business in China. Even then, the United States continued to hedge against China's rise by maintaining Taiwan as a strategic distraction, aiding the growth of Japan's military, modernizing its naval forces, and pressuring China on human rights.

The Chinese have drawn lessons about U.S. China policy from several sets of negotiations with Washington. During ambassadorial talks during the 1950s and 1960s, negotiations over arms control in the 1980s and 1990s, discussions over China's accession to the World Trade Organization in the 1990s, and negotiations over climate change during the decade that followed, the Chinese consistently saw the Americans as demanding and unyielding. But most decisive for Chinese understandings of U.S. policy were the three rounds of negotiations that took place over Taiwan in 1971-72, 1978-79, and 1982, which created the "communiqué framework" that governs U.S. Taiwan policy to this day. When the U.S.-Chinese rapprochement began, Chinese policymakers assumed that Washington would give up its support for Taipei in exchange for the benefits of normal state-to-state relations with Beijing. At each stage of the negotiations, the Americans seemed willing to do so. Yet decades later, the United States remains, in Beijing's view, the chief obstacle to reunification.

When Nixon went to China in 1972, he told the Chinese that he was willing to sacrifice Taiwan because it was no longer strategically important to the United States, but that he could not do so until his second term. On this basis, the Chinese agreed to the 1972 Shanghai Communiqué, even though it contained a unilateral declaration by the United States that "reaffirm[ed] its interest in a peaceful settlement of the Taiwan question," which was diplomatic code for a U.S. commitment to deter any effort by the mainland to take Taiwan by force. As events played out, Nixon resigned before he was able to normalize relations with Beijing, and his successor, Gerald Ford, was too weak politically to fulfill Nixon's promise.

When the next president, Jimmy Carter, wanted to normalize relations with China, the Chinese insisted on a clean break with Taiwan. In 1979, the United States ended its defense treaty with Taiwan but again issued a unilateral statement restating its commitment to a "peaceful resolution of the Taiwan issue." Congress then surprised both the Chinese and the administration by adopting the Taiwan Relations Act, which required the United States to "maintain [its] capacity . . . to resist any resort to force or other forms of coercion that would jeopardize the security . . . of the people on Taiwan." Once again, the deterrent intent was clear.

In 1982, when President Ronald Reagan sought closer relations with Beijing to ramp up pressure on Moscow, China prevailed on the United States to sign another communiqué, which committed Washington to gradually reducing its weapons sales to Taiwan. But once the agreement was in place, the Americans set the benchmark year at 1979, when arms sales had reached their highest level; calculated annual reductions at a small marginal rate, adjusting for inflation so that they were actually increases; claimed that the more advanced weapons systems that they sold Taiwan were the qualitative equivalents of older systems; and allowed commercial firms to cooperate with the Taiwanese armaments industry under the rubric of technology transfers rather than arms sales. By the time President George W. Bush approved a large package of advanced arms to Taiwan in April 2001, the 1982 communiqué was a dead letter. Meanwhile, as the United States prolonged its involvement with Taiwan, a democratic transition took place there, putting unification even further out of Beijing's reach.

Reviewing this history, Chinese strategists ask themselves why the United States remains so committed to Taiwan. Although Americans often argue that they are simply defending a loyal democratic ally, most Chinese see strategic motives at the root of Washington's behavior. They believe that keeping the Taiwan problem going helps the United States tie China down. In the words of Luo Yuan, a retired general and deputy secretary-general of the Chinese Society of Military Science, the United States has long used Taiwan "as a chess piece to check China's rise."

THE PERILS OF PLURALISM

The Taiwan Relations Act marked the beginning of a trend toward congressional assertiveness on U.S. China policy, and this continues to complicate Washington's relationship with Beijing. Ten years later, the 1989 Tiananmen incident, followed by the end of the Cold War, shifted the terms of debate in the United States. China had been perceived as a liberalizing regime; after Tiananmen, China morphed into an atavistic dictatorship. And the collapse of the Soviet Union vitiated the strategic imperative to cooperate with Beijing. What is more, growing U.S.-Chinese economic ties began to create frictions over issues such as the dumping of cheap manufactured Chinese goods on the U.S. market and the piracy of U.S. intellectual property. After decades of consensus in the United States, China quickly became one of the most divisive issues in U.S. foreign policy, partially due to the intense advocacy efforts of interest groups that make sure China stays on the agenda on Capitol Hill.

Indeed, since Tiananmen, <u>China has attracted the attention of more American interest groups than any other country</u>. China's political system elicits opposition from human rights organizations; its population-control policies anger the antiabortion movement; its repression of churches offends American Christians; its inexpensive exports trigger demands for protection from organized labor; its reliance on coal and massive dams for energy upsets environmental groups; and its rampant piracy and counterfeiting infuriate the film, software, and pharmaceutical industries. These <u>specific complaints add strength to the broader fear of a "China threat," which permeates American political discourse -- a fear that, in Chinese eyes, not only denies the legitimacy of Chinese aspirations but itself constitutes a kind of threat to China.</u>

Of course, there are also those in Congress, think tanks, the media, and academia who support positions favorable to China, on the basis that cooperation is important for American farmers, exporters, and banks, and for Wall Street, or that issues such as North Korea and climate change are more important than disputes over rights or religion. Those advocates may be more powerful in the long run than those critical of China, but they tend to work behind the scenes. **To Chinese analysts trying to make sense of the cacophony of views expressed in the U.S. policy community, the loudest voices are the easiest to hear, and the signals are alarming.**

SUGARCOATED THREATS

In trying to ascertain U.S. intentions, Chinese analysts also look at policy statements made by senior figures in the executive branch. Coming from a political system where the executive dominates, Chinese analysts consider such statements reliable guides to U.S. strategy. They find that the statements often do two things: they seek to reassure Beijing that Washington's intentions are benign, and at the same time, they seek to reassure the American public that the United States will never allow China's rise to threaten U.S. interests. This combination of themes produces what Chinese analysts perceive as sugarcoated threats.

For example, in 2005, Robert Zoellick, the U.S. deputy secretary of state, delivered a major China policy statement on behalf of the George W. Bush administration. He reassured his American audience that the United States would "attempt to dissuade any military competitor from developing disruptive or other capabilities that could enable regional hegemony or hostile action against the United States or other friendly countries." But he also explained that China's rise was not a threat because China "does not seek to spread radical, anti-American ideologies," "does not see itself in a death struggle with capitalism," and "does not believe that its future depends on overturning the fundamental order of the international system." On that basis, he said, the two sides could have "a cooperative relationship." But cooperation would depend on certain conditions. China should calm what he called a "cauldron of anxiety" in the United States about its rise. It should "explain its defense spending, intentions, doctrine, and military exercises"; reduce its trade surplus with the United States; and cooperate with Washington on Iran and North Korea. Above all, Zoellick advised, China should give up "closed politics." In the U.S. view, he said, "China needs a peaceful political transition to make its government responsible and accountable to its people."

The same ideas have been repeated in slightly gentler language by the Obama administration. In the administration's first major policy speech on China, in September 2009, James Steinberg, then deputy secretary of state, introduced the idea of "strategic reassurance." Steinberg defined the principle in the following way: "Just as we and our allies must make clear that we are prepared to welcome China's 'arrival' ... as a prosperous and successful power, China must reassure the rest of the world that its development and growing global role will not come at the expense of [the] security and well-being of others." China would need to "reassure others that this buildup does not present a threat"; it would need to "increase its military transparency in order to reassure all the countries in the rest of Asia and globally about its intentions" and demonstrate that it "respects the rule of law and universal norms." To Chinese analysts, such statements send the message that Washington wants cooperation on its own terms, seeks to deter Beijing from developing a military capability adequate to defend its interests, and intends to promote change in the character of the Chinese regime.

To be sure, Beijing's suspicion of Washington must contend with the fact that the United States has done so much to promote China's rise. But for Chinese analysts, history provides an answer to this puzzle. As they see it, the United States contained China for as long as it could. When the Soviet Union's rising strength made doing so necessary, the United States was forced to engage with China in order to reinforce its hand against Moscow. Once the United States started to engage with China, it came to believe that engagement would turn China toward democracy and would win back for the United States the strategic base on the mainland of Asia that Washington lost in 1949, when the Communists triumphed in the Chinese Civil War.

In the Chinese view, Washington's slow rapprochement with Beijing was not born of idealism and generosity; instead, it was pursued so that the United States could profit from China's economic opening by squeezing profits from U.S. investments, consuming cheap Chinese goods, and borrowing money to support the U.S. trade and fiscal deficits. While busy feasting at the Chinese table, U.S. strategists overlooked the risk of China's rise until the late 1990s. **Now that the United States perceives China as a threat, these Chinese analysts believe, it no longer has any realistic way to prevent it from continuing to develop**. In this sense, the U.S. strategy of engagement failed, vindicating the advice of Chinese leader Deng Xiaoping, who in 1991 advocated a strategy of "hiding our light and nurturing our strength." Faced with a China that has risen too far to be stopped, the United States can do no more than it is doing: demand cooperation on U.S. terms, threaten China, hedge militarily, and continue to try to change the regime.

HOW DO YOU HANDLE AN OFFENSIVE REALIST?

Despite these views, mainstream Chinese strategists do not advise China to challenge the United States in the foreseeable future. They expect the United States to remain the global hegemon for several decades, despite what they perceive as initial signs of decline. For the time being, as described by Wang Jisi, dean of Peking University's School of International Studies, "the superpower is more super, and the many great powers less great." Meanwhile, the two countries are increasingly interdependent economically and have the military capability to cause each other harm. **It is this mutual vulnerability that carries the best medium-term hope for cooperation. Fear of each other keeps alive the imperative to work together.**

In the long run, however, the better alternative for both China and the West is to create a new equilibrium of power that maintains the current world system, but with a larger role for China. China has good reasons to seek that outcome. Even after it becomes the world's largest economy, its prosperity will remain dependent on the prosperity of its global rivals (and vice versa), including the United States and Japan. The richer China becomes, the greater will be its stake in the security of sea-lanes, the stability of the world trade and financial regimes, nonproliferation, the control of global climate change, and cooperation on public health. China will not get ahead if its rivals do not also prosper. And Chinese strategists must come to understand that core U.S. interests -- in the rule of law, regional stability, and open economic competition -- do not threaten China's security.

The United States should encourage China to accept this new equilibrium by drawing clear policy lines that meet its own security needs without threatening China's. As China rises, it will push against U.S. power to find the boundaries of the United States' will. Washington must push back to establish boundaries for the growth of Chinese power. But this must be done with cool professionalism, not rhetorical belligerence. Hawkish campaign talk about trade wars and strategic competition plays into Beijing's fears while undercutting the necessary effort to agree on common interests. And in any case, putting such rhetoric into action is not a realistic option. To do so would require a break in mutually beneficial economic ties and enormous expenditures to encircle China strategically, and it would force China into antagonistic reactions.

Space

Space Mil real

Space militarization is real – lack of a legal framework means countries are beginning an arms race

Kamocsai 15 Peter Kamocsai is a graduate student at the George Washington University specializing in space policy, "Op-Ed | Why the U.S. Should Be a Leader in Space Weaponization", 1/10/15, http://spacenews.com/commentary-why-the-u-s-should-be-a-leader-in-space-weaponization//OF

Nations are already using the opportunity that the Outer Space Treaty presents to weaponize space. As some scholars observed, **although we are yet to deploy space-based weapons, we have already made the first steps**. The Soviet Union was building a secret military space station under the Almaz (Diamond) program and was also designing an anti-satellite spacecraft called Polyus. Currently, the Chinese are testing advanced anti-satellite weaponry and the Russians are building a system to neutralize space weapons. **These countries are preparing for a space arms race.** They will surpass the United States if it allows them to do so. The cost of space weaponization might not seem justifiable in the short term, but in the long term the cost of inaction is higher. The public is not yet involved in the space weaponization debate, and therefore explaining the reasons for deploying space weapons to taxpayers is moot. Moreover, the costs of developing, deploying and maintaining space weapons can seem prohibitive. According to some estimates, the Brilliant Pebbles space-based anti-missile weapon proposed in the 1980s would have cost around $20 million apiece in today's dollars.

Space militarization threats are real – tech developments and lack of governance

Haas 15 Michael Haas is a researcher with the Global Security Team at the Center for Security Studies (CSS). He specializes in air and sea power, military innovation, and U.S. defense planning, "Vulnerable Frontier: Militarized Competition in Outer Space", 3/2/15, http://www.isn.ethz.ch/Digital-Library/Articles/Detail/?lng=en&id=189524//OF

Critical dependencies on space-based infrastructure have grown dramati-cally in recent decades, and now extend to small states and the global economy as a whole. However, as geopolitical rivalries re-emerge in more traditional domains of interstate conflict, the prospects for future stability in space appear increasingly dim. **While the consequences of a great-power clash in space could be ruinous, a shared understanding of the perils in-volved has yet to take hold. Strategic interaction along the 'final frontier' is set to enter a period of considerable danger.** Among the various environments into which humans have expanded their economic, military, and scientific ac-tivities, outer space is easily the most unwelcoming and inhospitable. Im-possible to access except through mas-sive expenditures of energy per unit of mass to be placed into orbit, and utterly hostile to human life as well as to many types of man-made machin-ery, the maintenance of a permanent presence outside Earth's protective atmosphere remains a highly ambi-tious undertaking. Despite various complications, however, this presence – which, in most cases, has entailed the placement of unmanned artificial satellites in earth-centric orbits – has become an essential pillar of the global economic and security systems in the late 20th and early 21st centuries. From highly specialized scientific and com-mercial services to everyday applica-tions of information technology (IT), space-based infrastructures now form part of the life-support system of a civilization that has tied its economic well-being and, indeed, its very sur-vival to global connectivity. However, while the economically most developed societies in particular have come to accept this state of depend-ence on space-based systems as fairly natural and unproblematic, the space domain is, in fact, highly vulnerable to the direct and indirect effects of reckless behavior on the part of both commercial and governmental enti-ties. Instances of overcrowding are already in evidence within certain or-bital planes, increasing the likelihood of serious accidents, such as the 2009 collision between the Iridium 33 and Cosmos-2251 communications sat-ellites in low-earth orbit. Decades of ill-regulated activities in space have created millions of pieces of orbital debris, many of which have sufficient kinetic energy to permanently disable a satellite. However, **the most serious threat to the continued accessibility of the space environment by far is the pros-pect of a military confrontation**, in-volving the use of kinetic anti-satellite (ASAT) weaponry **by any of the grow-ing number of states that now possess the technological wherewithal to field such capabilities.** As was rather vividly demonstrated by the Chinese test of a direct-ascent ASAT missile in January 2007, which is estimated to have created more than two

million pieces of debris up to ten centimeters in size as well as 2,500 larger objects that can be routinely tracked by earth-based sensors, such a conflict would probably result in mas-sive environmental damage. Depend-ing on the number and position of satellites destroyed, the utilization of affected orbital planes could be severe-ly impaired. In a worst-case scenario, these orbits could become virtually unusable for extended periods of time, as most of the debris would remain in place for decades or even centuries, with serious implications for both commercial and military users. <u>Unfortunately, several trends point in the direction of an increased risk over the next 10 – 20 years of terrestrial con-flict that may involve attacks on space systems, including the use of kinetic ASAT weaponry</u>. These <u>trends are pri-marily the results of the re-emergence of sustained strategic rivalries among some great and medium-sized powers</u> – including the US and China in East Asia, the US and Russia in Eurasia, and potentially the China-India-Pa-kistan triangle in South Asia. With the exception of Pakistan, all of these states have already demonstrated a ba-sic anti-satellite capability, and **the US and China in particular are integrat-ing space warfare scenarios into their military planning.**

Threats are real – militarization and debris make the risk mutually reinforcing

Gallagher 15 Nancy Gallagher is interim director of the Center for International and Security Studies at Maryland and a senior research scholar at the University of Maryland's School of Public Policy. Previously, she was executive director of the Clinton administration's task force for the Comprehensive Nuclear Test Ban Treaty, an arms control specialist in the State Department, and a faculty member at Wesleyan University, "Antisatellite warfare without nuclear risk: A mirage", 5/29/15, http://thebulletin.org/space-weapons-and-risk-nuclear-exchanges8346//OF

But **even if the norm against attacking another country's satellites is never broken, developing and testing antisatellite weapons still increase the risk of nuclear war.** <u>If, for instance, US military leaders became seriously concerned that China or Russia were preparing an antisatellite attack, pressure could build for a pre-emptive attack against Chinese or Russian strategic forces</u>. **Should a satellite be struck by a piece of space debris** during a crisis or a low-level terrestrial conflict, **leaders might mistakenly assume that a space war had begun and retaliate before they knew what had actually happened**. Such scenarios may seem improbable, but they are no more implausible than the scenarios that are used to justify the development and use of antisatellite weapons.

The plan's dialogue can de-securitize space development

Chunsi 15 Wu Chunsi is director of the Institute of International Strategic Studies at the Shanghai Institutes for International Studies. Her research interests include Chinese-US relations, China's foreign strategy, arms control, and regional security in Asia. In 2012, she was a visiting research fellow at the Center for Strategic and International Studies in Washington, "New circumstances, new approaches", 7/27/15, http://thebulletin.org/space-weapons-and-risk-nuclear-exchanges8346//OF

<u>China understands why some in the international community are calling for a revival of arms control processes surrounding antisatellite weapons and other outer space issues</u>. And China is generally supportive of arms control in outer space. But as the saying goes, the devil is in the details. **The real question is not whether individual countries support arms control efforts and desire strategic stability—but rather, how these goals will be pursued**, according to which principles, and in pursuit of what priorities. <u>As circumstances change in space, the nature of nations' arms control engagements must change as well.</u> But **if the major players fail to reach a clear, common understanding of new realities in space, it will be difficult to establish constructive dialogue.**

Link Debate

Link Turn – Democracy

Curtailing domestic surveillance policy is necessary to reestablish a more authentic democracy through creating transparency – the alt does nothing to challenge current surveillance policy

Jacqueline L. **Ferreira, 2014** (Jacqueline L. Ferreira, Professor of Sociology at University of Western Ontario, "Testing the Democratic Credibility of an NSA (No∂ Secrets Allowed) Government," 2014, http://ir.lib.uwo.ca/cgi/viewcontent.cgi?article=1025&context=si) K.GEKKER

In explaining their interest, <u>government representatives have stated reasons of national∂ security and monitoring criminal activities</u> (Eddlam, 2013). Since this necessarily means that∂ governments will be monitoring activities that are not yet illegal (and may never be illegal) there∂ is a necessary contradiction with democratic rights. With this in mind, globalization can be said∂ to threaten the integrity of democracy with the introduction of new intelligence-gathering∂ organizations that have been created in order to keep up with the rapidly shrinking virtual world.∂ The <u>integrity of democracy has been threatened through their invention because there has not∂ been the transparency required of a democratic government in these organizations, because their∂ increased presence has resulted in the breaching the human rights of American citizens,</u> and∂ because the government's actions in relation to these organizations have been contradictory to∂ the ideals of democracy. Before addressing these main points, it is important to first understand∂ what type of democracy will be hereafter discussed.∂ <u>Democracy at its most fundamental level is the rule by and for the people</u> – the equal∂ representation of the wishes of each individual person within a sovereign state (Macpherson,∂ 1965). For reasons of simplicity and availability of research, this paper will focus on the liberal∂ democracy practiced in the United States. <u>Liberal democracy exists where the political system of∂ democracy is combined with the attributes of liberalism</u> (Macpherson, 1965; Fichtelberg, 2006).∂ A democratic society will include free elections, the rule of law, and the ability to choose∂ between multiple different political parties (Marable, 2009; Rose, 2009). Liberal attributes relate∂ to human and civil rights as well as political freedoms (Macpherson, 1965). Liberal societies∂ allow citizens the freedom to vote (or not) for whichever political party they may choose. <u>In∂ many liberal democratic societies, these rights are drawn from codified legislation and especially∂ constitutions that dictate what the fundamental rights of citizens are that must be respected∂</u> (Rose, 2009). It is assumed that through exercising these rights, citizens will be appropriately∂ represented by the individuals they elect to govern them and to produce legislation that will∂ accurately represent the desires of the majority (Rose, 2009). The way that an elected∂ government behaves in its everyday functions, as well as under special circumstances as in times∂ of war or likewise, should always take into account the needs of their citizens and respect the∂ rule of the majority. Additionally, <u>it is important for a democratic government to have∂ transparency as one of their guiding principles so that their citizens can remain informed about∂ what is happening in their society. At least, the aforementioned characteristics are what a liberal∂ democracy should ideally adhere</u> to.

Democracy induced policies like the plan check biopolitical violence.

Dickinson 04 (Edward Ross, Associate Professor of History at the University of California-Davis, " Biopolitics, Fascism, Democracy: Some Reflections on Our Discourse about "Modernity"", in Central European History, Vol. 37, No. 1 (2004), pg 35.)

In short, the continuities between early twentieth-century biopolitical discourse and the practices of the welfare state in our own time are unmistakable. Both are instances of the "disciplinary society" and of biopolitical, regulatory, social-engineering modernity, and they share that genealogy with more authoritarian states, including the National Socialist state, but also fascist Italy, for example. And it is certainly fruitful to view them from this very broad perspective. But that

analysis can easily become superficial and misleading, because it obfuscates the profoundly different strategic and local dynamics of power in the two kinds of regimes. Clearly the democratic welfare state is not only formally but also substantively quite different from totalitarianism. Above all, again, it has nowhere developed the fateful, radicalizing dynamic that characterized National Socialism (or for that matter Stalinism), the psychotic logic that leads from economistic population management to mass murder. Again, there is always the potential for such a discursive regime to generate coercive policies. In those cases in which the regime of rights does not successfully produce "health," such a system can and historically does create compulsory programs to enforce it. But again, there are political and policy potentials and constraints in such a structuring of biopolitics that are very different from those of National Socialist Germany. Democratic biopolitical regimes require, enable, and incite a degree of self-direction and participation that is functionally incompatible with authoritarian or totalitarian structures. And this pursuit of biopolitical ends through a regime of democratic citizenship does appear, historically, to have imposed increasingly narrow limits on coercive policies, and to have generated a "logic" or imperative of increasing liberalization. Despite limitations imposed by political context and the slow pace of discursive change, I think this is the unmistakable message of the really very impressive waves of legislative and welfare reforms in the 1920s or the 1970s in Germany.90

Link Turn - Drones

Drones are an instrument of biopower, which the state uses to put forth a state of war

Barringer '14 (Durante, political studies student at Bard College "Global War, Biopower and The Rise of Drone∂ Warfare in the 21st Century" April 2014 http://works.bepress.com/cgi/viewcontent.cgi?article=1001&context=durante_barringer) Foronda

Hardt and Negri posit that in order <u>for U.S. counterinsurgency strategy to work there must be a focus on an "unlimited form of dominance that involves all dimensions, the full∂ spectrum of power".</u>82 <u>There are forms of power that present themselves as viable options when∂ trying to control and retard human behavior: coercion, persuasion, and manipulation</u>, but∂ undoubtedly they all have a limit to what they can accomplish. All three forms influence choice,∂ but do not control it and choice leads to action. So, <u>in order to control action and choice, one∂ must control the life of the enemy, which then becomes unlimited due to the encompassing∂ character of life itself</u>. Life can be considered in two different models: one being the life force of∂ a human being and the other being the day-to-day happenings that represent daily life. Foucault∂ creates this dichotomy in The History of Sexuality by explaining the evolution of sovereign power. <u>In former times, the sovereign had the "right to decide life and death"83 while in modern∂ times, sovereign power comes in the form of life-administration. Life-administering is an act,∂ one done for Foucault by an unknown sovereign</u>. This act best shows itself in politics and the∂ business of economics. The power to decide or take life is focused on the destruction of one's∂ physical control through death. However, life-administration seeks to control both the physical∂ and life activities of a person. <u>So not only does biopower seek to control the political life of∂ bodies, but also the social behaviors and interactions as well. This biopower shapes the lives of those in the system through laws and regulations</u>.∂ Hardt and Negri suggest that biopower "threatens us with death but also rules over life".84∂ Death, also serves as a tool of subjugation and as a threat, which tries to reproduce certain∂ behaviors that are deemed acceptable by the powers that be.∂ <u>In</u> the case of <u>the War on Al Qaeda,</u> **<u>we see drones as an instrument of biopower, as administers of death</u>**. Jeh Johnson, Secretary of Homeland Security, echoed this in his address to∂ the Oxford Union. In this address, he argues that <u>there will be a tipping point</u>, "a tipping <u>in which so many</u> of the <u>leaders and operatives of al Qaeda have been killed</u> or captured, and <u>the group is no longer able to</u> attempt or <u>launch a strategic attack against the U</u>nited <u>S</u>tates, such that al Qaeda∂ as we know it, <u>the organization that</u> our <u>Congress authorized</u> the military to pursue in 2001, <u>has∂ been</u> effectively <u>destroyed</u>".85<u>This statement is biopower</u> at its best for all three scholars.∂ <u>Foucault would point out the life-administering aspects of what the American government is trying to do in terms of al Qaeda. The government is seeking to change a behavior and ultimately produce a human being that would be more acceptable to the status quo. However, if such conditioning is not possible then the only plausible use of biopower would be the use of death as a final control against al Qaeda</u>. This, for Hardt and Negri, is the ultimate culmination of∂ biopower.∂ Hardt and Negri also talk about how counterinsurgency strategies have to be formed in∂ order to possibly compete with guerrilla fighters or in this case, insurgents. Hardt and Negri∂ suggest that "<u>the dominant power</u> (...) <u>must adopt counterinsurgency strategies that seek not only to defeat the enemy through military means but also control it with social, political, ideological, and psychological weapons</u>".86 The reason for this is best viewed through <u>Foucault</u>, who <u>says</u>:∂ "<u>Wars are no

longer waged in the name of a sovereign who must be defended; they are waged on∂ behalf of the existence of everyone; entire populations are mobilized for the purpose of∂ wholesale slaughter in the name of life necessity".87 It is no longer enough kill to the opponent;∂ there must be a regulation of the spaces in which their bodies operate. If not, then danger could∂ still exist. In many ways the War on Al Qaeda has become a war of biopower; Al Qaeda seeks to∂ use terrorism to control the actions and militaristic choices of the American people and∂ government, while the U.S. seeks to control, regulate and possibly destroy Al Qaeda. The social,∂ political, ideological and psychological are all processes and concepts that inform how human∂ beings carry out life, the way they behave and what behaviors should be reproduced. By∂ infiltrating the aforementioned realms the dominant power, being America, would seek to kill Al Qaeda as a viable option, as a way of life.∂ The idea of the "global War on Al Qaeda" also falls in line with Foucault's belief that war is fought on "behalf of the existence of everyone".88 George Bush's speech to Congress and∂ the nation on September 20th, 2001 furthered this idea by bringing not only national security to the forefront of American politics, but personal security as well. Security becomes a notion∂ important enough for the masses to engage and exert their might through the extinction of life.∂ However, at the same time even the act of getting the masses to rise and stand is a form of lifeadministering,∂ a positive form of biopower. Foucault also uses the word "purpose" which is∂ important to understand when it comes to trying to understand the meaning of biopower.∂ Biopower is not just an unseen concept, but it is government, it is the ruling body that creates the∂ space for life processes, such as politics, in order for them to play out. Foucault argues: "It is as∂ managers of life and survival, of bodies and the race, that so many regimes have been able to wage so many wars, causing so many men to be killed".89 To manage something is an incredible∂ type of power to hold, especially over the lives of men. And survival, which in a Foucauldian∂ sense would be avoiding death and being productive, is the purpose of biopower. Bodies most∂ live in order to be productive, however what happens when productivity is lost? Death becomes much more realistic as an option for control.

Drones and warfare are tools of the state to extend their power and push their citizens into a perpetual state of exception

Barringer '14 (Durante, political studies student at Bard College "Global War, Biopower and The Rise of Drone∂ Warfare in the 21st Century" April 2014 http://works.bepress.com/cgi/viewcontent.cgi?article=1001&context=durante_barringer) Foronda

Hardt and Negri view the concepts of global war, the absolute, and biopower through the overarching theme of security. They observe that there has been a shift from defense to security∂ within politics.97 Defense in itself is reactionary and based upon a set criterion that justifies∂ action. By contrast, with security there is a sense of proactivity, of actively seeking ways to deter∂ and prevent threats. Hardt and Negri put it this way: "security requires rather actively and constantly shaping the environment through military and/or police activity".98 Surveillance and the consequent targeted killings that accompany them are security in its finest form. As Hardt∂ and Negri assert, security is a form of biopower in the sense that security seeks to reshape and∂ produce social life at its most general global scale.99 Security, especially defined within previous∂ National Security strategies, has been aimed at the destruction of Al Qaeda and lessening their∂ influence across the globe. By openly bringing death to Al Qaeda's doorstep and actively∂ exerting power over life, security is reinforced through fear and possibility of death. Death then∂ serves as a deterrent, thus solidifying American security.∂ In looking at drones as a form of security or enforcer of security, taking the place of field∂ soldiers, one has to view drones as more than simple machines. The expansion of drone operations to include targeted killing is a response to the unorthodoxy of insurgency and asymmetric warfare. For a long time, with just ground forces which included spies, soldiers and∂ informants war efforts could only go so far. While still operating on a global field, ground forces can only conduct intelligence gathering for a limited time, especially within a network as∂ amorphous as Al Qaeda. The prospect of conducting targeted killings using ground forces would∂ also seem unconventional. Drones, on the other hand, can target and successfully kill more than one

enemy during an operation; drones can also gather intelligence for an undefined amount of time. These capabilities have become increasingly more desirable in the war against Al Qaeda.∂ **Drones have become the instrument of biopower in technological form**. Both police and∂ military powers are able to be carried out at a very low cost while affording the government maneuverability and global reach; this global reach allows for the regulation of life abroad and∂ ultimately transforms not only the way Al Qaeda operatives live, but the way both domestic and∂ foreign civilians live as well.∂ When looking at how one should view the transformation of war in the 21st century, Al∂ Qaeda and technology become synonymous with ideations of global security. Using Hardt and∂ Negri's framework allows for a comprehensive analysis of the advent of global war and the perpetual state of exception that has become commonplace within U.S. politics today. With the∂ advent of policies such as the AUMF and the Office of Legal Counsel's white paper on the∂ legality of drones, which I will discuss in chapter three, one has to grapple with such questions in∂ an intellectual way.∂ Global War is not something that is merely conceptual. It exists as a part of America's∂ national security strategy. For the past twelve years the U.S. has changed the way in which it∂ fought the war, however it has not changed the political objective of the war, which is a global one; the destruction of the Al Qaeda network completely. With that being said, the U.S. had to∂ adapt to the insurgency tactics of Al Qaeda, which for a military built on conventional strategic and tactical principles was a feat in itself. However, this new unconventional war has led to the∂ expansion of technology as a more efficient and cost effective way of fighting insurgencies.∂ Drones, armed drones, have come to the forefront of American war fighting. One could say that∂ this was bound to happen; drones were being used since the late 1970's, yet not at the capacity∂ they are being used now. In an article written by Frank Strickland called "The Early Evolution of∂ the Predator Drone" he quotes a man by the name of James "Jim" Woolsey, who says, "We have∂ slain a large dragon. But now we live in a jungle filled with a bewildering variety of poisonous snakes. And in many ways, the dragon was easier to keep track of".100 This quote speaks directly∂ to the frame of thought that is reflected today in American ideations of global war, exception and∂ the use of drones as an offensive-defensive counterinsurgency weapon. Woolsey said that∂ America, after the fall of Russia, the large dragon, lived in a world where small dangers would∂ pose a threat to security. Woolsey was right. Dangers did exist that were unseen and were hard to∂ keep track of especially with human limitations.

Link Turn – Legal Protections Good

Although the internet makes surveillance easier, spying on people is not the right way to go. Large corporations should not betray the trust of their consumers.

John **Sullivan** Jan 20**14** (Associate Professor of Media and Communication at Muhlenberg College in Allentown, PA. He received his Master's and Ph.D. degrees in Communication. The Political Economy of Communication "Uncovering the data panopticon: The urgent need for critical scholarship in an era of corporate and government surveillance" polecom.org/index.php/polecom/article/view/23/192)

In Philip K. Dick's 1956 science fiction short story, The Minority Report, crime in a futuristic United States has been all but extinguished because the police have discovered the ability to predict future events. In this peaceful dystopia, suspects are arrested and charged before their crimes are even committed. While real-world law enforcement agencies cannot (yet) predict future events, the recent revelations about the scope and nature of the National Security Agency's (NSA) domestic digital spying program suggest they have developed some formidable tools to locate would-be terrorists. Privacy advocates were outraged by whistleblower Edward Snowden's revelation that the NSA, in cooperation with technology companies, routinely stored, processed and analyzed millions of private emails, video chats, online phone calls, and internet file transfers under the auspices of a program called PRISM. Recent news reports based upon Snowden's documents have revealed that even encrypted emails, documents, and online banking transactions are being regularly accessed by the NSA (Larson and Shane, 2013). While these revelations about domestic digital wiretapping without court orders have caused a stir in the American and global press, the privacy dangers associated with this type of data surveillance are not new to the scholarly community. Exactly 20 years ago, communication scholar Oscar H Gandy Jr (1993) meticulously outlined the growing threat to individual privacy posed by the cooperation between corporate and government data gathering in a book called The Panoptic Sort. At a time when the internet was in its infancy, when desktop computer processing was a fraction of what it is today, and five years before the founding of Google, Gandy warned that organizations like Equifax, TRW, and the Direct Marketing Association (DMA) were amassing huge repositories of consumer data that were gathered passively whenever individuals made purchases via credit cards. When these data are combined with sophisticated matching algorithms and sorted against huge government databases like the census, he argued, they enabled precise tracking of individuals' behaviors, political views, and other sensitive private information. The precision of such discrimination transforms the routine sorting of personal data into a powerful form of institutional power. Building upon Foucault's (1995) seminal analysis of disciplinary systems in society, Gandy argued that the scale of the data collection and analysis performed by government and corporate institutions created a panopticon wherein citizen actions would eventually become circumscribed within an ever-widening net of personal data surveillance. The end result, he observed, is "an antidemocratic system of control that cannot be transformed because it can serve no purpose other than that for which it was designed—the rationalization and control of human existence"(Gandy, 1993: 227). We've come a long way since 1993. Who could have imagined services like Facebook, Twitter, and Tumblr that not only encourage, but actively incentivize the voluntary dissemination of personal information online? Over the past 20 years, the centrality of the internet to the global communications infrastructure has made it a target for the type of panoptic sorting that Gandy described. Now that the world knows about PRISM, it is tempting to imagine that enhanced public scrutiny will effectively limit these programs. I don't think that is likely. In fact, there are four specific trends that foretell a greater expansion of the data panopticon: convergence and the central place of software in social, commercial and political systems; the growing importance of metadata for routing, storage and sorting of information; the global business of data storage and retrieval; the blurring of lines between corporate and government data mining. The convergence of digital technologies and the importance of software In the previous era of analog technologies, such as wired

telephones and reel-to-reel tapes, each specific technology had a limited range of capabilities alongside a specific set of legal standards to accompany their use. The Wiretap Act of 1968, for example, prohibits law enforcement from wiretapping telephones without a court order because doing so would violate the 4th Amendment protections of both the suspect and anyone that communicates with them. Today, there are few discrete technologies anymore. Thanks to technological convergence, almost all forms of communication today utilize some form of digital communication, and many do this via the Internet. Software has now replaced specific forms of communication hardware as the nexus for new types of digital communication, from Skype and FaceTime to emails and tweets. Creating legal precedents for protecting individual privacy throughout this myriad of new options has been difficult. Indeed, new options are emerging all the time, and software is extremely fungible in functionality as it adapts quickly to new situations and uses. We lack a coherent legal regime to counteract the interception of these communications. For example, Skype phone calls can be protected under the existing federal wiretap laws, but emails and text messages cannot. The rise of metadata The expansion of online communications has generated an explosion of metadata. Metadata are the transaction records that are generated whenever you send an email or text message. It identifies the location from which the message was sent, when it was sent, the subject of the message, the recipient(s) of the message, the web address of the recipient(s), and more. The Obama Administration has argued that its domestic intelligence program complied with the law because it simply scanned the metadata of email transactions to search for anomalies rather than accessing the content of those emails. As a recent article in The Economist (2013) pointed out, however, while the usefulness of metadata in an analog era was limited (hence the lower evidentiary standards required in courts to obtain that information), today, thanks to the internet, "metadata can now provide a detailed portrait of who people know, where they go, and their daily routines." (para. 8) Therefore, the argument that random metadata searches do not violate users' privacy becomes difficult to sustain.

Link Turn – Prisons

Prison is just a subtle form of control the government uses on the people. The isolation, surveillance, labor etc. were used to make prisoners feel separated from society. These feelings are what turned 'deliquents' into law abiding citizens.

Schriltz 99 ("Foucault on the prison: Torturing history to punish capitalism" Critical Review: A Journal of Politics and Society Karl von Schriltz, published online: 06 Mar 2008. http://www.tandfonline.com/doi/pdf/10.1080/08913819908443539

In the third and most important part of his argument, Foucault considers how the structure of the prison came to reflect the imperatives of power, which were roughly coextensive with the goals of Panopticism. The aim of the prison, Foucault opines, ultimately became the transformation of inmates into compliant, law-abiding, economically productive automatons, reflecting the efficiency demands of emerging market economies (163—64). To this end, prisons came to embody the coercive principles of Jeremy Bentham's Panopticon, as did the school, the hospital, and the factory. Panopticism disciplined its subjects through a program of constant surveillance coupled with strict regimentation according to detailed instructions. Constant surveillance forced subjects to internalize the gaze of authority—enabling them to regulate themselves—while regimentation molded their physical movements to maximize productivity. Foucault identifies five ways in which prisons incorporated Panopticism. First, cellular isolation forced the inmates into greater selfreflection, pushing them to internalize authority (236). Second, constant surveillance achieved the same end (249-50). Third, remunerated prison labor was adopted as a means of regimenting the habits and movements of inmates, while impressing upon them the centrality of wages as the incentive to work (240, 243). Fourth, flexible prison sentences were meted out, reflecting the requirements of psychological rehabilitation rather than the seriousness of the infraction—though Foucault admits that flexible sentencing was practiced only sporadically (244). The final, similar expression of Panopticism in the prison, Foucault asserts, was the cognitive shift from viewing inmates as "law breakers" to viewing them as "delinquents" (255). Prison administrators regarded their inmates no longer in terms of the crimes they had committed, but rather in terms of their lifelong social pathologies, as reflected by their "biographies." The prisoners were seen as, and made to feel alienated from, society. This portion of Foucault's argument is the one that is the most abstracted from reality, and is therefore the most difficult to relate to the historical record; but the actual evolution of the prison during the nineteenth century, and the explicit motivations behind its evolution, seem to diverge markedly from Foucault's account. Industrialization undoubtedly brought an unprecedented awareness of the importance of productivity to economic life, and the emergence of surveillance and hierarchy in schools, factories, and hospitals probably reflected this concern. Foucault is also credible in suggesting that the enhancement of efficiency through discipline initially appeared in the military—where the importance of efficiency was first recognized—long before the Industrial Revolution brought the same concern to other institutions. For this reason, efficiency concerns may have unconsciously undergirded the pronouncements of prison reformers—there is no way of ever verifying their true motivations (Wright 1983, 22). However, the actual extent to which ideas other than Panopticism were reflected in the structure of prisons suggests otherwise. The lukewarm reception of imprisonment in France was reflected in the disorganized state of the French prison system, which consisted of two levels. Roughly 400 local prisons housed half the prison population, including those waiting for trial and petty criminals serving brief sentences (Wright 1983,133-34). These squalid facilities were described by shocked prison inspectors as "filled with stupor and horror"; the lack of segregation according to age, sex, or degree of criminality rendered them veritable "crime factories" (ibid., 134). These prisons remained untouched by the philosophical speculation about incarceration, and certainly exhibited no trace of Panopticism—there was no cellular isolation, no work, and no organized surveillance of any kind.

Impact Debate

Impact Defense – Biopower

Case outweighs biopower – physical violence is worse than disciplinary power

Mark **Bevir**, Reader in Political Theory @ U. Newcastle, Feb. **1999**, Political Theory

Perhaps we might say, therefore, that power or pastoral-power recognises the value of the subject as an agent, whereas violence or discipline attempts to extinguish the capacity of the subject for agency. Although Foucault, of course, never describes things in quite these terms, he does come remarkably close to doing so. In particular, he defines violence, in contrast to power, as aiming at domination or as a physical constraint that denies the ability of the other to act: "where the determining factors saturate the whole there is no relationship of power," rather "it is a question of a physical relationship of constraint."27 Similarly, he defines power, in contrast to violence, as able to come into play only where people have a capacity to act, perhaps even a capacity to act freely: "power is exercised over free subjects, and only insofar as they are free," by which "we mean individual or collective subjects who are faced with a field of possibilities in which several ways of behaving, several reactions and diverse comportments may be realized."28 If we thus accept that power always treats the subject as an agent, whereas violence always attempts to extinguish the capacity of the subject for agency, we can see why Foucault's later work on power emphasises that power, unlike violence, necessarily entails a capacity for resistance. To treat someone as an agent, one has to recognise that they can do other than one wishes—they can resist. Power can exist only where people have a capacity to act freely, and so only where they can resist that power. Perhaps, therefore, we should define as violent any relationship—whether overtly violent or not—in which an individual has his action determined for him. Violence manifests itself in any relationship between individuals, groups, or societies in which one denies the agency of the others by seeking to define for them actions they must perform. Power, in contrast, appears in any relationship—although no overtly violent relationship could meet the following requirement—in which an individual does not have his action determined for him. Power manifests itself whenever individuals, groups, or societies act as influences on the agency of the subject without attempting to determine the particular actions the subject performs. Here a rejection of autonomy implies that power is ineliminable, while a defence of agency implies that power need not degenerate into violence. Foucault's final work on the nature of governmentality suggests, therefore, that society need not consist solely of the forms of discipline he had analysed earlier. Society might include an arena in which free individuals attempt only to influence one another. I hope my discussion of Foucault's theory of governmentality has pointed to the way in which a distinction between violence and power might provide us with normative resources for social criticism absent from his earlier work. Provided we are willing to grant that the capacity for agency has ethical value—and this seems reasonable enough—we will denounce violent social relations and champion instead a society based on a more benign power.29 We will favour forms of power that recognise the other as an agent, and so provide openings for resistance. As Foucault suggested, we will judge societies against an ideal of "a minimum of domination."30 A good society must recognise people as agents: it must encourage forms of resistance. What is more, of course, if we are to recognise people as agents and encourage forms of resistance, we must tolerate, perhaps even promote, difference. Most discussions of the sort of ethics poststructuralism might sustain, especially in relation to feminism, highlight the ideas of a recognition of the other and a tolerance of difference.31 What I hope I have added to these discussions is the suggestion that one way of generating these values is to treat Foucault's concept of governmentality as implying a recognition of the subject as an agent but not an autonomous agent. No doubt important questions remain to be answered. Questions such as, can we devise criteria by which to determine the extent of violence within a society? how should we promote resistance? and can we make further relevant distinctions between forms of violence or even between forms of power? It seems clear already, however, that Foucault provides us with a point of departure from which to address these questions. His concept of governmentality encourages us to look at social formations to see how they provide possibilities for agency and resistance understood as key forms of human freedom. As he himself said, "the notion of governmentality allows one, I believe, to set off the freedom of the subject and the relationship to others, i.e., that which constitutes the very matter of ethics."32

Impact Defense – Sovereignty

Sovereignty is not the founding moment of politics—the decision is haunted by the traces of its conceptual predecessors—ontologizing the sovereign decision within the heart of the political is a self-fulfilling prophecy

Barnett '9 Clive Barnett, Reader in Human Geography at The Open University, "Violence and publicity: constructions of political responsibility after 9/11," Critical Review of Social and Political Philosophy, 12 (3), 2009, pp. 353-375, http://dx.doi.org/doi:10.1080/13698230903127879

If Agamben drastically simplifies Foucault's work on power, then nor should Agamben's allusion to Derrida in the analysis of the state of exception be accepted as the authoritative political interpretation of deconstruction's relevance to contemporary geopolitics. It is common to find deconstructive topics such as undecidability interpreted, with the help of Schmitt, to support an account of 'the political' in terms of arbitrary force and unfounded decisions (see Barnett 2004). **The decisionistic interpretation of the performative force of foundations tends to take Schmitt's account of sovereignty as the power to decide on the exception as axiomatic**. In Schmitt's original formulation and in Agamben's faithful reiteration of it, **the sovereign is defined as the one who decides on the exception. The circularity in this definition** (Bull 2004) **effaces the interval between claiming the necessity of making an exception – of suspending the law – and the successful enactment of this claim. The absence of objective foundational validity to norms is**, through reference to the Derridean theme of undecidability, **made to imply that application and judgement are a purely arbitrary imposition of force by the strongest will. This interpretation misconstrues the practice of judgement that the deconstruction of foundations is meant to throw into new relief** (see Brenkman 2007, 59-77, Zerilli 2005). **In Derrida's writings, the absence of foundations is not the occasion for a depressed resignation to a decisionistic interpretation of sovereign power at all. Rather, a distinctive sense of responsibility is made visible by the undecidability of normative foundations.** Derrida does not locate the 'mystical' foundation of authority in the self-assertive will of the sovereign who decides on the exception, but in the exposure to the demands of others (see Barnett 2005). Derrida clearly articulated his doubts about the sustainability of **Schmitt's account of sovereignty** and the political, on the grounds that it **depends on a logic of conceptual purity in which enmity is always found to be the original source lying behind all apparently reciprocal relationships** (Derrida 1997, 246-247). In his own reflections on the philosophical resonances of contemporary geopolitics after 9/11, Derrida undermines the model of sovereignty as wilful self-assertion upon which the state of exception analysis rests. **The circularity of the Schmittian account of sovereignty maintains the assumption of an 'ipseity' of the self, defined by the security of an "I Can"** (Derrida 2005, 11-13). Against this self-founding circularity, **Derrida affirms the spacing between asserting sovereignty and the enactment of decision which is implied by thinking of sovereignty as performative: "To confer sense or meaning on sovereignty, to justify it, to find a reason for it, is already to compromise its deciding exceptionality, to subject it to rules, to a code of law, to some general law, to concepts. It is thus to divide it, to subject it to portioning, to participation, to being shared**" (Derrida 2005, 101). For Derrida, **pure sovereignty on the model of decisionist exceptionality does not and cannot exist, in so far as it would exclude the possibility of sharing upon which sovereignty depends**. In Derrida's account, **sovereignty is divided at is origin by a spacing that implies sovereignty is always distributed, shared with others** (Derrida 2005, 45). The deconstruction of the punctual ipseity of decisionistic sovereignty has consequences for understandings of concepts of force, power and mastery (Derrida 2005, 17). **If violence is a possibility inhabiting all relations, then so equally is its opposite, non-violence.** While Derrida acknowledged that "a certain force and violence" is irreducible in argumentation and discussion, he argued that "none the less this violence can only be practised and can only appear as such on the basis of a nonviolence, a vulnerability, an exposition. […]. I do not believe in non-violence as a descriptive and determinable experience, but rather as an irreducible promise and of the relation to the other as essentially non-instrumental" (Derrida 1996, 83). Reversing and displacing the order of priority found in decisionistic interpretations of deconstruction, Derrida affirms that **violence is always entangled in "a non-appropriative relation to the other that occurs without violence and on the basis of which all violence detaches itself and is**

determined" (Derrida 1996, 83). The point of calling attention to this entangled relationship of violence and non-violence in Derrida's work is to underscore that **if the relationship between norms and authority, justice and law, is understood to be 'undecidable', then this should not be construed as authorizing the sort of conceptualisation of power as necessarily violently sovereign** developed by Agamben (see Johnson 2007, Wortham 2007).

Impact Framing - Pragmatism Good

Conventional political action is the only way to reform power – Foucault's alternative fails

Michael **Walzer**, Social Sciene Prof @ Princeton, **1988**, Company of Critics, p. 207-9

Foucault is certianly right to say that the conventional truths of morality, law, medicine, and psychiatry are implicated in the exercise of power; that is a fact too easily forgotten by conventionally detached scientists, social scientists, and even philosophers. But those same truths also regulate the exercise of power. They set limits on what can rightly be done, and they give shape and conviction to the arguments the prisoners make. The limits are important, even if they are in some sense arbitrary. They aren't entirely arbitrary, however, insofar as they are intrinsic to the particular disciplines (in both senses of the word). It is the truths of jurisprudence and penology, for example, that distinguish punishment from preventive detention. It is the truths of psychiatry that distinguish the internment of madmen from the internment of political dissidents. And it is the commitment to truth itself, even if it is only local truth, that distinguishes the education of citizens from ideological drill. A liberal or social democratic state is one that maintains the limits of its constituent disciplines and disciplinary institutions and that enforces their intrinsic principles. Authoritarian and totalitarian states, by contrast, override those limits, turning education into indoctrination, punishment into repression, asylums into prisons, and prisons into concentration camps. These are crude definitions, but they can easily be elaborated or amended. They indicate, in any case, the enormous importance of the political regime, the sovereign state. For the state is the agency through which society acts upon itself, It is the state that establishes the general framework within which all other disciplinary institutions operate. It is the state that holds open or radically shuts down the possibility of local resistance.* The agents of every Disciplinary institution strive, of course, to extend their reach and and augment their discretionary power. In the long run, only political action and state power can stop them. Every act of local resistance is an appeal for political or legal intervention from the center. Consider, for example, the factory revolts of the 1930s that led (in the United States) to the establishment of collective bargaining and grievance procedures, critical restraints on scientific management, which is one of Foucault's disciplines, though one that he alludes to only occasionally. Success required not only the solidarity of the workers but also the support of the liberal and democratic state. And success was functional not to any state but to a state of that sort; we can easily imagine other "social wholes" that would require other kinds of factory discipline. A genealogical account of this discipline would be fascinating and valuable, and it would undoubtedly overlap with Foucault's accounts of prisons and hospitals. But if it were complete, it would have to include a genealogy of grievance procedures too, and this would overlap with an account that Foucault doesn't provide, of the liberal state and the rule of law. Here is a kind of knowledge—let's call it political theory or philosophical jurisprudence— that regulates disciplinary arrangements across our society. It arises within one set of power relations and extends toward the others; it offers a critical perspective on all the networks of constraint. The possibility of knowledge of this sort, specific to institutions and political cultures rather than to "points" in the power network, suggests that we still require (I don't mean that society requires, or capitalism or even socialism requires, but you and I require) Foucault's general intellectuals. We need men and women who tell us when state power is corrupted or systematically misused, who cry out that something is rotten, and who reiterate the regulative principles with which we might set things right. General intellectuals don't inhabit a realm of pure value, such as Bends described; Foucault is right to insist that there is no such place, no value untouched by power. They stand among us, in this place, here and now, and they find in our laws and norms reasons for argument. But Foucault stands nowhere and finds no reasons. Angrily, he rattles the bars of the iron cage. But he has no plans or projects for turning the cage into something more like a human home. But I don't want to end on this note. I don't want to ask Foucault to be uplifting. That is not the task he has set himself. The point is rather that one can't even be downcast, angry, grim, indignant, sullen, or embittered with reason, one can't be critical, unless one inhabits some social setting and adopts, however tentatively, its codes and categories. Or unless, and this is much harder, one constructs (along with other men and women) a new setting and works out new codes and categories. Foucault refuses to do either of these things, and that refusal, which makes his genealogies so relentless, is also the catastrophe of his political theory and his social criticism.

Alt Debate

Alt Bad - Conservatism DA

The alternative reproduces the ethics of moral conservativism, which ensures it is a constant form of inaction that leaves the subject to be destroyed.

Terry **Eagleton**, fellow of Linacre college, The Ideology of the Aesthetic, **1990**, pg. 393-395

As with Nietzsche, Foucault's vigorously self-mastering individual remains wholly monadic. Society is just an assemblage of autonomous self-disciplining agents, with no sense that their self-realization might flourish within bonds of mutuality. The ethic in question is also troublingly formalistic. What matters is one's control over and prudent distribution of one's powers and pleasures; it is in this ascetic self-restraint that true freedom lies, as the freedom of the artefact is inseparable from its self-imposed law. 'It was not a question', Foucault claims, 'of what was permitted or forbidden among the desires that one felt or the acts that one committed, but of prudence, reflection, and calculation in the way one distributed and controlled his acts' (p. 54). Foucault has now — at last! — introduced the question of critical self-reflection into desire and power, a position perhaps not wholly at one with his Nietzscheanism; but he does so only to produce a formalistic account of morality. The ancients, he writes, did not operate on the assumption that sexual acts were bad in themselves; what matters is not the mode of conduct one prefers but the 'intensity' of that practice, and so an aesthetic rather than ethical criterion. But it is surely not true that some sexual acts are not inherently vicious. Rape, or child abuse, are signal examples. Is rape morally vicious only because it signifies a certain imprudence or immoderacy on the part of the rapist? Is there nothing to be said about the victim? This is a subject-centred morality with a vengeance: 'For the wife [of Greek antiquityl' Foucault writes without the faintest sardonic flicker, 'having sexual relations only with her husband was a consequence of the fact that she was under his control. For the husband, having sexual relations only with his wife was the most elegant way of exercising his control' (p. 151). Chastity is a political necessity for women and an aesthetic flourish for men. There is no reason whatsoever to imagine that Foucault actually approves of this dire condition; but it is one odious corollary of the ethic he most certainly does endorse. It is also true that Foucault, at least at one point in his life, opposed the criminalization of rape. Part of the problem of his approach consists in taking sexuality as somehow paradigmatic of morality in general — a stance which ironically reduplicates the case of the moral conservative, for whom sex would seem to exhaust and epitomize all moral issues. How would Foucault's case work if it were transferred to, say, the act of slander? Is slander acceptable as long as I exercise my power to perform it moderately, judiciously, slandering perhaps three persons but not thirty? Am I morally admirable if I retain a certain controlled deployment of my slanderous powers, letting them out and reining them in in an elegant display of internal symmetry? Does it all come down to a question of how, in postmodernist vein, one 'stylizes~ ones s conduct? What would a stylish rape look like, precisely? Foucault's Greeks believe that one should temper and refine one's practices not because they are inherently good or bad, but because self-indulgence leads to a depletion of one's vital powers — a familiar male fantasy if ever there was one. The more one aesthetically restrains oneself, the richer the powers which accrue to one — which is to say that power here would seem in romantic vein an unquestioned good, a wholly undifferentiated category. The positivity of power can thus be maintained, but converted into the basis of a discriminatory ethics by virtue of adding to it the techniques of prudence and temperance. And the ethical theory which is the upshot of this — that 'the physical regimen ought to accord with the principle of a general aesthetics of existence in which the equilibrium of the body was one of the conditions of the proper hierarchy of the soul' (p. 104) — has long been familiar on the playing fields of Eton. With The Use of Pleasure, Foucault completes his long trek from the hymning of madness to the public school virtues. The ethical techniques with which Foucault is concerned in this book are ones of subjectivization; but how far the long-despised subject actually makes its belated appearance in these pages is a moot point. It is clear that Foucault's repressive hostility to subjectivity, which he can usually see only as self-incarceration, deprives him of all basis for an ethics or a politics, leaving his rebellion a useless passion; and this volume is among other things an attempt to plug that disabling gap. But he still cannot quite bring himself to address the question of the subject as such. What we have here, rather than the subject and its desires, is the body and its pleasures — a half-way, crab-wise, aestheticizing move towards the subject which leaves love as technique and conduct rather than as tenderness and affection, as praxis rather than interiority. It is symptomatic in this respect that the practice closest to sexuality in the book is that of eating. A massive repression, in other words, would still seem operative, as the body stands in for the subject and the aesthetic for the ethical. In one sense, the sudden appearance of the autonomous individual in this work, after an intellectual career devoted to systematically scourging it, comes as something of a surprise; but this individual is a matter, very scrupulously, of surface, art, technique, sensation. We are still not permitted to enter the tabooed realms of affection, emotional - intimacy and compassion, which are not particularly notable among the public school virtues.

Blatant rejections of the make imperialism more insidious – state key to stopping multiple international problems

An attack on the postcolonial state as the author of violence73 and its drive to produce a modern citizenry may seem cathartic, without producing the semblance of an alternative vision of a new political community or fresh forms of life among existing political communi- ties. Central to this critique is an assault on the state and other modern institutions said to disrupt some putatively natural flow of history. Tradition, on this logic, is uprooted to make room for grafted social forms; modernity gives birth to an intolerant and insolent Leviathan, a repository of violence and instrumental rationality's finest speci- men. Civil society - a realm of humaneness, vitality, creativity, and harmony - is superseded, then torn asunder through the tyranny of state-building. The attack on the institution of the state appears to substitute teleology for ontology. In the Third World context, especially, the rise of the modern state has been coterminous with the negation of past histories, cultures, identities, and above all with violence. The stubborn quest to construct the state as the fount of modernity has subverted extant communities and alternative forms of social orga- nization. The more durable consequence of this project is in the realm of the political imaginary: the constrictions it has afforded; the denials of alternative futures. The postcolonial state, however, has also grown to become more heterodox - to become more than simply modernity's reckless agent against hapless nativism. The state is also seen as an expression of greater capacities against want, hunger, and injustice; as an escape from the arbitrariness of communities established on narrower rules of inclusion/exclusion; as identity removed somewhat from capri- cious attachments. No doubt, the modern state has undermined tra- ditional values of tolerance and pluralism, subjecting indigenous so- ciety to Western-centered rationality. But tradition can also conceal particularism and oppression of another kind. Even the most elastic interpretation of universality cannot find virtue in attachments re- furbished by hatred, exclusivity, or religious bigotry. A negation of the state is no guarantee that a bridge to universality can be built. Perhaps the task is to rethink modernity, not to seek refuge in a blind celebration of tradition. Outside, the state continues to inflict a self-producing "security dilemma"; inside, it has stunted the emergence of more humane forms of political expres- sion. But there are always sites of resistance that can be recovered and sustained. A rejection of the state as a superfluous leftover of modernity that continues to straitjacket the South Asian imagination must be linked to the project of creating an ethical and humane order based on a restructuring of the state system that privileges the mighty and the rich over the weak and the poor.74 Recognizing the constrictions of the modern Third World state, a reconstruction of state-society re- lations inside the state appears to be a more fruitful avenue than wishing the state away, only to be swallowed by Western-centered globalization and its powerful institutions. A recognition of the patent failure of other institutions either to deliver the social good or to procure more just distributional rewards in the global political economy may provide a sobering reassessment of the role of the state. An appreciation of the scale of human tragedy accompanying the collapse of the state in many local contexts may also provide im- portant points of entry into rethinking the one-sided onslaught on the state. Nowhere are these costs borne more heavily than in the postcolonial, so-called Third World, where time-space compression has rendered societal processes more savage and less capable of ad- justing to rhythms dictated by globalization

Alt Fails – Inaction

Critique without direction a dead end – too much pessimism about modernity.

