Recognizing the political valence of pain—of **speaking pain—is essential to black survival.** Given the poorer health status of African Americans in the United States, the fact that pain is often ignored or borne silently before seeking care, and undertreated once care is sought, those who work with African Americans need to emphasize the right to tell stories of pain. Obstacles to black storytelling not only come from white institutional sources, but they also come from self-perceptions that if African Americans can claim nothing else, they can claim strength. The strong-black-woman stereotype, John Henry, the brave and stoic kids integrating the store, and other models of black strength fill the U.S. imaginary. **Reinterpreting the naming and** speaking of pain can be an act of power, not an act of powerlessness. One person who recognized the power in speaking about pain was Audre Lorde. In The Cancer Journals she described how she wanted people to respond to her cancer in a way that was atten- tive her identity, to the fact that she was black and feminist and a lesbian. After her mastectomy, she journaled, "I want to write about the pain."74 She wanted to write about the pain because she would "willingly pay whatever price in pain was needed, to savor the weight of completion; to be utterly fi lled, not with conviction nor with ¶ 181¶ faith, but with experience—knowledge, direct and different from all other certainties." Writing about the pain, speaking about the pain imparts knowledge, a different kind of knowledge than that validated by the allegedly objective methodologies of medicine and science, but knowledge nonetheless. The example of medical storytelling is a visceral example of how black pain has been dismissed or reframed in relationship to various political agendas. **Sentimental political storytelling, for all its faults, provides an important intervention.** ¶ A Coda on Moving from Spectator/ Spectacle to Agents in Our Own Care¶ This intervention can be, as in the best examples of sentimental political storytelling, both public and private, both therapeutic and a political call to arms. When I saw a call for papers for the "Anarcha Symposium," The Anarcha Project's Michigan workshop, I applied with both public and private work. I shared academic scholarship I had written about Anarcha as well as creative nonfi ction about my surgery, fi nding the rare space in the academy that made space for both. Called together in 2007, many of us engaged in scholarship who did not see ourselves as scholars, in creative performance when we did not see ourselves as performers. The group who came together to discuss Anarcha, J. Marion Sims, and the issues the history raised were eclectic: undergraduates taking classes in disability studies, scholars and performers who focused on African American culture, dancers, singers, those who had movement constraints, and those of us who had constraints that were less visible. Over the course of a few days we performed physical and mental exercises, bonding in both small and large groups in order to shape a performance at the end of our time together. We were transformed from spectators into spectacle, but it was a process of constructing a spectacle that was by no means one way—we looked back in history and looked out to those who could engage with us. While minimalist in presentation, it contained the excesses of our emotional response to Anarcha's history and our presents. ¶ If a problem with sentimental political storytelling is the conflation with other kinds of oppressed bodies, the productively messy conflations pushed us to think about a broader nexus of institutional oppression. We were divided into small performance groups, and we ¶ 182¶ struggled to fi nd a collective response that refl ected all of our readings of Anarcha's, Lucy's, and Betsey's histories, as well as the histories of other unnamed women. On a stark stage, with our bodies, micro- phones, and lights shaping the space, my group produced a short choreo-piece after two days of work in which the group collectively prompted individual stories with the refrain, "This is Anarcha's story, and . . ." it was the story of all of us. One of us challenged the his- torical record that Anarcha "willingly consented" in Sims's narrative while also addressing the issue of her relatives' lack of consent to medical experimentation during the Nazi Holocaust. Another of us without the use of her legs told the story of being sexually molested by a medical caregiver, describing "histories and futures lost . . . one black, one white, one slave, one not . . . neither touched by request, both silenced by circumstance." In drawing a comparison between the invisible stories—Anarcha's and her own—she explored how the broader issue of nonconsent and voicelessness in medical care can be read across history and identity. One of us discussed the lack of choices and resistance when fi ghting "medical men"; another discussed fear shaped by history. Drawing on my history, I added to the chorus with a recognition of my difference from Anarcha as well as my sense of connection to her: "I am not Anarcha," but see her story as my story, "not because my issues are hers, but because I need someone to hear her pain . . . and alleviate it." And as we moved in and out of our individual and collective refrains shaped by our specific stories, the chorus built community, acknowledging the differences between our histories and our similar investments at the same time. We learned, as Boal suggests in Theater of the Oppressed, to "practice theater as a language that is living and present, not as a finished product displaying images from the past."75 ¶ I fi nd telling my own story diffi cult; in some ways, telling the story of pain management after my surgery and telling of the Anarcha Symposium performance are equally diffi cult. Two spaces of judgment are possible—judgment of my tolerance for pain and judgment of my creative work, both of which are linked to what it means to make myself vulnerable. I was advised to cut my personal story from this chapter because of the danger of exposing myself. But if we take sentimental political storytelling seriously as an opportunity to treat affect and the story of pain as essential to political progress, what example would I set if I remained continually in a space of academic distance when I believe in the political efficacy ¶ 183¶ of the sentimental narrative? As a subject who has been raced and pained in the United States, I must don the mantle of articulating my affective investment in recognizing the relationship between race and pain without shame. ¶ As I say that it is hard to talk about pain—broadly—in the U.S. without talking about race, I recognize that the claim can be read as hyperbolic, and inadequately supported. The charge of hyperbole is often leveled against sentimental rhetoric. But a review of history, rhetoric, and social and medical discourse reveals that these concepts are often linked in the United States. When we recognize that we can be subjects of various discourses about race and pain, and not only subject to a specialized language, such a shift in understand- ing **may empower people**, as health-care advocates encourage, to be agents in their own care. Silence, as Audre Lorde, famously wrote, will not protect you.76 Allowing stories of pain to be silenced, dismissed, or obscured, however, will surely kill you. We must speak pain to power.

Perm

That's best --- sentimentality is politically effective when it is recognized as part of a larger project

Rebecca **Wanzo 9**, Associate Professor, Women, Gender, and Sexuality Studies Program, Washington U in St. Louis. The Suffering Will Not Be Televised, p. 9

However, sentimentality cannot easily be understood as progressive or conservative. When theorists criticize producers of sentimentality for conservative politics, they sometimes attack a rhetoric that is reactionary or designed to serve the status quo. At other times, such critics express disappointment at a text's possibly radical revolutionary or otherwise progressive potential having been short-circuited in favor of feel-good closure offered by the sentimental narrative. World Trade Center provoked exactly this response from movie critic David Edelstein, who wanted the fi lm about the event of 9/11 to be "more political," because the "heartwarming conclusion" to the fi lm is "unrepresentative—to the point where it almost seems like a denial of the deeper and more enduring horror."22 Sentimental texts present themselves frequently as progressive about social justice issues while they eventually preserve the status quo. Indeed, that is an overlying tendency of most sentimental texts. However, the binaries of good and bad, Left and Right are insufficient to categorize sentimentality as it does, by its nature, have a progressive political thrust. It addresses the suffering of the politically disadvantaged but utilizes conventional narratives and practices that will not fundamentally disrupt power. Rather than characterizing U.S. sentimentality as "good" or "bad" politics, a more precise characterization—albeit more of a mouthful and less dramatic—is to call it a **politically effective** but insufficient means of political change.

Youngs, Director-General FRIDE, '11

[February 2011, Richard- Professor Politics University of Warwick, "Misunderstanding The Maladies Of Liberal Democracy Promotion" http://www.eurasiareview.com/misunderstanding-the-maladies-of-liberal-democracy-promotion-18022011/]

Reflections on liberalism's future Current international political trends are complex and still in flux. History shows that there are no iron laws of democratisation, and dominant political dynamics can prove strikingly changeable. The easy triumphalism of the liberal democracy agenda in the 1990s was misplaced. However, much criticism now risks over-shooting.18 The Bush administration provided an easy dog to kick. But its excessive awfulness skewered the nature of conceptual debate: critical theory has become as lacking in self-reflexivity as the 'liberal imperialism' it everywhere sees and excoriates. A nuanced view is warranted of the 'democracy backlash'.19 We should be attentive to a lack of flexibility in the conceptualisation of democracy. The consideration of a variety of models is necessary and desirable. However, the evidence does not sustain the suggestion that the most serious problem with democracy promotion today is an excess of the 'liberal' in liberal democracy. Indeed, in many places quite the reverse is true. The most worrying problem is not practitioners' lack of willingness to consider varieties of democratic institutions, but the lack of priority attached to advancing core liberal rights. As Western powers decline, this trend is likely to deepen in the future. Liberalism will increasingly be on the back foot. In this sense, those that assume that liberalism is dominant risk lagging behind the policy curve. Dahl's definition of democracy may be partial and narrow, but can we really not say with confidence that it is better than the authoritarianism that the West is still propping up under the guise of respect for 'local values'? Moreover, the 'liberal overdose' argument is curious to the extent that since the end of the 1990s a central thrust of debate common to development, security and governance circles has been 'the rediscovery of the state'. The stress on core liberal political norms is today under- not over-played. It continues to be the centrally important area where local reformers look to the international community for support – most commonly, in vain. Deliberations over precise institutional configurations and second-generation reforms are of a lesser order of importance. Michael McFaul observes that some debates about the intricate sequencing of reform and different varieties of institutional pathways look incongruous, as the US can today do little to influence such details, but rather simply back core democratic values.20 Yet it still hesitates to do so, for all the standard commentary on US 'liberal imperialism'. Liberal internationalism is still de-legitimised by the pervasive assumption that it is concerned primarily with mobilising military force in support of democratic values; it must be made clearer that military power is simply anathema to the standard day-to-day agenda of democracy support. There are different levels of critique, which risk elision. One thing is to argue that Western powers should support core liberal democratic principles, then from this base work to build into their policies a concern with social equality, participation, deliberation and religious identity. It would be entirely convincing to argue that, while democracy promoters have advanced, they could and should be doing more in this direction. But it is quite another thing to suggest that such aims should be supported against or instead of core liberal norms. In practice, what many critics appear to advocate is not a cumulative combination, but a dilution of the liberal component in favour of other forms. They betray a core inconsistency: they dislike democracy promotion for being overly intrusive, but then advocate modifications that would make it more, not less, intrusive. This is because most suggested 'alternative forms of democracy' breach the line between process and substantive policy outputs – they advocate particular ends, not just a type of policy-making means. The concrete examples of European policies demonstrate that it is hardly credible to 'accuse' Brussels of being an unthinking citadel of blinkered liberalism. Indeed, in this author's experience, conversations with policy-makers reveal this to be akin to an almost unmentionable L-word. When so much doubt and ambivalence now suffuses democracy support strategies, it is unconvincing to admonish the latter for being uniformly, heavily prescriptive. Donors' tendency to see democracy

through the prism of their own political systems still often surfaces. But in terms of the way that the 'democracy' in democracy support is defined conceptually it would seem somewhat redundant now to warn donors of the dangers of heavily-prescriptive institutional templates. There is some evidence of the self-reflexive policy-learning on the part of democracy promotion practitioners that many critics assume is entirely lacking. Indeed, genuine doubt over the most suitable paths forward has reached the point where some actors' policies are reduced to immobilism. The problem is that while policy-relevant knowledge has accumulated, it has done so in an ad hoc fashion and has not been systematised into common or comprehensive new approaches.21 The influences on democracy strategy of academic traditions are eclectic. If we were to trace the philosophical roots of European good governance and democracy support policies, it is simply not the case that Locke prevails over all else. The breadth of democracy assistance programmes goes way beyond the Schumpeterian. The stress on the role of the state and the existential identity-value of the political community found in many current policy initiatives finds resonance (if unconsciously) in thinking that historically stood as the antithesis to political liberalism. Such a line can be traced from Aristotle's view of the political community as a biological organism; to Rousseau's insistence that the general will embodies a mystical, spiritual collective identity of the political community above and beyond the will of the majority; through to Hegel's system centred on the state as the organic embodiment of collective interests and identity, the 'absolute' within which the individual finds his very meaning. This is not to say any such strand of thinking would capture entirely the ideas that inform today's foreign policies. However, the pertinent point is that the underpinnings of these policies can be seen in writers who were in combat with Lockean liberalism. The standard European discourse on equality being more important than formal political democracy has a direct echo in (politically) anti-liberal Rousseau. Concerns over the 'tyranny of the majority' that inform power-sharing strategies in post-conflict situations have a long line of antecedent philosophers who inveighed strongly against the will of the majority, from Aristotle through even to Kant (who was concerned with the republican separation of executive and legislation but certainly not with augmenting popular power against the aristocracy). Even Benthamite radical utilitarianism shines through, in its concern with a strong rule of law to restrain individual freedoms and ensure greater equality in the furtherance of collective interests. If any modern philosopher is the thinker of choice for today's discerning Eurocrat it is Habermas, not the classic liberals. In general, deliberative democracy has been most widely advocated as a means of situating abstract cosmopolitan universalism within concrete and varied social settings.22 And all this is quite apart from the more obvious cases of

cynical realpolitik that take their cue from the more violent illiberalism of Machiavelli and Hobbes.23 It is self-evident that liberal democracy now shares the conceptual field with rivals in a way that it did not in the 1990s. This may provide for vibrant debate and much-needed selfexamination. But it does not necessarily mean that alternatives have superior legitimacy. Allowing analytic space for a wider variety of forms and definitions of democracy does not mean that sovereign democracy, Islamic democracy, tribal democracy or Bolivarian democracy are necessarily superior or more in tune with local demands. With the West accused of being overly-prescriptive of a liberal form of democracy, it would be subversive of the critique to jump straight into advocating other pre-cooked forms. It should be remembered that a form such as social democracy is just as 'Western' in it origins as liberal democracy: there is no reason a priori to assume that it corresponds more closely to 'local demands' in the way that is routinely and rather uncritically suggested (however one may oneself desire socially democratic outcomes). If the ascendance of conceptual competitors can add usefully to the parameters of desirable political reform, it is not incompatible with this that they should at the same time sharpen the West's defence of core liberalism. Critical theorists skate a thin line: they issue pleas for a rethinking of democracy, but scratch beneath the surface and what they really lionise is undemocratic state-led development; theirs is in fact not a genuine concern with reconceptualising democracy so much as a pretty wholesale questioning of the democracy agenda, dressed up in softened discourse. A central pivot of many such critiques is the criticism of liberalism's teleological arrogance. But this centres too much on one influential book published at one rather distinctive moment in time24; liberalism more broadly and properly understood is not teleology. Moreover, many writers argue against teleology and prescription but then in the next breath confidently assert that social democracy must be a superior and more acceptable form of democracy outside the West and one which has a more sustainable long-term future. This may be the case, but they have no philosophical justification for saying so without replicating the very same methodological features they profess to dislike in 'liberal' tenets – and thus contradicting themselves. Clearly, more debate about different forms of political representation would be healthy. Allowing space for a plurality of routes to and types of political reform would sit well with the core spirit of democracy. However, while more flexibility and open mindedness are still required in democracy promotion, there is a risk of being unduly defensive about the virtues of liberal democracy's core tenets. The problem in many places of the world is the absence of liberalism's core values, not their excess. Vigilance in the need for democracy's reconceptualisation is

indeed merited. But it would be a muddled reasoning that took this to provide a case for the wholesale pull back from the (already anaemic) support for liberal democracy's notion of fundamental political rights. We need more fully to understand local demands. But there is an automatic assumption routinely made that such demands are for more diverse, anti-liberal political forms. This may in many places be the case, but the evidence must be assembled. One cannot simply assert this as if it were axiomatic to the emerging world order; there is no reason for supposing a priori that this is a natural outcome of the rebalancing of international order. The evidence that exists points, again, to a more nuanced conclusion: a demand for the essential tenets of liberal universalism, made relevant to and expressed through the language and concepts of local cultures and histories. A growing focus within political philosophy has been on 'capabilities': negative liberal freedoms need to be deepened but also combined with the locally-rooted capabilities that ensure their effective realisation.25 The central thrust of Locke's liberalism was anti-dogmatism and prudence. The irony – and, for anyone concerned over democracy's health, the tragedy – is that international support for a supposedly liberal democratic agenda is today associated with exactly the opposite of these values. It is the non-dogmatic spirit that liberalism must work to recover: liberal democracy as a system that (simply) creates space for a variety of different local choices. Advocates and opponents of liberalism are trapped in a circular debate over this matter: while core liberal freedoms are required to make such local choices, critics insist that those very liberal rights are themselves a corruption of local autonomy. The imperative is not for liberalism to cede to other creeds, but to work towards squaring the circle that has always existed at its heart: that is, liberalism is in its very essence the rejection of utopian political design, yet, if not pursued with care, it can appear as an unbending utopia. This defines its challenge: can liberalism stand convincingly as an anti-utopian creed whose own propulsion requires courageous normative conviction? Can it strike the Rawlsian balance of deepening a plurality of values without descent into relativism?

Sovereignty is not a western notion. It predates the colonizers.

Cobb 6 (Amanda J Cobb, June 2006, American Studies Journal, Kansas University, pp. 118-119, Accessed 7/19/15, https://journals.ku.edu/index.php/amerstud/article/view/2956/2915) CH

At base, sovereignty is a nation's power to self-govern, to determine its own way of life, and to live that life—to whatever extent possible—free from interference. This is no different for tribal sovereignty, which by and large shares the attributes and characteristics of sovereignty as contextualized above. Native nations are culturally distinct peoples with recognizable governments and, in most cases, recognizable and defined territories. The sovereignty of Native nations is inherent and ancient. For Native nations within the boundaries of the United States, the underscoring of the inherent nature of sovereignty is critical because of the colonial process—a process that continues to dramatically diminish our ability to fully exercise tribal sovereignty. As David Wilkins (Lumbee) and K. Tsianina Lomawaima (Creek/Cherokee) have argued, "Tribes existed before the United States of America, so theirs is a more mature sovereignty, predating the Constitution; in that sense, tribal sovereignty exists 'outside' the Constitution."15 Kidwell and Velie agree that sovereignty "is held to be an inherent right" but emphasize that "its political effect depends upon its recognition by other sovereigns."16 Inherency and recognition are characteristics of sovereignty for all nations; however, the recognition and respect necessary to exercise sovereignty fully has not been consistently accorded Native nations by other sovereigns, particularly the United States. In fact, "[f]rom 1775 to the present, federal and state intentions toward tribes have changed direction in various ways. One could argue that indeterminacy or inconsistency is the hallmark of the tribal federal relationship."17 Because of this inconsistency, Native nations must constantly endeavor to exercise their sovereignty "under negotiation with states, in federal courts, and with the Congress of the United States."18 That dynamic is virtually inescapable for tribal peoples on one level or another. The recognition and exercise of tribal sovereignty is complicated by the power imbalance between the United States and Native nations. The American nation-state is so powerful, so hegemonic, that its cloak of sovereignty becomes almost invisible. The United States is so used to

looking through the lens of its own powerful sovereignty—and, importantly, to having that image reflected back to it by other nations—that the United States, including its citizens, too often cannot recognize that what is looked through is merely a lens. Too often, the United States falls into the trap of mistaking that lens for its eye. As Alfred has pointed out, "the Western view of power and human relationships is so thoroughly entrenched that it appears valid, objective, and natural."19 In other words, United States sovereignty has become normalized to such an extent that it rarely questions or is even conscious of any limit to its own sovereign power

Sovereignty good – helps make concrete political change on behalf of natives.

D'Errico, 2k (Peter. Peter d'Errico is a consulting attorney on indigenous issues. He was a staff attorney in Dinebeiina Nahiilna Be Agaditahe Navajo Legal Services from 1968 – 1970, and taught Legal Studies at the University of Massachusetts, Amherst, until 2002."SOVEREIGNTY." *A Brief History in the Context of U.S. "Indian Law"* 2000. Web. 26 July 2015.)TB

The concept of sovereignty, however convoluted and contradictory, remains an important part of federal Indian law. Tribal councils established under the Indian Reorganization Act are regarded as vehicles of "tribal sovereignty"; they act as governments and not just as corporations, though they are often limited by federal funding and authority. Indian hunting and fishing rights have been protected against state and local regulation, though an ultimate authority has been reserved outside the realm of tribal sovereignty. Indian nations are regarded as immune from suit without their consent, under the doctrine of "sovereign immunity," yet their power over non-members of the particular nation is sometimes severely limited. In short, the idea that indigenous nations have at their roots some aspect of their original, pre-colonial status as independent nations operates -- sometimes directly and sometimes by implication -- throughout federal Indian law today. This idea is accompanied by the colonial legacy of superior authority claimed over indigenous nations by the federal government. Both these ideas have been part of federal Indian law from its inception, and are the reason why Chief Justice Marshall could say, in formulating the foundations of this law in the *Cherokee Nation* case, "The condition of the Indians in relation to the United States is perhaps unlike that of any other two people in existence."

We don't defend the western notion of seovereignty – we defend indigenous sovereignty, or self-determination.

Gilio-Whitaker, 13 (Dina. Research Associate at CWIS, Freelance Writer and Indigenous Studies Scholar, MA University of New Mexico, American Studies, BA University of New Mexico, Native American Studies. "Indian Self-Determination and Sovereignty." *Indian Country Today Media Network.com*. 17 Jan. 2013. Web. 26 July 2015. http://indiancountrytodaymedianetwork.com/opinion/indian-self-determination-and-sovereignty-147025)TB

In general there's a huge difference between what the federal government means when it talks about Indian sovereignty and self-determination and the kind tribal nations mean. Although it can be said that the concepts probably vary from tribe to tribe, self-determination for Indian people overall is representative of the state of political independence that existed prior to colonization. The process of colonization has given a new meaning to the idea of self-determination for the colonized, and the process of decolonizing the relationships between tribes and the United States is, at least in part, about how we define the terms of "sovereignty" and "self-determination." Self-determination and sovereignty have become concepts that colonizing states have defined for the colonized, and indigenous peoples worldwide have pushed back against those limiting and self-serving definitions, which is why it took 22 years to pass the United Nations Declaration of the Rights of Indigenous Peoples. Self-determination and sovereignty for indigenous peoples is seen by colonizing states (especially the US) as "aspirational," that which doesn't really exist

but may (or may not) at some point in the future. There is, however, an important difference between the concepts of self-determination and sovereignty, reflected in a growing and sophisticated body of academic literature by Native scholars. For example, we find that the roots of the concept of sovereignty (and the modern nation-state) are in feudal European monarchies, characterized by hierarchical power structures with profound religious overtones. Because these kinds of governing structures were typically foreign to indigenous peoples, sovereignty is said to be an inappropriate concept for Indian nations. Self-determination, on the other hand, is as the name implies the ability to be self-determining independent of an outside power. The problem is that in the context of a colonial relationship such as the one between the United States and tribal nations, self-determination is reduced to the ability of a tribal nation to be merely self-governing. There's nothing innately wrong with tribes being allowed to govern themselves (as they have always done), but it leaves unaddressed a whole host of other problems that the colonial relationship presents, embodied in the system of domestic law that tribal nations are unconsentingly subjugated to, complete with its doctrines of discovery, plenary power, domestic dependent nationhood and trust. It is still a paternalistic relationship with tribes generally thought of as incapable, if not undeserving of the type of self-determination reserved for nation-states—despite their centuries-long histories of foreign relations with outside and international actors.

Global/Local

Alt = Conservatism

The left is failing because of a suspicion of the nation state – we might fight the right at all levels in order to be effective

Grayson and Little 11

(Deborah Grayson and Ben Little 4 August 2011, The far right are the masters of network politics, not the 'internationalist' left, http://www.opendemocracy.net/ourkingdom/deborah-grayson-and-ben-little/far-right-are-masters-of-network-politics-not-internationa)

While Norway mourns and attends to matters of justice, across Europe the left would be wise to pause and reflect upon the mixed responses to the worst case of child murder in northern Europe since the Second World War. We can only hope that Anders Breivik is a lone operator and that we will not see this kind of politically motivated mass murder repeated in the UK or anywhere else, but in showing how right wing ideology is formed and disseminated through increasingly international networks, the Utoya massacre has lessons for us all.

Although globally oriented 'lefties' may like to think this is a contradiction in terms, it is the far right who are pioneering the way towards a new form of internationalism. This is not to say that they have lost their attachment to the nation – for all that vigilantes like Breivik may think in civilisational or European terms, "small state" nationalism remains the bedrock of their politics. Those that see the blurring of boundaries between European and national perspectives as a sign of incoherence which will diminish the power of these ideological beliefs are mistaken. In an age of network politics it's a strength, and one that the left needs to understand if we are to reverse the electoral successes of the centre-right and the populist rise of the far-right across Europe. So far, the left has struggled to match the way far-right networks have learned to scale seamlessly from the local to the civilisational through the conceptual space of the national. The English Defence League, for example, explain local opposition to their marches as stemming from the malign influence of the SWP's campaign, Unite Against Fascism; cite the welfare state as evidence of leftist domination in national politics; and see in the European Court of Human Rights the imposition of socialist, multicultural values across the entire continent. This sense of multiple scales allows the EDL to create a language that reflects their politics at every level, and to communicate their message across local and national boundaries. They create a unified rhetoric that the left, with their suspicion of the national, cannot replicate.

Perm Solves

Perm Do Both –connecting the global and local are key to movements success AND Acting only at the local level ensures domination **is just moved to some other locality**

Davis (Department of Geography and Environmental Science, University of Hawaii) **11**
(Sasha, The US military base network and contemporary colonialism: Power projection, resistance and the quest for operational unilateralism, Political Geography xxx (2011))

 In this analysis of the shifting US military base network I have endeavored to examine the impacts and resistances going on in these "towns and villages" so as to better understand the US military's global network. As geographers have long been aware, <u>acting at the global or local scale is not an either/or choice</u>: <u>acting in the world at any scale has ramifications at a variety of scales</u>. Increasingly, <u>local anti-militarization groups have recognized this and have started to more formally engage in activism at a variety of other scales including the global</u>. At the global conference against military bases in 2007 activists put forward the view that the global imperial present is held together by violences committed in (colonized) place. That violence may be wielded globally, but it is produced at local sites. Furthermore, its operation relies on particular sites being legitimately seen as landscapes of emptiness or sacrifice. So when people resist these interpretations of place and claim them as places of life it not only makes everyday life more tolerable but also has repercussions at other scales. The military has currently been able to use its ability to spatially shift its activities to maintain its domination. <u>Activists</u>, however, <u>are attempting to incorporate a global vision into their movements so that local victories do not become someone else's loss; rather   they become the beginning of the empire's unraveling</u>.

AT Cooption/State

And despite threats of cooption, being able to forge ties with those in power is necessary to the success of movements

Yeo (Assistant Professor of Politics at the Catholic University of America) **11**
(Andrew, Activists, Alliances, and Anti-U.S. Base Protests, Cambridge University Press, pg 196-7)

In the previous section, 1 covered several policy implications and prescriptions for U.S. overseas basing strategy. What insights and lessons can be drawn for anti-base movements? I offer four sets of recommendations for activists regarding anti-base movement strategy and advocacy. The first suggestion stems directly from the security consensus framework: when possible, activists should form ties with political elites. As discussed in the introductory chapter, U.S. base policies are ultimately decided by government officials. Therefore, anti-base movements gain greater leverage and influence on basing policy outcomes when they form ties with key elites. This was certainly the case with successful anti-base movements such as the Anti-Treaty Movement in the Philippines and No Bases Coalition in Ecuador. Although not included in this volume, ties qeen Puerto Rican anti-base activists and several U.S. congressional repre utatives helped activists shut down Roosevelt Roads Naval Station in Vieques it, Loo-i. The support of several prominent U.S. political figures such as Hillary Clinton and Jesse Jackson, and the direct involvement of U.S. representatives 11ch as Nydia M. Velasquez and Luis V. Gutierrez, increased publicity and political leverage for the Vieques movement.57 Encouraging anti-base movements to form ties with sympathetic elites seems u'f-evident. Yet, one might find surprising the level of resistance to this suggestion by some activists. Ties to political elites raise the specter of co-optation. The lack of trust in politicians, the political establishment, or more generally formal politics often stems from activists' own experience and interaction with government officials over the course of several movement episodes. This attitude was expressed by several anti-base activists in South Korea, Japan, and even the Philippines. Activists in \ticeura also faced heated discussions over strategy: Should they maintain support for radical left parties? At the local level, should movement leaders move from informal to more formal avenues of politics? Although the wariness of movements in engaging formal political actors is understandable, research across several anti-base movement episodes suggests that movements that form alliances with political elites and engage base politics through both formal and informal channels tend to have a greater impact on basing policy outcomes.

AT Tradeoff

No Trade Off

a. Rooted cosmopolitanism solves their offence – their focus arguments are a false dichotomy. Our evidence includes testimony from activists that empirically disprove their value to life claims

Yeo (Assistant Professor of Politics at the Catholic University of America) **9**
(Andrew, Not in Anyone's Backyard: The Emergence and Identity of a Transnational Anti-Base Network, International Studies Quarterly (2009) 53, 571–594)

The choice between local and global is admittedly a false dichotomy. Although an activist may identify more closely with their local movement over the global anti-base movement or vice-versa, to some degree, actors identify with both movements. In response to a question asking whether one identifies more with the local or global movement, a Philippine activist and IOC member reported, ''[i]t is important for me to say both (emphasis hers). My work and grounding in the national anti-bases movement in the Philippines is what I carry and take with me as part of the Global No Bases Movement. Both works have to be integrated. I can not be an effective member of a global No Bases movement if I am not grounded in our own local struggle in the Philippines.'' This comment is telling because it sheds light on the identity of transnational anti-base activists. The IOC member's comment confirms what scholars have earlier argued about transnational activists: they are ''rooted cosmopolitans.'' The notion of a rooted cosmopolitan is what enables activists to connect their local frame of movement with the global No Bases movement.

b. Working at the global level does not erase local concerns – modern anti-militarism movements proves

Yeo (Assistant Professor of Politics at the Catholic University of America) **9**
(Andrew, Not in Anyone's Backyard: The Emergence and Identity of a Transnational Anti-Base Network, International Studies Quarterly (2009) 53, 571–594)

Without denying the importance of previous anti-base solidarity efforts, I argue that the Iraq War enabled anti-base activists to take advantage of global frames to accelerate the process of organizing an international network against foreign military bases. For sure, a small space at the transnational level existed even prior to the Iraq War through processes of diffusion and scale shift. The Iraq War, however, facilitated a horizontal spillover process. In particular, anti-base actors active in broader anti-war and global justice movements acted as brokers, taking concrete steps in forming an international anti-base network. Through frame-bridging and frame extension, anti-base activists were able to reframe the bases issue. A master frame identifying military bases as ''instruments of war and impe-rialism'' naturally resonated with actors in the larger ''network of networks.'' Whether intentional or not, this master frame helped solidify a transnational anti-base identity. Paradoxically, however, I argue that even as actors crossed horizontal divides and vertical gaps to come together at the transnational dimen- sion, transnational identities did not necessarily replace national ones, confirming the notion of transnational activists as ''rooted cosmopolitans.'' This conclusion is supported by the author's findings through participant observation, group discussions, and a preliminary survey conducted at the 2007 International No Bases conference. Figure 1 highlights the vertical and horizontal processes behind the emerging international No-Bases network.

AT Security

No Impact

No impact to our process of securitization --- it's a process
Ghughunishvili 10

(Securitization of Migration in the United States after 9/11: Constructing Muslims and Arabs as Enemies Submitted to Central European University Department of International Relations European Studies In partial fulfillment of the requirements for the degree of Master of Arts Supervisor: Professor Paul Roe http://www.etd.ceu.hu/2010/ghughunishvili_irina.pdf)

As provided by the Copenhagen School securitization theory is comprised by speech act, acceptance of the audience and facilitating conditions or other non-securitizing actors contribute to a successful securitization. The causality or a one-way relationship between the speech act, the audience and securitizing actor, where politicians use the speech act first to justify exceptional measures, has been criticized by scholars, such as Balzacq. According to him, the one-directional relationship between the three factors, or some of them, is not the best approach. To fully grasp the dynamics, it will be more beneficial to "rather than looking for a one-directional relationship between some or all of the three factors highlighted, it could be profitable to focus on the degree of congruence between them. 26 Among other aspects of the Copenhagen School's theoretical framework, which he criticizes, the thesis will rely on the criticism of the lack of context and the rejection of a 'one-way causal' relationship between the audience and the actor. The process of threat construction, according to him, can be clearer if external context, which stands independently from use of language, can be considered. 27 Balzacq opts for more context-oriented approach when it comes down to securitization through the speech act, where a single speech does not create the discourse, but it is created through a long process, where context is vital. 28 He indicates: In reality, the speech act itself, i.e. literally a single security articulation at a particular point in time, will at best only very rarely explain the entire social process that follows from it. In most cases a security scholar will rather be confronted with a process of articulations creating sequentially a threat text which turns sequentially into a securitization. 29 This type of approach seems more plausible in an empirical study, as it is more likely that a single speech will not be able to securitize an issue, but it is a lengthy process, where a the audience speaks the same language as the securitizing actors and can relate to their speeches.

Expertism Good

Expertise inevitable and good on national security- the alt fails
Cole '12

Rana is right to focus our attention on the assumptions that frame modern Americans' conceptions about national security, but his assessment raises three initial questions. First, it seems far from clear that there ever was a "golden" era in which national security decisions were made by the common man, or "the people themselves," as Larry Kramer might put it.8 Rana argues that neither Hobbes nor Locke would support a worldview in which certain individuals are vested with superior access to the truth, and that faith in the superior abilities of so-called "experts" is a phenomenon of the New Deal era.9 While an increased faith in scientific solutions to social problems may be a contributing factor in our current overreliance on experts,10 I doubt that national security matters were ever truly a matter of widespread democratic deliberation. Rana notes that in the early days of the republic, every able-bodied man had to serve in the militia, whereas today only a small (and largely disadvantaged) portion of society serves in the military.11 But serving in the militia and making decisions about national security are two different matters. The early days of the Republic were at least as dominated by "elites" as today. Rana points to no evidence that decisions about foreign affairs were any more democratic then than now. And, of course, the nation as a whole was far less democratic, as the majority of its inhabitants could not vote at all.12 Rather than moving away from a golden age of democratic decision-making, it seems more likely that we have simply replaced one group of elites (the aristocracy) with another (the experts). Second, to the extent that there has been an epistemological shift with respect to national security, it seems likely that it is at least in some measure a response to objective conditions, not just an ideological development. If so, it's not clear that we can solve the problem merely by "thinking differently" about national security. The world has, in fact, become more interconnected and dangerous than it was when the Constitution was drafted. At our founding, the oceans were a significant buffer against attacks, weapons were primitive, and travel over long distances was extremely arduous and costly. The attacks of September 11, 2001, or anything like them, would have been inconceivable in the eighteenth or nineteenth centuries. Small groups of non-state actors can now inflict the kinds of attacks that once were the exclusive province of states. But because such actors do not have the governance responsibilities that states have, they are less susceptible to deterrence. The Internet makes information about dangerous weapons and civil vulnerabilities far more readily available, airplane travel dramatically increases the potential range of a hostile actor, and it is not impossible that terrorists could obtain and use nuclear, biological, or chemical weapons.13 The knowledge necessary to monitor nuclear weapons, respond to cyber warfare, develop technological defenses to technological threats, and gather intelligence is increasingly specialized. The problem is not just how we think about security threats; it is also at least in part objectively based.

Expertism means our epistemology is sound – the alternative devolves into stereotypes and biases that collapses epistemology and turns the kritik
Snjezana 10

Let us define expertism as being a position that is composed of three statements: (i) experts exist; (ii) we should ascribe a distinctive testimonial status to experts due their exceptional expertise; (iii) therefore, we have the epistemic right to trust experts without evidence. Expertism is a genuine anti-evidentialist position with regards to trusting experts. 1. Experts exist. While it is rather plausible that

there are experts in science because they deal with facts, the existence of moral or aesthetic experts, who deal with values, is generally much more problematic. For instance, Milton Friedman holds that differences in values are differences caused by people's tastes which are more or less hardwired, undebatable and unchangeable (Friedman, 1984). Logical positivists believe that value judgments are "nonsense" and cannot be a matter of expertise because they are not verifiable. Many people think that most people have reasonable ethical competence and that philosophers (who are the prime candidates for moral experts) are inclined to the same self-serving rationalizations as other people. However, the untouchable status of experts in science can be disputed. From Kant, Kuhn, Quine to Goodman and Putnam, we are aware of an intelligible objection that theoretical hypotheses involve a theory laden, cognitively biased, socially manipulated and subjective interpretation of the world (Goldman, 1999). Also, in science as well as in ethics and aesthetics there are battles between experts who propose opposite theories. In spite of the fact that claiming the first thesis is not without its difficulties, I will assume that it is correct: there are people who are objective (not only reputational) experts. These objective experts are people who, in comparison with other people, are more effective in problem solving. When compared with other people, they are better guides to the truth or better in recognizing a false statement as false, and a true one as true.While the views of ordinary people are typically an ill sorted mass of material derived from experience and tradition which contains inconsistencies and tensions, skilled experts can detect inconsistencies, fallacious inferences, unwarranted generalizations and false premises. In contrast to the average person in ordinary epistemic circumstances, they possess knowledge about the appropriate methods of research and argumentation, more systematized information derived from long term experience of dealing with difficulties, distinctions, critics, and alternative conceptions. They are generally better trained to deal with epistemic, moral or aesthetic issues. Or, we can say like Aristotle that it is reasonable to suppose that none of them can miss the target totally, and that each has gotten something or even a lot of things right. 2. Distinctive testimonial status. In expertism, it is claimed that an expert's testimony requires considerable epistemic deference. I can see at least three reasons why would one ascribe a distinctive testimonial status to experts: (i) standing practice about an expert's reliability; (ii) insufficiency of evidence; (iii) epistemic dependence. Firstly, it could be seen that we have an epistemic right to treat an expert's knowledge and sincerity with the utmost credulity because there is a standing practice, social climate or ongoing policy that considers experts to be the most reliable sources of knowledge or that they are fundamental testimonial authorities in society (Pappas, 2000). By assuming such credentials about experts, it could be seen that a hearer may believe what an expert says without assessment, evaluation or additional evidence. Secondly, many philosophers hold that our evidence in favour of other people's testimonies is principally insufficient (Beanblossom, Lehrer, 1970; Coady, 1981; Webb, 1993; Foley, 1994). If it is true, our evidence in favour of an expert's testimony is even more insufficient: when a layperson relies on an expert, that reliance is necessary blind (Hardwig, 1991).3 We, as non-experts in a domain, cannot ever possess enough evidence to evaluate an experts' testimony as credible or non credible. An ordinary cognizer in ordinary epistemic circumstances does not possess, or even can never attain, a high enough level of expertise to evaluate the testimonies of experts. We simply do not have enough knowledge and experience in order to be capable of assessing the truth of an expert's testimony or an expert's reliability. Since our reasons for the acceptance of the content of an expert's report – by definition of them being experts and us as non-experts – cannot be the reasons the experts possess, our evidence about an experts' report cannot be ever sufficient for the justified acceptance of her testimony. If we are not experts in a domain, the relevant defeaters (undefeated defeaters) or certain kinds of experiences, doubts and beliefs that can undermine justified trust simply are not present to us. So, it could be seen that we have no choice other than to blindly trust experts. Thirdly, we are deeply aware of our epistemic dependence on the testimonies of experts. Without other people testimonies "we should have to confess to knowing pitifully little" (Dummet, 1993, 420). But without expert testimonies our knowledge about biology, physics, medicine, geography of the world, history would be devastated. The majority of our beliefs about nature and society that we acquired throughout our lives are based, finally, on what experts 'tell' us (see also in Beanblossom, Lehrer, 1970; Faulkner, 2002). Our judgments of value will be a mass of inconsistent intuitions, prejudices and stereotypes derived from our subjective and partial interests, understandings of tradition, our temper etc. Behind the majority of testimonies lies extensive research and reports by experts and without these basic experts' testimonies "our lives would be impoverished in startling and debilitating ways" (Lackey, 2006, 1). So, it could be said that such an epistemic dependence on experts entails blind trust as a precondition of the functioning of our reason.

Engagement with technocracy is more effective than passive rejection

Jiménez-Aleixandre, professor of education – University of Santiago de Compostela, and Pereiro-Muñoz High School Castelao, Vigo (Spain), **'2**

(Maria-Pilar and Cristina, "Knowledge producers or knowledge consumers? Argumentation and decision making about environmental management," International Journal of Science Education Vol. 24, No. 11, p. 1171–1190)

If science education and environmental education have as a goal to develop **critical thinking and** to promote **decision making**, it seems that the acknowledgement of a variety of experts and expertise is of relevance to both. **Otherwise citizens could be unable to challenge a common view** that places economical issues and technical features over other types of values or concerns. As McGinn and Roth (1999) argue, citizens should be prepared to participate in scientific practice, to be involved in situations where science is, if not created, at least used. The assessment of environmental management is, in our opinion, one of these, and citizens do not need to possess all the technical knowledge to be able to examine the positive and negative impacts and to weigh them up. The identification of instances of scientific practice in classroom discourse is difficult especially if this practice is viewed as a complex process, not as fixed 'steps'. Several instances were identified when it could be said that students acted as a knowledge-producing community in spite of the fact that the students, particularly at the beginning of the sequence, expressed doubts about their capacities to assess a project written by experts and endorsed by a government office. Perhaps these doubts relate to the nature of the project, a 'real life' object that made its way into the classroom, into the 'school life'. As Brown et al. (1989) point out, there is usually a difference between practitioners' tasks and stereotyped school tasks and, it could be added, students are not used to being confronted with the complexity of 'life-size' problems. However, as the sequence proceeded, **the students assumed the role of experts**, exposing inconsistencies in the project, offering alternatives and discussing it with one of its authors. The issue of expertise is worthy of attention and it needs to be explored in different contexts where the relationships among technical expertise, values hierarchies and possible biases caused by the subject matter could be unravelled. One of the objectives of environmental education is to **empower people with the capacity of decision making**; for this purpose the acknowledging of multiple **expertise is crucial.**

Security Good

You essentialize security and ignore its political potential

Nunes 12 -- post-doctoral fellow in the Department of Politics and International Studies at the University of Warwick, and has a PhD in International Politics from Aberystwyth University, Wales (Joao, 8/15/2012, "Reclaiming the political: Emancipation and critique in security studies," Security Dialogue 43(4), Sage)

This tendency in the literature is problematic for the critique of security in at least three ways. First, it constitutes a blind spot in the effort of politicization. The assumption of an exclusionary, totalizing or violent logic of security can be seen as an essentialization and a moment of closure. To be faithful to itself, the politicization of security would need to recognize that there is nothing natural or necessary about security – and that security as a paradigm of thought or a register of meaning is also a construction that depends upon its reproduction and performance through practice. The exclusionary and violent meanings that have been attached to security are themselves the result of social and historical processes, and can thus be changed. Second, the institution of this apolitical realm runs counter to the purposes of critique by foreclosing an engagement with the different ways in which security may be constructed. As Matt McDonald (2012) has argued, because security means different things for different people, one must always understand it in context. Assuming from the start that security implies the narrowing of choice and the empowerment of an elite forecloses the acknowledgment of security claims that may seek to achieve exactly the opposite: alternative possibilities in an already narrow debate and the contestation of elite power.5 In connection to this, the claims to insecurity put forward by individuals and groups run the risk of being neglected if the desire to be more secure is identified with a compulsion towards totalization, and if aspirations to a life with a degree of predictability are identified with violence. Finally, this tendency blunts critical security studies as a resource for practical politics. By overlooking the possibility of reconsidering security from within – opting instead for its replacement with other ideals – the critical field weakens its capacity to confront head-on the exceptionalist connotations that security has acquired in policymaking circles. Critical scholars run the risk of playing into this agenda when they tie security to exclusionary and violent practices, thereby failing to question security actors as they take those views for granted and act as if they were inevitable. Overall, security is just too important – both as a concept and as a political instrument – to be simply abandoned by critical scholars. As McDonald (2012: 163) has put it, If security is politically powerful, is the foundation of political legitimacy for a range of actors, and involves the articulation of our core values and the means of their protection, we cannot afford to allow dominant discourses of security to be confused with the essence of security itself. In sum, the trajectory that critical security studies has taken in recent years has significant limitations. The politicization of security has made extraordinary progress in problematizing predominant security ideas and practices; however, it has paradoxically resulted in a depoliticization of the meaning of security itself. By foreclosing the possibility of alternative notions of security, this imbalanced politicization weakens the analytical capacity of critical security studies, undermines its ability to function as a political resource and runs the risk of being politically counterproductive. Seeking to address these limitations, the next section revisits emancipatory understandings of security.

Their impact essentializes national identity as a source of violence. This is a rigged game more vulnerable to self-fulfilling prophecy than *provisional* and *empirical* uses for security

Fierke 2k1

(Karin FIERKE Politics @ Queens Univ. Belfast '1 in Constructing International Relations eds. Fierke and Jorgensen p. 119-120)

There are several underline{poststructuralist assumptions that are problematic} from a constructivist perspective. First, poststructuralists, in Campbells argument, focus on the theorization of identity, rather than assuming an a priori agency or pre-given subjects, as many constructivists do. However, the poststructuralist emphasis on theorizing identity often leads to a practice that is not qualitatively different than the "positivist orthodoxy" they criticize, that is. the **reification of a set of assumptions prior to detailed analysis**.' In this case, the theoretical maxim is that identity is constituted in difference, and-this has been modified since the end of the Cold War- this is an antagonistic relationship. As Ole Waever (1996a. 122) notes, there is reason to question this assumption: Many critical and poststructuralist authors enjoy remonstrating against the alleged 'other" that is at present taking place in relation to Russia. North Africa, or Asia. Many authors-including Campbell-balance between, on the one hand, (formally) saying that identity does not demand an Other. does not demand antagonism, only difference(s) that can be non-antagonistic and. on the other, actually assuming that identity is always based on an antagonistic relationship to an other. is always constituted as absolute difference. In the current situation, because of this unfortunate habit, when one notices that there are efforts in identity creation for Europe, one immediately looks wound and asks. "Who can it be directed against?' and then one discerns some more or less well-founded examples of, for example, Russia being castigated as other. 1 am not convinced. The dominant aspiration is rather to constitute Europe as a pole of attraction with graduated membership so that Europe fades out but is not constituted against an external enemy. Some of Europe's mechanisms for stabilizing or disciplining eastern Europe rely exactly on this non-definition of an eastern border. on the image of an open but heterogeneous polity of which some are more members than others, but none are defined as total outsiders or opponents. The context of post Cold War Europe raises questions about the assumption that identity requires an Other. In contrast to the emphasis on theorizing identity. Adler argues that constructivists want to know in detail how identities and interests are constituted in particular cases. If one takes the practices of actors in the world seriously, then a more fruitful analysis would, to cite Wittgenstein (1958. 66-67). 'look and see" how identities are constituted in specific contexts. As Onuf (199Kb. I) emphasizes, constructivism is not a theory: it is a "way of studying social relations." Second. from Campbell's perspective, constructivists are too easily drawn into the "protocols of 'empirical social science' rule, to the detriment of a politicized account of important practices" (Campbell 1998a, 225) This sounds very similar to Ashley's claim that poststructuralists are 'not especially interested in the meticulous examination of particular cases or sites for purposes of understanding them in their own terms" (Ashley. 1989. 278). In fact, one can argue that the critical endeavor of the poststructuralists suffers precisely because their own, often very **abstract, theoretical assumptions** are not sufficiently related to the analysis of actual practices. While claiming a desire to open up spaces for marginalized voices to speak, there is often a closing down of that possibility precisely because of another assumption, which shares a family resemblance with realist accounts, that is, states do reproduce realist practices. Campbell, and other poststructuralists (Doty, 1993)? ask how state action becomes possible; they emphasize processes of marginalization rather than how alternatives, which had been considered unrealistic, become possible. Subsequently. Campbell (1998, 7- 8) suggests that the practices of states remain largely unchanged since the end of the Cold War, ' By contrast. constructivists such as Koslowski and Kratochwil (1995) and Fierke (1998) have taken

dissident practice in the context of the ending Cold War seriously. As a result, there is an increasing awareness of the role of these actors in constituting the possibility of a change (Adler 1997, 342). When a detailed analysis of the practices of these actors is taken seriously, a different and more nuanced reading of both the end of the Cold War and the post Cold War practices of states is in order.

Self-fulfilling prophecy is backwards – failure to express our fears causes them to occur

Macy 95

(Joanna, General Systems Scholar and Deep Ecologist, Ecopsychology)

There is also the superstition that negative thoughts are self-fulfilling. This is of a piece with the notion, popular in New Age circles, that we create our own reality I have had people tell me that "to speak of catastrophe will just make it more likely to happen." Actually, the contrary is nearer to the truth. Psychoanalytic theory and personal experience show us that it is precisely what we repress that eludes our conscious control and tends to erupt into behavior. As Carl Jung observed, "When an inner situation is not made conscious, it happens outside as fate." But ironically, in our current situation, the person who gives warning of a likely ecological holocaust is often made to feel guilty of contributing to that very fate

Rejection of securitization causes the state to become more interventionist—turns the K

McCormack 10

(Tara McCormack, '10, is Lecturer in International Politics at the University of Leicester and has a PhD in International Relations from the University of Westminster. 2010, (Critique, Security and Power: The political limits to emancipatory approaches, page 127-129)

The following section will briefly raise some questions about the rejection of the old security framework as it has been taken up by the most powerful institutions and states. Here we can begin to see the political limits to critical and emancipatory frameworks. In an international system which is marked by great power inequalities between states, the rejection of the old narrow national interest-based security framework by major international institutions, and the adoption of ostensibly emancipatory policies and policy rhetoric, has the consequence of problematising weak or unstable states and allowing international institutions or major states a more interventionary role, yet without establishing mechanisms by which the citizens of states being intervened in might have any control over the agents or agencies of their emancipation. Whatever the problems associated with the pluralist security framework there were at least formal and clear demarcations. This has the consequence of entrenching international power inequalities and allowing for a shift towards a hierarchical international order in which the citizens in weak or unstable states may arguably have even less freedom or power than before. Radical critics of contemporary security policies, such as human security and humanitarian intervention, argue that we see an assertion of Western power and the creation of liberal subjectivities in the developing world. For example, see Mark Duffield's important and insightful contribution to the ongoing debates about contemporary international security and development.

Duffield attempts to provide a coherent empirical engagement with, and theoretical explanation of, these shifts. Whilst these shifts, away from a focus on state security, and the so-called merging of security and development are often portrayed as positive and progressive shifts that have come about because of the end of the Cold War, Duffield argues convincingly that these shifts are highly problematic and unprogressive. For example, the rejection of sovereignty as formal international equality and a presumption of nonintervention has eroded the division between the international and domestic spheres and led to an international environment in which Western NGOs and powerful states have a major role in the governance of third world states. Whilst for supporters of humanitarian intervention this is a good development, Duffield points out the depoliticising implications, drawing on examples in Mozambique and Afghanistan. Duffield also draws out the problems of the retreat from modernisation that is represented by sustainable development. The Western world has moved away from the development policies of the Cold War, which aimed to develop third world states industrially. Duffield describes this in terms of a new division of human life into uninsured and insured life. Whilst we in the West are 'insured' – that is we no longer have to be entirely self-reliant, we have welfare systems, a modern division of labour and so on – sustainable development aims to teach populations in poor states how to survive in the absence of any of this. Third world populations must be taught to be self-reliant, they will remain uninsured. Self-reliance of course means the condemnation of millions to a barbarous life of inhuman bare survival. Ironically, although sustainable development is celebrated by many on the left today, by leaving people to fend for themselves rather than developing a society wide system which can support people, sustainable development actually leads to a less human and humane system than that developed in modern capitalist states. Duffield also describes how many of these problematic shifts are embodied in the contemporary concept of human security. For Duffield, we can understand these shifts in terms of Foucauldian biopolitical framework, which can be understood as a regulatory power that seeks to support life through intervening in the biological, social and economic processes that constitute a human population (2007: 16). Sustainable development and human security are for Duffield technologies of security which aim to *create* self-managing and self-reliant subjectivities in the third world, which can then survive in a situation of serious underdevelopment (or being uninsured as Duffield terms it) without causing security problems for the developed world. For Duffield this is all driven by a neoliberal project which seeks to control and manage uninsured populations globally. Radical critic Costas Douzinas (2007) also criticises new forms of cosmopolitanism such as human rights and interventions for human rights as a triumph of American hegemony. Whilst we are in agreement with critics such as Douzinas and Duffield that these new security frameworks cannot be empowering, and ultimately lead to more power for powerful states, we need to understand why these frameworks have the effect that they do. We can understand that these frameworks have political limitations without having to look for a specific plan on the part of current powerful states. In new security frameworks such as human security we can see the political limits of the framework proposed by critical and emancipatory theoretical approaches.

Security is not an ideology of survival --- it is survival-plus --- that allows individuals the choice to act and become

Booth 2k5

(Ken – visiting researcher – US Naval War College, Critical Security Studies and World Politics, p. 22)

The best starting point for conceptualizing security lies in the real conditions of insecurity suffered by people and collectivities. Look around. What is immediately striking is that **some degree of insecurity**, as a life-determining condition, **is universal**. To the **extent** an individual or group is insecure, to the extent their life choices and changes are **taken away**; this is because of the resources and energy they need to invest in **seeking safety** from domineering threats–whether these are the lack of food for one's children, or organizing to resist a foreign aggressor. The corollary of the relationship between insecurity and a determined life is that a degree of security **creates life possibilities**. Security might therefore be conceived as synonymous with **opening up space** in people's lives. This allows for individual and collective **human becoming**–the capacity to have some choice about living differently–consistent with the same but different search by others. Two interrelated conclusion follow from this. First, security can be understood as an instrumental value; it frees its possessors to a greater or lesser extent from life-determining constraints and so allows different life possibilities to be explored. Second, **security is not synonymous simply with**

survival. One can survive without being secure (the experience of refugees in long-term camps in war-torn parts of the world, for example). Security is therefore more than mere animal survival (basic animal existence). It is **survival-plus**, the plus being the **possibility to explore human becoming**. As an instrumental value, security is sought because it free people(s) to some degree to do other than **deal with threats** to their human being. The achievement of a level of security –and security is always relative – gives to individuals and groups some time, energy, and scope **to choose to be** or become, other than **merely surviving** as human biological organisms. Security is an important dimension of the process by which the human species can **reinvent itself** beyond the merely biological.

Securitization is good – results in contesting antagonistic logic of security and breaks down competitive structures

Trombetta '8

(Maria Julia Trombetta, (Delft University of Technology, postdoctoral researcher at the department of Economics of Infrastructures) 3/19/08 http://archive.sgir.eu/uploads/Trombetta-the_securitization_of_the_environment_and_the_transformation_of_security.pdf)

On the one hand, an approach that considers the discursive formation of security issues provides a new perspective to analyse the environmental security discourse and its transformative potential. First, it allows for an investigation of the political process behind the selection of threats, exploring why some of them are considered more relevant and urgent than others. The focus shifts from the threats to the collectivities, identities and interests that deserve to be protected and the means to be employed. Second, securitization suggests that the awareness of environmental issues can have a relevant role in defining and transforming political communities, their interests and identities, since the process creates new ideas about who deserve to be protected and by whom. Finally, as Behnke points out, **securitization can open the space for a "genuinely political"** constitutive and formative **struggle through which political structures are contested and reestablished**.(Behnke 2000: 91) Securitization allows for the breaking and transforming of rules that are no longer acceptable, including the practices associated with an antagonistic logic of security. On the other hand, securitization is problematic because of the set of practices it is supposed to bring about. For the CopS security "carries with it a history and a set of connotations that it cannot escape."(Wæver 1995: 47) While securitizing an issue is a political choice, the practices it brings about are not. Accordingly, transforming an issue into a security issue is not always an improvement. In the case of the environment, the warning seems clear: "When considering securitizing moves such as 'environmental security'...one has to weigh the always problematic side effects of applying a mind-set of security against the possible advantages of focus, attention, and mobilization."(Buzan, Wæver and Wilde 1998: 29) The School shares the normative suggestion that "[a] society whose security is premised upon a logic of war should be re-shaped, re-ordered, simply changed."(Aradau 2001: introduction) For the CopS this does not mean to transform the practices and logic of security, because, as it will be shown below, for the School, this is impossible. The CopS suggests avoiding the transformation of issues into security issues. It is necessary "to turn threats into challenges; to move developments from the sphere of existential fear to one where they could be handled by ordinary means, as politics, economy, culture, and so on."(Wæver 1995: 55, quoting Jahn). This transformation, for the CopS, is "desecuritization", and the School has introduced a distinction between politicization - "meaning the issue is part of public policy, requiring government decision and resources allocation s"(Buzan, Wæver and Wilde 1998: 23) - and securitization - "meaning the issue is presented as an existential threat, requiring emergency measures and justifying actions outside the normal bounds of political procedure."(Buzan, Wæver and Wilde 1998: 23) The slogan is: "less security, more politics!"(Wæver 1995: 56) Nevertheless, there are two major problems behind this suggestion. First, if securitization is normatively problematic, desecuritization can be even more problematic. It can lead to a depoliticization and marginalisation of urgent and serious issues, while leaving unchallenged the practices associated with security. In the case of the environment, many appeals to security are aimed at both soliciting action and transforming what counts as security and the way of providing it. Second, within the School's framework, desecuritization cannot be possible. Securitization in fact can be inescapable, the unwanted result of discussing whether

or not the environment is a security issue. As Huysmans has noticed, the performative, constitutive approach suggested by the speech act theory implies that even talking and researching about security can contribute to the securitization of an issue, even if that (and the practices associated with it) is not the desired result. "The normative dilemma thus consists of how to write or speak about security when the security knowledge risks the production of what one tries to avoid, what one criticizes: that is, the securitization of migration, drugs and so forth."(Huysmans 2002: 43) When the understanding of security is the problematic one described by the CopS, research itself can become a danger. This captures a paradox that characterizes the debate about environmental security. As Jon Barnett has showed in The Meaning of Environmental Security (2001) the securitization of the environment can have perverse effects and several attempts to transform environmental problems into security issues have resulted in a spreading of the national security paradigm and the enemy logic, even if the intentions behind them were different. Barnett has argued that "environmental security is not about the environment, it is about security; as a concept, it is at its most meaningless and malign"(2001: 83) in this way, he seems to accept the ineluctability of the security mindset or logic evoked by securitization. However, his suggestion of promoting a "human centered" understanding of security, in which environmental security is not about (national) security but about people and their needs, within the securitization logic, cannot escape the trap he has described. Why, in fact, should the sort of his claim be different from that of similar ones? 2. The fixity of Security practices These dilemmas, however, are based on the idea that security practices are inescapable and unchangeable and the theory of securitization, as elaborated by the CopS, has contributed to suggest so. The CopS has achieved the result of making a specific, negative understanding of security – which has characterised the dominant Realist discourse within IR - appear as "natural" and unchangeable since all the attempts to transform it appear to reinforce its logic. To challenge this perverse mechanism it is necessary to unpack securitization further. First, it will be shown that securitization is not analytically accurate, the environment representing a relevant case. Second, the assumptions behind this problematic fixity will be explored. The CopS explores the specificity of the environmental sector in Security: A Framework for Analysis (Buzan, Wæver and Wilde 1998) (Security hereafter), the theoretical book where the CopS illustrates the theory of securitization and analyses the dynamics of securitization within five relevant sectors. For each sector the School identifies the actors or objects (referent objects) that are threatened, specifies the relevant threats and the agents that promote or facilitate securitization.11[11] The environmental sector is rather different from the others and the transformative intent that is associated with the appeal to environmental security is more evident.12[12] Amongst the peculiarities of the environmental sector described by the School, three deserve a specific analysis for their implications: First, the presence of two agendas - a scientific and a political one; second, the multiplicity of actors; third, the politicization/securitization relationship. They will be analysed in turn "One of the most striking features of the environmental sector," it is argued in Security, "is the existence of two different agendas: a scientific agenda and a political agenda."(Buzan, Wæver and Wilde 1998: 71) The scientific one refers mainly to natural science and non-governmental activities. The "scientific agenda is about the authoritative assessment of threat,"(Buzan, Wæver and Wilde 1998: 72) and Buzan, Wæver and de Wilde admit that "the extent to which scientific argument structures environmental security debates strikes us as exceptional."(Buzan, Wæver and Wilde 1998: 72) Quoting Rosenau, they suggest that "the demand for scientific proof is a broader emerging characteristic in the international system."(Buzan, Wæver and Wilde 1998: 72) This 11[11] So for instance in the military sector the referent object is usually the state and the threats are mainly military ones, while in the societal sector the referent objects are collective identities "that can function independent of the state, such as nations and religions."(Buzan, Wæver and Wilde 1998: 22-3) 12[12] This is the case even if the School adopts a conservative strategy that appears from the choice of the referent object (or what is threatened). In the first works of the School, the referent object within the environmental sector was the biosphere: "Environmental security concerns the maintenance of the local and the planetary biosphere as the essential support system on which all other human enterprises depend." (Buzan 1991: 19) In Security the School narrows down this perspective and identifies the level of civilization (with all the contradictions that contribute to environmental problems) as the main referent object. This move favours a conservative perspective which considers the securitization of the environment as a way to preserve the status quo and the security strategies on which it is based. Despite this, the description of the environmental sector captures the specificity of the sector and reveals the tensions within the overall framework. questions the "self referentiality" of the speech act security. Are some threats more "real" than others thanks to scientific proof? Can considerations developed to characterize reflective behaviours be applied to natural systems? Even if dealing with these issues is beyond the scope of this article, it is necessary to note that the appeal to an external discourse has serious implications. First, it questions the possibility and opportunity of desecuritization. Is it possible and what does it mean to "desecuritize" an issue which is on the scientific agenda? If scientific research outlines the dangerousness of an environmental problem, how is it possible to provide security? Second, it suggests that security and the practices associated with it can vary from one sector to another and thus from one context to another. The second peculiarity of the environmental sector is the presence of many actors. This contrasts with Wæver's suggestion that "security is articulated only from a specific place, in an institutional voice, by elites."(Wæver 1995: 57) The multiplicity of actors is largely justified by the School with the relative novelty of the securitization of the environment. "The discourses, power struggles, and securitizing moves in the other sectors are reflected by and have sedimented over time in concrete types of organizations - notably states...nations (identity configurations), and the UN system,"(Buzan, Wæver and Wilde 1998: 71) however, this is not the case with the environment: "It is as yet undetermined what kinds of political structures environmental concerns will generate."(Buzan, Wæver and Wilde 1998: 71). In this way a tension appears since the attempts to securitize the environment are described as having a transforming potential, requiring and calling for new institutions. Within the environmental sector securitization moves seem to have a transformative intent that contrasts with the conservative one, that characterizes other sectors. The third peculiarity is that many securitizing moves result in politicization. This is problematic for the School, which argues that "transcending a security problem by politicising it cannot happen through thematization in security terms, only away from such terms."(Wæver 1995: 56) For the School, once the enemy logic has been inscribed in a context, it is very difficult to return to an open debate. Nevertheless the various politicizations of environmental issues that followed the appeal to security – those the CopS dismissed as failed

securitizations - seem to reinforce the argument, suggested by Edkins, that there is a tendency to politicize issues through their securitization. (Edkins 1999: 11) **This represents another signal that securitization**, within the environmental sector, **can take a different form, and that the problematic aspects of evoking security are not so evident.** Securitization theory, for the CopS, is meant to be descriptive, however the environmental sector suggests that some of its aspects prevent it from providing an adequate instrument for analysis. To understand why this occurs, it is necessary to explore in more detail the conceptualization of security by Wæver, who has introduced securitization.

Our securitiziation is good - Extinction is <u>categorically different</u> than what they criticize --- our ontology/reps of fear are critical to compassion with the Other --- this solves and turns the kritik

Macy 2k

(Joanna Macy, adjunct professor at the California Institute of Integral Studies, 2000, Environmental Discourse and Practice: A Reader, p. 243)

The move to a wider ecological sense of self is in large part a function of the dangers that are threatening to overwhelm us. We are confronted by social breakdown, wars, nuclear proliferation, and the progressive destruction of our biosphere. Polls show that people today are aware that the world, as they know it, may come to an end. This loss of certainty that there will be a future is the pivotal psychological reality of our time. Over the past twelve years my colleagues and I have worked with tens of thousands of people in North America, Europe, Asia, and Australia, helping them confront and explore what they know and feel about what is happening to their world. The purpose of this work, which was first known as "Despair and Empowerment Work," is to overcome the numbing and powerlessness that result from suppression of painful responses to massively painful realities. As their grief and fear for the world is allowed to be expressed without apology or argument and validated as a wholesome, life-preserving response, people break through their avoidance mechanisms, break through their sense of futility and isolation. Generally what they break through into is a larger sense of identity. It is as if the pressure of their acknowledged awareness of the suffering of our world stretches or collapses the culturally defined boundaries of the self. It becomes clear, for example, that the grief and fear experienced for our world and our common future are categorically different from similar sentiments relating to one's personal welfare. This pain cannot be equated with dread of one's own individual demise. Its source lies less in concerns for personal survival than in apprehensions of collective suffering – of what looms for human life and other species and unborn generations to come. Its nature is akin to the original meaning of compassion – "suffering with." It is the distress we feel on behalf of the larger whole of which we are a part. And, when it is so defined, it serves as a trigger or getaway to a more encompassing sense of identity, inseparable from the web of life in which we are as intricately connected as cells in a larger body. This shift in consciousness is an appropriate, adaptive response. For the crisis that threatens our planet, be it seen in its military, ecological, or social aspects, derives from a dysfunctional and pathogenic notion of the self. It is a mistake about our place in the order of things. It is the delusion that the self is so separate and fragile that we must delineate and defend its boundaries, that it is so small and needy that we must endlessly acquire and endlessly consume, that it is so aloof that we can – as individuals, corporations, nation-states, or as a species – be immune to what we do to other beings.

AT Threat Con

No impact – threat construction isn't sufficient to cause wars

Kaufman, Prof Poli Sci and IR – U Delaware, **'9**

(Stuart J, "Narratives and Symbols in Violent Mobilization: The Palestinian-Israeli Case," *Security Studies* 18:3, 400 – 434)

Even when hostile narratives, group fears, and opportunity are strongly present, war occurs **only if these factors are harnessed.** Ethnic narratives and fears must combine to create significant ethnic hostility among mass publics. Politicians must also seize the opportunity to manipulate that hostility, evoking hostile narratives and symbols to gain or hold power by riding a wave of chauvinist mobilization. Such mobilization is often spurred by prominent events (for example, episodes of violence) that increase feelings of hostility and make chauvinist appeals seem timely. If the other group also mobilizes and if each side's felt security needs threaten the security of the other side, the result is a security dilemma spiral of rising fear, hostility, and mutual threat that results in violence. **A virtue of** this **symbolist theory is that symbolist logic** explains why ethnic **peace is more common than ethnonationalist war.** Even if hostile narratives, fears, and opportunity exist, severe violence usually can still be avoided if ethnic elites skillfully define group needs in moderate ways and collaborate across group lines to prevent violence: this is consociationalism.17 War is likely only if hostile narratives, fears, and opportunity spur hostile attitudes, chauvinist mobilization, and a security dilemma.