Loper '11 (Christiane, a graduate student of International Development, "Critique of the Critique: Post-Development and points of criticism" http://www.globalpolitics.cz/clanky/critique-of-the-critique-post-development-and-points-of-criticism) Wadhwani

Post-Development literature is highly influenced by Foucault and the method of discourse analysis: consequently, hegemony and power structures are being deconstructed. But what follows is the ignorance of how discourses can be transformed and resisted at the local level. The celebration of local knowledge and local resistance leads to a romantization and an unquestioned believe in tradition. ,The Local' is set equally with authenticity and emancipation. But power structures are, especially in application of the work of Foucault, ever-present (Jakinow 2008: 313). Why then are grassroots movements guarantors for being inclusive, non-hierarchic and democratic? Local forms of oppression are overlooked (Engel 2001:140). Nederveen Pieterse comments: "while the shift towards cultural sensibilities that accompanies this perspective is a welcome move, the plea for ,people's culture', indigenous culture, local knowledge and culture, can lead if not to ethnochauvinism, to reification of both culture and locality or people. It also envices a one-dimensional view of globalization which is equated with homogenization" (Nederveen Pieterse 1998: 366). Additionally, the exclusive validity of local knowledge precludes the view on multiple knowledge. In consequence the fundamental criticism on modernity and modern science implicates a rejection of the benefits: for example, the rights of the individual as well as the techniques of modern medicine are dismissed, although they brought health security and a higher life-expectancy (Ziai 2007: 102). Nederveen Pieterse even classifies Post- Development to belong "to the neo-traditionalist reaction to modernity" (Nederveen Pieterse 1998: 366?). In his opinion, Post- Development is struck into a paradox: not showing any regard for progressive implications and dialectics of modernity but at the same time dealing with issues like anti-authoritarianism, democratization, emancipation, that all clearly arose out of the Enlightenment and the modern age, is highly inconsistent (ebd. 1998: 365). global structures of inequality are not taken into concern. Storey asks for example how local actors are supposed to find solutions at the global level (Storey 2000). in emphasizing cultural diversity and in rejecting universalism, Post- Development is criticized of being cultural-relativist. Therefore Post- Development stands in suspicion to accept oppression and violence and to be indifferent towards the violation of human rights. Post- Development is accused to feel an affinity for neoliberalism. According to Nederveen Pieterse, it is argued that both approaches reject state intervention and agree on state failure: Escobar is skeptical towards state planning, he questions social engineering and the faith in progress lead by the state. The neoliberal thinker Deepak Lal condemns state-centered development economies (Nedeveen Pieterse 1998: 364). Further, also advocates of a neoliberal capitalism favor a strong civil society and the liberty of all citizens to choose their possibilities. The final criticism is that Post-Development, instead of offering a solution, sticks on the classical development paradigm by being in position of permanent critique. According to Tanja Jakimow Post-Development is "in danger of having to constantly re-manoeuvre to retain its 'alternative' status as elements of its critique are incorporated into the mainstream" (Jakimow 2008: 313). There is no vision of how Post-Development can look like in practice: "Post- Development parallels postmodernism both in its acute institutions and in being directionless in the end, as a consequence

Law Good – Responsibility

Equating politics with exception naturalizes violence and empties the political subject of any responsibility for others and shuts out progressivism

Barnett '9 Clive Barnett, Reader in Human Geography at The Open University, "Violence and publicity: constructions of political responsibility after 9/11," Critical Review of Social and Political Philosophy, 12 (3), 2009, pp. 353-375, http://dx.doi.org/doi:10.1080/13698230903127879

What do these empirical and theoretical reasons for remaining sceptical of Agamben's diagnosis of modernity reveal about the relationship of this strand of philosophical reflection to the task of conceptualising the double responsibility discussed in the first section of this paper? **The state of exception argument is informed by and also confirms a model of action that is freed from any horizon of responsibility whatsoever**. There are two dimensions to this disavowal of responsibility. First, with respect to political responsibility, **this analysis affirms that all constituted power is tainted with violence and death.** On Agamben's understanding, the actions of modern states always rest on arbitrary decision and violent force. This understanding provides resources with which any and all actions of states can be traced back to this fundamental root (Brenkman 2007, 66). **In turn, the expression of dissent is thereby freed from any sense of the legitimacy of struggling over the control of institutions** (Brennan and Ganguly 2006, 27). Second, **this abjuring of political responsibility is matched by the account of ethical action that likewise leaves no ontological or normative space for responsibility.** Agamben takes his distance from Schmitt only in so far as the latter sought to recuperate foundational, sovereign violence within the scope of the law (Agamben 2005, 59). As Leys (2007, 161) observes, **for Agamben the notion of responsibility is felt to be inherently unethical because it is "irremediably contaminated by law". In line with the persistent drive for conceptual purity** which Derrida identifies in Schmittian political theory, **responsibility is therefore abandoned in favour of a model of untainted ethical action modelled on Benjamin's messianic vision of 'pure violence', which seeks to assure violence "an existence outside of the law"** (Agamben 2005, 59). Benjamin's concept of the pure or divine violence of revolution is recuperated as a preferred figure of authentic ethical action freed from subordination to the law (Agamben 2005, 88). Pure violence is a figure for "action as pure means", with no relation to an end (Agamben 2000). **Agamben takes Benjamin as the inspiration for a model of action entirely freed from any implication in public practices where responsibility even arises, and not least freed from the scenes of exposure to alterity upon which Derrida seeks to erect a deconstructive sense of responsibility. The ontologization of violence leaves little scope for considering the possibility that power can and does circulate in normatively justified and justifiable forms. This posture does little more justice to the potential of concerted action in the public sphere than does the constant trumpeting of unending 'terrorist' threats**. But **there is no good reason to suppose that violence is not a contingent feature of human affairs. A decisionistic view of power is little help in understanding the processes of learning and repair that maintain the fabric of peaceable pluralistic societies** (see Spelman 2002). **Nor is a decisionistic view of power very much help when it comes to thinking about the possibility of addressing issues of security, international terrorism, or war democratically,** that is, through apparatuses of deliberatively generated influence (see Dryzek 2006, Habermas 2006, Young 2007, Ch. 5). **The value of practices of reasoning and reasonableness which are recognizably democratic is derived from their fragility, not their firm foundations in grounds of certainty** (Keane 2004, 3). **It is this fragility that is threatened by recourse to violence as a political instrument. What is required, therefore, is to think about the publicity conditions that function as more or less effective, but always fragile contexts of legitimation and justification that can serve as the basis for further progress towards the democratisation of violence** (Keane 2004, 154-164).

The law is necessary to prevent suffering

Kurasawa, 04 (Professor of Sociology, York University of Toronto, Fuyuki, Constellations Volume 11, No 4, 2004).

Moreover, keeping in mind the sobering lessons of the past century cannot but make us wary about humankind's supposedly unlimited ability for problemsolving or discovering solutions in time to avert calamities. In fact, the historical track-record of last-minute, technical 'quick-fixes' is hardly reassuring. What's more, most of the serious perils that we face today (e.g., nuclear waste, climate change, global terrorism, genocide and civil war) demand complex, sustained, long-term strategies of planning, coordination, and execution. On the other hand, an examination of fatalism makes it readily apparent that the idea that humankind is doomed from the outset puts off any attempt to minimize risks for our successors, essentially condemning them to face cataclysms unprepared. An a priori pessimism is also unsustainable given the fact that long-term preventive action has had (and will continue to have) appreciable beneficial effects; the examples of medical research, the welfare state, international humanitarian law, as well as strict environmental regulations in some countries stand out among many others. The evaluative framework proposed above should not be restricted to the critique of misappropriations of farsightedness, since it can equally support public deliberation with a reconstructive intent, that is, democratic discussion and debate about a future that human beings would freely self-determine. Inverting Foucault's Nietzschean metaphor, we can think of genealogies of the future that could perform a farsighted mapping out of the possible ways of organizing social life. They are, in other words, interventions into the present intended to facilitate global civil society's participation in shaping the field of possibilities of what is to come. Once competing dystopian visions are filtered out on the basis of their analytical credibility, ethical commitments, and political underpinnings and consequences, groups and individuals can assess the remaining legitimate catastrophic scenarios through the lens of genealogical mappings of the future. Hence, our first duty consists in addressing the present-day causes of eventual perils, ensuring that the paths we decide upon do not contract the range of options available for our posterity.42 Just as importantly, the practice of genealogically inspired farsightedness nurtures the project of an autonomous future, one that is socially self-instituting. In so doing, we can acknowledge that the future is a human creation instead of the product of metaphysical and extra-social forces (god, nature, destiny, etc.), and begin to reflect upon and deliberate about the kind of legacy we want to leave for those who will follow us. Participants in global civil society can then take – and in many instances have already taken – a further step by committing themselves to socio-political struggles forging a world order that, aside from not jeopardizing human and environmental survival, is designed to rectify the sources of transnational injustice that will continue to inflict needless suffering upon future generations if left unchallenged.

Permutation

Foucault suggests the scrutiny of discourse WITHOUT rejection so the perm solves

Foucault 77 (Michel, philosopher, "The Archaeology of Knowledge," pg. 25 http://monoskop.org/images/9/90/Foucault_Michel_Archaeology_of_Knowledge.pdf) Wadhwani

We must renounce all those themes whose function is to ensure the infinite continuity of discourse and its secret presence to itself in the interplay of a constantly recurring absence. We must be ready to receive every moment of discourse in sudden irruption; in that punctuality in which it appears, and in that temporal dispersion that enables it to be repeated, known, forgotten, transformed, utterly erased, and hidden, far from all view, in the dust of books. Discourse must not be referred to the distant presence of the origin, but treated as and when it occurs. These pre-existing forms of continuity, all these syntheses that are accepted without question, must remain in suspense. They must not be rejected definitively of course, but the tranquility with which they are accepted must be disturbed; we must show that they do not come out about of themselves, but are always the result of a construction the rules of which must be known, and the justifications of which must be scrutinized.

Sovereignty must be used strategically – critique can be simultaneous

Mark Owen **Lombardi**, Associate Political Science Prof @ Tampa, **1996**, Perspectives on Third-World Sovereignty, p 161

Sovereignty is in our collective minds. What we look at, the way we look at it and what we expect to see must be altered. This is the call for international scholars and actors. **The assumptions of the paradigm will dictate the solution and approaches considered. Yet, a mere call to change this structure of the system does little except activate reactionary impulses and intellectual retrenchment. Questioning the very precepts of sovereignty**, as has been done in many instances, **does not in and of itself address the problems and issues so critical to transnational relations. That is why theoretical changes and paradigm shifts must be coterminous with applicative studies. One does not and should not precede the other. We cannot wait until we have a neat self-contained and accurate theory of transnational relations before we launch into studies of** Third-World issues and **problem-solving. If we wait we will never address the latter and arguably most important issue-area: the welfare and quality of life for the human race.**

A2 Law Sucks/Excludes Us

Engaging Paradoxically with the law has value – if the law is BAD then the only way it will change is buying getting into the trenches

Hirsch 12 (Dr. Alexander Keller Hirsch is Assistant Professor in the Department of Political Science at the University of Alaska, Fairbanks. His primary field is political theory, and his research and teaching interests focus on the entanglements, impasses, and dreamworlds faced by people who inhabit the afterness of catastrophe, 2012, "The promise of the unforgiven: Violence, power and paradox in Arendt," pgs. 9-11, online @ psc.sagepub.com/content/early/2012/12/13/0191453712467319.full.pdf+html//DM)

My approach to the paradox differs from both Young-Bruehl's and Bar On's in that I am less interested in smoothing over, correcting, or otherwise neutralizing Arendt's aporia. Rather than view it as something to be explained or solved, I contend that the irresolvability of the paradox is precisely its source of generativity. In this sense I follow in line with a number of scholars who have recently argued that paradox, far from an endgame, represents a condition of possibility for a renewed vision of democratic politics as an inherently tragic venture. Perhaps Bonnie Honig has been most effective in this regard. In her marvelous recent collection of essays, Emergency Politics, Honig invokes Rousseau's well-known paradox of politics. For Rousseau, famously, political founding requires virtuous citizens to set it in motion, and yet such a citizenry cannot exist until that founding has conditioned a people capable of founding in the first place. As Honig parses Rousseau, 'In order for there to be a people well-formed enough for good lawmaking, there must be good law, for how else will the people be well formed? The problem is: Where would that good law come from absent an already well-formed, virtuous people?'44 Where most deliberative theorists, such as Seyla Benhabib or Ju¨rgen Habermas, work to find normative or prescriptive principles and procedures for solving Rousseau's paradox, Honig urges us to bracket the inclination to settle, sublimate, or otherwise resolve it at all. Rather she sees the paradox of politics as fecund with possibility. On this point, it is well worth quoting Honig at length: It might seem that acknowledging the vicious circularity of the paradox of politics must be costly to a democracy, or demoralizing: If the people do not exist as a prior – or even as a post hoc – unifying force, then what will authorize or legitimate their exercises of power? But there is ... also promise in such an acknowledgment. Besides, denial is costly too, for we can deny or disguise the paradox of politics only by suppressing or naturalizing the exclusion of those (elements of the) people whose residual, remaindered, minoritized existence might call the pure general will into question. From the perspective of the paradox of politics, unchosen, unarticulated, or minoritized alternatives – different forms of life, identities, solidarities, sexes or genders, alternative categories of justice, unfamiliar tempos – re-present themselves to us daily, in one form or another, sometimes inchoate. The paradox of politics provides a lens through which to re-enliven those alternatives. It helps us to see the lengths to which we go or are driven to insulate ourselves from the remainders of our settled paths. It keeps alive both the centripetal force whereby a people is formed or maintained as a unity and the centrifugal force whereby its other, the multitude, asserts itself.45 Here, Honig highlights those forms of exclusion that get erased when the paradox of politics is resolved or forgotten. Taking the irreparability of that paradox seriously means that new angles of vision get opened up. Specifically, the paradox helps us to see the extent of our attempts to conceal the violence committed in the act of founding a people. What is further revealed is the extent to which the work of democratic politics entails 'not just rupture but maintenance, not just new beginnings but preparation, receptivity, and orientation'.46 This is the tragic condition of the political paradox Honig redeems for democratic thinking. In qualifying what constitutes a tragic condition Honig turns to the moral philosophy of Bernard Williams. For Williams, Honig recalls, tragic situations are 'situations where there is no right thing to do but something must be done. Here every action is inaction.'47 Tragic situations are paradoxical ones. No matter what choice we make we are stuck. In this sense, tragedy questions the view that the subject is the sovereign master of its destiny. Tragedy raises doubts about the Platonist vision of the hyperrational ideal and the Kantian belief in the sufficiency and autonomy of the self.48 Instead, tragedy affirms the notion that the subject and its actions are vulnerable to forces and power not entirely within rational control. Moreover, for Williams, as for Honig, 'the question posed to the moral agent by the

tragic situation is not simply what should we do in a tragic situation but what does the tragic situation do to us and how can we survive it with our moral integrity intact?'49 The goal of moral theory is not to guide action or prescribe the normative 'right thing' to do, but rather to help the agent to survive the situation. 'The goal', Honig writes, 'is to salvage from the wreckage of the situation enough narrative unity for the self to go on.'50 Arendt's paradox is certainly tragic in this sense. If forgiveness is both violent, in its suddenness, and yet redeeming, in its capacity to release us from what we have violently done, we are left wedged between an impossible choice and a no less compelling imperative to act. If promising is what we do to subdue the unexpected and beckoning chaos of the future, then we must promise not to forgive, not to begin, not to do the violence required of us if we are to enter the world of appearances together and generate the conditions for power's emergence. This tragic situation calls for a theory of survivability and survivance, for a salvaging on behalf of the self. Importantly though, I think there is more than a moral dimension to the tragedy at play in the paradox of Arendt's treatment of violence, power, forgiveness and promising. There is a political face too. A tragic view sacralizes the restlessly ongoing and irresolvable quality of conflict endemic to human experience. It also induces a critical responsiveness to ambivalence, what Richard Seaford calls the 'prevalence of duality over unity'.51 Politics, seen as a tragic condition of human life, is conceived less as a means of foreclosing the conflicts that arise out of difference and disagreement than as a channel through which they might be quickened, elaborated and honed. In this sense, tragedy is attuned to an immensely complex field of powers, pressured encounters and civic possibilities. When conceived politically, which is to say tragically, democracy fosters robust and active modes of citizenship engaged in projects of public and counter-public building. These projects are aware both of the omnipresent and ineliminable quality of conflict and that the dynamism of this conflict is the source of political agency in the perpetually disputed and contingent character of the world held in common. This is a world shimmering with plurality, so long as the tragedy of democratic experience is upheld.

A2 Cant Engage the Surveillance Culture

Forum exists in the FISA Court to challenge the NSA – public advocates prove

Nolan et al. 13 (Andrew Nolan, Richard M. Thompson II, and Vivian S. Chu, Legislative Attorneys of the Congressional Research Service, 10/23/2013, "Introducing a Public Advocate into the Foreign Intelligence Surveillance Act's Courts: Select Legal Issues," https://www.justsecurity.org/wp-content/uploads/2013/10/CRS-Report-FISC-Public-Advocate-Oct.-25-2013.pdf)

It is a basic principle of American constitutional law that with one exception[46] the Constitution only applies to the federal government and, via the Fourteenth Amendment and certain other clauses, to the governments of the states.[47] Accordingly, before evaluating the constitutional implications of including a public advocate in FISA proceedings a threshold issue is to assess what the exact role of the FISA advocate is as a legal matter and, more specifically, whether the advocate is a sovereign entity that can be subject to the constraints of the Constitution.[48] At first blush, one can argue that <u>an opposition advocate in a FISA proceeding cannot be considered a government actor, as a public advocate represents the privacy interests of either the general public</u> or those being targeted. Indeed, as one scholar noted in another context regarding the concept of a public advocate, <u>the institution itself,</u> in actively opposing the position of a government agent, <u>is "so different from the traditional three branches of government" that the advocate "would be like a fourth branch of government</u>, totally different from anything contemplated by the framers at the time of the ratification of the Constitution," and, therefore, <u>free of the constraints of the Constitution</u>.[49] Moreover, <u>if one assumes a public advocate is a direct analogue to that of a public defender</u> in a federal criminal case, <u>the adversarial relationship of the FISA advocate with the government arguably prevents consideration of the opposition advocate as an instrument of the federal government.</u>[50] Specifically, <u>a public advocate,</u> being bound by the canons of professional responsibility, <u>must exercise independent judgment on behalf of his client – the public – and cannot be considered a "servant of an administrative superior" – i.e., the government</u>.[51] Put another way, an opponent of the government's position cannot be converted into its "virtual agent."[52] <u>In this light, some proposals for including an advocate have described the advocate's client as not being the government, but the "people of the United States" in "preserving privacy and civil liberties."</u>[53]

Cap Ans

A2: Do Nothing/Negativity Alt

Alt fails and leads to ressetiment
Connolly 11

(William E., A World of Becoming, Duke University Press)

But such cinematic labors of the negative are not sufficient; they certainly do not suffice to promote positive attachment to this world. Even a "negative dialectic" does not suffice. If things are left there, the embers of ressentiment can easily become more inflamed. That is one reason Deleuze is never happy with negative critique alone: the next task is to highlight how our participation in a world of real creativity that also finds expression elsewhere in the universe depends on and draws from such fugitive interruptions. To put it too starkly (for situational nuances and adjustments are pertinent here), the more people who experience a positive connection between modes of interruption and the possibility of our modest participation as individuals, constituencies, states, and a species in creative processes extending beyond us, the more apt we are to embrace the new temporal experiences around us as valuable parts of existence as such. Certainly, absent a world catastrophe or a repressive revolution that would create worse havoc than the conditions it seeks to roll back, these consummate features of late-modem life are not apt to dissipate soon. The fastest zones of late-modem life, for instance, are not apt to slow down in the absence of a catastrophe that transforms everything. So the radical task is to find ways to strengthen the connection between the fundamental terms of late-modem existence and positive attachment to life as such. This should be accomplished not by embracing exploitation and suffering, but by challenging them as we come to terms with the larger trends.

A2: Reformism Bad/Negativity Alt

Progressive change is possible and effective – the alt fails and leads to authoritarianism Connolly 11

(William E., A World of Becoming, Duke University Press)

Is it not obligatory to expose and resist the system as such rather than taking cumulative actions to move it? Don't such actions necessarily fold back in on themselves, feeding the dosed system they seek to move? Some theorists on the Left say such things, but they themselves have too dosed a view of the systems they criticize. No system in a world of becoming composed of multiple, interacting systems of different types, with different capacities of self-organization, is entirely dosed. It is both more vulnerable to the outside than the carriers of hubris imagine and periodically susceptible to creative movement from within and without simultaneously. Moreover, pure negativity on the Left does not sustain either critique or militancy for long, but rather, it tends eventually to lapse into resignation or to slide toward the authoritarian practices of the Right that already express with glee the moods of negativity, hubris, or existential revenge. We have witnessed numerous examples of such disappointing transitions in the last several decades, when a negative or authoritarian mood is retained while the creed in which it was set is changed dramatically. We must therefore work on mood, belief; desire, and action together. As we do so we also amplify positive attachment to existence itself amidst the specific political resentments that help to spur us on. To ignore the existential dimension of politics is to increase the risks of converting a noble movement into an authoritarian one and to amplify the power of bellicose movements that mobilize destructive potential. To focus on the negative dimension alone is to abjure the responsibilities of political action during a dangerous time.

To review, none of the role interventions listed above nor all in concert could suffice to break such a global resonance machine. Luck and pregnant points of contact with salutary changes in state actions, other cross-state citizen movements, the policies of international organizations, creative market innovations, and religious organization are needed. But those larger constellations may not themselves move far in a positive direction unless they meet multiple constituencies primed to join them and geared to press them whenever they lapse into inertia, if a world resonance machine of revenge and counter-revenge stretches, twists, and constrains the classical image of sovereign units, regionally anchored creeds, uneven capitalist exchange, and international organizations, while drawing selective sustenance from all of them, a new counter-machine must do so too.

Alt Fails – Withdrawal 2AC

Alt doesn't solve cap

Gordon (PhD from Oxford, teaches environmental politics and ethics at the Arava Institute for Environmental Studies) **12**

(Uri, Anarchist Economics in Practice in The Accumulation of Freedom, pg. 205-7)

Withdrawal

Perhaps better defined as a "non-practice" than as a practice, <u>the term "withdrawal" here indicates the various ways in which anarchists may abstain from participation in central institutions of the capitalist economy</u>-primarily the wage system and the consumption of purchased goods. <u>The goal of such a strategy is to weaken capitalism by sapping its energy</u>, reducing its inputs in terms of both human labor and cultural legitimation. To be sure, <u>the ubiquity of capitalist relations means that the options for withdrawal remain partial at best. Most of us must work for someone else to survive, and buy necessities that are not otherwise available for acquisition</u>. Nevertheless, there are ways in which participation in capitalism can be significantly reduced, or undertaken on its qualitatively different margins. Rather than seeking full employment and aspiring to a lifelong career, anarchists can choose to work part-time or itinerantly, earning enough to supply their basic needs but not dedicating more time to waged work than is absolutely necessary-perhaps on the way towards the abolition of work as compulsory, alienated production.3 In the area of housing, squatting a living space rather than renting one also abstains from participation in capitalism, though this option is less sustainable in most countfies since it will almost certainly end in eviction. Anarchists may also reduce their participation in the moneyed circulation of commodities by reusing and recycling durable goods, and by scavenging or growing some of their own food rather than purchasing it from the supermarket. 4 <u>Such practices can never by themselves destroy capitalism, since in the final analysis they remain confined to the level of personal lifestyle and rely on capitalism's continued existence in order to inhabit its margins and consume its surpluses</u>. Nevertheless, <u>strategies of withdrawal do complement other practices in carving out a separate space from capitalism</u>, as well as in expressing a rejection of its ideologies of dedication to the workplace and of consumption as the road to happiness.

Alt Fails – 1AR

Alt fails – movements too small, elite backlash, no material interests
Gordon (PhD from Oxford, teaches environmental politics and ethics at the Arava Institute for Environmental Studies) **12**
(Uri, Anarchist Economics in Practice in The Accumulation of Freedom, pg. 215)

On the one hand, <u>the</u> anarchist <u>movement is so small that even its most consistent and visible efforts are but a drop in the ocean</u>. On the other hand, <u>political elites have proven themselves extremely proficient at pulling the ground from under movements for social change, be it through direct repression and demonization of the activists, diversion of public attention to security and nationalist agendas,</u> or, at best, minimal concessions that ameliorate the most exploitative aspects of capitalism while contributing to the resilience of the system as a whole. It would seem that ethical commitments to social justice and the enhancement of human freedom can only serve as a motivation for a comparatively small number of people, and that <u>without the presence of genuine material interests among large sections of the population there is little hope for a mass movement to emerge that would herald the departure from existing social, economic, and political arrangements</u>.

Alt Fails – Reform Key

No revolution against cap possible now – the perm is crucial to avoid rightest takeover
Castree (School of Environment and Development, Manchester University) **10**

(N., Crisis, Continuity and Change: Neoliberalism, the Left and the Future of Capitalism. Antipode, 41: 185–213)

This essay had two major objectives. It sought to describe and explain the temporal coincidence of political economic and environmental crises less than a decade into the twenty-first century; and it offered some reasons for a seeming paradox, taking both a national level and international scale example—the paradox of crisis conditions leading to more of the same rather than a sharp turn away from the neoliberal path. The hopeful lessons of Marx's, Polanyi's and O'Connor's work will not (yet) be borne out: "<u>strong reform", never mind something more radical, is still a long way off</u>. <u>What we call "neoliberalism</u>" in the singular <u>is</u>, in reality, <u>a</u> variegated and <u>uneven global formation constituted differentially at a range of scales</u>. <u>Its existence and multiple incarnations are overdetermined</u>. Even so, I've suggested that <u>this</u> fact <u>does not necessarily render neoliberal policies vulnerable</u>, even at a time of perceived "crisis". If my analysis has any validity, then it calls to mind Gramsci's judgement that <u>the "morbid symptoms" of an existing order unwilling to die may persist for some considerable time</u>.

When might these symptoms disappear? Answers to this question are likely to be as reliable as a long-range weather forecast. NaomiKlein (2009:30), sensing the folly of detailed prophecy, offers some general speculations. Reflecting, as I have done, on the coincident political economic and ecological crisis, she argues that "<u>Capitalism can survive this</u> [double] crisis. But the world can't survive another capitalist comeback". I agree entirely with the first part of this statement, but not necessarily the second. <u>Capitalism will morph and adapt as it has always done: the operating hardware will remain intact, even as the all important details will alter quite profoundly</u>. But at what cost? Leftists have not just to hope for, but work vigorously towards, a future that can set capitalism on a path of much greater social and environmental justice. <u>The legacy of neoliberal capitalism constitutes a sickness that can be cured sooner rather than later: but the Left,</u> in its national and international forms, must do a lot more to administer the necessary medicine. <u>An essential</u>, if not sufficient, <u>condition is to occupy the political space vacated by established political parties that claim to be on the left</u>. <u>Until then, the Left's case will remain marginal to public life worldwide.</u>

A2: Change Possible Now/Collapsing Now

Cap isn't collapsing now – the economic and environmental crisis are not sufficient to dislodge the system
Castree (School of Environment and Development, Manchester University) **10**

To my mind, <u>the Left should not get its hopes up</u>—at least not yet. It's sad to say, but <u>only the most wild-eyed optimist could believe that the two perceived crises of our time are harbingers of a better future</u>. Taking two cases—one national scale, one international—I want to argue that Gramsci was right. <u>The "old" may be dying, but it's far from dead</u>. The essay comprises four parts. I begin in the heat of the moment, by describing how and why the idea of two concurrent worldwide "crises" became commonplace in a surprisingly short space of time (2007–2009). Following this, I take a theoretical detour intended to explain why these crises have arisen, and how they might play out. Marx, Karl Polanyi and James O'Connor are my guides. Focusing on Britain as an illustrative case, I then explain why <u>the present moment is not, regrettably, a propitious one for left-wing change-makers</u>. My point is to show that <u>even in neoliberalism's heartlands, in the thick of a financial crisis, there is only weak impetus for change</u>. After this examination of how crisis is playing-out at the scale of one notable nation state, I delve into the world of international emissions trading philosophy and practice—with a particular focus on the European Union's still young scheme. I suggest that the myriad practical failures of this and other market approaches to greenhouse gas mitigation belie the abstract logic of "free market environmentalism". Even so, these approaches will be with us for many years to come in all probability. A short conclusion looks to a future hopefully free of those "morbid symptoms" that Gramsci described just after the Great Crash of 1929. It's a future that will, I fear, be very hard to make. If William James were writing today, he probably would not bet on the Left making its ideals flesh any time soon. Not for the first time, some optimism of the will is required—quite a lot, in fact.

Perm – Reform Solves/Withdrawal Fails

Hybrid strategies like cooperative are crucial to the destruction of capitalism – the alt alone fails

Gordon (PhD from Oxford, teaches environmental politics and ethics at the Arava Institute for Environmental Studies) **12**

(Uri, Anarchist Economics in Practice in The Accumulation of Freedom, pg. 205-7)

There is certainly substance; to these objections. Nevertheless, I have chosen to keep the ten as wide as possible, if only for the reason that readers new to anarchism and less familiar with its internal controversies deserge to be introduced to the entire variety of practices that broadly fall within its sphere and left to make up their own minds. More generally, however, I would like to emphasize that the entire discussion of anarchist economics in practice must take place under the lens of imperfection and experimentation. This has to do with the distinction that Terry Leahy makes between purist and hybrid strategies, that is, between strategies that completely embody anarchist ideals and ones which continue to rely on aspects of capitalism.' Hybrid strategies have always been part of the anarchist repertoire of social resistance; yet the relevant question is whether hybrid strategies are viewed as already embodying the end point of desired social change (that is, a reformed capitalist system), or as necessary but temporary compromises with the ubiquity of capitalist social relations, a stepping-stone towards more comprehensive social change. As Leahy argues,

To an extent hybrid strategies are symbiotic with capitalism. They can be seen as productive for the capitalist class in ameliorating some of capitalism's excesses. Yet they are also antithetical to the culture and economy of capitalism as a system. Given enough time and enough proliferation they will replace capitalism with something completely different... For those who ultimately want nothing but the best that an anarchist utopia can offer, the thing to do is to be mobile and seize opportunities for hybrids as they arise and move on as they grow stale.2

It is in this inclusive and experimental spirit that I offer the following examples. While limitations of space mean that the discussion is necessarily cursory, I have referenced some relevant literature throughout the exposition, and the reader is invited to consult it for further information and analysis.

Varieties of Anarchist Economic Practice

Withdrawal

Perhaps better defined as a "non-practice" than as a practice, the term "withdrawal" here indicates the various ways in which anarchists may abstain from participation in central institutions of the capitalist economy-primarily the wage system and the consumption of purchased goods. The goal of such a strategy is to weaken capitalism by sapping its energy, reducing its inputs in terms of both human labor and cultural legitimation. To be sure, the ubiquity of capitalist relations means that the options for withdrawal remain partial at best. Most of us must work for someone else to survive, and buy necessities that are not otherwise available for acquisition. Nevertheless, there are ways in which participation in capitalism can be significantly reduced, or undertaken on its qualitatively different margins. Rather than seeking full employment and aspiring to a lifelong career, anarchists can choose to work part-time or itinerantly, earning enough to supply their basic needs but not dedicating more time to waged work than is absolutely necessary-perhaps on the way towards the abolition of work as compulsory, alienated production.3 In the area of housing, squatting a living space rather than renting one also abstains from participation in capitalism, though this option is less sustainable in most countfies since it will almost certainly end in eviction. Anarchists may also reduce their participation in the moneyed circulation of commodities by reusing and recycling durable goods, and by scavenging or growing some of their own food rather than purchasing it from the supermarket. 4 Such practices can never by themselves destroy capitalism, since in the final analysis they remain confined to the level of personal lifestyle and rely on capitalism's continued existence in order to inhabit its margins and consume its surpluses. Nevertheless,

<u>strategies of withdrawal do complement other practices in carving out a separate space from capitalism</u>, as well as in expressing a rejection of its ideologies of dedication to the workplace and of consumption as the road to happiness.

Perm – Reform Solves – A2: Market Link

Must work with some companies within the market in order to solve transition wars
Lewis and Canaty (executive director of the Center for Community Enterprise; honorary research fellow at the University of Birmingham and a director of Common Futures) **12**
(Michael and Patrick, The Resilience Imperative: Cooperative Transitions to a Steady-state Economy, New Society Publishers, googlebooks)

The agenda of the Great Transition also encompasses three major dimensions of change. Think of them as the 3 Ps: the personal, practical, and political. Simplistic silver-bullet solutions, and sound bites spun for culturally stunted attention spans, will not do. Consciously acting to link up the three Ps with a multi-level agenda guided by the resilience imperative and cooperative transitions is complex. Balkanized movements cannot contend with the scale of the problems and challenges we face, nor the powerful forces that must be resisted and restrained. All kinds of constituencies must be engaged unions, regionally based small and medium-sized businesses, all manner of community and cooperative enterprises and intermediaries, farmers, credit unions and progressive financial institutions, arts and culture organizations, faith organizations, environmental groups, politicians, and academics. We can also work with large companies, though caution and principled shrewdness is necessary. Companies occupying the low-road/high-carbon economy have too much power, are unaccountable, and are so addicted to the capitalist logic of growth that they represent a real and present danger to all of us. However, there are other companies that are committed to building a highroad/low-carbon economy, and we need their know-how and partnership if we are to navigate the Great Transition without violence.
So there we have it we are challenged to work consciously from local to global across sectors, engage creatively multiple constituencies, while all the while paying attention simultaneously to the macro and micro features of the transition challenge. Isn't life interesting?
We have been acutely conscious, while writing this book, that our concentration has been on the micro side of the transition challenge, though we have attempted to keep the macro side consciously in play as a kind of counterpoint tension. We hope we have shown how crucial change at the macro policy and systems level is for facilitating and easing transition to a low-carbon, more democratic, and fair economy. Indeed, there are a number of key policy questions that we have raised directly or indicated in passing. These evident and practical possibilities can be summarized as: 100 percent debt-free money: Why not mov e step by step toward governments issuing democratic currency free of interest and, indeed, removing from banks the power to freely issue money as high-cost debt?

Perm – Reform Solves – A2: Let It Collapse

Letting the system collapse on its own causes extinction – only struggle within the capitalism can end the system

Schwartzman (Professor in the Department of Biology at Howard University, PhD in Geochemistry from Brown University) **11**

And unlike the New Deal, achieving the GND on a global scale in the context of a robust solar transition, by necessityaccompanied by demilitarization, will not end with a reinforcement of militarized capital, as was the case in WWII and the Cold War aftermath. Rather, <u>the GND has real potential for opening up a path out of capitalism</u> into ecosocialism. WWII and the emergence of the MIC postponed the terminal crisis of capitalism to this century. Now we face the welcome project of taking that terminal crisis on and finishing the job.

<u>We need a strategy of transition</u>. This should be a priority in theory and practice for ecosocialists. Any Left worth its label and demonization by Glenn Beck and company must not only confront the immediate needs of the great majority of those exploited and oppressed by big capital, but also be a leader in organizing to fight back. So jobs, affordable housing, health and child care, environmental quality, and environmental justice must be on the left agenda. But what kind of jobs? For unsustainable or sustainable green production? And what about the conditions for the reproduction of labor power, itself a site of multi-dimensional class struggle, as Michael Lebowitz has argued (2003). Thus, the fightback program must confront the ecological crisis and demand solutions that address climate change by embracing clean energy.

<u>We should never advocate or even think that the "worse the better" will deliver socialism by the collapse of capitalism</u>, <u>anticipating its terminal illness as hope</u>. For <u>capitalism's dead weight will kill us all</u>. <u>No slogan or propaganda alone can achieve success</u>, as important as this ideological struggle is. Rather, <u>only multidimensional and local-to-transnational class struggle within capitalism</u> (see Abramsky's illuminating volume 2010) <u>can terminate this system</u>, which unfortunately will not die a natural death on its own accord. It will have to be put to sleep forever. A critical role of the ecosocialist Left is to identify the strategic class sectors—those existing and those in formation—that will be the gravediggers of capitalism. Additionally, <u>the ecosocialist Left must</u> also, of course, <u>participate in the creation of a collective vision and its realization as embryos within capitalism</u> of the new global civilization ending the rule of capital.

We now witness or can soon anticipate ongoing struggles for social governance of production and consumption on all scales from neighborhood to global. <u>Areas of struggle in this fight should include</u> nationalization of the energy, rail, and telecommunications industries; municipalization of electric and water supplies; <u>the creation and maintenance of</u> decentralized solar power, food, <u>energy</u> and farming <u>cooperatives</u>; the encouragement of worker-owned factories (solidarity economy), the replacement of industrial and GMO agriculture with agroecologies; the creation of green cities; and of course organizing the unorganized in all sectors, especially GND workers. All of these objectives should be part of the ecosocialist agenda for struggles around a GND, which of course, must include the termination of the MIC. One outstanding example of how to begin is found in Mike Davis 2010), who argues for the potential of a radical movement for green urbanism (see my commentary, Schwartzman, 2008).

Perm – Reform Solves – A2: Green Capitalism Link

A Green investment now is crucial to initiate a transition away from capitalism – starting now is key to avoid extinction from warming
Schwartzman (Professor in the Department of Biology at Howard University, PhD in Geochemistry from Brown University) **11**

Indeed, imposing such non-market limits is imperative, but the struggle to impose them must begin in capitalist societies now, and not be posed simply as the policies of future socialism. Yes, aggressive energy conservation is imperative, especially in the United States and other countries of the global North. We can all live better with a sharp reduction of wasteful consumption, breathe clean air, drink clean water, and eat organic food. Nevertheless, there needs to be a global increase in the power capacity, employing clean energy and not fossil fuels or nuclear power, to insure every child born on this planet has the material requirements for the highest quality of life (Schwartzman and Schwartzman 2011).

But should we anticipate that Green Capitalism, even pushed to its limits by class struggle, could indefinitely postpone the final demise of global capitalism and could actually replace the present unsustainable energy base with a renewable power infrastructure fast enough to avoid catastrophic climate change (C3)? I submit this prospect is highly unlikely. The legacy and political economy of real existing capitalism alone makes *global* solar capitalism a delusion (Schwartzman2009). While the Pentagon pretends to go "green," it remains the servant of the imperial system protecting fossil fuel and strategic metals flowing into the MIC, the Military Industrial (Fossil Fuel, Nuclear, State Terror) Complex. The immense power of the MIC is the biggest obstacle to implementing an effective prevention program that has a plausible chance of avoiding C3. The avoidance of C3 requires an end to coal and fossil fuel addiction, giving up the nuclear option, and a rapid conversion to a high-efficiency solar energy infrastructure.

To summarize, the MIC is at present the biggest single obstacle to preventing C3 because: It is the present core of global capital reproduction with its colossal waste of energy and material resources. The fossil fuel and nuclear industries are integrated within the MIC. The MIC has a dominant role in setting the domestic and foreign policy agenda of the United States and other leading capitalist countries. The Pentagon is the "global oil-protection service" for both the U.S. imperial agenda (Klare 2007) and the transnational capital class itself (e.g., Robinson 2004). The MIC's Imperial Agenda blocks the global cooperation and equity required to prevent C3.

Nevertheless, what the struggle for a GND [Green New Deal] can accomplish is very significant, indeed critical to confronting the challenge of preventing C3 [Catastrophic Climate Change]. *Humanity cannot afford to wait for socialism to replace capitalism to begin implementing this prevention program* [Italics Original]. And I have argued that starting this prevention program under existing capitalism can open up a path toward ecosocialist transition, indeed a 21st century Socialism worthy of its name.

Climate science tells us we must proceed now for any plausible chance of avoiding tipping points plunging us into C3. Green job creation is likewise the creation of a new working-class sector committed to ending the fossil fuel addiction. Such an historic shift to renewable energy supplies would be comparable to the industrial revolution that replaced plant power in the form of wood and agricultural products with coal.

AT State Bad

State Debate Good

Inev

Engaging with the law is inevitable and can be effective

Capulong 9 (Assistant Professor of Law, University of Montana)

(Eduardo R.C., CLIENT ACTIVISM IN PROGRESSIVE LAWYERING THEORY, CLINICAL LAW REVIEW, 16 Clinical L. Rev. 109, Fall, 2009)

Nevertheless, in contrast to what Steve Bachmann has called the [*116] "a-legal" or "crude Marxist" approach, n19 progressive activists recognize that the legal arena remains a forum for social struggle. n20 This is so for three reasons: First, activists often do not have a choice but to work within the legal system, as when they are arrested or otherwise prevented from engaging in activism by state authorities. Second, because law is relatively autonomous from economic and political interests, n21 campaigns for legal reform can win substantial gains and are frequently the only vehicles through which more far-reaching change takes shape; struggles for reform, in other words, beget more radical possibilities and aspirations. n22 And third, law is constitutive of the social order. Law--or, more accurately, the concept of it--is not (again as some crude analysts would argue) simply a tool of one ruling class or other, but rather an essential component of a just society. n23 Commentators observe that lawyers who base their practice on these three premises are "hungry for theory," n24 for theory checks the "occupational hazards [of] reformism or cynicism." n25 The theoretical project is thus a dialectic: while law reform alone cannot "disturb the basic political and economic organization of modern American society," n26 [*117] law and lawyering are "a complex, contradictory, and open-textured setting that provides opportunities to challenge the status quo."

K2 Short Term Survival

Debate about arcane legal details are crucial to the short-term survival of oppressed populations. Outside of the law being good or bad, legal education is crucial to empower even the most revolutionary of movements.

Arkles et al 10

(Gabriel Arkles, Pooja Gehi and Elana Redfield, The Role of Lawyers in Trans Liberation: Building a Transformative Movement for Social Change, Seattle Journal for Social Justice, 8 Seattle J. Soc. Just. 579, Spring / Summer, 2010, LN)

While agenda-setting by lawyers can lead to the replication of patterns of elitism and the reinforcement of systems of oppression, we do believe that legal work is a necessary and critical way to support movements for social justice. We must recognize the limitations of the legal system and learn to use that to the advantage of the oppressed. If lawyers are going to support work that dismantles oppressive structures, we must radically rethink the roles we can play in building and supporting these movements and acknowledge that our own individual interests or even livelihood may conflict with doing radical and transformative work. n162 A. Community Organizing for Social Justice When we use the term community organizing or organizing, we refer to the activities of organizations engaging in base-building and leadership development of communities directly impacted by one or more social [*612] problems and conducting direct action issue campaigns intended to make positive change related to the problem(s). In this article, we discuss community organizing in the context of progressive social change, but community-organizing strategies can also be used for conservative ends. Community organizing is a powerful means to make social change. A basic premise of organizing is that inappropriate imbalances of power in society are a central component of social injustice. In order to have social justice, power relationships must shift. In Organizing for Social Change: Midwest Academy Manual for Activists (hereinafter, "the Manual"), n163 the authors list three principles of community organizing: n164 (1) winning real, immediate, concrete improvements in people's lives; (2) giving people a sense of their own power; and (3) altering the relations of power. n165 Before any of these principles can be achieved it is necessary to have leadership by the people impacted by social problems. n166 As Rinku Sen points out: [E]ven allies working in solidarity with affected groups cannot rival the clarity and power of the people who have the most to gain and the least to lose . . . organizations composed of people whose lives will change when a new policy is instituted tend to set goals that are harder to reach, to compromise less, and to stick out a fight longer. n167 She also notes that, "[I]f we are to make policy proposals that are grounded in reality and would make a difference either in peoples' lives or in the debate, then we have to be in touch with the people who are at the center of such policies. n168 We believe community organizing has the potential to make fundamental social change that law reform strategies or "movements" led by lawyers cannot achieve on their own. However, community organizing is not always just and effective. Community-organizing groups are not immune to any number of problems that can impact other organizations, including internal oppressive dynamics. In fact, some strains of white, male-dominated [*613] community organizing have been widely criticized as perpetuating racism and sexism. n169 Nonetheless, models of community organizing, particularly as revised by women of color and other leaders from marginalized groups, have much greater potential to address fundamental imbalances of power than law reform strategies. They also have a remarkable record of successes. Tools from community organizers can help show where other strategies can fit into a framework for social change. The authors of the Manual, for example, describe various strategies for addressing social issues and illustrate how each of them may, at least to some extent, be effective. n170 They then plot out various forms of making social change on a continuum in terms of their positioning with regard to existing social power relationships. n171 They place direct services at the end of the spectrum that is most accepting of existing power relationships and community organizing at the end of the spectrum that most challenges existing power relationships. n172 Advocacy organizations are listed in the middle, closer to community organizing than direct services. n173 The Four Pillars of Social Justice Infrastructure model, a tool of the Miami Workers Center, is somewhat more nuanced than the Manual. n174 According to this model, four "pillars" are the key to transformative social justice. n175 They are (1) the pillar of service, which addresses community needs and stabilizes community members' lives; (2) the pillar of policy, which changes policies and institutions and achieves concrete gains with benchmarks for progress; (3) the pillar of consciousness, which alters public opinion and shifts political parameters through media advocacy and popular education; and (4) the pillar of power, which achieves autonomous community power through base-building and leadership development. n176 According to the Miami Workers Center, all of these pillars are essential in making social change, but the pillar of power is most crucial in the struggle to win true liberation for all oppressed communities. n177 [*614] In their estimation, our movements suffer when the pillar of power is forgotten and/or not supported by the other pillars, or when the pillars are seen as separate and independent, rather than as interconnected, indispensable aspects of the whole infrastructure that is necessary to build a just society. n178 Organizations with whom we work are generally dedicated solely to providing services, changing policies, or providing public education. Unfortunately, each of these endeavors exists separate from one another and perhaps most notably, separate from community organizing. In SRLP's vision of change, this separation is part of maintaining structural capitalism that seeks to maintain imbalances of power in our society. Without incorporating the pillar of power, service provision, policy change, and public education can never move towards real social justice. n179 B. Lawyering for Empowerment In the past few decades, a number of alternative theories have emerged that help lawyers find a place in social movements that do not replicate oppression. n180 Some of the most well-known iterations of this theme are "empowerment lawyering," "rebellious lawyering," and "community lawyering." n181 These perspectives share skepticism of the efficacy of impact litigation and traditional direct services for improving the conditions faced by poor clients and communities of color, because they do not and cannot effectively address the roots of these forms of oppression. n182 Rather, these alternative visions of lawyering center on the empowerment of community members and organizations, the elimination of the potential for dependency on lawyers and the legal system, and the collaboration between lawyers and directly impacted communities in priority setting. n183 Of the many models of alternative lawyering with the goal of social justice, we will focus on the idea of "lawyering for empowerment," generally. The goal of empowerment lawyering is to enable a group of people to gain control of the forces that affect their lives. n184 Therefore, the goal of empowerment lawyering for low-income transgender people of [*615] color is to support these communities in confronting the economic and social

policies that limit their life chances. Rather than merely representing poor people in court and increasing access to services, the role of the community or empowerment lawyer involves: organizing, community education, media outreach, petition drives, public demonstrations, lobbying, and shaming campaigns . . . [I]ndividuals and members of community-based organizations actively work alongside organizers and lawyers in the day-to-day strategic planning of their case or campaign. Proposed solutions--litigation or non-litigation based--are informed by the clients' knowledge and experience of the issue. n185 A classic example of the complex role of empowerment within the legal agenda setting is the question of whether to take cases that have low chances of success. The traditional approach would suggest not taking the case, or settling for limited outcomes that may not meet the client's expectations. However, when our goals shift to empowerment, our strategies change as well. If we understand that the legal system is incapable of providing a truly favorable outcome for low-income transgender clients and transgender clients of color, then winning and losing cases takes on different meanings. For example, a transgender client may choose to bring a lawsuit against prison staff who sexually assaulted her, despite limited chance of success because of the "blue wall of silence," her perceived limited credibility as a prisoner, barriers to recovery from the Prison Litigation Reform Act, and restrictions on supervisory liability in § 1983 cases. Even realizing the litigation outcome will probably be unfavorable to her, she may still develop leadership skills by rallying a broader community of people impacted by similar issues. Additionally, she may use the knowledge and energy gained through the lawsuit to change policy. If our goal is to familiarize our client with the law, to provide an opportunity for the client [*616] and/or community organizers to educate the public about the issues, to help our client assess the limitations of the legal system on their own, or to play a role in a larger organizing strategy, then taking cases with little chance of achieving a legal remedy can be a useful strategy. Lawyering for empowerment means not relying solely on legal expertise for decisionmaking. It means recognizing the limitations of the legal system, and using our knowledge and expertise to help disenfranchised communities take leadership. If community organizing is the path to social justice and "organizing is about people taking a role in determining their own future and improving the quality of life not only for themselves but for everyone," then "the primary goal [of empowerment lawyering] is building up the community." n186 C. Sharing Information and Building Leadership A key to meaningful participation in social justice movements is access to information. Lawyers are in an especially good position to help transfer knowledge, skills, and information to disenfranchised communities--the legal system is maintained by and predicated on arcane knowledge that lacks relevance in most contexts but takes on supreme significance in courts, politics, and regulatory agencies. It is a system intentionally obscure to the uninitiated; therefore the lawyer has the opportunity to expose the workings of the system to those who seek to destroy it, dismantle it, reconfigure it, and re-envision it. As Quigley points out, the ignorance of the client enriches the lawyer's power position, and thus the transfer of the power from the lawyer to the client necessitates a sharing of information. n187 Rather than simply performing the tasks that laws require, a lawyer has the option to teach and to collaborate with clients so that they can bring power and voice back to their communities and perhaps fight against the system, become politicized, and take leadership. "This demands that the lawyer undo the secret wrappings of the legal system and share the essence of legal advocacy--doing so lessens the mystical power of the lawyer, and, in practice, enriches the advocate in the sharing and developing of rightful power." n188 Lawyers have many opportunities to share knowledge and skills as a form of leadership development. This sharing can be accomplished, for example, through highly collaborative legal representation, through community clinics, through skill-shares, or through policy or campaign meetings where the lawyer explains what they know about the existing structures and fills in gaps and questions raised by activists about the workings of legal systems. D. Helping to Meet Survival Needs SRLP sees our work as building legal services and policy change that directly supports the pillar of power. n189 Maintaining an awareness of the limitations and pitfalls of traditional legal services, we strive to provide services in a larger context and with an approach that can help support libratory work. n190 For this reason we provide direct legal services but also work toward leadership development in our communities and a deep level of support for our community-organizing allies. Our approach in this regard is to make sure our community members access and obtain all of the benefits to which they are entitled under the law, and to protect our community members as much as possible from the criminalization, discrimination, and harassment they face when attempting to live their lives. While we do not believe that the root causes keeping our clients in poverty and poor health can be addressed in this way, we also believe that our clients experience the most severe impact from state policies and practices and need and that they deserve support to survive them. n191 Until our communities are truly empowered and our systems are fundamentally changed to increase life chances and health for transgender people who are low-income and people of color, our communities are going to continue to have to navigate government agencies and organizations to survive.

Short term survival – Rejecting engagement with the law directly trades off with mechanisms that help ensure the daily survival of underserved populations – [poor people flood legal services offices seeking assistance in accessing welfare benefits, contesting discriminatory employment terminations, petitioning for political asylum, resisting unlawful evictions, obtaining restraining orders from abusive spouses, and recovering illegally withheld wages]

Cummings and Eagly 2k1 (Staff Attorney, Community Development Project, Public Counsel Law Center, Los Angeles, California. J.D., Harvard Law School; Coordinating Attorney, Immigrant Domestic Violence Project, Coalition for Humane Immigrant Rights of Los Angeles (CHIRLA), Los Angeles, California. J.D., Harvard Law School)
(Scott L. and Ingrid V., A Critical Reflection on Law and Organizing, 48 UCLA L. Rev. 443, LN)

First, exaggerating the ineffectiveness of traditional legal interventions minimizes the significant institutional restructuring that legal advocacy has achieved. Indeed, creative litigation and court-ordered remedies have changed many aspects of the social, political, and economic landscape. n203 An analysis that obscures this fact truncates progressive legal practice by closing off potential avenues for redress. In addition, the suggestion by proponents of law and organizing that lawyers should act as organizers, facilitators, and educators would require that less time be spent providing conventional representation to low-income clients, n204 who are already drastically underserved. n205 As it stands, [*492] there are only six thousand full-time legal services staff lawyers to meet the legal needs of the forty-five million persons who are income-eligible for free legal services. n206 Each day, poor people flood legal services offices seeking assistance in accessing welfare benefits, contesting discriminatory employment terminations, petitioning for political asylum, resisting unlawful evictions, obtaining restraining orders from abusive spouses, and recovering illegally withheld wages. Given the scarcity of resources in legal aid programs, a shift toward an organizing-centered approach would result in a reduction of basic services to these clients.

AT Agency/Access

Discussing legal changes is possible and can help fuel a collective sense of agency for oppressed groups

Morales-Cruz 5 (teaches at Inter American University of Puerto Rico School of Law)

(Myrta, "Do not hand me fish, teach me how to fish", SELA 2005 Panel 4: The Lawyer's Role, http://www.law.yale.edu/documents/pdf/Do_not_hand_me_Fish.pdf)

We have found lobbying to be a good strategy for promoting empowerment among our clients. In the court, we, the lawyers, are in control of the process. Lobbying makes it easier for us to work side by side with our clients. They gain power as they speak and argue about their situation, about the law, about how the law should be. Their voice is independent from our voice as lawyers. Focusing on the legislative branch also makes it easier for our clients to gain access to the press and to make alliances with other community groups, which helps to create more public discussion about the issues. The public hearings have been crucial in the empowerment process. Finally, the fact that a statute, once approved, has a direct impact on more people that an average court decision, helps to bring more people into the process and furthers collective empowerment.53

More evidence

Guinier and Torres 14 (Prof of Law @ Harvard; Professor of Law @ Cornell)

(Lani and Gerald, THE MEANING OF THE CIVIL RIGHTS REVOLUTION: Changing the Wind: Notes Toward a Demosprudence of Law and Social Movements, June, 2014, Yale Law Journal, 123 Yale L.J. 2740, LN)

In many ways, our project is not new. Like Professor Ackerman, we are challenging the privileging of formal sources of authority that discount or minimize the role of social movement activists and other contentious forms of organized power to name their own reality and give that reality a heart, a soul, and a story. The political transformation of the United States comes not just from what the Court is doing or what arguments the lawyers for the social movements are making. The movement activists themselves are part of the law creation process. They make some arguments more resonant and even more plausible. This is what Adam Liptak, in describing the dueling roles played by iconic Supreme Court cases like Brown v. Board of Education, calls the "music" as opposed to the "logic" of law. n237 Lawyers are usually understood to control the logic of law through their analysis of precedent and commitment to principle. Meanwhile, the activists reveal the music of law by combining legal rights talk with home-grown stories of justice that define normative or narrative frames through which to understand what the courts thought they [*2800] were doing. According to Francesca Polletta, when the Southern civil rights movement organizers "transposed" conceptual frameworks from one institutional domain to another, they provided new energy for resistance. n238 The music these activists composed is the work of "transposition," which combines, for example, legal rights formulations with "locally resonant justificatory rhetorics." n239 Such work, through decentralized structures at some distance from national or state civil rights organizations, encouraged tactical and ideological experimentation and innovation, built organizational solidarity, and enabled movement activists to broaden their appeal in some cases and in other cases to engage, at minimum, in critical reflection. n240 When a "dynamic" constituency names its own reality by, for example, singing spirituals in the church choir, composing its own anthems in the call and response of the amen corner, or summoning in plain English, before a television audience, the brutal hardship of trying to register to vote in Mississippi, movement activists supply additional sources of authority for the lawyer and a new source of accountability for both the lawyer and "the law." By expressing what the law means to those subject to it, activists create new grounds on which to interpret the law and make it harder for elites to say it means something other than what those on the street thought it should mean if it were talking to their experience. Any substantial disjunction is felt as injustice. It is through this potential feedback effect that those who sing the music of law can have a role in composing its logic. By defining winning in its narrowest possible terms, as Joe Rauh did with the MFDP, lawyers may prompt litigants to celebrate important tactical victories. At the same time, the strategic vision essential to sustainable long-term change can be lost. n241 Nonetheless, whatever their historically contingent [*2801] role, Fred Gray's relationship with the MIA shows that law and lawyers ultimately do much of the heavy lifting in shaping a social movement's trajectory in fashioning both its short term objectives and long term consequences. n242 Because lawyers occupy both an elite and expert position and often do not reflect on the impact of their expertise on their imagination, their role in social movements deserves more attention. Cause lawyers and legal scholars have begun to take notice of the multiple ways practicing lawyers, organizers, and policy makers can and do represent marginalized communities to tell different stories and make new law. n243 There is renewed interest in researching the relationship between social movements and lawmaking among legal scholars and practitioners on the left n244 as well as the right. n245 [*2802] Even so, much of the focus is still on discovering new avenues for elite driven social change. Some cause lawyers search for ways to do "public education" or develop "communications strategies" to win support for their cases, but they rarely pause to wonder whether the cases they litigate resonate with the lived experience of their clients, not just their putative supporters and funders. n246 Sociologists, political scientists, and historians have long studied social movements, yet their theories of social change also separate out the role of law and lawyers, as if lawyers and social movement actors function on parallel but distinctive tracks. Similarly, many lawyers and law professors still focus on legal cases and judicial opinions without necessarily considering the social, political, and historical forces that influence the development of legal doctrine. Unlike Professor Ackerman, they concern themselves primarily with formal lawmaking by the judiciary, the legislature, or the executive. Lawyers, in particular, too often assume that their maximum opportunity to influence the [*2803] law is through formal argument in judicial settings. Their argument, however, is not necessarily situated in a larger story that has normative force of its own and may be distinguishable from what the courts say is important. Even when moments of popular constitutionalism are considered, the actions of "the people" count only when they can be canonized through the published opinions of courts or the statutory language of legislators. n247 In either case, it is the judiciary that serves as law's authoritative editor. By contrast, we contend that democratic societies are organized to produce a variety of authoritative interpretive communities. n248 The MFDP, Montgomery Bus Boycott, and UFW stories exemplify the ways a social movement functioning as an authoritative interpretative

community can play a critical role in redefining the meaning of accountability, democratic action, and American democracy. Hamer and the other MFDP delegates were exemplary "wind changers." Their goal was to widen the scope of meaningful participation in decision-making. They questioned the limited definition of what is legitimate representation; they redefined meaningful participation; and they insisted on a wider scope for who should be included in decision-making. By contrast, the politicians and the national leaders, as members of the state apparatus, stood with their wet fingers in the wind without noticing that the weather was changing. The roles played by Fred Gray and other lawyers in the Montgomery Bus Boycott, the story that law ultimately tells, the driving ideal of equality, the assumption about the source of power to make change, and the definition of success all reflect the distinctive interpretive communities to which the lawyers felt they were accountable.