Threats aren't psychological projections and the alt fails

Hoffman, 86

(Stanley, Center for European Studies at Harvard, "On the Political Psychology of Peace and War: A Critique and an Agenda," Political Psychology 7.1 JSTOR)

The traditionalists, even when, in their own work, they try scrupulous-ly to transcend national prejudices and to seek scientific truth, believe that it is unrealistic to expect statesmen to stand above the fray: By definition, the statesmen are there to worry not only about planetary survival, but — first of all—about national survival and safety. To be sure, they ought to be able to see how certain policies, aimed at enhancing security, actually increase in-security all around. But there are sharp limits to how far they can go in their mutual empathy or in their acts (unlike intellectuals in their advice), as long as the states' antagonisms persist, as long as uncertainty about each other's intentions prevails, and as long as there is reason to fear that one side's wise restraint, or unilateral moves toward "sanity," will be met, not by the rival's similar restraint or moves, but either by swift or skillful political or military exploitation of the opportunity created for unilateral gain, or by a for-midable domestic backlash if national self-restraint appears to result in ex-ternal losses, humiliations or perceptions of weakness. There is little point in saying that the state of affairs which imposes such limits is "anachronistic" or "unrational." To traditionalists, the radicals' stance — condemnation from the top of Mount Olympus — can only impede understanding of the limits and possibilities of reform. To be sure, the fragmentation of mankind is a formidable obstacle to the solution of many problems that cannot be handled well in a national framework, and a deadly peril insofar as the use of force, the very distinctive feature of world politics, now entails the risk of nuclear war. But one can hardly call anachronistic a phenomenon—the assertion of national identity — that, to the bulk of [HU]mankind, appears not only as a necessity but also as a positive good, since humanity's fragmentation results from the very

aspiration to self-determination. Many people have only recently emerged from foreign mastery, and have reason to fear that the alternative to national self-mastery is not a world government of assured fairness and efficiency, but alien domination. As for "unrationality," the drama lies in the contrast between the ra-tionality of the whole, which scholars are concerned about—the greatest good of the greatest number, in utilitarian terms — and the rationality or greatest good of the part, which is what statesmen worry about and are responsible for. What the radicals denounce as irrational and irresponsible from the viewpoint of mankind is what Weber called the statesman's ethic of responsibility. What keeps ordinary "competitive conflict processes" (Deutsch, 1983)— the very stuff of society — from becoming "unrational" or destructive, isprecisely what the nature of world politics excludes: the restraint of the partners either because of the ties of affection or responsibility that mitigate the conflict, or because of the existence of an outsider — marriage counselor, arbitrator, judge, policeman or legislator— capable of inducing or imposing restraints. Here we come to a third point of difference. The very absence of such safeguards of rationality, the obvious discrepancy between what each part intends, and what it (and the whole world) ends with, the crudeness of some of the psychological mechanisms at work in international affairs—as one can see from the statements of leaders, or from the media, or from inflamed publics—have led many radicals, especially among those whose training or profession is in psychoanalysis or mental health, to treat the age-old contests of states in terms, not of the psychology of politics, but of individual psychology and pathology. There are two manifestations of this. One is the tendency to look at nations or states as individuals writ large, stuck at an early stage of development (similarly, John Mack (1985) in a recent paper talks of political ideologies as carrying "forward the dichotomized structures of childhood"). One of my predecessors writes about "the correspondence between development of the individual self and that of the group or nation," and concludes "that intergroup or international conflict contains the basic elements of the conflict each individual experiences psychologically" (Volkan, 1985). Robert Holt, from the viewpoint of cognitive psychology, finds "the largest part of the American public" immature, in a "phase of development below the Conscientious" (Holt, 1984). The second related aspect is the tendency to look at the notions statesmen or publics have of "the enemy," not only as residues of childhood or adolescent phases of development, but as images that express "disavowed aspects of the self" (Stein, 1985), reveal truths about our own fears and hatreds, and amount to masks we put on the "enemy," because of our own psychological needs. Here is where the clash between traditionalists and radicals is strongest. Traditionalists do not accept a view of group life derived from the study of individual development or family relations, or a view of modern society derived from the simplistic Freudian model of regressed followers identifying with a leader. They don't see in ideologies just irra-tional constructs, but often rationally selected maps allowing individuals to cope with reality. They don't see national identification as pathological, as an appeal to the people's baser instincts, more aggressive impulses or un-sophisticated mental defenses; it is, as Jean-Jacques Rousseau so well understood, the competition of sovereign states that frequently pushes people from "sane" patriotism to "insane" nationalism (Rousseau's way of preventing the former from veering into the latter was, to say the least, im-practical: to remain poor in isolation). Nor do they see anything "primitive" in the nation's concern for survival: It is a moral and structural requirement. Traditionalists also believe that the "intra-psychic" approach distorts reality. Enemies are **not** mere **projections of negative identities; they are** often quite **real** . To be sure, the Nazis' view of the Jews fits the metaphor of the mask put on the enemy for one's own needs. But were, in return, those Jews who understood what enemies they had in the Nazis, doing the same? Is the Soviet domination of Eastern Europe, is the Soviet regime's treatment of dissidents, was the Gulag merely a convenient projection of our intrapsychic battles? Clichés such as the one about how our enemy "understands only force" may tell us a great deal about ourselves; but sometimes they contain half-truths about him, and not just revelations about us. Our fears flow not only from our private fantasies but also from concrete realities and from the fantasies which the international state of nature generates. In other words, the psychology of politics which traditionalists deem adequate is not derived from theories of psychic development and health; it is derived from the logic of the international milieu, which breeds the kind of vocabulary found in the historians and theorists of the state of nature: fear and power, pride and honor, survival and security, self-interest and reputation, distrust and misunderstanding, commitment and credibility. It is also derived from the social psychology of small or large groups, which resorts to the standard psychological vocabulary that describes mental mechanisms or maneuvers and cognitive processes: denial, projection, guilt, repression, closure, rigidity, etc.... But using this vocabulary does not imply that a group whose style of politics is paranoid is therefore composed of people who, as private individuals, are paranoid. Nor does it relieve us of the duty to look at the objective reasons and functions of these mental moves, and of the duty to make explicit our assumptions about what constitutes a "healthy," wise, or proper social process. Altogether, traditionalists find the mental health approach to world affairs unhelpful. Decisions about war and peace are usually taken by small groups of people; the temptation of analyzing their behavior either, literal-ly, in terms of their personalities, or, metaphysically, in terms borrowed from the study of human

development, rather than in those of group dynamics or principles of international politics is understandable. But it is misleading. What is pathological in couples, or in a well-ordered community, is, alas, frequent, indeed normal, among states, or in a troubled state. What is malignant or crazy is usually not the actors or the social process in which they are engaged: it is the possible results. The grammar of motives which the mental health approach brands as primitive or immature is actually rational for the actors. to the substitution of labels for explanations, to bad analysis and fanciful prescriptions. Bad analysis: the tendency to see in group coherence a regressive response to a threat, whereas it often is a rational response to the "existential" threats entailed by the very nature of the international milieu. Or the tendency to see in the effacement or minimization of individual differences in a group a release of unconscious instincts, rather than a phenomenon that can be perfectly adaptive—in response to stress or threats—or result from governmental manipulation or originate in the code of conduct inculcated by the educational system, etc.. . The habit of comparing the state, or modern society, with the Church or the army, and to analyze human relations in these institutions in ways that stress the libidinal more than the cognitive and superego factors, or equate libidinal bonds and the desire for a leader. The view that enemies are above all products of mental drives, rather than inevitable concomitants of social strife at every level. Or the view that the contest with the rival fulfills inter-nal needs, which may be true, but requires careful examination of the nature of these needs (psychological? bureaucratic? economic?), obscures the objective reasons of the contest, and risks confusing cause and function. Indeed, such analysis is particularly misleading in dealing with the pre-sent scene. The radicals are so (justifiably) concerned with the nuclear peril that the traditional ways in which statesmen and publics behave seem to vindicate the pathological approach. But this, in turn, incites radicals to overlook the fundamental ambiguity of contemporary world politics. On the one hand, there is a nuclear revolution—the capacity for total destruction. On the other hand, many states, without nuclear weapons, find that the use of force remains rational (in terms of a rationality of means) and beneficial at home or abroad—ask the Vietnamese, or the Egyptians after October 1973, or Mrs. Thatcher after the Falklands, or Ronald Reagan after Grenada. The superpowers themselves, whose contest has not been abolished by the nuclear revolution (it is the stakes, the costs of failure that have, of course, been transformed), find that much of their rivalry can be conducted in traditional ways — including limited uses of force —below the level of nuclear alarm. They also find that nuclear weapons, while—perhapsunusable rationally, can usefully strengthen the very process that has been so faulty in the prenuclear ages: deterrence (this is one of the reasons for nuclear proliferation). The pathological approach interprets deterrence as expressing the deterrer's belief that his country is good, the enemy's is bad. This is often the case, but it need not be; it can also reflect the conviction that one's country has interests that are not mere figments of the imagination, and need to be protected both because of the material costs of losing them, and because of the values embedded in them. As for war planning, it is not a case of "psychological denial of unwelcome reality" (Montville, 1985). but a — perhaps futile, perhaps dangerous— necessity in a world where deterrence may once more fail. The prescriptions that result from the radicals' psychological approach also run into traditionalist objections. Even if one accepts the metaphors of collective disease or pathology, one must understand that the "cure" can only be provided by politics. All too often, the radicals' cures consist of perfectly sensible recommendations for lowering tensions, but fail to tell us how to get them carried out —they only tell us how much better the world would be, if only "such rules could be established" (Deutsch, 1983). Sometimes, they express generous aspirations — for common or mutual security—without much awareness of the obstacles which conflict-ing interests, fears about allies or clients, and the nature of the weapons themselves, continue to erect. Sometimes, they too neglect the ambiguity of life in a nuclear world: The much lamented redundancy of weapons, a calamity if nuclear deterrence fails, can also be a cushion against failure. Finally, many of the remedies offered are based on an admirable liberal model of personality and politics: the ideal of the mature, well-adjusted, open-minded person (produced by liberal education and healthy family relations) transposed on the political level, and thus accompanied by the triumph of democracy in the community, by the elimination of militarism and the spread of functional cooperation abroad. But three obstacles remain unconquered: first, a major part of the world rejects this ideal and keeps itself closed to it (many of the radicals seem to deny it, or to ignore it, or to believe it doesn't matter). Second, the record shows that real democracies, in their behavior toward non-democratic or less "advanced" societies, do not conform to the happy model (think of the US in Central America). Third, the task of reform, both of the publics and of the statesmen, through consciousness raising and education is hopelessly huge, incapable of being pursued equally in all the important states, and — indeed — too slow if one accepts the idea of a mortal nuclear peril. These, then, are the dimensions of a split that should not be minimized or denied

Queerness

AT Edelman

Cooption

The K will be co-opted by right wing and abandon the queer community to immediate social violence
Fitzpatrick (associate professor of media studies @ Pomona College) **7**

(Kathleen, must we abandon reproductive futurism?, December 3, http://machines.pomona.edu/149-2007/node/225)

Edelman makes the disclaimer that this is more of a theoretical exercise of resistance, however, it seems a dangerous road to go down **given the possibility for co-optation by a violent right wing rhetoric**. He hails the Right for their acknowledgment of the truly devastating connotations of queerness, in light of the less radical-discourse of the Left which refuses to speak in terms of apocalyptic scale. Yet I can imagine an indignant Neo-Con reading this as the ultimate proof that the gays want to destroy us all - and while all of us are busy taking up Edelman's call for rhetorical queerness against reproductive futurism, **there remains the queer community receiving the social violence of oppression as a result of this getting to the wrong hands**. Pardon my paranoid musing,; I'm just concerned with the implications of making these delineations.

<u>Kills Collective Politics</u>

Aff makes collective resistance to oppression impossible and reprivatizes queerness
Fox (poet and writer) **7**

(Dominic, Contingency, Irony and Solidarity, June 15th, http://codepoetics.com/poetix/?p=418)

<u>The snare that</u> I think <u>proves most damaging</u> to **No Future**'s thesis <u>is not in fact that of special pleading on behalf of "the queer"</u>, with all the attendant question-begging issues of identification that would entail, <u>but</u> <u>that of emphasizing the particularity of the **sinthome** over its universality: **both are equally destructive of communal politics**</u>, but it is in the latter that the aleatory trajectory of the affinitive comes into play. This, needless to say, remains to be worked out, but <u>the specific problem with **Edelman's emphasis on particularity, primary narcissism and an essentially private communing** with the real of the drives is that it reinvests precisely the psychiatric model of queerness as individual perversion and social disorder that the "queer event" sought to overturn.</u> <u>The urgent question remains that of the **anabasis** which might convoke a collective body – and with it a politics worthy of the name</u>.

Utopianism Good

Refusing the future is a gay white male's bourgeois fantasy – it imagines a queer subject abstracted from the multiude of oppressions that mark everyday life. [We must reposition queerness as the desire for another way of being, to queer the future, not abandon it]
Munoz (the chair of the Department of Performance Studies at Tisch School of the Arts, New York University) **7**

(Jose Esteban, Cruising the Toilet: LeRoi Jones/Amiri Baraka, Radical Black Traditions, and Queer Futurity, GLQ: A Journal of Lesbian and Gay Studies 13.2-3, 353-367)

The question of children hangs heavily when one considers Baraka's present. On August 12, 2003, one of his daughters, Shani Baraka, and her female lover, Rayshon Holmes, were killed by the estranged husband of Wanda Pasha, who is also one of Baraka's daughters. The thirty-one- and thirty-year-old women's murders were preceded a few months earlier by another hate crime in Newark, the killing of fifteen-year-old Sakia Gunn. Gunn was a black transgendered youth who traveled from Hoboken to Greenwich Village and the Christopher Street piers to hang out with other young queers of color. Baraka and his wife, Amina, have in part dealt with the tragic loss of their daughter by turning to activism. The violent fate of their child has alerted them to the systemic violence that faces queer people (and especially young people) of color. The Barakas have both become ardent antiviolence activists speaking out directly on LGBT issues. Real violence has ironically brought Baraka back to a queer world that he had renounced so many years ago. Through his tremendous loss he has decided to further diversify his consistent commitment to activism and social justice to include what can only be understood as queer politics. In the world of *The Toilet* there are no hate crimes, no lexicon that identifies homophobia per se, but there is the fact of an aggression constantly on the verge of brutal actualization. The mimetic violence resonates across time and to the scene of the loss that the author will endure decades later. This story from real life is not meant to serve as the proof for my argument. Indeed, the play's highly homoerotic violence is in crucial ways nothing like the misogynist violence against women that befell the dramatist's family or the transgenderphobic violence that ended Gunn's young life. I mention these tragedies because it makes one simple point. The future is only the stuff of *some* kids. Racialized kids, queer kids, are not the sovereign princes of futurity. While Edelman does indicate that the future of the child as futurity is different from the future of actual children, his framing nonetheless **accepts and reproduces this monolithic figure of the child that is indeed always already white**. He all but ignores the point that other modes of particularity within the social are constitutive of subjecthood beyond the kind of *jouissance* that refuses both narratological meaning and what he understands as the fantasy of futurity. He anticipates and bristles against his future critics with a precognitive paranoia in footnote 19 of his first chapter. He rightly predicts that **[End Page 364]** some identitarian critics (I suppose that would be me in this instance, despite my ambivalent relation to the concept of identity) would dismiss his polemic by saying it is determined by his middle-class white gay male positionality. This attempt to inoculate himself from those who engage his polemic does not do the job. In the final analysis, white gay male crypto-identity politics (the restaging of whiteness as universal norm via the imaginary negation of all other identities that position themselves as not white) is beside the point. The deeper point is indeed "political," as, but certainly not more, political as Edelman's argument. It is important not to hand over futurity to normative white reproductive futurity. That dominant mode of futurity is indeed "winning," but that is all the more reason to call on a utopian political imagination that will enable us to glimpse another time and place: **a "not-yet" where queer youths of color actually get to grow up**. Utopian and willfully idealistic practices of thought are in order if we are to resist the perils of **heteronormative pragmatism and Anglo-normative pessimism**. Imagining a queer subject who is abstracted from the **sensuous intersectionalities that mark our experience is an ineffectual way out**. Such an escape via singularity is a ticket whose price most cannot afford. The way to deal with the asymmetries and violent frenzies that mark the present **is not to forget the future**. The here and now is simply not enough. Queerness should and could be **about a desire for another way of being** in both the world and time, a desire that resists mandates to accept that which is not enough.

Futurity Good

Frontline

Focusing on the future is good

a) Only way to challenge oppressive structures

b) It's not deterministic – focus on reproductive futurism allows us to be reflexive of the past and present as well

Unger 7

Roberto Mangabeira Unger Professor of Law Harvard, http://www.law.harvard.edu/unger/english/docs/pragmatism.doc.THE SELF AWAKENED: PRAGMATISM UNBOUND

The third theme is Futurity. Whether or not time is for real in the vast world of nature, of which our knowledge always remains at once remote and contradictory, is a subject that will always continue to arouse controversy. That time is for real in human existence is not, however, a speculative thesis; it is a pressure we face with mounting force, so long as we remain conscious and not deluded, in our passage from birth to death. The temporal character of our existence is the consequence of our embodiment, the stigma of our finitude, and the condition that gives transcendence its point. We are not exhausted by the social and cultural worlds we inhabit and build. They are finite. We, in comparison to them, are not. We can see, think, feel, build, and connect in more ways than they can allow. That is why we are required to rebel against them: to advance our interests and ideals as we now understand them, but also to become ourselves, affirming the polarity that constitutes the law-breaking law of our being. To seek what goes beyond the established structure and represents, for that very reason, the **possible beginning of another structure,** even of a structure that organizes its own remaking, is **to live for the future**. Living for the future is a way of living in the present as a being not wholly determined by the present conditions of its existence. We never completely surrender. We go about our business of passive submission, of voiceless despair, as if we knew that the established order were not for keeps, and had no final claim to our allegiance. Orientation to the future -- futurity -- is a defining condition of personality. So fundamental is this feature of our existence that it also shapes the experience of thinking, even when our thoughts are directed away from ourselves to nature. Ceaselessly reorganizing our experience of particulars under general headings, constantly breaking up and remaking the headings to master the experience, intuiting in one set of known relations the existence of another, next to it or hidden under it, finding out one thing when we had set out to find out another, and discovering indeed what our assumptions and methods may have ruled out as paradoxical, contradictory, or impossible, we come to see the next steps of thought -- its possibilities, its future -- as the point of the whole past of thought. Futurity should cease to be a predicament and should become a program: we should radicalize it to empower ourselves. That is the reason to take an interest in ways of organizing thought and society that diminish the influence of what happened before on what can happen next. Such intellectual and institutional innovations make change in thought less dependent on the pressure of unmastered anomalies and change in society less dependent on the blows of unexpected trauma. In any given historical situation, the effort to live for the future has consequences for how we order our ideas and for how we order our societies. There is a structure to the organized revision of structures. Its constituents, however, are not timeless. We paste them together with the time-soaked materials at hand.

Provides a value to life

Unger 7

Roberto Mangabeira Unger Professor of Law Harvard, http://www.law.harvard.edu/unger/english/docs/pragmatism.doc.THE SELF AWAKENED: PRAGMATISM UNBOUND

The hope held out by the thesis that we can change our relation to our contexts will remain hollow unless we can change this relation in biographical as well as in historical time, independently of the fate of all collective projects of transformation. It will be hollow as well unless that change will give us other people and the world itself more fully. That the hope is not hollow in any such sense represents part of the thesis implicit in the idea of futurity: to **live for the future** is to live in the present as a

being not fully determined by the present settings of organized life and thought and therefore more capable of openness to the other person, to the surprising experience, and to the entire phenomenal world of time and change. It is in this way that we can embrace the joy of life in the moment as both a revelation and a prophecy rather than discounting it as a trick that nature plays on spirit the better to reconcile us to our haplessness and our ignorance. The chief teaching of this book is that we become more godlike to live, not that we live to become more godlike. The reward of our striving is not arousal to a greater life later; it is arousal to a greater life now, a raising up confirmed by our **opening up to the other and to the new**. A simple way to grasp the point of my whole argument, from the vantage point of this its middle and its center, is to say that it explores a world of ideas about nature, society, personality, and mind within which this teaching makes sense and has authority.

Futurity k2 Queerness

Edelman has it entirely backwards. Queerness requires futurity. Their framework closes off the possibility of altering the present, thereby crushing social change and naturalizing hetero-normativity

Muñoz 6

José Esteban, Associate Professor of Performance Studies at NYU, PMLA, v121, n3, May, p. 825-826

I have chosen to counter polemics that argue for antirelationality by insisting on the essential need for an understanding of queerness as collectivity. At the 2005 MLA panel, in recent essays, and in my forthcoming book *Cruising Utopia*, I respond to the assertion that there is no future for the queer by arguing that **queerness is primarily about futurity**. Queerness is always on the horizon. Indeed, for queerness to have any value whatsoever, it must be considered visible only on the horizon. My argument is therefore interested in critiquing the ontological certitude that I understand to accompany the politics of presentist and pragmatic contemporary gay identity. This certitude is often represented through a narration of disappearance and negativity that boils down to another game of fort-da. My conference paper and the forthcoming book it is culled from have found much propulsion in the work of Ernst Bloch and other Marxist thinkers who did not dismiss utopia. Bloch found strident grounds for a critique of a totalizing and naturalizing idea of the present in his concept of the no-longer-conscious. A turn to the no-longer-conscious enabled a critical hermeneutics attuned to comprehending the not yet here. This temporal calculus deployed the past and the future as armaments to combat the devastating logic of the here and now, in which nothing exists outside the current moment and which **naturalizes cultural logics like capitalism and heteronormativity**. Concomitantly, Bloch has also sharpened our critical imagination's emphasis on what he famously called "a principle of hope." Hope is an easy target for antiutopians. But while antiutopians might understand themselves as critical in the rejection of hope, they would, in the rush to denounce it, miss the point that hope is spawned of a critical investment in utopia that is nothing like naive but, instead, profoundly resistant to the stultifying temporal logic of a broken-down present. My turn to Bloch, hope, and utopia challenges theoretical insights that have been stunted by the lull of presentness and by various romances of negativity and that have thus become routine and **resoundingly anticritical**.

Edelman is wrong about social change—Democratic politics can transform social relations without reaffirming homophobia

Brenkman 2

John, Professor of English and Comparative Literature, CUNY Graduate School, "Politics, Mortal and Natal: An Arendtian Rejoinder," Narrative 10:2, http://muse.jhu.edu/journals/narrative/v010/10.2brenkman02.html, p. 187-8,

In my view, Edelman effaces this difference between democracy and totalitarianism. He attributes to democracy the workings of totalitarianism: he makes no distinction between civil society and the state, equates "the social order" with politics as such, and equates both with the symbolic order. This misconception of democratic politics is what anchors his call for "a true oppositional politics" whose meaning-dissolving, identity-dissolving ironies would come from "the space outside the frame within which 'politics' appears" ("Post-Partum" 181). The democratic state, as opposed to the totalitarian, does not rule civil society but secures its possibility and flourishing; conversely, civil society is the nonpolitical realm from which emerge those initiatives that transform, moderately or radically, the political realm of laws and rights. For that very reason, the political frame of laws and rights, and of debate and decision, is intrinsically inadequate to the plurality of projects and the social divisions within society—there is always a gap in its

political representation of the "real" of the social—and for that very reason the political realm itself is **open to change and innovation**. Innovation is a crucial concept for understanding the gay and lesbian movement, which emerged from within civil society as citizens who were stigmatized and often criminalized for their sexual lives created new forms of association, transformed their own lifeworld, and organized a political offensive on behalf of political and social reforms. There was an innovation of rights and freedoms, and what I have called innovations in sociality. Contrary to the liberal interpretation of liberal rights and freedoms, I do not think that gays and lesbians have merely sought their place at the table. Their struggle has radically altered the scope and meaning of the liberal rights and freedoms they sought, first and foremost by making them include sexuality, sexual practices, and the shape of household and family. Where the movement has succeeded in changing the laws of the state, it has also opened up new possibilities within civil society. To take an obvious example, wherever it becomes unlawful to deny housing to individuals because they are gay, there is set in motion a transformation of the everyday life of neighborhoods, including the lives of heterosexuals and their children. Within civil society, this is a work of enlightenment, however uneven and fraught and frequently dangerous. It is **not** a reaffirmation of the symbolic and structural underpinnings of homophobia; on the contrary, it is a challenge to homophobia and a volatilizing of social relations within the nonpolitical realm.

Edelman's claim that sexual reproduction is the core of politics is just wrong. He treats reactionary movement as the norm and would reverse decades of cultural change

Brenkman 2

John, Professor of English and Comparative Literature, CUNY Graduate School, "Politics, Mortal and Natal: An Arendtian Rejoinder," Narrative 10:2, http://muse.jhu.edu/journals/narrative/v010/10.2brenkman02.html, p. 188-9,

> What I have challenged is the claim that this discourse defines, or even dominates, the political realm as such. It is the discourse of conservative Catholicism and Christian fundamentalism, and even though it resonates in strands of liberal discourse, it represents an intense reaction, backlash, against changes that have already taken place in American society, many of them as the direct result of feminism and the gay and lesbian movement. It is indeed important not to underestimate the depth and danger of this reaction, but it is a reactionary, not a foundational, discourse. The **uncoupling** of sexuality and reproduction is ubiquitous in American culture today as a result of multiple developments beyond the expansion of gay rights and the right to abortion, including birth control, divorce, and changing patterns of family life, as well as consumerism and mass culture; it may well be that the sheer scope, and **irreversibility**, of these developments also intensifies the targeting of gays by conservative ideology and Christian fundamentalist movements. But that is **all the more reason** to recognize that the deconstruction of the phobic **figuration of the queer is a struggle to be pursued** inside as well as outside politics.

( ) Queer politics aren't a root cause – focus on reproductive futurism can't explain gay oppression in family life, consumerism, mass culture or religion. Accepting the multiple intersections underscores the <u>necessity</u> of working through political institutions to achieve change.

Political calculation doesn't necessitate a conservative social order. Edelman's argument is ridiculously totalizing

Brenkman 2

John, Professor of English and Comparative Literature, CUNY Graduate School, "Politics, Mortal and Natal: An Arendtian Rejoinder," <u>Narrative</u> 10:2, http://muse.jhu.edu/journals/narrative/v010/10.2brenkman02.html, p. 189,

> I stand by my claim that Edelman builds a psychoanalytic theory of the political realm, in the sense that he gives a psychoanalytic account of what the political realm is. Politics in his account fuses the Symbolic order to the social order and, in response to the Symbolic's inherent failure to symbolize the Real of the drives that unhinge every human being's integration into the social-symbolic order, generates a subtending futurist-nostalgic fantasy of sexuality as reproduction. Because the fantasy too is everywhere exceeded by reality, this mechanism in turn produces the homophobic figuration Edelman has described in "The Future is Kid Stuff": "the order of social reality demands some figural repository for what the logic of its articulation is destined to foreclose, for the fracture that persistently haunts it as the death within itself" ("Future is Kid Stuff" 28). I cited Claude Lefort at some length because he visits the same precincts of the psychoanalytic theory of discourse in order to formulate the discursive dynamic of democracy. But rather than conceptualizing the **entire** social-political order as a psychic apparatus as Edelman does, Lefort draws on Lacan's notion of the inherent gap between symbolization and the "real" to formulate the modern state's representation of the "real" of the social. Since the democratic state limits its own powers and thus delimits civil society as the nonpolitical space it impossibly must represent, the gap between symbolic and real is the **opening of political conflict and change, not an endless replication or reaffirmation of *the* social order**. Every ideological or political articulation—whether the particular discourses of power (<u>law, economics, aesthetics</u>, etc.) <u>or</u>

the institution of the state itself—holds a potentiality for change *because of*, not in spite of the fact that its representation of the "real" fails.

( ) Queer pessimism is fatalism at its worst – the gap created by the symbolic and the Real <u>is</u> civil society – progressive politics are possible in the state <u>because</u> the representation of the Real is not totalizing.

Futurity k2 Social Change

Failure to evaluate responsibility for the future denies any collective social change

Grossberg 3

Lawrence, Professor of Communication Studies at UNC-Chapel Hill, "Cultural studies, the war against kids, and the re-becoming of US modernity," Postcolonial Studies, 6:3, 346-347

The war on kids is about erasing the future as a burden on the present. Or better, it is about changing the very mode by which the future functions, for the future is itself necessary to the possibility of an individualizing identity built on labour and citizenship. The rejection of kids as the core of our common national and social identity is, at the same time, a rejection of the future as an affective investment. Increasingly, the future is defined as either indistinguishable from the present35 (and therefore as the servant of the present rather than vice versa), or apocalyptically (as radically other than the present, without any continuity). To put it simply, <u>the claim that we are **no longer responsible to**</u>/for our **children** (because they no longer deserve it) '<u>signifies</u>', if you will, <u>that the present is no longer responsible to the future</u>. On the contrary, in the re-imagined modernity, the future is to be held responsible to the present. We may be witnessing the attempt to reinvent the individual and the relationship of individuality to the forces that produce reality and are producing our collective futures, and the emergence of a new and distinct mode of individualization and (as)sociation. This 'revolution' involves economic, political, ideological, social, theoretical, cultural and media vectors, all together, and their multiple articulations. It is what brings together new conservative, neo-conservative and neo-liberal groups, and sometimes other constituencies, however temporarily. What is at stake is the production of a new modernity and of the impossibility of those conceptions of agency which have sustained us for centuries. <u>This new modernity would</u> seem to negate the very reality, and even the possibility, of the social or, more accurately, of social agency. What we are witnessing, what I have been trying to describe and imagine, is the production of a new context, a new modernity, out of the old. This production seems to <u>require</u> and seek <u>the negation of many forms of **individual and collective agency**, including the very possibility of</u> imagining alternative futures, of <u>imagining the future as always holding open the possibility of alternatives</u>. That is, the attack on kids is about the relationship between individuality and time. It is a struggle to change our investment in and the possibility of imagining the future. And it is, as Bauman says, a struggle about escaping from the present.36 Because <u>as long as you believe in the future, there's</u> always <u>an escape route</u>, there's always <u>a way to get from here to there. And as long as there's an escape route, there is always a possibility of a community defined **in opposition** to the present</u>. This struggle against modernity (in the name of a new modernity) must negate the possibility of imagination, of the imaginative power of the future. And in fact, the new modernity seems to demand that we deny the importance of the future. But **if we are to take back control of our present**, if we are to take back the possibility of imagining the future, <u>we must **somehow return to kids**</u>—all over the world—<u>the possibility of embodying hope for themselves</u> (without once again imposing on them the burden that they embody hope for us as well). We must also claim hope for ourselves as intellectuals. I recognize that my argument may stretch one's credulity, but I want to defend myself by agreeing with my good friend Meaghan Morris, who has suggested, 'Things are too urgent now to be giving up our imagination'.37 I want to suggest that there is no other way except imaginatively to make sense of what is going on and that, in the end, <u>it is precisely our ability to imagine that is at stake in the current political struggle</u>.

Futurity is key to new social orders which are less oppressive

Bateman 6

R. Benjamin, Doctoral candidate in English, University of Virginia, "The Future of Queer Theory," Minnesota Review, Spring,

http://www.theminnesotareview.org/journal/ns6566/bateman_r_benjamin_ns6566_stf1.shtml

Certain readers might chafe at Edelman's suggestion that Butler's politics is insufficiently radical. After all, Butler has been criticized, like Edelman, for trafficking in recondite theories and postmodern argot and for failing to offer a viable model of political agency. To be sure, Butler's post-structuralist and Foucaultian commitments constrain her ability to posit a stable political agent and to conceive a politics that would radically oppose, rather than merely reinforce or marginally reinflect, a dominant cultural order. But in her recent work, perhaps most strikingly in 2004's **Undoing Gender**, Butler has turned to the "question of social transformation" (the title of **UG**'s tenth chapter), arguing, quite programmatically, that social transformation "...is a question of developing, within law, within psychiatry, within social and literary theory, a new legitimating lexicon for the gender complexity that we have always been living" (219). Lest she be accused of nominalism, Butler stresses the importance of real bodies in forging such a vocabulary: "...the body is that which can occupy the norm in myriad ways, exceed the norm, rework the norm, and expose realities to which we thought we were confined as open to transformation" (217). While Edelman rejects the future as a site of social reproduction, Butler prizes it as a space of uncertainty, an ambiguous terrain upon which competing and perhaps unforeseeable claims will be made and new social orders elaborated. Butler's model offers queer theory a brighter future than Edelman's, not simply because it confers agency upon social actors and highlights the social's capacity for transformation, but because it supersedes the liberal inclusiveness for which Edelman faults it. Butler's queer world is not one in which the dominant order remains stable as it incorporates, or ingests, peripheral sexualities into its fold. Rather, it is one in which the **periphery remakes the center**, rearticulating what it means to be "normal" or "American" or "queer." Thus, queers do not simply enter society on heterosexuality's terms; they recast such terms, seizing upon instabilities in signification to elaborate previously unarticulated and perhaps unanticipatable ways of life. Edelman's point that 'queer' names "the resistance of the social to itself" (2002) combats the very anti-futurism he endorses; in this formulation, queerness functions as the force that prevents a particular social order from coinciding with itself, from congealing into a futureless nightmare. Queer, then, might denote the instability of all norms and social orders, their intrinsic capacity for change.

Futurity is necessary to alter the current social order

Kurasawa 4

Fuyuki, Assistant Professor of Sociology at York University, "Cautionary Tales: The Global Culture of Prevention and the Work of Foresight," Constellations, 11:4, p. 454

But neither evasion nor fatalism will do. Some authors have grasped this, reviving hope in large-scale socio-political transformation by sketching out utopian **pictures of an alternative world order**. Endeavors like these are essential, for they spark ideas about possible and desirable futures that transcend the existing state of affairs and undermine the flawed prognoses of the post-Cold War world order; what ought to be and the Blochian 'Not-Yet' remain powerful figures of critique of what is, and inspire us to contemplate how social life could be organized differently. Nevertheless, my aim in this paper is to pursue a different tack by exploring how a dystopian imaginary can lay the foundations for a constructive engagement with the future.

Futurity k2 Environment

Focusing on the future is key to prevent environmental destruction

Dator 99

Jim Dator is Professor of Political Science at the University of Hawaii at Manoa and Director of the Hawaii Research Center for Futures Studies.,
http://www.futures.hawaii.edu/dator/governance/futgen.html

But simultaneously, and in stark contrast, "the environmental movement" began to question "development" as a proper basis for anticipating the future. Looming threats of environmental pollution, resource exhaustion, overpopulation, and global change seemed to many people vastly more important than continuing to urge blind economic growth. Fretting over the problems of a world of abundance and leisure was viewed as utter folly. Indeed, it was the unanticipated consequences of continued economic growth itself which caused many people to have such a bleak and fearful view of the future. "Development" was definitely not all it was cracked up to be. So, whatever view one might have of the future--be it bright or dark, prosperous or penurious--more and more people were becoming aware of their obligation to take the needs of **future generations into account** when making present decisions. Various advocates for governmental foresight have created, or attempted to create, new processes or institutions within existing systems of democratic government in different parts of the world. These include long-range planning departments, futures commissions, requirements that legislatures conduct future-impact statements on proposed legislation, environmental protection agencies, offices of technology assessment, and the like. Examples of these are discussed elsewhere in this volume.

Environmental destruction causes extinction

Richard **Margoluis**, Biodiversity Support Program, 19**96**, http://www.bsponline.org/publications/showhtml.php3?10

Biodiversity not only provides direct benefits like food, medicine, and energy; it also affords us a "life support system." Biodiversity is required for the recycling of essential elements, such as carbon, oxygen, and nitrogen. It is also responsible for mitigating pollution, protecting watersheds, and combating soil erosion. Because biodiversity acts as a buffer against excessive variations in weather and climate, it protects us from catastrophic events beyond human control. The importance of biodiversity to a healthy environment has become increasingly clear. We have learned that the future well-being of **all humanity depends on** our stewardship of **the Earth**. When we overexploit living resources, we threaten our own survival.

Focusing on the future solves extinction – solves resource planning that averts conflict and environmental collapse

Dator 99

Jim Dator is Professor of Political Science at the University of Hawaii at Manoa and Director of the Hawaii Research Center for Futures Studies.,
http://www.futures.hawaii.edu/dator/governance/futgen.html

Thus, **future-oriented political philosophies** and processes are given meaning not through specific policies about the future per se, but through certain perspectives, institutions, and actions intended to bring the interests of future generations into the decision making and implementation of the present. Future-oriented actions also include those made by governments and citizens which attempt seriously to assess the

potential impacts of proposed policies on future generations before the policies are made or implemented. Recent discussions about why we need to be aware of our obligations to future generations fall into four general categories: fairness, maintaining options, quality of life, and humility. The "fairness" obligation concerns not imposing risks on future generations that present generations would also not accept. For example, MacLean states that "levels of risk to which future generations will be subjected will be no greater than those of present persons'" [4]. Risks can include those of premature "death owing to environmental or other preventable catastrophes" [5] or other significant threats to the quality of life. "Fairness" also implies "consent." According to Schrader-Frechette, "until or unless a risk imposition receives the consent of those who are its potential victims, it cannot be justified"[6]. Future generations can offer no such consent, so ways need to be invented and created which attempt to include the interests, and consent, of future generations in all current decisions which will impact them. The "maintaining options" obligation entails giving to our posterity future worlds that are as free of human-made constraints as possible. In other words, there is a need to prevent environmental and other catastrophes "that would restrict the future of the human race by cutting off certain possible futures" [7]. By cutting off many futures, the ability of future societies to grow and mature is reduced [8] as is the freedom for people to "reason about means and ends and evaluate preferences, to match desires and beliefs and then act" [9]. Frankenfeld [10] argues that current generations owe posterity a world as simple, controllable, and affordable as possible. Brown's "Principle of Conservation of Options" holds that "each generation should conserve the diversity of the natural and cultural resource base so that is does not unduly restrict options available to future generations..." [11]. The "quality-of-life" obligation refers to ensuring that **future generations** enjoy all the most important aspects of life. From an international survey, Tough distilled the following quality-of-life obligations to future generations: peace and security, a healthy environment, a small risk of preventable catastrophe, stable governments, conservation of knowledge, a good life for children, and opportunities for living [12]. DesJardings' three quality-of-life obligations to future generations are development of alternative energy sources, conservation of energy resources, and a reasonable chance of happiness [13]. Economic concerns relating to quality-of-work and increasing standards of living could be added to this list, in addition to other variables that are found important by the world's diversity of cultures. Bell believes that "humility" should inhibit humanity from creating obligations to future generations. In his words, "humble ignorance ought to lead present generations to act with prudence toward the well-being of future generations." In addition, he states that "there is a prima facie obligation of present generations to ensure that important business is not left unfinished" [14] National governments make numerous decisions that bear on such obligations, either positively or negatively. Decisions within the sphere of the interest of obligations to future generations include environmental and energy policies, science and space programs, agriculture, land use, infrastructure, and education--indeed, almost everything. A future-oriented government might make decisions that support sustainability, species protection, ecosystem protection, reduction of pollutants into the environment, and conservation of non-renewable resources, with concomitant focus on using renewable resources.

Blackness

Link

AT "Destroy the Human"

Attempting to destroy the category of the human prevents an effective critique of anti-blackness

Nissim-Sabat 9 (Professor Emeritus and Adjunct Professor, Department of Philosophy, Lewis University) (Marilyn, *Neither victim nor survivor: thinking toward a new humanity*, pg. 102)

The difference between this Fanonian critique of the modus operandi of universals in antiblack racist thought on one hand, and postmodern thought's discarding of universals on the other hand, is clear. Gordon's statement that the "European practice of science . . . denied the existence of the black in its construction of the human being" is a critique of the failure of Eurocentrism in its exclusion of the black from the universal: "human being." Just so, the critique is not of the universal "human being' qua universal, but of the attempt to pass off a particular, the white human being, as the universal. From this point of view, discarding universality in toto does not advance the critique of antiblack racism; on the contrary, it obstructs that critique: "Philosophy that fails to account for existence is, therefore, trapped in a bad-faith claim to universality. In Fanon's critique, then, there is a perspective beyond particularity and universality, a perspective that sees multiple worlds" (44). The bad faith universality of which Gordon speaks is that of the racist; however, it applies just as well to the postmodern perspective. First, those who discard universality believe that just invoking it entails bad faith—tlierefore, from this perspective, all uses of universality arc in bad faith, and arc equally complicit. In other words, neither the racist nor the postmodern critic of the racist acknowledge that the category "human being' encompasses all human beings, past, present, and future, and therefore that racism artificially limits its scope to some. So, how then can the racist be held accountable as a racist? What then would be a notion of universality that is not complicit in one form or another of oppression? It seems to me that when Gordon refers to Fanon's critique as a "perspective bevond particularity and universality" that sees multiple worlds" he suggests something akin to, or better an existential recasting of, Hegel's concrete universal or individuality as the unity of the universal and particular.' Such a notion is also expressed by Alice Cherki in her recent biography of Fanon.

AT Futurism

Humanism requires a positive orientation towards the future and our responsibilities towards others

Gordon 9 (Professor of Philosophy and African American Studies at UConn and one of the premier Fanon scholars in the world)
(Lewis R., Introduction to *Neither victim nor survivor: thinking toward a new humanity*, pg. viii)

This book is aptly entitled Neither Victim nor Survivor: Thinking toward a New Humanity. <u>Nissim-Sabat's commitments</u>, as a philosopher, therapist, and activist, a<u>re against the stultifying social forces and interpretations of reality that</u>, as Fanon once observed, <u>make life "brittle" and block the path of action and imagination</u>, <u>which led to her struggle for thinking about the future, of future thinking, of responsibilities faced each generation for those who succeed them</u>. In the course of such thought, the constitutional paradox comes to the fore, where we in effect make that which we are trying to find. This effort, <u>in which our humanity haunts our failings, demands our not collapsing into a state of permanent ruin</u>. There is a sense in which ruin is unavoidable, since, at least in psychoanalytical terms, the separation from the womb is a loss for which we seek external reconciliation in our cultivation of a home. History, however, reveals that although such a journey is shared by all, the obstacles placed on the majority of humankind renders its prize, not only coming home but also having a home, available to few. <u>The human condition reveals a common goal that's an uncommon achievement.</u>

To remain only tied to the past an exclude the future prevents any transformative action and destroys the radical potential of humanism

Nissim-Sabat 9 (Professor Emeritus and Adjunct Professor, Department of Philosophy, Lewis University)
(Marilyn, *Neither victim nor survivor: thinking toward a new humanity*, pg. 188-89)

It is true, as Morrison tells us, that the past is disremembered. It is also tragic that this forgetting of immense human suffering seems to be hereto- fore concomitant with our need to move forward and integrate or reintegrate ourselves. To this extent, <u>we are all</u> compromised, all <u>condemned to repeat history</u>. Far, <u>far better it would be to remember, and in remembering be, not traumatized, but rather empowered to create the conditions for the possibility of a future for humanity such that there will be no more victims, no more holocausts, and thus no more survivors</u>. The paralysis <u>and total devastation brought about by surviving</u> in a perpetual state of trauma-that is, <u>by not forgetting, is</u>, of course<u>, not a solution either for in such a state</u> constructive or <u>transformative action is impossible</u>. This should not be taken as a critique of the traumatized, for that would indeed be to blame the victims, and doing so is both incorrect and ethically anathema. Rather, it is meant as a critique of those who think that traumatized persons have no resources within that can enable them to move beyond survival toward personal wholeness, even in conjunction with "forgetting." To deny this is to blame the victims by seulng them apart as a special category-those condemned perpetually to relive their trauma and survival of it. If the "fairy tale" ending of Beloved is ambiguous, and I believe it is, it is not because it is marked by trauma denying implausi-bility, but precisely becauseit is not a "fairy tale" in the pejorative senseor an act of "willful optimism." Sethe can achieve subject status. She can be- come a self through her Own struggles and with the intervention of Beloved, Beloved's baby, and Paul D. For Sethe, life can now, after living for eighteen years in a free stale, be more than mere survival for she has reconnected with her self before her most devastating traumas, and this enables her to recon nec~w.ith .the people whom she loves and who love her. Moreover, there is no IOdlc~tlon whatsoever in the novel that Sethe and Paul D's future in this world will be a blissful happi ly-cver-after, even if it is much, much happier than what really happened 10 Margaret Garner and Ihe Sixty-Million victims of the Middle Passage'. What really would be a "fairy tale" in the pejorative sense,a fairy tale thai IS not at all represented in Beloved. is the notion that we, any and all of us, can fully realize our humanity, can become whole, no ~at1er how favorable our circumstances, in

a world of continued, pervasive inhumanity, The ending of Beloved shows, therefore, that Paul D and Sethe are enabled to live a meaningful life together becausethey understood from all of their struggles to survive that they survived partly in virtue of their implicit realization that just surviving was not enough; they were implicitly aware that they are not the animals that slavery held them to be, but human beings. For, they might have survived in slavery, but not living human lives. Just so, Frederick Douglass asserted himself and turned on his overseer Covey when he realized that not his survival but his humanity, his dignity as a human being, was at stake.

"I am not the slave of the Slavery that dehumanized my ancestors," wrote Panon.? How can we throw off this slavery? Fanon has his own ideas about this, ideas that are not very different from Toni Morrison's in Beloved. We must abandon the abstract, reined victim-survivor binary, the dialectic of false consciousness. We, as both individual persons and as the human community, must trace the line of fusion that connects our best things-our personhood before victimization and our human future beyond mere survival.

AT Freedom

Freedom is a necessary goal and tactic of human liberation that must be practiced in the now

Gibson 10 (Professor in postcolonial and African/a studies at Emerson, one of the leading figures in Fanon scholarship)
(Nigel C., Fanonian Presences in South Africa: From Theory and from Practice, in *Fanon and the Decolonization of Philosophy*, Pg. 236-7)

Whatever challenges the movement faces in the future, <u>the strength of the shack dwellers movement must be judged by its commitment to freedom and liberation</u>. The idea of freedom is central to "Living Learning." How could it not be, ~Jnce fifteen years after freedom was won there is no freedom for the poor? An Idea of freedom becomes necessary because of the daily situation<u>. The quest for freedom is the human response to the situation, the daily emergency, of millions of shack dwellers and rural dwellers in South Africa; it is a situation that de- mands freedom</u>. <u>This is</u> uncomplicated and <u>absolute</u>, in Fanon's sense, <u>a situation of life and death</u>. This world is un viable and therefore people must rebel: "Our world is burning and so we need another world.,,136 This absoluteness is expressed in the movement's uncompromising language of change: "There is a difference when the poor say another world is necessary and when civi I society says that another world is possible. We conclude to say that it is the formations of the poor and the grassroots that are the agency to make this other world come-not civil society."!" The emphasis on the concrete condition of the shack dwellers highlights the fact that the fundamental difference between pos- sibility and necessity turns on the importance of their own agency, In other words, <u>the necessity of another world in the here-and-now is something demanded by conscious agency, their thought and their action</u>. There is another philosophical point about necessity and freedom that Marx makes in Capital that has a resonance with the Living Learning discussion. Marx argues that freedom is not about imagining the possible but freedom only begins where necessity ends: "[t]he true realm of freedom, the development of human powers as an end in itself, begins beyond it, though it can only flourish with this realm of necessity as its basis.

The nature of freedom is also a complicated question. The answer devel- oped here is that it is the self-organization of the shack dwellers and the insis- tence on their own agency and intelligence-as force and reason for ~he recon- struction of societi39-that gives content to freedom. <u>Freedom</u> is not an abstraction. Its content <u>is generated out of the reality of "unfreedom."</u> In other words Abahlali do not need to hear a philosophic discourse on Freedom because 'they are already "professors of our own poverty." <u>Freedom "will come from becoming masters of our own history ... and from makmg our own paths Out of unfreedom</u>.,, <u>It is this vision of freedom as collective empowerment that transforms the struggle into one for a whole new society</u>. The struggle does. not demand greater technical efficiency from the state nor a change in the relationship between a community and the state, but rejects the states logic of freedom" which is limited to voting in exchange for "bits and pieces of service dell very" and argues instead that the state become subservient to poor people's needs. The participants are clear that:

We also see that our ideas about freedom go much further and deeper than the way our struggles arc presented when they arc described as "service delivery protest." If the heart of our struggle was just for houses and services to be deli- vered, we would be just like beggars with our hands out, waiting someone to help us- No, what we are struggling for, a real freedom, goes much further than that! 141

They insist, against the stunted and antipolitical language of the NGOs and hu- man rights organizations, that <u>freedom is not only the goal but must also be something that is practiced now in the day-to-day critical, democratic, open- ended</u>. <u>and praxis-based vision</u> that Fanon envisioned <u>would be needed to counter the degeneration of liberation</u>: "[w]e don't say that we in the movements are perfect, but at least we are opening these gates; at least we are on a right path to search for the truth. We have a deep responsibility to make sure that no-one can shut the gates." They stress that collective reflection on the experience of oppression and resistance is essential to that praxis: "[o]ur experience in life and in the movement means that we must always remain open to debate, question and new learning from and with the people." The point is not to tell the people what to think but

to create spaces that can enable people to discuss how and why they are not free. The notion is dialogic rather than hierarchical and relies on the "damned of the earth" speaking for themselves. As Fanon reminds us, the strug- gle for freedom aims for a fundamental change in social relations. After the con- flict, there is not only the disappearance of the unfreedom but also the unfree person.I'" It is praxis that enables the transcendence of unfreedom, transforming the system and individuals. That transcendence depends on breaking the mind forged manacles of unfreedom. 143

Fanon's visionary critique of postcolonial elite politics mapped out a "living politics" based on a decentralized and democratic form of self-governing which opens up new spaces for the politics of the excluded from the ground up is being practiced in "living learning." It is only a small beginning toward building coun- ter- hegemony from below that opens up spaces that fundamentally change the political status quo and contest the moral and intellectual narcissism of the rul- ing elites. Recently Fanon's conclusions to The Wretched of the Earth- with its challenge to Europe and its call to work out a "new humanism" based on the inclusion, indeed centrality, of the "enlightening and fruitful work" of nation building has been concretely rearticulated by S'bu Zikode of Abahlali: "[it] is one thing if we are beneficiaries who need delivery. It is another thing if we are citizens who want to shape the future of our cities even our country. It is another thing if we are human beings who have decided that it is our duty to humanize the world."!"

AT Humanism

[Insert after the Yancy card]

The human is contingent, rather than ontologically fixed

Lewis R. **Gordon** (Professor of Philosophy and African American Studies at UConn and one of the premier Fanon scholars in the world) **13**
(The Black Scholar, Vol. 43, No. 4, Special Issue: Role of Black Philosophy (Winter 2013), pp. 46-51)

The problem cannot be transformed, however, simply by making blacks the standard, especially since that history was not granted the opportunity to be interrogated on terms beyond conditions of white su- premacy and anti-black racism. The task, then, is to raise the standard of humanity by going through and beyond black, white, brown, yellow, and red to the conditions of standards themselves. Standards of the human, it soon becomes evident, are open and incomplete by virtue of depending for their creation on those whom they are supposed to evaluate. The human, in other words, is humanity's project, and we see that in the ever-expanding reach of culture as a condition of possibility of the materially human.

AT Humanism = Structural Violence

Adopting an ethic of revolutionary humanism is necessary to solve <u>global structural violence</u>, create an enabling language of revolutionary praxis and animate a material force for stealing hope

Pithouse (teaches politics at Rhodes University in Grahamstown, South Africa) **3**
(Richard, THAT THE TOOL NEVER POSSESS THE MAN: Taking Fanon's Humanism Seriously, Politikon: South African Journal of Political Studies, Volume 30, Issue 1, 2003)

<u>So what if Fanon is a humanist?</u> So what if, against the positivists, we discover that that means something in the world of lived experience? So what if Fanon developed a destalinized and dehistoricized radicalism before the post-structuralists? <u>Fanon is not an end in himself</u>. <u>We do no justice to his spirit by defending him while</u> Bush bombs Baghdad, <u>the World Bank reorganises the world</u> so that the poor can step up their subsidisation of the rich <u>and 600 of us die from a manageable disease every day</u>. Fanon didn't invest his energies in the defence of Toussaint l'Ouverture. He made history.

<u>Revolutionary humanism is the strongest current in the movement of movements that seek to subordinate the market, state and empire</u> to democratic control. In Seattle and Chiappas and Namada and Vrygrond ('Ons is nie fokken honde nie!') <u>humanism is the</u> spontaneous, universal and <u>enabling language of resistance</u>. And <u>it is at the core of the work</u> of the great essayists and scholars that <u>inspire</u> and are inspired in <u>this movement of movements. Humanism animates a material force that is</u> inventing and tending and <u>stealing hope</u>. This matters.

<u>Everywhere</u> – the media, the academy, trade unions, NGOs, government, business, social movements – <u>transcendent ideas</u> like The Market, The Leader, The Nation, Africa, International Norms, The Party, Economic Fundamentals, The Struggle, The Foreign Investor, uBuntu, The International Community, Competitiveness, Development and Professionalism <u>still slip in to thought</u>, so smoothly, <u>as easy justification for choices that inflict deprivation, suffering and death</u>. This matters.

We are so constrained by colonial Manicheanism that many of us think that we were born to take a side on the African potato vs. anti-retrovirals or Mugabe vs. the white farmers or Bush vs. Hussein; or that it is a crisis when white policemen set their dogs on black Mozambiqueans but that Lindela is just business. Business as usual. This matters. <u>Humanism is just a way of saying that everybody's right to self-creation matters. It isn't even a map. Its just a signpost. It only matters when we are lost</u>.

A posititve orientation towards history and the ideals of radical humanist freedom are key to global liberationist struggles. Only this can avert every major crisis of our times.

Karenga (Professor and Chair Department of Africana Studies California State University, Long Beach, activist and author, best known as the creator of Kwanzaa, was a major figure in the Black Power movement and co-founded the black nationalism organization US) **6**

(Maulana, Philosophy in the African Tradition of Resistance: Issues or Human Freedom a.nd Human Flourishing in Not Only The Master's Tools, pg. 242-5)

Surely, <u>we are at a moment of history fraught with</u> new and old fOnTIS of anxiety, <u>alienation</u>, and antagonism; <u>deepening poverty</u> in the midst of increasing wealth; proposals and practices of ethnic cleansing and <u>genocide;</u> <u>pandemic diseases</u>; increased plunder; <u>pollution and depletion of the environment; constant conflicts</u>, large and small; <u>and world-threatening delusions on the part of a superpower aspiring to a return to empire</u>, with spurious claims of the right to preemptive aggression, to openly attack and overthrow nonfavored and fragile

governments openly, and to seize the lands and resources of vulnerable peoples and establish "democracy" through military dictatorship abroad, all the while suppressing political dissent at home (Chang 2002; Cole et at. 2002). These anxieties are undergirded by racist and religious chauvinism, by the self-righteous and veiled references of these rulers to themselves as a kind of terrible and terrorizing hand of God, appointed to rid the world of evil (Ahmad 2002; Arnin 2001; Blum1995). At the same time, in this context of turmoil and terror and the use and threatened use of catastrophic weapons, there is the irrational and arrogant expectation that the oppressed will acquiesce, abandon resistance, and accept the disruptive and devastating consequences of globalization, along with the global hegemony it implies (Martin and Schumann 1997). There is great alarm among the white-supremicist rulers of these globalizing nations, given the metical resistance rising up against them, even as globalization'S technological, organizational, and economic capacity continues to expand (Barber 1996; Karenga 2002e, 2003a; Lusane 1997). There is great alarm when people who should "know" when they are defeated ridicule the assessment, re- fuse to be defeated or dispirited, and, on the contrary, intensify and diversify their struggles (Zepezauer 2002).

Certainly the battlefields of Palestine, Venezuela, long"suffering Haiti,and Chiapas, Mexico, along with other continuing emancipatory struggles everywhere, reaffirm the indomitable character of the human spirit and the durability and adaptive vitality of a people determined to be free, regardless of the odds and assessments against them. Indeed, they remind us that the motive force of history is struggle, informed by the ongoing quest for freedom, justice, power of the masses, and peace in the world. Despite "end of history" claims and single-super- power resolve and resolutions, these struggles continue. For still the oppressed want freedom, the wronged and injured want justice, the people want power over their destiny and daily lives, and tbe world wants peace. And all over the world-especially in this U.S. citadel of aging capitalism with its archaic dreams of empire-clarity in the analysis of issues, and in the critical determination of tasks and prospects, requires the deep and disciplined reflection dlaracteristic of the personal and social practice we call philosophy.

But this sense of added urgency for effective intervention is prompted not only by the critical juncture at which we stand but also by an awareness of our long history of resistance as a people, because in our collective strivings and social struggles we seek a new future for our people, our descendants, and the world. Joined also to these conditions and considerations is the compelling character of our self-understanding as a people, as a moral vanguard in this country and the world. For we have launched, fought, and won with our allies struggles that not only have expanded the realm of freedom in this country and the world but also have served as an ongoing inspiration and a model of liberation struggles for other marginalized and oppressed peoples and groups throughout the world. Indeed, they have borrowed from and built on our moral vocabularyand moral vision, sung our songs of freedom, and held up our struggle for liberation as a model to emulate. Now, self-understanding and self-assertion are dialectically linked. In other words, how we understand ourselves in the world determines how we assert ourselves in the world. Thus, an expansive concept of ourselves as Africans-continental and diasporan-and as Africana philosophers forms an essential component of our sense of mission and the urgency with which we approach it.

It is important to note that I have conceived and written this chapter within the framework of Kausaida ph.ilosoph.y (Karenga 1978, 1980, 1997)K.awaida is a philosophic initiative that was forged in the crucible ofi deological and practical struggles around issues of freedom, justice, equalitys, self-determination, conullunal power, self-defense, pan~African- ism, coalition and alliance, Black Studies, intellectual emancipation, and cultural recovery and reconstlouction. It continued to develop in the midst of these ongoing struggies within the life of the mind and stmggles iottbtn the life of the people, as well as within the context of the conditions of the world. Kawaida is defined as an ongoing synthesis of the best of African thought and practice in constant exchange tuttb tl3e 'U)()ltd. It characterizes culture as a unique, instruc- tive,a nd valuable way of being human in the world-as a foundation and framework for self-understanding and self-assertion.

As a philosophy of culture and struggle, Kawaida maintains that <u>our intellectual and social practice</u> as Nricana activist scholars <u>must be undergirded and informed by ongoing efforts to (1) ground our- selves in our own culture; (2) constantly recover, reconstruct, .and bring forth from our culture the best of what it means to be African and human in the fullest sense</u>; (3) speak this special cultural truth to the world and (4) <u>use our culture to constantly make our own unique contribution to the reconception and reconstruction of this country, and to the forward flow of human history</u>.

AT Humanism Kills Resistance

Black resistance is a profoundly positive and human act
Yancy (Prof of Philosophy at Duqesne) **8**

(George, Black Bodies, White Gazes: The Contining Significance of Race, Pg. 111-2) [**Italics original** – DQ]

The significant point here is that the needed slippage did occur; indeed, <u>the Black body's history in the "New World" has been a history of resistance</u>. This history does not deny the Black body's history of self-hatred, its passing for white, and its history of accommodation, In other words, "resistance is cardinal and crucial to any description, definition, and interpretation of African American culture,,,. [That culture] in its full substance and scope is more complex than a singular thrust in the monodirection of resistance,"'
<u>Despite the power of white discursive disciplinary control and physical brutality, the Black body has historically disrupted the reduction of its being to that of a **thing**</u>, To comprehend the Black body as a site of resistance, <u>it is important to understand that the body "is not what it is and it is not yet what it will become,"</u>[10] In short, <u>the Black body (as with the white body) is a **process**</u>, It might be argued that the Black body/embodied Black existence in relation to the white gaze is ontologically excessive, something more than the white gaze is capable of nullifying through its power, Of course, <u>to refer to the Black body as a site of resistance, I am referring to Black **embodied** existence as **socially situated**, that perspective from which the embodied self is capable of recognizing the possibility of reconfiguring or overcoming a set of circumstances</u>. Resistance is linked to a level of comprehension of one's social conditions and not simply a question of psychological renewal. Resistance involves seeing through the "impersonal" discursive practices of whites, rejecting the "naturelike" constructions of social reality that threaten Blacks' lives, and transforming the debilitating psyche and the physical conditions in terms of which they have been imprisoned," As Paget Henry notes, "Agency against these normative and institutional structures requirefs] the decoding of their impersonal, nature-like appearance and their rewriting in codes that reveal their roots in ordinary communication and social action," Indeed, Black resistance is a form of decoding of the ideological prison house of racist discourse, a discourse that "operates in the name of values" that valorize whiteness and dehumanize Black people.[13] Of course, such values assume the status of neutrality so as to appear natural.

> I argue that <u>Black resistance</u>, as a mode of decoding, <u>is simultaneously a process of recoding Black embodied existence through processes of opposition and **affirmation**</u>. According to bell hooks, "<u>Opposition is not enough, In that vacant space after one has resisted there is still the necessity to become-to make oneself anew</u>."[14] While I agree with hooks's claim that opposition is certainly not enough, I question her thesis that there is a "vacant space after one has resisted," Indeed, I argue that resistance can occupy that "vacant space" and that the process of becoming and making oneself anew has already been enacted, though time is certainly needed to nourish and further develop the process of becoming and remaking the self anew, Rather than asking what exists on the other side of resistance, one might explore the affirmative dimensions of what is already embedded within resistance itself, The moment of *resistance,* in other words, *is* the moment of *becoming,* of being made *anew.* And while "human transcendence always involves becoming.,,, self-creation for an oppressed people whose transcendence is denied often finds its founding moments in resistance,"[15]
> Within a context where Black bodies are constantly under discursive and physical erasure, to resist *{re-sistere),* "to take a stand," is linked, existentially, to taking up a different *project,* that is, not settling for an antiblack project superimposed by the white other, <u>Resisting is not simply limited to saying "No, I refuse!" It is not simply a negative process</u>. <u>Resistance is an instantiation of affirmation</u>. Within the context of white mythmaking regarding the docility and subhumanity of the Black body and the refusal to grant the Black body a perspective on the world, <u>taking a stand demonstrates and affirms the existential and ontological force of having a perspective, a subjectivity.</u> Indeed, the moment of Black resistance calls into question the philosophical anthropological assumptions of white racism, assumptions that deny the reality and complexity of Black self-determination, self-reflexivity, and

interiority. <u>Black resistance, then, is a profoundly embodied **human** act of epistemological re-</u><u>cognition, an affirmation that carries with it an ontological repositioning of the being of Black</u> <u>embodiment as a significant site of</u> discursive (and material) <u>self-possession.</u>

AT Survival

The political significance of humanity is both terrible and terribly important. Though the concept of humanity makes us guilty, it also is a pre-requisite for a politics that can fight atrocity.

Hannah **Arendt 3** [*The Portable Hannah Arendt* p. 155]

For many years now we have met Germans who declare that they are ashamed of being Germans. I have often felt tempted to answer that I am ashamed of being human. This elemental shame, which many people of the most various nationalities share with one another today, is what finally is left of our sense of international solidarity; and it has not yet found an adequate political expression. Our fathers' enchantment with humanity was of a sort which not only light-mindedly ignored the national question; what is far worse, it did not even conceive of the terror of the idea of humanity and of the Judeo-Christian faith in the unitary origin of the human race. It was not very pleasant even when we had to bury our false illusions about "the noble savage," having discovered that men were capable of being cannibals. Since then people have learned to know one another better and have learned more and more about the evil potentialities in men. The result is that they have recoiled more and more from the idea of humanity and they become more susceptible to the doctrine of race, which denies the very possibility of a common humanity. They instinctively felt that the idea of humanity, whether it appears in a religious or humanistic form, implies the obligation of a general responsibility which they do not wish to assume. For the idea of humanity, when purged of all sentimentality, has the very serious consequence that in one form or another mean must assume responsibility for all crimes committed by men and that all nations share the onus of evil by all others. Shame at being a human being is the purely individual and still non-political expression of this thought. In political terms, the idea of humanity, excluding no people and assigning a monopoly of guilt to no one, is the only guarantee that one "superior race" after another may not feel obligated to follow the "natural law of the right of the powerful, and exterminate "inferior races unworthy of survival"' so that at the end of an "imperialistic age" we should find ourselves in a stage which would make the Nazis look like crude precursors of future political methods. To follow a non-imperialistic policy and maintain a non-racist faith becomes daily more difficult because it becomes daily clearer how great a burden mankind is for man. Perhaps those Jews, to whose forefathers we owe the first conception of the idea of humanity, knew something about the burden when each year they used to say "Our Father and King, we have sinned before you," taking not only the sins of their own community but all human offenses upon themselves. Those who today are ready to follow this road in a modern version do not content themselves with the hypocritical confession "God be thanked, I am not like that," in horror at the undreamed-of-potentialities of the German national character. Rather, in fear and trembling, have they finally realized of what man is capable—and this is indeed the precondition of any modern political thinking. Such persons will not serve very well as functionaries of vengeance. This, however, is certain: Upon them and only upon them, who are filled with a genuine fear of the inescapable guilt of the human race, can there be any reliance when it comes to fighting fearlessly, uncompromisingly, everywhere against the incalculable evil that men are capable of bringing about.

Prag

Framing

Can't separate the question of the desirability of the end of the world or that imagination from the question of how we achieve that

Glaude (Professor of Religion and African American Studies, Department of Religion, and Chair, Center for African American at Princeton) **7**
(EDDIE S. GLAUDE JR., In a Shade of Blue: Pragmatism and the Politics of Black America, Pg. 8-9)

Pragma is Greek for things, facts, deeds, affairs. Pragmatists hold the view that our practice is primary. Knowledge, for example, does not re- quire, in the pragmatist view, philosophical foundations in direct per- sonal awareness. Instead, it is bound up in culture, society, and history, results, in part, from our doings and sufferings, our ability or inability to secure desired aims in a somewhat hostile environment. The good pragmatist, in the end, seeks to avoid dogmas that settle matters prior to experience and calls us to see the ethical import of our actions— that what we believe about the world has ethical significance and that what we do has ethical implications for how we will live our lives. C. I. Lewis best cap- tures this view of pragmatism: "At bottom, all problems are problems of conduct; all judgments are implicitly judgments of value; that as there can be ultimately no valid distinction between the theoretical or practical, so there can be no final separation of questions of truth of any kind from questions of the justifiable ends of actions."

Ths book attempts to show that pragmatism can help to address some of the more challenging dimensions of contemporary African American politics. But I maintain that, it first ought to undergo a reconstruction of sorts. Pragmatism must be made to sing the blues. In chapter, I argue that, contrary to standard accounts, John Dewey's reconstruction of moral experience insists on the tragic dimensions of our moral lives: we are consistently confronted with competing values that often require that some good or value is butchered. I then put Deweyin conversation with one of America's greatest writers, Toni Morrison. Dewey indeed has re- sources capable of addressing what Stanley Cavell describes as the work of mourning- but my reading of Morrison aims to reconstruct those re- sources in light of the racialized experiences that haunt American life. What might it mean to think of the tragic in the contest of those black persons forced to force a self amid the absurdities of a society still fundamentally committed to racist practices? I suggest that Morrison's novel exemplifies what it means to hold a pragmatic view of the tragic that takes seriously the ofte brutal realities of white supremacy. Morrison then teaches Dewey a lesson about race, American democracy, and the often tragic choices imposed on this country's darker citizens. The chapter thus opens the way for a more sustained encounter between pragmatism as I understand it and African American political life.

Chapters 2, 3 and 4 examine how pragmatism might aid us in rethinking the various ways appeals to black identity, history and agency impact and form content of African American political activity. Too often such appeals settle political matters beforehand. Black history, for some, constitutes a reservoir of meaning that predetermines our orientation to problem, irrespective of their particulars and black agency is imagined from the start as bound up an emancipatory politics. When identity is determined by way of reference to a fixed racial self, the complexity of African American life is denied. Moreover, the actual moral dilemmas. African American face reduced to a crude racial calculus in which the answers are somehow genetically or culturally encoded.

No Black Only Movement

Black only movements can't generate steam – too many internal and external social cleavages

Dawson (Professor of Political Science and Director of the Center for the Study of Race, Politics and Culture at the University of Chicago) **1**

(Michael C., BLACK VISIONS The Roots of Contemporary African-American Political Ideologies, pg. 318-9)

An additional consequence of the conditions which face black activists is that most blacks still believe that Wright was bitterly prophetic when he stated (in the epigraph that opens the chapter) that America lacks commit- ment to racial equality. Remember that 65 percent of African Americans during the middle 1990s believed that racial progress in America would ei- ther not be achieved in their lifetime or would never be achieved at all. By late 2000 this percentage had climbed to 71percent (from data compiled by the author). In the face of this level of disillusionment, black activists and ideologues face three additional extremely daunting problems, First, the changes in the political economy of the black community mean that con- ditions are dramatically worsening for some black Americans but improv- ing for others, This has led not just to growing class divisions. As Cohen (1999) details, among others, these divisions are not confined to ones of class; black politics is fracturing along the many lines of social cleavage. The result, claims Marable (as I did in my earlier work), is that "many of the social, economic, and cultural linkages which previously connected various social classes and organizations began to erode" (Marable and Mullings 1995,204; see also Dawson 1994a). These bridging organizations have been undermined in many cases by having to cope with a hostile po- litical environment and occasionally by the self-interested strategies chosen by their leaders. Political unity, which has been achieved in the past even without ideological unity, will be increasingly difficult to achieve given the class, gender, and generational divisions that are becoming increasingly prominent. Second, the rest of country has moved much more profoundly to the right than the black community, leaving a political environment and establishment that is hostile even to just claims of either racial or economic redistribution and justice, Third, the growing magnitude of problems fac- ing the black community and the simultaneous dwindling of political op- portunities has led to widespread dissatisfaction with the racial status quo and significant dissatisfaction with the economic status quo, The result has been a resurgence in both nationalism and liberal disillusionment that makes it more difficult to build political movements and coalitions, both within the black community and between the black community and other communities.

Unitary Identity Fails

Movements based on unitary black ID fails

Glaude (Professor of Religion and African American Studies, Department of Religion, and Chair, Center for African American at Princeton) **7**
(EDDIE S. GLAUDE JR., In a Shade of Blue: Pragmatism and the Politics of Black America, Pg. 129-30)

Katrina revealed that the many challenges confronting black America require an imaginative and immediate shift in our political lexicon-that our traditional "vocabularies of struggle" require recalibration in light of the particular conditions of our current circumstances. This effort goes far beyond the narrow debate between those who would deny or accept the relevance of race to political matters. The question instead is how we address the actual problems African American communities confront, realizing that those communities fracture and fragment in varying ways and along different fault lines. What are our mobilizing tropes in light of this differentiation? How do they inspire us to respond passionately and intelligently to the problems at hand? Of course, these questons require a closer examination of what we mean by "our" and "us"; Katrina, after all, revealed the extraordinary class cleavages among African Americans.