In the case of the bus boycott, law is practiced tactically. It retains its link to a mobilized community that is seeking change to produce justice. A narrative whose higher authority comes from the idea that [*2804] national citizenship applies to black people in Alabama motivates this community. These people are inspired to take risks in support of this ideal because of their belief in a just God and the support they gain from religious cultural rituals, as manifest in the religious tenor, the spirituality, and the singing at mass meetings. Through their collective struggle and communal resourcefulness they gain a sense of agency and create a constituency of resistance that builds a new organization and inspires a series of national movements.

AT Legal Details Bad

Link goes the opposite way – it is white elites who benefit from a lack of formal details

McCann 4 (Professor of Law at University of New Hampshire)

(Michael, Law and Social Movements in The Blackwell Companion to Law and Society Pg. 510)

Law is often especially important to one specific aim of many "outsider" groups _ that of "formalizing" policy formulation and implementation processes. Formality, as understood here, refers to the degree to which relations are conducted according to procedures and standards that are public, general, explicit, and uniform (Lowi, 1979). The basic supposition here is that dominant groups tend to prefer relatively insular (autonomous or hidden) modes of highly discretionary policy implementa- tion unhampered by standardized procedures, substantive guidelines, high visibility, and outside supervision. In such informal settings, established prerogatives of prevailing elites can more easily prevail to minimize costs, maintain control, and protect their own privileges while granting empty symbolic gestures to challengers. By contrast, marginalized groups usually benefit from more formalized processes where specified procedural rights and substantive standards can be employed to render accountable dominant interests who control the bulk of material and organizational resources (Delgado et al., 1985).

AT Liberalism Bad

Rejecting liberalism and while continuing to fight for justice within the law are necessary and compatible

Sharpless 12 (Associate Clinical Professor, University of Miami School of Law)
(Rebecca, MORE THAN ONE LANE WIDE: AGAINST HIERARCHIES OF HELPING IN PROGRESSIVE LEGAL ADVOCACY, 19 Clinical L. Rev. 347, Fall, LN)

Matsuda offers insights based in the "double consciousness" experience of people of color in which "deep criticism" is combined with "an aspirational vision of law." n203 From this point of view, we can believe in both the necessity and the inadequacy of rights. n204 We can believe in both the necessity and the inadequacy of direct service lawyering. Theoretical critiques of liberalism may require the critique of individual client services as, at best, a panacea and, at worst, a practice that perpetuates client domination and the status quo. Yet social reality requires that progressive lawyers work with individual people and within the current legal system. Social justice lawyers can believe in the inadequacy of the liberal rights framework and the adversarial system but still make rights claims in court; reject formalism but still engage in rule-bound lawyering; believe that helping individuals alone will never bring about social justice, but keep helping individuals; understand the indeterminacy of any road towards social justice but still meaningfully debate the best goals and methods; and believe that there is inherent domination whenever lawyers engage with their clients but still offer their professional skills in the service of others and the movement. Progressive legal advocates--attorneys and academics alike--should value the work of those who have the patience and commitment to offer life-sustaining help day in and day out.

AT Passivity/Disempowerment

Legal education empowers a critique of the law, not liberal passivity

Harris and Maeda 4 (Prof @ UC Davis School of Law; Professor of Critical Theory and Social Justice @ Occidental) (Angela Harris and Donna Maeda, Power and Resistance in Contemporary Legal Education, in Legal Education and the Reproduction of Hierarchy, Project MUSE)

Efforts by progressive students to transform hierarchies indicate the importance of constant resistance, and also the usefulness of a midlevel political analysis: not focusing on the law school (the local) as a fulcrum for changing the world (the global) but understanding legal education as one aspect of very particular social struggles for justice. The Coalition for Diversity in some ways is the embodiment of the kind of resistance Kennedy advocates. Its diffuse structure and efforts have enabled members to figure out how to connect issues, to constantly look for complex relationships of the operations of power, and to set in motion dynamics of change even beyond specific, planned actions. The organization's success may at times appear small, but the complexity of power relationships indi- cates the necessity of such small, constant resistances. Such organizing work, which contributes to the development of complex critical perspectives and coalition-building skills, as well as lessons learned by efforts to change the most elite, hierarchical structures (such as law review), may help prepare such students for struggles in the hierarchically ordered lib- eral legal-political world we inhabit. At the same time, progressive students in the Coalition and elsewhere add to Kennedy's two left stances an ability to treat law as only one thread in a web of relations of power and to bring their prior experiences of sub- ordination, resistance, and critical thinking directly to bear on their law school organizing. Both the liberal and radical stances Kennedy describes understand the law as the law understands itself: as, for good or ill, the foundation of the house of power. This view, however, sustains power relations by appealing only to the realm of law itself for resistance. The belief that law school, the legal profession, and the law more generally are the sole, or even key, places for reproducing or undoing hierarchy sets up this realm as the most significant place for work in confronting power, so that people with legal skills continue to be held up as the most important ac- tors for social change. As an alternative, progressive law students may use their involvement with the law to participate in broader resistance practices. We have focused on connecting resistance against legal hierarchy with the fight for racial justice, but of course there are many other kinds of anti-subordina- tion struggles that can serve as the basis for a valuable praxis. Kennedy's assessment of the circuits of institutional self-replication remains a valu- able one; but left students who come to law school need not choose between liberal naïveté and radical alienation. Instead, law students may draw on their experiences of hierarchy outside legal education to transform their conditions of life, grounded in the knowledge of the necessity of constant struggle and resistance.

AT Roleplaying Bad

First, there's obviously no link

Taking on different roles is a powerful tool of amplifiying collective action. Purely negative critique is dangerous
Connolly 11

(William E., A World of Becoming, Duke University Press)

What are possible modes of positive intervention in this amplification machine? Certainly state and interstate actions could make a major difference, even though they cannot dismantle the machine done. Concerted state and interstate pressure to regulate derivative markets, to roll back Israeli settlements, to promote a new state of Palestine (or even a larger, pluralistic Israel) would help immeasurably. So would the end of preemptive wars and the bellicose image the United States has presented to much of the world during large stretches of time. But these and other actions are also insufficient to the times. Equally important, they require significant constituency changes on the ground to make them feasible. A combination of luck, exhaustion of the most militant constituencies on each side, cultural shaming, and creative action by nonstate actors within and across states is also needed to turn the machine in a new direction. The hawkish minorities on each side must be matched and surpassed by counter-constituencies anchored in multiple sites. Here I focus primarily on one dimension of such activity, a "triggering" force that carries Hegel's expressive dimension of sovereignty into contemporary role definitions. It is misleading to divide the political world into individuals, constituency organizations, and states. Each individual, for instance, is ensconced in a variety of roles. And each role both informs the individual and is linked to larger assemblages. The connections are relatively conscious when consumption patterns of dress, hairstyle, housing, entertainment, and car choke forge identity niches. Role specific habits of eye contact are less conscious, as in the street rules of middle class eye contact between the sexes in the United States of the 1950s. Yet those habits helped to constitute a pattern of gender relations that found expression in family life, education, dating, sports, work life, voting habits, and church practices. A role is neither reducible entirely to the individuals who inhabit it nor thoroughly assimilable to the larger assemblages that help to shape and manage it. It is the site of strategic ambiguity, periodically susceptible for that reason to creative political deployment. To consider multiple roles in relation to this global resonance machine suggests how accumulated changes in these practices might make a contribution to turning the machine in a different direction. Certainly, a large number of preachers, imams, rabbis, writers, military leaders, talking heads, and unemployed workers introduced changes into role conduct that helped to organize the current machine. Osama bin Laden's roles as a wealthy man, investor, devotee of Islam, Saudi, and charismatic leader all underwent change when he founded Al Qaeda. We are, variously, teachers, blue collar workers, writers, film directors, consumers, investors, faith devotees, parents, lovers, voters, Internet users, Tv viewers, military veterans, charity donors, members of an age cohort, contributors to retirement funds, homeowners or renters, neighbors, models, athletes, students, advertising executives, geologists, oil drifters, and so on, endlessly. The trick today is to infuse a bit of the warrior ethic into the performance of several of these roles, not in the spirit of Napoleon, Putin, and Bush, of Gandhi, Thoreau, Nietzsche, and Martin Luther King Jr., with the inspiration and strategic sense of each adjusted to the new circumstances of being. The task is to inhabit several roles in more militant, visible, creative, and inspirational ways, as we come to terms with their cumulative effects on the world. The accumulation of rapid shifts in role performance might introduce new pressures into the world. The goals in ascending order are: first, to induce cumulative changes in individual and group conducts that shift the center of gravity in this or that way and encourage others to do so; second, to push collective role assemblages in new directions; and third, to inspire initiatives that draw energy from activity on these first two fronts to escalate both internal and external pressures upon corporations, states, universities, churches and temples, investment firms, the media, the Internet, and international organizations. The initial potentialities are numerous. Consumers can, as the need and opportunity arises, alter patterns of consumption with respect to food acquisition, vehicle use, housing, cuisine, clothing, and entertainment, seeking to gear each mode more closely to a near future that reduces oil dependence, improves food production, and curtails emissions, and also to inspire more active and intense support for collective modes of consumption that reduce inequality within and between regions. Investors and participants in retirement investment funds can readjust the priorities of those investments, as they also organize to demand closer state regulation of volatile markets. Congregants within churches, temples, synagogues, mosques, and madrassas can repudiate publicaliy the most ugly pronouncements and actions taken by others in the name of theft faith, to shame those who have hijacked their creed for retrograde means, and to press their own congregations to change their energy use, relations with other faiths, and relations to corporations and the state. By doing so they also help to recompose the connection between existential faith and drives to implacable revenge so prominent today. Experts in oil exploration, sustainable energy production, electrical engineering, and automobile production can experiment with new modes of transportation and energy use. Writers, Tv producers, actors, bloggers, and film directors can infuse a gratitude for being more actively into their writing, films, and characters, seeking to challenge cynical existential dispositions on the Left that come perilously close to the forces they would resist. Veterans, who have experienced the horror of war up close, can relate that sense of horror to others, while publicizing nonmilitary ways to engage contemporary issues. Reporters and dissident economists can publicize microeconomic experiments in various corners of the world that could be extended, exposing investors, consumers, and producers to a larger range of possibilities than generally recognized. Teachers in schools and universities can teach students how the media work upon them daily at multiple levels of the sensorium, and how they too can acquire sophisticated media skills. The possibilities are endless. The point of individual and group experimentation with role assignments is simultaneously to make a direct difference through our

conduct, to open us to new experiences that might alter our relational sensibilities even further, to unscramble role assumptions assumed by others, to form operational connections with others from which larger political movements might be generated, and to make connections with noble role warriors in other regions and walks of life to enlarge the space and visibility of positive action. A stated change in personal or constituency belief is not enough since the layered embodiment of belief and the actual performance of roles are so closely bound together. A belief is an embodied tendency to performance; concerted practices of performance help to alter or intent efy belief; and new intensities of belief fold back into future desires, performative priorities, and potentialities of political action. Such a spiral can produce positive as well as negative effects. For example, an accumulation of resentments against states, corporations, and consumers for their refusal to address global warming could eventually inspire a cross-regional movement to launch simultaneous general strikes in several states. Such dramatic actions are not apt to take place unless and until the spiritual ground has been prepared and the unity of obstinate elites has been weakened. Effective role adventurism helps. It builds a reservoir of public readiness for more militant action upon and by civil society, state, and interstate institutions. As some churches modify their behavior toward mosques, and vice versa, the door is open to form a cross-state citizen movement to modify the practices of states and international organizations. As those movements coalesce, support for the most bellicose forces on each side wanes. When those effects are consolidated, corporations, churches, states, and international organizations are placed under yet more positive pressure, or alternatively find it possible to take more risks, if and when such a machine becomes organized, each pressure point begins to resonate with the others, creating a resonance machine larger than its parts. At the early stages of such a movement, it is important to think tactically about how to proceed, so as to put effective pressure on others through example, inspiration, and shaming. The goal is to build a resonant assemblage by deploying mobile intersections between belief, role performance, desire, and action to prepare the way for more militant sit-ins, highway blockages, selective refusals of participation, and so on, as events unfold. One key to formation of vibrant cross-state citizen movements is to respond creatively to new and surprising events as they arise, drawing upon the fund of readiness built up by role adventurism to engender larger, more militant actions. Such a combination takes a leaf out of the "shock doctrine" of the neoliberal right while diverging from it in every other respect. As Naomi Klein shows, the neoliberal right has been primed for decades to use surprising events as a pretext to install a neoliberal agenda through top-down action. 17 The shock side of its economic doctrine shows how political neoliberalism is in its essence. It pursues a neoliberal politics of elite control in the service of military bellicosity and regional inequality in the name of freeing a self-regulating economy that it pretends is waiting to emerge. Its politics is top down, war-like, and inegalitarian while its doctrine celebrates the ever receding promise of world markets that thrive most when they are least regulated. We, by contrast, must start in the middle of things and constituencies, pushing out in several directions, responding creatively to new events in a world in which no self-organizing economic system can fulfill the promises of neoliberalism, because the world is composed of multiple, interacting temporal systems, with many containing capacities of selforganization and metamorphosis. Micropolitics on several fronts can render creative mass responses to new events promising because of the dose interinvolvements between role performance, intensities of belief, and political action. Is it not obligatory to expose and resist the system as such rather than taking cumulative actions to move it? Don't such actions necessarily fold back in on themselves, feeding the dosed system they seek to move? Some theorists on the Left say such things, but they themselves have too dosed a view of the systems they criticize. No system in a world of becoming composed of multiple, interacting systems of different types, with different capacities of self-organization, is entirely dosed. It is both more vulnerable to the outside than the carriers of hubris imagine and periodically susceptible to creative movement from within and without simultaneously. Moreover, pure negativity on the Left does not sustain either critique or militancy for long, but rather, it tends eventually to lapse into resignation or to slide toward the authoritarian practices of the Right that already express with glee the moods of negativity, hubris, or existential revenge. We have witnessed numerous examples of such disappointing transitions in the last several decades, when a negative or authoritarian mood is retained while the creed in which it was set is changed dramatically. We must therefore work on mood, belief; desire, and action together. As we do so we also amplify positive attachment to existence itself amidst the specific political resentments that help to spur us on. To ignore the existential dimension of politics is to increase the risks of converting a noble movement into an authoritarian one and to amplify the power of bellicose movements that mobilize destructive potential. To focus on the negative dimension alone is to abjure the responsibilities of political action during a dangerous time. To review, none of the role interventions listed above nor all in concert could suffice to break such a global resonance machine. Luck and pregnant points of contact with salutary changes in state actions, other cross-state citizen movements, the policies of international organizations, creative market innovations, and religious organization are needed. But those larger constellations may not themselves move far in a positive direction unless they meet multiple constituencies primed to join them and geared to press them whenever they lapse into inertia, if a world resonance machine of revenge and counter-revenge stretches, twists, and constrains the classical image of sovereign units, regionally anchored creeds, uneven capitalist exchange, and international organizations, while drawing selective sustenance from all of them, a new counter-machine must do so too.

AT We Know Law Is Bad

Legal education needs to be tailored to specific acts of resistance

Morales-Cruz 12 (teaches at Inter American University of Puerto Rico School of Law)
(Myrta, Oñati Socio-Legal Series, v. 2, n. 1, ¡Los Filtros Luchan!1 A Case Study of Lawyering and Participatory Democracy: Participatory Lobbying as a Strategy for Working with Marginalized Communities)

Finally, the third image of lawyering presented by White is "lawyering together toward change" (White 1988). This image of lawyering combines pedagogy and strategic action. White (1988 cited Freire 1970 and De Lauretis 1984) is inspired by Paulo Freire's popular education theory and the feminist methodology of consciousness raising. Both show how a critical consciousness can emerge among oppressed groups as they reflect together about their situation (White 1988). This is a learning practice that is non-hierarchical "in which small groups reflect together upon the immediate conditions of their lives" (White 1988, p. 761). It is a "dialogic process of reflection and action" (White 1988, p. 761). In this model, nobody monopolizes the teacher role (White 1988). However, an "outsider" with professional skills can have an important role to play (White 1988, p.762). The lawyer who assumes this role must, according to White, above all else, have humility. The strategic work entailed by this image of lawyering must help the group "devise concrete actions that challenge the patterns of domination that they identify" (White 1988, p. 763). This work is a process where "the group learns to interpret their relationship with those in power as an ongoing drama" instead of a static condition (White 1988, p. 763). They must learn how to design specific acts of resistance, which reveal the wrongness of the positions of the oppressor to itself and to the public (White 1988).

White (1988, p. 765) posits that "fluency in the law" which she describes as a "deep practical understanding of law as a discourse for articulating norms of justice and an array of rituals for resolving social conflict" is beneficial for the type of work that she describes: "An understanding of law as discourse on norms will help [the "outsider"] work with the clients to deepen their own consciousness of their injuries and their needs. Knowledge of the law's procedural rituals will give the group access to a central arena for public resistance and challenge."

State/Reform Good

Law K2 Movements

Momentum Building – Campaigning against particular laws can be effective and is often necessary. Seemingly small reform efforts can be effective tools to mobilize populations. This draw factor disproves their general claim about reformism

Cummings and Eagly 2k1 (Staff Attorney, Community Development Project, Public Counsel Law Center, Los Angeles, California. J.D., Harvard Law School; Coordinating Attorney, Immigrant Domestic Violence Project, Coalition for Humane Immigrant Rights of Los Angeles (CHIRLA), Los Angeles, California. J.D., Harvard Law School)
(Scott L. and Ingrid V., A Critical Reflection on Law and Organizing, 48 UCLA L. Rev. 443, LN)

Gordon has offered a particularly comprehensive vision of law and organizing practice. She argues that there are "three interesting and under-explored possibilities for how to use law" in grassroots organizing work. n105 First, law can be used "as a draw" to bring new members into an organization that has larger organizing and reformist goals. n106 The promise of legal assistance on a discrete case can motivate a worker to come to a workers' meeting at which she will be exposed to the broader educational and organizing activities of the group. Second, the law can be used as a "measure of injustice." n107 For instance, as part of educational efforts, workers can be asked to analyze how their own experiences may diverge from what the law defines as basic legal protections. In this way, a discussion of legal issues can highlight discrepancies between the law as written and the law as lived by marginalized workers. n108 The gap between the legal ideal and practical reality can then be used to chart a course for political action and community mobilization. Finally, the law can be used as "part of a larger organizing campaign" n109 in which the ultimate goal is not to win a particular lawsuit, but rather to achieve specific organizing objectives and build power among unrepresented groups. According to this conception, the law serves as a strategic mechanism to support or advance organizing campaigns in practical ways - for example, by filing a lawsuit to call attention to a broader structural issue or to put pressure on an employer or industry to undertake systemic reforms. n110

.

Reform K2 Minorities

Marginalized groups use the law precisely because they lack power

Lobel 7 (Assistant Professor of Law, University of San Diego)
(Orly, THE PARADOX OF EXTRALEGAL ACTIVISM: CRITICAL LEGAL CONSCIOUSNESS AND TRANSFORMATIVE POLITICS, 120 Harv. L. Rev. 937, February, 2007, LN)

In the triangular conundrum of "law and social change," law is regularly the first to be questioned, deconstructed, and then critically dismissed. The other two components of the equation - social and change - are often presumed to be immutable and unambiguous. Understanding the limits of legal change reveals the dangers of absolute reliance on one system and the need, in any effort for social reform, to contextualize the discourse, to avoid evasive, open-ended slogans, and to develop greater sensitivity to indirect effects and multiple courses of action. Despite its weaknesses, however, law is an optimistic discipline. It operates both in the present and in the future. Order without law is often the privilege of the strong. Marginalized groups have used legal reform precisely because they lacked power. Despite limitations, these groups have often successfully secured their interests through legislative and judicial victories. Rather than experiencing a disabling disenchantment with the legal system, we can learn from both the successes and failures of past models, with the aim of constantly redefining the boundaries of legal reform and making visible law's broad reach

Reform K2 Native Americans

Legal reform is vital to provide meaningful redress for past violence to natives—can't fix the law outside of the law

Bradford 2

(William Bradford 2, Chiricahua Apache. LL.M., 2001, Harvard Law School; Ph.D., 1995, Northwestern University, "With a Very Great Blame on Our Hearts": 1 Reparations, Reconciliation, and an American Indian Plea for Peace with Justice, 27 Am. Indian L. Rev. 1)

[*17] Nevertheless, even if the non-Indian majority would reject the American Myth in the interest of mending national fences, the path to Indian redress winds through terrain unmapped heretofore. Compensation and apologies, gestures potentially part of an amicable settlement, are not germane to the resolution of Indian claims for injustices that cannot be remedied save by reinvestiture of lands and sovereignty in self-determining Indian tribes. 70 This requires not merely an abstract acknowledgment of the value of pluralism but a comprehensive program of legal reform that dispenses with doctrines and precedents perpetuating the denial of the human rights of Indian tribes and people. 71 As law, more than any other social variable, has reproduced the subordination of Indians in the United States, 72 legal reform occupies a central position in the claim for Indian redress. 73¶ [*18] In short, proponents of Indian redress must not only displace a flawed version of history: they must articulate a proposal for remediation that transports the American people far beyond the strictures of existing law to enable the peaceful restoration of Indian lands and powers of self-government. 74 Such a transformative mission cannot be accomplished by positing Indians and the non-Indian majority as adversaries, as would reparations; rather, redress of Indian claims and the healing of the American nation -- crucial foci of the drive toward perfection -- necessitate dialogue, reconciliation, and joint authorship of a future history of peace, harmony, and justice. 75¶ Part II of this Article offers a disquieting version of U.S-Indian history that accelerates erosion of the American Myth and acquaints the non-Indian majority with the necessary factual predicate to Indian redress. Parts III and IV contrast the assumptions, procedures, and remedies that distinguish reparations and reconciliation, 76 the dominant contending models of redress available to group victims of human injustice, and demonstrate that, because it offers the best hope for a peaceful American coexistence marked by mutual respect for sovereignty, reconciliation is a more appropriate avenue to Indian redress. Several preliminary proposals, including the introduction of traditional tribal peacemaking as perhaps the most appropriate form of [*19] reconciliation, will be offered to stimulate thinking.

Reform Key

Have to transform systems from the inside out-otherwise rhetoric changes but not policies.

McCormack 10

(Tara, PhD in International Relations from the University of Westminster, Critique, Security and Power: The political limits to emancipatory approaches, pg 59-61)

In chapter 7 I engaged with the human security framework and some of the problematic implications of 'emancipatory' security policy frameworks. In this chapter I argued that the shift away from the pluralist security framework and the elevation of cosmopolitan and emancipatory goals has served to enforce international power inequalities rather than lessen them. Weak or unstable states are subjected to greater international scrutiny and international institutions and other states have greater freedom to intervene, but the citizens of these states have no way of controlling or influencing these international institutions or powerful states. This shift away from the pluralist security framework has not challenged the status quo, which may help to explain why major international institutions and states can easily adopt a more cosmopolitan rhetoric in their security policies. As we have seen, the shift away from the pluralist security framework has entailed a shift towards a more openly hierarchical international system, in which states are differentiated according to, for example, their ability to provide human security for their citizens or their supposed democratic commitments. In this shift, the old pluralist international norms of (formal) international sovereign equality, non-intervention and 'blindness' to the content of a state are overturned. Instead, international institutions and states have more freedom to intervene in weak or unstable states in order to 'protect' and emancipate individuals globally. Critical and emancipatory security theorists argue that the goal of the emancipation of the individual means that security must be reconceptualised away from the state. As the domestic sphere is understood to be the sphere of insecurity and disorder, the international sphere represents greater emancipatory possibilities, as Tickner argues, 'if security is to start with the individual, its ties to state sovereignty must be severed' (1995: 189). For critical and emancipatory theorists there must be a shift towards a 'cosmopolitan' legal framework, for example Mary Kaldor (2001: 10), Martin Shaw (2003: 104) and Andrew Linklater (2005). For critical theorists, one of the fundamental problems with Realism is that it is unrealistic. Because it prioritises order and the existing status quo, Realism attempts to impose a particular security framework onto a complex world, ignoring the myriad threats to people emerging from their own governments and societies. Moreover, traditional international theory serves to obscure power relations and omits a study of why the system is as it is: [O]mitting myriad strands of power amounts to exaggerating the simplicity of the entire political system. Today's conventional portrait of international politics thus too often ends up looking like a Superman comic strip, whereas it probably should resemble a Jackson Pollock. (Enloe, 2002 [1996]: 189) Yet as I have argued, contemporary critical security theorists seem to show a marked lack of engagement with their problematic (whether the international security context, or the Yugoslav break-up and wars). Without concrete engagement and analysis, however, the critical project is undermined and critical theory becomes nothing more than a request that people behave in a nicer way to each other. Furthermore, whilst contemporary critical security theorists argue that they present a more realistic image of the world, through exposing power relations, for example, their lack of concrete analysis of the problematic considered renders them actually unable to engage with existing power structures and the way in which power is being exercised in the contemporary international system. For critical and emancipatory theorists the central place of the values of the theorist mean that it cannot fulfil its promise to critically engage with contemporary power relations and emancipatory possibilities. Values must be joined with engagement with the material circumstances of the time.

AT Alternatives Key

Can only assess the viability of the law in relation to alternatives

Cummings 9 (Professor of Law, UCLA School of Law)
(Scott L., A PRAGMATIC APPROACH TO LAW AND ORGANIZING: A COMMENT ON "THE STORY OF SOUTH ARDMORE",
42 J. Marshall L. Rev. 631, LN)

The classic justification for public interest law, particularly the lawsuits attacking Jim Crow during the Civil Rights Movement, was the entrenched and immobile political opposition to the cause of racial equality. Law may be a second-best option, but sometimes it is the most powerful weapon available. When organizing groups are contemplating different courses of action, the use of law must be compared to alternative non-legal strategies and their likely outcomes. It may be that in a particular organizing context, law poses significant risks. But what are the risks of other strategies? How might the risks be weighted and usefully compared? Realizing Shdaimah's call for a "fluid" approach to law and organizing requires a genuine analysis of the trade-offs of legal action and non-legal alternatives and a strategic plan of action that combines the best of both.

AT Law = Cap

Law not inherently classist or bad

Robertson 97 (Osgoode Hall Law School, York University)

(Cherie. "The Demystification of Legal Discourse: Reconceiving the Role of the Poverty Lawyer as Agent of the Poor." Osgoode Hall Law Journal 35.3/4 (1997))

The observation has been made that lawyers, as espousers of and adherents to law, are participants in its oppressive nature, in its discriminatory regulation, and in its inequities; lawyers in effect are "greasing the wheels" for the law as a tool of social oppression, and are perpetuating the legitimacy and facilitating the operation of an unjust system. Marxist analyses have attempted to explain how law operates as an instrument of repression promoting the interests of certain classes at the expense of those of others in contemporary Western societies while, at the same time, contributing to shape a climate of thought in these societies that makes possible a reduction of direct repression through law to a minimum. Yet, if all poverty lawyers in Toronto simultaneously withdrew their services, the result would most certainly be increased suffering for the poor. While a reconceptualization of the work that poverty lawyers do is essential, I would argue that it must take place while we continue to represent the poor. We cannot put our work on hold until we devise the perfect way to help poor people. Besides, there will never be unanimous agreement amongst leftist activist lawyers on what the best strategies for self-reform are. Furthermore, I am not of the mind that there is nothing redemptive about law as a mechanism for bringing about positive social change. Of dominant ideologies in society, law is a discourse which at least pays lip-service to the ideals of justice. As such, it continues to be a site where power relations can be debated, challenged and reconstituted. E.P. Thompson's words are inspiring in this regard: It is true that in history the law can be seen to mediate and to legitimize existent class relations. Its forms and procedures may crystallize those relations and mask ulterior injustice. But this mediation, through the forms of law, is something quite distinct from the exercise of unmediated force. The forms and rhetoric of law acquire a distinct identity which may, on occasion, inhibit power and afford some protection to the powerless. 22 Besides, poor people do not have the luxury of choosing whether or not they will engage with law. As Wexler writes, "poor people must go to government officials for many of the things which not-poor people get privately ... . Poverty creates an abrasive interface with society; poor people are always bumping into sharp legal things."23 Consequently, as lawyers, we have to continue to try to renegotiate with legal discourse while simultaneously challenging its inadequacies.

Education about the state is crucial to anti-capitalism

a. The state is not an end, but it is a crucial facet to make massive change possible

Abramsky 10 (visiting fellow at the Institute of Advanced Studies in Science, Technology and Society; fmr. coordinator of the Danish-based World Wind Energy Institute)
(Koyla, SPARKING AN ENERGY REVOLUTION Building New Relations of Production, Exchange, and Livelihood in Sparking A Worldwide Energy Revolution, ed. Koyla Abramsky, pg. 646)

As this book has sought to show, leadership in an emancipatory transition process is unlikely to come predominantly from structures from above, like governments, multilateral institutions and agreements, or corporations. It is more likely that autonomous movements, self-organizing from below in order to gain greater control and autonomy over their own lives, will lead the way.. This is not to say that state regulation is unimportant; it is completely essential in order to secure a legal and institutional framework (as well as financial support) conducive to a grassroots process led from below. However, the regulatory process is very unlikely to be the driving force of the changes, but rather a necessary process that enables wider changes. Furthermore, it is highly unlikely that emancipatory regulation that is strong enough to be effective could even come about without major pressure from below.

b. Even if revolutionary change is necessary, Understanding its inner workings is crucial

AK Press 12 (February 17, http://www.revolutionbythebook.akpress.org/accumulation-of-freedom-video-promo-2/)

Anti-capitalism is too often little more than a sentiment, easily captured as a slogan on a wall or banner. Much of the discussion stays close to the surface. It's as if we, as anarchists, don't feel a responsibility to intellectually challenge capitalist dogma on its own terms (because we can't? because it requires an incredible amount of work?). We rail

<u>against capitalist institutions and forms but spend too little time working to understand them and to effectively translate that understanding to others</u>. So it's with pleasure that we welcome works likeAccumulation, David Graeber's Debt, and forthcoming titles like Wayne Price's revamped book on Marx's economics for anarchists (2012), and Geoff Mann's Dissassembly Required: A Field Guide to Actually Existing Capitalism (2013). Those smug anarchists quick to dismiss the study of economic

AT Reject State/Civil Society

Radical politics must engage the state – the alt is right wing take over
Mouffe 10
(What is Radical Politics Today?, Edited by Jonathan Pugh, pg. 235)

It is clear that, once we envisage social reality in terms of 'hegemonic and 'counter-hegemonic' practices, radical politics is not about withdrawing completely from existing institutions. Rather, we have no other choice but to engage with hegemonic practices, in order to challenge them. This is crucial' otherwise we will be faced with a chaotic situation. Moreover, if we do not engage with and challenge the existing order, if we instead choose to simply escape the state completely, we leave the door open for others to take control of systems of authority and regulation. Indeed there are many historical (and not so historical) examples of this. When the Left shows little interest, Right-wing and authoritarian groups are only too happy to take over the state.

The left is failing because of a suspicion of the nation state – we might fight the right at all levels in order to be effective
Grayson and Little 11
(Deborah Grayson and Ben Little 4 August 2011, The far right are the masters of network politics, not the 'internationalist' left, http://www.opendemocracy.net/ourkingdom/deborah-grayson-and-ben-little/far-right-are-masters-of-network-politics-not-internationa)

While Norway mourns and attends to matters of justice, across Europe the left would be wise to pause and reflect upon the mixed responses to the worst case of child murder in northern Europe since the Second World War. We can only hope that Anders Breivik is a lone operator and that we will not see this kind of politically motivated mass murder repeated in the UK or anywhere else, but in showing how right wing ideology is formed and disseminated through increasingly international networks, the Utoya massacre has lessons for us all. Although globally oriented 'lefties' may like to think this is a contradiction in terms, it is the far right who are pioneering the way towards a new form of internationalism. This is not to say that they have lost their attachment to the nation – for all that vigilantes like Breivik may think in civilisational or European terms, "small state" nationalism remains the bedrock of their politics. Those that see the blurring of boundaries between European and national perspectives as a sign of incoherence which will diminish the power of these ideological beliefs are mistaken. In an age of network politics it's a strength, and one that the left needs to understand if we are to reverse the electoral successes of the centre-right and the populist rise of the far-right across Europe. So far, the left has struggled to match the way far-right networks have learned to scale seamlessly from the local to the civilisational through the conceptual space of the national. The English Defence League, for example, explain local opposition to their marches as stemming from the malign influence of the SWP's campaign, Unite Against Fascism; cite the welfare state as evidence of leftist domination in national politics; and see in the European Court of Human Rights the imposition of socialist, multicultural values across the entire continent. This sense of multiple scales allows the EDL to create a language that reflects their politics at every level, and to communicate their message across local and national boundaries. They create a unified rhetoric that the left, with their suspicion of the national, cannot replicate.

Without the state /civil society the violent will take control -- they exploit the people and replicate the worst aspects of the state structure

Jackson 3 Paul Jackson, International Development Department of the University of Birmingham, UK (2003): Warlords as alternative forms of Governance, Small Wars & Insurgencies, 14:2, 131-150 Tandf online

Use of Violence to Reassert Local Power With the complete breakdown of moral authority and the law, let alone any means of enforcement, the only recourse is to establish rule through force. The violence associated with warlords is the most publicised aspect of their activity, and its seeming randomness is undoubtedly one of the most horrific characteristics of warlords. The casual nature of violence within areas held by warlords is symptomatic of the gang culture outlined by Lary in China, but equally resonant of earlier cultures of violence. Replacement of Formal Structures with Gang Mentality The collapse of formal structures and norms, including formal military structures, lead warlords to develop their own internal structures. In particular, the replacement of hierarchical structures with gang cultures, with the warlord and close associates at the core of the gang. This gang culture manifests itself in particular ways, not least of which is the fact that gangs act as a spur to further violence by subgroups. In other words, the replacement of formal structures by ad hoc, primitive and personalised control leads to a behavioural logic based on the licensing of gratuitous violence. The gang culture has a further element of interest: the development of subgroups. These subgroups may be smaller gangs, or alternatively part of the larger group aiming to progress up the pecking order. One of the features of all periods of warlord rule has been the behaviour of smaller groups of armed men on the periphery of the gang, which adds a further element of randomness into the violence. We will return to this below.

Lack of state authority / civil society means endless war among factions

Woodward 99 Dr. Susan L. Woodward, Senior Fellow at the Brookings Institution in Washington, served as Head, Analysis and Assessment Unit, Office of the Special Representative of the Secretary General, UNPROFOR, in 1994, and was associate professor of political science at Yale University prior to joining Brookings   Naval War College Review, 00281484, Spring 99, Vol. 52, Issue 2 "Failed states" Academic Search Premier

The loss of a state's monopoly on authority to legislate, tax, enforce, and restrict the right to bear arms creates a situation of relative balance in resources, especially arms, and in access to finances for war. Examples are regional control over trade routes and customs posts, as can be seen in Bosnia, and over mineral resources, as in Angola today. (The Angolan case shows that where there are such resources, lucrative financial offers are likely to appear from international businesses who have no scruples about dealing with warlords and who do not condition their payments on certain behavior and reforms, as do the United States and international organizations.) Contrary to the stabilizing effects of balance-of-power interstate relations, the most likely result of this anarchic balance of resources (particularly military ones) domestically is unending war of attrition.[7] The equilibrium result--a negative equilibrium, in economists' terms--is "stable anarchy," in which "all resources would be spent in fighting rather than production." There may be temporary cessations of fighting, but only as battlefield stalemates; internal actors cannot on their own end the fight.
This relative balance also creates layer upon layer of security dilemmas. A spiraling dynamic of mutual fear continues to feed such wars once they begin.[8] To understand the disintegration of Yugoslavia or the Bosnian war, for example, one must recognize that once the federal state lost its authority, each group pressed for its own national fights and claimed to be at risk of exploitation and even extirpation by other groups in the same dissolving state; it became critical that each group was a numerical minority and perceived itself as acting only in defensive ways. Interventions that attempt to remain impartial, delivering food and shelter to all civilians but not intervening politically to stop the spiraling dynamic, thus are likely to perpetuate these perceptions and the stalemate; those that do intervene politically, taking one side but not going to war in support of that side (and thereby resolving the battlefield situation) also perpetuate the conflict, by demonstrating to the other sides that they are indeed endangered and that they cannot safely disarm, psychologically or physically.

Ethnic cleansing occurs in the absence of state authority

Duffield 98 Mark Duffield School of Public Policy, University of Birmingham, Spring 1998   Post-modern conflict: Warlords,   post-adjustment states and private protection, Civil Wars, 1:1, 65-102 tandfonline

While the Balkan war may have coined the term ethnic cleansing, it is clear that the process of social inclusion and exclusion involved has a much wider application. It is typical of the reworking of political authority in a period of declining nation-state

competence and globalisation. It is these processes and not the alleged reappearance of age-old and suppressed ethnic hatreds (Kaplan, 1994; Kennedy, 1993), which are important. Africa and the European East provide many examples. Regarding the latter, the effects of the demise of central authority have been greatest where pre-existing federal systems collapsed as republics declared their autonomy. That is, in Yugoslavia and parts of the Soviet Union. While less violent, similar processes have been taking place in other areas including Hungary and the Czech Republic.

Without the state, public goods disappear and the population suffers

Rotberg 2 ROBERT I. ROTBERG, Director of the Program on Intrastate Conflict at Harvard University's John F. Kennedy School of Government and President of the World Peace Foundation. Foreign Affairs, Vol. 81, No. 4 (Jul. - Aug., 2002), pp. 127-140   Failed States in a World of Terror   JSTOR

STRONG STATES control their territories and deliver a high order of political goods to their citizens. They perform well according to standard indicators such as per capita GDP, the UN'S Human Development Index, Transparency International's Corruption Perception Index, and Freedom House's Freedom in the World report. Strong states offer high levels of security from political and criminal violence, ensure political freedom and civil liberties, and create environments conducive to the growth of economic opportunity. They are places of peace and order. In contrast, failed states are tense, conflicted, and dangerous. They generally share the following characteristics: a rise in criminal and political violence; a loss of control over their borders; rising ethnic, religious, linguistic, and cultural hostilities; civil war; the use of terror against their own citizens; weak institutions; a deteriorated or insufficient infrastructure; an inability to collect taxes without undue coercion; high levels of corruption; a collapsed health system; rising levels of infant mortality and declining life expectancy; the end of regular schooling opportunities; declining levels of GDP per capita; escalating inflation; a widespread preference for non-national currencies; and basic food shortages, leading to starvation. Failed states also face rising attacks on their fundamental legitimacy. As a state's capacity weakens and its rulers work exclusively for themselves, key interest groups show less and less loyalty to the state. The people's sense of political community vanishes and citizens feel disenfranchised and marginalized. The social contract that binds citizens and central structures is forfeit. Perhaps already divided by sectional differences and animosity, citizens transfer their allegiances to communal warlords. Domestic anarchy sets in. The rise of terrorist groups becomes more likely.

The state / civil society prevents pillaging by caspitalism

Moore 96   Richard Moore, Political Scientist, 1996 [THE FATEFUL DANCE OF CAPITALISM AND DEMOCRACY, p. http://legalminds.lp.findlaw.com/list/cyberjournal/frm00089.html].

Maastricht, Scottish independence, ethnic or regional autonomy, stronger international "peace" arrangements -- these are all developments which might have much to be said for them taken in isolation, or if implemented within a democratic framework. But within the context of the corporate elite storming the Bastille of democracy, it is necessary to re-examine all changes and "reforms" from the perspective of whether they strengthen or weaken our fundamental democratic institutions. If we don't look at the big picture, then we'll be like the frog who submits to being cooked -- the victim of a sneaky slow-boiling policy. The fact is that the modern nation state is the most effective democratic institution mankind has been able to come up with since outgrowing the small-scale city-state. With all its defects and corruptions, this gift from the Enlightenment -- the national republic --is the only effective channel the people have to power-sharing with the elites. If the strong nation-state withers away, we will not -- be assured --enter an era of freedom and prosperity, with the "shackles of wasteful governments off our backs". No indeed. If you want to see the future --in which weak nations must deal as-best-they-can with mega-corporations -- then look at the Third World.

AT Sovereignty Bad

Each use of the state has to judged on its own terms. Universal opposition to the state creates multiple other forms of oppression

Derrida 3

(Jacques, THE "WORLD" OF THE ENLIGHTENMENT TO COME (EXCEPTION, CALCULATION, SOVEREIGNTY), Research in Phenomenology. Pittsburgh: 2003. Vol. 33 pg. 9, 44 pgs)

And yet, in the second place, it would be imprudent and hasty, in truth hardly reasonable, to oppose unconditionally, that is, head on, a sovereignty that is itself unconditional and indivisible. One cannot combat, head on, all sovereignty, sovereignty in general, without threatening at the same time, beyond the nation-state figure of sovereignty, the classical principles of freedom and self-determination. Like the classical tradition of law (and the force that it presupposes), these classical principles remain inseparable from a sovereignty at once indivisible and yet able to be shared. Nation-state sovereignty can even itself, in certain conditions, become an indispensable bulwark against certain international powers, certain ideological, religious, or capitalist, indeed linguistic, hegemonies, which, under the cover of liberalism or universalism, would still represent, in a world that would be little more than a market, a rationalization in the service of particular interests. Yet again, in a context that is **each time singular**, where the respectful attention paid to singularity is not relativist but universalizable and rational, responsibility would consist in orienting ourselves without any determinative knowledge of the rule. To be responsible, to keep within reason [garder raison], would be to invent maxims of transaction for deciding between two just as rational and universal but contradictory exigencies of reason as well as its enlightenment.

AT State Action = Evil

Not this federal government

Past injustice was done by different people in a different government. It Obama isn't responsible for what the Bush administration did, this government can't be held responsible for past wrongs

Institutional guilt applies to all of us

The people were complicitous in past government wrongs. If the federal government must be rejected because of past wrongs, everyone must be rejected. Nothing can be done.

Insisting that government comply with the law undermines the colonial order.

Saito 4 Natsu Saito, professor of law at Georgia State University, December 2004 ["Like a Disembodied Shade: Colonization and Internment as the American Way of Life," Bad Subjects 71, http://bad.eserver.org/issues/2004/71/saito.html]

The other option left us is to follow the advice of Supreme Court Justice Robert H. Jackson who, in his capacity as the chief U.S. prosecutor for the Nuremberg Tribunal (1945), stated, "We are able to do away with domestic tyranny and violence and aggression by those in power against the rights of their own people only when we make all men answerable to the law." In this spirit we can insist that the government which purports to represent us comply with the rule of law – as articulated in both the U.S. Constitution and in international law – in all of its actions and with respect to all territories and peoples over whom it exercises jurisdiction. To the extent we fail to do so we are complicit in, and therefore responsible for, the maintenance of a colonial order in which law serves only to protect and privilege the colonizers.

Rejection of government action means black social death (from capitalism)

Ford 10 Glen Ford, Black Agenda Radio 09/15/2010 Black Folks Ain't Got No Money For Bootstraps: The Black Capitalist Dead End   http://www.blackagendareport.com/?q=content/black-folks-aint-got-no-money-bootstraps-black-capitalist-dead-end

The two devastating recessions of the last decade have had catastrophic effects on Black economic prospects. Yet, despite the monstrous setbacks of recent years and the general failure to bridge the racial wage and wealth gap over the last three decades, there still exists a strong current of Black political thought that insists African Americans can pull themselves and the rest of the race up by their financial bootstraps, through hard work and pooling of collective resources. Some of these arguments are unashamedly Black capitalist; others preach a brand of communal partnerships among Black entrepreneurs and consumers that attempts to make the entire Black community a kind of capitalist engine of self-help. What binds the variations on the "bootstrap" theme together, is an essential refusal to challenge the capitalist system. The belief is that Black "buying power" or race-based investment schemes will allow Black folks to rise from the bottom of the American economic barrel. Implicit in this line of thinking is the notion that Blacks are at the bottom because they have not been trying hard enough to move up - which is also the assumption of white racists, whether they call themselves conservatives or liberals. The most fatal flaw in the Black capitalist world view is the assumption that Black people actually have the wealth and discretionary income to build an internal economy that could insulate them from the general capitalist crisis. We know different, because all the data tell us that Black household income is stuck at the same level relative to whites as back in 1979, and Black comparative wealth was steadily eroding

even before the last decade's recessions. And we know that Black wealth has been further diminished relative to whites in the ongoing housing meltdown, in which Blacks are twice as likely to face foreclosure. And we know that Blacks, a majority of whom are renters, bear the brunt of the dislocations caused by rampant gentrification, which in some urban areas forces families to spend more than half their income on rent. "The most fatal flaw in the Black capitalist world view is the assumption that Black people actually have the wealth and discretionary income to build an internal economy that could insulate them from the general capitalist crisis." Simply put, there ain't no damn money for these bootstrap capitalism dreams, and there never was. There was never the possibility of building a Black General Motors - and now General Motors requires billions of dollars in federal infusions to survive. What a great distraction this nonsense about bootstrap racial upward mobility has been - so much wasted time and misdirected dreams over the generations. Worse than that, the bootstraps mythology - sometimes under the shorthand, "Do for Self" - implicitly or explicitly urges Black people to forego making demands of government, as if that amounts to "begging the white man" for something. This attitude surrenders all Black claims to any of the society's resources except those we currently hold in our own pockets - which is the equivalent of social death. President Obama also warns Blacks to expect no redress from their government. At a recent press conference, he once again urged Blacks to be patient, that when the economy grows, everybody will be "swept up into that virtuous circle." It never happened before, and it never will. Blacks need to "Do for Self," but not as aspiring capitalists. We have always made our greatest progress in political struggle. That's the Promised Land that we make, together.

AT Structuralism

Structuralism about the law is wrong

Connolly 13 (Krieger-Eisenhower Professor of Political Science at Johns Hopkins University)
(William, The Fragility of Things: Self-Organizing Processes, Neoliberal Fantasies, and Democratic Activism, pg. 36-38)

A philosophy attending to the acceleration, expansion, irrationalities, interdependencies, and fragilities of late capitalism suggests that we do not know with confidence, in advance of experimental action, just how far or fast changes in the systemic character of neoliberal capitalism can be made. The structures often **seem** solid and intractable, and indeed such a sem- blance may turn out to be true. Some may seem solid, infinitely absorptive, and intractable when they are in fact punctuated by hidden vulnerabilities, soft spots, uncertainties, and potential lines of flight that become appar- ent when they are subjected to experimental action, upheaval, testing, and strain. Indeed no ecology of late capitalism, given the variety of forces to which it is connected by a thousand pulleys, vibrations, impingements, dependencies, shocks, and threads, can specify with supreme confidence the solidity or potential flexibility of the structures it seeks to change. The strength of structural theory, at its best, was in identifying insti- tutional intersections that hold a system together; its conceit, at its worst, was the claim to know in advance how resistant such intersections are to potential change. Without adopting the opposite conceit, it seems important to pursue possible sites of strategic action that might open up room for productive change. Today it seems important to attend to the relation be- tween the need for structural change and identification of multiple sites of potential action. You do not know precisely what you are doing when you participate in such a venture. You combine an experimental temper with the appreciation that living and acting into the future inevitably contain a shifting quotient of uncertainty. The following tentative judgments and sites of action may be pertinent. 1) Neither neoliberal theory, nor socialist productivism, nor deep ecology, nor social democracy in its classic form seems sufficient to the contemporary condition. This is so in part because the powers of market self- regulation are both real and limited in relation to a larger multitude of heterogeneous force fields beyond the human estate with differential powers of self-regulation and metamorphosis. A first task is to challenge neoliberal ideology through critique and by elaborating and publicizing positive alternatives that acknowledge the disparate relations between mar- ket processes, other cultural systems, and nonhuman systems. Doing so to render the fragility of things more visible and palpable. Doing so, too, to set the stage for a series of intercoded shifts in citizen role performances, social movements, and state action. *2)* Those who seek to reshape the ecology of late capitalism might set an interim agenda of radical reform and then recoil back on the initiatives adopted to see how they work. An *interim agenda* is the best thing to focus on because in a world of becoming the more distant future is too cloudy to engage. We must, for instance, become involved in experimental micro- politics on a variety of fronts, as we participate in role experimentations, social movements, artistic displays, erotic-political shows, electoral campaigns, and creative interventions on the new media to help recode the ethos that now occupies investment practices, consumption desires, family savings, state priorities, church assemblies, university curricula, and media reporting. It is important to bear in mind how extant ideologies, estab- lished role performances, social movements, and commitments to state action intersect. To shift some of our own role performances in the zones of travel, church participation, home energy use, investment, and consump- tion, for instance, that now implicate us deeply in foreign oil dependence and the huge military expenditures that secure it, could make a minor dif- ference on its own *and also lift some of the burdens of institutional implica- tion from us* to support participation in more adventurous interpretations, political strategies, demands upon the state, and cross-state citizen actions.

No Link

Negative State Action

We're NOT THE LAW OR STATE AFFIRMATION – demands that a state not exclude groups doesn't reaffirm the state

Newman 10

(Saul, Reader in Political Theory at Goldsmiths, U of London, Theory & Event Volume 13, Issue 2)

There are two aspects that I would like to address here. Firstly, the notion of demand: making certain demands on the state – say for higher wages, equal rights for excluded groups, to not go to war, or an end to draconian policing – is one of the basic strategies of social movements and radical groups. Making such demands **does not necessarily mean working within the state or reaffirming its legitimacy**. On the contrary, demands are made from a **position outside the political order, and they** often **exceed the question of the implementation of this or that specific measure.** They implicitly call into question the legitimacy and even the sovereignty of the state by highlighting fundamental inconsistencies between, for instance, a formal constitutional order which guarantees certain rights and equalities, and state practices which in reality violate and deny them.

Alt Fails

Corporates DA

Must consider each use of sovereignty as unique – cannot universalize our opposition to the state or we will create the same problems of universal sovereignty and give ourselves over to multiple other forms of oppression

Derrida 3

(Jacques, THE "WORLD" OF THE ENLIGHTENMENT TO COME (EXCEPTION, CALCULATION, SOVEREIGNTY), Research in Phenomenology. Pittsburgh: 2003. Vol. 33 pg. 9, 44 pgs)

And yet, in the second place, it would be imprudent and hasty, in truth hardly reasonable, to oppose unconditionally, that is, head on, a sovereignty that is itself unconditional and indivisible. One cannot combat, head on, all sovereignty, sovereignty in general, without threatening at the same time, beyond the nation-state figure of sovereignty, the classical principles of freedom and self-determination. Like the classical tradition of law (and the force that it presupposes), these classical principles remain inseparable from a sovereignty at once indivisible and yet able to be shared. Nation-state sovereignty can even itself, in certain conditions, become an indispensable bulwark against certain international powers, certain ideological, religious, or capitalist, indeed linguistic, hegemonies, which, under the cover of liberalism or universalism, would still represent, in a world that would be little more than a market, a rationalization in the service of particular interests. Yet again, in a context that is **each time singular**, where the respectful attention paid to singularity is not relativist but universalizable and rational, responsibility would consist in orienting ourselves without any determinative knowledge of the rule. To be responsible, to keep within reason [garder raison], would be to invent maxims of transaction for deciding between two just as rational and universal but contradictory exigencies of reason as well as its enlightenment.

Cooption DA

Monolithic rejections of the law are wrong – cooption is more likely in non-state activism and fails to compare to alternative mechanisms for change. <u>Concrete mechanisms for success</u> should be your metric for evaluation.