I have tried to show on pragmatic grounds, that there are ways to imagine "us" without falling into the trap of racial essentialism or succumbing to what Adolph Reed rightly "decries as a misguided view of corporate racial interests. My aim has been to turn our the actual "doings and sufferings" of black folk. There we find richly textured experiences that trouble any reductive account of the lives of African Americans. Time and again, appeals to racial identity and unity, or to notions of black history and agency, have masked, often to the detriment of the most vulnerable, the competing interests informing the political and moral choices of African Americans. Competing interests are ignored in favor of racial politics that presumes, dangerously, that black individuals see themselves as necessarily in solidarity with other black individuals solely on the ban of race. This assumption, more often than not, results in a form of racial politics that relies heavily on a set of tropes that signal to those willing to listen that black interests, whatever they may be, are in jeopardy. We need only invoke the images of our past, or the many persons who gave their lives in the struggle for black freedom, to orient ourselves appropriately to any political matter. For some, these tropes stand in for democratic deliberation; they, in effect, do our thinking for us. But such invocations blind us to a crucial insight:
that democratic and participatory value must be the cornerstone of credibility for the notion of black politics; group consensus must be constructed through active participation. Even then, it is inmportant to realize that often there will be no universal racial consensus on key issues; that some conflicts derive from irreconcilable material differences. Unity is always on specific terms and in pursuit of specific objectives.
By my pragmatic lights, African American politics, if they are to be genuinely democratic, must, like the nation in general, embrace the full complexity of the racialized experiences of black folk and not succumb to what I termed in chapter 3 the descripdve, theoretical and existential problematic). That complexity will give the lie to any facile racial politics that fails to exemplify the black democratic energies necessary for a fundamental transformation in this nation.

These difference are real and matter as much as racial identification – other IDs can supercede Blackness

hooks (Distinguished Professor in Residence at Barea) **12**
(bell, Writing Beyond Race: Living Theory and Practice, Pg. 2-3)

Public discourses about race and gender did create new ways of thinking and knowing. Talking about class and the various ways class differences separate groups has been much harder. Class standing and status tend frequently to link us more intimately to the dominant economic system and its concomitant hierarchies, For

example: it is much more likely that a white person will bond with a black person when the two share a common class lifestyle, It is less likely that a materially prosperous person will establish a mutual bond with someone who is poor and indigent. One of the most difficult and delicate subjects to discuss among African Americans is the reality of class differences and of class difference among us. The central position race has occupied in our political discourse has often obscured the way in which class differences disrupt notions of racial unity. And yet, today, class differences coupled with racial integration have created a cultural context where the very meaning of blackness and its impact on our lives differs greatly among black people. There is no longer a common notion of shared black identity.

In other words, a sense of shared identity is no longer a platform that can draw folks together in meaningful solidarity. Along with class, gender issues and feminist awareness have served to place black folks in different camps, creating conflicts that can only be resolved through education for critical consciousness. There is also the reality of changing religious practices. There was a time in our nation when it was just assumed that every black person was a Christian or at least coming from a Christian background. This is simply no longer the case. Black children today have diverse religious practices. Some are raised in Muslim and Buddhist traditions with no understanding of Christian beliefs. And more young black people than ever before choose no religious practice at all. Hence the shared theological language that once served as a basis of communication and bonding can no longer be assumed.

Impact D

AT Ethics

Every individual has an ethical imperative to recognize not only themselves and each other as responsible <u>human agents rather than as objects</u>. Their call for an immediate inversion of our internal ethical imperatives is a destructive overreading of Fanon's pessimism that refuses to allow human freedom and responsibility as a telos for politics, especially in the tactical short term.

We are called to do battle for the creation of a human world, using all possible revolutionary tactics. Freedom and responsibility are not just an ethically neutral description of the human condition. They are also a positive ethical position

Pithouse (teaches politics at Rhodes University in Grahamstown, South Africa) **1**

(Richard, FRANTZ FANON AND THE PERSISTENCE OF HUMANISM, from Protest and Engagement: Philosophy After Apartheid at an Historically Black South African University

http://www.crvp.org/book/Series02/II-7/chapter_i.htm)

Fanon's thought is clearly existentialist in that he shares, with other existentialist thinkers like Jean-Paul Sartre, a belief that <u>the human condition is to be free – in the sense that existence precedes essence – and to be fully responsible for the exercise of that freedom</u>. The nature of that freedom lies in the capacity to choose and to act – to create within the context of the unchosen facts in response to which we negotiate our lives – facticity in existential discourse. So, for example, Fanon insists that: '<u>the body of history does not determine a single one of my actions. I am my own foundation.</u>" (1967:231) <u>Denial of that freedom is considered to be self-deception</u> – bad faith – <u>and is</u>, clearly<u>, considered as an ethical failure</u> by Fanon. So, for example, he argues that "Every one of my acts commits me as a man. Everyone of my silences, every one of my cowardices reveals me as a man." (1967:88-89) Two of the more important examples of bad faith mentioned by Fanon are denial of the embodied nature of existence and denial of the humanity of the Other. The embodied nature of existence is obviously important in the context of racism. And, indeed, Fanon, in the chapter from *Black Skin White Masks* titled *The Fact of Blackness* reproached Sartre on the grounds that: "Jean-Paul Sartre had forgotten that the Negro suffers in his body quite differently from the white man." (1967:138) <u>In the context of anti-black racism, blackness becomes a stark reality in the social world</u>. To deny it is bad faith.

It is also vitally important in the context of the bodily needs that must be met if the body is to survive and be healthy and so allow consciousness to survive and flourish. So, <u>while it is important to recognise that a man in prison is free to choose how to respond to the fact of his imprisonment, it is also important to acknowledge that human beings are not pure consciousness and that</u>, therefore, <u>a full understanding of freedom must include some recognition of the needs of the bod</u>y. There is a clear recognition of this throughout Fanon's work – from *Black Skin White Masks* through to *The Wretched of the Earth*. He takes somatic well-being very seriously. But the recognition of the importance of embodiment does not mean that the body is always prior to consciousness in value. Clearly, consciousness cannot survive without the body, but Biko, who would be considered a hero in existentialist terms, put his body on the line to defend the integrity of his consciousness.

There is also an important connection between embodiment and the other. As Lewis Gordon explains: "The human being is at least three perspectives of embodiment: the perspective from a standpoint in the world; the perspective seen from other standpoints in the world; and the human being is a perspective that is aware of itself being seen from other standpoints in the world." (1995:19) <u>For Fanon it is imperative that human beings recognise not only themselves but also each other as human – as agents who are free/responsible and expansive rather</u>

than as objects who are determined/not responsible and contained. "I do battle" he says "for the creation of a human world – that is, of a world reciprocal of recognition." (1967:219) Fanon's central concerns – a desire to avoid bad faith in general and a particular desire to avoid the objectification of human beings – leads to a short but clear statement of his basic (existential humanist) ethical position: "I have one right alone: That of demanding human behaviour from the other. One duty alone: that of not renouncing my freedom through my choices." (1967:229) So, for Fanon freedom and responsibility are not just an ethical neutral description of the human condition. They are also a positive ethical position. It is an ethics which takes truth as fundamental, not received truth or any form of doxa, but rather truth as an honest examination of one's self and the world. For Fanon the humanity of man is the truth and so inhumanity must either be founded on conscious lies, a failure to face up to the truth or sheer, conscious contempt for humanity. But, because even in the latter case contempt for humanity will often mask itself, an inhuman society is a society in which "everyday reality is a tissue of lies, of cowardice, of contempt for man." (1967 b:52)

This commitment to truth is not the reactionary humanism that presents some normalising orthodoxy/ideology as the essence of what it is to be human. This is a humanism that returns to the truth of the experiences of individual human beings – to immanence.

Affirming the power to make ethical prescriptions and alter the world is possible and crucial to agency and counter-hegemonic praxis. The black human is not a contradiction and its ontological position can be altered

Yancy 13

(George, Introduction: Black Philosophy and the Crucible of Lived, The Black Scholar, Vol. 43, No. 4, Special Issue: Role of Black Philosophy (Winter 2013), pp. 5-10)

Black philosophy and its role are funda- mentally linked with existential struggle. The lived experiences of struggle and resistance (etymologically, "to take a stand") speak to the fact that the social ontological structure of the world is not a metaphysical fait accompli. Black philosophy acknowledges its historical conditionality and emergence against the backdrop of white racism, vio- lence, colonialism, dehumanization, en- slavement, oppression, and objectification. It recognizes this backdrop as constituted through lived embodiment and configurations of thought and action that were not necessary, but that are predicated upon contingent sites of power and hegemony that are linked to oppressive ideologies and the possession of material power to superimpose such oppressive ideologies. Hence, relevant to black philosophy is its clarion call: "The world is not as it ought to be!"

It is the power of "ought" that points to the openness of human history, agency, and counter-hegemonic praxis. The "ought" implies slippage, excess, lacunae, and the capacity to create. The subtext here is that one can reconfigure the world, reshape its direction, undo its normative repetitions, and create new and ever freeing forms of political formation, relationality, and performance. [Italics in original article – DQ] The role of black philosophy, then, having its point of origin within a matrix of oppression, even as this oppression was/is diasporic, is antagonistic and iconoclastic; indeed, resis- tant to claims of philosophical universality that are actually forms of discourse that are predicated upon a philosophical anthropol- ogy that is, in this case, underwritten by whiteness as the transcendental norm and that valorizes its vision of the world and the meaning of humanity at the exclusion of others. Hence, to engage in black philosophy on conceptual terms set forth here is to affirm one's humanity in the face of those who deem you a sub-person, ersatz, ontologically nugatory.

AT Libidinal Econ

Their insidious targeting arg relies on the libidinal economy which is wrong and cannot be the foundation for ethics or the political

Gordon 1

(Paul, psychotherapist living and working in London **Psychoanalysis and Racism**: The politics of defeat Race & Class v. 42, n. 4)

The postmodernists' problem is that they cannot live with disappointment. All the tragedies of the political project of emancipation ± the evils of Stalinism in particular ± are seen as the inevitable product of men and women trying to create a better society. But, rather than engage in a critical assessment of how, for instance, radical political movements go wrong, they discard the emancipatory project and impulse itself. The postmodernists, as Sivanandan puts it, blame modernity for having failed them: `the intellectuals and academics have fled into discourse and deconstruction and representation ± as though to interpret the world is more important than to change it, as though changing the interpretation is all we could do in a changing world'.58 To justify their flight from a politics holding out the prospect of radical change through self-activity, the disappointed intellectuals and abundant intellectual alibis for themselves in the very work they champion, including, in Cohen's case, psychoanalysis. What Marshall Berman says of Foucault seems true also of psychoanalysis; that it offers `a world-historical alibi' for the passivity and helplessness felt by many in the 1970s, and that it has nothing but contempt for those naive enough to imagine that it might be possible for modern human-kind to be free. At every turn for such theorists, as Berman argues, whether in sexuality, politics, even our imagination, we are nothing but prisoners: there is no freedom in Foucault's world, because his language forms a seamless web, a cage far more airtight than anything Weber ever dreamed of, into which no life can break . . . There is no point in trying to resist the oppressions and injustices of modern life, since even our dreams of freedom only add more links to our chains; however, once we grasp the futility of it all, at least we can relax.59 Cohen's political defeatism and his conviction in the explanatory power of his new faith of psychoanalysis lead him to be contemptuous and dismissive of any attempt at political solidarity or collective action. For him, `communities' are always `imagined', which, in his view, means based on fantasy, while different forms of working-class organisation, from the craft fraternity to the revolutionary group, are dismissed as `fantasies of self-sufficient combination'.60 In this scenario, the idea that people might come together, think together, analyse together and act together as rational beings is impossible The idea of a genuine community of equals becomes a pure fantasy a `symbolic retrieval' of something that never existed in the first place: `Community is a magical device for conjuring something apparently solidary out of the thin air of modern times, a mechanism of re-enchantment.' As for history, it is always false, since `We are always dealing with invented traditions.'61 Now, this is not only non-sense, but dangerous nonsense at that. Is history `always false'? Did the Judeocide happen or did it not? And did not some people even try to resist it? Did slavery exist or did it not, and did not people resist that too and, ultimately, bring it to an end? And are communities always `imagined'? Or, as Sivanandan states, are they beaten out on the smithy of a people's collective struggle? Furthermore, all attempts to legislate against ideology are bound to fail because they have to adopt `technologies of surveillance and control identical to those used by the state'. Note here the Foucauldian language to set up the notion that all `surveillance' is bad. But is it? No society can function without surveillance of some kind. The point, surely, is that there should be a public conversation about such moves and that those responsible for implementing them be at all times accountable. To equate, as Cohen does, a council poster about `Stamping out racism' with Orwell's horrendous prophecy in 1984 of a boot stamping on a human face is ludicrous and insulting. (Orwell's image was intensely personal and destructive; the other is about the need to challenge not individuals, but a collective evil.) Cohen reveals himself to be deeply ambivalent about punitive action against racists, as though punishment or other firrm action against them (or anyone else transgressing agreed social or legal norms) precluded `understand- ing' or even help through psychotherapy. It is indeed a strange kind of `anti-racism' that portrays active racists as the `victims', those who are in need of `help'. But this is where Cohen's argument ends up. In their move from politics to the academy and the world of `discourse', the postmodernists may have simply exchanged one grand narrative, historical materialism, for another, psychoanalysis.62 For psychoanalysis is a grand narrative, par excellence. It is a theory that seeks to account for the world and which recognises few limits on its explanatory potential. And the claimed radicalism of psycho- analysis, in the hands of the postmodernists at least, is not a radicalism at all but a prescription for a politics of quietism, fatalism and defeat. Those wanting to change the world, not just to interpret it, need to look elsewhere.

Libidinal economy doesn't explain violence

Havi **Carel 6**, Senior Lecturer in Philosophy at the University of the West of England, "Life and Death in Freud and Heidegger", googlebooks

Secondly, the constancy principle on which these ideas are based is incompatible with observational data. Once the passive model of the nervous system has been discarded, there was no need for external excitation in order for discharge to take place, and more generally, "the behavioural picture seemed to negate the notion of drive, as a separate energizer of behaviour" {Hcbb. 1982. p.35}. According to Holt, the nervous system is not passive; it does not take in and conduct out energy from the environment, and it shows no tendency to discharge its impulses. 'The principle of constancy is quite without any biological basis" (1965, p. 109). He goes on to present the difficulties that arise from the pleasure principle as linked to a tension-reduction theory. The notion of tension is "conveniently ambiguous": it has phenomenological, physiological and abstract meaning. But empirical evidence against the theory of tension reduction has been "mounting steadily" and any further attempts to link pleasure with a reduction of physiological tension are "decisively refuted" (1965, pp. 1102). Additionally, the organism and the mental system are no longer considered closed systems. So the main arguments for the economic view collapse, as does the entropic argument for the death drive (1965, p. 114). A final, more general criticism of Freud's economic theory is sounded by Compton, who argues, "Freud fills in psychological discontinuities with neurological hypotheses" (1981, p. 195). The Nirvana principle is part and parcel of the economic view and the incomplete and erroneous assumptions about the nervous system (Hobson, 1988, p.277). It is an extension ad extremis of the pleasure principle, and as such is vulnerable to all the above criticisms. The overall contemporary view provides strong support for discarding the Nirvana principle and reconstructing the death drive as aggression.

No empirical basis for scaling up psychoanalysis

Epstein, senior lecturer in government and IR – University of Sydney, **'10**

(Charlotte, "Who speaks? Discourse, the subject and the study of identity in international politics," European Journal of International Relations XX(X) 1–24)

One key advantage of the Wendtian move, granted even by his critics (see Flockhart, 2006), is that it simply does away with the level-of-analysis problem altogether. If states really are persons, then we can apply everything we know about people to understand how they behave. The study of individual identity is not only theoretically justified but it is warranted. This cohesive self borrowed from social psychology is what allows Wendt to bridge the different levels of analysis and travel between the self of the individual and that of the state, by way of a third term, 'group self', which is simply an aggregate of individual selves. Thus for Wendt (1999: 225) 'the state is simply a "group Self" capable of group level cognition'. Yet that the individual possesses a self does not logically entail that the state possesses one too. It is in this leap, from the individual to the state, that IR's fallacy of composition surfaces most clearly. Moving beyond Wendt but maintaining the psychological self as the basis for theorizing the state Wendt's bold ontological claim is far from having attracted unanimous support (see notably, Flockhart, 2006; Jackson, 2004; Neumann, 2004; Schiff, 2008; Wight, 2004). One line of critique of the states-as-persons thesis has taken shape around the resort to psychological theories, specifically, around the respective merits of Identity Theory (Wendt) and SIT (Flockhart, 2006; Greenhill, 2008; Mercer, 2005) for understanding state behaviour.9 Importantly for my argument, that the state has a self, and that this self is pre-social, remains unquestioned in this further entrenching of the psychological turn. Instead questions have revolved around how this pre-social self (Wendt's 'Ego') behaves once it encounters the other (Alter): whether, at that point (and not before), it takes on roles prescribed by pre-existing cultures (whether Hobbesian, Lockean or Kantian) or whether instead other, less culturally specific, dynamics rooted in more universally human characteristics better explain state interactions. SIT in particular emphasizes the individual's basic need to belong, and it highlights the dynamics of in-/out-group categorizations as a key determinant of behaviour (Billig, 2004). SIT seems to have attracted increasing interest from IR scholars, interestingly, for both critiquing (Greenhill, 2008; Mercer, 1995) and rescuing constructivism (Flockhart, 2006). For Trine Flockart (2006: 89–91), SIT can provide constructivism with a different basis for developing a theory of agency that steers clear of the states-as-persons thesis while filling an important gap in the socialization literature, which has tended to focus on norms rather than the actors adopting them. She shows that a state's adherence to a new norm is best understood as the act of joining a group that shares a set of norms and values, for example the North Atlantic Treaty Organization (NATO). What SIT draws out are the benefits that accrue to the actor from belonging to a group, namely increased self-esteem and a clear cognitive map for categorizing other states as 'in-' or 'out-group' members and, from there, for orientating states' self–other relationships. Whilst coming at it from a stance explicitly critical of constructivism, for Jonathan Mercer (2005: 1995) the use of psychology remains key to correcting the systematic evacuation of the role of emotion and other 'non-rational' phenomena in rational choice and behaviourist analyses, which has significantly impaired the understanding of international politics. SIT serves to draw out the emotional component of some of the key drivers of international politics, such as trust, reputation and even choice (Mercer, 2005: 90–95; see also Mercer, 1995). Brian Greenhill (2008) for his part uses SIT amongst a broader array of psychological theories to analyse the phenomenon of self–other recognition and, from there, to take issue with the late Wendtian assumption that mutual recognition can provide an adequate basis for the formation of a collective identity amongst states. The main problem with this psychological turn is the very utilitarian, almost mechanistic, approach to non-

rational phenomena it proposes, which tends to evacuate the role of meaning. In other words, it further shores up the pre-social dimension of the concept of self that is at issue here. Indeed norms (Flockhart, 2006), emotions (Mercer, 2005) and recognition (Greenhill, 2008) are hardly appraised as symbolic phenomena. In fact, in the dynamics of in- versus out-group categorization emphasized by SIT, language counts for very little. Significantly, in the design of the original experiments upon which this approach was founded (Tajfel, 1978), whether two group members communicate at all, let alone share the same language, is non-pertinent. It is enough that two individuals should know (say because they have been told so in their respective languages for the purposes of the experiment) that they belong to the same group for them to favour one another over a third individual. The primary determinant of individual behaviour thus emphasized is a pre-verbal, primordial desire to belong, which seems closer to pack animal behaviour than to anything distinctly human. What the group stands for, what specific set of meanings and values binds it together, is unimportant. What matters primarily is that the group is valued positively, since positive valuation is what returns accrued self-esteem to the individual. In IR Jonathan Mercer's (2005) account of the relationship between identity, emotion and behaviour reads more like a series of buttons mechanically pushed in a sequence of the sort: positive identification produces emotion (such as trust), which in turn generates specific patterns of in-/out-group discrimination. Similarly, Trine Flockhart (2006: 96) approaches the socializee's 'desire to belong' in terms of the psychological (and ultimately social) benefits and the feel-good factor that accrues from increased self-esteem. At the far opposite of Lacan, the concept of desire here is reduced to a Benthamite type of pleasure- or utility-maximization where meaning is nowhere to be seen. More telling still is the need to downplay the role of the Other in justifying her initial resort to SIT. For Flockhart (2006: 94), in a post-Cold War context, 'identities cannot be constructed purely in relation to the "Other"'. Perhaps so; but not if what 'the other' refers to is the generic, dynamic scheme undergirding the very concept of identity. At issue here is the confusion between the reference to a specific other, for which Lacan coined the concept of *le petit autre*, and the reference to *l'Autre*, or Other, which is that symbolic instance that is essential to the making of *all* selves. As such it is not clear what meaning Flockhart's (2006: 94) capitalization of the 'Other' actually holds. The individual self as a proxy for the state's self

Another way in which the concept of self has been centrally involved in circumventing the level-of-analysis problem in IR has been to treat the self of the individual as a proxy for the self of the state. The literature on norms in particular has highlighted the role of individuals in orchestrating norm shifts, in both the positions of socializer (norm entrepreneurs) and socializee. It has shown for example how some state leaders are more susceptible than others to concerns about reputation and legitimacy and thus more amenable to being convinced of the need to adopt a new norm, of human rights or democratization, for example (Finnemore and Sikkink, 1998; Keck and Sikkink, 1998; Risse, 2001). It is these specific psychological qualities pertaining to their selves (for example, those of Gorbachev; Risse, 2001) that ultimately enable the norm shift to occur. Once again the individual self ultimately remains the basis for explaining the change in state behaviour. To summarize the points made so far, whether the state is literally considered as a person by ontological overreach, whether so only by analogy, or whether the person stands as a proxy for the state, the 'self' of that person has been consistently taken as the reference point for studying state identities. Both in Wendt's states-as-persons thesis, and in the broader psychological turn within constructivism and beyond, the debate has consistently revolved around the need to evaluate which of the essentialist assumptions about human nature are the most useful for explaining state behaviour. **It has never questioned the validity of starting from these assumptions in the first place.** That is, what is left unexamined is this assumption is that what works for individuals will work for states too. This is IR's central fallacy of composition, by which it has persistently eschewed rather than resolved the level-of-analysis problem. Indeed, in the absence of a clear demonstration of a logical identity (of the type A=A) between states and individuals, the assumption that individual interactions will explain what states do rests on **little more than a leap of faith**, or indeed an analogy.

AT Social Death

Social death is an incorrect homogenization of the past AND reifies colonial power relations by placing European whiteness at the center of symbolic examination

Walker 12

(Tracey, Birkbeck University Masters in Psychosocial Studies, "The Future of Slavery: From Cultural Trauma to Ethical Remembrance", Graduate Journal of Social Science, 9.2, July, JSTOR)

To argue that there is more to the popular conception of slaves as victims who experienced social death within the abusive regime of transatlantic slavery is not to say that these subjectivities did not exist. When considering the institution of slavery we can quite confidently rely on the assumption that it did indeed destroy the self-hood and the lives of millions of Africans. Scholar Vincent Brown (2009) however, has criticised Orlando Patterson's (1982) seminal book Slavery and Social Death for positioning the slave as a subject without agency and maintains that those who managed to dislocate from the nightmare of plantation life 'were not in fact the living dead', but 'the mothers of gasping new societies' (Brown 2009, 1241). The Jamaican Maroons were one such disparate group of Africans who managed to band together and flee the Jamaican plantations in order to create a new mode of living under their own rule. These 'runaways' were in fact 'ferocious fighters and master strategists', building towns and military bases which enabled them to fight and successfully win the war against the British army after 200 years of battle (Gotlieb 2000,16). In addition, the story of the Windward Jamaican Maroons disrupts the phallocentricism inherent within the story of the slave 'hero' by the very revelation that their leader, 'Queen Nanny' was a woman (Gotlieb 2000). As a leader, she was often ignored by early white historians who dismissed her as an 'old hagg' or 'obeah' woman (possessor of evil magic powers) (Gotlieb 2000, xvi). Yet, despite these negative descriptors, Nanny presents an interesting image of an African woman in the time of slavery who cultivated an exceptional army and used psychological as well as military force against the English despite not owning sophisticated weapons (Gotlieb 2000). As an oral tale, her story speaks to post-slavery generations through its representation of a figure whose gender defying acts challenged the patriarchal fantasies of the Eurocentric imaginary and as such 'the study of her experiences might change the lives of people living under paternalistic, racist, classist and gender based oppression' (Gotlieb 2000, 84). The label of 'social death' is rejected here on the grounds that it is a narrative which is positioned from the vantage point of a European hegemonic ideology. Against the social symbolic and its gaze, black slaves were indeed regarded as non-humans since their lives were stunted, diminished and deemed less valuable in comparison to the Europeans. However, Fanon's (1967) assertion that 'not only must the black man be black; he must be black in relation to the white man' (Fanon 1967, 110) helps us to understand that this classification can only have meaning relative to the symbolic which represents the aliveness of whiteness against the backdrop of the dead black slave (Dyer 1997). Butler (2005) makes it clear that the 'death' one suffers relative to the social symbolic is imbued with the fantasy that having constructed the Other and interpellated her into 'life', one now holds the sovereignty of determining the subject's right to live or die: this death, if it is a death, is only the death of a certain kind of subject, one that was never possible to begin with, the death of the fantasy of impossible mastery, and so a loss of what one never had, in other words it is a necessary grief (Butler 2005, 65). The point to make here is that although the concept of social death has proved useful for theorists to describe the metaphysical experience of those who live antagonistically in relation to the social symbolic, it is nevertheless a colonial narrative within which the slaves are confined to a one dimensional story of terror. In keeping with Gilroy's (1993b) argument that the memory of slavery must be constructed from the slaves' point of view, we might instead concentrate, not on the way in which the slaves are figured within the European social imaginary, but on how they negotiated their own ideas about self and identity. We might therefore find some value in studying a group like the Maroons who not only managed to create an autonomous world outside of the hegemonic discourse which negated them, but also, due to their unique circumstances, were forced to create new modes of communication which would include a myriad of African cultures, languages and creeds (Gottlieb 2000). This creative and resistive energy of slave subjectivity not only disrupts the colonial paradigm of socially dead slaves, but also implies the ethical tropes of creation, renewal and mutual recognition. In contrast, the passive slave proved to feature heavily in the 2007 bicentenary commemorations causing journalist Toyin Agbetu to interrupt the official speeches and exclaim that it had turned into a discourse of freedom engineered mostly by whites with stories of black agency excluded8. Young's argument that 'one of the damaging side effects of the focus on white people's role in abolition is that Africans are represented as being passive in the face of oppression', appears to echo the behaviour in the UK today given that a recent research poll reveals that the black vote turnout is significantly lower than for the white majority electorate and that forty percent of second generation 'immigrants' believe that voting 'doesn't matter'.9 Yet, Gilroy (1993a) argues that this political passivity may not simply be a self fulfilling prophecy, but might allude to the 'lived contradiction' of being black and English which affects one's confidence about whether opinions will be validated in a society that, at its core, still holds on to the fantasy of European

superiority (Gilroy 1993a). ==Without considering the slaves' capacity for survival and their fundamental role in overthrowing the European regime of slavery, we limit the use–value of the memory and risk becoming overly attached to singular slave subjectivities seeped in death and passivity.== The Maroons story however, enables slave consciousness to rise above the mire of slavery's abject victims and establishes an ethical relation with our ancestors who lived and survived in the time of slavery.

The Black body should be understood as active subject – refuse to allow their notion of a monolithic white civil society control all description of the world

Yancy (Prof of Philosophy at Duqesne) **8**

(George, Black Bodies, White Gazes: The Contining Significance of Race, Pg. 122)

As agential, Black people confront the world and construct the world from unique perspectives. They take up their ex-istence within the framework of a given set of circumstances.42 Despite the horrible conditions that came with being forced to live and to work on plantations, many Blacks were able to reconfigure what was given, They were able to take a stand against dehuman-ization and negotiate ways of achieving a sense of dignity. Moreover, this had to be done while making whites think that they had succeeded in producing the most obedient and docile slaves around. In short, Blacks had to "conform" to white myths while undermining those myths simultaneously. The negotiation between myth and reality took place within a variety of work activities, For example, as stated, many Blacks would break tools and destroy crops, As stated, whites rationalized such behaviors as the result of clumsiness and stupidity, Apparently, these same tools were not broken when Blacks worked their own meager areas for planting. In fact, "one slaveholder felt aggrieved when he saw that the small patches which his Negroes cultivated for themselves were better cared for and more productive than his own field."43 This suggests a process of selective valuing. To be selective, of course, involves deliberation, which is indicative of having a perspective on the world. Hence, contrary to the myth that Black people were devoid of agency, they cultivated these small patches of their own in order to exercise a measure of economic independence and agency. Blacks would grow their own food, as well as steal food from the plantation, selling it through a complex network of trade with passing ships.
Breaking tools was one way that enslaved Black people were able to exercise control over their work. To break a tool (or destroy a patch of land) requires the establishment of a different/alternative way of relating to a given object (the tool or the land). To engage in this type of alternative engagement involves the telic dimensions of embodied subjectivity. In short, Blacks assumed a position of transcendence in relationship to a field of objects, Deborah White notes, "While some Southern whites called such behavior [breaking tools, for example] 'rascality,' slaves [or the ensltma) understood it to be an effective form of resistance,"

Hudson/Ontic DA

2AC

Now we'll answer their descriptive claims about the world

First, blackness is not an unchanging ontological void – it is political, contingent and able to be changed. If we win this claim then every one of their framing issues is disproven.

Hudson 13 (Political Studies Department, University of the Witwatersrand, Johannesburg)

(Peter, Social Dynamics (2013): The state and the colonial unconscious, Social Dynamics: A journal of African studies, DOI: 10.1080/02533952.2013.802867)

[BEGIN FOOTNOTE]
My foil here is the ontological fatalism of Frank Wilderson's argument. See Wilderson (2008), according to which "the only way Humanity can maintain both its corporeal and libidinal integrity is through the various strategies through which Blackness is the abyss into which humanness can never fall" (105). And "were there to be a place and time for blacks cartography and temporality would be impossible" (111). Here then, the closure of colonialism is absolute.
[END FOOTNOTE]

"Whiteness" as whiteness – the meaning of whiteness and that of "blackness" – is carried via "a constellation of postulates, a series of propositions that slowly and subtly work their way into one's mind and shape one's view of the world of the group to which one belongs" – "a thousand details, anecdote stories" which are "woven" into "prejudices, myths, the collective attitudes of a given group" (Fanon 1968, 78, 133). This is how the "subject positions" of both whites and blacks are constituted. We can call this constellation the Colonial Big Other (symbolic) in and through which the colonial relation is constituted and reproduced. This Big Other is white, in that whiteness is its master signifier and therefore all identities are "white" under colonialism.

Everyone is white in the colonial symbolic – including blacks; it is just that they are "less white" than "whites" to the point of not being at all – Fanon says again and again that "the black man desires to be white" – but, when he looks at himself through the eyes he has adopted, the "eyes" that are "his" – what he (qua white eyes) sees is something that doesn't exist – "inequality, no non-existence" (Fanon 1968, 98, original emphasis). He "subsists at the level of non-being" (131) – just as the white, when it sees the black, sees an other that is, as Fanon says "absolutely not self," so does the black see himself – "as absolutely not self" (114). This is the depth of the fissure in the black colonial subject position, caught between two impossibles: "whiteness," which he desires but which is barred to him, and "black- ness," which is "non-existence."

Colonialism, anxiety and emancipation3

Thus the self-same/other distinction is necessary for the possibility of identity itself. There always has to exist an outside, which is also inside, to the extent it is desig- nated as the impossibility from which the possibility of the existence of the subject derives its rule (Badiou 2009, 220). But although the excluded place which isn't excluded insofar as it is necessary for the very possibility of inclusion and identity may be universal (may be considered "ontological"), its content (what fills it) – as well as the mode of this filling and its reproduction – are contingent. In other words, the meaning of the signifier of exclusion is not determined once and for all: the place of the place of exclusion, of death is itself over-determined, i.e. the very framework for deciding the other and the same, exclusion and inclusion, is nowhere engraved in ontological stone but is political and never terminally settled. Put differ- ently, the "curvature of intersubjective space" (Critchley 2007, 61) and thus, the specific modes of the "othering" of "otherness" are nowhere decided in advance (as a certain ontological fatalism might have it) (see Wilderson 2008). The social does not have to be divided into white and black, and the meaning of these signifiers is never necessary – because they are signifiers.

To be sure, colonialism institutes an ontological division, in that whites exist in a way barred to blacks – who are not. But this ontological relation is really on the side of the ontic – that is, of all contingently constructed identities, rather than the ontology of the social which refers to the ultimate unfixity, the indeterminacy or lack of the social. In this sense, then, the white man doesn't exist, the black man doesn't exist (Fanon 1968, 165); and neither does the colonial symbolic itself, including its most intimate structuring relations – division is constitutive of the social, not the colonial division.

"Whiteness" may well be very deeply sediment in modernity itself, but respect for the "ontological difference" (see Heidegger 1962, 26; Watts 2011, 279) shows up its ontological status as ontic. It may be so deeply sedimented that it becomes difficult even to identify the very possibility of the separation of whiteness from the very possibility of order, but from this it does not follow that the "void" of "black being" functions as the ultimate substance, the transcendental signified on which all possible forms of sociality are said to rest. What gets lost here, then, is the specificity of colonialism, of its constitutive axis, its "ontological" differential.

And this is an impact turn to the alt – their dualistic description of the world is incorrect but makes challenging white supremacy impossible

hooks 12 (Distinguished Professor in Residence at Barea)
(bell, Writing Beyond Race: Living Theory and Practice, 177)

Religion is important because it is there that many folks learn the western metaphysical dualism—the notion of world divided between the good and the bad, the chosen and the unchosen, the worthy and the unworthy, the blacks and the whites—that is the philosophical foundation for white supremacy and other forms of domination. As long as this thinking serves as the foundation for how most people think about life (in neat binaries) then it will be impossible to eradicate racism. White supremacist capitalist patriarchy thrives on the core dualistic thinking that is the foundation of all systems of domination.

Second, accepting their impact framing makes any specific action impossible and locks in structural violence. The public sphere is not absolutely determined by anti-blackness and can be altered by political action

Yancy 13
(George, Introduction: Black Philosophy and the Crucible of Lived, The Black Scholar, Vol. 43, No. 4, Special Issue: Role of Black Philosophy (Winter 2013), pp. 5-10)

Black philosophy and its role are funda- mentally linked with existential struggle. The lived experiences of struggle and resistance (etymologically, "to take a stand") speak to the fact that the social ontological structure of the world is not a metaphysical fait accompli. Black philosophy acknowledges its historical conditionality and emergence against the backdrop of white racism, vio- lence, colonialism, dehumanization, enslavement, oppression, and objectification. It recognizes this backdrop as constituted through lived embodiment and configurations of thought and action that were not necessary, but that are predicated upon contingent sites of power and hegemony that are linked to oppressive ideologies and the possession of material power to superimpose such oppressive ideologies. Hence, relevant to black philosophy is its clarion call: "The world is not as it ought to be!"
It is the power of "ought" that points to the openness of human history, agency, and counter-hegemonic praxis. The "ought" implies slippage, excess, lacunae, and the capacity to create. The subtext here is that one **can** reconfigure the world, reshape its direction, undo its normative repetitions, and create new and

==ever freeing forms of political formation==, relationality, and performance. [Italics in original article – DQ] The role of black philosophy, then, having its point of origin within a matrix of oppression, even as this oppression was/is diasporic, is antagonistic and iconoclastic; indeed, resis- tant to claims of philosophical universality that are actually forms of discourse that are predicated upon a philosophical anthropol- ogy that is, in this case, underwritten by whiteness as the transcendental norm and that valorizes its vision of the world and the meaning of humanity at the exclusion of others. Hence, to engage in black philosophy on conceptual terms set forth here is to affirm one's humanity in the face of those who deem you a sub-person, ersatz, ontologically nugatory.

Blackness = Contingent Ext

Ext. Hudson

The Black body is not ontologically closed or devoid of relationality – they can't account for Black resistance as subjectivity

Yancy (Prof of Philosophy at Duqesne) **8**

(George, Black Bodies, White Gazes: The Contining Significance of Race, Pg. 109-10)

The history of Black resistance is a complex narrative, particularly as this history is tied to the context of a white racist episteme. After all, it is the dominant white culture's view that Black people have no role to play in "the world of meaning as meaning-makers,"[1] Frantz Fanon was painfully aware of the hegemony and misanthropy of white racist ideology with regard to the denial of Black peoples' subjectivity and humanity, "All 1 wanted was to be a man among other men," he noted, "I wanted to come lithe and young into the world that was ours and to help to build it together," However, within the lived or phenomenological domain of anti-Black racism, Fanon was expected to live, to think, to feel, to exist, *to be* "like a nigger."[3] Within the context of an anti-Black racist world, the lived experience of the Black is under the constant threat of being collapsed into the phenomenological or lived experience of the nigger. Once collapsed into the one-dimensional mode of niggerhood, as it were, it is easy to undergo a certain ontological resignation, a capitulation in the face of a reality whose past, present, and future seem fixed and stacked against any possibility of historical breach. For Fanon, "transformation,.. requires something like a critical resistance to the dominating [white] episteme-an active denial of the mythos that intervenes in the formation of body-images."[4]

Historically, "the imago of the [Black] in the European mind" has involved a process of discursive and material violence,[5] Whether discursive or extra-discursive, this violence was designed originally to aid in breaking the Black body's claim to dignity and humanity. As I have argued, the Black body, through the hegemony of the white gaze, undergoes a phenomenological return that leaves it distorted and fixed as a pre-existing essence. The Black body becomes a "prisoner" of an imago-an elaborate distorted image of the Black, an image whose reality is held together through white bad faith and projection— that is ideologically orchestrated to leave no trace of its social and historical construction, The aim is to foreclose any possibility of slippage between the historically imposed imago and how the Black body lives its reality as fixed. But like the white body, the Black body is never simply pregiven. While "history has been terribly unkind to the African body," the Black body has, within the context of its tortuous sojourn through the crucible of American and European history, been a site of discursive, symbolic, ontological, and existential battle. If the Black body's metastability had reached a point of ontological closure as a result of the power of the distorted imago projected from the white imaginary, there would have been no history of the Black body engaged in struggle and transformation. Blacks have struggled mightily to disrupt, redefine, and transcend white fictions. They have struggled with profound issues around identity and place. Yet Blacks have always struggled to make a way out of no way, using the resources they had available. Although I will return to a discussion of the Middle Passage in chapter 5, one might look at the movement through the Middle Passage to the so-called New World as a medium through which an especially dynamic and difficult challenge to define and redefine a narrative of Black identity emerged, This narrative tells a complex story of the Black experience, one that is shaped through syncretism, bricolage, the blending of cultural, epistemological, and ontological retentions with ever-new horrific and challenging experiences, There is no aim here to celebrate or recuperate an "authentic" identity qua essence or to ground a sense of identity in fixed meta-narratives, There is the effort, however, to make sense of one's existence within the context of lived history, one that recognizes and acknowledges the reality of fissures in collective and individual identity formation and refuses to romanticize origins or points of historical continuity. Nevertheless, it is my sense that Black identity-talk within the context of North America must begin from below, that is, one must begin with the existential terror of whiteness faced by Black people, and realize that Black people continue to define and redefine themselves through the deployment of conceptual and affective

resources that are themselves *historical*.

***And the White subject position is also contingent. Some limited change and progress is possible.

Yancy (Prof of Philosophy at Duqesne) **8**

(George, Black Bodies, White Gazes: The Continuing Significance of Race, Pg. 150) [Italics original – DQ]

The process of becoming a white racist is linked to larger racially embedded sociohistorical practices of intelligibility. Yet, within the context of America's racist history, there was always already the counter-white racist position, the counter-anti-Black voice, to be taken up, and pursued, even as various social forces militated against the taking up of such a counter-white racist position/ voice. <u>Whites were not **determined** by the fixity of a racist axiological framework</u>. <u>There was still the freedom to challenge the "rigid training,</u> long persisted _{ien} in<u>" that reinforces the fixity of values</u>. Hence, <u>there is always the possibility of troubling one subject position and "leaning" into another</u>. Along with heteronomy, then, there is autonomy. <u>Without the concept of autonomy, we would be forced to claim that the self is no more than the plaything of external forces</u>, a constantly shifting "voice" with absolutely no agency. There is thus the sense that <u>the human subject is not a plenum, but always already incomplete, capable of claiming a counter-racist voice</u>, though not one created ex nihilo, For the white racist to admit that one is always already becoming what one is not yet calls into question whiteness as an essential category of identity and mode of being, The consequence of this admittance is coming face-to-face with a profound sense of anguish. <u>Even as whites are interpellated within a racist social structure</u>, there is the reality of a reflective apprehension of themselves as freedom and the realization that <u>they can continually engage in the action of choosing themselves as antiracists over and over again</u>**.**

Black subject position is contingent and alterable

Yancy (Prof of Philosophy at Duqesne) **8**

(George, Black Bodies, White Gazes: The Contining Significance of Race, Pg. xxii) [Italics original – DQ]

Given the above, it is clear that part of <u>the meaning of Black embodiment</u> is disclosed within the context of an anti-Black racist world, <u>The disclosure of its meaning, while inextricably and</u> <u>relational tied to the history of anti-Black racism, is not **reduced** to that history</u>. The point here is that <u>the meaning of the Black body **is** historical</u>. <u>And as historical, the Black body and the white body are explored not in terms of an ontology of essences, but in terms of a historical ontology that appreciates the fluidity of the historical formation of the meaning of</u>, in is case<u>, the Black body and the white body</u>, even as the white body engages in bad-faith practices of stipulating its modes of being as sacrosanct, reified, and independent of meaning-bestowing human beings. <u>As **historical**, the Black body does not have its meaning ontologically (qua essence) given or sealed in advance. The Black body is a historical project and as such is capable of taking up new historical meanings through struggle and affirmation</u>. As affirmative, <u>the Black body is not simply defined in its opposition to a racist episteme</u>, but engages its meaning beyond the horizon of the Black imago in the white imaginary while always keeping track of whiteness's recuperative efforts, its institutional rigidity, material power, and various complex forms of insidious manifestation.

Contingency Good Ext

Ext hooks

This prevents the ability to affirm the beauty of Black life and modify the conditions of living

Glaude (Professor of Religion and African American Studies, Department of Religion, and Chair, Center for African American at Princeton) **7**
(EDDIE S. GLAUDE JR., In a Shade of Blue: Pragmatism and the Politics of Black America, Pg. 110)

My general aim in this chapter has been to insist on the complexity of African American religious life and to resist naive attempts to reduce that complexity to an easily manageable political reality—a tendency that is, I believe, typical of this country's melodramatic approach to the problem of race. I am of the firm belief that <u>appeals to a fixed and stable notion of black identity</u>, to a conception of history as a storehouse stocked with answers to all our problems, or appeals to an idea of black agency that presumes our inclination to resist <u>limit our imaginations and in various ways blunt our capacity to modify our conditions of living</u>, precisely because each denies the active work e do in the face of problematic situations. Such appeals too often direct our attention to antecedent and not consequent phenomena. <u>They seek to tame the</u> potential <u>chaos of contingency but end up obscuring the moral imperative that we act</u> intelligently and earn our deaths <u>by passionately embracing the conundrum of life</u>. In short, <u>bad thinking about African American history, identity, and agency compromises</u> what James Baldwin referred to as all of that beauty—<u>those</u> funded <u>experiences</u>, colored in a dark shade of blue, <u>that enable us to invade the future with a bit more than luck.</u>

AT Middle Passage/Bill of Sale

Blackness is dynamic and contingent – structuring it on the Middle Passage is flawed and functions monolithically to conceal the diversity of Black life

Yancy 13

(George, Introduction: Black Philosophy and the Crucible of Lived, The Black Scholar, Vol. 43, No. 4, Special Issue: Role of Black Philosophy (Winter 2013), pp. 5-10)

Consistent with the idea of an open- ended perspective and a diversity of voices, I conceptualize black philosophy within the crucible of *lived* history. This raises the in- terrelated themes of context, situation, and philosophical thought. Indeed, this dynamic interrelation points to the dialectical rela- tionship between philosophical thought and socio-existential setting. On this score, and as philosopher William R. Jones's epigraph implies, black philosophy is protean and historically contextual. To refer to "black" philosophy is not to imply a chromosomal matrix out of which philosophical thought *causally* proceeds. There is no genetic sub- stratum (or biological *telos*) that inexorably dictates the existence of black philosophy r the diverse philosophical content and tra- jectories of black philosophy, though the process of racialization is central to thinking about the meaning of black philosophy and its role. And since <u>"blackness" is itself an identity category that has its origins within history</u>, the idea of a <u>black philosophy and its role must be couched within a hermeneutic lens that takes seriously the</u> dimension of black *Erlebnis,* through a form <u>of lived experience that is not homogenous for all of those who identify as black people even as there are shared dimensions of historical and contemporary forms of black oppression</u>, marginalization, and dehumanization.

In my book *Black Bodies, White Gazes,* I point to the middle passage as the crucible in terms of which black identity is marked and the black body is ontologically truncated and returned to itself as distorted and mon- strous, thus locating the black body within a context of anti-black racism. Theorizing the black body from this location critiques an ontogenic perspective and raises the is- sue of the sociogenic. <u>The middle passage</u>, I argue, <u>functions as that space of death</u>, do- cility, amalgamation, and resistance that is important for comprehending black people in North America. So, it becomes a central existential and social ontological motif through which I theorize what it means to be black and how I understand black philosophy and its role. <u>Yet, it is important to note that those black bodies were scattered and not confined to North America</u>. So, I think that it is important to theorize the ways in which that oceanic experience shaped other black bodies that were dispersed throughout the world. As such, then, <u>one must be attentive to and examine the different genealogies and phenomenological configurations that speak not only to those bodies that were not enslaved in North America, but also speak to those black bodies that did not arrive at their "destinies" through the transatlantic slave trade at all</u>. <u>This raises important questions regarding the lived meaning of "blackness" and how blackness is differentially defined diachronically and in terms of points of geo- graphical origin, suggesting that blackness is dynamically protean</u>.

<u>Although above I point to the middle pas- sage as the matrix in terms of which black identity is shaped, we must be cognizant of how black identity and black subjectivity can be</u> erroneously tethered <u>to that moment in time and physical space,</u>[3] <u>which then raises the issue of how a specific black historical narrative can function monolithically and thus exclude those black bodies that don't narrativize the middle passage in the same way or even at all</u>. While I will not pursue this issue here, I want to be clear that <u>there is a diverse "terrain of blackness"</u> in terms of the changing landscape and mean- ing of blackness and that this change im- pacts <u>differential experiences for those who consider themselves black people</u>. Indeed, such differential experiences <u>have an impact on how we think about the dynamics of black identity and black philosophizing, and the latter's key normative assumptions,</u> mo- dalities, and different morphologies of ques- tions and responses that emerge. My point is to remain critically cognizant of the ways in which I privilege the middle passage and how that privileging might function as a his- torical gap for black people who neverthe- less see themselves as black and yet whose experiences are shaped differently, though not incommensurably vis-à-vis other black people

who contend with anti-black racism.

AT Blackness = Negativity

Defining Blackness as a purely negative erases the joy of black life and prevents action to solve suffering

Glaude (Professor of Religion and African American Studies, Department of Religion, and Chair, Center for African American at Princeton) **7**
(EDDIE S. GLAUDE JR., In a Shade of Blue: Pragmatism and the Politics of Black America, Pg. 78-9)

Metaphysical claims are collapsed here into ontological claims and the re- sult, despite Cone's protestations, is a reification of blackness. Tradition and History, far wiser than we will ever be, have settled the problems of our living in advance of our experience. The meanings of African American historical experiences are thus oversimplified. The complexity of in- dividual African American lives denied. Such a view of history can deny us the power of reflexive thought about ourselves and our interactions with the world, the exercise of which informs daily, sometimes tragic, choice sand recognizes the contingency and indeterminacy at the heart of action.
In my view, three difficulties – descriptive, theoretical and existential- attend such accounts. The descriptive problematic involves the plotline of the story. I am reminded here of James Baldwin and Ralph Ellison's critique of Richard Wright. Both worried that Wright's representations of black life betrayed the complexity of African American existence. The same can be said of stories of African American experience that are mainly about liberation and presuppose a subject in constant struggle. There is much more to our living than simply resisting white supremacy. Moreover, the singular focus often results in a relatively coherent account in which internal fissures of black communities are obscured. Suffering and resistance then subordinate all other considerations—even the differential experience of that suffering and the different aims of resistance.
The theoretical problematic refers to the Christian dimension of the problem of being both black and Christian. Like Anderson, I worry that God talk among black theologians, at least in their worst moments, functions merely as a source of the strenuous mood, serving simply to justify and sanctify a particular political orientation—even though it is precisely in our relation to God and His relation that we resist oppression.24
Lastly, the existential problematic again entails a simplification of the complexity of African American lives. The existential involves how to live, how to hope, and how to love. But if our lives are reduced simply to struggle and our stories presume an understanding of black agency as always already political, then the various ways we have come to love and hope are cast into the shadows as we obsess about politics, narrowly understood, and as History orients us retrospectively, instead of prospectively. We end up, despite our best intentions, ignoring the sheer joy of black life and unwittingly reducing our capacity to reflect and act in light of the hardships of our actual lives. Perhaps, more importantly, "our ability to make delicate distinctions" is lost as History settles beforehand the difficult existential questions "Who am I?" "How should I live?" and "What should I do?"

And it is a false description and ignores the messy realities of African American life

Glaude (Professor of Religion and African American Studies, Department of Religion, and Chair, Center for African American at Princeton) **7**
(EDDIE S. GLAUDE JR., In a Shade of Blue: Pragmatism and the Politics of Black America, Pg. 112)

I do hold the view, however, that much of the politics of the black power era was premised on, problematic conceptions of black identity, history and agency such as I have addressed in the previous chapters. In chapter 4, for example, I sought to trouble conceptions of black agency that presuppose a teleology of emancipatory politics. My aim was not to deny the notion of black agency but to insist, given my pragmatic commitments, that agency be viewed as an emergent property of particular situations. We ought not to offer a phenomenology of black

agency as inclined, in advance of the contexts within which it is exercised, to resist oppression and to seek freedom. To do so narrows, often in the name of unspecified ideological commitments, our descriptions of what African Americans actually do. This is particularly relevant for characterizations of African American religious life.

I made this point about description explicit in my earlier discussions of black identity and history. In each instance, I invoked specific political formulations associated with some variant of black nationalist politics as examples of bad ways of thinking about political and moral matters. Black identity, I argued, should not be thought of as the findings of an archeological project aimed at discovering, once and for all, who we really are.   And African American history should not be viewed as a reservoir meaning that singularly and prior to individual experience determines who we are and provides us with the tools to become who we are destined to be. These formulations, I maintained, amount to what can be called black quests for certainty detached from the messy realities of African Americans' actual beliefs, choices, and actions. Such seeming certainty often entails a crude reduction of the moral complexity of the moral lives of African Americans and an attachment to one value to the exclusion of others. In other words, black quests for certainty too often deny the lessons of tragedy and produce melodramatic politics.

AT Excluded from Civil Society

"Civil society" does not exist as a unitary object. There are multiple overlapping Black and white public sphere and their presumption that the Black body is permanently excluded from civil society centers a White bourgeois unitary civil society

Dawson (Professor of Political Science and Director of the Center for the Study of Race, Politics and Culture at the University of Chicago) **1**

(Michael C., BLACK VISIONS The Roots of Contemporary African-American Political Ideologies, pg. 24-5) [Italics original –DQ]

Black political thought evolves and develops through the clash of ideologies which typifies political debate among African Americans. The discursive site for these debates has historically been the black public sphere, or more precisely, the black counterpublic. The concept of a black counterpublic sphere that interacts with other spheres within American society is useful for understanding how the ideologies contained within black political thought both develop semi-autonomously and interact with the political debates coursing throughout the polity.

The idea of a black counterpublic is needed because for most of Amer- ican political history, blacks were excluded from the "American" bourgeois public sphere. Just as feminist critics have pointed out that Habermas's c o n c e p t o f t h e b o u r g e o i s p u b l i c s p h e r e i s b o t h e x c l u s i o n a r y a n d h e g e mo n i c , there are several aspects of Habermas's formulation which render it in- appropriate as a model for black politics (Fraser 1989; Ryan 1989). First, Habermas consistently presented a romanticized version of Western Eu- ropean history (Eley 1989; Fraser 1989). A number of scholars have dem- onstrated that historically existing bourgeois public spheres were always exclusionary. Gender was a prime basis for exclusion, and spheres were formed in some circumstances as a patriarchal alternative to already existing spheres in which women's voices were prominent (Fraser 1989; Ryan

10 1989). What emerged in these and other Western polities were a variety of alternatives to the bourgeois and post-bourgeois public spheres that facilitated women's and other excluded groups' access to public life. Several scholars explicidy connect the stratification of a society and the creation of alternative subaltern counterpublics (Fraser 1989; Ryan 1989), We can re- state the thesis of Fraser and others as follows; Alternative public spheres have developed in Western democracies, at least in keeping with the fun- damental constitutive stratification lines of a given society.

By fundamental constitutive stratification lines I mean that, histori- cally, societies of which we have records have been organized systemati- cally to provide favorable outcomes for privileged groups. Favorable out- comes include material goods, life chances (including the ability to capture resources), status, individual autonomy (consider the role of women in many societies, or of slaves), and ideological privileging/degradation of a *pap)* place in the social order. Most, perhaps all, societies on record which reach a certain stage of development have at least two such organizing principles. These are gender and how economic activity (including the distribution of 11 resources) is organized.

These systems of stratification produce social groups which are systematically excluded from the **bourgeois** public sphere. However, I agree with Fraser (1989) that the claim that these groups are excluded from **the** public sphere is an **ideological** claim, since it privileges the bourgeois sphere as being *the only sphere* of consequence for discourse that is capable of critiquing the state and its policies. [Italics original –DQ]

Anti-Ethics

Ethics 2AC

Anti-ethics is not a desirable frame for the debate

<u>Begs the question</u> of both the prag and method debates above – they have to win the entire weight of their framing claims in order to win this as a relation to the ballot

Err Aff on late breaking explanations of what this means – their evidence does not support this as a ethical d-rule to vote for them or against rationality. If the block has a new explanation of what anti-ethics means we get new 1AR answers

Ethics are good – the Aff's project of survival of others, allowing the agency to work, play, struggle and desire free from the destruction of their biological life is ethical

[can read a different card if desired, like a different exn first card]

Fassin 10 (James D. Wolfensohn Professor in the School of Social Science at the Institute for Advanced Study, Princeton, as well as directeur d'études at the École des Hautes Études en Sciences Sociales, Paris.)

(Didier, ETHICS OF SURVIVAL: A DEMOCRATIC APPROACH TO THE POLITICS OF LIFE, http://www.humanityjournal.org/humanity-volume-1-issue-1/ethics-survival-democratic-approach-politics-life)

"Long before the experience of survival that I am presently facing, I wrote that <u>survival is an original concept which constitutes the very structure of what we call existence</u>. <u>We are, structurally speaking, survivors, marked by this structure of the trace</u>, of the testament. That said, I would not endorse the view according to which survival is more on the side of death and the past than of life and the future. No, deconstruction is always on the side of the affirmation of life."[3] A few weeks before his death, Jacques Derrida gave his last interview in which he developed at length his conception of life as survival. Suffering from a terminal disease, he confided: "Since certain health problems are becoming more pressing, the question of survival and reprieve, which has always haunted me, literally, every moment of my life, in a concrete and tireless way, takes on a different color today." In reference to a sentence he had used in one of his books ("I would finally like to know how to live") he commented with a penetrating irony: "No, I never learned to live. Definitely not! Learning to live should mean learning to die. I never learned to accept death. I remain impervious to being educated in the wisdom of knowing how to die."

However, beyond the emergency of this "shrinking time of reprieve" (which he rejected with humor, saying, "we are not here for a health bulletin"), it is the more general problem of survival on which the philosopher wanted to meditate: "I have always been interested in the question of survival, the meaning of which does not add to life and death. It is originary: life is survival." In fact, both dimensions were for him intimately related, the personal experience repeating the existential experience, the circumstantial ordeal making the structural reality more evident and more painful. How else to understand that on the verge of death, thinking about survival could become so insistent in this interview, until the final profession of faith? "<u>Everything I say about survival as a complication of the opposition between life and death proceeds from an unconditional affirmation of life</u>. Survival is life beyond life, life more than life, and the discourse I undertake is not about death. On the contrary, <u>it is the affirmation of a living being who prefers life and therefore survival to death</u>, because survival is not simply what remains; it is the most intense life possible."

I want to show that Derrida's conception of life as survival, in its polysemy and even its ambiguity, may offer an alternative to conceptions of life which, from Benjamin to Agamben, and in a quite different perspective, from Lamarck to Canguilhem, have presented a seductive dualistic framework for the humanities and social sciences. Both visions are inherited from Aristotle. On the one hand, life is presented as biopolitical fact: "Behind the long strife-ridden process that leads to the recognition of rights and formal liberties stands the body of the sacred man with his

double sovereign, his life that cannot be sacrificed yet may be killed," affirms Giorgio Agamben in Homo Sacer, where he develops his theory of "bare life."4 From the "politicization of life" in totalitarian systems to the "isolation of the sacred life" in contemporary democracies, he therefore establishes a continuum of the power over life. On the other hand, life is conceived as a biological phenomenon: "any datum of experience possible to trace as a history comprised between its birth and its death is living, is the object of biological knowledge," writes Georges Canguilhem for the entry "Life" in theEncyclopedia Universalis.5 He presents life successively as "animation," "mechanism," "organization," and "information," in a chronological review of biological theories extending from ancient conceptions to contemporary genetics—and everyone knows that the genome is often said to be the "code of life." In other words, these two readings present life as what can be put to death (for Agamben), and as what is comprised from birth to death (for Canguilhem). The social sciences have largely drawn from these two repertoires: the former has been used to comprehend the government of populations and human beings; the latter has nourished the sociology and anthropology of sciences and techniques. However different they may be, these two models rest on the same premises. Both treat life as a physical phenomenon, whether it is "bare life" or "biological life" (both philosophers insisting that it is the dimension shared with the entire animal kingdom). And both assume that life can be separated, for scientific or political reasons, from life as an existential phenomenon, whether it is called "qualified life" or "lived experience" (by Agamben and Canguilhem respectively).[6] It seems to me that Derrida's reflection shatters this distinction: "survival" mixes inextricably physical life, threatened by his cancer, and existential experience, expressed in his work. To survive is to be still fully alive and to live beyond death. It is the "unconditional affirmation" of life and the pleasure of living, and it is the hope of "surviving" through the traces left for the living.

There is, I believe, in this revelation much more than the last testimony of a philosopher who did not accustom us to such clarity and simplicity. I see it as an ethical gesture through which life is rehabilitated in its most obvious and most ordinary dimension—life which has death for horizon but which is not separated from life as a social form, inscribed in a history, a culture, an experience. I consider the consequences of this gesture to be decisive for the humanities and social sciences: or so I want to argue here.

Their prioritization of social death plays into dominant forms of politics and papers over the inevitable resistance of bodies to domination

Fassin 10 (James D. Wolfensohn Professor in the School of Social Science at the Institute for Advanced Study, Princeton, as well as directeur d'études at the École des Hautes Études en Sciences Sociales, Paris.)

(Didier, ETHICS OF SURVIVAL: A DEMOCRATIC APPROACH TO THE POLITICS OF LIFE, http://www.humanityjournal.org/humanity-volume-1-issue-1/ethics-survival-democratic-approach-politics-life)

Survival, in the sense Jacques Derrida attributed to the concept in his last interview, not only shifts lines that are too often hardened between biological and political lives: it opens an ethical space for reflection and action. Critical thinking in the past decade has often taken biopolitics and the politics of life as its objects. It has thus unveiled the way in which individuals and groups, even entire nations, have been treated by powers, the market, or the state, during the colonial period as well as in the contemporary era.

However, through indiscriminate extension, this powerful instrument has lost some of its analytical sharpness and heuristic potentiality. On the one hand, the binary reduction of life to the opposition between nature and history, bare life and qualified life, when systematically applied from philosophical inquiry in sociological or anthropological study, erases much of the complexity and richness of life in society as it is in fact observed. On the other hand, the normative prejudices which underlie the evaluation of the forms of life and of the politics of life, when generalized to an undifferentiated collection of social facts, end up by depriving social agents of legitimacy, voice, and action. The risk is therefore both scholarly and political. It calls for ethical attention.

In fact, the genealogy of this intellectual lineage reminds us that the main founders of these theories expressed tensions and hesitations in their work, which was often more complex, if even sometimes more obscure, than in its

reduced and translated form in the humanities and social sciences today. And also biographies, here limited to fragments from South African lives that I have described and analyzed in more detail elsewhere, suggest the necessity of complicating the dualistic models that oppose biological and political lives. Certainly, powers like the market and the state do act sometimes as if human beings could be reduced to "mere life," but democratic forces, including from within the structure of power, tend to produce alternative strategies that escape this reduction. And people themselves, even under conditions of domination, manage subtle tactics that transform their physical life into a political instrument or a moral resource or an affective expression.

But let us go one step further: ethnography invites us to reconsider what life is or rather what human beings make of their lives, and reciprocally how their lives permanently question what it is to be human. "The blurring between what is human and what is not human shades into the blurring over what is life and what is not life," writes Veena Das. In the tracks of Wittgenstein and Cavell, she underscores that the usual manner in which we think of forms of life "not only obscures the mutual absorption of the natural and the social but also emphasizes form at the expense of life."[22] It should be the incessant effort of social scientists to return to this inquiry about life in its multiple forms but also in its everyday expression of the human.

Alt Fails

2AC

<u>The alternative cannot solve</u> – they do not have evidence or explanation for how they can undo all of social relations up until this point. The huge structural claims that they have had to advance in order to get their framing claims doom their alt solvency. They will say that you should just imagine it or somehow invoke it with your ballot but this all begs the question of what this means for practical politics

The Neg should have to defend the material implementation of their alternative and how they would produce large scale social change. The Neg has no explanation for how they could galvanize large scale social movements let alone end America or the world.

Results matters – failure to have a course of action for mobilizing populations dooms the alt. EVEN if they win their ethics claims, you have to evaluate the question of alt solvency first.
Day 9

(Christopher, The Historical Failure of Anarchism: Implications for the Future of the Revolutionary Project,
http://mikeely.files.wordpress.com/2009/07/historical_failure_of_aanarchism_chris_day_kasama.pdf)

The strength of anarchism is its moral insistence   on the primacy of human freedom over political expediency. But human freedom exists in a political context.   It is not sufficient, however, to simply take the most uncompromising position in defense of freedom. It is neccesary to actually win freedom. Anti-capitalism doesn't do the victims of capitalism any good if you   don't actually destroy capitalism. Anti-statism doesn't   do the victims of the state any good if you don't actually smash the state. Anarchism has been very good at putting forth visions of a free society and that is for the   good. But it is worthless if we don't develop an actual strategy for realizing those visions. It is not enough to   be right, we must also win. Continues… Finally revolutionaries have a responsibility to   have a plausible plan for making revolution. Obviously   there are not enough revolutionaries to make a revolution at this moment. We can reasonably anticipate that   the future will bring upsurges in popular opposition to   the existing system. Without being any more specific   about where those upsurges might occur it seems clear   that it is from the ranks of such upsurges that the numbers of the revolutionary movement will be increased,   eventually leading to a revolutionary situation (which   is distinguished from the normal crises of the current   order only by the existence of a revolutionary movement ready to push things further). People who are   fed up with the existing system and who are willing to   commit themselves to its overthrow will look around   for likeminded people who have an idea of what to do. If we don't have a plausible plan for making revolution we can be sure that there will be somebody else   there who will. There is no guarantee that revolutionary-minded people will be spontaneously drawn to   anti-authoritarian politics. The plan doesn't have to be an exact blueprint. It   shouldn't be treated as something sacred. It should be   subject to constant revision in light of experience and   debate. But at the very least it needs to be able to answer questions that have been posed concretely in the   past. We know that we will never confront the exact   same circumstances as previous revolutions. But we   should also know that certain problems are persistent   ones and that if we can't say what we would have done   in the past we should not expect people to think much   of our ability to face the future.

We win even if its a debate of competing methodologies – deliberative spaces like political discussions between college students are valuable but we need to tie our advocacies to addressing particular problems in the world. This is crucially effective in the context of Black politics. The democratic public sphere <u>is not structurally closed</u> to Black bodies

Glaude (William S. Tod Professor of Religion and African American Studies, Department of Religion, and Chair, Center for African American Studies at Princeton) **7**
(EDDIE S. GLAUDE JR., In a Shade of Blue: Pragmatism and the Politics of Black America, pg. x-xii)

Another young man stood up and offered a slight correction to his colleague's impassioned remarks. He said, "I agree with what has just been said, but we should know that ==knowledge without action is useless==. We must *do* something with that knowledge." The conversation that followed was instructive. Students weighed in on the matter. West and Smiley of- fered their views. I asked, "What if we understand knowledge not as sepa- rate from doing, but rather as a *consequence* of it? What if knowledge is s simply the fruit of our undertaking? To use one of Tavis Smiley's favorite words, we proceeded to "marinate" for a while on the implications of the relation between how we think and how we act. At one level, my questions had been aimed simply at countering an implicit anti-intellectualism. But what I had also done was to invoke, verbatim, John Dewey's definition of knowledge as the "fruit of our undertakings." <u>In a room full of young people with varied backgrounds and challenges in their lives, we found ourselves thinking with distinctly pragmatic tools about epistemology and how our thoughts about the subject could affect how we seek to change the world.</u>

Why John Dewey in this context? Because I believe that the tradition of American pragmatism exemplified by Dewey offers powerful resources for redefining African American leadership and politics. This book seeks to make that case. I argue that ==pragmatism, when attentive to the darker dimensions of human living== (what we often speak of as the blues), ==can address many of the conceptual problems that plague contemporary African American political life==. <u>How we think about black identity</u>, how we imagine black history, <u>and</u> ==how we conceive of black agency can be rendered in ways that escape bad racial reasoning - reasoning that assumes a tendentious unity among African Americans simply because they are black==, ==or that short- circuits imaginative responses to problems confronting **actual** black people==.

The relationship I propose between pragmatism and African American politics is mutually beneficial. Pragmatism must reckon with the blues or remain a stale academic exercise. The blues, of course, are much more than a musical idiom. They constitute, as Albert Murray notes in his classic book on the subject, "a statement about confronting the complexities inherent in the human situation and about improvising or experiment- ing or riffing or otherwise playing with (or even gambling with) such posibiliteis as are inherent in the obstacles, the disjunctures, and the jeopardy." Murray goes on to say, in words that I hope will resonate through the pages that follow, that the blues are "a statement about perseverance and .about resilience and thus also about the maintenance"of equilibrium despite precarious circumstances and about achieving elegance in the very process of coping with the rudiments of subsistence." In one sense, to take up the subject of African American politics is inevitably to take up the blues. That is to say, the subject cannot but account for the incredible efforts of ordinary black folk to persevere with elegance and a smile as they confront a world fraught with danger and tragedy. ==To embrace pragmatism is to hold close a fundamental faith in the capacities of ordinary people to transform their circumstances== while rejecting hidden and not- so-hidden <u>assumptions that would deny them that capacity</u>**.** ==To bind pragmatism and African American politics together==, I hope to show, ==is to open up new avenues for thinking about both.==

My book does not offer a political blueprint nor is it concerned with putting forwad concrete solution to specific political problems, <u>it seeks instead to open up deliberative space within African American communities and throughout the country for reflection on how we think about the pressing matters confronting black communities and our nation</u>. Reflection is not opposed to action. I hope to make clear how the theoretical and

the practical are intimately connected.

To be sure, the bleak realities of our country constitute the backdrop of my efforts. Our democratic way of life is in jeopardy. Fear and our clamoring need for security have revealed the more unsavory features of American culture. The foundational elements of a free and open society are being eroded, and our political leaders lie to justify their destruction. The corrosive effects of corporate greed on the form and content of our democ- racy are also apparent: the top 1 percent of the population is getting richer while the vast majority of Americans, of whatever color, struggle to make ends meet. In many African American communities in particular, we see the signs of crisis: deteriorating health, alarming rates of incarceration, the devastating effects of drug economies, and the hypercon- centration of poverty because work has simply disappeared. Political fac- tions stay the course, exploiting faith communities, stoking the fires of homophobia (while denying the epidemic of HIV/AIDS in black commu- nities), and appealing to uncritical views of black solidarity that often blind our fellow citizens to the destructive policies that, ultimately, undermine the values of democratic life. All the while, established African American leaders seem caught in a time warp in which the black revolu- tion of the 1960s is the only frame of reference, obscuring their ability to see clearly the distinctive challenges of our current moment.