Lobel 7 (Assistant Professor of Law, University of San Diego)

(Orly, THE PARADOX OF EXTRALEGAL ACTIVISM: CRITICAL LEGAL CONSCIOUSNESS AND TRANSFORMATIVE POLITICS, 120 Harv. L. Rev. 937, February, 2007, LN)

In the following sections, I argue that the extralegal model has suffered from the same drawbacks associated with legal cooptation. I show that as an effort to avoid the risk of legal cooptation, the current wave of suggested alternatives has effects that ironically mirror those of cooptation itself. Three central types of difficulties exist with contemporary extralegal scholarship. First, in the contexts of the labor and civil rights movements, arguments about legal cooptation often developed in response to a perceived gap between the conceptual ideal toward which a social reform group struggled and its actual accomplishments. But, ironically, the contemporary message of opting out of traditional legal reform avenues may only accentuate this problem. As the rise of informalization (moving to nonlegal strategies), civil society (moving to extralegal spheres), and pluralism (the proliferation of norm-generating actors) has been effected and appropriated by supporters from a wide range of political commitments, these concepts have had unintended implications that conflict with the very social reform ideals from which they stem. Second, the idea of opting out of the legal arena becomes self-defeating as it discounts the ongoing importance of law and the possibilities of legal reform in seemingly unregulated spheres. A model encompassing exit and rigid sphere distinctions further fails to recognize a reality of increasing interpenetration and the blurring of boundaries between private and public spheres, profit and nonprofit sectors, and formal and informal institutions. It therefore loses the critical insight that law operates in the background of seemingly unregulated relationships. Again paradoxically, the extralegal view of decentralized activism and the division of society into different spheres in fact have worked to subvert rather than support the progressive agenda. Finally, since extralegal actors view their actions with romantic idealism, they fail to develop tools for evaluating their success. If the critique of legal cooptation has involved the argument that legal reform, even when viewed as a victory, is never radically transformative, we must ask: what are the criteria for assessing the achievements of the suggested alternatives? As I illustrate in the following sections, much of the current scholarship obscures the lines between the descriptive and the prescriptive in its formulation of social activism. If current suggestions present themselves as alternatives to formal legal struggles, we must question whether the new extralegal politics that are proposed and celebrated are capable of producing a constructive theory and meaningful channels for reform, rather than passive status quo politics. A. Practical Failures: When Extralegal Alternatives Are Vehicles for Conservative Agendas We don't want the 1950s back. What we want is to edit them. We want to keep the safe streets, the friendly grocers, and the milk and cookies, while blotting out the political bosses, the tyrannical headmasters, the inflexible rules, and the lectures on 100 percent Americanism and the sinfulness of dissent. n163 A basic structure of cooptation arguments as developed in relation to the labor and civil rights movements has been to show how, in the move from theory to practice, the ideal that was promoted by a social group takes on unintended content, and the group thus fails to realize the original vision. This risk is particularly high when ideals are framed in broad terms that are open to multiple interpretations. Moreover, the pitfalls of the potential risks presented under the umbrella of cooptation are in fact accentuated in current proposals. Paradoxically, as the extralegal movement is framed by way of opposition to formal legal reform paths, without sufficiently defining its goals, it runs the very risks it sought to avoid by working outside the legal system. Extralegal paths are depicted mostly in negative terms and as resorting to new alternative forms of action rather than established models. Accordingly, because the ideas of social organizing, civil society, and legal pluralism are framed in open-ended contrarian terms, they do not translate into specific visions of social justice reform. The idea of civil society, which has been embraced by people from a broad array of often conflicting ideological commitments, is particularly demonstrative. Critics argue that "some ideas fail because they never make the light of day. The idea of civil society ... failed because it [*972] became too popular." n164 Such a broadly conceived ideal as civil society sows the seeds of its own destruction. In former eras, the claims about the legal cooptation of the transformative visions of workplace justice and racial equality suggested that through legal strategies the visions became stripped of their initial depth and fragmented and framed in ways that were narrow and often merely symbolic. This observation seems accurate in the contemporary political arena; the idea of civil society revivalism evoked by progressive activists has been reduced to symbolic acts with very little substance. On the left, progressive advocates envision decentralized activism in a third, nongovernmental sphere as a way of reviving democratic participation and rebuilding the state from the bottom up. By contrast, the idea of civil society has been embraced by conservative politicians as a means for replacing government-funded programs and steering away from state intervention. As a result, recent political uses of civil society have subverted the ideals of progressive social reform and replaced them with conservative agendas that reject egalitarian views of social provision. In particular, recent calls to strengthen civil society have been advanced by politicians interested in dismantling the modern welfare system. Conservative civil society revivalism often equates the idea of self-help through extralegal means with traditional family structures, and blames the breakdown of those structures (for example, the rise of the single parent family) for the increase in reliance and dependency on government aid. n165 This recent depiction of the third sphere of civic life works against legal reform precisely because state intervention may support newer, nontraditional social structures. For conservative thinkers, legal reform also risks increasing dependency on social services by groups who have traditionally

been marginalized, including disproportionate reliance on public funds by people of color and single mothers. Indeed, the end of welfare as we knew it, n166 as well as the [*973] transformation of work as we knew it, n167 is closely related to the quest of thinkers from all sides of the political spectrum for a third space that could replace the traditional functions of work and welfare. Strikingly, a range of liberal and conservative visions have thus converged into the same agenda, such as the recent welfare-to-work reforms, which rely on myriad non-governmental institutions and activities to support them. n168 When analyzed from the perspective of the unbundled cooptation critique, it becomes evident that there are multiple limits to the contemporary extralegal current. First, there have been significant problems with resources and zero-sum energies in the recent campaigns promoting community development and welfare. For example, the initial vision of welfare-to-work supported by liberal reformers was a multifaceted, dynamic system that would reshape the roles and responsibilities of the welfare bureaucracy. The Personal Responsibility and Work Opportunity Reconciliation Act of 1996 n169 (PRWORA), supported by President Clinton, was designed to convert various welfare programs, including Aid to Families with Dependent Children, into a single block grant program. The aim was to transform passive cash assistance into a more active welfare system, in which individuals would be better assisted, by both the government and the community, to return to the labor force and find opportunities to support themselves. Yet from the broad vision to actual implementation, the program quickly became limited in focus and in resources. Indeed, PRWORA placed new limits on welfare provision by eliminating eligibility categories and by placing rigid time limits on the provision of benefits. n170 Moreover, the need to frame questions relating to work, welfare, and poverty in institutional arrangements and professional jargon and to comply with various funding block grants has made some issues, such as the statistical reduction of welfare recipients, more salient, whereas other issues, such as the quality of jobs offered, have been largely eliminated from policymakers' consideration. Despite aspects of the reform that were hailed as empowering for those groups they were designed to help, such as individual private training vouchers, serious questions have been raised about the adequacy of the particular [*974] policy design because resources and institutional support have been found lacking. n171 The reforms require individual choices and rely on the ability of private recipients to mine through a vast range of information. As in the areas of child care, health care, and educational vouchers, critics worry that the most disadvantaged workers in the new market will not be able to take advantage of the reforms. n172 Under such conditions, the goal of eliminating poverty may be eroded and replaced by other goals, such as reducing public expenses. Thus, recalling the earlier cooptation critique, once reforms are envisioned, even when they need not be framed in legalistic terms, they in some ways become reduced to a handful of issues, while fragmenting, neglecting, and ultimately neutralizing other possibilities. At this point, the paradox of extralegal activism unfolds. While public interest thinkers increasingly embrace an axiomatic rejection of law as the primary form of progress, their preferred form of activism presents the very risks they seek to avoid. The rejected "myth of the law" is replaced by a "myth of activism" or a "myth of exit," romanticizing a distinct sphere that can better solve social conflict. Yet these myths, like other myths, come complete with their own perpetual perils. The myth of exit exemplifies the myriad concerns of cooptation. For feminist agendas, for example, the separation of the world into distinct spheres of action has been a continuous impediment to meaningful reform. Efforts to create better possibilities for women to balance work and family responsibilities, including relaxing home work rules and supporting stay-at-home parents through federal child care legislation, have been couched in terms of support for individual choice and private decisionmaking. n173 Indeed, recent initiatives in federal child care legislation to support stay-at-home parents have been clouded by preconceptions of the separation of spheres and the need to make one-or-the-other life choices. Most importantly, the emergence of a sphere-oriented discourse abandons a critical perspective that distinguishes between valuing traditional gender-based characteristics and celebrating feminine difference in a universalist and essentialist manner. n174 [*975] Not surprisingly then, some feminist writers have responded to civil society revivalism with great skepticism, arguing that efforts to align feminine values and agendas with classic republican theory of civil society activism should be understood, at least in part, as a way of legitimizing historical social structures that subordinated women. The feminist lesson on the law/exit pendulum reveals a broader pattern. In a classic example of cooptation, activists should be concerned about the infusion (or indeed confusion) of nonlegal strategies with conservative privatization agendas. Indeed, in significant social policy contexts, legal scholarship oriented toward the exploration of extralegal paths reinforces the exact narrative that it originally resisted - that the state cannot and should not be accountable for sustaining and improving the lifeworld of individuals in the twenty-first-century economy and that we must seek alternative ways to bring about social reform. Whether using the terminology of a path-dependent process, an inevitable downward spiral, a transnational prisoner's dilemma, or a global race to the bottom, current analyses often suggest a lack of control over the forces of new economic realities. Rather than countering the story of lack of control, pointing to the ongoing role of government and showing the contradictions between that which is being kept regulated and that which is privatized, alternative extralegal scholarship accepts these developments as natural and inevitable. Similar to the arguments developed in relation to the labor movement - in which focusing on a limited right to collective bargaining demobilized workers and stripped them of their voice, participation, and decisionmaking power - contemporary extralegal agendas are limited to very narrow and patterned sets of reforms. A striking example has been the focus on welfare reform as the single frontier of economic redistribution without a connection being made between these reforms and social services in which the middle class has a strong interest, such as Social Security and Medicare. Similarly, on the legal pluralism frontier, when activists call for more corporate social responsibility, the initial expressions are those of broad demands for sustainable development and overall industry obligations for the social and environmental consequences of their activities. n176 The discourse, however, quickly becomes coopted by a shift to a narrow focus on charitable donations and corporate philanthropy or [*976] private reporting absent an institutionalized compliance structure. n177 Moreover, because of institutional limitations and crowding out effects possible in any type of reform agenda, the focus shifts to the benefits of corporate social responsibility to businesses, as marketing, recruit-ment, public relations, and "greenwashing" strategies. n178 Critics therefore become deeply cynical about the industry's real commitments to ethical conduct. A similar process can be described with regard to the literature on globalization. Globalization scholarship often attempts to produce a unifying narrative and an image of unitary struggle when in fact such unity does not exist. Embodied in the aforementioned irony of a "global anti-globalization" movement, social reform activism that resides under the umbrella of global movements is greatly diverse, some of it highly conservative. An "anti-globalization" movement can be a defensive nationalist movement infused with xenophobia and protective ideologies. n179 In fact, during central instances of collective action, such as those in Seattle, Quebec, Puerto Alegre, and Genoa, competing and conflicting claims were frequently encompassed in the same protest. n180 Nevertheless, there is a tendency to celebrate and idealize these protests as united and world-altering. Similarly, at the local level, grassroots politics often lack a clear agenda and are particularly ripe for cooptation resulting in far lesser achievements than what may have been expected by the groups involved. In a critical introduction to the law and organizing model, Professor Scott Cummings and Ingrid Eagly describe the ways in which new community-based approaches to progressive lawyering privilege grassroots activism over legal reform efforts and the facilitation of community mobilization over conventional lawyering. n181 After carefully unpacking the

ways in which community lawyers embrace [*977] law and organizing, Professor Cummings and Eagly rightfully warn against "exaggerating the ineffectiveness of traditional legal interventions" and "closing off potential avenues for redress." n182 Significantly, the strategies embraced by new public interest lawyers have not been shown to produce effective change in communities, and certainly there has been no assurance that these strategies fare comparatively better than legal reform. Moreover, what are meant to be progressive projects of community action and community economic development frequently can have a hidden effect of excluding worse-off groups, such as migrant workers, because of the geographical scope and zoning restrictions of the project. n183 In the same way that the labor and corporate social responsibility movements have failed because of their embrace of a legal framework, the community economic development movement - so diverse in its ideological appeal yet so prominent since the early 1990s as a major approach to poverty relief - may bring about its own destruction by fracture and diffusion. n184 In all of these cases, it is the act of engagement, not law, that holds the risks of cooptation and the politics of compromise. It is not the particularities of lawyers as a professional group that create dependency. Rather, it is the dynamics between skilled, networked, and resourced components and those who need them that may submerge goals and create reliance. It is not the particularities of the structural limitations of the judiciary that threaten to limit the progressive vision of social movements. Rather, it is the essential difficulties of implementing theory into practice. Life is simply messier than abstract ideals. Cooptation analysis exposes the broad, general risk of assuming ownership over a rhetorical and conceptual framework of a movement for change. Subsequently, when, in practice, other factions in the political debate embrace the language and frame their projects in similar terms, groups experience a sense of loss of control or possession of "their" vision. In sum, in the contemporary context, in the absence of a more programmatic and concrete vision of what alternative models of social reform activism need to achieve, the conclusions and rhetoric of the contemporary critical legal consciousness are appropriated by advocates representing a wide range of political commitments. Understood [*978] from this perspective, cooptation is not the result of the turn to a particular reform strategy. Rather, cooptation occurs when imagined ideals are left unchecked and seemingly progressive rhetoric is reproduced by a conservative agenda. Dominant interpretations such as privatization and market competitiveness come out ahead, whereas other values, such as group empowerment and redistributive justice, receive only symbolic recognition, and in turn serve to facilitate and stabilize the process. n185

Radical politics must engage the state – the alt is right wing take over
Mouffe 10
(What is Radical Politics Today?, Edited by Jonathan Pugh, pg. 235)

It is clear that, once we envisage social reality in terms of 'hegemonic and 'counter-hegemonic' practices, radical politics is not about withdrawing completely from existing institutions. Rather, we have no other choice but to engage with hegemonic practices, in order to challenge them. This is crucial' otherwise we will be faced with a chaotic situation. Moreover, if we do not engage with and challenge the existing order, if we instead choose to simply escape the state completely, we leave the door open for others to take control of systems of authority and regulation. Indeed there are many historical (and not so historical) examples of this. When the Left shows little interest, Right-wing and authoritarian groups are only too happy to take over the state.

The left is failing because of a suspicion of the nation state – we might fight the right at all levels in order to be effective
Grayson and Little 11
(Deborah Grayson and Ben Little 4 August 2011, The far right are the masters of network politics, not the 'internationalist' left, http://www.opendemocracy.net/ourkingdom/deborah-grayson-and-ben-little/far-right-are-masters-of-network-politics-not-internationa)

While Norway mourns and attends to matters of justice, across Europe the left would be wise to pause and reflect upon the mixed responses to the worst case of child murder in northern Europe since the Second World War. We can only hope that Anders Breivik is a lone operator and that we will not see this kind of politically motivated mass murder repeated in the UK or anywhere else, but in showing how right wing ideology is formed and disseminated through increasingly international networks, the Utoya massacre has lessons for us all.
Although globally oriented 'lefties' may like to think this is a contradiction in terms, it is the far right who

are pioneering the way towards a new form of internationalism. This is not to say that they have lost their attachment to the nation – for all that vigilantes like Breivik may think in civilisational or European terms, "small state" nationalism remains the bedrock of their politics. Those that see the blurring of boundaries between European and national perspectives as a sign of incoherence which will diminish the power of these ideological beliefs are mistaken. In an age of network politics it's a strength, and one that the left needs to understand if we are to reverse the electoral successes of the centre-right and the populist rise of the far-right across Europe. So far, the left has struggled to match the way far-right networks have learned to scale seamlessly from the local to the civilisational through the conceptual space of the national. The English Defence League, for example, explain local opposition to their marches as stemming from the malign influence of the SWP's campaign, Unite Against Fascism; cite the welfare state as evidence of leftist domination in national politics; and see in the European Court of Human Rights the imposition of socialist, multicultural values across the entire continent. This sense of multiple scales allows the EDL to create a language that reflects their politics at every level, and to communicate their message across local and national boundaries. They create a unified rhetoric that the left, with their suspicion of the national, cannot replicate.

State Inev

You can't just wish away institutions
McCormack 10

(Tara, Leicester international politics lecturer, Critique, Security and Power: The Political Limits to Emancipatory Approaches, pg 58)

Contemporary critical and emancipatory approaches reject the possibility of reaching an objective evaluation of the world or social reality because they reject the possibility of differentiating between facts and values. For the contemporary critical theorists, theory can only ever be for someone and for some purpose. As this is so then quite logically critical theorists elevate their own values to be the most important aspect of critical theory. As a result of the rejection of the fact/value distinction we see within the work of contemporary critical theorists a **highly unreflective certainty** about the power of their moral position. Critical theorists argue that all theory is normative, they offer in its place better norms: ones, as we have seen, that will lead to emancipation and will help the marginalised. The claims made for the central role of the values of the theorist reveal the theoretical limits of critical and emancipatory theory today. Yet even good or critical theory has no agency, and **only political action** can lead to change. Theory does of course play an important role in political change. This must be the first step towards a critical engagement with contemporary power structures and discourses. In this sense, we can see that it is critical theory that really has the potential to solve problems, unlike problem-solving theory which seeks only to ensure the smooth functioning of the existing order. Through substantive analysis the critical theorist can transcend the narrow and conservative boundaries of problem-solving theory by explaining how the problematic arises. Unlike problem-solving theory, critical theory makes claims to be able to explain why and how the social world functions as it does, it can go beyond the 'given framework for action'. The critical theorist **must** therefore be able to **differentiate between facts** (or social reality) **and values**, this ability is what marks the critical theorist apart from the traditional or problem-solving theorists, who cannot, because of their values and commitment to the existing social world, go beyond the 'given framework for action'. If we cannot differentiate between our desires or values or norms (or our perspective, to put it in Cox's terms) and actually occurring social and political and historical processes and relationships, it is hard to see how we can have a critical perspective (Jahn, 1998: 614). Rather, through abolishing this division we can no longer draw the line between what we would like and everything else, and thereby contemporary critical theories are as much of a dogma as problem-solving theories. Contemporary critical theorists are like **modern-day alchemists, believing** that **they can transform the base metal of the unjust international order into a golden realm of equality and justice through their own words.** For contemporary critical theorists, all that seems that the crucial step towards progress to a better world order is for the theorist to state that their theory is for the purposes of emancipation and a just world order.

Expertism Good

Expertism means our epistemology is sound – the alternative devolves into stereotypes and biases that collapses epistemology and turns the kritik
Snjezana 10

(Faculty of Humanities and Social Sciences "Trusting Experts: Trust, Testimony, and Evidence". Received: 2010-02-19. Original scientific article. University of Rijeka, Faculty of Humanities and Social Sciences, Omladinska 14, 51000, Scholar)

Let us define expertism as being a position that is composed of three statements: (i) experts exist; (ii) we should ascribe a distinctive testimonial status to experts due their exceptional expertise; (iii) therefore, we have the epistemic right to trust experts without evidence. Expertism is a genuine anti-evidentialist position with regards to trusting experts. 1. Experts exist. While it is rather plausible that there are experts in science because they deal with facts, the existence of moral or aesthetic experts, who deal with values, is generally much more problematic. For instance, Milton Friedman holds that differences in values are differences caused by people's tastes which are more or less hardwired, undebatable and unchangeable (Friedman, 1984). Logical positivists believe that value judgments are "nonsense" and cannot be a matter of expertise because they are not verifiable. Many people think that most people have reasonable ethical competence and that philosophers (who are the prime candidates for moral experts) are inclined to the same self-serving rationalizations as other people. However, the untouchable status of experts in science can be disputed. From Kant, Kuhn, Quine to Goodman and Putnam, we are aware of an intelligible objection that theoretical hypotheses involve a theory laden, cognitively biased, socially manipulated and subjective interpretation of the world (Goldman, 1999). Also, in science as well as in ethics and aesthetics there are battles between experts who propose opposite theories. In spite of the fact that claiming the first thesis is not without its difficulties, I will assume that it is correct: there are people who are objective (not only reputational) experts. These objective experts are people who, in comparison with other people, are more effective in problem solving. When compared with other people, they are better guides to the truth or better in recognizing a false statement as false, and a true one as true. While the views of ordinary people are typically an ill sorted mass of material derived from experience and tradition which contains inconsistencies and tensions, skilled experts can detect inconsistencies, fallacious inferences, unwarranted generalizations and false premises. In contrast to the average person in ordinary epistemic circumstances, they possess knowledge about the appropriate methods of research and argumentation, more systematized information derived from long term experience of dealing with difficulties, distinctions, critics, and alternative conceptions. They are generally better trained to deal with epistemic, moral or aesthetic issues. Or, we can say like Aristotle that it is reasonable to suppose that none of them can miss the target totally, and that each has gotten something or even a lot of things right. 2. Distinctive testimonial status. In expertism, it is claimed that an expert's testimony requires considerable epistemic deference. I can see at least three reasons why would one ascribe a distinctive testimonial status to experts: (i) standing practice about an expert's reliability; (ii) insufficiency of evidence; (iii) epistemic dependence. Firstly, it could be seen that we have an epistemic right to treat an expert's knowledge and sincerity with the utmost credulity because there is a standing practice, social climate or ongoing policy that considers experts to be the most reliable sources of knowledge or that they are fundamental testimonial authorities in society (Pappas, 2000). By assuming such credentials about experts, it could be seen that a hearer may believe what an expert says without assessment, evaluation or additional evidence. Secondly, many philosophers hold that our evidence in favour of other people's testimonies is principally insufficient (Beanblossom, Lehrer, 1970; Coady, 1981; Webb, 1993; Foley, 1994). If it is true, our evidence in favour of an expert's testimony is even more insufficient: when a layperson relies on an expert, that reliance is necessary blind (Hardwig, 1991). 3 We, as non-experts in a domain, cannot ever possess enough evidence to evaluate an experts' testimony as credible or non credible. An ordinary cognizer in ordinary epistemic circumstances does not possess, or even can never attain, a high enough level of expertise to evaluate the testimonies of experts. We simply do not have enough knowledge and experience in order to be capable of assessing the truth of an expert's testimony or an expert's reliability. Since our reasons for the acceptance of the content of an expert's report – by definition of them being experts and us as non-experts – cannot be the reasons the experts possess, our evidence about an experts' report cannot be ever sufficient for the justified acceptance of her testimony. If we are not experts in a domain, the relevant defeaters (undefeated defeaters) or certain kinds of experiences, doubts and beliefs that can undermine justified trust simply are not present to us. So, it could be seen that we have no choice other than to blindly trust experts. Thirdly, we are deeply

aware of our epistemic dependence on the testimonies of experts. Without other people testimonies "we should have to confess to knowing pitifully little" (Dummet, 1993, 420). But without expert testimonies our knowledge about biology, physics, medicine, geography of the world, history would be devastated. The majority of our beliefs about nature and society that we acquired throughout our lives are based, finally, on what experts 'tell' us (see also in Beanblossom, Lehrer, 1970; Faulkner, 2002). Our judgments of value will be a mass of inconsistent intuitions, prejudices and stereotypes derived from our subjective and partial interests, understandings of tradition, our temper etc. Behind the majority of testimonies lies extensive research and reports by experts and without these basic experts' testimonies "our lives would be impoverished in startling and debilitating ways" (Lackey, 2006, 1). So, it could be said that such an epistemic dependence on experts entails blind trust as a precondition of the functioning of our reason.

Multiple Methods Good

Methodologies are always imperfect – endorsing multiple epistemological frameworks can correct the blindspots of each

Stern and Druckman 00

(Paul, National Research Council and Daniel, Institute for Conflict Analysis and Resolution – George Mason University, International Studies Review, Spring, p. 62-63)

Using several distinct research approaches or sources of information in conjunction is a valuable strategy for developing generic knowledge. This strategy is particularly useful for meeting the challenges of measurement and inference. The nature of historical phenomena makes controlled experimentation—the analytic technique best suited to making strong inferences about causes and effects—practically impossible with real-life situations. Making inferences requires using experimentation in simulated conditions and various other methods, each of which has its own advantages and limitations, but none of which can alone provide the level of certainty desired about what works and under what conditions. We conclude that debates between advocates of different research methods (for example, the quantitative-qualitative debate) are unproductive except in the context of a search for ways in which different methods can complement each other. Because there is no single best way to develop knowledge, the search for generic knowledge about international conflict resolution should adopt an epistemological strategy of triangulation, sometimes called "critical multiplism."53 That is, it should use multiple perspectives, sources of data, constructs, interpretive frameworks, and modes of analysis to address specific questions on the presumption that research approaches that rely on certain perspectives can act as partial correctives for the limitations of approaches that rely on different ones. An underlying assumption is that robust findings (those that hold across studies that vary along several dimensions) engender more confidence than replicated findings (a traditional scientific ideal, but not practicable in international relations research outside the laboratory). When different data sources or methods converge on a single answer, one can have increased confidence in the result. When they do not converge, one can interpret and take into account the known biases in each research approach. A continuing critical dialogue among analysts using different perspectives, methods, and data could lead to an understanding that better approximates international relations than the results coming from any single study, method, or data source.

AT Prior Questions Generic

No prior questions- scholarly orientations cause gridlock
Owen 2

(David, Southampton political theory reader, "Re-orienting International Relations: On Pragmatism, Pluralism and Practical Reasoning", Millennium 31.3, SAGE)

Commenting on the 'philosophical turn' in IR, Wæver remarks that '[a] frenzy for words like "epistemology" and "ontology" often signals this philosophical turn', although he goes on to comment that these terms are often used loosely.4 However, loosely deployed or not, it is clear that debates concerning ontology and epistemology play a central role in the contemporary IR theory wars. In one respect, this is unsurprising since it is a characteristic feature of the social sciences that periods of disciplinary disorientation involve recourse to reflection on the philosophical commitments of different theoretical approaches, and there is no doubt that such reflection can play a valuable role in making explicit the commitments that characterise (and help individuate) diverse theoretical positions. Yet, such a philosophical turn is not without its dangers and I will briefly mention three before turning to consider a confusion that has, I will suggest, helped to promote the IR theory wars by motivating this philosophical turn. The first danger with the philosophical turn is that it has an inbuilt tendency to prioritise issues of ontology and epistemology over explanatory and/or interpretive power as if the latter two were merely a simple function of the former. But while the explanatory and/or interpretive power of a theoretical account is not wholly independent of its ontological and/or epistemological commitments (otherwise criticism of these features would not be a criticism that had any value), it is by no means clear that it is, in contrast, wholly dependent on these philosophical commitments. Thus, for example, one need not be sympathetic to rational choice theory to recognise that it can provide powerful accounts of certain kinds of problems, such as the tragedy of the commons in which dilemmas of collective action are foregrounded. It may, of course, be the case that the advocates of rational choice theory cannot give a good account of why this type of theory is powerful in accounting for this class of problems (i.e., how it is that the relevant actors come to exhibit features in these circumstances that approximate the assumptions of rational choice theory) and, if this is the case, it is a philosophical weakness—but this does not undermine the point that, for a certain class of problems, rational choice theory may provide the best account available to us. In other words, while the critical judgement of theoretical accounts in terms of their ontological and/or epistemological sophistication is one kind of critical judgement, it is not the only or even necessarily the most important kind. The second danger run by the philosophical turn is that because prioritisation of ontology and epistemology promotes theory-construction from philosophical first principles, it cultivates a theory-driven rather than problem-driven approach to IR. Paraphrasing Ian Shapiro, the point can be put like this: since it is the case that there is always a plurality of possible true descriptions of a given action, event or phenomenon, the challenge is to decide which is the most apt in terms of getting a perspicuous grip on the action, event or phenomenon in question given the purposes of the inquiry; yet, from this standpoint, 'theory-driven work is part of a reductionist program' in that it 'dictates always opting for the description that calls for the explanation that flows from the preferred model or theory'.5 The justification offered for this strategy rests on the mistaken belief that it is necessary for social science because general explanations are required to characterise the classes of phenomena studied in similar terms. However, as Shapiro points out, this is to misunderstand the enterprise of science since 'whether there are general explanations for classes of phenomena is a question for social-scientific inquiry, not to be prejudged before conducting that inquiry'.6 Moreover, this strategy easily slips into the promotion of the pursuit of generality over that of empirical validity. The third danger is that the preceding two combine to encourage the formation of a particular image of disciplinary debate in IR—what might be called (only slightly tongue in cheek) 'the Highlander view'—namely, an image of warring theoretical approaches with each, despite occasional temporary tactical alliances, dedicated to the strategic achievement of sovereignty over the disciplinary field. It encourages this view because the turn to, and prioritisation of, ontology and epistemology stimulates the idea that there can only be one theoretical approach which

gets things right, namely, the theoretical approach that gets its ontology and epistemology right. This image feeds back into IR exacerbating the first and second dangers, and so a potentially vicious circle arises.

Prior questions will never be fully settled---must take action even under conditions of uncertainty
Cochran '99

(Molly, Assistant Professor of International Affairs at Georgia Institute for Technology, "Normative Theory in International Relations", 1999, pg. 272)

To conclude this chapter, while modernist and postmodernist debates continue, while we are still unsure as to what we can legitimately identify as a feminist ethical/political concern, while we still are unclear about the relationship between discourse and experience, it is particularly important for feminists that we proceed with analysis of both the material (institutional and structural) as well as the discursive. This holds not only for feminists, but for all theorists oriented towards the goal of extending further moral inclusion in the present social sciences climate of epistemological uncertainty. Important ethical/political concerns hang in the balance. We cannot afford to wait for the meta-theoretical questions to be conclusively answered. Those answers may be unavailable. Nor can we wait for a credible vision of an alternative institutional order to appear before an emancipatory agenda can be kicked into gear. Nor do we have before us a chicken and egg question of which comes first: sorting out the metatheoretical issues or working out which practices contribute to a credible institutional vision. The two questions can and should be pursued together, and can be via moral imagination. Imagination can help us think beyond discursive and material conditions which limit us, by pushing the boundaries of those limitations in thought and examining what yields. In this respect, I believe international ethics as pragmatic critique can be a useful ally to feminist and normative theorists generally.

AT Discourse First

Discourse fails
Schwartz, 9

(Joseph, Poli Sci Prof @ Temple, "The Future of Democratic Equality," Routledge, pg 64-5)

'Discursive' performance is not the sole manner by which individuals deal with (and express) the material and cultural structural realities that both empower and constrain individuals. For example. **individuals cannot readily "discursively perform" themselves out of their socio-economic or class position.** There is a certain materiality to poverty or to being "bossed" that can't simply be "ironically" and "performatively" transformed. Class relations are structural, as well as discursive. The greater difficulty in forming unions in the United States- as compared to other advanced industrial democracies- has much to do with American legal, ideological, and political constraints and not simply with the rel- ative inefficacy of the "performative," "counter-hegemonic" behavior of (frag- mented) individuals. Even the "parodic" possibilities of "gender" reversal are constrained by the communities in which one resides. **Is the "reversal" of "drag" a viable public possibility in a violently homophobic community?** Were not the "performative" options of a Matthew Sheperd (extremely) more limited than those of a gay or lesbian student at a "progressive" residential liberal arts college (and unsafe-and even degrading and violent-social spaces confront gay and lesbian people and women and students of color in the most allegedly "cosmopolitan" of social spaces). Simply put, **distinct "social spaces" set differ- ential constraints on "performative" choices.** Of course, how individuals express class, race, gender, and sexuality does, in part, involve how we "perform" (or "racist") cultural and discursive "norms." Hence, the inevitable controversies over "authenticity" within racial, sexual, and ethnic communities, as well as criticism of people taking on the mores of a class different from those who share their "place" in the labor process, neighborhood, or income strata. But there are material constraints to **performative "choice": one can't "perform" one's way out of an under-funded inner city school** or out of being a **laid-off auto worker with dim prospects of finding a new job with comparable wages and benefits.** Traditional sociological theories of **"structuration"** provide **greater insight into how these individuals would deal with these social dilemmas** than do **micro-level theories of the discursive construction of subjectivity.** To her credit, Wendy Brown is more concerned with issues of class and political economy than are many post-structuralist political theorists. She expressly claims to bring class back into her political analysis and condemns identity poli- tics as a "phantasmagorical reflection of the 'middle-class' American dream." But there is little attention in her work to developing a political strategy that could promise a structural and material redistribution of power, rather than an alter- ation of how we think of epistemology, discourse, and politics." While ideology and culture play a relatively autonomous role in constituting subjectivity, both have a material structure that must be altered if society is to be democratized. Brown implies that radical social change does not as much involve democratiz- ing social structural relations as it does popularizing a radical epistemological approach to discourse. Brown argues that if we will ourselves to "surrender epis- temological foundations" and give up "specifically moral claims" we will all be able to engage in "the sheerly political: 'wars of position' and amoral contests about the just and good in which truth is always grasped as coterminous with power, as always already power, as the voice of power."""' Even if one resists asking whether democracy can rest on "amoral" principles, one can still ask whether Brown's Foucauldian assertation that power and truth are co-terminous can distinguish between more or less democratic forms of power? The post-structuralist hyper- emphasis on "discourse" and the agonal construction of the self also **overly devalues the state as an arena for political reform.** Brown's work makes a positive political contribution by warning social movements about fetishizing the struggle for group rights within the law as potential minefields of "reversed" power/knowledge formations. State regulation and technocratic control which claim to defend the interests of newly, legally- recognized identities may yield the perverse consequence of "domesticating" the identity of the insurgent social group (e.g. state micro-management of the work place in "comparable worth legislation," or enforcement of patriarchal values in regard to punitive workfare or "child support" regulation)?" Sometimes, as Brown contends, new-found rights may enhance separation and alienation between and within individuals and groups, as well as constitute new forms of state regulation in the name of the impersonal subject. But Brown rejects the possibility (and historical reality) that new "rights" can, in other contexts, con- tribute to human emancipation by enhancing individual choice and freedom. To deny this is to ignore the elective affinity between the struggle for "rights" and struggles to achieve political equality for formerly subordinate peoples. Not all new-found rights are "co-optative" and a "reinscribing of domination.""7 Nor will the conflict within the American polity over how we should interpret and defend "rights" ever cease. One only has to witness contemporary political con- conflict over "abortion rights," "voting rights," "gun rights," etc. Rights are both politically contested and protective of certain forms of human choice and agency. **Rights do not "fix" identities** as intransigently as Brown and other post-structuralists claim. Do rights only serve, as Brown contends, to

promote "the discursive denial of historically layered and institutionally secured bounds, by denying with words the effects of relatively wordless, politically invisible, yet material constraints"?"" Patri- cia Williams and other critical race theorists have argued that being included under the state's equal protection law helped limit violence against people of color." Despite legitimate fears about excessive state regulation of sexuality, would Brown reject the use of state force to limit domestic violence? How does her philosophical fear of the bureaucratic-regulatory powers of the state speak to the experience of hundreds of thousands of women who have been spared the "privatization" of domestic violence by the extension of the rights of state author- ity (e.g. the police) to act against violence within the household? Are such prac- tices solely evidence of the "reconstruction of domination by the regulation of the technocratic-bureaucratic state"? Of course, state regulation of domestic violence may, in Brown's language, produce a female subject "dependent upon the pater- nal state" for protection. But is this not preferable to the prior form of paternal state that let a man be the violent definer of "rights" in his home?

AT Individual Ethics First

Individual ethical orientations aren't effective – it's more productive to rearticulate systems from the inside
Pugh 10

(Jonathan, Newcastle Postcolonial Geographer, "The Stakes of Radical Politics have Changed: Post-crisis, Relevance and the State", Globalizations, March-June, ebsco)

In this polemical piece I have just been talking about how, following an ethos of radicalism as withdrawal from the state, some from the radical Left were incapable of being able to respond to the new stakes of radical politics. In particular, they were not found at the state, where the passive public turned to resolve the crisis. I will now go on to examine how in recent years significant parts of the radical Left have also tended to prioritise raising awareness of our ethical responsibilities, over capturing state power. I am going to say that it is important to create this awareness. However, in an effort to draw attention to the stakes of politics as we find them now, post-2008, I will also point out that we should not place too much faith in this approach alone. Against the backdrop of what I have just been saying, it is important to remember that while much attention is focused upon President Obama, in many other parts of the world the Right and fundamentalism are gaining strength through capturing state power. The perception that the USA has changed is accompanied by a sense of relief among many radicals. However, the European Elections of 2009, the largest trans-national vote in history, heralded a continent-wide shift to the Right (and far Right) in many places—in Austria, Belgium, Bulgaria, Cyprus, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Italy, Estonia, Lithuania, Luxembourg, Poland, Portgual, Slovenia, Spain, Romania, as just some examples (Wall Street Journal, 2009). Despite Obama's election and a near depression, neo-liberalism continues to be implemented through a world spanning apparatus of governmental and intergovernmental organisations, think tanks and trans-national corporations (Massey, 2009; Castree, 2009). The power of the Right in countries like Iran, while checked, remains unchallenged by the Left. Albertazzi et al. (2009) draw attention to how a disconnected Left is leaving power in the hands of the Right in many other countries nationally, like Italy for example. Reflecting upon contemporary radical politics, the British Labour politician Clare Short (2009, p. 67) concludes: In the fog of the future, I see a rise of fascistic movements . . . I am afraid it will all get nastier before we see a rise in generous, radical politics, but I suspect that history is about to speed up in front of our eyes and all who oppose the radicalisation of fear, ethnic hatred, racialism and division have to be ready to create a new movement that contains the solutions to the monumental historical problems we currently face. So, the stakes of politics are clear. The Right is on the rise. Neo-liberal ideology is still dominant. How is the Left responding to these stakes? I have already discussed how some from the radical Left are placing too much faith in civil society organisations that seek to withdraw from the state. I will now turn to how others have too much faith in the power of raising awareness of our ethical responsibilities. Post-crisis, the increasing popularity of David Chandler's (2004, 2007, 2009a, 2009b) work reflects the sense that radicals too often celebrate the ethical individual as a radical force, at the expense of wider representational programmes for change His central argument is that this leaves radicals impotent. Chandler (2009a, p. 78–79) says that many radicals argue that there is nothing passive or conservative about radical political activist protests, such as the 2003 anti-war march, anti-capitalism and anti-globalisation protests, the huge march to Make Poverty History at the end of 2005, involvement in the World Social Forums or the radical jihad of Al-Qaeda. I disagree; these new forms of protest are highly individualised and personal ones— there is no attempt to build a social or collective movement It appears that theatrical suicide, demonstrating, badge and bracelet wearing are ethical acts in themselves: personal statements of awareness, rather than attempts to engage politically with society. In one way, Chandler's reflective insight here is not particularly unique. Many others also seem to think that radicals today are too isolated and disengaged (Martin, 2009).5 Neither is it particularly original to say that there is too much emphasis upon creativity and spontaneity (what Richard Sennett, 2004, calls 'social jazz'), and not enough upon representational politics. Indeed, go to many radical blogs and you find radicals themselves constantly complaining about how it has become too easy to sign up to ethical web petitions, email complaints, join a variety of ethical causes, without actually developing the political programmes themselves that matter. So it is not Chandler's point about radicals being disengaged from instrumental politics that concerns me here. It is his related point—that there has been a flight into ethics, away from political accountability and responsibility that I find intriguing. Personal statements of ethical awareness have become particularly important within radical politics today. It is therefore interesting to note, as I will now discuss, that we have been here before. In his earlier writings Karl Marx (1982) criticised the German Idealists for retreating into ethics, instead of seizing the institutions of power that mattered for themselves. Unwilling to express their self-interests politically through capturing power, the Idealists would rather make statements about their ethical awareness. Such idealism, along with an unwillingness to be held accountable for political power, often goes hand in hand. For Marx, it is necessary to feel the weight, but also the responsibility of power. Chandler argues that, just as when the early Marx critiqued German Idealism, we should now be drawing attention to the pitfalls of the flights to ethics today. He says: In the case of the German bourgeoisie, Marx concludes that it is their weakness and fragmentation, squeezed between the remnants of the ancien re´gime and the developing industrial proletariat, which explains their ideological flight into values. Rather than take on political responsibility for overthrowing the old order, the German bourgeoisie denied their specific interests and idealised progress in the otherworldly terms of abstract philosophy, recoiling from the consequences of their liberal aspirations in practice. (Chandler, 2007, p. 717) Today we are witnessing a renewed interest in ethics (Lai¨di, 1998; Badiou, 2002). Fragmented, many radicals retreat into abstract ethical slogans like 'another world is possible', 'global human rights', or 'making poverty history'. As discussed above, we are also of course seeing the return of Kant's cosmopolitanism. While I think we should not attack the ethical turn for its values, as many of these around environmental issues and human rights are admirable, it is equally important to say that the turn to ethics seems to reflect a certain lack of willingness to seize power and be held accountable to it. For the flight to ethics, as it often plays out in radical politics today, seems to be accompanied by scepticism toward representational politics. Continuing with this theme for a moment, Slavoj Zizek (2008) also sheds some more light upon why ethics (when compared to representational politics) has become so important to the Left in recent years. He says that many of us (he is of course writing for the Left) feel that we are

<u>unable to make a real difference</u> through representational politics on a larger scale, when it comes to the big political problems of life. Zizek (2008, p. 453) talks of this feeling that 'we cannot ever predict the consequences of our acts'; that nothing we do will 'guarantee that the overall outcome of our interactions will be satisfactory'. And he is right to make this point. Today, our geographical imaginations are dominated by a broader sense of chaos and Global Complexity (Urry, 2003; Stengers, 2005). These ways of thinking, deep in the psyche of many radicals on the Left may be one other reason why so many have retreated into ethics. When we do not really believe that we can change the world through developing fine detailed instruments, capturing the state, or predictive models, we are naturally more hesitant. It is better to try and raise ethical awareness instead. Whereas in the past power was something to be won and treasured, something radicals could use to implement a collective ideology, today, with the risk posed by representation in fragmented societies, top-down power

often becomes a hazard, even an embarrassment, for many on the Left (Laïdi, 1998). This is, as I have already discussed, where the Right and neo-liberal ideologues are seizing the opportunity of the moment. <u>Putting what I have just said another way, there is a need to be clear, perhaps more so in these interdisciplinary times—ethics and politics (particularly representational politics) are different</u>. Of course they are related. You cannot do politics without an ethical perspective. **But my point here is that ==the Right== and neo-liberal ideologues ==will not== simply ==go away if the Left adopt== or raise ==awareness of alternative ethical== lifestyles**. <u>The Right are willing to capture state power, particularly at this time when the state is increasingl</u>y powerful. When we compare the concerted political programme of neo-liberalism, first developed by Reagan, Thatcher, the IMF, the World Bank, NATO, multi-national banks, and the G20, as just some of many examples, ethical individuals across the world offer some counter-resistance. <u>But the 2008 crisis, and the response of protests like the Alternative G20, demonstrated how weak ethical resistance is in the face of the institutions of the neo-liberal economy. Another reason for this is because the ethical individual contributes so much to neo-liberal societies themselves.</u> To explain how, we must briefly step back. The new social movements of previous decades have, in general, been effectively recuperated by the existing system of capital, by satisfying them in a way that neutralised their subversive potential. This is how capital has maintained its hegemonic position in post-Fordist societies. Luc Boltanski and Eve Chiapello (2005) explain how capitalists have worked with, rather than against, the characteristics of new social movements. <u>They say the new social movements desire for autonomy, the ideal of self-management, the anti-hierarchical exigency, and the search for authenticity, were important in developing post-Fordism</u>. These replaced the hierarchical framework of the Fordist period with new forms of networked control. And so, in this way, we see that the relationship between new social movements and capital has been productive. In turn, and this is the important point I want to make about the present moment, clearly the stakes of radical politics have now changed once more. As discussed earlier, it would now seem that post-Fordist society is actually more hierarchical and controllable than many previously thought. <u>Without the neoliberal state, and the public's subordination to its actions, it would not now exist in anything like its present form. ==Our subordination to the state has stopped a post-crisis implosion of neo-liberalism. And this is of course where one of the central characteristics of the ethical individual has== been so productive. Endemic individualism, so dominant in liberal societies, has been recuperated by the ethical individual who is unwilling to seize the state.</u> **So ==the salient point here is== that the ==ethical individual is reflective of the conservative forces in society today.==**

AT Epist First

Causes endless paradigm wars

<u>Wendt</u>, professor of international security – Ohio State University, **'98**

(Alexander, "On Constitution and Causation in International Relations," British International Studies Association)

As a community, we in the academic study of international politics spend too much time worrying about the kind of issues addressed in this essay. <u>The **central point** of IR scholarship is to increase our knowledge of how the world works, not to worry about how</u> (or whether) <u>we can know how the world works</u>. What matters for IR is ontology, not epistemology. This doesn't mean that there are no interesting epistemological questions in IR, and even less does it mean that there are no important political or sociological aspects to those questions. Indeed there are, as I have suggested above, and as a discipline IR should have more awareness of these aspects. At the same time, however, these are questions best addressed by philosophers and sociologists of knowledge, not political scientists. <u>Let's face it: most IR scholars</u>, including this one, <u>have little or no proper training in epistemology,</u> <u>and</u> as such ==the attempt to solve epistemological problems== anyway ==will **inevitably lead to confusion**== (after all, **after 2000 years, even** the **specialists are still having a hard time**). Moreover, <u>as long as we let our research be driven in an open-minded fashion by substantive questions and problems rather than by epistemologies and methods, there is little need to answer epistemological questions</u> either. <u>It is simply not the case that we have to undertake an epistemological analysis of how we can know something before we can know it, a fact amply attested to by the success of the natural sciences, whose practitioners are only rarely forced by the results of their inquiries to consider epistemological questions.</u> ==In important respects we do know how international politics works, and it doesn't much matter how we came to that knowledge==. In that light, <u>going into the epistemology business will distract us from the real business of IR, which is international politics.</u> **Our great ==debates should be about== first-order issues of ==substance==**, like the 'first debate' between Realists and Idealists, **==not== second-order issues of ==method==.**

Unfortunately, it is no longer a simple matter for IR scholars to 'just say no' to ==epistemological discourse==. The problem is that this discourse ==has== already ==contaminated our thinking== about international politics, ==helping to polarize the discipline into '**paradigm wars**'==. Although the resurgence of these wars in the 1980s and 90s is due in large part to the rise of post-positivism, its roots lie in the epistemological anxiety of positivists, who since the 1950s have been very concerned to establish the authority of their work as Science. This is an important goal, one that I share, but its implementation has been marred by an overly narrow conception of science as being concerned only with causal questions that can be answered using the methods of natural science. The effect has been to marginalize historical and interpretive work that does not fit this mould, and to encourage scholars interested in that kind of work to see themselves as somehow not engaged in science. One has to wonder whether the two sides should be happy with the result. Do positivists really mean to suggest that it is not part of science to ask questions about how things are constituted, questions which if those things happen to be made of ideas might only be answerable by interpretive methods? If so, then they seem to be saying that the double-helix model of DNA, and perhaps much of rational choice theory, is not science. And ==do post-positivists== <u>really</u> mean to ==suggest that students== of social life ==should not ask causal questions or== attempt to ==test==

<u>their claims</u> against empirical evidence? <mark>If so, then it is **not clear by what criteria their work should be judged, or how it differs from art or revelation**</mark>. On both sides, in other words, the result of <u>the</u> Third Debate's **sparring over epistemology is often one-sided, intolerant caricatures** of science.

AT Ontology First

Questions of ontology shut down pragmatic political action – we never move past ontological "priming" to practiced material struggle
Barnett, Geography Prof at Open, 8

(Political affects in public space: normative blind-spots in non-representational ontologies, Transactions of the Institute of British Geographers, Volume 33, Issue 2)

Thrift's spatial politics of affect and Connolly's neuropolitics of media affects sits, therefore, in a much broader range of work that is concerned with affective aspects of political life. But the examples noted above all focus on the affective aspects of life without adopting a vocabulary of ontological layers, levels and priority. This is in contrast to the characteristic ontologisation of affect in human geography. The ==ontologisation== of affect ==as a layer of preconscious 'priming to act'== ==reduces embodied action== simply ==to the dimension of being attuned to== and coping with ==the world.== **This elides the aspect of embodied knowing that involves** the ==capacity to take part== in 'games of giving and asking for reasons'. While the ==ontologisation== of theory in human geography ==has been accompanied by claims to transform== and reconfigure understandings of what counts as '==the political', this== project ==has been articulated in a register which== ==eschews the conventions of justification==, that is, the giving and asking for reasons. This is particularly evident when it comes to accounting for why the contemporary deployment of affective energy in the public realm is bad for democracy. The contemporary deployment of anxious, obsessive and compulsive affect in the political realm is presented as having 'deleterious consequences' on the grounds that it ==works against democratic expression== (Thrift 2007, 253); ==contributes to== a style of ==democracy that is **consumed but not practised**== (2007, 248); ==promotes== forms of ==sporadic engagement that can be switched on and off== (2007, 240); ==and generally leads to certain dispositions being placed beyond question==. There is certainly a vision of democracy as a particular type of engaged ethical practice at work in these occasional judgements (2007, 14), but the precise normative force of this view is not justified in any detail. The ==eschewing of justification arises== in part ==because the content of these ontologies, which emphasise various layers of knowing== that kick-in prior to representation, ==is projected directly onto the form of exposition.== **There is a particular type of authority put into play** in this move. ==The== avowedly ==antiintentionalist materialism== associated with contemporary cultural-theoretic ontologies of affect **==closes down the conceptual space in which argument and disagreement can even get off the ground==** (see Leys 2007). In contrast, and as outlined above, the argument pursued here follows an avowedly 'nonrepresentationalist' perspective according to which assertions of knowledge, including the types of knowledge asserted by ontologies of affect, always stand in need of reasons, precisely because they emerge as reasons for certain sorts of commitments and entitlements (Brandom 1996, 167). On this understanding ontological assertions act as justifications, and are subject to the demand for justification. If 'placing things in the space of reasons' (McDowell 1994, 5) in this sense is not acknowledged as one aspect of practice, then **==recourse to the ontological register closes down the inconclusive conversations upon which democratic== cultural ==politics depends==** (Rorty 2006).

Ontology doesn't come first: ontological unity is a mirage and judging the impacts of our actions is key to environmental ethics, and human survival
Norton 96

(Professor of Philosophy at the Georgia Institute of Technology

Bryan, "Environmental Pragmatism," Edited by Light and Katz, pg. 106)

Thus ends my explanation of, and please for, a practical environmental ethic that seeks to integrate pluralistic principles across multiple levels/dynamics. **==Rather than reducing==** pluralistic **==principles by relating them to== an underlying ==value==** theory **==that recognizes only==** economic preferences or "inherent" value as the ==**ontological**== stuff that unifies all moral **==judgments. I have sought integration of multiple values== on** three irreducible scales of **human concern** and valuation, choosing **pluralism**

over monism, **and attempting to integrate values within an ecologically informed, multi-scalar model of the human habitat**. I believe that **the non-ontological**, pluralistic **approach** to values **can better express** the inductively based **values and management** approach of Leopold's land ethic, which can be seen as a precursor to the tradition of adaptive management. And, if the problem of environmentalism is the need to support rationally the goals of environmental protection – the problem Callicott misconceived as the need for a realist moral ontology to establish the "objectivity" of environmental goals – then I endorse the broadly Darwinian approach to both epistemology and morals proposed by the American pragmatists. **The environmental community is the community of inquirers**; it is the community of inquirers that, for better or worse, must struggle, immediately as individuals and indefinitely as a community, both to survive and to know. In this struggle useful knowledge will be information about how to survive in a rapidly evolving culture and habitat. It is in this sense that human actors are a part of multi-layered nature; our actions have impacts on multiple dynamics and multiple scales. **We humans will understand our moral responsibilities only if we understand** the **consequences of our action** as they unfold on multiple scales; **and the human community will only survive** to further evolve and adapt **if we learn to achieve individual welfare** and justice in the present in ways **that are less disruptive of the processes**, evolving on larger spatio-temporal scales, **essential to human and ecological communities**.

AT Predictions Bad

The aff's investigation of scenerios is good - even if its low probability it sharpens political science analysis and allows us to test theories

Mahnken and Junio 13

(2013, Thomas, PhD, Jerome E. Levy Chair of Economic Geography and National Security at the U.S. Naval War College and a Visiting Scholar at the Philip Merrill Center for Strategic Studies at The Johns Hopkins University's Paul H. Nitze School of Advanced International Studies, and Timothy, Predoctoral Fellow, Center for International Security and Cooperation, Stanford University, PhD in Political Science expected 2013, "Conceiving of Future War: The Promise of Scenario Analysis for International Relations," International Studies Review Volume 15, Issue 3, pages 374–395, September 2013)

This article introduces political scientists to scenarios—future counterfactuals—and demonstrates their value in tandem with other methodologies and across a wide range of research questions. The authors describe best practices regarding the scenario method and argue that scenarios contribute to theory building and development, identifying new hypotheses, analyzing data-poor research topics, articulating "world views," setting new research agendas, avoiding cognitive biases, and teaching. The article also establishes the low rate at which scenarios are used in the international relations subfield and situates scenarios in the broader context of political science methods. The conclusion offers two detailed examples of the effective use of scenarios. In his classic work on scenario analysis, The Art of the Long View, Peter Schwartz commented that "social scientists often have a hard time [building scenarios]; they have been trained to stay away from 'what if?' questions and concentrate on 'what was?'" (Schwartz 1996:31). While Schwartz's comments were impressionistic based on his years of conducting and teaching scenario analysis, his claim withstands empirical scrutiny. Scenarios—counterfactual narratives about the future—are woefully underutilized among political scientists. The method is almost never taught on graduate student syllabi, and a survey of leading international relations (IR) journals indicates that scenarios were used in only 302 of 18,764 sampled articles. The low rate at which political scientists use scenarios—less than 2% of the time—is surprising; the method is popular in fields as disparate as business, demographics, ecology, pharmacology, public health, economics, and epidemiology (Venable, Li, Ginter, and Duncan 1993; Leufkens, Haaijer-Ruskamp, Bakker, and Dukes 1994; Baker, Hulse, Gregory, White, Van Sickle, Berger, Dole, and Schumaker 2004; Sanderson, Scherbov, O'Neill, and Lutz 2004). Scenarios also are a **common tool employed by the policymakers** whom political scientists study. This article seeks to elevate the status of scenarios in political science by demonstrating their usefulness for **theory building and pedagogy**. Rather than constitute mere speculation regarding an unpredictable future, **as critics might suggest**, scenarios assist scholars with developing testable hypotheses, gathering data, and identifying a theory's upper and lower bounds. Additionally, **scenarios are an effective way to teach students to apply theory to policy**. In the pages below, a "best practices" guide is offered to advise scholars, practitioners, and students, and an argument is developed in favor of the use of scenarios. The article concludes with two examples of how political scientists have invoked the scenario method to improve the specifications of their theories, propose falsifiable hypotheses, and design new empirical research programs. Scenarios in the Discipline What do counterfactual narratives about the future look like? Scenarios may range in length from a few sentences to many pages. One of the most common uses of the scenario method, which will be referenced throughout this article, is to study the conditions under which **high-consequence, low-probability** events may occur. Perhaps the best example of this is **nuclear warfare**, a circumstance that has never resulted, but has captivated generations of political scientists. For an introductory illustration, let us consider a very simple scenario regarding how a first use of a nuclear weapon might occur: During the year 2023, the US military is ordered to launch air and sea patrols of the Taiwan Strait to aid in a crisis. These highly visible patrols disrupt trade off China's coast, and result in skyrocketing insurance rates for shipping companies. Several days into the contingency, which involves over ten thousand US military personnel, an intelligence estimate concludes that a Chinese conventional strike against US air patrols and naval assets is imminent. The United States conducts a preemptive strike against anti-air and anti-sea systems on the Chinese mainland. The US strike is far more successful than Chinese military leaders thought possible; a new source of intelligence to the United States—unknown to Chinese leadership—allowed the US

military to severely degrade Chinese targeting and situational awareness capabilities. Many of the weapons that China relied on to dissuade escalatory US military action are now reduced to single-digit-percentage readiness. Estimates for repairs and replenishments are stated in terms of weeks, and China's confidence in readily available, but "dumber," weapons is low due to the dispersion and mobility of US forces. Word of the successful US strike spreads among the Chinese and Taiwanese publics. The Chinese Government concludes that for the sake of preserving its domestic strength, and to signal resolve to the US and Taiwanese Governments while minimizing further economic disruption, it should escalate dramatically with the use of an extremely small-yield nuclear device against a stationary US military asset in the Pacific region. This short story reflects a future event that, while unlikely to occur and far too vague to be used for military planning, contains many dimensions of political science theory. These include the following: what leaders perceive as "limited," "proportional," or "escalatory" uses of force; the importance of private information about capabilities and commitment; audience costs in international politics; the relationship between military expediency and political objectives during war; and the role of compressed timelines for decision making, among others. The purpose of this article is to explain to scholars how **such stories**, and more rigorously developed narratives that specify variables of interest and draw on extant data, may **improve the study of IR**. An important starting point is to explain how future counterfactuals fit into the methodological canon of the discipline.

Epistemic uncertainty isn't a <u>voting issue</u>: imaging scenarios, even if unlikely or flawed is a pre requisite to good analysis – the aff isn't a research paper, just dismiss poorly constructed impacts

Wimbush, 08 – director of the Center for Future Security Strategies

(S. Enders, senior fellow at the Hudson Institute and the author of several books and policy articles, "A Parable: The U.S.-ROK Security Relationship Breaks Down", Asia Policy, Number 5 (January 2008), 7-24)

What if the U.S.-ROK security relationship were to break down? This essay explores the alternative futures of such a scenario. Analyzing scenarios is one technique for **trying to understand the increasing complexity** of strategic environments. A scenario is an account of an imagined sequence of events. The intent of a scenario is to suggest how alternative futures might arise and where they might lead, where conflicts might occur, how the interests of different actors **might be challenged**, and the kinds of strategies actors might pursue to achieve their objectives. Important to keep in mind is that scenarios are nothing more than **invented, in-depth stories**—stories about what different futures could look like and what might happen along plausible pathways to those futures. The trends and forces that go into building a scenario may be carefully researched, **yet a scenario is not a research paper**. Rather, it is a work of the imagination. As such, scenarios are, first, tools that can help bring order to the way analysts think about what might happen in future security environments; second, scenarios are a provocative way of revealing possible dynamics of future security environments that might not be apparent simply by projecting known trends into the future. Scenarios are particularly useful in suggesting where the interests and actions of different actors might converge or collide with other forces, trends, attitudes, and influences. By using scenarios, to explore the question "what if this or that happened?" in a variety of different ways, with the objective of uncovering as many potential answers as possible, analysts can build hedging strategies for dealing with many different kinds of potential problems. Though they may choose to discount some of these futures and related scenarios, analysts will not be ignorant of the possibilities, with luck avoiding having to say: "I never thought about that."

AT Affirmation of Self

Their deployment of identity/social location/privilege arguments shuts down effective collective action – this reifies racism and leads to endless squabbling about authenticity
Rob 13

(the Idealist, Carleton College, JD candidate, 10/1, Tim Wise & The Failure of Privilege Discourse, www.orchestratedpulse.com/2013/10/tim-wise-failure-privilege-discourse/)

I don't find it meaningful to criticize Tim Wise the person and judge whether he's living up to some anti-racist bona fides. Instead, I choose to focus on the paradigm of "White privilege" upon which his work is based, and its conceptual and practical limitations. Although the personal is political, not all politics is personal; we have to attack **systems**. To paraphrase the urban poet and philosopher Meek Mill: there are levels to this shit. How I Define Privilege There are power structures that shape individuals' lived experiences. Those structures provide and withhold resources to people based on factors like class, disability status, gender, and race. It's not a "benefit" to receive resources from an unjust order because ultimately, injustice is cannibalistic. Slavery binds the slave, but destroys the master. So, the point then becomes not to assimilate the "underprivileged", but to instead eradicate the power structures that create the privileges in the first place. The conventional wisdom on privilege often says that it's "benefits" are "unearned". However, this belief ignores the reality and history that privilege is earned and maintained through violence. Systemic advantages are allocated and secured as a class, and simply because an individual hasn't personally committed the acts, it does not render their class dominance unearned. The history and modern reality of violence is why Tim Wise' comparison between whiteness and tallness fails. White supremacy is not some natural evolution, nor did it occur by happenstance. White folks *murdered* people for this thing that we often call "White privilege"; it was bought and paid for by blood and terror. White supremacy is not some benign invisible knapsack. The same interplay between violence and advantage is true of any systemic hierarchy (class, gender, disability, etc). Being tall, irrespective of its advantages, does not follow that pattern of violence. Privilege is Failing Us Unfortunately, I think our use of the term "privilege" is no longer a productive way for us to gain a thorough understanding of systemic injustice, nor is it helping us to develop collective strategies to dismantle those systems. Basically, **I never want to hear the word "privilege" again** because **the term is so thoroughly misused at this point that it does more harm than good.** Andrea Smith, in the essay "The Problem with Privilege", outlines the pitfalls of misapplied privilege theory. Those who had little privilege did not have to confess and were in the position to be the judge of those who did have privilege. Consequently, people aspired to be oppressed. Inevitably, those with more privilege would develop new heretofore unknown forms of oppression from which they suffered… Consequently, the goal became not to actually end oppression but to be as oppressed as possible. These rituals often substituted confession for political movement-building. Andrea Smith, The Problem with Privilege Dr. Tommy Curry says it more bluntly, "It's not genius to say that in an oppressive society there are benefits to being in the superior class instead of the inferior one. That's true in any hierarchy, that's not an 'aha' moment." Conceptually, privilege is best used when narrowly focused on explaining how structures generally shape experiences. However, when we overly personalize the problem, then privilege becomes a tit-for-tat exercise in blame, shame, and guilt. In its worst manifestations, this dynamic becomes "oppression Olympics" and people tally perceived life advantages and identities in order to invalidate one another. At best, we treat structural injustice as a personal problem, and moralizing exercises like "privilege confessions" inadequately address the nexus between systemic power and individual behavior. The undoing of privilege occurs not by individuals confessing their privileges or trying to think themselves into a new subject position, but through the creation of collective structures that dismantle the systems that enable these privileges. The activist genealogies that produced this response to racism and settler colonialism were not initially focused on racism as a problem of individual prejudice. Rather, the purpose was for individuals to recognize how they were shaped by structural forms of oppression. Andrea Smith, The Problem with Privilege Bigger than Tim Wise However, the problem with White privilege isn't simply that Tim Wise, a white man, can build a career off of Black struggles. As I've already said, White people need to talk to White people about the historical and social construction of their racial identities and power, and the foundation for that conversation often comes from past Black theory and political projects. The problem for me is that privilege work has become a cottage industry of self-help moralizing that **in no way attacks** the systemic ills that create the personal injustices in the first place. A **substantive critique of privilege requires us to get beyond identity politics**. It's not about good people and bad people; it's a bad system. It's not just White people that participate in the White privilege industry, although not everyone equally benefits/profits (see:

Tim Wise). Dr. Tommy Curry takes elite Black academics to task for their role in profiting from the White privilege industry while offering no challenge to White supremacy. These conversations about White privilege are not conversations about race, and certainly not about racism; it's a business where Blacks market themselves as racial therapists for White people… The White privilege discourse became a bourgeois distraction. It's a tool that we use to morally condemn whites for not supporting the political goals of elite black academics that take the vantages of white notions of virtue and reformism and persuade departments, journals, and presses into making concessions for the benefit of a select species of Black intellectuals in the Ivory Tower, without seeing that the white racial vantages that these Black intellectuals claim they're really interested in need to be dissolved, need to be attacked all the way to the very bottom of American society. Dr. Tommy Curry, Radio Interview The truth is that a lot of people, marginalized groups included, simply want more access to existing systems of power. They don't want to challenge and push beyond these systems; they just want to participate. So if we continue to play identity politics and persist with a personal privilege view of power, then we will lose the struggle. Barack Obama is president, yet White supremacy marches on, and often with his help (record deportations, expanded a drone war based on profiling, fought on behalf of US corporations to repeal a Haitian law that raised the minimum wage). Adolph Reed, writing in 1996, predicted the quagmire of identity politics in the Age of Obama. In Chicago, for instance, we've gotten a foretaste of the new breed of foundation-hatched black communitarian voices; one of them, a smooth Harvard lawyer with impeccable do-good credentials and vacuous-to-repressive neoliberal politics, has won a state senate seat on a base mainly in the liberal foundation and development worlds. His fundamentally bootstrap line was softened by a patina of the rhetoric of authentic community, talk about meeting in kitchens, small-scale solutions to social problems, and the predictable elevation of process over program — the point where identity politics converges with old-fashioned middle-class reform in favoring form over substance. I suspect that his ilk is the wave of the future in U.S. black politics. Adolph Reed Jr., Class Notes: Posing As Politics and Other Thoughts on the American Scene Although it has always been the case, Obama's election and subsequent presidency has made it starkly clear that it's not just White people that can perpetuate White supremacy. Systems of oppression condition all members of society to accept systemic injustice, and there are (unequal) incentives for both marginalized and dominant groups to perpetuate these structures. Our approaches to injustice must reflect this reality. This isn't a naïve plea for "unity", nor am I saying that talking about identities/experiences is inherently "divisive". Many of these privilege discussions use empathy to build personal and collective character, and there certainly should be space for us to work together to improve/heal ourselves and one another. People will always make mistakes and our spaces have to be flexible enough to allow for reconciliation. Though we don't have to work with persistently abusive people who refuse to redirect their behavior, there's a difference between establishing boundaries and puritanism. Fighting systemic marginalization and exploitation requires more than good character, and we cannot fetishize personal morals over collective action.

China Threat

Rigid rejection of "China threat" gets <u>warped</u> into a new orthodoxy and fuels extremism. Recognizing plural interpretations and linkages is more productive.

Callahan 2k5

(William A., Professor of Politics – University of Manchester, "How to Understand China: The Dangers and Opportunities of Being a Rising Power", Review of International Studies, 31)

Although 'China threat theory' is ascribed to the Cold War thinking of foreigners who suffer from an enemy deprivation syndrome, the use of containment as a response to threats in Chinese texts suggests that Chinese strategists are also seeking to fill the symbolic gap left by the collapse of the Soviet Union, which was the key threat to the PRC after 1960. **Refutations of 'China threat theory'** do not seek to deconstruct the discourse of 'threat' as part of critical security studies. Rather they **are expressions of a geopolitical identity politics because they refute 'Chinese' threats as a way of facilitating the production of an America threat**, a Japan threat, an India threat, and so on. Uniting to fight these foreign threats affirms China's national identity. Unfortunately, **by refuting China threat in this bellicose way** – that is by generating a new series of threats – the **China threat theory texts end up confirming the threat** that **they seek to deny**: Japan, India and Southeast Asia are increasingly threatened by China's protests of peace.43 Moreover, the estrangement produced and circulated in China threat theory is not just among nation-states. The recent shift in the focus of the discourse from security issues to more economic and cultural issues suggests that China is estranged from the 'international standards' of the 'international community'. After a long process of difficult negotiations, China entered the WTO in December 2001. Joining the WTO was not just an economic or a political event; it was an issue of Chinese identity.44 As Breslin, Shih and Zha describe in their articles in this Forum, this process was painful for China as WTO membership subjects the PRC to binding rules that are not the product of Chinese diplomacy or culture. Thus although China enters international organisations like the WTO based on shared values and rules, China also needs to distinguish itself from the undifferentiated mass of the globalised world. Since 2002, a large proportion of the China threat theory articles have been published in economics, trade, investment, and general business journals – rather than in international politics, area studies and ideological journals as in the 1990s. Hence China threat theory is one way to differentiate China from these international standards, which critics see as neo-colonial.45 Another way is for China to assert ownership over international standards to affirm its national identity through participation in globalisation.46 Lastly, some China threat theory articles go beyond criticising the ignorance and bad intentions of the offending texts to conclude that those who promote China threat must be crazy: 'There is a consensus within mainland academic circles that there is hardly any reasonable logic to explain the views and practices of the United States toward China in the past few years. It can only be summed up in a word: ''Madness'' '.47 Indians likewise are said to suffer from a 'China threat theory syndrome'.48 This brings us back to Foucault's logic of 'rationality' being constructed through the exclusion of a range of activities that are labelled as 'madness'. The rationality of the rise of China depends upon distinguishing it from the madness of those who question it. **Like** Joseph **Nye's concern that warnings of a China threat could become a self-fulfilling prophesy, China threat theory texts vigorously reproduce the dangers of the very threat they seek to deny. Rather than adding to the debate, they end up** policing **what** Chinese and **foreigners can rationally say**. Conclusion **The argument** of this essay **is** not **that** China is a threat. Rather, it has examined the **productive linkages** that **knit together the image of China as** a **peacefully rising** power **and the discourse of China as a threat to** the **economic and military stability** of East Asia. **It would be easy to join the chorus of those who denounce 'China threat theory'** as the misguided product of the Blue Team, as do many in China and the West. **But that would be a mistake, because depending on circumstances anything** – from rising powers to civilian aircraft – **can be interpreted as a threat. The purpose is not to argue that interpretations are false in relation to some reality** (such as that China is fundamentally peaceful rather than war-

like), **but that it is necessary to unpack the** political and historical **context of each perception of threat**. Indeed, 'China threat' has never described a unified American understanding of the PRC: it has always been one position among many in debates among academics, public intellectuals and policymakers. **Rather than** inflate extremist positions (in both the West and China) **into irrefutable truth**, **it is more interesting to examine** the **debates** that produced the threat/opportunity dynamic.

The alt causes CCP lashout and makes war more likely

Friedberg 12

(Aaron L. Friedberg, Professor of Politics and International Affairs at the Woodrow Wilson School of Public and International Affairs at Princeton University and the author of A Contest for Supremacy: China, America, and the Struggle for Mastery in Asia. From 2003 to 2005, he served as a Deputy Assistant for National Security Affairs in the Office of the Vice President, "Bucking Beijing", Foreign Affairs, September / October)

The primary objection to recalibrating U.S. policy along the lines suggested here is that it would create a self-fulfilling prophecy, strengthening the hand of Beijing's so-called hard-liners while undercutting its reform-minded liberals. The notion that there are good guys among those contending for power in China and that a nonconfrontational approach would favor them has intuitive appeal. At this point, however, the opposite is at least equally plausible. If Washington reverts to a softer stance, Beijing's hard-liners could try to take the credit. They might argue that the change was a direct result of their tough policies, including the sustained military buildup they have long championed. It would be dangerous for American policymakers to try to shape an intraparty competition that they do not fully understand. This does not mean that China's political evolution is a matter of indifference; far from it. But any outside power's influence over the outcome will be indirect and long term. Democratic countries should continue to support the growth of civil society in China, promote the freest possible flow of ideas into and inside China, and speak out in defense of those who take risks for real reform. At least for the moment, the trend lines in Asia are moving in unfavorable directions. Four years after the global financial meltdown, the United States is still mired in recession and hobbled by political deadlock. China's economy, too, shows signs of slowing, but the country continues to grow richer and stronger while the CCP remains in power. In the not-too-distant future, however, the situation is likely to reverse. The United States and the other advanced industrial democracies will bounce back from their present difficulties. A CCP-led China might not. China will have to cope with the combined effects of unchecked corruption, a rapidly aging population, and an investment-driven economic model that most experts believe to be unsustainable. China's ability to engage in a strategic rivalry is likely to diminish, even as the ability of the United States and its allies increases. The challenge facing U.S. policymakers is how best to navigate the intervening period of uncertainty and constraint. China's recent behavior may prove helpful in this regard. Beijing's truculence has caused deep anxiety among many of China's neighbors, making them more inclined than ever to work together to balance the Asian giant. For this reason, other governments in the region have generally welcomed the more muscular rhetoric that has been

emanating from Washington in recent months. But they remain uncertain whether the United States will have the resources and the resolve to back up its brave words. Whoever is elected president in November will have to take steps to dispel these doubts. Developing and funding a credible strategy for countering China's buildup and adopting a tougher approach to economic engagement will both be important. So, too, will be continuing to stand firm on issues of principle. As it engages and balances Beijing, the United States must do what it can to encourage what George Kennan might have termed the "gradual mellowing" of Chinese power.

Suffering

Our critique of structural injustice turns vampirism. Contextualizing vulnerability, and the background of injustice balances emphasizing with material suffering and avoiding sentimentality

Michalinos **Zembylas 13**, Education @ Open (Cyprus), "The 'Crisis of Pity" and the Radicalization of Solidarity: Toward Critical Pedagogies of Compassion", *Educational Studies* 49, p. 512-516

First of all, a politics of compassion that takes into consideration the possible dangers of compassion fatigue, desensitization, and self victimization has to begin from acknowledging common human vulnerability and its influence in **inspiring meaningful actions that avoid presumptuous paternalism** (Porter 2006; Whitebrook 2002). The recognition of one's own vulnerability can constitute a powerful point of departure for developing compassion and solidarity with the other's vulnerability (Butler 2004). As Butler asserts: "Each of us is constituted politically in part by virtue of the social vulnerability of our bodies. ... We cannot ... will away this vulnerability. We must attend to it" (2004, p. 29). Butler's description of the vulnerable body and self refers to the way we perform and are performed upon, and part of what we fear in the other is a projection of our own selves. Hence, Butler suggests that recognition of our own vulnerability opens up the potential for recognition of all humanity as vulnerable. Vulnerability may therefore, be a more appropriate term than suffering to ground the political applications of compassion, because **the focus is not merely on the alleviation of material suffering and hence a slide from compassion to benevolence and sentimentality** (Porter 2006; Whitebrook 2002). Suggesting this epistemological shift of focus does not imply however, **that a narrative that focuses on the alleviation of material suffering will necessarily result in a slide into sentimentality**. Undoubtedly, the political applications of compassion cannot be completely separated from questions of material suffering Thus, it needs to be acknowledged that although the move away from suffering may be theoretically useful, the shift to a narrative of common human vulnerability is not completely unproblematic. 8 The idea of common vulnerability enables us—teachers and **students** in the classroom, for instance—to explore how we might move beyond dichotomies that single out the self or the other as victims, and therefore as deserving someone else's pity. That is, the idea of common vulnerability puts in perspective the notion of all of us as vulnerable, rather than the individual-other who needs our compassion. This notion addresses the concerns of **students** for example, who **seem to be stuck in self-victimization claims and refuse to acknowledge that others also suffer**. Although the idea of common vulnerability does not guarantee any departure from such claims, it opens some space to problematize moralistic positioning. In addition, the notion of common vulnerability attacks a major emotional ideology grounded in the view that it is natural or normal to be fearful of the other, especially if it involves racial differences. This is one of the most common and pernicious emotional ideologies underlying resistance (especially among White, middle-class students) to identifying with the other. However, if vulnerability concerns everyone and yet compassion is assigned differently (i.e., students think that some deserve compassion but others do not), then it is important to explore what it would take for students to begin imagining themselves as objects of lesser compassion in an unsuspected vulnerable moment. Through addressing this issue in ways that do not reify stereotypes or promote essentialism, it is possible to respond to some of the desensitization concerns outlined earlier, because the dichotomies between we and they will become meaningless and unproductive. Second, **compassion serves to reinforce a strong connection between the personal and the political** and accentuates the interpersonal and the interrelational (Whitebrook 2002). **Empathetic identification with the plight of others**, then, **is not a sentimental recognition of potential sameness**—you are in pain and so am I, so we both suffer the same—**but a realization of our own common humanity, while acknowledging asymmetries of suffering**, inequality, and injustice. A discourse of vulnerability neither eschews questions of material suffering nor obscures issues of inequality and injustice; on the contrary, it highlights both the symmetries and the asymmetries of vulnerability. That is, although the experience of vulnerability may be more or less universal, the discourse of common vulnerability raises important critical questions such as "vulnerable to what? to whom?" to dismiss the possibility of sliding into a sentimental recognition of potential sameness—which is exactly what a politics of compassion ardently seeks to avoid. Without this double realization—that is, we are all vulnerable but not in the same manner—our actions run the danger of being a form of charity and condescension toward those who are systematically and institutionally oppressed (Bunch 2002). If properly recognized in schools, this double realization can potentially address both the concern about the desensitization of students and that of their self-

victimization, because **the distance between spectator and sufferer will not be taken for granted** any more, but rather **its multiple complexities will be acknowledged and interrogated** In a sense then, the kind of compassion that is explored here requires a simultaneous identification and disidentification with the suffering of the other. The simultaneous recognition of symmetry and asymmetry with the other removes the arrogance of claiming that we know and feel their pain and suffering. This emotional ambivalence of simultaneous identification and disidentification is needed to focus attention on the other's suffering, but not becoming too identified with it —a point raised earlier in Nelson's (2004) reading of Arendt's reporting on Eichmann's trial. Students who already endure forms of suffering, of course, do not need a pedagogy to enlighten them how to disidentify with their own suffering. This does not imply, however, that pedagogies that interrogate pity and encourage critical compassion are not for them; on the contrary, the critical awareness that others are vulnerable too, is important in the struggle for **action-oriented solidarity** and the avoidance of egocentricity and cultural **narcissism** Finally, the third element of a politics of compassion is attentiveness to how the ethics of compassion questions injustice and inequality. 9 In particular, an important component of a politics of compassion that is critical and justice-oriented is how it deals with anger at injustice (Hoggett 2006). A politics of compassion does not intentionally seek to cause anger, however, but rather encourages students and teachers to develop a critical analysis of anger, as it is likely that they will experience such feelings, when they begin questioning long-held assumptions and beliefs about other people and social events (Zembylas 2007). Anger may call attention to demands for recognition, but also emphasize inequalities (Holmes 2004) and injustices at the civic level (Silber 2011). Anger at injustice can be a positive and powerful source of personal and political insight in education (Lorde 1984), because it helps to move teachers and students out of a cycle of self-pity, blame, or guilt into a mode of action that somehow responds to injustice. For example, civic anger can be promoted in the classroom as a form of cultivating individual and collective political consciousness and social resistance to injustices in the students' community, although anger is not inevitably emancipatory. However, recognizing the positive power of anger and its link to the struggle against injustice in one's own community is valuable, if teachers want to promote options for action that may change the conditions of others' vulnerability. The pedagogical challenge for critical pedagogues is how to encourage students to become active participants with a nuanced understanding of the emotional complexities involved in histories of injustice and oppression.

Their sentiment K is totally wrong---stories of pain combined with political action avoid vampiristic consumption and motivate effective harm-reduction

Rebecca **Wanzo 9**, Associate Professor, Women, Gender, and Sexuality Studies Program, Washington U in St. Louis. The Suffering Will Not Be Televised, 228-232

Despite my disappointment in these films and frequent annoyance with the narrative trajectory of many of their productions, I admit that I have a bit of a soft spot for the Lifetime network. I, too, used to automatically criticize made-for-television movies "inspired by a true story" about women at risk. I found them exploitative, as any film can be that makes entertainment out of a personal tragedy. Lifetime Television has been called "television for victims," in a criticism of its seemingly endless capacity to show fi lms about the victimization of women.5 One of the questions that this moniker raises is what kind of storylines about people have the most dramatic impact. Popular fi lms with high dramatic impact depict violence, stories of surviv- ing some atypical traumatic event, or struggling with some more powerful person or entity. One aspect of the criticisms of Lifetime is the objection to formulaic melodrama in itself, framed within the gendered derision of women's victimization narratives or, on the other side of the political spectrum, discomfort with such narratives as demeaning, reductive, and trite. The fi lms shown on the network, some produced by Lifetime but most produced elsewhere, vary in quality, but the criticisms of Lifetime raise a question that I have explored throughout this book: What is the best way to represent a story of suffering? ¶ 229¶ Simply crying at a Lifetime film clearly cannot sustain any sub- stantive political work— but what if the crying citizen is directed to, at the very least, awareness, and in the best case scenario, action, after their emotional catharsis? Sorrow produced at the sight of a dead or wounded woman may not accomplish anything **unless the representation is framed in relationship to** some **political action**, but tears in relation to abolition and child abduction did produce action. However, a major ethical problem with using sympathy and compassion as the primary mechanism for political change is that sentimental politics depends on the cultural feelings of those in power, and the disempowered must depend on patronage. Hannah Arendt argues that compassion cannot embrace a larger population, but pity can, and pity is a dangerous affect because it cannot exist without misfortune, thus "it has just as much vested interest in the existence of the unhappy as thirst for power has a vested interest in the existence of the weak . . . by being a virtue of sentiment, pity can be enjoyed for its own sake, and this will almost automatically lead to a glorifi cation of its cause, which is the suffering of others."6 ¶ Following Arendt, the charge against Lifetime could be that it thus encourages sadism because watchers could take pleasure in pity. Or, as literary critic Marianne Noble has suggested in her study of sentimentality, the network might embrace masochism because watchers would identify with the sufferer and might begin to take pleasure in these fantasies of subjection.7 **However, these readings of the pleasures of consuming stories of subjection are too narrow**. In the case of Lifetime, casting these films as only narratives of victimization is too limited a reading. After watching several fi lms, I began to be compelled by stories I had not heard before about women interven- ing when the state fails to protect them. The stories were clearly not only about victimization, but also about survival. The movies negotiate a balance between structural critique and stories of individual heroism, and I am often disappointed, as with the fi lms discussed above, with how much weight is placed on the side of individual transformation. Nonetheless I later began defending the network out of political principle, as part of a broader effort to challenge the ¶ 230¶ facile denunciation of the word "victim." Lifetime's fi lms are often poor in terms of artistic merit, but the network is contributing to a national conversation about what agency can look like. ¶ My argument may seem as if I am looking for politics in all the wrong places, relying on

sentimentality when I should focus on politically rational arguments that eschew the appeals of emotional response. I am not asking for radical progressivism from popular culture. Instead, I am arguing that politics is often accomplished through the popular and conventional work of emotional appeals, as many activists throughout history have demonstrated. The question facing activists for African American women—or, for that matter, advocates for any identity group outside the national imaginary of ideal citizenship—is not only how to expose discrimination, but also how to make use of existing rhetoric so that attacks on their bodies can be read as pressing concerns for all U.S. citizens. Affect and popular culture can be easily criticized as tools of anti-intellectual conservative machines. As Max Horkheimer and Theodor Adorno rightly argue, popular culture focuses on producing narratives of comfort or affects that can ultimately serve the state's purposes.8 Totally escaping the political storytelling of the status quo elicited by mass-produced texts is indeed impossible. However, the impossibility of total escape does not preclude the possibility of making use of tools produced by ideology. Mobilizing affect demands use of proven rhetorical tools, but this use need not forestall a criticism of the need to employ the structures in the first place. Negotiating the relationship between challenging the "master's tools" and making use of them to garner financial support and political power is not an easy project, but it is a necessary one. ¶ The book's title is inspired by this very tension between see- ing popular cultural productions as inevitably politically ineffi cacious and recognizing the possibilities offered by making use of widely circulated genres and media. When Gil Scott-Heron produced his famous choreo-poem, "The Revolution Will Not Be Televised," in 1974, he called attention to the disconnect between radical action and violent struggles taking place in the streets and the pleasures of oblivion offered by scripted television and commercials.9 Television stood in for mass-produced media that would not show what was really occurring in the streets, like "pigs shooting down brothers in instant replay." Scott-Heron pointed to the need for his audience to take to the streets and participate, live, in the revolution. Indeed, a ¶ 231¶ rue revolution requires "live" political action and organizing, and television and many cultural productions neglect a multitude of issues that are politically urgent. However, it is clearly no longer the case that "pigs shooting down brothers in the street is left off of instant replay." Important events are depicted on the news, in scripted tele- vision shows, in genre fi ction, in magazines, in movies, and on the Internet. You can even catch the occasional social message in a television commercial. Rather than reject various media wholesale, we are left with a set of questions about what to do with contemporary media realities. How and why are certain kinds of traditionally neglected issues represented? Once represented, how are they interpreted, and can activists play a role in that interpretation? What do activists do about the complexities lost when they make use of certain kinds of mass-marketed discourses? ¶ Octavia Butler perhaps best articulated this problem in her science-fi ction novel Parable of the Talents. The novel exempli es what Lauren Berlant calls the postsentimental text—one that exhibits longing for the unconfl icted intimacy and political promise senti- mentality offers but is skeptical of the ultimate political effi cacy of making feeling central to political change. Her heroine, Olamina, suffers from "hyperempathy" syndrome, which allows her to feel the emotions of others, but Butler is careful to argue that being able to feel the pain of others is not the means for liberation—it is a "delusional disorder." Thus Olamina focuses on other modes of political change, and struggles to gain followers for her politi- cal and spiritual project for survival, Earthseed, in a United States devastated by environmental destruction and the domination of a repressive fusion of government and a religious right organiza- tion called Christian America. Through Olamina's struggle, Butler addresses the intellectual discomfort with consumption by having a character explicitly argue that only strategic commodifi cation will result in successful dissemination of radical ideas. Olamina struggles with the means by which she can circulate Earthseed, until someone suggests to her that she must use the marketing tools she slightly disparages to compel people to her project. Her companion, Len, argues that Olamina must "focus on what people want and tell them how your system will help them get it." She resists the call to "preach" the way her Christian American enemy Jarret does, rejecting "preaching," "telling folksy stories," emphasizing a profi t motive, and self-consciously using her charismatic persona to sell Earthseed. ¶ 232¶ Len argues that her resistance to using the tools of commodifi cation "leaves the fi eld to people who are demagogues—to the Jarrets of the world."10 Butler ultimately presents the moral that the project of producing populist texts for mass consumption cannot be left to those with unproductive or dangerous dreams, abandoned by a Left that desires not only revolution but also political change resulting in real material gains.¶ Clearly, the productions of mass-culture are not the only way to move people to action, but they are no doubt a tool. The dismissiveness accompanying the label of the sentimental in contemporary culture is because academic critics claim that it does not do anything, it is the antithesis of action. However, this book is about how sentimentality is doing things all the time. For better or worse, it teaches people to identify "proper" objects of sympathy. It teaches people how to relate to each other. It teaches people how to make compelling arguments about their pain. The circulation of sentimental political storytelling often depends on media to which many progressives have a schizophrenic relationship. News media and television are often tools of the state, but citizens depend on the news for the free circulation of information and often look for progressive politics in television shows. Others disavow the "idiot box" altogether and have faith only in alternative news sources. However, the dichotomy between the popular and other spaces in which people tell stories about suffering is a false one. Sentimental political storytelling is omnipresent in U.S. culture. While the discourse has many short-comings, people interested in political change are taking a perilous road if they ignore the possibilities of imperfect stories told about citizens in pain.

Suffering - Blackness

Alt silences black suffering

Rebecca **Wanzo 9**, Associate Professor, Women, Gender, and Sexuality Studies Program, Washington U in St. Louis. The Suffering Will Not Be Televised, 180-3

Recognizing the political valence of pain—of **speaking pain—is essential to black survival.** Given the poorer health status of African Americans in the United States, the fact that pain is often ignored or borne silently before seeking care, and undertreated once care is sought, those who work with African Americans need to emphasize the right to tell stories of pain. Obstacles to black storytelling not only come from white institutional sources, but they also come from self-perceptions that if African Americans can claim nothing else, they can claim strength. The strong-black-woman stereotype, John Henry, the brave and stoic kids integrating the store, and other models of black strength fill the U.S. imaginary. **Reinterpreting the naming and speaking of pain can be an act of power, not an act of powerlessness.** One person who recognized the power in speaking about pain was Audre Lorde. In The Cancer Journals she described how she wanted Anarcha as well as creative nonfiction about my surgery, finding the rare space in the academy that made space for both. Called together in 2007, many of us engaged in scholarship who did not see ourselves as scholars, in creative performance when we did not see ourselves as performers. The group who came together to discuss Anarcha, J. Marion Sims, and the issues the history raised were eclectic: undergraduates taking classes in disability studies, scholars and performers who focused on African American culture, dancers, singers, those who had movement constraints, and those of us who had constraints that were less visible. Over the course of a few days we performed physical and mental exercises, bonding in both small and large groups in order to shape a performance at the end of our time together. We were transformed from spectators into spectacle, but it was a process of constructing a spectacle that was by no means one way—we looked back in history and looked out to those who could engage with us. While minimalist in presentation, it contained the excesses of our emotional response to Anarcha's history and our presents. ¶ If a problem with sentimental political storytelling is the conflation with other kinds of oppressed bodies, the productively messy conflations pushed us to think about a broader nexus of institutional oppression. We were divided into small performance groups, and we ¶ 182¶ struggled to find a collective response that reflected all of our readings of Anarcha's, Lucy's, and Betsey's histories, as well as the histories of other unnamed women. On a stark stage, with our bodies, micro-phones, and lights shaping the space, my group produced a short choreo-piece after two days of work in which the group collectively prompted individual stories with the refrain, "This is Anarcha's story, and . . ." it was the story of all of us. One of us challenged the his-torical record that Anarcha "willingly consented" in Sims's narrative while also addressing the issue of her relatives' lack of consent to medical experimentation during the Nazi Holocaust. Another of us without the use of her legs told the story of being sexually molested by a medical caregiver, describing "histories and futures lost . . . one black, one white, one slave, one not . . . neither touched by request, both silenced by circumstance." In drawing a comparison between the invisible stories—Anarcha's and her own—she explored how the broader issue of nonconsent and voicelessness in medical care can be read across history and identity. One of us discussed the lack of choices and resistance when fighting "medical men"; another discussed fear shaped by history. Drawing on my history, I added to the chorus with a recognition of my difference from Anarcha as well as my sense of connection to her: "I am not Anarcha," but see her story as my story, "not because my issues are hers, but because I need someone to hear her pain . . . and alleviate it." And as we moved in and out of our individual and collective refrains shaped by our specific stories, the chorus built community, acknowledging the differences between our histories and our similar investments at the same time. We learned, as Boal suggests in Theater of the Oppressed, to "practice theater as a language that is living and present, not as a finished product displaying images from the past."75 ¶ I find telling my own story difficult; in some ways, telling the story of pain management after my surgery and telling of the Anarcha Symposium performance are equally difficult. Two spaces of judgment are possible—judgment of my tolerance for pain and judgment of my creative work, both of which are linked to what it means to make myself vulnerable. I was advised to cut my personal story from this chapter because of the danger of exposing myself. But if we take sentimental political storytelling seriously as an opportunity to treat affect and the story of pain as essential to political progress, what example would I set if I remained continually in a space of academic distance when I believe in the political efficacy ¶ 183¶ of the sentimental narrative? As a subject who has been raced and pained in the United States, I must don the mantle of articulating my affective investment in recognizing the relationship between race and pain without shame. ¶ As I say that it is hard to talk about pain—broadly—in the U.S. without talking about race, I recognize that the claim can be read as hyperbolic, and inadequately supported. The charge of hyperbole is often leveled against sentimental rhetoric. But a review of history, rhetoric, and social and medical discourse reveals that these concepts are often linked in the United States. When we recognize that we can be subjects of various discourses about race and pain, and not only subject to a specialized language, such a shift in understand-ing **may empower people**, as health-care advocates encourage, to be agents in their own care. Silence, as Audre Lorde, famously wrote, will not protect you.76 Allowing stories of pain to be silenced, dismissed, or obscured, however, will surely kill you. We must speak pain to power.

Suffering - Perm

That's best --- sentimentality is politically effective when it is recognized as part of a larger project

Rebecca **Wanzo 9**, Associate Professor, Women, Gender, and Sexuality Studies Program, Washington U in St. Louis. The Suffering Will Not Be Televised, p. 9

However, sentimentality cannot easily be understood as progressive or conservative. When theorists criticize producers of sentimentality for conservative politics, they sometimes attack a rhetoric that is reactionary or designed to serve the status quo. At other times, such critics express disappointment at a text's possibly radical revolutionary or otherwise progressive potential having been short-circuited in favor of feel-good closure offered by the sentimental narrative. World Trade Center provoked exactly this response from movie critic David Edelstein, who wanted the fi lm about the event of 9/11 to be "more political," because the "heartwarming conclusion" to the fi lm is "unrepresentative—to the point where it almost seems like a denial of the deeper and more enduring horror."22 Sentimental texts present themselves frequently as progressive about social justice issues while they eventually preserve the status quo. Indeed, that is an overlying tendency of most sentimental texts. However, the binaries of good and bad, Left and Right are insufficient to categorize sentimentality as it does, by its nature, have a progressive political thrust. It addresses the suffering of the politically disadvantaged but utilizes conventional narratives and practices that will not fundamentally disrupt power. Rather than characterizing U.S. sentimentality as "good" or "bad" politics, a more precise characterization—albeit more of a mouthful and less dramatic—is to call it a **politically effective** but insufficient means of political change.

Terror

Terrorism studies are epistemologically valid---our authors are self-reflexive
Boyle 2k8

(**Michael J. Boyle, School of International Relations, University of St. Andrews, and John Horgan, International Center for the Study of Terrorism, Department of Psychology, Pennsylvania State University, April 2008, "A Case Against Critical Terrorism Studies," Critical Studies On Terrorism, Vol. 1, No. 1, p. 51-64)**

Jackson (2007c) calls for the development of an explicitly CTS on the basis of what he argues preceded it, dubbed 'Orthodox Terrorism Studies'. The latter, he suggests, is characterized by: (1) its poor methods and theories, (2) its state centricity, (3) its problem-solving orientation, and (4) its institutional and intellectual links to state security projects. Jackson argues that the major defining characteristic of CTS, on the other hand, should be 'a skeptical attitude towards accepted terrorism "knowledge"'. An implicit presumption from this is that terrorism scholars have laboured for all of these years without being aware that their area of study has an implicit bias, as well as definitional and methodological problems. In fact, terrorism scholars are **not only well aware of these problems**, but also have provided their own searching critiques of the field at various points during the last few decades (e.g. Silke 1996, Crenshaw 1998, Gordon 1999, Horgan 2005, esp. ch. 2, 'Understanding Terrorism'). Some of those scholars most associated with the critique of empiricism implied in 'Orthodox Terrorism Studies' have also engaged in **deeply critical examinations** of the nature of sources, methods, and data in the study of terrorism. For example, Jackson (2007a) regularly cites the handbook produced by Schmid and Jongman (1988) to support his claims that theoretical progress has been limited. But this fact was well recognized by the authors; indeed, in the introduction of the second edition they point out that they have not revised their chapter on theories of terrorism from the first edition, because the failure to address persistent conceptual and data problems has undermined progress in the field. The point of their handbook was to sharpen and make more comprehensive the result of research on terrorism, not to glide over its methodological and definitional failings (Schmid and Jongman 1988, p. xiv). Similarly, Silke's (2004) volume on the state of the field of terrorism research performed a similar function, highlighting the shortcomings of the field, in particular the lack of rigorous primary data collection. A non-reflective community of scholars does not produce such scathing indictments of its own work.

A new study incorporating long-term metrics proves counter-terrorism is successful
Price, 12 - major in the U.S. Army and former Assistant Professor of Social Sciences at the U.S. Military Academy

(**Bryan, "Targeting Top Terrorists" International Security, Spring, http://shakes31471.typepad.com/files/how-leadership-decapitation-contributes-to-counterterrorism.pdf)**

I argue that leadership decapitation significantly increases the mortality rate of terrorist groups, even after controlling for other factors. Using an original database—the **largest and most comprehensive of its kind**—I analyzed the effects of leadership decapitation on the mortality rate of 207 terrorist groups from 1970 to 2008. The analysis differs from previous quantitative studies because it evaluates the effects of decapitation on the duration of terrorist groups as opposed to the number, frequency, or

lethality of attacks after a group experiences leadership decapitation.15 In doing so, it challenges the conventional wisdom regarding terrorist group duration and addresses some of the most pressing questions about the effectiveness of decapitation. For example, does it matter whether a terrorist group leader is killed versus captured? Does the size, ideology, or age of the group increase its susceptibility to organizational death? In addition to answering these questions, this study illustrates the importance of evaluating the long-term effects of counterterrorism policies in conjunction with the short-term metrics more commonly used today. The article is structured as follows. First, I survey the literature on leadership decapitation and show why new metrics are needed to accurately evaluate its effectiveness. I then use concepts from leadership studies, organizational ecology, and terrorism to provide a theoretical explanation for why terrorist groups are particularly susceptible to decapitation tactics. I argue that terrorist groups have unique organizational characteristics that amplify the importance of their top leaders and make leadership succession more difficult. After discussing the data limitations inherent in terrorism research, I identify the covariates most likely to influence terrorist group duration and then explain how I estimated them. Following a review of the main findings, I conclude with some thoughts on the possible implications of bin Laden's death for al-Qaida and recommendations for policymakers.

Warming

It's good and solves
Veldman 12

(Robin, Flordida religion PhD student, "Narrating the Environmental Apocalypse: How Imagining the End Facilitates Moral Reasoning Among Environmental Activists", Ethics and the Environment, 17.1, JSTOR)

As we saw in the introduction, critics often argue that apocalyptic rhetoric induces feelings of hopelessness or fatalism. While it certainly does for some people, in this section I will present evidence that apocalypticism also often goes hand in hand with activism. Some of the strongest evidence of a connection between environmental apocalypticism and activism comes from a national survey that examined whether Americans perceived climate change to be dangerous. As part of his analysis, Anthony Leiserowitz identified several "interpretive communities," which had consistent demographic characteristics but varied in their levels of risk perception. The group who perceived the risk to be the greatest, which he labeled "alarmists," described climate change ETHICS & THE ENVIRONMENT, 17(1) 2012 using apocalyptic language, such as "Bad…bad…bad…like after nuclear war…no vegetation," "Heat waves, it's gonna kill the world," and "Death of the planet" (2005, 1440). Given such language, this would seem to be a reasonable way to operationalize environmental apocalypticism. If such apocalypticism encouraged fatalism, we would expect alarmists to be less likely to have engaged in environmental behavior compared to groups with moderate or low levels of concern. To the contrary, however, Leiserowitz found that alarmists "were significantly more likely to have taken personal action to reduce greenhouse gas emissions" (ibid.) than respondents who perceived climate change to pose less of a threat. Interestingly, while one might expect such radical views to appeal only to a tiny minority, Leiserowitz found that a respectable eleven percent of Americans fell into this group (ibid). Further supporting Leiserowitz's findings, in a separate national survey conducted in 2008, Maibach, Roser-Renouf, and Leiserowitz found that a group they labeled "the Alarmed" (again, due to their high levels of concern about climate change) "are the segment most engaged in the issue of global warming. They are very convinced it is happening, human-caused, and a serious and urgent threat. The Alarmed are already making changes in their own lives and support an aggressive national response" (2009, 3, emphasis added). This group was far more likely than people with lower levels of concern over climate change to have engaged in consumer activism (by rewarding companies that support action to reduce global warming with their business, for example) or to have contacted elected officials to express their concern. Additionally, the authors found that "[w]hen asked which reason for action was most important to them personally, **the Alarmed were most likely to select preventing the destruction of most life on the planet** (31%)" (2009, 31)—a finding suggesting that for many in this group it is specifically the desire to avert catastrophe, rather than some other motivation, that encourages pro-environmental behavior. Taken together, these and other studies (cf. Semenza et al. 2008 and DerKarabetia, Stephenson, and Poggi 1996) provide important evidence that many of those who think environmental problems pose a severe threat practice some form of activism, rather than giving way to fatalistic resignation.

Impact Framing

AT RC

RC Generic

Root cause logic is poor scholarship

Sharpe 10

(lecturer, philosophy and psychoanalytic studies, and Goucher, senior lecturer, literary and psychoanalytic studies – Deakin University, '10

(Matthew and Geoff, Žižek and Politics: An Introduction, p. 231 – 233)

We realise that this argument, which we propose as a new 'quilting' framework to explain Žižek's theoretical oscillations and political prescriptions, raises some large issues of its own. While this is not the place to further that discussion, we think its analytic force leads into a much wider critique of 'Theory' in parts of the latertwentieth- century academy, which emerged following the 'cultural turn' of the 1960s and 1970s in the wake of the collapse of Marxism. Žižek's paradigm to try to generate all his theory of culture, subjectivity, ideology, politics and religion is psychoanalysis. But a similar criticism would apply, for instance, to theorists who feel that the method Jacques Derrida developed for criticising philosophical texts can meaningfully supplant the methodologies of political science, philosophy, economics, sociology and so forth, when it comes to thinking about 'the political'. Or, differently, thinkers who opt for Deleuze (or Deleuze's and Guattari's) Nietzschean Spinozism as a new metaphysics to explain ethics, politics, aesthetics, ontology and so forth, seem to us candidates for the same type of **criticism, as a reductive passing over** the **empirical and analytic distinctness of** the **different** object **fields in complex societies.** In truth, we feel that Theory, and the continuing line of 'master thinkers' who regularly appear particularly in the English- speaking world, is the last gasp of what used to be called First Philosophy. The philosopher ascends out of the city, Plato tells us, from whence she can espie the Higher Truth, which she must then bring back down to political earth. From outside the city, we can well imagine that she can see much more widely than her benighted political contemporaries. But from these philosophical heights, we can equally suspect that the 'master thinker' is also always in danger of passing over the salient differences and features of political life – differences only too evident to people 'on the ground'. Political life, after all, is always a more complex affair than a bunch of ideologically duped fools staring at and enacting a wall (or 'politically correct screen') of ideologically produced illusions, from Plato's timeless cave allegory to Žižek's theory of ideology. We know that Theory largely understands itself as avowedly 'post-metaphysical'. It aims to erect its new claims on the gravestone of First Philosophy as the West has known it. But it also tells us that people very often do not know what they do. And so it seems to us that too many of its proponents and their followers are mourners who remain in the graveyard, propping up the gravestone of Western philosophy under the sign of some totalising account of absolutely everything – enjoyment, différance, biopower ... Perhaps the time has come, we would argue, less for one more would- be global, allpurpose existential and political Theory than for a **multi- dimensional and interdisciplinary** critical **theory** that would challenge the chaotic specialisation neoliberalism speeds up in academe, which mirrors and accelerates the splintering of the Left over the last four decades. This would mean that we would have to shun the hope that one method, one perspective, or one master thinker could single-handedly decipher all the complexity of socio- political life, the concerns of really existing social movements – which specifi cally does not mean mindlessly celebrating difference, marginalisation and multiplicity as if they could be suffi cient ends for a new politics. **It would be to reopen critical theory and non- analytic philosophy to the other intellectual disciplines**, most of **whom** today **pointedly reject Theory's legitimacy,** neither reading it nor taking it seriously.

RC Patriarchy

Patriarchy's not the root cause

Bell, senior lecturer – Department of Politics and International Studies @ Cambridge University, **'6**

(Duncan, "Beware of false prophets: biology, human nature and the future of International Relations theory," International Affairs 82, 3 p. 493–510)

Writing in *Foreign Aff airs* in 1998, Francis Fukuyama, tireless promulgator of the 'end of history' and now a member of the President's Council on Bioethics, employed EP reasoning to argue for the central role in world politics of 'masculine values', which are 'rooted in biology'. His argument starts with the claim that male and female chimps display asymmetric behaviour, with the males far more prone to violence and domination. 'Female chimps have relationships; male chimps practice realpolitik.' Moreover, the 'line from chimp to modern man is continuous' and this has signifi cant consequences for international politics.46 He argues that the world can be divided into two spheres, an increasingly peaceful and cooperative 'feminized' zone, centred on the advanced democracies, and the brutal world outside this insulated space, where the stark realities of power politics remain largely masculine. This bifurcation heralds dangers, as 'masculine policies' are essential in dealing with a masculine world: 'In anything but a totally feminized world, feminized policies could be a liability.' Fukuyama concludes the essay with the assertion that the form of politics best suited to human nature is—surprise, surprise— free-market capitalist democracy, and that other political forms, especially those promoted by feminists and socialists, do not correspond with our biological inheritance.47 Once again **the authority of science is invoked in order to naturalize a** particular **political objective.** This is a pattern that has been repeated across the history of modern biology and remains potent to this day.48 It is worth noting in brief that Fukuyama's argument is badly flawed even in its own terms. As anthropologist R. Brian Ferguson states, Fukuyama's claims about the animal world display 'a breathtaking leap over a mountain of contrary evidence'.49 Furthermore, Joshua Goldstein concludes in **the most detailed analysis of the data on war and gender** that although biological differences do play a **minor role,** focusing so heavily on them is **profoundly misleading**.50 The simplistic claims, crude stereotyping and casual use of evidence that characterize Fukuyama's essay unfortunately recur throughout the growing literature on the biology of international politics.

Extinction First

Ext O/W

Extinction is unique—if you think there's a one in 75 million chance of our disad you should vote neg

POSNER 2004 (Richard, US Court of Appeals judge and Senior Lecturer at the University of Chicago Law School, Catastrophe: Risk and Response 249-250)

Even if our insouciant reaction to small probabilities of great losses is accepted as an authentic basis for estimating the value of life in most such situations, the reaction may not generalize to ones in which the loss, should it materialize, would be the near or total extinction of the human race. If the annual probability of an asteroid collision that would kill 6 billion people is only 1 in 75 million, the expected number of deaths worldwide is only 80 per year, which may not seem a large enough number to justify the expense of an effective defense against an asteroid collision. (This of course ignores smaller but still lethal collisions; but read on.) But if there is a minute chance that the entire human race, both current and future, would be wiped out, together with all or most of the world's animal population, we (the ambiguous "we" of policy analysis, but there it may represent dominant public opinion) may think that *something* should be done to eliminate or reduce the risk, slight as it is, beyond what a standard cost-benefit analysis would imply; may be willing, if the risk and the possible responses are explained carefully, to incur some cost in higher taxes or otherwise to reduce the risk.

Uncertainty doesn't matter—any risk of extinction outweighs any other impact

SCHELL 1982 (Jonathan, Fate of the Earth, pp. 93-96)

To say that human extinction is a certainty would, of course, be a misrepresentation – just as it would be a misrepresentation to say that extinction can be ruled out. To begin with, we know that a holocaust may not occur at all. If one does occur, the adversaries may not use all their weapons. If they do use all their weapons, the global effects in the ozone and elsewhere, may be moderate. And if the effects are not moderate but extreme, the ecosphere may prove resilient enough to withstand them without breaking down catastrophically. These are all substantial reasons for supposing that mankind will not be extinguished in a nuclear holocaust, or even that extinction in a holocaust is unlikely, and they tend to calm our fear and to reduce our sense of urgency. Yet at the same time we are compelled to admit that there may be a holocaust, that the adversaries may use all their weapons, that the global effects, including effects of which we as yet unaware, may be severe, that the ecosphere may suffer catastrophic breakdown, and that our species may be extinguished. We are left with uncertainty, and are forced to make our decisions in a state of uncertainty. If we wish to act to save our species, we have to muster our resolve in spite of our awareness that the life of the species may not now in fact be jeopardized. On the other hand, if we wish to ignore the peril, we have to admit that we do so in the knowledge that the species may be in danger of imminent self-destruction. When the existence of nuclear weapons was made known, thoughtful people everywhere in the world realized that if the great powers entered into a nuclear-arms race the human species would sooner or later face the possibility of extinction. They also realized that in the absence of international agreements preventing it an arms race would probably occur. They knew that the path of nuclear armament was a dead end for mankind. The discovery of the energy in mass – of "the basic power of the universe" – and of a means by which man could release that energy altered the relationship between man and the source of his life, the earth. In the shadow of this power, the earth became small and the life of the human species doubtful. In that sense, the question of human extinction has been on the political agenda of the world ever since the first nuclear weapon was detonated, and there was no need for the world to build up its present tremendous arsenals before starting to worry about it. At just what point the species crossed, or will have crossed, the boundary between merely having the technical knowledge to destroy itself and actually having the arsenals at hand, ready to be used at any second, is not precisely knowable. But it is clear that at present, with some twenty thousand megatons of nuclear explosive power in existence, and with more being added every day, we have entered into the zone of uncertainty, which is to say the zone of risk of extinction. But the mere risk of extinction has a significance that is categorically different from, and immeasurably greater than that of any other risk and as we make our decisions we have to take that significance into account. Up to now, every risk has been contained within the framework of life; extinction would shatter the frame. It represents not the defeat of some purpose but an abyss in which all human purpose would be drowned for all time. We have no right to place the possibility of this limitless, eternal defeat on the same footing as risk that we run in the ordinary conduct of our affairs in our particular transient moment of human history. To employ a

mathematician's analogy, we can say that although the risk of extinction may be fractional, the stake is, humanly speaking, infinite, and a fraction of infinity is still infinity. In other words, once we learn that a holocaust might lead to extinction we have no right to gamble, because if we lose, the game will be over, and neither we nor anyone else will ever get another chance. Therefore, although, scientifically speaking, there is all the difference in the world between the mere possibility that a holocaust will bring about extinction and the certainty of it, morally they are the same, and we have no choice but to address the issue of nuclear weapons as though we knew for a certainty that their use would put an end to our species. In weighing the fate of the earth and, with it, our own fate, we stand before a mystery, and in tampering with the earth we tamper with a mystery. We are in deep ignorance. Our ignorance should dispose us to wonder, our wonder should make us humble, our humility should inspire us to reverence and caution, and our reverence and caution should lead us to act without delay to withdraw the threat we now post to the world and to ourselves.

Extinction O/W - Ethics

Extinction impacts must be prioritized-any alternative frame fails in the context of public policy
Isaac 2

(Jeffrey, political science professor Indiana University, "Ends, Means, and Politics, Dissent Magazine, Spring 2002)

Power is not a dirty word or an unfortunate feature of the world. It is the core of politics. Power is the ability to effect outcomes in the world. Politics, in large part, involves contests over the distribution and use of power. ==To accomplish anything in the political world, one must attend to the means that are necessary== to bring it about. And to develop such means is to develop, and to exercise, power. To say this is not to say that power is beyond moral- ity. It is to say that power is not reducible to morality. As writers such as Niccolo Machiavelli, Max Weber, Reinhold Niebuhr, and Hannah Arendt have taught, an ==unyielding concern with moral goodness undercuts political responsibility==. The concern may be morally laudable, reflecting a kind of personal integrity, but it suffers from three fatal flaws: (1) It fails to see that the ==purity of one's intention does not ensure the achievement of what one intends==. Abjuring violence or refusing to make common cause with morally compromised parties may seem like the right thing; but if such tactics entail impotence, then it is hard to view them as serving any moral good beyond the clean con- science of their supporters; (2) ==it fails to see that in a world of real violence and injustice, moral purity is== not simply a form of powerless- ness; ==it is often a form of complicity in injustice==. This is why, from the standpoint of politics—as opposed to religion—pacifism is always a potentially immoral stand. In categorically repudiating violence, it refuses in principle to oppose certain violent injustices with any effect; and (3==) it fails to see that politics== is as much about unintended consequences as it is about intentions; it ==is the effects of action, rather than the motives of action==, that is most significant. Just as the alignment with "good" may engender impotence, it is often the pursuit of "good" that generates evil. This is the lesson of communism in the twentieth century: it is not enough that one's goals be sincere or idealistic; it is equally important, always, to ask about the effects of pursuing these goals and to judge these effects in pragmatic and historically contextualized ways. ==Moral absolutism inhibits this judgment. It alienates those who are not true believers. It promotes arrogance. And it undermines political effectiveness==.

Extinction O/W - Nietzsche

Global extinction risks require a revision of the politics of compassion – survival is still paramount. New risks dictate embracing our ethic DEPSITE their impacts

Winchester 94

(James J. Winchester teaches Philosophy at Spelman College

Nietzsche's Aesthetic Turn)

As uninformed as it is to assume that there is an easy connec- tion between his thought and National Socialism, it is neither diffi- cult nor misguided to consider his lack of social concern. Nietzsche saw one danger in our century, but failed to see a second. His critique of herd mentality reads like a prophetic warning against the dictatorships that have plagued and continue to haunt the twentieth cen- tury. But the context of our world has changed in ways that Nietzsche never imagined. We now have, as never before, the ability to destroy-the planet. The threat of the destruction of a society is not new. From the beginnings of Western literature in the Iliad and the Odyssey, the Western mind has contemplated the destruction that, for example, warfare has wrought. Although the Trojan war destroyed almost everyone involved, both the victors and the van- quished, it did not destroy the entire world. In the twentieth century, what has changed is the scale of destruction. If a few countries destroy the ozone layer, the whole world perishes, or if two countries fight a nuclear or biological war, the whole planet is threatened. This is something new in the history of the world/ The intercon- nectedness of the entire world has grown dramatically. We live, as never before, in a global community where our actions effect ever- larger numbers of the world's population. The earth's limits have become more apparent. Our survival depends on working together to solve problems like global pollution. **Granted** mass movements have instituted reigns of terror, **but** our survival as a planet is becoming ever-more predicated on community efforts of the sort that Nietzsche's thought seems to denigrate if not preclude. I do not criticize Nietzsche for failing to predict the rise of problems requiring communal efforts such as the disintegration of the ozone layer, acid rain, and the destruction of South American rain forests. Noting his lack of foresight and his occasional extrem- ism, I propose, in a Nietzschean spirit, to reconsider his particular tastes, without abandoning his aesthetic turn. Statements like "com- mon good is a self-contradiction" are extreme, even for Nietzsche. He was not always so radical. Yet there is little room in Nietzsche's egoism for the kind of cooperation and sense of community that is today so important for our survival. I am suggesting that the time for Nietzsche's radical individualism is past. There are compelling prag- matic and aesthetic reasons why we should now be more open to the positive possibilities of living in a community. There is nothing new about society's need to work together. What has changed is the level of interconnectedness that the technological age has pressed upon us.

Life = Prereq

Life is a pre-requisite to death's symbolic value---fearing death doesn't preclude recognizing life's finitude and its inevitability---we can still create provisional value in life---individuals should have the option to live

Kalnow 9

(Cara Kalnow 9 A Thesis Submitted for the Degree of MPhil at the University of St. Andrews "WHY DEATH CAN BE BAD AND IMMORTALITY IS WORSE" https://research-repository.st-andrews.ac.uk/bitstream/10023/724/3/Cara%20Kalnow%20MPhil%20thesis.PDF)

(PA) also provided us with good reason to reject the Epicurean claim that the finitude of life cannot be bad for us. With (PA), we saw that our lives could accumulate value through the satisfaction of our desires beyond the boundaries of the natural termination of life. But Chapter Four determined that the finitude of life is a necessary condition for the value of life as such and that many of our human values rely on the finite temporal structure of life. I therefore argued that an indefinite life cannot present a desirable alternative to our finite life, because life as such would not be recognized as valuable. In this chapter, I have argued that the finitude of life is instrumentally good as it provides the recognition that life itself is valuable. Although I ultimately agree with the Epicureans that the finitude of life cannot be an evil, this conclusion was not reached from the Epicurean arguments against the badness of death, and I maintain that (HA) and (EA) are insufficient to justify changing our attitudes towards our future deaths and the finitude of life. Nonetheless, the instrumental good of the finitude of life that we arrived at through the consideration of immortality should make us realize that the finitude of life cannot be an evil; it is a necessary condition for the recognition that life as such is valuable. Although my arguments pertaining to the nature of death and its moral implications have yielded several of the Epicurean conclusions, my position still negotiates a middle ground between the Epicureans and Williams, as (PA) accounts for the intuition that it is rational to fear death and regard it as an evil to be avoided. I have therefore reached three of the Epicurean conclusions pertaining to the moral worth of the nature of death: (1) that the state of being dead is nothing to us, (2) death simpliciter is nothing to us, and (3) the finitude of life is a matter for contentment. But against the Epicureans, I have argued that we can rationally fear our future deaths, as categorical desires provide a disutility by which the prospect of death is rationally held as an evil to be avoided. Finally, I also claimed against the Epicureans, that the prospect of death can rationally be regarded as morally good for one if one no longer desires to continue living. 5.3 Conclusion I began this thesis with the suggestion that in part, the Epicureans were right: death—when it occurs—is nothing to us. I went on to defend the Epicurean position against the objections raised by the deprivation theorists and Williams. I argued that the state of being dead, and death simpliciter, cannot be an evil of deprivation or prevention for the person who dies because (once dead), the person—and the grounds for any misfortune—cease to exist. I accounted for the anti-Epicurean intuition 115 that it is rational to fear death and to regard death as an evil to be avoided, not because death simpliciter is bad, but rather because the prospect of our deaths may be presented to us as bad for us if our deaths would prevent the satisfaction of our categorical desires. Though we have good reasons to rationally regard the prospect of our own death as an evil for us, the fact that life is finite cannot be an evil and is in fact instrumentally good, because it takes the threat of losing life to recognize that life as such is valuable. In this chapter, I concluded that even though death cannot be of any moral worth for us once it occurs, we can attach two distinct values to death while we are alive: we can attach a value of disutility (or utility) to the prospect of our own individual deaths, and we must attach an instrumentally good value to the fact of death as such. How to decide on the balance of those values is a matter for psychological judgment.

Nuclear War Turns

Turns Disability/Ageism

Nuclear war would disproportionately hurt children, the elderly, and disabled people

FME 2006 (For Mother Earth, "The Effects of Nuclear Weapons," Last Modified 4-17-06, http://www.motherearth.org/nuke/begin2.php)

From a psychological point of view, limited nuclear war probably is the worst of all worlds.

The imagery of nuclear war, the widespread casualties, and the intense fear of radioactivity would lead to the "nuclear war survivor syndrome". This powerful sense of personal vulnerability, helplessness, guilt, isolation and fear, was seen to varying degrees in the Hiroshima and Nagasaki survivors. The powerful psychological effects of the fear of radioactivity, and the "loss of trust" were described in studies of the nuclear accident at Three Mile Island. The spread of radioactive fallout would create the image of nuclear threat and vulnerability across wide areas.

The very short period required to carry out highly destructive nuclear attacks would intensify the emotional impact, particularly those reactions associated with denial of the true extent of the damage or fostering flight from damaged areas.

Robert J. Lifton, in his study of Hiroshima survivors, described the psychological effect as "a sudden and absolute shift from normal existence to an overwhelming encounter with death." The reaction, as reported by a witness to the disaster, Father Siemes: "Among the passers-by, there are many who are uninjured. In a purposeless, insensate manner, distraught by the magnitude of the disaster, most of them rush by and none conceives the thought of organizing help on his own initiative. They are concerned only with the welfare of their own families." In some cases even families were abandoned. The result of this experience was a deep fear of returning to the cities to rebuild the any form of normal life that may be possible after a nuclear attack.

Families would be broken up by death, severe injury, disease, evacuation, or military and labour conscription. The young, elderly, and handicapped would suffer disproportionately since they depend most on society's material and institutional resources. For example, the young and elderly showed significant increases in accidental death attributed to neglect in Great Britain in World War II. The loss of material and institutional resources in urban-industrial attacks would make survival in the post-attack period difficult for individuals and groups alike, compounding the psychological stresses of the attack itself. Satisfying even the simplest survival requirements (food, shelter, and clothing) would become major tasks.