In dark and trying times, particularly in democracies, it is incumbent upon citizens to engage one another in order to imagine possibilities and to see beyond the recalcitrance of their condition. Participatory democracies are always fragile, and moments of crisis serve as easy excuses to discard the values that sustain them. When we stop talking with and provoking our fellows we in effect cede our democratic forms of life to those forces that would destroy it. In a Shade of Blue seeks, among other things, to make explicit the values and commitments that inform my own think- ing about African American politics and democratic life. The book continuously asserts the primacy of participatory democracy the necessity for responsibility and accountability, and the pressing need for more imaginative thinking about African American conditions of living.

For me, these are not abstract concerns. I have been blessed over the last couple of years to be able to speak all around the country and talk with fel- low citizens about the challenges confronting African American commu- nities specifically and our democratic form of life generally. On college campuses from New Haven to Denver to Urbana, and in town-hall meet- ings from Oakland to Houston, I have invoked my pragmatic commitments as a basis for reimagining African American politics-to reject specious conceptions of black identity, facile formulations of black history, and easy appeals to black agency. I have insisted that we hold one another accountable and responsible in light of an understanding that democracy is a way of life and not merely a set of procedures—that it involves a certain moral and ethical stance and requires a particular kind of disposition committed to the cognitive virtues of free and open debate. I have urged young African Americans to take up the challenge to forge a politics that speaks to the particular problems of this moment and not simply to mimic the strategies and approaches of the black freedom struggle of the 1960s. I have done so because of my philosophical commitment to the idea that publics come into and out of existence all the time and that our challenge is to find the requisite tools to respond to the shifts and transformations that call new publics into being.

This book emerged out of these encounters. It carries the burden of making the case that pragmatism, rightly understood, offers resources for thinking about African American politics in the twenty-first century. As such, In a Shade of Blue isn't for the philosophically faint of heart. Chapter 1 is perhaps the most challenging, as it seeks to make clear the significance of John Dewey's moral and political philosophy. I hope that the gen- eral reader will find it worthwhile to persevere through the book's more difficult passages. My argument ends with the call for a "post-soul politics"—a form of political engagement that steps out of the shadows of the black freedom struggles of the sixties and rises to the challenges of our current moment with new voices, innovative thinking, and an unshakable commitment to the values of participatory democracy.

AND engaging in public sphere debates over issues like nuclear weapons is crucial to the success of Black movements. An Aff ballot can affirm multiple overlapping counter-publics simultaneously and even if we lose our framework arguments about materiality this evidence is an impact turn to rejecting optimism and democratic deliberation

Dawson (Professor of Political Science and Director of the Center for the Study of Race, Politics and Culture at the University of Chicago) **1**

(Michael C., BLACK VISIONS The Roots of Contemporary African-American Political Ideologies, pg. 321-3)

But building a mass base is not sufficient. One of the planks from the BRC "Principles of Unity" included the following language: "We must be democratic and inclusive in our dealings with one another" (Black Radical Congress 1998). To do so, however, means rebuilding a black counterpublic that allows people to air differences of opinion honestly and vigorously without worrying about having their "blackness" questioned. To build a successful political movement requires more. It means building overlapping counterpublics and public spheres which reach across the racial and other divisions that plague the American political landscape. It will also take considerably more than black willingness to engage in democratic debate about the nature and future of the country. It will require two components that have been sadly lacking from the political landscape. First, po- litical leaders must be willing to engage in a dialogue concerning race with- out either ducking and not engaging or resorting to race-baiting in order to gain votes, Second, white Americans in particular must be willing both to engage in such a debate and to seriously question the sources of their privilege as well as the legacy ofwhite supremacy, As Martin Luther King Jr. remarked thirty years ago, black nationalist resurgence is a reaction to the lack of active goodwill on the part of white America when it comes to matters of race and economics.
We must finally ask whether African Americans can rely on a totalizing ideology to shape our visions of black justice and our future in America. My answer is no. I believe we need a more flexible approach than ideologies such as black Marxism, black nationalism, and at least the Cold War version of liberalism have allowed. We need a black critical theory that draws on and combines liberalism's concern with individual rights and autonomy, republican concerns with community, socialist concern with an egalitarian society and economic justice for all, feminist traditions such as resistance to suppressing intragroup differences in the name of a false and oppressive unity, and blends these with recognition of the need for autonomous organization and cultural pride. No single world view or ideology comfortably accommodates all of these, But a critical theory can—and such a theory must be political. We've had a black aesthetic, black power, and a plethora of black public policy pronouncements. But a black *political* theory has to embody a theory of the state, power, human nature, and the good life. And such a theory must be based on the hope for and potential of the improvement of human nature while recognizing the wickedness of the world. Kantian pronouncements about systems that can be governed by devils have led us to a world where ethnic strife and nuclear and other horrors proliferate. We must strive for something better, something democratic, something cosmopolitan, not in the elite sense but in the sense that, since homogeneity is a thing of the past, even within states, we must fall back on our basic humanness. It is no coincidence that within American political thought this perspective appears most often in the black traditions and in black political thought, at least in the contemporary period—most often in the black feminist tradition, Thus the best legacy of black political ideologies for America is a tough, activist, inclusive democracy willing to challenge privileges of power and resources in the name of a grander vision which asserts that we are more than the mere aggregation of our individual preferences, Its morality, while democratic, would not be based on the latest consumer fad nor use the return to stockholders as the final arbiter of the public good, That we often fail in living up to our standards of justice within black activism as well as within America—that we are imperfect as individuals and as communities—does not mean, as King so eloquently demonstrated, that the vision itself is not a worthy goal. What black critical theory and e a c h b l a c k i d e o l o g y h a v e d e mo n s t r a t e d i s t h a t t h e d o a b l e , t h e

mu n d a n e , i n – c r è m e n t a l r e f o r m of the workings of American society is not enough; only the full promise of America has the potential to be truly liberating, Any other solution is not only unsatisfactory—it is likely to provoke the ldnd of deadly conflict most clearly seen in the Civil War but also seen today in the rapid upward spiral of political and personal violence which results as people measure their circumstances against what they see as the lies that fester at the center of the American Dream. Anew, black, critical theory needs to retain one aspect of black ideological visions, At the heart of all of the black visions is a sense of pragmatic optimism combined with a stead- fast determination to gain black justice. Both the optimism and the determination are needed now as ever to sustain the political projects and new visions of African Americans.

Death

Framing

Extinction O/W Generic

Life is a pre-requisite to death's symbolic value---fearing death doesn't preclude recognizing life's finitude and its inevitability---we can still create provisional value in life---individuals should have the option to live

Kalnow 9

(Cara Kalnow 9 A Thesis Submitted for the Degree of MPhil at the University of St. Andrews "WHY DEATH CAN BE BAD AND IMMORTALITY IS WORSE" https://research-repository.st-andrews.ac.uk/bitstream/10023/724/3/Cara%20Kalnow%20MPhil%20thesis.PDF)

(PA) also provided us with good reason to reject the Epicurean claim that the finitude of life cannot be bad for us. With (PA), we saw that our lives could accumulate value through the satisfaction of our desires beyond the boundaries of the natural termination of life. But Chapter Four determined that the finitude of life is a necessary condition for the value of life as such and that many of our human values rely on the finite temporal structure of life. I therefore argued that an indefinite life cannot present a desirable alternative to our finite life, because life as such would not be recognized as valuable. In this chapter, I have argued that the finitude of life is instrumentally good as it provides the recognition that life itself is valuable. Although I ultimately agree with the Epicureans that the finitude of life cannot be an evil, this conclusion was not reached from the Epicurean arguments against the badness of death, and I maintain that (HA) and (EA) are insufficient to justify changing our attitudes towards our future deaths and the finitude of life. Nonetheless, the instrumental good of the finitude of life that we arrived at through the consideration of immortality should make us realize that the finitude of life cannot be an evil; it is a necessary condition for the recognition that life as such is valuable. Although my arguments pertaining to the nature of death and its moral implications have yielded several of the Epicurean conclusions, my position still negotiates a middle ground between the Epicureans and Williams, as (PA) accounts for the intuition that it is rational to fear death and regard it as an evil to be avoided. I have therefore reached three of the Epicurean conclusions pertaining to the moral worth of the nature of death: (1) that the state of being dead is nothing to us, (2) death simpliciter is nothing to us, and (3) the finitude of life is a matter for contentment. But against the Epicureans, I have argued that we can rationally fear our future deaths, as categorical desires provide a disutility by which the prospect of death is rationally held as an evil to be avoided. Finally, I also claimed against the Epicureans, that the prospect of death can rationally be regarded as morally good for one if one no longer desires to continue living. 5.3 Conclusion I began this thesis with the suggestion that in part, the Epicureans were right: death—when it occurs—is nothing to us. I went on to defend the Epicurean position against the objections raised by the deprivation theorists and Williams. I argued that the state of being dead, and death simpliciter, cannot be an evil of deprivation or prevention for the person who dies because (once dead), the person—and the grounds for any misfortune—cease to exist. I accounted for the anti-Epicurean intuition 115 that it is rational to fear death and to regard death as an evil to be avoided, not because death simpliciter is bad, but rather because the prospect of our deaths may be presented to us as bad for us if our deaths would prevent the satisfaction of our categorical desires. Though we have good reasons to rationally regard the prospect of our own death as an evil for us, the fact that life is finite cannot be an evil and is in fact instrumentally good, because it takes the threat of losing life to recognize that life as such is valuable. In this chapter, I concluded that even though death cannot be of any moral worth for us once it occurs, we can attach two distinct values to death while we are alive: we can attach a value of disutility (or utility) to the prospect of our own individual deaths, and we must attach an instrumentally good value to the fact of death as such. How to decide on the balance of those values is a matter for psychological judgment.

Extinction O/W - Nietzsche

Global extinction risks require a revision of the politics of compassion – survival is still paramount. New risks dictate embracing our ethic DEPSITE their impacts

Winchester 94

(James J. Winchester teaches Philosophy at Spelman College

Nietzsche's Aesthetic Turn)

As uninformed as it is to assume that there is an easy connec- tion between his thought and National Socialism, it is neither diffi- cult nor misguided to consider his lack of social concern. Nietzsche saw one danger in our century, but failed to see a second. His critique of herd mentality reads like a prophetic warning against the dictatorships that have plagued and continue to haunt the twentieth cen- tury. But the context of our world has changed in ways that Nietzsche never imagined. We now have, as never before, the ability to destroy-the planet. The threat of the destruction of a society is not new. From the beginnings of Western literature in the Iliad and the Odyssey, the Western mind has contemplated the destruction that, for example, warfare has wrought. Although the Trojan war destroyed almost everyone involved, both the victors and the van- quished, it did not destroy the entire world. In the twentieth century, what has changed is the scale of destruction. If a few countries destroy the ozone layer, the whole world perishes, or if two countries fight a nuclear or biological war, the whole planet is threatened. This is something new in the history of the world/ The intercon- nectedness of the entire world has grown dramatically. We live, as never before, in a global community where our actions effect ever- larger numbers of the world's population. The earth's limits have become more apparent. Our survival depends on working together to solve problems like global pollution. **Granted** mass movements have instituted reigns of terror, **but** our survival as a planet is becoming ever-more predicated on community efforts of the sort that Nietzsche's thought seems to denigrate if not preclude. I do not criticize Nietzsche for failing to predict the rise of problems requiring communal efforts such as the disintegration of the ozone layer, acid rain, and the destruction of South American rain forests. Noting his lack of foresight and his occasional extrem- ism, I propose, in a Nietzschean spirit, to reconsider his particular tastes, without abandoning his aesthetic turn. Statements like "com- mon good is a self-contradiction" are extreme, even for Nietzsche. He was not always so radical. Yet there is little room in Nietzsche's egoism for the kind of cooperation and sense of community that is today so important for our survival. I am suggesting that the time for Nietzsche's radical individualism is past. There are compelling prag- matic and aesthetic reasons why we should now be more open to the positive possibilities of living in a community. There is nothing new about society's need to work together. What has changed is the level of interconnectedness that the technological age has pressed upon us.

AT Extinction Inev

Extinction does not make our efforts worthless.
Trisel 4

[Brooke Alan Trisel, Medical Facilities Consultant with the Ohio Department of Health, "Human Extinction and the Value of Our Efforts," *The Philosophical Forum*, Volume XXXV, Number 3, Fall, 2004, p. 390-391]

Although our works will not last forever, this should not matter if we accomplished what we set out to do when we created these works. Wanting our [end page 390] creations to endure forever was not likely part of our goal when we created them. If we accomplish our goals and then later in life conclude that these accomplishments were of no significance, then this is a sign that a desire for long-lastingness has crept into the standards that we use to judge significance. Escalating desires can lead to escalating standards since the standards that we establish reflect our goals and desires. Including long-lastingness as a criterion for judging the significance of our efforts is unreasonable. If one includes long-lastingness as part of the standard, then one will feel that it is necessary for humanity to persist forever. There is no need for humanity to live forever for our lives and works to be significant. If the standard that we adopt for judging significance does not include long-lastingness as part of the standard, then it will not matter whether humanity will endure for a long time. Like Tolstoy, we may be unable to keep from wanting to have our achievements remembered forever. We may also be unable to keep from wanting our works to be appreciated forever. But we can refrain from turning these desires into standards for judging whether our efforts and accomplishments are significant. If we can keep from doing this, it will be to our advantage. Then, during those times when we look back on life from an imagined perspective that encompasses times after humanity has become extinct, we will not conclude that our efforts amounted to nothing. Rather, we will conclude that many people made remarkable accomplishments that made their lives, and possibly the lives of others, better than they would have been if these goals had never been pursued. And if we expand our evaluation, as we should, to take into account all experiences associated with living, not just goal-related experiences, we will conclude not that life was empty, but that living was worthwhile.

AT Ressentiment

Ressentiment doesn't come first – extinction and material impacts do

Torbjörn **Tännsjö 11**, the Kristian Claëson Professor of Practical Philosophy at Stockholm University, 2011, "Shalt Thou Sometimes Murder? On the Ethics of Killing," online: http://people.su.se/~jolso/HS-texter/shaltthou.pdf

I suppose it is correct to say that, if Schopenhauer is right, if life is never worth living, then according to utilitarianism we should all commit suicide and put an end to humanity. But this does not mean that, each of us should commit suicide. I commented on this in chapter two when I presented the idea that utilitarianism should be applied, not only to individual actions, but to collective actions as well.¶ It is a well-known fact that people rarely commit suicide. Some even claim that no one who is mentally sound commits suicide. Could that be taken as evidence for the claim that people live lives worth living? That would be rash. Many people are not utilitarians. They may avoid suicide because they believe that it is morally wrong to kill oneself. It is also a possibility that, even if people lead lives not worth living, they believe they do. And even if some may believe that their lives, up to now, have not been worth living, their future lives will be better. They may be mistaken about this. They may hold false expectations about the future.¶ From the point of view of evolutionary biology, it is natural to assume that people should rarely commit suicide. If we set old age to one side, it has poor survival value (of one's genes) to kill oneself. So it should be expected that it is difficult for ordinary people to kill themselves. But then theories about cognitive dissonance, known from psychology, should warn us that we may come to believe that we live better lives than we do.¶ My strong belief is that most of us live lives worth living. However, I do believe that our lives are close to the point where they stop being worth living. But then it is at least not very far-fetched to think that they may be worth not living, after all. My assessment may be too optimistic.¶ Let us just for the sake of the argument assume that our lives are not worth living, and let us accept that, if this is so, we should all kill ourselves. As I noted above, this does not answer the question what we should do, each one of us. My conjecture is that we should not commit suicide. The explanation is simple. If I kill myself, many people will suffer. Here is a rough explanation of how this will happen: ¶ ... suicide "survivors" confront a complex array of feelings. Various forms of guilt are quite common, such as that arising from (a) the belief that one contributed to the suicidal person's anguish, or (b) the failure to recognize that anguish, or (c) the inability to prevent the suicidal act itself. Suicide also leads to rage, loneliness, and awareness of vulnerability in those left behind. Indeed, the sense that suicide is an essentially selfish act dominates many popular perceptions of suicide. ¶ The fact that all our lives lack meaning, if they do, does not mean that others will follow my example. They will go on with their lives and their false expectations — at least for a while devastated because of my suicide. But then I have an obligation, for their sake, to go on with my life. It is highly likely that, by committing suicide, I create more suffering (in their lives) than I avoid (in my life).

AT VTL

Preventing death is the first ethical priority – it's the only impact you can't recover from.

Bauman 95 Zygmunt Bauman, University of Leeds Professor Emeritus of Sociology, 1995, Life In Fragments: Essays In Postmodern Morality, p. 66-71

The **being-for is** like **living towards-the-future**: a being filled with anticipation, a being aware of the abyss between future foretold and future that will eventually be; it is this gap which, like a magnet, draws the self towards the Other,as it draws life towards the future, making life into an activity of overcoming, transcending, leaving behind. The self stretches towards the Other, as life stretches towards the future; neither can grasp what it stretches toward, but it is in this hopeful and desperate, never conclusive and never abandoned stretching-toward that the self is ever anew created and life ever anew lived. In the words of M. M. Bakhtin, it is only in this not-yet accomplished world of anticipation and trial, leaning toward stubbornly an-other Other, that life can be lived - not in the world of the `events that occurred'; in the latter world, `it is impossible to live, to act responsibly; in it, I am not needed, in principle I am not there at all." Art, the Other, the future: what unites them, what makes them into three words vainly trying to grasp the same mystery, is the modality of possibility. A curious modality, at home neither in ontology nor epistemology; itself, like that which it tries to catch in its net, `always outside', forever `otherwise than being'. The possibility we are talking about here is not the all-too-familiar unsure-of-itself, and through that uncertainty flawed, inferior and incomplete being, disdainfully dismissed by triumphant existence as `mere possibility', `just a possibility'; possibility is instead `plus que la reahte' - both the origin and the foundation of being. The hope, says Blanchot, proclaims the possibility of that which evades the possible; `in its limit, this is the hope of the bond recaptured where it is now lost."' The hope is always the hope of *being fu filled,* but what keeps the hope alive and so keeps the being open and on the move is precisely its *unfu filment.* One may say that the paradox *of hope* (and the paradox of possibility founded in hope) is that it may pursue its destination solely through betraying its nature; the most exuberant of energies expends itself in the urge towards rest. Possibility uses up its openness in search of closure. Its image of the better being is its own impoverishment . . . The togetherness of the being-for is cut out of the same block; it shares in the paradoxical lot of all possibility. It lasts as long as it is unfulfilled, yet it uses itself up in never ending effort of fulfilment, of recapturing the bond, making it tight and immune to all future temptations. In an important, perhaps decisive sense, it is selfdestructive and self-defeating: its triumph is its death. The Other, like restless and unpredictable art, like the future itself, is a *mystery.* And being-for-the-Other, going towards the Other through the twisted and rocky gorge of affection, brings that mystery into view - makes it into a challenge. That mystery is what has triggered the sentiment in the first place - but cracking that mystery is what the resulting movement is about. The mystery must be unpacked so that the being-for may focus on the Other: one needs to know what to focus on. (The `demand' is *unspoken,* the responsibility undertaken is *unconditional;* it is up to him or her who follows the demand and takes up the responsibility to decide what the following of that demand and carrying out of that responsibility means in practical terms.) Mystery - noted Max Frisch - (and the Other is a mystery), is an exciting puzzle, but one tends to get tired of that excitement. `And so one creates for oneself an image. This is a loveless act, the betrayal." Creating an image of the Other leads to the substitution of the image for the Other; the Other is now fixed - soothingly and comfortingly. There is nothing to be excited about anymore. I know what the Other needs, I know where my responsibility starts and ends. Whatever the Other may now do will be taken down and used against him. What used to be received as an exciting surprise now looks more like perversion; what used to be adored as exhilarating creativity now feels like wicked levity. Thanatos has taken over from Eros, and the excitement of the ungraspable turned into the dullness and tedium of the grasped. But, as Gyorgy Lukacs observed, `everything one person may know about another is only expectation, only potentiality, only wish or fear, acquiring reality only as a result of what happens later, and this reality, too, dissolves straightaway into potentialities'. **Only death, with its finality and irreversibility, puts an end to** the musical-chairs game of **the real and the potential** - it **once and for all closes the embrace of togetherness which was before** invitingly **open** and tempted the lonely self." `Creating an image' is the dress rehearsal of that death. But creating an image is the inner urge, the constant temptation, the *must* of all affection . . . It is the loneliness of being abandoned to an unresolvable ambivalence and an unanchored and formless sentiment which sets in motion the togetherness of being-for. But what loneliness seeks in togetherness is an end to its present condition - an end to itself. Without knowing - without being capable of knowing - that the hope to replace the vexing loneliness with togetherness is founded solely on its own unfulfilment, and that once loneliness is no more, the togetherness (the being-for togetherness) must also collapse, as it cannot survive its own completion. What the loneliness seeks in togetherness (suicidally for its own cravings) is the foreclosing and pre-empting of the future, cancelling the future before it comes, robbing it of mystery but also of the possibility with which it is pregnant. Unknowingly yet necessarily, it seeks it all to its own detriment, since the success (if there is a success) may only bring it back to where it started and to the condition which prompted it to start on the journey in the first place. **The togetherness of being-for is always in the future**, and nowhere else. It is no more once the self proclaims: `I have arrived', `I have done it', `I fulfilled my duty.' The being-for starts from the realization of the bottomlessness of the task, and ends with the declaration that the infinity has been exhausted. **This is the tragedy of being-for - the reason why it cannot but be death-bound while simultaneously remaining an undying attraction**. In this tragedy, there are many happy moments, but no happy end. **Death is always the foreclosure of possibilities**, and it comes eventually in its own time, even if not brought forward by the impatience of love. **The catch is to direct the affection to staving off the end,** and to do this against the affection's nature. What follows is that, if moral relationship is grounded in the being-for togetherness (as it is), then it can exist as a project, and guide the self's conduct only as long as its nature of a project (a not yet-completed project) is not denied. **Morality, like the future itself, is forever not-yet.** (And this is why the ethical code, any ethical code, the more so the more perfect it is by its own standards, supports morality the way the rope supports the hanged man.) It is because of our loneliness that we crave togetherness. It is because of our loneliness that we open up to the Other and allow the Other to open up to us. It is because of our loneliness (which is only belied, not overcome, by the hubbub of the being-with) that we turn into moral selves. And **it is only through allowing the togetherness its possibilities which only the future can disclose that we stand a chance of acting morally**, and sometimes even of being good, **in the present**.

AT Nietzsche Link

Resentment of particular aspects of the world is inevitable and necessary to spur action – acting to change the world is life affirming
Connolly 11

(William E., A World of Becoming, Duke University Press)

By "belief in this world:' neither Deleuze nor I, again, means that the established distribution of power, exploitation, and inequality now in place is to be protected, though some critics love to jump to this conclusion. Such arrangements make people suffer too much, and they rest upon the repression of essential features of the contemporary condition, including the minoritization of the world occurring at a more rapid pace. Exploitation and domination are things to contest and oppose, as Deleuze did actively while embracing the points reviewed above. The restoration of belief in this world provides an existential resource to draw upon as those struggles are fought energetically and creatively. Nor do we mean that it is always illegitimate to resent your place in the world. Resentment is often a needed impetus to action, even if it carries the danger of becoming transfigured into ressontimont. It is existential resentment we worry about most, the kind that is apparent today in practices of capitalist greed, religious exclusivity; media bellicosity, authoritarian strategies, sexual narrowness, and military aggression. We mean, first, positive affirmation of the cosmos in which human beings are set, as you yourself understand that cosmos, second, coming to terms in a positive way with the enduring modem fact of interruptions in experience and the faster pace at which minorithation occurs, and third, accepting the contestability of your existential creed without profound resentment of that condition.

AT Excess of Language

***The part of language that always exceeds control or intention is not the end of the possibility of communication or subjectivity, it is the beginning**
Connolly 11

(William E., A World of Becoming, Duke University Press)

Affect consists of relatively mobile energies with powers that flow into conscious, cultural feeling and emotion; yet these affective energies also exceed the formations they help to foment. Affect has an element of wildness in it. The human being thus absorbs pressures from the world that both help to compose its subjectivity and exceed it. There is no transcendental subject, but rather an emergent, layered subject. Emotion with no affect would be dead, merely a pile of words as empty containers; emotion and mood filled with affect often brim over with energy-potentials that exceed ready-made articulations. The outside, affect, and the politics of becoming are thus interinvolved. Seers make more of such a network of inter-involvements than most of us do.

We must constantly hold intention the incompleteness of communication and its necessity for acting in the world
Connolly 11

(William E., A World of Becoming, Duke University Press)

The powers of the nutty professor limit him from another direction: the unruly mass of incipiencies pressing urgently upon him inhibit his efficacy in everyday life; they can even stop an incipient thought from being consolidated enough to pose a challenge to this or that cliché -that is, to disturb something in settled understandings of God, identity, morality, tolerance, causality, justice, finance, reason, or scientific method. The unruly swarm of incipiencies consists of half-formed tendencies, while the operational world of well formed judgments and resolute action unavoidably blocks, diverts, or absorbs some things on the way in order to attain coherence and stability. This is the paradox residing in the human experience of temporality as such. Everyone, including the most creative thinker, is thus doomed to be less than they could be. This may explain why many viewers of The Nutty Professor tacitly include themselves among the objects of friendly disparagement, as they laugh good naturedly at the hapless teacher. Such laughter may express a paradox of being in the world: the persistent discrepancy between the stereotypes appropriate to action-oriented perception and communication on the one side and the loss of bearings needed to think experimentally under new conditions on the other. Both modalities are part of being in the world; each interferes with the efficacy of the other. This, again, is the paradoxical condition of being in the world that Henri Bergson understood so well and that theorists need to negotiate sensitively in the contemporary world of becoming in which things often move faster than heretofore. The need is to negotiate a new balance between action-oriented perception and dwelling in fecund moments of temporal disequilibrium.

The acceleration of certain facets of technology and lived experience do not end the possibility of acting positively in the world nor do they eliminate the possibility of agency. Affirming a world constantly in a state of becoming is a founding condition for agency that their strives towards mastery nor gives up on the possibility of making a little bit better
Connolly 11

(William E., A World of Becoming, Duke University Press)

You may initially connect the temper I commend to "optimism" or "romanticism" rather than to the pessimism, coolness, realism, or abiding sense of the negative that you respect. I don't see it that way, though. My sense is that those who jump to such a conclusion have too limited an arsenal of ontological alternatives available. To appreciate two registers of experience in a world of becoming can also help us come to. terms with tragic possibility. Such an appreciation encourages us to embrace the world as we act and intervene resolutely in it, even though it is replete with neither divine providence nor ready susceptibility to human mastery. Indeed, I doer read the absence of providence or mastery as a "lack;' finding the use of that term by some to express a hangover of previous views inadequately overcome in the view officially adopted. I also know that shared experiences of grief or loss can help to consolidate connections with others, and that collective anger, resentment, and indignation are often indispensable spurs to critical action. So there is no sense here that "thinking it is so makes it so" or that "optimism is always healthy?' These orientations are attached to a different take on existence than that advanced here, though there are people who confuse the two. I do suspect that when inordinate drives for individual self-sufficiency, unity, community, consensus, or divine redemption are severely disappointed, things can become dangerous. These disappointed drives -I am sure there• are others as wellreadily cross over into entrenched dispositions to take revenge on the most fundamental terms of human existence, as a person, a constituency, or a putative nation grasps those terms. If and when that happens, an exclusionary, punitive, scandal-ridden, bitter politics is aprto result, regardless of how the carriers represent themselves to others. Here actions speak louder than words . . . .

 A world of becoming has considerable evidence on its side, as we shall. see; and affirmation of this condition without existential taut provides one way to act resolutely in the world while warding off individual and collective drives to existential resentment. There are others, as we. shall also see. Given the human predicament (explored in chapter 4), no theological or nontheological perspective at this level carries iron-clad guarantees. A crack or fissure running through every final perspective is part of the human predicament as I construe it . .. . H

On my rendering, the course of time is neither governed solely by a pattern of efficient causation -where each event is determined to occur by some prior event in linear temporal order - nor expressive of an inherent purpose revolving around the human animal as such. Neither/nor. To put it indifferent terms, time is neither mechanical nor organic, and its human apprehension is neither susceptible to the method of "individualism" nor that of "holism? We participate, rather, in a world of becoming in a universe set on multiple zones of temporality, with each temporal force-field periodically encountering others as outside forces, and the whole universe open to an uncertain degree. From this perspective, tragic possibility-not inevitability but possibility- is real: tragic possibility as seen from the vantage point of your time or country or species; tragic possibility sometimes actualized through the combination of hubris and an unlikely conjunction of events. Or by some other combination. I even suspect that differential degrees of agency in other force-fields, with which we enter into encounters of many types, increases the risk of that possibility. The universe is not only open; there is an "outside" to every temporal force-field. We are not only limited as agents, but part of our limitation comes from the different degrees of agency in other force-fields

with which we interact. The operation of multiple tiers of becoming in a world without a higher purpose amplifies the need to act with dispatch, and sometimes with militancy, in particular situations of stress. The fact that we are not consummate agents in such a world, combined with the human tendency to hubris, means that we must work to cultivate wisdom under these very circumstances. These two dictates, engendering each other while remaining in tension, constitute the problematic of political action in a world of becoming.

William James, Henri Bergson, Ptiedrich Nietzsche, Alfred North Whitehead, and Glues Deleuze all advance different versions of time as becoming. Perhaps Merleau-Ponty and Marcel Proust do too, with qualifications. I draw from several of them the idea that it takes both philosophical speculation linked to scientific experiment and dwelling in uncanny experiences of duration to vindicate such an adventure. Both. Luckily, as we shall see, some strains of complexity theory in the natural sciences also support the theme of time as becoming as they compose new experiments and rework classical conceptions of causality. Moreover, in everyday life fugitive glimmers of becoming are available to more people more of the time, as we experience the acceleration of many zones of life, the enhanced visibility of natural disasters across the globe, the numerous pressures to minoritize the entire world along several dimensions at a more rapid pace, the globalization of capital and contingency together, the previously unexpected ingress of capital into climate change, the growing number of film experiments with the uncanniness of time, and the enlarged human grasp of the intelligence and differential degrees of agency in other plant and animal species. Such experiences and experiments together call into question early modem conceptions of time. Many. respond to such experiences by intensifying religious and secular drives to protect an established image, as either linear and progres-. sive or infused with divine providence. I suspect, however, that such responses - unless their proponents actively engage the comparative contestsbility of them without deep existential resentment-can amplify the dangers and destructiveness facing our time Or, at least, they need to be put into more active competition with a conception that speaks to an array of contemporary experiences otherwise pushed into the shadows.

To amplify the experience of becoming is one affirmative way to belong to time today. Active exploration and support of such a perspective can make a positive contribution to the late-modem period by drawing more people• toward such a perspective or by showing others how much work they need to do to vindicate their own perspective. I belong to a growing contingent who think that a perspective defined by active examination of becoming can make positive contributions to explorations of spirituality, economics, political action, poetic experience, and ethics.

As already indicated, periodic sensitivity to a rich drop of time merely sets a threshold condition to, entertain the themes advanced here. More is needed to endow them with plausibility. The threshold condition, nonetheless, may be important, for it opens a window to place the theme of a world of becoming in relation to other conceptions of time and it may increase the possibility of positive engagement between bearers of alternative ontotheological images of time. I wish you had been at that party with me.