Turns Racism/Sexism/Etc

Nuclear war would cause authoritarianism, racism, xenophobia, sexism, and religious intolerance

FME 2006 (For Mother Earth, "The Effects of Nuclear Weapons," Last Modified 4-17-06, http://www.motherearth.org/nuke/begin2.php)

To understand the effects of a nuclear war it is important to distinguish it from conventional war or a natural disaster. In particular, all the factors that would make it possible to cope with a normal emergency situation would be lacking: limited damage, a relatively small number of casualties, surviving political or social leadership, a desire to perform common emergency work rather than look after ones own family, large reservoirs of external, easily mobilized skilled workers, material resources, and organizational skills.

The massive and simultaneous destruction of economic and human resources would result in an inability to provide immediate and sufficient human and material aid to damaged areas. There will be no time to adapt and to innovate as nations did in World War II. More importantly, the lack of outside aid would create a sense of individual and common isolation. Aid symbolizes a reconnection with a larger, normal world. This connection helps provide the impetus for rebuilding the damaged society, creating a sense of vitality and ability to dispel the continuing perception of isolation. It also has an important function for binding together society, restating a common thread of hope and shared aspirations.

Economic destruction, loss of political leadership (especially at the local level), and the need to mobilize resources for relief and recovery would present extraordinary demands on weakened political institutions. In the interest of implementing survival programs, legal norms and practices would have to be suspended for prolonged periods in many areas. The character of political institutions and authority would almost certainly change, especially if hostilities or the threat of hostilities persisted. Both old and new political structures would be likely to suffer from greatly reduced credibility. Decentralization of political power and more authoritarian methods of political, social, and economic control would be probable responses to post-attack conditions.

However, even before any outbreak of nuclear war, the presence of nuclear weapons has an enormous potential to distort social and economic priorities. Each of the nuclear weapons states has spent billions of dollars on constructing, maintaining and protecting its nuclear weapons. It is not necessary to point out that this money could have been better spent on providing health care, education or other public services.

The development of nuclear weapons also makes it necessary to create an unaccountable "nuclear elite", made up of scientists, military and civil servants, who work largely in secret to control the development, testing and deployment of nuclear weapons. This makes the presence of nuclear weapons incompatible with a democratic society.

It is possible to link an increased importance of the military, and a general increase in militarism, to a growth of xenophobia, racial and religious intolerance, as well as male chauvinism.

Nuclear war would create widespread psychological problems that magnify the effect of war, cause authoritarianism, and encourage racism, war, and ethnic conflict

KATZ AND OSDOBY 1982 (Arthur, nuclear war researcher, served as consultant to the Joint Congressional Committee on Defense Production, Sima, graduate student in the Department of Political Science, The Johns Hopkins University, "The Social and Economic Effects of Nuclear War," April 21, http://www.cato.org/pubs/pas/pa009.html)

To understand the effects of a nuclear war it is important to distinguish it from common disasters, even World War II. Especially if hostilities continue or their resumption is threatened, all the elements that make a small disaster tractable will be lacking: limited damage, modest casualties, surviving leadership, a diminishing incidence of role conflict (desire to protect one's family rather than to perform emergency work) and large reservoirs of external, easily mobilized skilled workers, material resources, and organizational skills.

The massive and simultaneous destruction of economic and human resources would result in an inability to provide immediate and sufficient human and material aid to damaged areas. There will be no time to adapt and to innovate as nations did in World War II (U.S.S.R. as previously cited is an

example). More important, the <u>lack of outside aid would create a sense of individual and communal isolation. Aid</u> symbolizes a reconnection with a larger, normal world. This connection helps provide the impetus for rebuilding the damaged society, creating a sense of vitality and competence to dispel the continu- ing perception of isolation. It also <u>has an important function for binding together society</u>, restating a common thread of hope and shared aspirations that are the essence of national life. The post-attack situation could be like Japan near the end of World War II.

There could be "<u>a drift toward accomplishing personal and private aims</u> rather than those which are national...farmers...growing little more than is required for their own subsistence,"[17] <u>or more likely,</u> the <u>complete demoralization</u> seen in an earlier tragedy: "<u>Survivors of the Black Death in growing helplessness fell into apathy, leaving ripe wheat uncut and livestock untended...no one had any inclination to concern themselves about the future</u>."[18] More pertinent, a panel of experts in a study of social consequence of nuclear war for the Office of Civil Defense concluded: "One month after the attack, less than half the potential labor force could be expected to work without immediately beneficial compensation, and that, of these, one in five would be able to function only at a level greatly degraded from his normal abilities."[19]

The experience of <u>nuclear war is likely to have devastating psychological effects</u>, especially for Americans, whose homes and institutions have essentially escaped the ravages of recent wars. The very short period required to carry out highly destructive nuclear attacks would intensify the emotional impact, particularly those reactions associated with denial of the true extent of the damage or fostering flight from and resistance to reentering damaged areas.

Robert J. Lifton, in his study of Hiroshima survivors, described the psychological effect as "a sudden and absolute shift from normal existence to an overwhelming encounter with death."[20] The reaction, as reported by a witness to the disaster, Father Siemes: "Among the passersby, there are many who are uninjured. In a purposeless, insensate manner, distraught by the magnitude of the disaster, most of them rush by and none conceives the thought of organizing help on his own initiative. They are concerned only with the welfare of their own families."[21] In some cases even families were abandoned. The result of this experience was, as Fred Ikle described it 25 years ago, a deep aversion to returning to the cities to rebuild the economy. "And thus a very different situation will exist from that envisaged in most civil defense plans (in the 1950s)."[22] The economic implications of this type of withdrawal would be serious.

<u>A high incidence of abnormal behavior, ranging from the nonfunctional to the antisocial, could be anticipated. Specific psychological effects would include disorientation, fear, doubt, apathy, and antipathy toward authorities</u>. The effects on Hiroshima/Nagasaki survivors provide ample evidence to support these concerns.

Families would be broken up by death, severe injury, disease, evacuation, or military and labor conscription. <u>The young, elderly, and handicapped would suffer disproportionately</u> since they depend most on society's material and institutional resources. For example, the young and elderly showed significant increases in accidental death attributed to neglect in Great Britain in World War II.

The loss of material and institutional resources in urban-industrial attacks would make survival in the post-attack period difficult for individuals and groups alike, compounding the psychological stresses of the attack itself. Satisfying even the simplest survival requirements -- food, shelter, and clothing -- would become major tasks.

<u>Significant interpersonal, intergroup, and inter-regional conflicts would probably arise. Ethnic, racial, regional, and economic conflicts present in the pre-attack society</u>, while minimized in the period immediately after an attack, <u>would be heightened</u> after only a limited time <u>by</u> the extent of the <u>deprivation</u> and the resulting tensions. <u>New antagonisms would develop between hosts and evacuees or refugees over the possession and use of surviving resources</u>.

These phenomena were observed both in Britain and in Japan during World War II. The Allnutt study predicted these <u>conflicts would be so serious that they "would necessitate the imposition of martial law or other authoritarian system</u> in many localities, <u>and the widespread use of troops to maintain order</u>." r 231

Continuing hostilities or prolonged threat of renewed war would engender even more profound changes in the social fabric. Major, possibly permanent, changes in social values and institutions could be expected as society sought to adjust to a radically altered environment dominated by the question of physical survival.

Economic destruction, loss of political leadership (especially at the local level), and the need to mobilize resources for relief and recovery would present extraordinary demands on weakened political institutions. In the interest of implementing survival programs, <u>legal norms and practices would have to be suspended</u> for prolonged periods in many areas. <u>The character of political institutions and authority would almost certainly change, especially if hostilities or the threat of hostilities persisted. Both old and new political structures would be likely to suffer from greatly reduced credibility. Decentralization of political</u>

power and more authoritarian methods of political, social, and economic control would be probable responses to post-attack conditions.

Turns Structural Violence

Nuclear war exacerbates inequality and violence against women, children, the poor, and nonhuman species

MALLAVARAPU 2013 (Siddharth Mallavarapu, Mallavarapu is an associate professor in, and chairperson of, the Department of International Relations at South Asian University in New Delhi, "Monumental failure in an interconnected world," Bulletin of the Atomic Scientists, September 4, http://thebulletin.org/nuclear-detonations-contemplating-catastrophe/monumental-failure-interconnected-world)

Dire circumstances. But given all that, how would a nuclear detonation affect poor and middle-income nations and their development goals? To begin with, nations situated well beyond the blast site would feel the effects. The world today is deeply interconnected and events can no longer be confined to the areas where they occur. The United Nations Development Programme underscores this reality in its 2013 Human Development Report, which argues that "as global development challenges become more complex and transboundary in nature, coordinated action on the most pressing challenges of our era, whether they be poverty eradication, climate change, or peace and security, is essential." And efforts to contend with the four areas of development upon which the report focuses—"enhancing equity, including on the gender dimension; enabling greater voice and participation of citizens, including youth; confronting environmental pressures; and managing demographic change"—would in every case be seriously complicated by a nuclear detonation.

Indeed, as argued succinctly by Ray Acheson of the disarmament organization Reaching Critical Will, a detonation would seriously compromise efforts to achieve all the Millennium Development Goals. It would undermine poverty alleviation initiatives as well as cooperative efforts to foster development; limit agricultural productivity; undermine women's and children's well-being; damage national infrastructures; and reduce the planet's biodiversity.

Nuclear war would disproportionately affect women and children

MALLAVARAPU 2013 (Siddharth Mallavarapu, Mallavarapu is an associate professor in, and chairperson of, the Department of International Relations at South Asian University in New Delhi, "Monumental failure in an interconnected world," Bulletin of the Atomic Scientists, September 4, http://thebulletin.org/nuclear-detonations-contemplating-catastrophe/monumental-failure-interconnected-world)

Third, the health and well-being of populations in the developing world would be seriously threatened. Not only would food prices increase, but essential drugs would likely be in short supply—both in the areas directly affected and, as supplies were directed to these areas, in other regions as well. The well-being of women and children in particular might be severely threatened—as Acheson observes, "women suffer disproportionately in disasters and … their specific needs are usually ignored during relief and rehabilitation initiatives." She also notes that "violence against women soars under the stress in post-disaster environments." The negative impact on women's quality of life would likely have a direct bearing on the well-being of children: Women's capacity to care for their children would be diminished, and children would be affected in areas ranging from nutrition to cognitive development.

AT K Impacts

AT Biopower

No impact – democratic norms and civil society check totalitarianism and genocide
Dickinson, associate professor of history – UC Davis, **'4**

(Edward, Central European History, 37.1)

In short, the continuities between early twentieth-century biopolitical discourse and the practices of the welfare state in our own time are unmistakable. Both are instances of the "disciplinary society" and of biopolitical, regulatory, social-engineering modernity, and they share that genealogy with more authoritarian states, including the National Socialist state, but also fascist Italy, for example. And it is certainly fruitful to view them from this very broad perspective. **But that analysis can easily become superficial and misleading**, because it obfuscates the **profoundly different** strategic and local dynamics of power in the two kinds of regimes. Clearly the democratic welfare state is not only formally but also substantively **quite different from totalitarianism.** Above all, again, it has nowhere developed the fateful, radicalizing dynamic that characterized National Socialism (or for that matter Stalinism), the psychotic logic that leads from economistic population management to mass murder. Again, there is always the potential for such a discursive regime to generate coercive policies. In those cases in which the regime of rights does not successfully produce "health," such a system can —and historically does— create compulsory programs to enforce it. But again, there are political and policy potentials and constraints in such a structuring of biopolitics that are very different from those of National Socialist Germany. Democratic biopolitical regimes require, enable, and incite a degree of self-direction and participation that is **functionally incompatible** with authoritarian or totalitarian structures. And this pursuit of biopolitical ends through a regime of democratic citizenship does appear, historically, to have imposed increasingly **narrow limits on coercive policies**, and to have generated a "logic" or imperative of increasing liberalization. Despite limitations imposed by political context and the slow pace of discursive change, I think this is the unmistakable message of the really very impressive waves of legislative and welfare reforms in the 1920s or the 1970s in Germany.90 Of course it is not yet clear whether this is an irreversible dynamic of such systems. Nevertheless, such regimes are characterized by sufficient degrees of autonomy (and of the potential for its expansion) for sufé cient numbers of people that I think it becomes useful to conceive of them as productive of a strategic coné guration of power relations that might fruitfully be analyzed as a condition of "liberty," just as much as they are productive of constraint, oppression, or manipulation. At the very least, **totalitarianism cannot be the sole orientation point** for our understanding of biopolitics, the only end point of the logic of social engineering. **This notion is not** at all **at odds with the core of Foucauldian** (and Peukertian) **theory.** Democratic welfare states are regimes of power/knowledge no less than early twentieth-century totalitarian states; these systems are not "opposites," in the sense that they are two alternative ways of organizing the same thing. But they are two very different ways of organizing it. The concept "power" should not be read as a universal stiè ing night of oppression, manipulation, and entrapment, in which all political and social orders are grey, are essentially or effectively "the same." Power is a set of social relations, in which individuals and groups have varying degrees of autonomy and effective subjectivity. And discourse is, as Foucault argued, "tactically polyvalent." Discursive elements (like the various elements of biopolitics) can be combined in different ways to form parts of quite different strategies (like totalitarianism or the democratic welfare state); they cannot be assigned to one place in a structure, but rather circulate. The varying possible constellations of power in modern societies create "multiple modernities," modern societies with quite **radically differing potentials.**91

Their internal link is terrible causality and empirically denied
Amy 7, professor of Politics at Mount Holyoke College

(Douglas, "More Government Does Not Mean Less Freedom," Government is Good, http://governmentisgood.com/articles.php?aid=18&print=1)

The minimal-government crowd uses this "more government = less freedom" formula to make all sorts of alarmist claims. For example, **some suggest that every increase in government power is a step down the road to totalitarianism** and repression. This is a favorite argument of many conservatives and they use it to oppose even small and seemingly reasonable increases in government programs or regulations. For example, they argue is that if we allow the government to insist on background checks to buy guns, this will lead to mandatory gun registration, which will eventually lead to confiscation of guns, and this will put the government in a position to repress a disarmed and helpless citizenry. Or they suggest that legalizing assisted-suicide for terminally ill patients will only set the stage for government euthanasia programs aimed at the handicapped and others. Or they fear that mandating non-smoking areas is merely a step toward outlawing cigarettes altogether. Or they contend that if we allow environmental regulations to restrict how an owner deals with wetlands on their property, we are going down a road in which property rights will eventually be meaningless because the state will control all property. This seems to be the view of the conservative judge Janice Rogers – one of George W. Bush's appointees to the federal judiciary. In one of her opinions, she railed against local restrictions on the rights of real estate developers in California and concluded that "Private property, already an endangered species in California, is now entirely extinct in San Francisco."6 In his book, Defending Government, Max Nieman has labeled this argument the "Big Brother Road to Dictatorship." It suggests that the expansion of government powers in the U.S. during the last 75 years has been inevitably leading us down the path toward totalitarianism. But as he has noted, **there is** really **no** valid **evidence for this theory**. If we look at how **modern dictatorships** have come about, they **have not been the product of gradually increasing social programs and regulations** over property and business. As Neiman explains: It is common among conservative critics of public sector activism to characterize government growth in the arena of social welfare, environment, consumer and worker protection, and income security as steps toward the loss of liberty and even totalitarianism. Many critics of the emergence of the modern social welfare state … have tried to convey the sense that the road to totalitarian hell is paved with the good intentions of the social democratic program. …There is no record, however, of any oppressive regime having taken power by advancing on the social welfare front. Lenin and Stalin, Mussolini, Mao Tse-tung, Fidel Castro, and Chile's Pinochet did not consolidate power by gradually increasing social welfare programs, taxes, and regulation of the environment or workplace. **Rather, these assaults on personal freedom and democratic governance involved limitation on civil rights and political rights, the legitimization of oppression and discrimination against disfavored or unpopular groups**, and the centralization and expansion of military and policy forces. **Hitler did not become the supreme ruler of the Nazi state by first taking over the health department.**7

AT Endless War

No risk of endless warfare
GRAY 7

(Colin, Director of the Centre for Strategic Studies and Professor of International Relations and Strategic Studies at the University of Reading, graduate of the Universities of Manchester and Oxford, Founder and Senior Associate to the National Institute for Public Policy, [July 2007, "The Implications of Preemptive and Preventive War Doctrines: A Reconsideration," http://www.ciaonet.org/wps/ssi10561/ssi10561.pdf)

7. A policy that favors preventive warfare expresses a futile quest for absolute security. It could do so. Most controversial policies contain within them the possibility of misuse. In the hands of a paranoid or boundlessly ambitious political leader, prevention could be a policy for endless warfare. However, the American political system, with its checks and balances, was designed explicitly for the purpose of constraining the executive from excessive folly. Both the Vietnam and the contemporary Iraqi experiences reveal clearly that although the conduct of war is an executive prerogative, in practice that authority is disciplined by public attitudes. Clausewitz made this point superbly with his designation of the passion, the sentiments, of the people as a vital component of his trinitarian theory of war. 51 It is true to claim that power can be, and indeed is often, abused, both personally and nationally. It is possible that a state could acquire a taste for the apparent swift decisiveness of preventive warfare and overuse the option. One might argue that the easy success achieved against Taliban Afghanistan in 2001, provided fuel for the urge to seek a similarly rapid success against Saddam Hussein's Iraq. In other words, the delights of military success can be habit forming. On balance, claim seven is not persuasive, though it certainly contains a germ of truth. A country with unmatched wealth and power, unused to physical insecurity at home—notwithstanding 42 years of nuclear danger, and a high level of gun crime—is vulnerable to demands for policies that supposedly can restore security. But we ought not to endorse the argument that the United States should eschew the preventive war option because it could lead to a futile, endless search for absolute security. One might as well argue that the United States should adopt a defense policy and develop capabilities shaped strictly for homeland security approached in a narrowly geographical sense. Since a president might misuse a military instrument that had a global reach, why not deny the White House even the possibility of such misuse? In other words, constrain policy ends by limiting policy's military means. This argument has circulated for many decades and, it must be admitted, it does have a certain elementary logic. It is the opinion of this enquiry, however, that the claim that a policy which includes the preventive option might lead to a search for total security is not at all convincing. Of course, folly in high places is always possible, which is one of the many reasons why popular democracy is the superior form of government. It would be absurd to permit the fear of a futile and dangerous quest for absolute security to preclude prevention as a policy option. Despite its absurdity, this rhetorical charge against prevention is a stock favorite among prevention's critics. It should be recognized and dismissed for what it is, a debating point with little pragmatic merit. And strategy, though not always policy, must be nothing if not pragmatic.

No endless war

Rodwell 5

(Jonathan Rodwell is a PhD student at Manchester Met. researching the U.S. Foreign Policy of the late 70's / rise of 'neo-cons' and Second Cold War, "Trendy But Empty: A Response to Richard Jackson," http://www.49thparallel.bham.ac.uk/back/issue15/rodwell1.htm)

To be specific if the U.S. and every other nation is continually reproducing identities through 'othering' it is a constant and universal phenomenon that fails to help us understand at all why one result of the othering turned out one way and differently at another time. For example, how could one explain how the process resulted in the 2003 invasion of Iraq but didn't produce a similar invasion of Afghanistan in 1979 when that country (and by the logic of the Regan administrations discourse) the West was threatened by the 'Evil Empire'. By the logical of discourse analysis in both cases these policies were the result of politicians being able to discipline and control the political agenda to produce the outcomes. So why were the outcomes not the same? To reiterate the point how do we explain that the language of the War on Terror actually managed to result in the eventual Afghan invasion in 2002? Surely it is impossible to explain how George W. Bush was able to convince his people (and incidentally the U.N and Nato) to support a war in Afghanistan without referring to a simple fact outside of the discourse; the fact that a known terrorist in Afghanistan actually admitted to the murder of thousands of people on the 11h of Sepetember 2001. The point is that if the discursive 'othering' of an 'alien' people or group is what really gave the U.S. the opportunity to persue the war in Afghanistan one must surly wonder why Afghanistan. **Why not North Korea? Or Scotland**? If the discourse is so powerfully useful in it's own right why could it not have happened anywhere at any time and more often? Why could the British government not have been able to justify an armed invasion and regime change in Northern Ireland throughout the terrorist violence of the 1980's? Surely they could have just employed the same discursive trickery as George W. Bush? Jackson is absolutely right when he points out that the actuall threat posed by Afghanistan or Iraq today may have been thoroughly misguided and conflated and that there must be more to explain why those wars were enacted at that time. Unfortunately that explanation cannot simply come from the result of inscripting identity and discourse. On top of this there is the clear problem that the consequences of the discursive othering are not necessarily what Jackson would seem to identify. This is a problem consistent through David Campbell's original work on which Jackson's approach is based[iii]. David Campbell argued for a linguistic process that 'always results in an other being marginalized' or has the potential for 'demonisation'[iv]. At the same time Jackson, building upon this, maintains without qualification that the systematic and institutionalised abuse of Iraqi prisoners first exposed in April 2004 "is a direct consequence of the language used by senior administration officials: conceiving of terrorist suspects as 'evil', 'inhuman' and 'faceless enemies of freedom creates an atmosphere where abuses become normalised and tolerated"[v]. The only problem is that the process of differentiation does not actually necessarily produce dislike or antagonism. In the 1940's and 50's even subjected to the language of the 'Red Scare' it's obvious not all Americans came to see the Soviets as an 'other' of their nightmares. And in Iraq the abuses of Iraqi prisoners are isolated cases, it is not the case that the U.S. militarily summarily abuses prisoners as a result of language. Surely the massive protest against the war, even in the U.S. itself, is also a self evident example that the language of 'evil' and 'inhumanity' does not necessarily produce an outcome that marginalises or demonises an 'other'. Indeed one of the points of discourse is that we are continually differentiating ourselves from all others around us without this necessarily leading us to hate fear or abuse anyone.[vi] Consequently, the clear fear of the Soviet Union during the height of the Cold War, and the abuses at Abu Ghirab are unusual cases. To understand what is going on we must ask how far can the process of inscripting identity really go towards explaining them? As a result at best all discourse analysis provides us with is a set of universals and a heuristic model

Endless violence is not a thing

Chandler 9

(David, Westminster IR professor, "War Without End(s): Grounding the Discourse of `Global War'", Security Dialogue, 40.3, SAGE)

Western governments appear to portray some of the distinctive characteristics that Schmitt attributed to 'motorized partisans', in that the shift from narrowly strategic concepts of security to more abstract concerns reflects the fact that Western states have tended to fight free-floating and non-strategic wars of aggression without real enemies at the same time as professing to have the highest values and the absolute enmity that accompanies these. The government policy documents and critical frameworks of 'global war' have been so accepted that it is assumed that it is the strategic interests of Western actors that lie behind the often irrational policy responses, with

'global war' thereby being understood as merely the extension of instrumental struggles for control **This perspective seems unable to contemplate the possibility that it is the lack of a strategic desire for control that drives and defines 'global' war today.** Very few studies of the 'war on terror' start from a study of the Western actors themselves rather than from their declarations of intent with regard to the international sphere itself. This methodological framing inevitably makes assumptions about strategic interactions and grounded interests of domestic or international regulation and control, which are then revealed to explain the proliferation of enemies and the abstract and metaphysical discourse of the 'war on terror' (Chandler, 2009a). For its radical critics, the abstract, global discourse merely reveals the global intent of the hegemonizing designs of biopower or neoliberal empire, as critiques of liberal projections of power are 'scaled up' from the international to the global. Radical critics working within a broadly Foucauldian problematic have no problem grounding global war in the needs of neoliberal or biopolitical governance or US hegemonic designs. These critics have produced numerous frameworks, which seek to assert that global war is somehow inevitable, based on their view of the needs of late capitalism, late modernity, neoliberalism or biopolitical frameworks of rule or domination. From the declarations of global war and practices of military intervention, rationality, instrumentality and strategic interests are read in a variety of ways (Chandler, 2007). Global war is taken very much on its own terms, with the declarations of Western governments explaining and giving power to radical abstract theories of the global power and regulatory might of the new global order of domination, hegemony or empire The alternative reading of 'global war' rendered here seeks to clarify that the declarations of global war are a sign of the **lack of political stakes** and strategic structuring of the international sphere **rather than frameworks for asserting global domination** We increasingly see Western diplomatic and military interventions presented as justified on the basis of value-based declarations, rather than in traditional terms of interest-based outcomes. This was as apparent in the wars of humanitarian intervention in Bosnia, Somalia and Kosovo – where there was no clarity of objectives and therefore little possibility of strategic planning in terms of the military intervention or the post-conflict political outcomes – as it is in the 'war on terror' campaigns, still ongoing, in Afghanistan and Iraq. There would appear to be a **direct relationship between the lack of strategic clarity shaping** and structuring **interventions and the lack of political stakes involved in their outcome.** In fact, the globalization of security discourses seems to reflect the **lack of political stakes rather than the urgency of the security threat** or of the intervention. Since the end of the Cold War, the central problematic could well be grasped as one of withdrawal and the emptying of contestation from the international sphere rather than as intervention and the contestation for control. The disengagement of the USA and Russia from sub-Saharan Africa and the Balkans forms the backdrop to the policy debates about sharing responsibility for stability and the management of failed or failing states (see, for example, Deng et al., 1996). It is the lack of political stakes in the international sphere that has meant that the latter has become more open to ad hoc and **arbitrary interventions as** states and international institutions use the **lack of strategic imperatives** to **construct their own meaning through intervention** As Zaki Laïdi (1998: 95) explains: war is not waged necessarily to achieve predefined objectives, and it is in waging war that the motivation needed to continue it is found. In these cases – of which there are very many – war is no longer a continuation of politics by other means, as in Clausewitz's classic model – but sometimes the initial expression of forms of activity or organization in search of meaning. …. War becomes not the ultimate means to achieve an objective, but the most 'efficient' way of finding one. **The lack of political stakes in the international sphere would** appear to **be the precondition for the globalization of security discourses and the ad hoc and often arbitrary decisions to go to 'war'.** In this sense, global wars reflect the fact that the international sphere has been reduced to little more than a vanity mirror for globalized actors who are **freed from strategic necessities** and **whose concerns are no longer structured in the form of political struggles against 'real enemies'.** The mainstream critical approaches to global wars, with their heavy reliance on recycling the work of Foucault, Schmitt and Agamben, appear to invert this reality, portraying the use of military firepower and the implosion of international law as a product of the high stakes involved in global struggle, rather than the lack of clear contestation involving the **strategic accommodation of diverse powers and interests**.

No global war impact

Teschke 11

(Benno Gerhard, IR prof at the University of Sussex, "Fatal attraction: a critique of Carl Schmitt's international political and legal theory", International Theory (2011), 3 : pp 179-227)

For at the centre of the heterodox – partly post-structuralist, partly realist – neo-Schmittian analysis stands the conclusion of The Nomos: the thesis of a structural and continuous relation between liberalism and violence (Mouffe 2005, 2007; Odysseos 2007). It suggests that, in sharp contrast to the liberal-cosmopolitan programme of 'perpetual peace', the geographical expansion of liberal modernity was accompanied by the intensification and de-formalization of war in the international construction of liberal-constitutional states of law and the production of liberal subjectivities as rights-bearing individuals. Liberal world-ordering proceeds via the conduit of wars for humanity, leading to Schmitt's 'spaceless universalism'. In this perspective, a straight line is drawn from WWI to the War on Terror to verify Schmitt's long-term prognostic of the 20th century as the age of 'neutralizations and de-politicizations' (Schmitt 1993). But this attempt to read the history of 20th century international relations in terms of a succession of confrontations between the carrier-nations of liberal modernity and the criminalized foes at its outer margins seems unable to comprehend the complexities and specificities of 'liberal' world-ordering, then and now. For in the cases of Wilhelmine, Weimar and fascist Germany, the assumption that their conflicts with the Anglo-American liberal-capitalist heartland were grounded in an antagonism between liberal modernity and a recalcitrant Germany outside its geographical and conceptual lines runs counter to the historical evidence. For this reading presupposes that late-Wilhelmine Germany was not already substantially penetrated by capitalism and fully incorporated into the capitalist world economy, posing the question of whether the causes of WWI lay in the capitalist dynamics of inter-imperial rivalry (Blackbourn and Eley 1984), or in processes of belated and incomplete liberal-capitalist development, due to the survival of 're-feudalized' elites in the German state classes and the marriage between 'rye and iron' (Wehler 1997). It also assumes that the late-Weimar and early Nazi turn towards the construction of an autarchic German regionalism – Mitteleuropa or Großraum – was not deeply influenced by the international ramifications of the 1929 Great Depression, but premised on a purely political–existentialist assertion of German national identity. Against a reading of the early 20th century conflicts between 'the liberal West' and Germany as 'wars for humanity' between an expanding liberal modernity and its political exterior, there is more evidence to suggest that these confrontations were interstate conflicts within the crisis-ridden and nationally uneven capitalist project of modernity. Similar objections and caveats to the binary opposition between the Western discourse of liberal humanity against non-liberal foes apply to the more recent period. For how can this optic explain that the 'liberal West' coexisted (and keeps coexisting) with a large number of pliant authoritarian client-regimes (Mubarak's Egypt, Suharto's Indonesia, Pahlavi's Iran, Fahd's Saudi-Arabia, even Gaddafi's pre-intervention Libya, to name but a few), which were and are actively managed and supported by the West as anti-liberal Schmittian states of emergency, with concerns for liberal subjectivities and Human Rights secondary to the strategic interests of political and geopolitical stability and economic access? Even in the more obvious cases of Afghanistan, Iraq, and, now, Libya, the idea that Western intervention has to be conceived as an encounter between the liberal project and a series of foes outside its sphere seems to rely on a denial of their antecedent histories as geopolitically and socially contested state-building projects in pro-Western fashion, deeply co-determined by long histories of Western anti-liberal colonial and post-colonial legacies. If these states (or social forces within them) turn against their imperial masters, the conventional policy expression is 'blowback'. And as the Schmittian analytical vocabulary does not include a conception of human agency and social forces – only friend/enemy groupings and collective political entities governed by executive decision – it also lacks the categories of analysis to comprehend the social dynamics that drive the struggles around sovereign power and the eventual overcoming, for example, of Tunisian and Egyptian states of emergency without US-led wars for humanity. Similarly, it seems unlikely that the generic idea of liberal world-ordering and the production of liberal subjectivities can actually explain why Western intervention seems improbable in some cases (e.g. Bahrain, Qatar, Yemen or Syria) and more likely in others (e.g. Serbia, Afghanistan, Iraq, and Libya). Liberal world-ordering consists of differential strategies of building, coordinating, and drawing liberal and anti-liberal states into the Western orbit, and overtly or covertly intervening and refashioning them once they step out of line. These are conflicts within a world, which seem to push the term liberalism beyond its original meaning. The generic Schmittian idea of a liberal 'spaceless universalism' sits uncomfortably with the realities of maintaining an America-supervised 'informal empire', which has to manage a persisting interstate system in diverse and case-specific ways. But it is this persistence of a worldwide system of states, which encase national particularities, which renders challenges to American supremacy possible in the first place.

AT Extinction Inev

Extinction does not make our efforts worthless.
Trisel 4

[Brooke Alan Trisel, Medical Facilities Consultant with the Ohio Department of Health, "Human Extinction and the Value of Our Efforts," *The Philosophical Forum*, Volume XXXV, Number 3, Fall, 2004, p. 390-391]

Although our works will not last forever, this should not matter if we accomplished what we set out to do when we created these works. Wanting our [end page 390] creations to endure forever was not likely part of our goal when we created them. If we accomplish our goals and then later in life conclude that these accomplishments were of no significance, then this is a sign that a desire for long-lastingness has crept into the standards that we use to judge significance. Escalating desires can lead to escalating standards since the standards that we establish reflect our goals and desires. Including long-lastingness as a criterion for judging the significance of our efforts is unreasonable. If one includes long-lastingness as part of the standard, then one will feel that it is necessary for humanity to persist forever. There is no need for humanity to live forever for our lives and works to be significant. If the standard that we adopt for judging significance does not include long-lastingness as part of the standard, then it will not matter whether humanity will endure for a long time. Like Tolstoy, we may be unable to keep from wanting to have our achievements remembered forever. We may also be unable to keep from wanting our works to be appreciated forever. But we can refrain from turning these desires into standards for judging whether our efforts and accomplishments are significant. If we can keep from doing this, it will be to our advantage. Then, during those times when we look back on life from an imagined perspective that encompasses times after humanity has become extinct, we will not conclude that our efforts amounted to nothing. Rather, we will conclude that many people made remarkable accomplishments that made their lives, and possibly the lives of others, better than they would have been if these goals had never been pursued. And if we expand our evaluation, as we should, to take into account all experiences associated with living, not just goal-related experiences, we will conclude not that life was empty, but that living was worthwhile.

AT Libidinal Econ

Their insidious targeting arg relies on the libidinal economy which is wrong and cannot be the foundation for ethics or the political

Gordon 1

(Paul, psychotherapist living and working in London **Psychoanalysis and Racism**: The politics of defeat Race & Class v. 42, n. 4)

The postmodernists' problem is that they cannot live with disappointment. All the tragedies of the political project of emancipation ± the evils of Stalinism in particular ± are seen as the inevitable product of men and women trying to create a better society. But, rather than engage in a critical assessment of how, for instance, radical political movements go wrong, they discard the emancipatory project and impulse itself. The postmodernists, as Sivanandan puts it, blame modernity for having failed them: `the intellectuals and academics have fled into discourse and deconstruction and representation ± as though to interpret the world is more important than to change it, as though changing the interpretation is all we could do in a changing world'.58 To justify their flight from a politics holding out the prospect of radical change through self-activity, the disappointed intellectuals and abundant intellectual alibis for themselves in the very work they champion, including, in Cohen's case, psychoanalysis. What Marshall Berman says of Foucault seems true also of psychoanalysis; that it offers `a world-historical alibi' for the passivity and helplessness felt by many in the 1970s, and that it has nothing but contempt for those naive enough to imagine that it might be possible for modern human-kind to be free. At every turn for such theorists, as Berman argues, whether in sexuality, politics, even our imagination, we are nothing but prisoners: there is no freedom in Foucault's world, because his language forms a seamless web, a cage far more airtight than anything Weber ever dreamed of, into which no life can break . . . There is no point in trying to resist the oppressions and injustices of modern life, since even our dreams of freedom only add more links to our chains; however, once we grasp the futility of it all, at least we can relax.59 Cohen's political defeatism and his conviction in the explanatory power of his new faith of psychoanalysis lead him to be contemptuous and dismissive of any attempt at political solidarity or collective action. For him, `communities' are always `imagined', which, in his view, means based on fantasy, while different forms of working-class organisation, from the craft fraternity to the revolutionary group, are dismissed as `fantasies of self-sufficient combination'.60 In this scenario, the idea that people might come together, think together, analyse together and act together as rational beings is impossible The idea of a genuine community of equals becomes a pure fantasy a `symbolic retrieval' of something that never existed in the first place: `Community is a magical device for conjuring something apparently solidary out of the thin air of modern times, a mechanism of re-enchantment.' As for history, it is always false, since `We are always dealing with invented traditions.'61 Now, this is not only non- sense, but dangerous nonsense at that. Is history `always false'? Did the Judeocide happen or did it not? And did not some people even try to resist it? Did slavery exist or did it not, and did not people resist that too and, ultimately, bring it to an end? And are communities always `imagined'? Or, as Sivanandan states, are they beaten out on the smithy of a people's collective struggle? Furthermore, all attempts to legislate against ideology are bound to fail because they have to adopt `technologies of surveillance and control identical to those used by the state'. Note here the Foucauldian language to set up the notion that all `surveillance' is bad. But is it? No society can function without surveillance of some kind. The point, surely, is that there should be a public conversation about such moves and that those responsible for implementing them be at all times accountable. To equate, as Cohen does, a council poster about `Stamping out racism' with Orwell's horrendous prophecy in 1984 of a boot stamping on a human face is ludicrous and insulting. (Orwell's image was intensely personal and destructive; the other is about the need to challenge not individuals, but a collective evil.) Cohen reveals himself to be deeply ambivalent about punitive action against racists, as though punishment or other firrm action against them (or anyone else transgressing agreed social or legal norms) precluded `understand- ing' or even help through psychotherapy. It is indeed a strange kind of `anti-racism' that portrays active racists as the `victims', those who are in need of `help'. But this is where Cohen's argument ends up. In their move from politics to the academy and the world of `discourse', the postmodernists may have simply exchanged one grand narrative, historical materialism, for another, psychoanalysis.62 For psychoanalysis is a grand narrative, par excellence. It is a theory that seeks to account for the world and which recognises few limits on its explanatory potential. And the claimed radicalism of psycho- analysis, in the hands of the postmodernists at least, is not a radicalism at all but a prescription for a politics of quietism, fatalism and defeat. Those wanting to change the world, not just to interpret it, need to look elsewhere.

Libidinal economy doesn't explain violence

Havi **Carel 6**, Senior Lecturer in Philosophy at the University of the West of England, "Life and Death in Freud and Heidegger", googlebooks

Secondly, the constancy principle on which these ideas are based is incompatible with observational data. Once the passive model of the nervous system has been discarded, there was no need for external excitation in order for discharge to take place, and more generally, "the behavioural picture seemed to negate the notion of drive, as a separate energizer of behaviour" {Hcbb. 1982. p.35}. According to Holt, the nervous system is not passive; it does not take in and conduct out energy from the environment, and it shows no tendency to discharge its impulses. 'The principle of constancy is quite without any biological basis" (1965, p. 109). He goes on to present the difficulties that arise from the pleasure principle as linked to a tension-reduction theory. The notion of tension is "conveniently ambiguous": it has phenomenological, physiological and abstract meaning. But empirical evidence against the theory of tension reduction has been "mounting steadily" and any further attempts to link pleasure with a reduction of physiological tension are "decisively refuted" (1965, pp. 1102). Additionally, the organism and the mental system are no longer considered closed systems. So the main arguments for the economic view collapse, as does the entropic argument for the death drive (1965, p. 114). A final, more general criticism of Freud's economic theory is sounded by Compton, who argues, "Freud fills in psychological discontinuities with neurological hypotheses" (1981, p. 195). The Nirvana principle is part and parcel of the economic view and the incomplete and erroneous assumptions about the nervous system (Hobson, 1988, p.277). It is an extension ad extremis of the pleasure principle, and as such is vulnerable to all the above criticisms. The overall contemporary view provides strong support for discarding the Nirvana principle and reconstructing the death drive as aggression.

No empirical basis for scaling up psychoanalysis

Epstein, senior lecturer in government and IR – University of Sydney, **'10**

(Charlotte, "Who speaks? Discourse, the subject and the study of identity in international politics," European Journal of International Relations XX(X) 1–24)

One key advantage of the Wendtian move, granted even by his critics (see Flockhart, 2006), is that it simply does away with the level-of-analysis problem altogether. If states really are persons, then we can apply everything we know about people to understand how they behave. The study of individual identity is not only theoretically justified but it is warranted. This cohesive self borrowed from social psychology is what allows Wendt to bridge the different levels of analysis and travel between the self of the individual and that of the state, by way of a third term, 'group self', which is simply an aggregate of individual selves. Thus for Wendt (1999: 225) 'the state is simply a "group Self" capable of group level cognition'. Yet that the individual possesses a self does not logically entail that the state possesses one too. It is in this leap, from the individual to the state, that IR's fallacy of composition surfaces most clearly. Moving beyond Wendt but maintaining the psychological self as the basis for theorizing the state Wendt's bold ontological claim is far from having attracted unanimous support (see notably, Flockhart, 2006; Jackson, 2004; Neumann, 2004; Schiff, 2008; Wight, 2004). One line of critique of the states-as-persons thesis has taken shape around the resort to psychological theories, specifically, around the respective merits of Identity Theory (Wendt) and SIT (Flockhart, 2006; Greenhill, 2008; Mercer, 2005) for understanding state behaviour.9 Importantly for my argument, that the state has a self, and that this self is pre-social, remains unquestioned in this further entrenching of the psychological turn. Instead questions have revolved around how this pre-social self (Wendt's 'Ego') behaves once it encounters the other (Alter): whether, at that point (and not before), it takes on roles prescribed by pre-existing cultures (whether Hobbessian, Lockean or Kantian) or whether instead other, less culturally specific, dynamics rooted in more universally human characteristics better explain state interactions. SIT in particular emphasizes the individual's basic need to belong, and it highlights the dynamics of in-/out-group categorizations as a key determinant of behaviour (Billig, 2004). SIT seems to have attracted increasing interest from IR scholars, interestingly, for both critiquing (Greenhill, 2008; Mercer, 1995) and rescuing constructivism (Flockhart, 2006). For Trine Flockart (2006: 89–91), SIT can provide constructivism with a different basis for developing a theory of agency that steers clear of the states-as-persons thesis while filling an important gap in the socialization literature, which has tended to focus on norms rather than the actors adopting them. She shows that a state's adherence to a new norm is best understood as the act of joining a group that shares a set of norms and values, for example the North Atlantic Treaty Organization (NATO). What SIT draws out are the benefits that accrue to the actor from belonging to a group, namely increased self-esteem and a clear cognitive map for categorizing other states as 'in-' or 'out-group' members and, from there, for orientating states' self–other relationships. Whilst coming at it from a stance explicitly critical of constructivism, for Jonathan Mercer (2005: 1995) the use of psychology remains key to correcting the systematic evacuation of the role of emotion and other 'non-rational' phenomena in rational choice and behaviourist analyses, which has significantly impaired the understanding of international politics. SIT serves to draw out the emotional component of some of the key drivers of international politics, such as trust, reputation and even choice (Mercer, 2005: 90–95; see also Mercer, 1995). Brian Greenhill (2008) for his part uses SIT amongst a broader array of psychological theories to analyse the phenomenon of self–other recognition and, from there, to take issue with the late Wendtian assumption that mutual recognition can provide an adequate basis for the formation of a collective identity amongst states. The main problem with this psychological turn is the very utilitarian, almost mechanistic, approach to non-

rational phenomena it proposes, which tends to evacuate the role of meaning. In other words, it further shores up the pre-social dimension of the concept of self that is at issue here. Indeed norms (Flockhart, 2006), emotions (Mercer, 2005) and recognition (Greenhill, 2008) are hardly appraised as symbolic phenomena. In fact, in the dynamics of in- versus out-group categorization emphasized by SIT, language counts for very little. Significantly, in the design of the original experiments upon which this approach was founded (Tajfel, 1978), whether two group members communicate at all, let alone share the same language, is non-pertinent. It is enough that two individuals should know (say because they have been told so in their respective languages for the purposes of the experiment) that they belong to the same group for them to favour one another over a third individual. The primary determinant of individual behaviour thus emphasized is a pre-verbal, primordial desire to belong, which seems closer to pack animal behaviour than to anything distinctly human. What the group stands for, what specific set of meanings and values binds it together, is unimportant. What matters primarily is that the group is valued positively, since positive valuation is what returns accrued self-esteem to the individual. In IR Jonathan Mercer's (2005) account of the relationship between identity, emotion and behaviour reads more like a series of buttons mechanically pushed in a sequence of the sort: positive identification produces emotion (such as trust), which in turn generates specific patterns of in-/out-group discrimination. Similarly, Trine Flockhart (2006: 96) approaches the socializee's 'desire to belong' in terms of the psychological (and ultimately social) benefits and the feel-good factor that accrues from increased self-esteem. At the far opposite of Lacan, the concept of desire here is reduced to a Benthamite type of pleasure- or utility-maximization where meaning is nowhere to be seen. More telling still is the need to downplay the role of the Other in justifying her initial resort to SIT. For Flockhart (2006: 94), in a post-Cold War context, 'identities cannot be constructed purely in relation to the "Other"'. Perhaps so; but not if what 'the other' refers to is the generic, dynamic scheme undergirding the very concept of identity. At issue here is the confusion between the reference to a specific other, for which Lacan coined the concept of *le petit autre*, and the reference to *l'Autre*, or Other, which is that symbolic instance that is essential to the making of *all* selves. As such it is not clear what meaning Flockhart's (2006: 94) capitalization of the 'Other' actually holds. The individual self as a proxy for the state's self

Another way in which the concept of self has been centrally involved in circumventing the level-of-analysis problem in IR has been to treat the self of the individual as a proxy for the self of the state. The literature on norms in particular has highlighted the role of individuals in orchestrating norm shifts, in both the positions of socializer (norm entrepreneurs) and socializee. It has shown for example how some state leaders are more susceptible than others to concerns about reputation and legitimacy and thus more amenable to being convinced of the need to adopt a new norm, of human rights or democratization, for example (Finnemore and Sikkink, 1998; Keck and Sikkink, 1998; Risse, 2001). It is these specific psychological qualities pertaining to their selves (for example, those of Gorbachev; Risse, 2001) that ultimately enable the norm shift to occur. Once again the individual self ultimately remains the basis for explaining the change in state behaviour. To summarize the points made so far, whether the state is literally considered as a person by ontological overreach, whether so only by analogy, or whether the person stands as a proxy for the state, the 'self' of that person has been consistently taken as the reference point for studying state identities. Both in Wendt's states-as-persons thesis, and in the broader psychological turn within constructivism and beyond, the debate has consistently revolved around the need to evaluate which of the essentialist assumptions about human nature are the most useful for explaining state behaviour. It has never questioned the validity of starting from these assumptions in the first place. That is, what is left unexamined is this assumption is that what works for individuals will work for states too. This is IR's central fallacy of composition, by which it has persistently eschewed rather than resolved the level-of-analysis problem. Indeed, in the absence of a clear demonstration of a logical identity (of the type A=A) between states and individuals, the assumption that individual interactions will explain what states do rests on little more than a leap of faith, or indeed an analogy.

AT Ressentiment

Resentment of particular aspects of the world is inevitable and necessary – it is only Loyola's resentment of the very terms of human experience that is truly dangerous. We must begin with an affirmation of belief in the world
Connolly 11

(William E., A World of Becoming, Duke University Press)

By "belief in this world:' neither Deleuze nor I, again, means that the established distribution of power, exploitation, and inequality now in place is to be protected, though some critics love to jump to this conclusion. Such arrangements make people suffer too much, and they rest upon the repression of essential features of the contemporary condition, including the minoritization of the world occurring at a more rapid pace. Exploitation and domination are things to contest and oppose, as Deleuze did actively while embracing the points reviewed above. The restoration of belief in this world provides an existential resource to draw upon as those struggles are fought energetically and creatively. Nor do we mean that it is always illegitimate to resent your place in the world. Resentment is often a needed impetus to action, even if it carries the danger of becoming transfigured into ressontimont. It is existential resentment we worry about most, the kind that is apparent today in practices of capitalist greed, religious exclusivity; media bellicosity, authoritarian strategies, sexual narrowness, and military aggression. We mean, first, positive affirmation of the cosmos in which human beings are set, as you yourself understand that cosmos, second, coming to terms in a positive way with the enduring modem fact of interruptions in experience and the faster pace at which minorithation occurs, and third, accepting the contestability of your existential creed without profound resentment of that condition.

No internal link to their lash out impact – It is only when the desire for revenge and redemptive justice is allowed to take precedence is action against suffering resentful and dangerous
Connolly 11

(William E., A World of Becoming, Duke University Press)

It is perhaps salient to point out again how my attention to the rolling and roiling interactions between hubris and existential resentment does not carry with it a denial of the positive role that anger, resentment, indignation, and the like can and do play in politics. There is no politics without passion. It is when the trials of life /or the hubris of mastery slide into institutionally embedded drives to existential revenge that things become most dangerous. That is a risk accompanying any and every positive social movement. As we saw in chapter 3, it is also a risk that we should engage self-critically as we respond to new configurations of struggle.

Ressentiment doesn't come first – extinction and material impacts do

Torbjörn **Tännsjö 11**, the Kristian Claëson Professor of Practical Philosophy at Stockholm University, 2011, "Shalt Thou Sometimes Murder? On the Ethics of Killing," online: http://people.su.se/~jolso/HS-texter/shaltthou.pdf

I suppose it is correct to say that, if Schopenhauer is right, if life is never worth living, then according to utilitarianism we should all commit suicide and put an end to humanity. But this does not mean that, each of us should commit suicide. I commented on this in chapter two when I presented the idea that utilitarianism should be applied, not only to individual actions, but to collective actions as well.¶ It is a well-known fact that people rarely commit suicide. Some even claim that no one who is mentally sound commits suicide. Could that be taken as evidence for the claim that people live lives worth living? That would be rash. Many people are not utilitarians. They may avoid suicide because they believe that it is morally wrong to kill oneself. It is also a possibility that, even if people lead lives not worth living, they believe they do. And even if some may believe that their lives, up to now, have not been worth living, their future lives will be better. They may be mistaken about this. They may hold false expectations about the future.¶ From the point of view of evolutionary biology, it is natural to assume that people should rarely commit suicide. If we set old age to one side, it has poor survival value (of one's genes) to kill oneself. So it should be expected that it is difficult for ordinary people to kill themselves. But then theories about cognitive dissonance, known from psychology, should warn us that we may come to believe that we live better lives than we do.¶ My strong belief is that most of us live lives worth living. However, I do believe that our lives are close to the point where they stop being worth living. But then it is at least not very far-fetched to think that they may be worth not living, after all. My assessment may be too optimistic.¶ Let us just for the sake of the argument assume that our lives are not worth living, and let us accept that, if this is so, we should all kill ourselves. As I noted above, this does not answer the question what we should do, each one of us. My conjecture is that we should not commit suicide. The explanation is simple. If I kill myself, many people will suffer. Here is a rough explanation of how this will happen: ¶ ... suicide "survivors" confront a complex array of feelings. Various forms of guilt are quite common, such as that arising from (a) the belief that one contributed to the suicidal person's anguish, or (b) the failure to recognize that anguish, or (c) the inability to prevent the suicidal act itself. Suicide also leads to rage, loneliness, and awareness of vulnerability in those left behind. Indeed, the sense that suicide is an essentially selfish act dominates many popular perceptions of suicide. ¶ The fact that all our lives lack meaning, if they do, does not mean that others will follow my example. They will go on with their lives and their false expectations — at least for a while devastated because of my suicide. But then I have an obligation, for their sake, to go on with my life. It is highly likely that, by committing suicide, I create more suffering (in their lives) than I avoid (in my life).

AT Social Death

Social death is an incorrect homogenization of the past AND reifies colonial power relations by placing European whiteness at the center of symbolic examination

Walker 12

(Tracey, Birkbeck University Masters in Psychosocial Studies, "The Future of Slavery: From Cultural Trauma to Ethical Remembrance", Graduate Journal of Social Science, 9.2, July, JSTOR)

To argue that there is more to the popular conception of slaves as victims who experienced social death within the abusive regime of transatlantic slavery is not to say that these subjectivities did not exist. When considering the institution of slavery we can quite confidently rely on the assumption that it did indeed destroy the self-hood and the lives of millions of Africans. Scholar Vincent Brown (2009) however, has criticised Orlando Patterson's (1982) seminal book Slavery and Social Death for positioning the slave as a subject without agency and maintains that those who managed to dislocate from the nightmare of plantation life 'were not in fact the living dead', but 'the mothers of gasping new societies' (Brown 2009, 1241). The Jamaican Maroons were one such disparate group of Africans who managed to band together and flee the Jamaican plantations in order to create a new mode of living under their own rule. These 'runaways' were in fact 'ferocious fighters and master strategists', building towns and military bases which enabled them to fight and successfully win the war against the British army after 200 years of battle (Gotlieb 2000,16). In addition, the story of the Windward Jamaican Maroons disrupts the phallocentricism inherent within the story of the slave 'hero' by the very revelation that their leader, 'Queen Nanny' was a woman (Gotlieb 2000). As a leader, she was often ignored by early white historians who dismissed her as an 'old hagg' or 'obeah' woman (possessor of evil magic powers) (Gotlieb 2000, xvi). Yet, despite these negative descriptors, Nanny presents an interesting image of an African woman in the time of slavery who cultivated an exceptional army and used psychological as well as military force against the English despite not owning sophisticated weapons (Gotlieb 2000). As an oral tale, her story speaks to post-slavery generations through its representation of a figure whose gender defying acts challenged the patriarchal fantasies of the Eurocentric imaginary and as such 'the study of her experiences might change the lives of people living under paternalistic, racist, classist and gender based oppression' (Gotlieb 2000, 84). The label of 'social death' is rejected here on the grounds that it is a narrative which is positioned from the vantage point of a European hegemonic ideology. Against the social symbolic and its gaze, black slaves were indeed regarded as non-humans since their lives were stunted, diminished and deemed less valuable in comparison to the Europeans. However, Fanon's (1967) assertion that 'not only must the black man be black; he must be black in relation to the white man' (Fanon 1967, 110) helps us to understand that this classification can only have meaning relative to the symbolic which represents the aliveness of whiteness against the backdrop of the dead black slave (Dyer 1997). Butler (2005) makes it clear that the 'death' one suffers relative to the social symbolic is imbued with the fantasy that having constructed the Other and interpellated her into 'life', one now holds the sovereignty of determining the subject's right to live or die: this death, if it is a death, is only the death of a certain kind of subject, one that was never possible to begin with, the death of the fantasy of impossible mastery, and so a loss of what one never had, in other words it is a necessary grief (Butler 2005, 65). The point to make here is that although the concept of social death has proved useful for theorists to describe the metaphysical experience of those who live antagonistically in relation to the social symbolic, it is nevertheless a colonial narrative within which the slaves are confined to a one dimensional story of terror. In keeping with Gilroy's (1993b) argument that the memory of slavery must be constructed from the slaves' point of view, we might instead concentrate, not on the way in which the slaves are figured within the European social imaginary, but on how they negotiated their own ideas about self and identity. We might therefore find some value in studying a group like the Maroons who not only managed to create an autonomous world outside of the hegemonic discourse which negated them, but also, due to their unique circumstances, were forced to create new modes of communication which would include a myriad of African cultures, languages and creeds (Gottlieb 2000). This creative and resistive energy of slave subjectivity not only disrupts the colonial paradigm of socially dead slaves, but also implies the ethical tropes of creation, renewal and mutual recognition. In contrast, the passive slave proved to feature heavily in the 2007 bicentenary commemorations causing journalist Toyin Agbetu to interrupt the official speeches and exclaim that it had turned into a discourse of freedom engineered mostly by whites with stories of black agency excluded8.

Young's argument that 'one of the damaging side effects of the focus on white people's role in abolition is that Africans are represented as being passive in the face of oppression', appears to echo the behaviour in the UK today given that a recent research poll reveals that the black vote turnout is significantly lower than for the white majority electorate and that forty percent of second generation 'immigrants' believe that voting 'doesn't matter'.9 Yet, Gilroy (1993a) argues that this political passivity may not simply be a self fulfilling prophecy, but might allude to the 'lived contradiction' of being black and English which affects one's confidence about whether opinions will be validated in a society that, at its core, still holds on to the fantasy of European

superiority (Gilroy 1993a). ==Without considering the slaves' capacity for surviv==al and their fundamental role in overthrowing the European regime of slavery, ==we limit the use–value of the memory and risk becoming overly attached to singular slave subjectivities seeped in death and passivity.== The Maroons story how-ever, enables slave consciousness to rise above the mire of slavery's abject victims and establishes an ethical relation with our ancestors who lived and survived in the time of slavery.

The Black body should be understood as active subject – refuse to allow their notion of a monolithic white civil society control all description of the world

Yancy (Prof of Philosophy at Duqesne) **8**

(George, Black Bodies, White Gazes: The Contining Significance of Race, Pg. 122)

As agential, Black people confront the world and construct the world from unique perspectives. They take up their ex-istence within the framework of a given set of circumstances.42 Despite the horrible conditions that came with being forced to live and to work on plantations, many Blacks were able to reconfigure what was given, They were able to take a stand against dehuman-ization and negotiate ways of achieving a sense of dignity. Moreover, this had to be done while making whites think that they had succeeded in producing the most obedient and docile slaves around. In short, Blacks had to "conform" to white myths while undermining those myths simultaneously. The negotiation between myth and reality took place within a variety of work activities, For example, as stated, many Blacks would break tools and destroy crops, As stated, whites rationalized such behaviors as the result of clumsiness and stupidity, Apparently, these same tools were not broken when Blacks worked their own meager areas for planting. In fact, "one slaveholder felt aggrieved when he saw that the small patches which his Negroes cultivated for themselves were better cared for and more productive than his own field."43 This suggests a process of selective valuing. To be selective, of course, involves deliberation, which is indicative of having a perspective on the world. Hence, contrary to the myth that Black people were devoid of agency, they cultivated these small patches of their own in order to exercise a measure of economic independence and agency. Blacks would grow their own food, as well as steal food from the plantation, selling it through a complex network of trade with passing ships.
Breaking tools was one way that enslaved Black people were able to exercise control over their work. To break a tool (or destroy a patch of land) requires the establishment of a different/alternative way of relating to a given object (the tool or the land). To engage in this type of alternative engagement involves the telic dimensions of embodied subjectivity. In short, Blacks assumed a position of transcendence in relationship to a field of objects, Deborah White notes, "While some Southern whites called such behavior [breaking tools, for example] 'rascality,' slaves [or the ensltma) understood it to be an effective form of resistance,"

AT Structural Violence

No impact to structural violence

a. Declining Now

Larry **Obhof**, JD @ Yale, 200**3** ("WHY GLOBALIZATION? A LOOK AT GLOBAL CAPITALISM AND ITS EFFECTS". University of Florida Journal of Law & Public Policy. Fall 2003)

The effects of globalization have largely been positive for both developed and developing countries. Consider, for example, the effects of the Uruguay Round of trade negotiations, which lasted from 1986 to 1994 and resulted in agreements to reduce tariffs and other non-tariff barriers. Advanced countries agreed to lower their tariffs by an average of 40%, and [*99] the signatories agreed to liberalize trade in the important areas of agriculture and clothing. n32 The effects of the Uruguay Round have been both positive and large. Reducing tariffs and non-tariff barriers has produced annual increases in global GDP of $ 100-300 billion. n33 This figure is five times larger than the total worldwide aid to developing countries. n34 More importantly, a significant share of this increase has gone to the poorest people. The percentage of the population in developing countries living under $ 1 per day has fallen from 30% to 24% in the past decade. n35 The recent experience of Mexico offers an excellent example of global capitalism in action. The extent of poverty in Mexico is shocking; 20 million people live on less than $ 2 per day. n36 This is so for a number of reasons, including government intervention in the market in the form of protectionist measures intended to help ailing or failing industries. Using government interventions to shape the allocation of resources traditionally led to gross inefficiencies and a low pace of innovation and adoption of new technologies. n37 Trade liberalization has helped curb such interventions - indeed, the opening of its markets has become one of the most important and far-reaching reforms in Mexico. The effects of trade liberalization on the Mexican economy have been significant. Exports in Mexico have increased sixfold since 1985, and the GDP of the country has grown at an average rate of 5.4% per year since 1996. n38 Since NAFTA created a "free trade area" among the United States, Canada, and Mexico in 1994, Mexican labor productivity has grown fast in its tradable sectors. n39 Not surprisingly, however, productivity has remained stagnant in nontradable sectors. n40 NAFTA has also improved Mexico's aggregate trade balance and helped to ameliorate the effect of the [*100] peso crisis on capital flows. n41 As most economists predicted during the NAFTA debate, the effects of the agreement have been positive and large for Mexico. n42 The effects have also been positive, although smaller, for the United States. This is also consistent with the pre-NAFTA analyses of most economists. n43 The positive effects of globalization have been consistent throughout the developing world. Dramatic increases in per capita income have accompanied the expansion of trade in countries that have become more globalized. Korea, for example, has seen average incomes increase eightfold since 1960. n44 China has experienced an average growth of 5.1% during the same period, and other countries in Asia, Africa, and Latin America have experienced faster growth than that in advanced countries. n45 The evidence is incredibly one-sided. "[P]romoting openness, and supporting it with sound domestic policies, leads to faster growth." n46 The most successful third of developing countries have lowered average import tariffs by 34% and increased trade relative to income by 104% since 1980. n47 Per capita income in these countries rose by a yearly average of [*101] 3.5% in the 1980s, and a yearly average of 5% in the 1990s. n48 The remaining developing countries, which have lowered tariffs by an average of only 11%, experienced "little or no growth in GDP per capita in the post-1980 period." n49 In countries that have become more open, increased growth has undoubtedly been good for the poor. "Cross-country evidence suggests that the incomes of the poorest 20 percent of the population increase roughly one-for-one with the average per capita income." n50 Some studies have found an even stronger effect: a 1% increase in the average per capita income is associated with a reduction in poverty rates by up to 3.5%. n51 Poverty rates fall, almost always, simultaneously with growth in average living standards. The evidence is clear: increasing integration leads to greater growth, and with it, greater income levels, particularly for the poorest. n52

b. Not root of war and Case Turns it

Goldstein 1 (Joshua S., Professor Emeritus of International Relations – American University, Adjunct Professor in the Watson Institute for International Studies – Brown University, War and Gender: How Gender Shapes the War System and Vice Versa, p. 412)

First, <u>peace **activists face a dilemma in thinking about causes of war**</u> <u>and working for peace. Many peace</u> scholars and <u>activists support the approach, "if you want peace, work for justice."</u> Then, if one believes that sexism contributes to war, one can work for gender justice specifically (perhaps among others) in order to pursue peace. <u>This approach</u> brings strategic allies to the peace movement (women, labor, minorities), but <u>rests on the assumption that injustices</u> <u>cause war. The evidence in this book suggests that</u> <mark>causality runs</mark> <u>at least as strongly</u> <mark>the other way. War</mark> <mark>is not a product of</mark> capitalism, imperialism, <mark>gender</mark>, innate aggression, <mark>or any other single cause</mark>, although all of these influence wars' outbreaks and outcomes. <u>Rather,</u> <mark>war has</mark> in part <mark>fueled</mark> and sustained <mark>these and other</mark> <u>injustices. So</u>, "if you want peace, work for peace." Indeed, <u>if you want justice</u> (gender and others), <mark>work for</mark> <mark>peace</mark>. Causality does not run just upward through the levels of analysis, from types of individuals, societies, and governments up to war. It runs downward too. Enloe suggests that <mark>changes in attitudes towards war</mark> and the military <mark>may be the most</mark> <mark>important way to "reverse women's oppression</mark>." The dilemma is that <u>peace work focused on justice brings</u> <u>to the peace movement energy, allies</u>, and moral grounding, <u>yet, in light of this book's evidence, the emphasis</u> <u>on injustice as the main cause of war seems to be empirically inadequate.</u>

Life has intrinsic and objective value achieved through subjective pleasures---its preservation should be an a priori goal

Kacou 8

(Amien WHY EVEN MIND? On The A Priori Value Of "Life", Cosmos and History: The Journal of Natural and Social Philosophy, Vol 4, No 1-2 (2008)
cosmosandhistory.org/index.php/journal/article/view/92/184)

Furthermore, that manner of finding things good that is in pleasure can certainly not exist in any world without consciousness (i.e., without "life," as we now understand the word)—slight analogies put aside. In fact, we can begin to develop a more sophisticated definition of the concept of "pleasure," in the broadest possible sense of the word, as follows: it is the common psychological element in all psychological experience of goodness (be it in joy, admiration, or whatever else). In this sense, pleasure can always be pictured to "mediate" all awareness or perception or judgment of goodness: there is pleasure in all consciousness of things good; pleasure is the common element of all conscious satisfaction. In short, it is simply the very experience of liking things, or the liking of experience, in general. In this sense, pleasure is, not only uniquely characteristic of life but also, the core expression of goodness in life—the most general sign or phenomenon for favorable conscious valuation, in other words. This does not mean that "good" is absolutely synonymous with "pleasant"—what we value may well go beyond pleasure. (The fact that we value things needs not be reduced to the experience of liking things.) However, what we value beyond pleasure remains a matter of speculation or theory. Moreover, we note that a variety of things that may seem otherwise unrelated are correlated with pleasure—some more strongly than others. In other words, there are many things the experience of which we like. For example: the admiration of others; sex; or rock-paper-scissors. But, again, what they are is irrelevant in an inquiry on a priori value—what gives us pleasure is a matter for empirical investigation. Thus, we can see now that, in general, something primitively valuable is attainable in living—that is, pleasure itself. And it seems equally clear that we have a priori logical reason to pay attention to the world in any world where pleasure exists. Moreover, we can now also articulate a foundation for a security interest in our life: since the good of pleasure can be found in living (to the extent pleasure remains attainable),[17] and only in living, therefore, a priori, life ought to be continuously (and indefinitely) pursued at least for the sake of preserving the possibility of finding that good. However, this platitude about the value that can be found in life turns out to be, at this point, insufficient for our purposes. It seems to amount to very little more than recognizing that our subjective desire for life in and of itself shows that life has some objective value. For what difference is there between saying, "living is unique in benefiting something I value (namely, my pleasure); therefore, I should desire to go on living," and saying, "I have a unique desire to go on living; therefore I should have a desire to go on living," whereas the latter proposition immediately seems senseless? In other words, "life gives me pleasure," says little more than, "I like life." Thus, we seem to have arrived at the conclusion that the fact that we already have some (subjective) desire for life shows life to have some (objective) value. But, if that is the most we can say, then it seems our enterprise of justification was quite superficial, and the subjective/objective distinction was useless—for all we have really done is highlight the correspondence between value and desire. Perhaps, our inquiry should be a bit more complex.

Life is always valuable

Torchia 2, Professor of Philosophy, Providence College, Phd in Philosophy, Fordham College (Joseph, "Postmodernism and the Persistent Vegetative State," The National Catholic Bioethics Quarterly Summer 2002, Vol. 2, No. 2, http://www.lifeissues.net/writers/torc/torc_01postmodernismandpvs1.html)

Ultimately, Aquinas' theory of personhood requires a metaphysical explanation that is rooted in an understanding of the primacy of the existence or esse of the human person. For humans beings, the upshot of this position is clear: while human personhood is intimately connected with a broad range of actions (including consciousness of oneself and others), the definition of personhood is not based upon any specific activity or capacity for action, but upon the primacy of esse. Indeed, human actions would have neither a cause nor any referent in the absence of a stable, abiding self that is rooted in the person's very being. A commitment to the primacy of esse, then, allows for an adequate recognition of the importance of actions in human life, while providing a principle for the unification and stabilizing of these behavioral features. In this respect, the human person is defined as a dynamic being which actualizes the potentiality for certain behavior or operations unique to his or her own existence. Esse thereby embraces all that the person is and is capable of doing. In the final analysis, **any attempt to define the person in terms of a single attribute, activity, or capability** (e.g., consciousness) flies in the face of the depth and multi-dimensionality which is part and parcel of personhood itself. To do so **would abdicate the ontological core of the person and the very center which renders human activities intelligible.** And Aquinas' anthropology, I submit, provides an effective philosophical lens through which the depth and profundity of the human reality comes into sharp focus. In this respect, Kenneth Schmitz draws an illuminating distinction between "person" (a term which conveys such hidden depth and profundity) and "personality" (a term which pertains to surface impressions and one's public image).40 The preoccupation with the latter term, he shows, is very much an outgrowth of the eighteenth century emphasis upon a human individuality that is understood in terms of autonomy and privacy. This notion of the isolated, atomistic individual was closely linked with a subjective focus whereby the "self" became the ultimate referent for judging reality. By extension, such a presupposition led to the conviction that only self-consciousness provides a means of validating any claims to personhood and membership in a community of free moral agents capable of responsibilities and worthy of rights. In contrast to such an isolated and enclosed conception (i.e., whereby one is a person by virtue of being "set apart" from others as a privatized entity), Schmitz focuses upon an intimacy which presupposes a certain relation between persons. From this standpoint, intimacy is only possible through genuine self-disclosure, and the sharing of self-disclosure that allows for an intimate knowledge of the other.41 For Schmitz, such a revelation of one's inner self transcends any specific attributes or any overt capacity the individual might possess.42 Ultimately, Schmitz argues, intimacy is rooted in the unique act of presencing, whereby the person reveals his or her personal existence. But such a mystery only admits of a metphysical explanation, rather than an epistemological theory of meaning which confines itself to what is observable on the basis of perception or sense experience. Intimacy, then, discloses a level of being that transcends any distinctive properties. Because intimacy has a unique capacity to disclose being, it places us in touch with the very core of personhood. Metaphysically speaking, intimacy is not grounded in the recognition of this or that characteristic a person has, but rather in the simple unqualified presence the person is.43

Preventing death is the first ethical priority – it's the only impact you can't recover from.

Bauman 95 Zygmunt Bauman, University of Leeds Professor Emeritus of Sociology, 1995, Life In Fragments: Essays In Postmodern Morality, p. 66-71

The being-for is like living towards-the-future: a being filled with anticipation, a being aware of the abyss between future foretold and future that will eventually be; it is this gap which, like a magnet, draws the self towards the Other, as it draws life towards the future, making life into an activity of overcoming, transcending, leaving behind. The self stretches

towards the Other, as life stretches towards the future; neither can grasp what it stretches toward, but it is in this hopeful and desperate, never conclusive and never abandoned stretching-toward that the self is ever anew created and life ever anew lived. In the words of M. M. Bakhtin, it is only in this not-yet accomplished world of anticipation and trial, leaning toward stubbornly an-other Other, that life can be lived - not in the world of the `events that occurred'; in the latter world, `it is impossible to live, to act responsibly; in it, I am not needed, in principle I am not there at all." Art, the Other, the future: what unites them, what makes them into three words vainly trying to grasp the same mystery, is the modality of possibility. A curious modality, at home neither in ontology nor epistemology; itself, like that which it tries to catch in its net, `always outside', forever `otherwise than being'. The possibility we are talking about here is not the all-too-familiar unsure-of-itself, and through that uncertainty flawed, inferior and incomplete being, disdainfully dismissed by triumphant existence as `mere possibility', `just a possibility'; possibility is instead `plus que la reahte' - both the origin and the foundation of being. The hope, says Blanchot, proclaims the possibility of that which evades the possible; `in its limit, this is the hope of the bond recaptured where it is now lost."' The hope is always the hope of *being fu filled,* but what keeps the hope alive and so keeps the being open and on the move is precisely its *unfu filment.* One may say that the paradox *of hope* (and the paradox of possibility founded in hope) is that it may pursue its destination solely through betraying its nature; the most exuberant of energies expends itself in the urge towards rest. Possibility uses up its openness in search of closure. Its image of the better being is its own impoverishment . . . The togetherness of the being-for is cut out of the same block; it shares in the paradoxical lot of all possibility. It lasts as long as it is unfulfilled, yet it uses itself up in never ending effort of fulfilment, of recapturing the bond, making it tight and immune to all future temptations. In an important, perhaps decisive sense, it is selfdestructive and self-defeating: its triumph is its death. The Other, like restless and unpredictable art, like the future itself, is a *mystery.* And being-for-the-Other, going towards the Other through the twisted and rocky gorge of affection, brings that mystery into view - makes it into a challenge. That mystery is what has triggered the sentiment in the first place - but cracking that mystery is what the resulting movement is about. The mystery must be unpacked so that the being-for may focus on the Other: one needs to know what to focus on. (The `demand' is *unspoken,* the responsibility undertaken is *unconditional;* it is up to him or her who follows the demand and takes up the responsibility to decide what the following of that demand and carrying out of that responsibility means in practical terms.) Mystery - noted Max Frisch - (and the Other is a mystery), is an exciting puzzle, but one tends to get tired of that excitement. `And so one creates for oneself an image. This is a loveless act, the betrayal." Creating an image of the Other leads to the substitution of the image for the Other; the Other is now fixed - soothingly and comfortingly. There is nothing to be excited about anymore. I know what the Other needs, I know where my responsibility starts and ends. Whatever the Other may now do will be taken down and used against him. What used to be received as an exciting surprise now looks like perversion; what used to be adored as exhilarating creativity now feels like wicked levity. Thanatos has taken over from Eros, and the excitement of the ungraspable turned into the dullness and tedium of the grasped. But, as Gyorgy Lukacs observed, `everything one person may know about another is only expectation, only potentiality, only wish or fear, acquiring reality only as a result of what happens later, and this reality, too, dissolves straightaway into potentialities'. Only death, with its finality and irreversibility, puts an end to the musical-chairs game of the real and the potential - it once and for all closes the embrace of togetherness which was before invitingly open and tempted the lonely self." `Creating an image' is the dress rehearsal of that death. But creating an image is the inner urge, the constant temptation, the *must* of all affection . . . It is the loneliness of being abandoned to an unresolvable ambivalence and an unanchored and formless sentiment which sets in motion the togetherness of being-for. But what loneliness seeks in togetherness is an end to its present condition - an end to itself. Without knowing - without being capable of knowing - that the hope to replace the vexing loneliness with togetherness is founded solely on its own unfulfilment, and that once loneliness is no more, the togetherness (the being-for togetherness) must also collapse, as it cannot survive its own completion. What the loneliness seeks in togetherness (suicidally for its own cravings) is the foreclosing and pre-empting of the future, cancelling the future before it comes, robbing it of mystery but also of the possibility with which it is pregnant. Unknowingly yet necessarily, it seeks it all to its own detriment, since the success (if there is a success) may only bring it back to where it started and to the condition which prompted it to start on the journey in the first place. The togetherness of being-for is always in the future, and nowhere else. It is no more once the self proclaims: `I have arrived', `I have done it', `I fulfilled my duty.' The being-for starts from the realization of the bottomlessness of the task, and ends with the declaration that the infinity has been exhausted. This is the tragedy of being-for - the reason why it cannot but be death-bound while simultaneously remaining an undying attraction. In this tragedy, there are many happy moments, but no happy end. Death is always the foreclosure of possibilities, and it comes eventually in its own time, even if not brought forward by the impatience of love. The catch is to direct the affection to staving off the end, and to do this against the affection's nature. What follows is that, if moral relationship is grounded in the being-for togetherness (as it is), then it can exist as a project, and guide the self's conduct only as long as its nature of a project (a not yet-completed project) is not denied. Morality, like the future itself, is forever not-yet. (And this is why the ethical code, any ethical code, the more so the more perfect it is by its own standards, supports morality the way the rope supports the hanged man.) It is because of our loneliness that we crave togetherness. It is because of our loneliness that we open up to the Other and allow the Other to open up to us. It is because of our loneliness (which is only belied, not overcome, by the hubbub of the being-with) that we turn into moral selves. And it is only through allowing the togetherness its possibilities which only the future can disclose that we stand a chance of acting morally, and sometimes even of being good, in the present.

War is possible--geopolitics

Ferguson 8 [Niall – Prof History @ Harvard. Hoover Digest, No 1 Winter 2008]

The risk of a major geopolitical crisis in 2007 is certainly lower than it was in 1914. Yet it is not so low as to lie altogether beyond the realm of probability. The escalation of violence in the Middle East as Iraq disintegrates and Iran presses on with its nuclear program is close to being a certainty, as are the growing insecurity of Israel and the impossibility of any meaningful U.S. exit from the region. All may be harmonious between the United States and China today, yet **the potential for tension over trade and exchange rates has unquestionably increased** since the Democrats gained control of Congress. **Nor should we forget about security flashpoints** such as the independence of Taiwan, the threat of North Korea, and the nonnuclear status of Japan. To consign political risk to the realm of uncertainty seems almost as **rash today as it was in the years leading up the First World War**. Anglo-German economic commercial ties reached a peak in 1914, but geopolitics trumped economics. It often does.

Great power wars are possible

Kagan 99 [Donald. Hillhouse Professor of History and Classics at Yale University "History Is Full Of Surprises," *Survival*, Volume 41, Number 2, Summer, p. 141]

Now having said all this, even if all these men were wrong, this does not mean that Michael Mandelbaum cannot be right. But it should inspire some degree of modesty and caution. In fact Mandelbaum is very cautious in the language that he uses. Major war is not necessarily finished, he concedes. It's **not dead**, it's obsolete. This is a charming term that seems to say more than it does, because that allows Mandelbaum to draw back from the more total claims later on. A major war is unlikely but not unthinkable, which is to say he thinks it can happen. It is obsolete, he writes, in the sense that it is no longer fashionable. To pick up the metaphor is to see some of its limitations as well as its charm. Is war really a matter of fashion? And even if it is, don't we have to face the fact that there are some people who choose to be unfashionable, and then there are other people who have never heard of fashion in the first place? China and Russia are two cases to which the writer points. He identifies the Taiwan Straits and the Russo-Ukrainian border as places where wars may well break out, should they erupt anywhere. They are the 'potential Sarajevos of the twenty-first century'. He is right. And, of course, it is this concession, however genuinely and generously and modestly expressed, that **gives away the game**. Since there are at least two places where major wars between great powers might well break out even today – and two are quite enough – it seems to me that his **entire thesis** is undermined.

One nuke is all it takes

Betts 2k [Richard Professor and the Director of the Institute of War and Peace Studies at Columbia, "Universal Deterrence or Conceptual Collapse? Liberal Pessimism and Utopian Realism," The Coming Crisis: Nuclear Proliferation, U.S. Interests, and World Order, ed. Utgoff p. 82]

Quite opposite reactions are imaginable. The shock might jar sluggish statesmen into taking the danger seriously, cutting through diplomatic and military red tape, and undertaking dramatic actions to push the genie back in the bottle. Or the shock might prompt panic and a rush to stock up on WMD, as the possibility of use underlines the need for deterrent capability, or the effectiveness of such weapons as instruments of policy One seldom-noticed danger is that breakage of the taboo

could demystify the weapons and make them look more conventional than our post-Hiroshima images of them. It helps to recall that in the 1930s, popular images of conventional strategic bombing were that it would be apocalyptic, bringing belligerent countries to their knees quickly. The apocalyptic image was fed by the German bombing of Guernica, a comparatively small city in Spain. When World War II came in Europe, both British and Germans initially refrained from bombing attacks on cities. Once city bombing began and gathered steam, however, it proved to be far less decisive than many had expected. British and German populations managed to adjust and absorb it. Over time, however, the ferocity of Allied bombing of Germany and Japan did approach the apocalyptic levels originally envisioned. In short, dire assumptions about the awesomeness of strategic bombing deterred its initiation, but once initiated did not prevent gradual escalation to the devastating level originally envisioned. Nuclear weapon inventories of countries like India and Pakistan are likely to remain small in number and yield for some time. According to press reports, by some U.S. estimates the yields of the 1998 tests were only a few kilotons. If the first weapon detonated in combat is a low-yield device in a large city with uneven terrain and lots of reinforced concrete, it might only destroy a small part of the city A bomb that killed 10,000 to 20,000 people would be seen as a stunning catastrophe, but there are now many parts of the world where that number would be less than 1 percent of a city's population. The disaster could seem surprisingly limited, since in the popular imagination (underwritten by the results in the small and flimsy cities of Hiroshima and Nagasaki), nuclear weapons mean 'one bomb, one city" Awful destruction that yet seems surprisingly limited could prompt revisionist reactions among lay elites in some countries about the meaning of nuclear ordnance.

Breaking the nuclear taboo ensures escalation

Alagappa 9 [Muthiah. The Long Shadow, 2009, Pg 480-1]

Nuclear weapons cast a long shadow that informs in fundamental ways the strategic policies and behavior of major powers (all but one of which possess nuclear weapons), their allies, and those states facing existential threats. They induce caution and set boundaries to the strategic interaction of nuclear weapon states and condition the role and use of force in their interactions. The danger of escalation limits military options in a crisis between nuclear weapon states and shapes the purpose and manner in which military force is used. Although relevant only in a small number of situations, these include the most serious regional conflicts that could escalate to large-scale war. Nuclear weapons help prevent the outbreak of hostilities, keep hostilities limited when they do break out, and prevent their escalation to major wars. Nuclear weapons enable weaker powers to deter stronger adversaries and help ameliorate the effects of imbalance in conventional military capability. By providing insurance to cope with unanticipated contingencies, they reduce immediate anxieties over military imbalances and vulnerabilities. Nuclear weapons enable major powers to take a long view of the strategic environment, set a moderate pace for their force development, and focus on other national priorities, including mutually beneficial interaction with other nuclear weapon states. Although nuclear weapons by themselves do not confer major power status, they are an important ingredient of power for countries that conduct themselves in a responsible manner and are experiencing rapid growth in other dimensions of power.

Accidental launch is highly likely – malfunctions, accidents, deteriorating systems

Helfand et. al 98 Co-president of International Physicians for the Prevention of Nuclear War and a past president of the organization's U.S. affiliate, Physicians for Social Responsibility (Ira, "Accidental Nuclear War — A Post–Cold War Assessment", The New England Journal of Medicine, 1998, http://www.nejm.org/doi/full/10.1056/NEJM199804303381824#t=article) //BZ

Although many people believe that the threat of a nuclear attack largely disappeared with the end of the Cold War, there is considerable evidence to the contrary.10 The United States and Russia no longer confront the daily danger of a deliberate, massive nuclear attack, but both nations continue to operate nuclear forces as though this

danger still existed. **Each side routinely maintains thousands of nuclear warheads on high alert**.

Furthermore, to compensate for its weakened conventional armed forces, Russia has abandoned its "no first use" policy.[11] Even though both countries declared in 1994 that they would not aim strategic missiles at each other, not even one second has been added to the time required to launch a nuclear attack: providing actual targeting (or retargeting) instructions is simply a component of normal launch procedures.[12-14] The default targets of U.S. land-based missiles are now the oceans, but Russian missiles launched without specific targeting commands automatically revert to previously programmed military targets.[13] There have been numerous "broken arrows" (major nuclear-weapons accidents) in the past, including at least five instances of U.S. missiles that are capable of carrying nuclear devices flying over or crashing in or near the territories of other nations.[15,16] From 1975 to 1990, 66,000 military personnel involved in the operational aspects of U.S. nuclear forces were removed from their positions. Of these 66,000, 41 percent were removed because of alcohol or other drug abuse and 20 percent because of psychiatric problems.[17,18] General George Lee Butler, who as commander of the U.S. Strategic Command from 1991 to 1994 was responsible for all U.S. strategic nuclear forces, recently reported that he had "investigated a dismaying array of accidents and incidents involving strategic weapons and forces."[19] **Any nuclear arsenal is susceptible to accidental, inadvertent, or unauthorized use**.[20,21] This is true both in countries declared to possess nuclear weapons (the United States, Russia, France, the United Kingdom, and China) and in other countries widely believed to possess nuclear weapons (Israel, India, and Pakistan). The combination of the massive size of the Russian nuclear arsenal (almost 6000 strategic warheads) and growing problems in Russian control systems makes Russia the focus of greatest current concern. **Since the end of the Cold War, Russia's nuclear command system has steadily deteriorated**. Aging nuclear communications and computer networks are malfunctioning more frequently, and deficient early-warning satellites and ground radar are more prone to reporting false alarms.[10,22-24] The saga of the Mir space station bears witness to the problems of aging Russian technical systems. In addition, budget cuts have reduced the training of nuclear commanders and thus their proficiency in operating nuclear weapons safely. Elite nuclear units suffer pay arrears and housing and food shortages, which contribute to low morale and disaffection. New offices have recently been established at Strategic Rocket Forces bases to address the problem of suicide[25] (and unpublished data). Safeguards against a nuclear attack will be further degraded if the Russian government implements its current plan to distribute both the unlock codes and conditional launch authority down the chain of command. Indeed, a recent report by the Central Intelligence Agency, which was leaked to the press, warned that some Russian submarine crews may already be capable of authorizing a launch.[26] As then Russian Defense Minister Igor Rodionov warned last year, "No one today can guarantee the reliability of our control systems. . . . Russia might soon reach the threshold beyond which its rockets and nuclear systems cannot be controlled."[24] A particular danger stems from the reliance by both Russia and the United States on the strategy of "launch on warning" — the launching of strategic missiles after a missile attack by the enemy has been detected but before the missiles actually arrive. Each country's procedures allow a total response time of only 15 minutes: a few minutes for detecting an enemy attack, another several minutes for top-level decision making, and a couple of minutes to disseminate the authorization to launch a response.[27,28]

Possible scenarios of an accidental or otherwise unauthorized nuclear attack range from the launch of a single missile due to a technical malfunction to the launch of a massive salvo due to a false warning. A strictly mechanical or electrical event as the cause of an accidental launch, such as a stray spark during missile maintenance, ranks low on the scale of plausibility.[29] Analysts also worry about whether computer defects in the year 2000 may compromise the control of strategic missiles in Russia, but the extent of this danger is not known. Several authorities consider a launch based on a false warning to be the most plausible scenario of an accidental attack.[20,29] This **danger is not merely theoretical**. Serious false alarms occurred in the U.S. system in 1979 and 1980, when human error and computer-chip failures resulted in indications of a massive Soviet missile strike.[10,30] On January 25, 1995, a warning related to a U.S. scientific rocket launched from Norway led to the activation, for the first time in the nuclear era, of the "nuclear suitcases" carried by the top Russian leaders and initiated an emergency nuclear-decision-making conference involving the leaders and their top nuclear advisors. It took about eight minutes to conclude that the launch was not part of a surprise nuclear strike by Western submarines — less than four minutes before the deadline for ordering a nuclear response under standard Russian launch-on-warning protocols.[10,24,27] **A missile launch activated by false warning is thus possible in both U.S. and Russian arsenals**. For the reasons noted above, an accidental Russian launch is currently considered the greater risk.

Leaders are irrational – war can generate personal benefit that doesn't affect the population

Chiozza and Goemans 4 Assistant Professor Vanderbilt University and Associate Professor at University of Rochester (Giacomo and Hein, "International Conflict and the Tenure of Leaders: Is War Still "Ex Post" Inefficient?", *American Journal of Political Science*, July 2004, Vol. 48. No. 3, pp. 604-619, http://www.jstor.org.proxy.lib.umich.edu/stable/pdfplus/1519919.pdf?&acceptTC=true&jpdConfirm=true)

In an important article, <u>Fearon</u> (1995) <u>sought to provide answers for what he called the fundamental puzzle of war: the occurrence of war in spite of its costliness</u>. Central to his argument is the claim that" <u>[a]s long as both sides suffer some costs for fighting, then war is always inefficient ex post</u>" <u>for rational unitary-actors</u> (383). War is inefficient ex post because the pie to be divided between the opponents will be smaller after the war than it was before the war. He proposed three mechanisms to explain why, <u>when war is negative-sum</u>, ==rational== unitary-==actors may be un-able to reach agreements that avoid war==. <u>Specifically</u>: (1) <u>private information and incentives to misrepresent one's capabilities</u>, resolve, or anticipated costs of war, (2) <u>commitment problems</u>, <u>and</u> (3) <u>issue indivisibilities</u>. Nevertheless, Fearon explicitly acknowledged that his focus on "rational unitary-actor explanations" addressed only one of three types of arguments that could explain the occurrence of costly wars. The first of these two alternative types of arguments claims that **==leaders are== sometimes, or even ==always, irrationa==**l. Such arguments currently are poor candidates for systematic examination. The second alternative, however, is not. As Fearon noted, "**==war may be rational for... leaders if they will enjoy various benefits of war without suffering costs imposed on the population==**." It deserves emphasis to note that he continued "I believe that 'second-image' mechanisms of this sort are very important empirically..." (379, fn. 1). ==If leaders enjoy "various benefits of war"== which more than off- set their costs, ==then war is obviously no longer ex post inefficient for the opposing leader==s, and Fearon's three mechanisms are no longer sufficient to explain war. In- stead, new mechanisms could come to the fore, perhaps explaining why, when, and which leaders enjoy "various benefits of war" that more than offset its costs.

Nuclear Reps Good

No Impact

No impact to our process of securitization --- it's a <u>process</u>
Ghughunishvili 10

(Securitization of Migration in the United States after 9/11: Constructing Muslims and Arabs as Enemies Submitted to Central European University Department of International Relations European Studies In partial fulfillment of the requirements for the degree of Master of Arts Supervisor: Professor Paul Roe http://www.etd.ceu.hu/2010/ghughunishvili_irina.pdf)

<u>As provided by the Copenhagen School securitization theory is comprised by speech act</u>, acceptance of the audience and facilitating conditions or other non-securitizing actors contribute to a successful securitization. <u>The causality or a one-way relationship between the speech act, the audience and securitizing actor, where politicians use the speech act first to justify exceptional measures, has been criticized</u> by scholars, such as Balzacq. According to him, the one-directional relationship between the three factors, or some of them, is not the best approach. <u>To fully grasp the dynamics, it will be more beneficial to "rather than looking for a one-directional relationship between some or all of the three factors highlighted, it could be profitable to focus on the degree of congruence between them</u>. 26 Among other aspects of the Copenhagen School's theoretical framework, which he criticizes, the thesis will rely on the criticism of the lack of context and the rejection of a 'one-way causal' relationship between the audience and the actor. <u>The process of threat construction, according to him, can be clearer if external context, which stands independently from use of language, can be considered</u>. 27 Balzacq opts for more context-oriented approach when it comes down to securitization through the speech act, where **a single speech <u>does not create</u>** the <u>discourse, but it is created through a long process, where context is vital.</u> 28 He indicates: In reality, the speech act itself, i.e. literally a single security articulation at a particular point in time, will at best only very rarely explain the entire social process that follows from it. In most cases a security scholar will rather be confronted with a process of articulations creating sequentially a threat text which turns sequentially into a securitization. 29 This type of approach seems more plausible in an empirical study, as <u>it is more likely that **a single speech will not** be able to securitize an issue,</u> but it is a lengthy process, where a the audience speaks the same language as the securitizing actors and can relate to their speeches.

Expertism Good

Expertise inevitable and good on national security- the alt fails
Cole '12

(David Cole, Professor Of Law at Georgetown, "Confronting the Wizard of Oz: National Security,

Expertise, and Secrecy" 44 Conn. L. Rev. 1617-1625 (2012), http://scholarship.law.georgetown.edu/facpub/1085, 2012)

Rana is right to focus our attention on the assumptions that frame modern Americans' conceptions about national security, but his assessment raises three initial questions. First, it seems **far from clear** that there ever was a "golden" era in which national security decisions were made by the common man, or "the people themselves," as Larry Kramer might put it.8 Rana argues that neither Hobbes nor Locke would support a worldview in which certain individuals are vested with superior access to the truth, and that faith in the superior abilities of so-called "experts" is a phenomenon of the New Deal era.9 While an increased faith in scientific solutions to social problems may be a contributing factor in our current overreliance on experts,10 I doubt that national security matters were ever truly a matter of widespread democratic deliberation. Rana notes that in the early days of the republic, every able-bodied man had to serve in the militia, whereas today only a small (and largely disadvantaged) portion of society serves in the military.11 But serving in the militia and making decisions about national security are two different matters. The early days of the Republic were at least as dominated by "elites" as today. Rana points to no evidence that decisions about foreign affairs were any more democratic then than now. And, of course, the nation as a whole was far less democratic, as the majority of its inhabitants could not vote at all.12 Rather than moving away from a golden age of democratic decision-making, it seems more likely that we have simply replaced one group of elites (the aristocracy) with another (the experts). Second, to the extent that there has been an epistemological shift with respect to national security, it seems likely that it is at least in some measure **a response to objective conditions**, not just an ideological development. If so, it's not clear that we can solve the problem **merely by "thinking differently**" about national security. **The world has, in fact, become more interconnected and dangerous** than it was when the Constitution was drafted. At our founding, the oceans were a significant buffer against attacks, weapons were primitive, and travel over long distances was extremely arduous and costly. The attacks of September 11, 2001, or anything like them, would have been inconceivable in the eighteenth or nineteenth centuries. Small groups of non-state actors can now inflict the kinds of attacks that once were the exclusive province of states. But because such actors do not have the governance responsibilities that states have, they are less susceptible to deterrence. The Internet makes information about dangerous weapons and civil vulnerabilities far more readily available, airplane travel dramatically increases the potential range of a hostile actor, and it is not impossible that terrorists could obtain and use nuclear, biological, or chemical weapons.13 The knowledge necessary to monitor nuclear weapons, respond to cyber warfare, develop technological defenses to technological threats, and gather intelligence is **increasingly specialized**. The problem is **not just how we think about security** threats; it is also at least in part **objectively based**.

Expertism means our epistemology is sound – the alternative devolves into stereotypes and biases that collapses epistemology and turns the kritik
Snjezana 10

(Faculty of Humanities and Social Sciences "Trusting Experts: Trust, Testimony, and Evidence". Received: 2010-02-19. Original scientific article. University of Rijeka, Faculty of Humanities and Social Sciences, Omladinska 14, 51000, Scholar)

Let us define expertism as being a position that is composed of three statements: (i) experts exist; (ii) we should ascribe a distinctive testimonial status to experts due their exceptional expertise; (iii) therefore, we have the epistemic right to trust experts without evidence. Expertism is a genuine anti-evidentialist position with regards to trusting experts. 1. Experts exist. While it is rather plausible that

there are experts in science because they deal with facts, the existence of moral or aesthetic experts, who deal with values, is generally much more problematic. For instance, Milton Friedman holds that differences in values are differences caused by people's tastes which are more or less hardwired, undebatable and unchangeable (Friedman, 1984). Logical positivists believe that value judgments are "nonsense" and cannot be a matter of expertise because they are not verifiable. Many people think that most people have reasonable ethical competence and that philosophers (who are the prime candidates for moral experts) are inclined to the same self-serving rationalizations as other people. However, the untouchable status of experts in science can be disputed. From Kant, Kuhn, Quine to Goodman and Putnam, we are aware of an intelligible objection that theoretical hypotheses involve a theory laden, cognitively biased, socially manipulated and subjective interpretation of the world (Goldman, 1999). Also, in science as well as in ethics and aesthetics there are battles between experts who propose opposite theories. In spite of the fact that claiming the first thesis is not without its difficulties, I will assume that it is correct: there are people who are objective (not only reputational) experts. These objective experts are people who, in comparison with other people, are more effective in problem solving. When compared with other people, they are better guides to the truth or better in recognizing a false statement as false, and a true one as true. While the views of ordinary people are typically an ill sorted mass of material derived from experience and tradition which contains inconsistencies and tensions, skilled experts can detect inconsistencies, fallacious inferences, unwarranted generalizations and false premises. In contrast to the average person in ordinary epistemic circumstances, they possess knowledge about the appropriate methods of research and argumentation, more systematized information derived from long term experience of dealing with difficulties, distinctions, critics, and alternative conceptions. They are generally better trained to deal with epistemic, moral or aesthetic issues. Or, we can say like Aristotle that it is reasonable to suppose that none of them can miss the target totally, and that each has gotten something or even a lot of things right. 2. Distinctive testimonial status. In expertism, it is claimed that an expert's testimony requires considerable epistemic deference. I can see at least three reasons why would one ascribe a distinctive testimonial status to experts: (i) standing practice about an expert's reliability; (ii) insufficiency of evidence; (iii) epistemic dependence. Firstly, it could be seen that we have an epistemic right to treat an expert's knowledge and sincerity with the utmost credulity because there is a standing practice, social climate or ongoing policy that considers experts to be the most reliable sources of knowledge or that they are fundamental testimonial authorities in society (Pappas, 2000). By assuming such credentials about experts, it could be seen that a hearer may believe what an expert says without assessment, evaluation or additional evidence. Secondly, many philosophers hold that our evidence in favour of other people's testimonies is principally insufficient (Beanblossom, Lehrer, 1970; Coady, 1981; Webb, 1993; Foley, 1994). If it is true, our evidence in favour of an expert's testimony is even more insufficient: when a layperson relies on an expert, that reliance is necessary blind (Hardwig, 1991). 3 We, as non-experts in a domain, cannot ever possess enough evidence to evaluate an experts' testimony as credible or non credible. An ordinary cognizer in ordinary epistemic circumstances does not possess, or even can never attain, a high enough level of expertise to evaluate the testimonies of experts. We simply do not have enough knowledge and experience in order to be capable of assessing the truth of an expert's testimony or an expert's reliability. Since our reasons for the acceptance of the content of an expert's report – by definition of them being experts and us as non-experts – cannot be the reasons the experts possess, our evidence about an experts' report cannot be ever sufficient for the justified acceptance of her testimony. If we are not experts in a domain, the relevant defeaters (undefeated defeaters) or certain kinds of experiences, doubts and beliefs that can undermine justified trust simply are not present to us. So, it could be seen that we have no choice other than to blindly trust experts. Thirdly, we are deeply aware of our epistemic dependence on the testimonies of experts. Without other people testimonies "we should have to confess to knowing pitifully little" (Dummet, 1993, 420). But without expert testimonies our knowledge about biology, physics, medicine, geography of the world, history would be devastated. The majority of our beliefs about nature and society that we acquired throughout our lives are based, finally, on what experts 'tell' us (see also in Beanblossom, Lehrer, 1970; Faulkner, 2002). Our judgments of value will be a mass of inconsistent intuitions, prejudices and stereotypes derived from our subjective and partial interests, understandings of tradition, our temper etc. Behind the majority of testimonies lies extensive research and reports by experts and without these basic experts' testimonies "our lives would be impoverished in startling and debilitating ways" (Lackey, 2006, 1). So, it could be said that such an epistemic dependence on experts entails blind trust as a precondition of the functioning of our reason.

Engagement with technocracy is more effective than passive rejection

Jiménez-Aleixandre, professor of education – University of Santiago de Compostela, and Pereiro-Muñoz High School Castelao, Vigo (Spain), **'2**

If science education and environmental education have as a goal to develop critical thinking and to promote decision making, it seems that the acknowledgement of a variety of experts and expertise is of relevance to both. Otherwise citizens could be unable to challenge a common view that places economical issues and technical features over other types of values or concerns. As McGinn and Roth (1999) argue, citizens should be prepared to participate in scientific practice, to be involved in situations where science is, if not created, at least used. The assessment of environmental management is, in our opinion, one of these, and citizens do not need to possess all the technical knowledge to be able to examine the positive and negative impacts and to weigh them up. The identification of instances of scientific practice in classroom discourse is difficult especially if this practice is viewed as a complex process, not as fixed 'steps'. Several instances were identified when it could be said that students acted as a knowledge-producing community in spite of the fact that the students, particularly at the beginning of the sequence, expressed doubts about their capacities to assess a project written by experts and endorsed by a government office. Perhaps these doubts relate to the nature of the project, a 'real life' object that made its way into the classroom, into the 'school life'. As Brown et al. (1989) point out, there is usually a difference between practitioners' tasks and stereotyped school tasks and, it could be added, students are not used to being confronted with the complexity of 'life-size' problems. However, as the sequence proceeded, the students assumed the role of experts, exposing inconsistencies in the project, offering alternatives and discussing it with one of its authors. The issue of expertise is worthy of attention and it needs to be explored in different contexts where the relationships among technical expertise, values hierarchies and possible biases caused by the subject matter could be unravelled. One of the objectives of environmental education is to empower people with the capacity of decision making; for this purpose the acknowledging of multiple expertise is crucial.

Security Good

You essentialize security and ignore its political potential

Nunes 12 -- post-doctoral fellow in the Department of Politics and International Studies at the University of Warwick, and has a PhD in International Politics from Aberystwyth University, Wales (Joao, 8/15/2012, "Reclaiming the political: Emancipation and critique in security studies," Security Dialogue 43(4), Sage)

This tendency in the literature is problematic for the critique of security in at least three ways. First, it constitutes a blind spot in the effort of politicization. The assumption of an exclusionary, totalizing or violent logic of security can be seen as an essentialization and a moment of closure. To be faithful to itself, the politicization of security would need to recognize that there is nothing natural or necessary about security – and that security as a paradigm of thought or a register of meaning is also a construction that depends upon its reproduction and performance through practice. The exclusionary and violent meanings that have been attached to security are themselves the result of social and historical processes, and can thus be changed. Second, the institution of this apolitical realm runs counter to the purposes of critique by foreclosing an engagement with the different ways in which security may be constructed. As Matt McDonald (2012) has argued, because security means different things for different people, one must always understand it in context. Assuming from the start that security implies the narrowing of choice and the empowerment of an elite forecloses the acknowledgment of security claims that may seek to achieve exactly the opposite: alternative possibilities in an already narrow debate and the contestation of elite power.5 In connection to this, the claims to insecurity put forward by individuals and groups run the risk of being neglected if the desire to be more secure is identified with a compulsion towards totalization, and if aspirations to a life with a degree of predictability are identified with violence. Finally, this tendency blunts critical security studies as a resource for practical politics. By overlooking the possibility of reconsidering security from within – opting instead for its replacement with other ideals – the critical field weakens its capacity to confront head-on the exceptionalist connotations that security has acquired in policymaking circles. Critical scholars run the risk of playing into this agenda when they tie security to exclusionary and violent practices, thereby failing to question security actors as they take those views for granted and act as if they were inevitable. Overall, security is just too important – both as a concept and as a political instrument – to be simply abandoned by critical scholars. As McDonald (2012: 163) has put it, If security is politically powerful, is the foundation of political legitimacy for a range of actors, and involves the articulation of our core values and the means of their protection, we cannot afford to allow dominant discourses of security to be confused with the essence of security itself. In sum, the trajectory that critical security studies has taken in recent years has significant limitations. The politicization of security has made extraordinary progress in problematizing predominant security ideas and practices; however, it has paradoxically resulted in a depoliticization of the meaning of security itself. By foreclosing the possibility of alternative notions of security, this imbalanced politicization weakens the analytical capacity of critical security studies, undermines its ability to function as a political resource and runs the risk of being politically counterproductive. Seeking to address these limitations, the next section revisits emancipatory understandings of security.

Their impact essentializes national identity as a source of violence. This is a rigged game more vulnerable to self-fulfilling prophecy than *provisional* and *empirical* uses for security

Fierke 2k1

(Karin FIERKE Politics @ Queens Univ. Belfast '1 in Constructing International Relations eds. Fierke and Jorgensen p. 119-120)

There are several underline{poststructuralist assumptions that are problematic} from a constructivist perspective. First, poststructuralists, in Campbells argument, focus on the theorization of identity, rather than assuming an a priori agency or pre-given subjects, as many constructivists do. However, ==the poststructuralist emphasis on theorizing identity often leads to a practice that is not qualitatively different than the "positivist orthodoxy"== they criticize, that is. ==the **reification of a set of assumptions** prior to detailed analysis==.' In this case==, the theoretical maxim is that identity is constituted in difference==, and-this has been modified since the end of the Cold War- this is an antagonistic relationship. As Ole Waever (1996a. 122) notes, ==there is reason to question this assumption==: Many critical and poststructuralist authors enjoy remonstrating against the alleged 'other" that is at present taking place in relation to Russia. North Africa, or Asia. Many authors-including Campbell-balance between, on the one hand, (formally) saying that identity does not demand an Other. does not demand antagonism, only difference(s) that can be non-antagonistic and. on the other, actually assuming that identity is always based on an antagonistic relationship to an other. is always constituted as absolute difference. In the current situation, because of this unfortunate habit, when one notices that there are efforts in identity creation for Europe, one immediately looks wound and asks. "Who can it be directed against?' and then one discerns some more or less well-founded examples of, for example, Russia being castigated as other. 1 am not convinced. The dominant aspiration is rather to constitute Europe as a pole of attraction with graduated membership so that Europe fades out but is not constituted against an external enemy. Some of Europe's mechanisms for stabilizing or disciplining eastern Europe rely exactly on this non-definition of an eastern border. on the image of an open but heterogeneous polity of which some are more members than others, but none are defined as total outsiders or opponents. The context of post Cold War Europe raises questions about the assumption that identity requires an Other. In contrast to the emphasis on theorizing identity. Adler argues that underline{constructivists want to know in detail how identities and interests are constituted in particular cases. If one takes the practices of actors in the world seriously, then a more fruitful analysis would}, to cite Wittgenstein (1958. 66-67). 'look and underline{see" how identities are constituted in specific contexts}. As Onuf (199Kb. I) emphasizes, constructivism is not a theory: it is a "way of studying social relations." Second. underline{from Campbell's perspective, constructivists are too easily drawn into the "protocols of 'empirical social science' rule}, to the detriment of a politicized account of important practices" (Campbell 1998a, 225) This sounds very similar to Ashley's claim that ==poststructuralists are 'not especially interested in the meticulous examination of particular cases== or sites for purposes of understanding them in their own terms" (Ashley. 1989. 278). In fact, one can argue that ==the critical endeavor of the poststructuralists suffers precisely because their own, often very **abstract, theoretical assumptions** are not sufficiently related to the analysis of actual practices==. While ==claiming a desire to open up spaces for marginalized voices to speak, there is often a closing down of that possibility precisely because of another assumption==, which shares a family resemblance with realist accounts, ==that is, states do reproduce realist practices==. underline{Campbell, and} other poststructuralists (underline{Doty}, 1993underline{)?} ask how state action becomes possible; they emphasize processes of marginalization rather than how alternatives, which had been considered unrealistic, become possible. Subsequently. Campbell (1998, 7- 8) underline{suggests that the practices of states remain largely unchanged} since the end of the Cold War, ' By contrast. constructivists such as Koslowski and Kratochwil (1995) and Fierke (1998) have taken

dissident practice in the context of the ending Cold War seriously. As a result, there is an increasing awareness of the role of these actors in constituting the possibility of a change (Adler 1997, 342). When a detailed analysis of the practices of these actors is taken seriously, a different and more nuanced reading of both the end of the Cold War and the post Cold War practices of states is in order.

Self-fulfilling prophecy is backwards – failure to express our fears causes them to occur

Macy 95

(Joanna, General Systems Scholar and Deep Ecologist, Ecopsychology)

There is also the superstition that negative thoughts are self-fulfilling. This is of a piece with the notion, popular in New Age circles, that we create our own reality I have had people tell me that "to speak of catastrophe will just make it more likely to happen." Actually, the contrary is nearer to the truth. Psychoanalytic theory and personal experience show us that it is precisely what we repress that eludes our conscious control and tends to erupt into behavior. As Carl Jung observed, "When an inner situation is not made conscious, it happens outside as fate." But ironically, in our current situation, the person who gives warning of a likely ecological holocaust is often made to feel guilty of contributing to that very fate

Rejection of securitization causes the state to become more interventionist—turns the K

McCormack 10

(Tara McCormack, '10, is Lecturer in International Politics at the University of Leicester and has a PhD in International Relations from the University of Westminster. 2010, (Critique, Security and Power: The political limits to emancipatory approaches, page 127-129)

The following section will briefly raise some questions about the rejection of the old security framework as it has been taken up by the most powerful institutions and states. Here we can begin to see the political limits to critical and emancipatory frameworks. In an international system which is marked by great power inequalities between states, the rejection of the old narrow national interest-based security framework by major international institutions, and the adoption of ostensibly emancipatory policies and policy rhetoric, has the consequence of problematising weak or unstable states and allowing international institutions or major states a more interventionary role, yet without establishing mechanisms by which the citizens of states being intervened in might have any control over the agents or agencies of their emancipation. Whatever the problems associated with the pluralist security framework there were at least formal and clear demarcations. This has the consequence of entrenching international power inequalities and allowing for a shift towards a hierarchical international order in which the citizens in weak or unstable states may arguably have even less freedom or power than before. Radical critics of contemporary security policies, such as human security and humanitarian intervention, argue that we see an assertion of Western power and the creation of liberal subjectivities in the developing world. For example, see Mark Duffield's important and insightful contribution to the ongoing debates about contemporary international security and development.

Duffield attempts to provide a coherent empirical engagement with, and theoretical explanation of, these shifts. Whilst these shifts, away from a focus on state security, and the so-called merging of security and development are often portrayed as positive and progressive shifts that have come about because of the end of the Cold War, Duffield argues convincingly that these shifts are highly problematic and unprogressive. For example, the rejection of sovereignty as formal international equality and a presumption of nonintervention has eroded the division between the international and domestic spheres and led to an international environment in which Western NGOs and powerful states have a major role in the governance of third world states. Whilst for supporters of humanitarian intervention this is a good development, Duffield points out the depoliticising implications, drawing on examples in Mozambique and Afghanistan. Duffield also draws out the problems of the retreat from modernisation that is represented by sustainable development. The Western world has moved away from the development policies of the Cold War, which aimed to develop third world states industrially. Duffield describes this in terms of a new division of human life into uninsured and insured life. Whilst we in the West are 'insured' – that is we no longer have to be entirely self-reliant, we have welfare systems, a modern division of labour and so on – sustainable development aims to teach populations in poor states how to survive in the absence of any of this. Third world populations must be taught to be self-reliant, they will remain uninsured. Self-reliance of course means the condemnation of millions to a barbarous life of inhuman bare survival. Ironically, although sustainable development is celebrated by many on the left today, by leaving people to fend for themselves rather than developing a society wide system which can support people, sustainable development actually leads to a less human and humane system than that developed in modern capitalist states. Duffield also describes how many of these problematic shifts are embodied in the contemporary concept of human security. For Duffield, we can understand these shifts in terms of Foucauldian biopolitical framework, which can be understood as a regulatory power that seeks to support life through intervening in the biological, social and economic processes that constitute a human population (2007: 16). Sustainable development and human security are for Duffield technologies of security which aim to *create* self-managing and self-reliant subjectivities in the third world, which can then survive in a situation of serious underdevelopment (or being uninsured as Duffield terms it) without causing security problems for the developed world. For Duffield this is all driven by a neoliberal project which seeks to control and manage uninsured populations globally. Radical critic Costas Douzinas (2007) also criticises new forms of cosmopolitanism such as human rights and interventions for human rights as a triumph of American hegemony. Whilst we are in agreement with critics such as Douzinas and Duffield that these new security frameworks cannot be empowering, and ultimately lead to more power for powerful states, we need to understand why these frameworks have the effect that they do. We can understand that these frameworks have political limitations without having to look for a specific plan on the part of current powerful states. In new security frameworks such as human security we can see the political limits of the framework proposed by critical and emancipatory theoretical approaches.

Security is not an ideology of survival --- it is survival-plus --- that allows individuals the choice to act and become

Booth 2k5

(Ken – visiting researcher – US Naval War College, Critical Security Studies and World Politics, p. 22)

The best starting point for conceptualizing security lies in the real conditions of insecurity suffered by people and collectivities. Look around. What is immediately striking is that **some degree of insecurity**, as a life-determining condition, **is universal**. To the **extent** an individual or group is insecure, to the extent their life choices and changes are **taken away**; this is because of the resources and energy they need to invest in **seeking safety** from domineering threats–whether these are the lack of food for one's children, or organizing to resist a foreign aggressor. The corollary of the relationship between insecurity and a determined life is that a degree of security **creates life possibilities**. Security might therefore be conceived as synonymous with **opening up space** in people's lives. This allows for individual and collective **human becoming**–the capacity to have some choice about living differently–consistent with the same but different search by others. Two interrelated conclusion follow from this. First, security can be understood as an instrumental value; it frees its possessors to a greater or lesser extent from life-determining constraints and so allows different life possibilities to be explored. Second, **security is not synonymous simply with**

survival. One can survive without being secure (the experience of refugees in long-term camps in war-torn parts of the world, for example). Security is therefore more than mere animal survival (basic animal existence). It is **survival-plus**, the plus being the **possibility to explore human becoming**. As an instrumental value, security is sought because it free people(s) to some degree to do other than **deal with threats** to their human being. The achievement of a level of security –and security is always relative – gives to individuals and groups some time, energy, and scope **to choose to be** or become, other than **merely surviving** as human biological organisms. Security is an important dimension of the process by which the human species can **reinvent itself** beyond the merely biological.

Securitization is good – results in contesting antagonistic logic of security and breaks down competitive structures

Trombetta '8

(Maria Julia Trombetta, (Delft University of Technology, postdoctoral researcher at the department of Economics of Infrastructures) 3/19/08 http://archive.sgir.eu/uploads/Trombetta-the_securitization_of_the_environment_and_the_transformation_of_security.pdf)

On the one hand, an approach that considers the discursive formation of security issues provides a new perspective to analyse the environmental security discourse and its transformative potential. First, it allows for an investigation of the political process behind the selection of threats, exploring why some of them are considered more relevant and urgent than others. The focus shifts from the threats to the collectivities, identities and interests that deserve to be protected and the means to be employed. Second, securitization suggests that the awareness of environmental issues can have a relevant role in defining and transforming political communities, their interests and identities, since the process creates new ideas about who deserve to be protected and by whom. Finally, as Behnke points out, **securitization can open the space for a "genuinely political" constitutive and formative struggle through which political structures are contested and reestablished**.(Behnke 2000: 91) Securitization allows for the breaking and transforming of rules that are no longer acceptable, including the practices associated with an antagonistic logic of security. On the other hand, securitization is problematic because of the set of practices it is supposed to bring about. For the CopS security "carries with it a history and a set of connotations that it cannot escape."(Wæver 1995: 47) While securitizing an issue is a political choice, the practices it brings about are not. Accordingly, transforming an issue into a security issue is not always an improvement. In the case of the environment, the warning seems clear: "When considering securitizing moves such as 'environmental security'...one has to weigh the always problematic side effects of applying a mind-set of security against the possible advantages of focus, attention, and mobilization."(Buzan, Wæver and Wilde 1998: 29) The School shares the normative suggestion that "[a] society whose security is premised upon a logic of war should be re-shaped, re-ordered, simply changed."(Aradau 2001: introduction) For the CopS this does not mean to transform the practices and logic of security, because, as it will be shown below, for the School, this is impossible. The CopS suggests avoiding the transformation of issues into security issues. It is necessary "to turn threats into challenges; to move developments from the sphere of existential fear to one where they could be handled by ordinary means, as politics, economy, culture, and so on."(Wæver 1995: 55, quoting Jahn). This transformation, for the CopS, is "desecuritization", and the School has introduced a distinction between politicization - "meaning the issue is part of public policy, requiring government decision and resources allocation s"(Buzan, Wæver and Wilde 1998: 23) - and securitization - "meaning the issue is presented as an existential threat, requiring emergency measures and justifying actions outside the normal bounds of political procedure."(Buzan, Wæver and Wilde 1998: 23) The slogan is: "less security, more politics!"(Wæver 1995: 56) Nevertheless, there are two major problems behind this suggestion. First, if securitization is normatively problematic, desecuritization can be even more problematic. It can lead to a depoliticization and marginalisation of urgent and serious issues, while leaving unchallenged the practices associated with security. In the case of the environment, many appeals to security are aimed at both soliciting action and transforming what counts as security and the way of providing it. Second, within the School's framework, desecuritization cannot be possible. Securitization in fact can be inescapable, the unwanted result of discussing whether

or not the environment is a security issue. As Huysmans has noticed, the performative, constitutive approach suggested by the speech act theory implies that even talking and researching about security can contribute to the securitization of an issue, even if that (and the practices associated with it) is not the desired result. "The normative dilemma thus consists of how to write or speak about security when the security knowledge risks the production of what one tries to avoid, what one criticizes: that is, the securitization of migration, drugs and so forth."(Huysmans 2002: 43) When the understanding of security is the problematic one described by the CopS, research itself can become a danger. This captures a paradox that characterizes the debate about environmental security. As Jon Barnett has showed in The Meaning of Environmental Security (2001) the securitization of the environment can have perverse effects and several attempts to transform environmental problems into security issues have resulted in a spreading of the national security paradigm and the enemy logic, even if the intentions behind them were different. Barnett has argued that "environmental security is not about the environment, it is about security; as a concept, it is at its most meaningless and malign"(2001: 83) in this way, he seems to accept the ineluctability of the security mindset or logic evoked by securitization. However, his suggestion of promoting a "human centered" understanding of security, in which environmental security is not about (national) security but about people and their needs, within the securitization logic, cannot escape the trap he has described. Why, in fact, should the sort of his claim be different from that of similar ones? 2. The fixity of Security practices   These dilemmas, however, are based on the idea that security practices are inescapable and unchangeable and the theory of securitization, as elaborated by the CopS, has contributed to suggest so. The CopS has achieved the result of making a specific, negative understanding of security – which has characterised the dominant Realist discourse within IR - appear as "natural" and unchangeable since all the attempts to transform it appear to reinforce its logic. To challenge this perverse mechanism it is necessary to unpack securitization further. First, it will be shown that securitization is not analytically accurate, the environment representing a relevant case. Second, the assumptions behind this problematic fixity will be explored.   The CopS explores the specificity of the environmental sector in Security: A Framework for Analysis (Buzan, Wæver and Wilde 1998) (Security hereafter), the theoretical book where the CopS illustrates the theory of securitization and analyses the dynamics of securitization within five relevant sectors. For each sector the School identifies the actors or objects (referent objects) that are threatened, specifies the relevant threats and the agents that promote or facilitate securitization.11[11] The environmental sector is rather different from the others and the transformative intent that is associated with the appeal to environmental security is more evident.12[12] Amongst the peculiarities of the environmental sector described by the School, three deserve a specific analysis for their implications: First, the presence of two agendas - a scientific and a political one; second, the multiplicity of actors; third, the politicization/securitization relationship. They will be analysed in turn "One of the most striking features of the environmental sector," it is argued in Security, "is the existence of two different agendas: a scientific agenda and a political agenda."(Buzan, Wæver and Wilde 1998: 71) The scientific one refers mainly to natural science and non-governmental activities. The "scientific agenda is about the authoritative assessment of threat,"(Buzan, Wæver and Wilde 1998: 72) and Buzan, Wæver and de Wilde admit that "the extent to which scientific argument structures environmental security debates strikes us as exceptional."(Buzan, Wæver and Wilde 1998: 72) Quoting Rosenau, they suggest that "the demand for scientific proof is a broader emerging characteristic in the international system."(Buzan, Wæver and Wilde 1998: 72) This 11[11] So for instance in the military sector the referent object is usually the state and the threats are mainly military ones, while in the societal sector the referent objects are collective identities "that can function independent of the state, such as nations and religions."(Buzan, Wæver and Wilde 1998: 22-3) 12[12] This is the case even if the School adopts a conservative strategy that appears from the choice of the referent object (or what is threatened). In the first works of the School, the referent object within the environmental sector was the biosphere: "Environmental security concerns the maintenance of the local and the planetary biosphere as the essential support system on which all other human enterprises depend." (Buzan 1991: 19) In Security the School narrows down this perspective and identifies the level of civilization (with all the contradictions that contribute to environmental problems) as the main referent object. This move favours a conservative perspective which considers the securitization of the environment as a way to preserve the status quo and the security strategies on which it is based. Despite this, the description of the environmental sector captures the specificity of the sector and reveals the tensions within the overall framework. questions the "self referentiality" of the speech act security. Are some threats more "real" than others thanks to scientific proof? Can considerations developed to characterize reflective behaviours be applied to natural systems? Even if dealing with these issues is beyond the scope of this article, it is necessary to note that the appeal to an external discourse has serious implications. First, it questions the possibility and opportunity of desecuritization. Is it possible and what does it mean to "desecuritize" an issue which is on the scientific agenda? If scientific research outlines the dangerousness of an environmental problem, how is it possible to provide security? Second, it suggests that security and the practices associated with it can vary from one sector to another and thus from one context to another. The second peculiarity of the environmental sector is the presence of many actors. This contrasts with Wæver's suggestion that "security is articulated only from a specific place, in an institutional voice, by elites."(Wæver 1995: 57) The multiplicity of actors is largely justified by the School with the relative novelty of the securitization of the environment. "The discourses, power struggles, and securitizing moves in the other sectors are reflected by and have sedimented over time in concrete types of organizations - notably states...nations (identity configurations), and the UN system,"(Buzan, Wæver and Wilde 1998: 71) however, this is not the case with the environment: "It is as yet undetermined what kinds of political structures environmental concerns will generate."(Buzan, Wæver and Wilde 1998: 71). In this way a tension appears since the attempts to securitize the environment are described as having a transforming potential, requiring and calling for new institutions. Within the environmental sector securitization moves seem to have a transformative intent that contrasts with the conservative one, that characterizes other sectors. The third peculiarity is that many securitizing moves result in politicization. This is problematic for the School, which argues that "transcending a security problem by politicising it cannot happen through thematization in security terms, only away from such terms."(Wæver 1995: 56) For the School, once the enemy logic has been inscribed in a context, it is very difficult to return to an open debate. Nevertheless the various politicizations of environmental issues that followed the appeal to security – those the CopS dismissed as failed

securitizations - seem to reinforce the argument, suggested by Edkins, that there is a tendency to politicize issues through their securitization. (Edkins 1999: 11) **This represents another signal that securitization**, within the environmental sector, **can take a different form, and that the problematic aspects of evoking security are not so evident.** Securitization theory, for the CopS, is meant to be descriptive, however the environmental sector suggests that some of its aspects prevent it from providing an adequate instrument for analysis. To understand why this occurs, it is necessary to explore in more detail the conceptualization of security by Wæver, who has introduced securitization.

Our securitiziation is good - Extinction is <u>categorically different</u> than what they criticize --- our ontology/reps of fear are critical to compassion with the Other --- this solves and turns the kritik

Macy 2k

(Joanna Macy, adjunct professor at the California Institute of Integral Studies, 2000, Environmental Discourse and Practice: A Reader, p. 243)

The move to a wider ecological sense of self is in large part a function of the dangers that are threatening to overwhelm us. We are confronted by social breakdown, wars, nuclear proliferation, and the progressive destruction of our biosphere. Polls show that people today are aware that the world, as they know it, may come to an end. This loss of certainty that there will be a future is the pivotal psychological reality of our time. Over the past twelve years my colleagues and I have worked with tens of thousands of people in North America, Europe, Asia, and Australia, helping them confront and explore what they know and feel about what is happening to their world. The purpose of this work, which was first known as "Despair and Empowerment Work," is to overcome the numbing and powerlessness that result from suppression of painful responses to massively painful realities. As their grief and **fear for the world is** allowed to be **expressed** without apology or argument and validated as a wholesome, life-preserving response, people break through their avoidance mechanisms, break through their sense of futility and **isolation**. Generally what they break through into is a larger sense of identity. It is as if the pressure of their acknowledged awareness of the suffering of our world stretches or **collapses** the culturally **defined** boundaries of the self. It becomes clear, for example, that the grief and **fear** experienced for **our world** and our common future are **categorically different** from similar sentiments relating to one's personal welfare. This pain cannot be equated with dread of one's own individual demise. Its source lies less in concerns for personal survival than in apprehensions of collective suffering – of what looms for human life and other species and unborn generations to come. Its nature is akin to the original meaning of compassion – "suffering with." It is the distress we feel on behalf of the larger whole of which we are a part. And, when it is so defined, it serves as a trigger or getaway to a more encompassing sense of identity, inseparable from the web of life in which we are as intricately connected as cells in a larger body. This shift in consciousness is an appropriate, adaptive response. For the crisis that threatens our planet, be it seen in its military, ecological, or social aspects, derives from a dysfunctional and pathogenic notion of the self. It is a mistake about our place in the order of things. It is the delusion that the self is so separate and fragile that we must delineate and defend its boundaries, that it is so small and needy that we must endlessly acquire and endlessly consume, that it is so aloof that we can – as individuals, corporations, nation-states, or as a species – be immune to what we do to other beings.

AT Threat Con

No impact – threat construction isn't sufficient to cause wars

Kaufman, Prof Poli Sci and IR – U Delaware, **'9**

(Stuart J, "Narratives and Symbols in Violent Mobilization: The Palestinian-Israeli Case," *Security Studies* 18:3, 400 – 434)

Even when hostile narratives, group fears, and opportunity are strongly present, war occurs **only if these factors are harnessed.** Ethnic narratives and fears must combine to create significant ethnic hostility among mass publics. Politicians must also seize the opportunity to manipulate that hostility, evoking hostile narratives and symbols to gain or hold power by riding a wave of chauvinist mobilization. Such mobilization is often spurred by prominent events (for example, episodes of violence) that increase feelings of hostility and make chauvinist appeals seem timely. If the other group also mobilizes and if each side's felt security needs threaten the security of the other side, the result is a security dilemma spiral of rising fear, hostility, and mutual threat that results in violence. **A virtue of** this **symbolist theory is that symbolist logic explains why** ethnic **peace is more common than ethnonationalist war.** Even if hostile narratives, fears, and opportunity exist, severe violence usually can still be avoided if ethnic elites skillfully define group needs in moderate ways and collaborate across group lines to prevent violence: this is consociationalism.17 War is likely only if hostile narratives, fears, and opportunity spur hostile attitudes, chauvinist mobilization, and a security dilemma.

Threats aren't psychological projections and the alt fails

Hoffman, 86

(Stanley, Center for European Studies at Harvard, "On the Political Psychology of Peace and War: A Critique and an Agenda," Political Psychology 7.1 JSTOR)

The traditionalists, even when, in their own work, they try scrupulous-ly to transcend national prejudices and to seek scientific truth, believe that it is unrealistic to expect statesmen to stand above the fray: By definition, the statesmen are there to worry not only about planetary survival, but — first of all—about national survival and safety. To be sure, they ought to be able to see how certain policies, aimed at enhancing security, actually increase in-security all around. But there are sharp limits to how far they can go in their mutual empathy or in their acts (unlike intellectuals in their advice), as long as the states' antagonisms persist, as long as uncertainty about each other's intentions prevails, and as long as there is reason to fear that one side's wise restraint, or unilateral moves toward "sanity," will be met, not by the rival's similar restraint or moves, but either by swift or skillful political or military exploitation of the opportunity created for unilateral gain, or by a for-midable domestic backlash if national self-restraint appears to result in ex-ternal losses, humiliations or perceptions of weakness. There is little point in saying that the state of affairs which imposes such limits is "anachronistic" or "unrational." To traditionalists, the radicals' stance — condemnation from the top of Mount Olympus — can only impede understanding of the limits and possibilities of reform. To be sure, the fragmentation of mankind is a formidable obstacle to the solution of many problems that cannot be handled well in a national framework, and a deadly peril insofar as the use of force, the very distinctive feature of world politics, now entails the risk of nuclear war. But one can hardly call anachronistic a phenomenon—the assertion of national identity — that, to the bulk of [HU]mankind, appears not only as a necessity but also as a positive good, since humanity's fragmentation results from the very

aspiration to self-determination. Many people have only recently emerged from foreign mastery, and have reason to fear that the alternative to national self-mastery is not a world government of assured fairness and efficiency, but alien domination. As for "unrationality," the drama lies in the contrast between the ra-tionality of the whole, which scholars are concerned about—the greatest good of the greatest number, in utilitarian terms — and the rationality or greatest good of the part, which is what statesmen worry about and are responsible for. What the radicals denounce as irrational and irresponsible from the viewpoint of mankind is what Weber called the statesman's ethic of responsibility. What keeps ordinary "competitive conflict processes" (Deutsch, 1983)— the very stuff of society — from becoming "unrational" or destructive, isprecisely what the nature of world politics excludes: the restraint of the partners either because of the ties of affection or responsibility that mitigate the conflict, or because of the existence of an outsider — marriage counselor, arbitrator, judge, policeman or legislator— capable of inducing or imposing restraints. Here we come to a third point of difference. The very absence of such safeguards of rationality, the obvious discrepancy between what each part intends, and what it (and the whole world) ends with, the crudeness of some of the psychological mechanisms at work in international affairs—as one can see from the statements of leaders, or from the media, or from inflamed publics—have led many radicals, especially among those whose training or profession is in psychoanalysis or mental health, to treat the age-old contests of states in terms, not of the psychology of politics, but of individual psychology and pathology. There are two manifestations of this. One is the tendency to look at nations or states as individuals writ large, stuck at an early stage of development (similarly, John Mack (1985) in a recent paper talks of political ideologies as carrying "forward the dichotomized structures of childhood"). One of my predecessors writes about "the correspondence between development of the individual self and that of the group or nation," and concludes "that intergroup or international conflict contains the basic elements of the conflict each individual experiences psychologically" (Volkan, 1985). Robert Holt, from the viewpoint of cognitive psychology, finds "the largest part of the American public" immature, in a "phase of development below the Conscientious" (Holt, 1984). The second related aspect is the tendency to look at the notions statesmen or publics have of "the enemy," not only as residues of childhood or adolescent phases of development, but as images that express "disavowed aspects of the self" (Stein, 1985), reveal truths about our own fears and hatreds, and amount to masks we put on the "enemy," because of our own psychological needs. Here is where the clash between traditionalists and radicals is strongest. Traditionalists do not accept a view of group life derived from the study of individual development or family relations, or a view of modern society derived from the simplistic Freudian model of regressed followers identifying with a leader. They don't see in ideologies just irra-tional constructs, but often rationally selected maps allowing individuals to cope with reality. They don't see national identification as pathological, as an appeal to the people's baser instincts, more aggressive impulses or un-sophisticated mental defenses; it is, as Jean-Jacques Rousseau so well understood, the competition of sovereign states that frequently pushes people from "sane" patriotism to "insane" nationalism (Rousseau's way of preventing the former from veering into the latter was, to say the least, im-practical: to remain poor in isolation). Nor do they see anything "primitive" in the nation's concern for survival: It is a moral and structural requirement. Traditionalists also believe that the "intra-psychic" approach distorts reality. Enemies are **not** mere **projections of negative identities; they are** often quite **real** . To be sure, the Nazis' view of the Jews fits the metaphor of the mask put on the enemy for one's own needs. But were, in return, those Jews who understood what enemies they had in the Nazis, doing the same? Is the Soviet domination of Eastern Europe, is the Soviet regime's treatment of dissidents, was the Gulag merely a convenient projection of our intrapsychic battles? Clichés such as the one about how our enemy "understands only force" may tell us a great deal about ourselves; but sometimes they contain half-truths about him, and not just revelations about us. Our fears flow not only from our private fantasies but also from concrete realities and from the fantasies which the international state of nature generates. In other words, the psychology of politics which traditionalists deem adequate is not derived from theories of psychic development and health; it is derived from the logic of the international milieu, which breeds the kind of vocabulary found in the historians and theorists of the state of nature: fear and power, pride and honor, survival and security, self-interest and reputation, distrust and misunderstanding, commitment and credibility. It is also derived from the social psychology of small or large groups, which resorts to the standard psychological vocabulary that describes mental mechanisms or maneuvers and cognitive processes: denial, projection, guilt, repression, closure, rigidity, etc.... But using this vocabulary does not imply that a group whose style of politics is paranoid is therefore composed of people who, as private individuals, are paranoid. Nor does it relieve us of the duty to look at the objective reasons and functions of these mental moves, and of the duty to make explicit our assumptions about what constitutes a "healthy," wise, or proper social process. Altogether, traditionalists find the mental health approach to world affairs unhelpful. Decisions about war and peace are usually taken by small groups of people; the temptation of analyzing their behavior either, literal-ly, in terms of their personalities, or, metaphysically, in terms borrowed from the study of human

development, rather than in those of group dynamics or principles of international politics is understandable. But it is misleading. What is pathological in couples, or in a well-ordered community, is, alas, frequent, indeed normal, among states, or in a troubled state. What is malignant or crazy is usually not the actors or the social process in which they are engaged: it is the possible results. The grammar of motives which the mental health approach brands as primitive or immature is actually rational for the actors. to the substitution of labels for explanations, to bad analysis and fanciful prescriptions. Bad analysis: the tendency to see in group coherence a regressive response to a threat, whereas it often is a rational response to the "existential" threats entailed by the very nature of the international milieu. Or the tendency to see in the effacement or minimization of individual differences in a group a release of unconscious instincts, rather than a phenomenon that can be perfectly adaptive—in response to stress or threats—or result from governmental manipulation or originate in the code of conduct inculcated by the educational system, etc.. . The habit of comparing the state, or modern society, with the Church or the army, and to analyze human relations in these institutions in ways that stress the libidinal more than the cognitive and superego factors, or equate libidinal bonds and the desire for a leader. The view that enemies are above all products of mental drives, rather than inevitable concomitants of social strife at every level. Or the view that the contest with the rival fulfills inter-nal needs, which may be true, but requires careful examination of the nature of these needs (psychological? bureaucratic? economic?), obscures the objective reasons of the contest, and risks confusing cause and function. Indeed, such analysis is particularly misleading in dealing with the pre-sent scene. The radicals are so (justifiably) concerned with the nuclear peril that the traditional ways in which statesmen and publics behave seem to vindicate the pathological approach. But this, in turn, incites radicals to overlook the fundamental ambiguity of contemporary world politics. On the one hand, there is a nuclear revolution—the capacity for total destruction. On the other hand, many states, without nuclear weapons, find that the use of force remains rational (in terms of a rationality of means) and beneficial at home or abroad—ask the Vietnamese, or the Egyptians after October 1973, or Mrs. Thatcher after the Falklands, or Ronald Reagan after Grenada. The superpowers themselves, whose contest has not been abolished by the nuclear revolution (it is the stakes, the costs of failure that have, of course, been transformed), find that much of their rivalry can be conducted in traditional ways — including limited uses of force —below the level of nuclear alarm. They also find that nuclear weapons, while—perhapsunusable rationally, can usefully strengthen the very process that has been so faulty in the prenuclear ages: deterrence (this is one of the reasons for nuclear proliferation). The pathological approach interprets deterrence as expressing the deterrer's belief that his country is good, the enemy's is bad. This is often the case, but it need not be; it can also reflect the conviction that one's country has interests that are not mere figments of the imagination, and need to be protected both because of the material costs of losing them, and because of the values embedded in them. As for war planning, it is not a case of "psychological denial of unwelcome reality" (Montville, 1985). but a — perhaps futile, perhaps dangerous— necessity in a world where deterrence may once more fail. The prescriptions that result from the radicals' psychological approach also run into traditionalist objections. Even if one accepts the metaphors of collective disease or pathology, one must understand that the "cure" can only be provided by politics. All too often, the radicals' cures consist of perfectly sensible recommendations for lowering tensions, but fail to tell us how to get them carried out —they only tell us how much better the world would be, if only "such rules could be established" (Deutsch, 1983). Sometimes, they express generous aspirations — for common or mutual security—without much awareness of the obstacles which conflict-ing interests, fears about allies or clients, and the nature of the weapons themselves, continue to erect. Sometimes, they too neglect the ambiguity of life in a nuclear world: The much lamented redundancy of weapons, a calamity if nuclear deterrence fails, can also be a cushion against failure. Finally, many of the remedies offered are based on an admirable liberal model of personality and politics: the ideal of the mature, well-adjusted, open-minded person (produced by liberal education and healthy family relations) transposed on the political level, and thus accompanied by the triumph of democracy in the community, by the elimination of militarism and the spread of functional cooperation abroad. But three obstacles remain unconquered: first, a major part of the world rejects this ideal and keeps itself closed to it (many of the radicals seem to deny it, or to ignore it, or to believe it doesn't matter). Second, the record shows that real democracies, in their behavior toward non-democratic or less "advanced" societies, do not conform to the happy model (think of the US in Central America). Third, the task of reform, both of the publics and of the statesmen, through consciousness raising and education is hopelessly huge, incapable of being pursued equally in all the important states, and — indeed — too slow if one accepts the idea of a mortal nuclear peril. These, then, are the dimensions of a split that should not be minimized or denied

AT Schlag

AFF = Agency

The AFF specifically activates agency
Hanghoj 8

(Thorkild, University of Aarhus School of Education Assistant Professor, "PLAYFUL KNOWLEDGE An Explorative Study of Educational Gaming", http://static.sdu.dk/mediafiles/Files/Information_til/Studerende_ved_SDU/Din_uddannelse/phd_hum/afhandlinger/2009/ThorkilHanghoej.pdf)

Thus, debate games require teachers to balance the centripetal/centrifugal forces of gaming and teaching, to be able to reconfigure their discursive authority, and to orchestrate the multiple voices of a dialogical game space in relation to particular goals. These Bakhtinian perspectives provide a valuable analytical framework for describing the discursive interplay between different practices and knowledge aspects when enacting (debate) game scenarios. In addition to this, Bakhtin's dialogical philosophy also offers an explanation of why debate games (and other game types) may be valuable within an educational context. One of the central features of multi-player games is that players are expected to experience a simultaneously real and imagined scenario both in relation to an insider's (participant) perspective and to an outsider's (co-participant) perspective. According to Bakhtin, the outsider's perspective reflects a fundamental aspect of human understanding: In order to understand, it is immensely important for the person who understands to be located outside the object of his or her creative understanding – in time, in space, in culture. For one cannot even really see one's own exterior and comprehend it as a whole, and no mirrors or photographs can help; our real exterior can be seen and understood only by other people, because they are located outside us in space, and because they are others (Bakhtin, 1986: 7). As the quote suggests, every person is influenced by others in an inescapably intertwined way, and consequently no voice can be said to be isolated. Thus, it is in the interaction with other voices that individuals are able to reach understanding and find their own voice. Bakhtin also refers to the ontological process of finding a voice as "ideological becoming", which represents "the process of selectively assimilating the words of others" (Bakhtin, 1981: 341). Thus, by teaching and playing debate scenarios, it is possible to support students in their process of becoming not only themselves, but also in becoming articulate and responsive citizens in a democratic society.

The inclusion of hypothetical impact scenarios supercharges the deliberative process by providing a normative means of assessing consequences
Larsen et al 9

(a KTH – Royal Institute of Technology, Department of Philosophy and History of Technology, Division of History of Science and Technology, Teknikringen 76, SE-100 44 Stockholm, Sweden b KTH – Royal Institute of Technology, Department of Urban Planning and Environment, Division of Environmental Strategies Research, Drottning Kristinas väg 30, Habitat International Volume 33, Issue 3, July 2009, Pages 260–266 Climate Change and Human Settlements Climatechange scenarios and citizen-participation: Mitigation and adaptation perspectives in constructing sustainable futures)

In constructing normative scenarios a set of images are generated illustrating future ways of living, travelling and consuming products and services where certain goal such as a reduced climate impact is fulfilled. These are not predictions of the future, but can be used as a way to act in accordance to achieving a desired future development. They can also be a contribution to the general debate or foundations for policy decisions. These scenarios also often include an account of changes in terms of consumption patterns and behavioural change. In this sense, these scenarios are extended beyond socio-economic predictions and relations to environmental load dealt within other field, such as climatechange predictions in the work of IPCC. The scenarios in focus here build on some predictive elements, but in addition the sustainability focus when including behavioural change also includes some normative elements as how to achieve a sustainable society in the future. In essence, this also means that images of behavioural change are included, but not necessary including explanations on how these changes came about (Larsen & Höjer, 2007). The behavioural change is there formulated by describing level of acceptance (of introducing a new environmental tax) or new behaviour in daily travel patterns (new modes of transport). However, even though scenario construction is often a creative process including a range of participants demanding change, trust is built and ideas exchanged, these processes are seldom analyzed as deliberative processes. Deliberation takes places in communicative processes where participants with diverse opinions, but open to preference shifts, are seen as equal (see Hendriks, Dryzek, & Hunold, 2007). Process values such as learning and mutual understanding are created in addition to outputs such as policies. Experiences from exploring transition pathways towards sustainability distinguish between process management aspects of learning (learns how?), learning about policy options and the context in which decisions take place (learns what?), the subjects of learning (who learns?), and the results of learning (Van de Kerkhof & Wieczorek, 2005: 735). Especially questions such as who takes part in the process and whom these participants are to represent become important since the scenarios often expect great behavioural changes. Is it legitimate to expect all people to change even if they did not feel as they were represented? It is important to keep in mind that scenario making processes are not set up only to share ideas and create mutual understanding, they aim at solving specific targets such as minimizing climate change. Some writers (e.g. Hendriks et al., 2007) underline the importance of deliberative

processes being open and diverse and do not put as much attention to the outcome. Understanding the importance of legitimacy we see the **process** as crucial, but aiming for goals such as **minimized climatechange** both the content and the **impact** of the output are also critical. Thus, we agree with Connelly and Richardson (in press) seeing effective deliberation as a process where stakeholders are engaged and the primary assessment should be regarding the process' "effectiveness in delivering an intended policy". They also underline that governance as a whole should be assessed regarding its possibilities to take action and achieve legitimacy, where legitimacy is understood as "**the recognised right to make policy**" (Connelly & Richardson, in press). There are thus three dimensions Connelly and Richardson (in press) find important: content sustainability, capacity to act and legitimacy. We believe those dimensions are also important for participatory processes generating scenarios aiming at mitigation as well as adaptation to climatechange, otherwise they will not have any strong (and legitimate) impact on development. Hendriks et al. (2007) make an important distinction between partisan and non-partisan forums. We believe this distinction is important also when analysing scenario generating processes since it affects the legitimacy of the outcome. Partisans can be activists or belong to interest groups, organisations or associations, which strive for particular matters. Partisans are thus committed to certain agendas and are therefore often seen as poor deliberators (Hendriks et al., 2007: 362). However, from a democracy perspective they are seen as important since they legitimate processes by making sure that particular stakes are represented. While partisan forums are made up to represent interest groups in society, non-partisan forums consist of randomly selected citizens, which ideally have rather open preferences. When exploring one partisan and one non-partisan process Hendriks et al. (2007) found that contrary to common expectations, partisan forums can have substantial legitimacy and impact problems. They also found that non-partisan forums might be favourable in deliberative capacity but they might fall short in external legitimacy and policy impact. The fact was that partisan participants accepted that deliberation means that you must be willing to adjust preferences, but they failed to do so (Hendriks et al., 2007: 370). Both the partisan and non-partisan forums included participants who stuck to their positions, but non-partisan participants had greater autonomy "so their deliberative capacity can be judged superior to that of partisan forums" (Hendriks et al., 2007: 371). In the study by Hendriks et al. (2007: 372) legitimacy is defined and operationalized as: "the extent to which key-actors, decision-makers and the media accept and support the procedure and its outcomes." In other words, the legitimacy (as defined in that study) is grounded on actors largely outside the forums active in the deliberation processes. This study also showed (by interviews of experts themselves) that the deliberation by citizens and capacity of lay people was questioned by some experts (Hendriks et al., 2007: 373–374). In addition to this distinction of external legitimacy, the concept of legitimacy is in the literature largely divided in strategic and institutional legitimacy (Suchman, 1995: 572). The strategic tradition stresses the managerial standpoint in how organisations making legitimate strategies resulting in manipulating to gain societal support. Hence, rather than emphasising participatory processes (and the inherent process values), these values and the participatory process can be by-passed by e.g. "astroturfing"1 or other strategic options adopted. The branch of institutional studies of legitimacy, instead, emphasizes the "normative and cognitive forces that constrain, construct, and empower the organizational actors" as described in Suchman (1995: 571) examining the two approaches. The conclusion of this examination of the two parallel domains of research on legitimacy concludes three categories: pragmatic (based on audience self-interest), moral (based on normative approval) and cognitive (based on comprehensibility and taken-for-grantedness). In practical cases one of these categories can be more protruding or legitimacy being a blend of these three. The external legitimacy category, discussed previously, share some common traits with the audience self-interest category (labelled pragmatic) in the sense that actors external to the deliberative process (the audience consisting of experts and media) has a strong saying in the legitimate value of the outcome. The constellations of forums and involvement of stakeholders in governance processes is also featured in studies recognised as communicative planning theory (Healey, 1996) and the question also becomes relevant when implementing future-oriented development in European metropolitan regions (Healey, 2000). Campbell (2006) underlines that conceptualization of justice in contemporary planning theory is much about procedural concerns. However, individual liberties may be in conflict or as Campbell (2006: 95) puts it: "In relation to planning matters, the nature of interests is often complex and problematic; for example, individuals generally both desire clean air and to be able to drive their car(s) freely. Our preferences are therefore often inconsistent and overlapping." Also the previous work with Swedish futures studies construction in the 1960–1970s having aims at democratic scenario construction by proposing a "particular responsibility to society's weakest groups" (Andersson, 2006: 288). At that time these groups were discussed in terms of the "weakest groups" (including the poor, elderly, unemployed and the disabled). Other examples of relevance when discussing communication among actors can be found in game theory (Sally, 1995). **Conditions where reciprocity and trust can help overcome self-interests are built by "cheap talk".** As we will see, content sustainability, capacity to act and legitimacy are intimately connected. Findings from studies of collective actions frequently find that "when the users of a common-pool resource organize themselves to devise and enforce some of their own basic rules, they tend to manage local resources more sustainably than when rules are externally imposed on them" (Ostrom, 2000: 148). Common-pool resources are in this case understood as "natural or humanly created systems that generate a finite flow of benefits where it is costly to exclude beneficiaries and one person's consumption subtracts from the amount of benefits available to others" (Ostrom, 2000: 148). The explanation from game theory is that individuals obtain results that are "better than rational" when they are allowed to communicate, or do "cheap talk" as some economists call it (see e.g. Ostrom, 1998). In other words, communicative approaches can make collaboration work better since people have the possibility to bond with each other. From this reasoning we conclude that in a process where participants are active, open to preference shifts and are allowed to actually influence the result, both the content sustainability and the capacity to act might increase.

Our heuristic overcomes disbelief and mobilizes public responses
<u>Romm 12</u>

(Joe Romm is a Fellow at American Progress and is the editor of Climate Progress, which New York Times columnist Tom Friedman called "the indispensable blog" and Time magazine named one of the 25 "Best Blogs of 2010." In 2009, Rolling Stone put Romm #88 on its list of 100 "people who are reinventing America." Time named him a "Hero of the Environment" and "The Web's most influential climate-change blogger." Romm was acting assistant secretary of energy for energy efficiency and renewable energy in 1997, where he oversaw $1 billion in R&D, demonstration, and deployment of low-carbon technology. He is a Senior Fellow at American Progress and holds a Ph.D. in physics from MIT., 2/26/2012, "Apocalypse Not: The Oscars, The Media And The Myth of 'Constant Repetition of Doomsday Messages' on Climate", http://thinkprogress.org/romm/2012/02/26/432546/apocalypse-not-oscars-media-myth-of-repetition-of-doomsday-messages-on-climate/#more-432546)

The two greatest myths about global warming communications are 1) constant repetition of doomsday messages has been a major, ongoing strategy and 2) that strategy doesn't work and indeed is actually counterproductive! These myths are so deeply ingrained in the environmental and progressive political community that when we finally had a serious shot at a climate bill, the powers that be decided not to focus on the threat posed by climate change in any serious fashion in their $200 million communications effort (see my 6/10 post "Can you solve global warming without talking about global warming?"). These myths are so deeply ingrained in the mainstream media that such messaging, when it is tried, is routinely attacked and denounced — and the flimsiest studies are interpreted exactly backwards to drive the erroneous message home (see "Dire straits: Media blows the story of UC Berkeley study on climate messaging") The only time anything approximating this kind of messaging — not "doomsday" but what I'd call blunt, science-based messaging that also makes clear the problem is solvable — was in 2006 and 2007 with the release of An Inconvenient Truth (and the 4 assessment reports of the Intergovernmental Panel on Climate Change and media coverage like the April 2006 cover of Time). The data suggest that strategy measurably moved the public to become more concerned about the threat posed by global warming (see recent study here). You'd think it would be pretty obvious that the public is not going to be concerned about an issue unless one explains why they should be concerned about an issue. And the social science literature, including the vast literature on advertising and marketing, **could not be clearer that only repeated messages have any chance of sinking in and moving the needle**. Because I doubt any serious movement of public opinion or mobilization of political action could possibly occur until these myths are shattered, I'll do a multipart series on this subject, featuring public opinion analysis, quotes by leading experts, and the latest social science research. Since this is Oscar night, though, it seems appropriate to start by looking at what messages the public are exposed to in popular culture and the media. It ain't doomsday. Quite the reverse, climate change has been mostly an invisible issue for several years and the message of conspicuous consumption and business-as-usual reigns supreme. The motivation for this post actually came up because I received an e-mail from a journalist commenting that the "constant repetition of doomsday messages" doesn't work as a messaging strategy. I had to demur, for the reasons noted above. But it did get me thinking about what messages the public are exposed to, especially as I've been rushing to see the movies nominated for Best Picture this year. I am a huge movie buff, but as parents of 5-year-olds know, it isn't easy to stay up with the latest movies. That said, good luck finding a popular movie in recent years that even touches on climate change, let alone one a popular one that would pass for doomsday messaging. Best Picture nominee The Tree of Life has been billed as an environmental movie — and even shown at environmental film festivals — but while it is certainly depressing, climate-related it ain't. In fact, if that is truly someone's idea of environmental movie, count me out. The closest to a genuine popular climate movie was the dreadfully unscientific The Day After Tomorrow, which is from 2004 (and arguably set back the messaging effort by putting the absurd "global cooling" notion in people's heads! Even Avatar, the most successful movie of all time and "the most epic piece of environmental advocacy ever captured on celluloid," as one producer put it, omits the climate doomsday message. One of my favorite eco-movies, "Wall-E, is an eco-dystopian gem and an anti-consumption movie," but it isn't a climate movie. I will be interested to see The Hunger Games, but I've read all 3 of the bestselling post-apocalyptic young adult novels — hey, that's my job! — and they don't qualify as climate change doomsday messaging (more on that later). So, no, the movies certainly don't expose the public to constant doomsday messages on climate. Here are the key points about what repeated messages the American public is exposed to: The broad American public is exposed to virtually no doomsday messages, let alone constant ones, on climate change in popular culture (TV and the movies and even online). There is not one single TV show on any network devoted to this subject, which is, arguably, more consequential than any other preventable issue we face. The same goes for the news media, whose coverage of climate change has collapsed (see "Network News Coverage of Climate Change Collapsed in 2011"). When the media do cover climate change in recent years, the overwhelming majority of coverage is devoid of any doomsday messages — and many outlets still feature hard-core deniers. Just imagine what the public's view of climate would be if it got the same coverage as, say, unemployment, the housing crisis or even the deficit? When was the last time you saw an "employment denier" quoted on TV or in a newspaper? The public is exposed to constant messages promoting business as usual and indeed idolizing

conspicuous consumption. See, for instance, "Breaking: The earth is breaking … but how about that Royal Wedding? Our political elite and intelligentsia, including MSM pundits and the supposedly "liberal media" like, say, MSNBC, hardly even talk about climate change and when they do, it isn't doomsday. Indeed, there isn't even a single national columnist for a major media outlet who writes primarily on climate. Most "liberal" columnists rarely mention it. At least a quarter of the public chooses media that devote a vast amount of time to the notion that global warming is a hoax and that environmentalists are extremists and that clean energy is a joke. In the MSM, conservative pundits routinely trash climate science and mock clean energy. Just listen to, say, Joe Scarborough on MSNBC's Morning Joe mock clean energy sometime. The major energy companies bombard the airwaves with millions and millions of dollars of repetitive pro-fossil-fuel ads. The environmentalists spend far, far less money. As noted above, the one time they did run a major campaign to push a climate bill, they and their political allies including the president explicitly did NOT talk much about climate change, particularly doomsday messaging Environmentalists when they do appear in popular culture, especially TV, are routinely mocked. There is very little mass communication of doomsday messages online. Check out the most popular websites. General silence on the subject, and again, what coverage there is ain't doomsday messaging. Go to the front page of the (moderately trafficked) environmental websites. Where is the doomsday? If you want to find anything approximating even modest, blunt, science-based messaging built around the scientific literature, interviews with actual climate scientists and a clear statement that we can solve this problem — well, you've all found it, of course, but the only people who see it are those who go looking for it. Of course, this blog is not even aimed at the general public. Probably 99% of Americans haven't even seen one of my headlines and 99.7% haven't read one of my climate science posts. And Climate Progress is probably the most widely read, quoted, and reposted climate science blog in the world. Anyone dropping into America from another country or another planet who started following popular culture and the news the way the overwhelming majority of Americans do would get the distinct impression that nobody who matters is terribly worried about climate change. And, of course, they'd be right — see "The failed presidency of Barack Obama, Part 2." It is total BS that somehow the American public has been scared and overwhelmed by repeated doomsday messaging into some sort of climate fatigue. If the public's concern has dropped — and public opinion analysis suggests it has dropped several percent (though is bouncing back a tad) — that is primarily due to the conservative media's disinformation campaign impact on Tea Party conservatives and to the treatment of this as a nonissue by most of the rest of the media, intelligentsia and popular culture.

Simulation allows us to influence state policy AND is key to agency
Eijkman 12

(The role of simulations in the authentic learning for national security policy development: Implications for Practice / Dr. Henk Simon Eijkman. [electronic resource] http://nsc.anu.edu.au/test/documents/Sims_in_authentic_learning_report.pdf. Dr Henk Eijkman is currently an independent consultant as well as visiting fellow at the University of New South Wales at the Australian Defence Force Academy and is Visiting Professor of Academic Development, Annasaheb Dange College of Engineering and Technology in India. As a sociologist he developed an active interest in tertiary learning and teaching with a focus on socially inclusive innovation and culture change. He has taught at various institutions in the social sciences and his work as an adult learning specialist has taken him to South Africa, Malaysia, Palestine, and India. He publishes widely in international journals, serves on Conference Committees and editorial boards of edited books and international journal)

However, whether as an approach to learning, innovation, persuasion or culture shift, policy simulations derive their power from two central features: their combination of simulation and gaming (Geurts et al. 2007). 1. The simulation element: the unique combination of simulation with role-playing. The unique simulation/role-play mix enables participants to create possible futures relevant to the topic being studied. This is diametrically opposed to the more traditional, teacher-centric approaches in which a future is produced for them. In policy simulations, possible futures are much more than an object of tabletop discussion and verbal speculation. 'No other technique allows a group of participants to engage in collective action in a safe environment to create and analyse the futures they want to explore' (Geurts et al. 2007: 536). 2. The game element: the interactive and tailor-made modelling and design of the policy game. The actual run of the policy simulation is only one step, though a most important and visible one, in a collective process of investigation, communication, and evaluation of performance. In the context of a post-graduate course in public policy development, for example, a policy simulation is a dedicated game constructed in collaboration with practitioners to

achieve a high level of proficiency in relevant aspects of the policy development process. To drill down to a level of finer detail, policy development simulations—as forms of interactive or participatory modelling— are particularly effective in developing participant knowledge and skills in the five key areas of the policy development process (and success criteria), namely: Complexity, Communication, Creativity, Consensus, and Commitment to action ('the five Cs'). The capacity to provide effective learning support in these five categories has proved to be particularly helpful in strategic decision-making (Geurts et al. 2007). Annexure 2.5 contains a detailed description, in table format, of the synopsis below.

Simulation doesn't jeopardize agency

Thus, **debate games** require teachers to balance the centripetal/centrifugal forces of gaming and teaching, to be able to reconfigure their discursive authority, and to orchestrate the multiple voices of a dialogical game space in relation to particular goals. These Bakhtinian perspectives provide a valuable analytical framework for describing the discursive interplay between different practices and knowledge aspects when enacting (debate) game scenarios. In addition to this, Bakhtin's **dialogical philosophy** also offers an explanation of why **debate games** (and other game types) may be valuable within an educational context. One of the central features of multi-player games is that players are expected to experience a simultaneously real and **imagined scenario** both in relation to an insider's (participant) perspective and to an outsider's (co-participant) perspective. According to Bakhtin, the **outsider's perspective** reflects a fundamental aspect of human understanding: In order to understand, it is immensely important for the person who understands to be located outside the object of his or her creative understanding – in time, in space, in culture. For one cannot even really see one's own exterior and comprehend it as a whole, and no mirrors or photographs can help; our real exterior can be seen and understood only by other people, because they are located outside us in space, and because they are others (Bakhtin, 1986: 7). As the quote suggests, every person is influenced by others in an inescapably intertwined way, and consequently no voice can be said to be isolated. Thus, it is in the interaction with other voices that individuals are able to reach understanding and **find their own voice**. Bakhtin also refers to the ontological process of finding a voice as **"ideological becoming"**, which represents "the process of selectively assimilating the words of others" (Bakhtin, 1981: 341). Thus, by teaching and playing **debate scenarios,** it is possible to support students in their process of becoming not only themselves, but also in becoming articulate and responsive citizens in a democratic society.

PRECONDITION for education

4.2.1. Play and imagination Among educational theorists, John Dewey is well-known for stressing the learning potential of play and game activities within education (Makedon, 1993; Vaage, 2000). Thus, Dewey devotes an entire chapter in Democracy and Education to "Play and Work in the Curriculum". In tune with the main argument presented throughout the book, he begins the chapter by noting that it is "desirable" that education, as such, starts "from and with the experience and capacities of learners" (Dewey, 1916: 202). This can be done through the "the introduction of forms of activity, in play and work, similar to those in which children and youth engage outside of school" (Dewey, 1916: 202). Dewey makes no fundamental distinction between play and work activities, as they "both involve ends consciously entertained and the selection and adaptation of materials and processes designed to affect the desired ends" (Dewey, 1916: 210). Thus, play and work mostly differ in terms of "timespans", which "influence the directness of means and ends" (Dewey, 1916: 210). In this sense, play and work activities simply represent two different aspects on a continuum of meaningful relations between ends and means. This assertion also goes against the commonsensical notion that play is goal-free or is an end in itself. In summary, Dewey views play as being meaningful, goal-oriented, and interestbased. Moreover, play is free and plastic as it is both directed toward present and future (projected) activities (cf. chapter 2). However, in order to realise the educational value of play it is necessary to understand play as an imaginative activity (Dewey, 1916: 245). Play activities are too important to be reduced to a purely developmental phenomenon among children: It is still usual to regard this [imaginative] activity as a specially marked-off stage of childish growth, and to overlook the fact that the difference between play and what is regarded as serious employment should be not a difference between the presence and absence of imagination, but a difference in the materials with which imagination is occupied (Dewey, 1916: 245). In this way, play is closely linked with the imagination, which is "the medium of realization of every kind of thing which lies beyond the scope of direct physical response" (Dewey, 1916: 245). Put differently, Dewey's conception of imagination represents "the capacity to concretely perceive what is before us in light of what could be" (Fesmire, 2003: 65). Thus, the educational value of play activities must be based on the understanding that: The imagination is as much a normal and integral part of human activity as is muscular movement. The educative value of manual activities and of laboratory exercises, as well as of play, depends upon the extent in which they aid in bringing about a sensing of the meaning of what is going on. In effect, if not in name, they are dramatizations. Their utilitarian value in forming habits of skill to be used for tangible results is important, but not when isolated from the appreciative side. Were it not for the accompanying play of imagination, there would be no road from a direct activity to representative knowledge; for it is by imagination that symbols are translated over into a direct meaning and integrated with a narrower activity so as to expand and enrich it (Dewey, 1916: 245-6; my emphasis added). Play activity as such is no guarantee for avoiding "mechanical methods in teaching" (Dewey, 1916: 245). Thus, the value of **educational gaming** is **entirely dependent** upon whether the imaginative aspects of play are able to support students understanding of "what is going on". In this way, imaginative play allows meaning to be created through "dramatizations" of particular aspects of knowledge. Consequently, the presumably distinct categories of imagination and reality represent a subtle continuum of finely graded experience as human beings do not experience reality directly but always through symbols, language, and social interaction (Waskul & Lust, 2004

AT Tuck and Yang

Suffering Reps Good

Our critique of structural injustice turns vampirism. Contextualizing vulnerability, and the background of injustice balances emphasizing with material suffering and avoiding sentimentality

Michalinos **Zembylas 13**, Education @ Open (Cyprus), "The 'Crisis of Pity" and the Radicalization of Solidarity: Toward Critical Pedagogies of Compassion", *Educational Studies* 49, p. 512-516

First of all, a politics of compassion that takes into consideration the possible dangers of compassion fatigue, desensitization, and self-victimization has to begin from acknowledging common human vulnerability and its influence in **inspiring meaningful actions that avoid presumptuous paternalism** (Porter 2006; Whitebrook 2002). The recognition of one's own vulnerability can constitute a powerful point of departure for developing compassion and solidarity with the other's vulnerability (Butler 2004). As Butler asserts: "Each of us is constituted politically in part by virtue of the social vulnerability of our bodies. ... We cannot ... will away this vulnerability. We must attend to it" (2004, p. 29). Butler's description of the vulnerable body and self refers to the way we perform and are performed upon, and part of what we fear in the other is a projection of our own selves. Hence, Butler suggests that recognition of our own vulnerability opens up the potential for recognition of all humanity as vulnerable. Vulnerability may therefore, be a more appropriate term than suffering to ground the political applications of compassion, because **the focus is not merely on the alleviation of material suffering and hence a slide from compassion to benevolence and sentimentality** (Porter 2006; Whitebrook 2002). Suggesting this epistemological shift of focus does not imply however, **that a narrative that focuses on the alleviation of material suffering will necessarily result in a slide into sentimentality.** Undoubtedly, the political applications of compassion cannot be completely separated from questions of material suffering. Thus, it needs to be acknowledged that although the move away from suffering may be theoretically useful, the shift to a narrative of common human vulnerability is not completely unproblematic. 8 The idea of common vulnerability enables us—teachers and **students** in the classroom, for instance—to explore how we might move beyond dichotomies that single out the self or the other as victims, and therefore as deserving someone else's pity. That is, the idea of common vulnerability puts in perspective the notion of all of us as vulnerable, rather than the individual-other who needs our compassion. This notion addresses the concerns of **students** for example, who **seem to be stuck in self-victimization claims and refuse to acknowledge that others also suffer.** Although the idea of common vulnerability does not guarantee any departure from such claims, it opens some space to problematize moralistic positioning. In addition, the notion of common vulnerability attacks a major emotional ideology grounded in the view that it is natural or normal to be fearful of the other, especially if it involves racial differences. This is one of the most common and pernicious emotional ideologies underlying resistance (especially among White, middle-class students) to identifying with the other. However, if vulnerability concerns everyone and yet compassion is assigned differently (i.e., students think that some deserve compassion but others do not), then it is important to explore what it would take for students to begin imagining themselves as objects of lesser compassion in an unsuspected vulnerable moment. Through addressing this issue in ways that do not reify stereotypes or promote essentialism, it is possible to respond to some of the desensitization concerns outlined earlier, because the dichotomies between we and they will become meaningless and unproductive. Second, **compassion serves to reinforce a strong connection between the personal and the political** and accentuates the interpersonal and the interrelational (Whitebrook 2002). **Empathetic identification with the plight of others**, then, **is not a sentimental recognition of potential sameness**—you are in pain and so am I, so we both suffer the same—**but a realization of our own common humanity, while acknowledging asymmetries of suffering**, inequality, and injustice. A discourse of vulnerability neither eschews questions of material suffering nor obscures issues of inequality and injustice; on the contrary, it highlights both the symmetries and the asymmetries of vulnerability. That is, although the experience of vulnerability may be more or less universal, the discourse of common vulnerability raises important critical questions such as "vulnerable to what? to whom?" to dismiss the possibility of sliding into a sentimental recognition of potential sameness—which is exactly what a politics of compassion ardently seeks to avoid. Without this double realization—that is, we are all vulnerable but not in the same manner—our actions run the danger of being a form of charity and condescension toward those who are systematically and institutionally oppressed (Bunch 2002). If properly recognized in schools, this double realization can potentially address both the concern about the desensitization of students and that of their self-

victimization, because **the distance between spectator and sufferer will not be taken for granted** any more, but rather **its multiple complexities will be** acknowledged and interrogated. In a sense then, the kind of compassion that is explored here requires a simultaneous identification and disidentification with the suffering of the other. The simultaneous recognition of symmetry and asymmetry with the other removes the arrogance of claiming that we know and feel their pain and suffering. This emotional ambivalence of simultaneous identification and disidentification is needed to focus attention on the other's suffering, but not becoming too identified with it—a point raised earlier in Nelson's (2004) reading of Arendt's reporting on Eichmann's trial. Students who already endure forms of suffering, of course, do not need a pedagogy to enlighten them how to disidentify with their own suffering. This does not imply, however, that pedagogies that interrogate pity and encourage critical compassion are not for them; on the contrary, the critical awareness that others are vulnerable, too, is important in the struggle for **action-oriented solidarity** and the avoidance of egocentricity and cultural **narcissism**. Finally, the third element of a politics of compassion is attentiveness to how the ethics of compassion questions injustice and inequality. 9 In particular, an important component of a politics of compassion that is critical and justice-oriented is how it deals with anger at injustice (Hoggett 2006). A politics of compassion does not intentionally seek to cause anger, however, but rather encourages students and teachers to develop a critical analysis of anger, as it is likely that they will experience such feelings, when they begin questioning long-held assumptions and beliefs about other people and social events (Zembylas 2007). Anger may call attention to demands for recognition, but also emphasize inequalities (Holmes 2004) and injustices at the civic level (Silber 2011). Anger at injustice can be a positive and powerful source of personal and political insight in education (Lorde 1984), because it helps to move teachers and students out of a cycle of self-pity, blame, or guilt into a mode of action that somehow responds to injustice. For example, civic anger can be promoted in the classroom as a form of cultivating individual and collective political consciousness and social resistance to injustices in the students' community, although anger is not inevitably emancipatory. However, recognizing the positive power of anger and its link to the struggle against injustice in one's own community is valuable, if teachers want to promote options for action that may change the conditions of others' vulnerability. The pedagogical challenge for critical pedagogues is how to encourage students to become active participants with a nuanced understanding of the emotional complexities involved in histories of injustice and oppression.

Their sentiment K is totally wrong---stories of pain combined with political action avoid vampiristic consumption and motivate effective harm-reduction

Rebecca **Wanzo 9**, Associate Professor, Women, Gender, and Sexuality Studies Program, Washington U in St. Louis. The Suffering Will Not Be Televised, 228-232

Despite my disappointment in these films and frequent annoyance with the narrative trajectory of many of their productions, I admit that I have a bit of a soft spot for the Lifetime network. I, too, used to automatically criticize made-for-television movies "inspired by a true story" about women at risk. I found them exploitative, as any film can be that makes entertainment out of a personal tragedy. Lifetime Television has been called "television for victims," in a criticism of its seemingly endless capacity to show fi lms about the victimization of women.5 One of the questions that this moniker raises is what kind of storylines about people have the most dramatic impact. Popular fi lms with high dramatic impact depict violence, stories of surviv- ing some atypical traumatic event, or struggling with some more powerful person or entity. One aspect of the criticisms of Lifetime is the objection to formulaic melodrama in itself, framed within the gendered derision of women's victimization narratives or, on the other side of the political spectrum, discomfort with such narratives as demeaning, reductive, and trite. The fi lms shown on the network, some produced by Lifetime but most produced elsewhere, vary in quality, but the criticisms of Lifetime raise a question that I have explored throughout this book: What is the best way to represent a story of suffering? ¶ 229¶ Simply crying at a Lifetime film clearly cannot sustain any sub- stantive political work— but what if the crying citizen is directed to, at the very least, awareness, and in the best case scenario, action, after their emotional catharsis? Sorrow produced at the sight of a dead or wounded woman may not accomplish anything **unless the representation is framed in relationship to** some **political action**, but tears in relation to abolition and child abduction did produce action. However, a major ethical problem with using sympathy and compassion as the primary mechanism for political change is that sentimental politics depends on the cultural feelings of those in power, and the disempowered must depend on patronage. Hannah Arendt argues that compassion cannot embrace a larger population, but pity can, and pity is a dangerous affect because it cannot exist without misfortune, thus "it has just as much vested interest in the existence of the unhappy as thirst for power has a vested interest in the existence of the weak . . . by being a virtue of sentiment, pity can be enjoyed for its own sake, and this will almost automatically lead to a glorifi cation of its cause, which is the suffering of others."6 ¶ Following Arendt, the charge against Lifetime could be that it thus encourages sadism because watchers could take pleasure in pity. Or, as literary critic Marianne Noble has suggested in her study of sentimentality, the network might embrace masochism because watchers would identify with the sufferer and might begin to take pleasure in these fantasies of subjection.7 **However, these** readings of the pleasures of consuming stories of subjection are too narrow. In the case of Lifetime, casting these films as only narratives of victimization is too limited a reading. After watching several fi lms, I began to be compelled by stories I had not heard before about women interven- ing when the state fails to protect them. The stories were clearly not only about victimization, but also about survival. The movies negotiate a balance between structural critique and stories of individual heroism, and I am often disappointed, as with the fi lms discussed above, with how much weight is placed on the side of individual transformation. Nonetheless I later began defending the network out of political principle, as part of a broader effort to challenge the ¶ 230¶ facile denunciation of the word "victim." Lifetime's fi lms are often poor in terms of artistic merit, but the network is contributing to a national conversation about what agency can look like. ¶ My argument may seem as if I am looking for politics in all the wrong places, relying on

sentimentality when I should focus on politically rational arguments that eschew the appeals of emotional response. I am not asking for radical progressivism from popular culture. Instead, I am arguing that politics is often accomplished through the popular and conventional work of emotional appeals, as many activists throughout history have demonstrated. The question facing activists for African American women—or, for that matter, advocates for any identity group outside the national imaginary of ideal citizenship—is not only how to expose discrimination, but also how to make use of existing rhetoric so that attacks on their bodies can be read as pressing concerns for all U.S. citizens. Affect and popular culture can be easily criticized as tools of anti-intellectual conservative machines. As Max Horkheimer and Theodor Adorno rightly argue, popular culture focuses on producing narratives of comfort or affects that can ultimately serve the state's purposes.8 Totally escaping the political storytelling of the status quo elicited by mass-produced texts is indeed impossible. However, the impossibility of total escape does not preclude the possibility of making use of tools produced by ideology. Mobilizing affect demands use of proven rhetorical tools, but this use need not forestall a criticism of the need to employ the structures in the first place. Negotiating the relationship between challenging the "master's tools" and making use of them to garner financial support and political power is not an easy project, but it is a necessary one. ¶ The book's title is inspired by this very tension between see- ing popular cultural productions as inevitably politically ineffi cacious and recognizing the possibilities offered by making use of widely circulated genres and media. When Gil Scott-Heron produced his famous choreo-poem, "The Revolution Will Not Be Televised," in 1974, he called attention to the disconnect between radical action and violent struggles taking place in the streets and the pleasures of oblivion offered by scripted television and commercials.9 Television stood in for mass-produced media that would not show what was really occurring in the streets, like "pigs shooting down brothers in instant replay." Scott-Heron pointed to the need for his audience to take to the streets and participate, live, in the revolution. Indeed, a ¶ 231¶ rue revolution requires "live" political action and organizing, and television and many cultural productions neglect a multitude of issues that are politically urgent. However, it is clearly no longer the case that "pigs shooting down brothers in the street is left off of instant replay." Important events are depicted on the news, in scripted tele- vision shows, in genre fi ction, in magazines, in movies, and on the Internet. You can even catch the occasional social message in a television commercial. Rather than reject various media wholesale, we are left with a set of questions about what to do with contemporary media realities. How and why are certain kinds of traditionally neglected issues represented? Once represented, how are they interpreted, and can activists play a role in that interpretation? What do activists do about the complexities lost when they make use of certain kinds of mass-marketed discourses? ¶ Octavia Butler perhaps best articulated this problem in her science-fi ction novel Parable of the Talents. The novel exempli es what Lauren Berlant calls the postsentimental text—one that exhibits longing for the unconfl icted intimacy and political promise senti- mentality offers but is skeptical of the ultimate political effi cacy of making feeling central to political change. Her heroine, Olamina, suffers from "hyperempathy" syndrome, which allows her to feel the emotions of others, but Butler is careful to argue that being able to feel the pain of others is not the means for liberation—it is a "delusional disorder." Thus Olamina focuses on other modes of political change, and struggles to gain followers for her politi- cal and spiritual project for survival, Earthseed, in a United States devastated by environmental destruction and the domination of a repressive fusion of government and a religious right organiza- tion called Christian America. Through Olamina's struggle, Butler addresses the intellectual discomfort with consumption by having a character explicitly argue that only strategic commodifi cation will result in successful dissemination of radical ideas. Olamina struggles with the means by which she can circulate Earthseed, until someone suggests to her that she must use the marketing tools she slightly disparages to compel people to her project. Her companion, Len, argues that Olamina must "focus on what people want and tell them how your system will help them get it." She resists the call to "preach" the way her Christian American enemy Jarret does, rejecting "preaching," "telling folksy stories," emphasizing a profi t motive, and self-consciously using her charismatic persona to sell Earthseed. ¶ 232¶ Len argues that her resistance to using the tools of commodifi cation "leaves the fi eld to people who are demagogues—to the Jarrets of the world."10 Butler ultimately presents the moral that the project of producing populist texts for mass consumption cannot be left to those with unproductive or dangerous dreams, abandoned by a Left that desires not only revolution but also political change resulting in real material gains.¶ Clearly, the productions of mass-culture are not the only way to move people to action, but they are no doubt a tool. The dismissiveness accompanying the label of the sentimental in contemporary culture is because academic critics claim that it does not do anything, it is the antithesis of action. However, this book is about how sentimentality is doing things all the time. For better or worse, it teaches people to identify "proper" objects of sympathy. It teaches people how to relate to each other. It teaches people how to make compelling arguments about their pain. The circulation of sentimental political storytelling often depends on media to which many progressives have a schizophrenic relationship. News media and television are often tools of the state, but citizens depend on the news for the free circulation of information and often look for progressive politics in television shows. Others disavow the "idiot box" altogether and have faith only in alternative news sources. However, the dichotomy between the popular and other spaces in which people tell stories about suffering is a false one. Sentimental political storytelling is omnipresent in U.S. culture. While the discourse has many short-comings, people interested in political change are taking a perilous road if they ignore the possibilities of imperfect stories told about citizens in pain.

Blackness Turn

Alt silences black suffering