Impact D

AT Biopower

No impact – democratic norms and civil society check totalitarianism and genocide
Dickinson, associate professor of history – UC Davis, **'4**

(Edward, Central European History, 37.1)

In short, the continuities between early twentieth-century biopolitical discourse and the practices of the welfare state in our own time are unmistakable. Both are instances of the "disciplinary society" and of biopolitical, regulatory, social-engineering modernity, and they share that genealogy with more authoritarian states, including the National Socialist state, but also fascist Italy, for example. And it is certainly fruitful to view them from this very broad perspective. **But that analysis can easily become superficial and misleading**, because it obfuscates the **profoundly different** strategic and local dynamics of power in the two kinds of regimes. Clearly the democratic welfare state is not only formally but also substantively **quite different from totalitarianism.** Above all, again, it has nowhere developed the fateful, radicalizing dynamic that characterized National Socialism (or for that matter Stalinism), the psychotic logic that leads from economistic population management to mass murder. Again, there is always the potential for such a discursive regime to generate coercive policies. In those cases in which the regime of rights does not successfully produce "health," such a system can —and historically does— create compulsory programs to enforce it. But again, there are political and policy potentials and constraints in such a structuring of biopolitics that are very different from those of National Socialist Germany. Democratic biopolitical regimes require, enable, and incite a degree of self-direction and participation that is **functionally incompatible** with authoritarian or totalitarian structures. And this pursuit of biopolitical ends through a regime of democratic citizenship does appear, historically, to have imposed increasingly **narrow limits on coercive policies**, and to have generated a "logic" or imperative of increasing liberalization. Despite limitations imposed by political context and the slow pace of discursive change, I think this is the unmistakable message of the really very impressive waves of legislative and welfare reforms in the 1920s or the 1970s in Germany.90 Of course it is not yet clear whether this is an irreversible dynamic of such systems. Nevertheless, such regimes are characterized by sufficient degrees of autonomy (and of the potential for its expansion) for sufé cient numbers of people that I think it becomes useful to conceive of them as productive of a strategic coné guration of power relations that might fruitfully be analyzed as a condition of "liberty," just as much as they are productive of constraint, oppression, or manipulation. At the very least, **totalitarianism cannot be the sole orientation point** for our understanding of biopolitics, the only end point of the logic of social engineering. **This notion is not** at all **at odds with the core of Foucauldian** (and Peukertian) **theory.** Democratic welfare states are regimes of power/knowledge no less than early twentieth-century totalitarian states; these systems are not "opposites," in the sense that they are two alternative ways of organizing the same thing. But they are two very different ways of organizing it. The concept "power" should not be read as a universal stiè ing night of oppression, manipulation, and entrapment, in which all political and social orders are grey, are essentially or effectively "the same." Power is a set of social relations, in which individuals and groups have varying degrees of autonomy and effective subjectivity. And discourse is, as Foucault argued, "tactically polyvalent." Discursive elements (like the various elements of biopolitics) can be combined in different ways to form parts of quite different strategies (like totalitarianism or the democratic welfare state); they cannot be assigned to one place in a structure, but rather circulate. The varying possible constellations of power in modern societies create "multiple modernities," modern societies with quite **radically differing potentials.**91

Their internal link is terrible causality and empirically denied
Amy 7, professor of Politics at Mount Holyoke College

(Douglas, "More Government Does Not Mean Less Freedom," Government is Good, http://governmentisgood.com/articles.php?aid=18&print=1)

The minimal-government crowd uses this "more government = less freedom" formula to make all sorts of alarmist claims. For example, **some suggest that every increase in government power is a step down the road to totalitarianism and repression.** This is a favorite argument of many conservatives and they use it to oppose even small and seemingly reasonable increases in government programs or regulations. For example, they argue is that if we allow the government to insist on background checks to buy guns, this will lead to mandatory gun registration, which will eventually lead to confiscation of guns, and this will put the government in a position to repress a disarmed and helpless citizenry. Or they suggest that legalizing assisted-suicide for terminally ill patients will only set the stage for government euthanasia programs aimed at the handicapped and others. Or they fear that mandating non-smoking areas is merely a step toward outlawing cigarettes altogether. Or they contend that if we allow environmental regulations to restrict how an owner deals with wetlands on their property, we are going down a road in which property rights will eventually be meaningless because the state will control all property. This seems to be the view of the conservative judge Janice Rogers – one of George W. Bush's appointees to the federal judiciary. In one of her opinions, she railed against local restrictions on the rights of real estate developers in California and concluded that "Private property, already an endangered species in California, is now entirely extinct in San Francisco."6 In his book, Defending Government, Max Nieman has labeled this argument the "Big Brother Road to Dictatorship." It suggests that the expansion of government powers in the U.S. during the last 75 years has been inevitably leading us down the path toward totalitarianism. But as he has noted, **there is** really **no** valid **evidence for this theory**. If we look at how **modern dictatorships** have come about, they **have not been the product of gradually increasing social programs and regulations** over property and business. As Neiman explains: It is common among conservative critics of public sector activism to characterize government growth in the arena of social welfare, environment, consumer and worker protection, and income security as steps toward the loss of liberty and even totalitarianism. Many critics of the emergence of the modern social welfare state … have tried to convey the sense that the road to totalitarian hell is paved with the good intentions of the social democratic program. …There is no record, however, of any oppressive regime having taken power by advancing on the social welfare front. Lenin and Stalin, Mussolini, Mao Tse-tung, Fidel Castro, and Chile's Pinochet did not consolidate power by gradually increasing social welfare programs, taxes, and regulation of the environment or workplace. **Rather, these assaults on personal freedom and democratic governance** involved **limitation on civil rights and political rights, the legitimization of oppression and discrimination against disfavored or unpopular groups,** and the centralization and expansion of military and policy forces. **Hitler did not become the supreme ruler of the Nazi state by first taking over the health department.**7

AT Endless War

No risk of endless warfare
GRAY 7

(Colin, Director of the Centre for Strategic Studies and Professor of International Relations and Strategic Studies at the University of Reading, graduate of the Universities of Manchester and Oxford, Founder and Senior Associate to the National Institute for Public Policy, [July 2007, "The Implications of Preemptive and Preventive War Doctrines: A Reconsideration," http://www.ciaonet.org/wps/ssi10561/ssi10561.pdf)

7. A policy that favors preventive warfare expresses a futile quest for absolute security. It could do so. Most controversial policies contain within them the possibility of misuse. In the hands of a paranoid or boundlessly ambitious political leader, prevention could be a policy for endless warfare. However, the American political system, with its checks and balances, was designed explicitly for the purpose of constraining the executive from excessive folly. Both the Vietnam and the contemporary Iraqi experiences reveal clearly that although the conduct of war is an executive prerogative, in practice that authority is disciplined by public attitudes. Clausewitz made this point superbly with his designation of the passion, the sentiments, of the people as a vital component of his trinitarian theory of war. 51 It is true to claim that power can be, and indeed is often, abused, both personally and nationally. It is possible that a state could acquire a taste for the apparent swift decisiveness of preventive warfare and overuse the option. One might argue that the easy success achieved against Taliban Afghanistan in 2001, provided fuel for the urge to seek a similarly rapid success against Saddam Hussein's Iraq. In other words, the delights of military success can be habit forming. On balance, claim seven is not persuasive, though it certainly contains a germ of truth. A country with unmatched wealth and power, unused to physical insecurity at home—notwithstanding 42 years of nuclear danger, and a high level of gun crime—is vulnerable to demands for policies that supposedly can restore security. But we ought not to endorse the argument that the United States should eschew the preventive war option because it could lead to a futile, endless search for absolute security. One might as well argue that the United States should adopt a defense policy and develop capabilities shaped strictly for homeland security approached in a narrowly geographical sense. Since a president might misuse a military instrument that had a global reach, why not deny the White House even the possibility of such misuse? In other words, constrain policy ends by limiting policy's military means. This argument has circulated for many decades and, it must be admitted, it does have a certain elementary logic. It is the opinion of this enquiry, however, that the claim that a policy which includes the preventive option might lead to a search for total security is not at all convincing. Of course, folly in high places is always possible, which is one of the many reasons why popular democracy is the superior form of government. It would be absurd to permit the fear of a futile and dangerous quest for absolute security to preclude prevention as a policy option. Despite its absurdity, this rhetorical charge against prevention is a stock favorite among prevention's critics. It should be recognized and dismissed for what it is, a debating point with little pragmatic merit. And strategy, though not always policy, must be nothing if not pragmatic.

No endless war

Rodwell 5

(Jonathan Rodwell is a PhD student at Manchester Met. researching the U.S. Foreign Policy of the late 70's / rise of 'neo-cons' and Second Cold War, "Trendy But Empty: A Response to Richard Jackson," http://www.49thparallel.bham.ac.uk/back/issue15/rodwell1.htm)

To be specific if the U.S. and every other nation is continually reproducing identities through 'othering' it is a constant and universal phenomenon that fails to help us understand at all why one result of the othering turned out one way and differently at another time. For example, how could one explain how the process resulted in the 2003 invasion of Iraq but didn't produce a similar invasion of Afghanistan in 1979 when that country (and by the logic of the Regan administrations discourse) the West was threatened by the 'Evil Empire'. By the logical of discourse analysis in both cases these policies were the result of politicians being able to discipline and control the political agenda to produce the outcomes. So why were the outcomes not the same? To reiterate the point how do we explain that the language of the War on Terror actually managed to result in the eventual Afghan invasion in 2002? Surely it is impossible to explain how George W. Bush was able to convince his people (and incidentally the U.N and Nato) to support a war in Afghanistan without referring to a simple fact outside of the discourse; the fact that a known terrorist in Afghanistan actually admitted to the murder of thousands of people on the 11h of Sepetember 2001. The point is that if the discursive 'othering' of an 'alien' people or group is what really gave the U.S. the opportunity to persue the war in Afghanistan one must surly wonder why Afghanistan. Why not North Korea? Or Scotland? If the discourse is so powerfully useful in it's own right why could it not have happened anywhere at any time and more often? Why could the British government not have been able to justify an armed invasion and regime change in Northern Ireland throughout the terrorist violence of the 1980's? Surely they could have just employed the same discursive trickery as George W. Bush? Jackson is absolutely right when he points out that the actuall threat posed by Afghanistan or Iraq today may have been thoroughly misguided and conflated and that there must be more to explain why those wars were enacted at that time. Unfortunately that explanation cannot simply come from the result of inscripting identity and discourse. On top of this there is the clear problem that the consequences of the discursive othering are not necessarily what Jackson would seem to identify. This is a problem consistent through David Campbell's original work on which Jackson's approach is based[iii]. David Campbell argued for a linguistic process that 'always results in an other being marginalized' or has the potential for 'demonisation'[iv]. At the same time Jackson, building upon this, maintains without qualification that the systematic and institutionalised abuse of Iraqi prisoners first exposed in April 2004 "is a direct consequence of the language used by senior administration officials: conceiving of terrorist suspects as 'evil', 'inhuman' and 'faceless enemies of freedom creates an atmosphere where abuses become normalised and tolerated"[v]. The only problem is that the process of differentiation does not actually necessarily produce dislike or antagonism. In the 1940's and 50's even subjected to the language of the 'Red Scare' it's obvious not all Americans came to see the Soviets as an 'other' of their nightmares. And in Iraq the abuses of Iraqi prisoners are isolated cases, it is not the case that the U.S. militarily summarily abuses prisoners as a result of language. Surely the massive protest against the war, even in the U.S. itself, is also a self evident example that the language of 'evil' and 'inhumanity' does not necessarily produce an outcome that marginalises or demonises an 'other'. Indeed one of the points of discourse is that we are continually differentiating ourselves from all others around us without this necessarily leading us to hate fear or abuse anyone.[vi] Consequently, the clear fear of the Soviet Union during the height of the Cold War, and the abuses at Abu Ghirab are unusual cases. To understand what is going on we must ask how far can the process of inscripting identity really go towards explaining them? As a result at best all discourse analysis provides us with is a set of universals and a heuristic model

Endless violence is not a thing

Chandler 9

(David, Westminster IR professor, "War Without End(s): Grounding the Discourse of `Global War'", Security Dialogue, 40.3, SAGE)

Western governments appear to portray some of the distinctive characteristics that Schmitt attributed to 'motorized partisans', in that the shift from narrowly strategic concepts of security to more abstract concerns reflects the fact that Western states have tended to fight free-floating and non-strategic wars of aggression without real enemies at the same time as professing to have the highest values and the absolute enmity that accompanies these. The government policy documents and critical frameworks of 'global war' have been so accepted that it is assumed that it is the strategic interests of Western actors that lie behind the often irrational policy responses, with

'global war' thereby being understood as merely the extension of instrumental struggles for control. **This perspective seems unable to contemplate the possibility that it is the lack of a strategic desire for control that drives and defines 'global' war today.** Very few studies of the 'war on terror' start from a study of the Western actors themselves rather than from their declarations of intent with regard to the international sphere itself. This methodological framing inevitably makes assumptions about strategic interactions and grounded interests of domestic or international regulation and control, which are then revealed to explain the proliferation of enemies and the abstract and metaphysical discourse of the 'war on terror' (Chandler, 2009a). For its radical critics, the abstract, global discourse merely reveals the global intent of the hegemonizing designs of biopower or neoliberal empire, as critiques of liberal projections of power are 'scaled up' from the international to the global. Radical critics working within a broadly Foucauldian problematic have no problem grounding global war in the needs of neoliberal or biopolitical governance or US hegemonic designs. These critics have produced numerous frameworks, which seek to assert that global war is somehow inevitable, based on their view of the needs of late capitalism, late modernity, neoliberalism or biopolitical frameworks of rule or domination. From the declarations of global war and practices of military intervention, rationality, instrumentality and strategic interests are read in a variety of ways (Chandler, 2007). Global war is taken very much on its own terms, with the declarations of Western governments explaining and giving power to radical abstract theories of the global power and regulatory might of the new global order of domination, hegemony or empire. The alternative reading of 'global war' rendered here seeks to clarify that the declarations of global war are a sign of the **lack of political stakes** and strategic structuring of the international sphere **rather than frameworks for asserting global domination**. We increasingly see Western diplomatic and military interventions presented as justified on the basis of value-based declarations, rather than in traditional terms of interest-based outcomes. This was as apparent in the wars of humanitarian intervention in Bosnia, Somalia and Kosovo – where there was no clarity of objectives and therefore little possibility of strategic planning in terms of the military intervention or the post-conflict political outcomes – as it is in the 'war on terror' campaigns, still ongoing, in Afghanistan and Iraq. There would appear to be a **direct relationship between the lack of strategic clarity shaping and structuring interventions and the lack of political stakes involved in their outcome.** In fact, the globalization of security discourses seems to reflect the **lack of political stakes rather than the urgency of the security threat** or of the intervention. Since the end of the Cold War, the central problematic could well be grasped as one of withdrawal and the emptying of contestation from the international sphere rather than as intervention and the contestation for control. The disengagement of the USA and Russia from sub-Saharan Africa and the Balkans forms the backdrop to the policy debates about sharing responsibility for stability and the management of failed or failing states (see, for example, Deng et al., 1996). It is the lack of political stakes in the international sphere that has meant that the latter has become more open to ad hoc and **arbitrary interventions** as states and international institutions use the **lack of strategic imperatives** to **construct their own meaning through intervention**. As Zaki Laïdi (1998: 95) explains: war is not waged necessarily to achieve predefined objectives, and it is in waging war that the motivation needed to continue it is found. In these cases – of which there are very many – war is no longer a continuation of politics by other means, as in Clausewitz's classic model – but sometimes the initial expression of forms of activity or organization in search of meaning. …. War becomes not the ultimate means to achieve an objective, but the most 'efficient' way of finding one. **The lack of political stakes in the international sphere would appear to be the precondition for the globalization of security discourses and the ad hoc and often arbitrary decisions to go to 'war'.** In this sense, global wars reflect the fact that the international sphere has been reduced to little more than a vanity mirror for globalized actors who are **freed from strategic necessities** and **whose concerns are no longer structured in the form of political struggles against 'real enemies'**. The mainstream critical approaches to global wars, with their heavy reliance on recycling the work of Foucault, Schmitt and Agamben, appear to invert this reality, portraying the use of military firepower and the implosion of international law as a product of the high stakes involved in global struggle, rather than the lack of clear contestation involving the **strategic accommodation of diverse powers and interests**.

No global war impact

Teschke 11

(Benno Gerhard, IR prof at the University of Sussex, "Fatal attraction: a critique of Carl Schmitt's international political and legal theory", International Theory (2011), 3 : pp 179-227)

For at the centre of the heterodox – partly post-structuralist, partly realist – neo-Schmittian analysis stands the conclusion of The Nomos: the thesis of a structural and continuous relation between liberalism and violence (Mouffe 2005, 2007; Odysseos 2007). It suggests that, in sharp contrast to the liberal-cosmopolitan programme of 'perpetual peace', the geographical expansion of liberal modernity was accompanied by the intensification and de-formalization of war in the international construction of liberal-constitutional states of law and the production of liberal subjectivities as rights-bearing individuals. Liberal world-ordering proceeds via the conduit of wars for humanity, leading to Schmitt's 'spaceless universalism'. In this perspective, a straight line is drawn from WWI to the War on Terror to verify Schmitt's long-term prognostic of the 20th century as the age of 'neutralizations and de-politicizations' (Schmitt 1993). But this attempt to read the history of 20th century international relations in terms of a succession of confrontations between the carrier-nations of liberal modernity and the criminalized foes at its outer margins seems unable to comprehend the complexities and specificities of 'liberal' world-ordering, then and now. For in the cases of Wilhelmine, Weimar and fascist Germany, the assumption that their conflicts with the Anglo-American liberal-capitalist heartland were grounded in an antagonism between liberal modernity and a recalcitrant Germany outside its geographical and conceptual lines runs counter to the historical evidence. For this reading presupposes that late-Wilhelmine Germany was not already substantially penetrated by capitalism and fully incorporated into the capitalist world economy, posing the question of whether the causes of WWI lay in the capitalist dynamics of inter-imperial rivalry (Blackbourn and Eley 1984), or in processes of belated and incomplete liberal-capitalist development, due to the survival of 're-feudalized' elites in the German state classes and the marriage between 'rye and iron' (Wehler 1997). It also assumes that the late-Weimar and early Nazi turn towards the construction of an autarchic German regionalism – Mitteleuropa or Großraum – was not deeply influenced by the international ramifications of the 1929 Great Depression, but premised on a purely political–existentialist assertion of German national identity. Against a reading of the early 20th century conflicts between 'the liberal West' and Germany as 'wars for humanity' between an expanding liberal modernity and its political exterior, there is more evidence to suggest that these confrontations were interstate conflicts within the crisis-ridden and nationally uneven capitalist project of modernity. Similar objections and caveats to the binary opposition between the Western discourse of liberal humanity against non-liberal foes apply to the more recent period. For how can this optic explain that the 'liberal West' coexisted (and keeps coexisting) with a large number of pliant authoritarian client-regimes (Mubarak's Egypt, Suharto's Indonesia, Pahlavi's Iran, Fahd's Saudi-Arabia, even Gaddafi's pre-intervention Libya, to name but a few), which were and are actively managed and supported by the West as anti-liberal Schmittian states of emergency, with concerns for liberal subjectivities and Human Rights secondary to the strategic interests of political and geopolitical stability and economic access? Even in the more obvious cases of Afghanistan, Iraq, and, now, Libya, the idea that Western intervention has to be conceived as an encounter between the liberal project and a series of foes outside its sphere seems to rely on a denial of their antecedent histories as geopolitically and socially contested state-building projects in pro-Western fashion, deeply co-determined by long histories of Western anti-liberal colonial and post-colonial legacies. If these states (or social forces within them) turn against their imperial masters, the conventional policy expression is 'blowback'. And as the Schmittian analytical vocabulary does not include a conception of human agency and social forces – only friend/enemy groupings and collective political entities governed by executive decision – it also lacks the categories of analysis to comprehend the social dynamics that drive the struggles around sovereign power and the eventual overcoming, for example, of Tunisian and Egyptian states of emergency without US-led wars for humanity. Similarly, it seems unlikely that the generic idea of liberal world-ordering and the production of liberal subjectivities can actually explain why Western intervention seems improbable in some cases (e.g. Bahrain, Qatar, Yemen or Syria) and more likely in others (e.g. Serbia, Afghanistan, Iraq, and Libya). Liberal world-ordering consists of differential strategies of building, coordinating, and drawing liberal and anti-liberal states into the Western orbit, and overtly or covertly intervening and refashioning them once they step out of line. These are conflicts within a world, which seem to push the term liberalism beyond its original meaning. The generic Schmittian idea of a liberal 'spaceless universalism' sits uncomfortably with the realities of maintaining an America-supervised 'informal empire', which has to manage a persisting interstate system in diverse and case-specific ways. But it is this persistence of a worldwide system of states, which encase national particularities, which renders challenges to American supremacy possible in the first place.

AT Lashout

No internal link to their lash out impact – It is only when the desire for revenge and redemptive justice is allowed to take precedence is action against suffering resentful and dangerous
Connolly 11

(William E., A World of Becoming, Duke University Press)

It is perhaps salient to point out again how my attention to the rolling and roiling interactions between hubris and existential resentment does not carry with it a denial of the positive role that anger, resentment, indignation, and the like can and do play in politics. ==There is no politics without passion.== ==It is when the trials of life== /==or the hubris of mastery slide into institutionally== ==embedded drives to existential revenge that things become most dangerous.== ==That is a risk accompanying any and every positive social movement==. As we saw in chapter 3, it is also a risk that we should engage self-critically as we respond to new configurations of struggle.

AT Ressentiment/Victimization

Resentment of particular aspects of the world is inevitable and necessary – it is only Loyola's resentment of the very terms of human experience that is truly dangerous. We must begin with an affirmation of belief in the world
Connolly 11

(William E., A World of Becoming, Duke University Press)

By "belief in this world:' neither Deleuze nor I, again, means that the established distribution of power, exploitation, and inequality now in place is to be protected, though some critics love to jump to this conclusion. Such arrangements make people suffer too much, and they rest upon the repression of essential features of the contemporary condition, including the minoritization of the world occurring at a more rapid pace. Exploitation and domination are things to contest and oppose, as Deleuze did actively while embracing the points reviewed above. The restoration of belief in this world provides an existential resource to draw upon as those struggles are fought energetically and creatively. Nor do we mean that it is always illegitimate to resent your place in the world. Resentment is often a needed impetus to action, even if it carries the danger of becoming transfigured into ressontimont. It is existential resentment we worry about most, the kind that is apparent today in practices of capitalist greed, religious exclusivity; media bellicosity, authoritarian strategies, sexual narrowness, and military aggression. We mean, first, positive affirmation of the cosmos in which human beings are set, as you yourself understand that cosmos, second, coming to terms in a positive way with the enduring modem fact of interruptions in experience and the faster pace at which minorithation occurs, and third, accepting the contestability of your existential creed without profound resentment of that condition.

No internal link to their lash out impact – It is only when the desire for revenge and redemptive justice is allowed to take precedence is action against suffering resentful and dangerous
Connolly 11

(William E., A World of Becoming, Duke University Press)

It is perhaps salient to point out again how my attention to the rolling and roiling interactions between hubris and existential resentment does not carry with it a denial of the positive role that anger, resentment, indignation, and the like can and do play in politics. There is no politics without passion. It is when the trials of life /or the hubris of mastery slide into institutionally embedded drives to existential revenge that things become most dangerous. That is a risk accompanying any and every positive social movement. As we saw in chapter 3, it is also a risk that we should engage self-critically as we respond to new configurations of struggle.

AT VTL

Life has intrinsic and objective value achieved through subjective pleasures---its preservation should be an a priori goal

Kacou 8

(Amien WHY EVEN MIND? On The A Priori Value Of "Life", Cosmos and History: The Journal of Natural and Social Philosophy, Vol 4, No 1-2 (2008)
cosmosandhistory.org/index.php/journal/article/view/92/184)

Furthermore, that manner of finding things good that is in pleasure can certainly not exist in any world without consciousness (i.e., without "life," as we now understand the word)—slight analogies put aside. In fact, we can begin to develop a more sophisticated definition of the concept of "pleasure," in the broadest possible sense of the word, as follows: it is the common psychological element in all psychological experience of goodness (be it in joy, admiration, or whatever else). In this sense, pleasure can always be pictured to "mediate" all awareness or perception or judgment of goodness: there is pleasure in all consciousness of things good; pleasure is the common element of all conscious satisfaction. In short, it is simply the very experience of liking things, or the liking of experience, in general. In this sense, pleasure is, not only uniquely characteristic of life but also, the core expression of goodness in life—the most general sign or phenomenon for favorable conscious valuation, in other words. This does not mean that "good" is absolutely synonymous with "pleasant"—what we value may well go beyond pleasure. (The fact that we value things needs not be reduced to the experience of liking things.) However, what we value beyond pleasure remains a matter of speculation or theory. Moreover, we note that a variety of things that may seem otherwise unrelated are correlated with pleasure—some more strongly than others. In other words, there are many things the experience of which we like. For example: the admiration of others; sex; or rock-paper-scissors. But, again, what they are is irrelevant in an inquiry on a priori value—what gives us pleasure is a matter for empirical investigation. Thus, we can see now that, in general, something primitively valuable is attainable in living—that is, pleasure itself. And it seems equally clear that we have a priori logical reason to pay attention to the world in any world where pleasure exists. Moreover, we can now also articulate a foundation for a security interest in our life: since the good of pleasure can be found in living (to the extent pleasure remains attainable),[17] and only in living, therefore, a priori, life ought to be continuously (and indefinitely) pursued at least for the sake of preserving the possibility of finding that good. However, this platitude about the value that can be found in life turns out to be, at this point, insufficient for our purposes. It seems to amount to very little more than recognizing that our subjective desire for life in and of itself shows that life has some objective value. For what difference is there between saying, "living is unique in benefiting something I value (namely, my pleasure); therefore, I should desire to go on living," and saying, "I have a unique desire to go on living; therefore I should have a desire to go on living," whereas the latter proposition immediately seems senseless? In other words, "life gives me pleasure," says little more than, "I like life." Thus, we seem to have arrived at the conclusion that the fact that we already have some (subjective) desire for life shows life to have some (objective) value. But, if that is the most we can say, then it seems our enterprise of justification was quite superficial, and the subjective/objective distinction was useless—for all we have really done is highlight the correspondence between value and desire. Perhaps, our inquiry should be a bit more complex.

Life is always valuable

Torchia 2, Professor of Philosophy, Providence College, Phd in Philosophy, Fordham College (Joseph, "Postmodernism and the Persistent Vegetative State," The National Catholic Bioethics Quarterly Summer 2002, Vol. 2, No. 2, http://www.lifeissues.net/writers/torc/torc_01postmodernismandpvs1.html)

Ultimately, Aquinas' theory of personhood requires a metaphysical explanation that is rooted in an understanding of the primacy of the existence or esse of the human person. For humans beings, the upshot of this position is clear: while human personhood is intimately connected with a broad range of actions (including consciousness of oneself and others), the definition of personhood is not based upon any specific activity or capacity for action, but upon the primacy of esse. Indeed, human actions would have neither a cause nor any referent in the absence of a stable, abiding self that is rooted in the person's very being. A commitment to the primacy of esse, then, allows for an adequate recognition of the importance of actions in human life, while providing a principle for the unification and stabilizing of these behavioral features. In this respect, the human person is defined as a dynamic being which actualizes the potentiality for certain behavior or operations unique to his or her own existence. Esse thereby embraces all that the person is and is capable of doing. In the final analysis, **any attempt to define the person in terms of a single attribute, activity, or capability** (e.g., consciousness) flies in the face of the depth and multi-dimensionality which is part and parcel of personhood itself. To do so **would abdicate the ontological core of the person and the very center which renders human activities intelligible.** And Aquinas' anthropology, I submit, provides an effective philosophical lens through which the depth and profundity of the human reality comes into sharp focus. In this respect, Kenneth Schmitz draws an illuminating distinction between "person" (a term which conveys such hidden depth and profundity) and "personality" (a term which pertains to surface impressions and one's public image).40 The preoccupation with the latter term, he shows, is very much an outgrowth of the eighteenth century emphasis upon a human individuality that is understood in terms of autonomy and privacy. This notion of the isolated, atomistic individual was closely linked with a subjective focus whereby the "self" became the ultimate referent for judging reality. By extension, such a presupposition led to the conviction that only self-consciousness provides a means of validating any claims to personhood and membership in a community of free moral agents capable of responsibilities and worthy of rights. In contrast to such an isolated and enclosed conception (i.e., whereby one is a person by virtue of being "set apart" from others as a privatized entity), Schmitz focuses upon an intimacy which presupposes a certain relation between persons. From this standpoint, intimacy is only possible through genuine self-disclosure, and the sharing of self-disclosure that allows for an intimate knowledge of the other.41 For Schmitz, such a revelation of one's inner self transcends any specific attributes or any overt capacity the individual might possess.42 Ultimately, Schmitz argues, intimacy is rooted in the unique act of presencing, whereby the person reveals his or her personal existence. But such a mystery only admits of a metphysical explanation, rather than an epistemological theory of meaning which confines itself to what is observable on the basis of perception or sense experience. Intimacy, then, discloses a level of being that transcends any distinctive properties. Because intimacy has a unique capacity to disclose being, it places us in touch with the very core of personhood. Metaphysically speaking, intimacy is not grounded in the recognition of this or that characteristic a person has, but rather in the simple unqualified presence the person is.43

Alt/Perm

Perm – 2AC Ressentiment NB

The force of communication/capital/whatever is not a reason to turn away from the world – their fear of the fundamental terms of human existence is ressentiment
Connolly 11

(William E., A World of Becoming, Duke University Press)

During a time when the expansion of capital, inter-territory media communication, and population migration generate a more rapid minoridzation of the world, part of the contemporary predicament is how to respond to the obdurate plurality of being in positive ways. The pluralization of the world, in conjunction with bellicose movements that turn militantly against it, forms a critical part of the contemporary predicament. Today, it is important, first, to articulate comparative readings of the human predicament, second, to affirm the reading that makes the most sense of evidence, argument, and experience to you, third, to cultivate a presumption of agonistic respect for other readings, and fourth, to find ways to embrace without existential resentment the most fundamental character of being as you yourself confess it to be. The "you" refers to intra-individual, micro- and macro-assemblages of desire.

Calls for Change Good

Calls for change are the best means to celebrate life – inaction breeds resentment

May, Lemon Professor of Philosophy at Clemson University, '5

(Todd, "To change the world, to celebrate life" Philosophy and Social Criticism, Vol 31 No 5-6, p 517-531, SagePub)

To change the world and to celebrate life. This as the theologian Harvey Cox saw, is the struggle within us.1 It is a struggle in which one cannot choose sides; or better, a struggle in which one must choose both sides. The abandonment of one for the sake of the other can lead only to disaster or callousness. Forsaking the celebration of life for the sake of changing the world is the path of the sad revolutionary. In his preface to Anti-Oedipus, Foucault writes that one does not have to be sad in order to be revolutionary. The matter is more urgent than that, however. One cannot be both sad and revolutionary. Lacking a sense of the wondrous that is already here, among us, one who is bent upon changing the world can only become solemn or bitter. He or she is focused only on the future; the present is what is to be overcome. The vision of what is not but must come to be overwhelms all else, and the point of change itself becomes lost. The history of the left in the 20th century offers numerous examples of this, and the disaster that attends to it should be evident to all of us by now. The alternative is surely not to shift one's allegiance to the pure celebration of life, although there are many who have chosen this path. It is at best blindness not to see the misery that envelops so many of our fellow humans, to say nothing of what happens to sentient non-human creatures. The attempt to jettison world-changing for an uncritical assent to the world as it is requires a self-deception that I assume would be anathema for those of us who have studied Foucault. Indeed, it is anathema for all of us who awaken each day to an America whose expansive boldness is matched only by an equally expansive disregard for those we place in harm's way This is the struggle, then. The one between the desire for life-celebration and the desire for world-changing. The struggle between reveling in the contingent and fragile joys that constitute our world and wresting it from its intolerability. I am sure it is a struggle that is not foreign to anyone who is reading this. I am sure as well that the stakes for choosing one side over another that I have recalled here are obvious to everyone. The question then becomes one of how to choose both sides at once. III Maybe it happens this way. You walk into a small meeting room at the back of a local bookstore. There are eight or ten people milling about. They're dressed in dark clothes, nothing fancy, and one or two of them have earrings or dreadlocks. They're young in age. You don't know any of them. You've never seen them before. Several of them seem to know one another. They are affectionate, hugging, letting a hand linger on a shoulder or an elbow. A younger man, tall and thin, with an open face and a blue baseball cap bearing no logo, glides into the room. Two others, a man and a woman, shout, 'Tim!' and he glides over to them and hugs them, one at a time. They tell him how glad they are that he could make it, and he says that he just got back into town and heard about the meeting. You stand a little off to the side. Nobody has taken a seat at the rectangle of folding tables yet. You don't want to be the first to sit down. Tim looks around the room and smiles. Several other people filter in. You're not quite sure where to put your hands so you slide them into your jean pockets. You hunch your shoulders. Tim's arrival has made you feel more of an outsider. But then he sees you. He edges his way around several others and walks up to you and introduces himself. You respond. Tim asks and you tell him that this is your first time at a meeting like this. He doesn't ask about politics but about where you're from. He tells you he has a friend in that neighborhood and do you know . . . ? Then several things happen that you only vaguely notice because you're talking with Tim. People start to sit down at the rectangle of tables. One of them pulls out a legal pad with notes on it. She sits at the head of the rectangle; or rather, when she sits down there, it becomes the head. And there's something you don't notice at all. You are more relaxed, your shoulders have stopped hunching, and when you sit down the seat feels familiar. The woman at the head of the table looks around. She smiles; her eyes linger over you and a couple of others that you take to be new faces, like yours. She says, 'Maybe we should begin.' IV I can offer only a suggestion of an answer here today. It is a suggestion that brings together some thoughts from the late writings of Maurice Merleau-Ponty with those of Foucault, in order to sketch not even a framework for thought, but the mere outlines of a framework. It is not a framework that would seek to find the unconscious of each in the writings of the other. Neither thinker finishes or accomplishes the other. (Often, for example regarding methodology, they do not even agree.) Rather, it is a framework that requires both of them, from their very different angles, in order to be able to think it. My goal in constructing the outlines of this framework is largely philosophical. That is to say, the suggestion I would like to make here is not one for resolving for each of us the struggle of life-celebration and world-changing, but of offering a way to conceive ourselves that allows us to embrace both sides of this battle at the same time. Given the thinkers I have chosen as reference points, it will be no surprise when I say that that conception runs through the body. Let me start with Merleau-Ponty. In his last writings, particularly in The Visible and the Invisible, he offers a conception of the body that is neither at odds nor even entangled with the world, but is of the very world itself. His concept of the flesh introduces a point of contact that is also a point of undifferentiation. The flesh, Merleau-Ponty writes, 'is the coiling over of the visible upon the seeing body, of the tangible upon the touching body, which is attested in particular when the body sees itself, touches itself seeing and touching the things, such that, as tangible it descends among them'.2 We must recall this economy of the flesh before we turn to Foucault. There is, for Merleau-Ponty, a single Being. Our world is of that Being, and we are of our world. We are not something that confronts the world from outside, but are born into it and do not leave it. This does not mean that we cannot remove ourselves from the immediacy of its grasp. What it means is that to remove ourselves from that immediacy is neither the abandonment of a bond nor the discovery of an original dichotomy or dualism. What is remarkable about human beings is precisely our capacity to confront the world, to reflect upon it, understand it, and change it, while still being of a piece with it. To grasp this remarkable character, it is perhaps worth recalling Gilles Deleuze's concept of the fold. The world is not composed of different parts; there is no transcendent, whether of God or of subjectivity. The world is one. As Deleuze sometimes says, being is univocal. This oneness is not, however, inert or inanimate. Among other things, it can fold over on itself, creating spaces that are at once insides and outsides, at once different from and continuous with one another. The flesh is a fold of Being in this sense. It is of the world, and yet encounters it as if from a perceptual or cognitive distance. It is a visibility that sees, a tangible that touches, an audible that hears. Merleau-Ponty writes: There is vision, touch when a certain visible, a certain tangible, turns back upon the whole of the visible, the whole of the tangible, of which it is a part, or when suddenly it finds itself surrounded by them, or when between it and them, and through their commerce, is formed a Visibility, a Tangible in itself, which belong properly neither to the body qua fact nor to the world qua fact . . . and which therefore form a couple, a couple more real than either of them.3 For Merleau-Ponty, thought and reflection do not attach themselves to this flesh from beyond it, but arise through it. As our body is of this world, our thought is of our bodies, its language of a piece with the world it addresses. '[I]f we were to make completely explicit the architectonics of the human body, its ontological framework, and how it sees itself and hears itself, we would see the possibilities of language already given in it.'4 This conception of the body as flesh of the world is not foreign to Foucault, although of course the terms Merleau-Ponty uses are not his. We might read Foucault's politics as starting from here, inaugurated at the point of undifferentiation between body and world. The crucial addition he would make is that that point of undifferentiation is not historically inert. The body/world nexus is inscribed in a history that leaves its traces on both at the same time, and that crosses the border of the flesh and reaches the language that arises from it, and the thought that language expresses. How does this work? V Maybe it doesn't happen that way. Maybe it happens another way. Maybe you walk into a room at a local community center. The room is large, but there aren't many people, at least yet. There's a rectangular table in the center, and everyone is sitting around it. A couple of people look up as you walk in. They nod slightly. You nod back, even more slightly. At the head of the table is someone with a legal pad. She is reading the notes on the pad, making occasional marks with the pen in her right hand. Other people come in and take places at the table. One or two of them open laptop computers and look for an outlet. Eventually, the table fills up and people start sitting in chairs behind the table. Your feel as though you're in an inner circle where you don't belong. You wonder whether you should give up your chair and go sit on the outside with the others who are just coming in now. Maybe people notice you, think you don't belong there. At this moment you'd like to leave. You begin to feel at once large and small, visually intrusive and an object of scrutiny. You don't move because maybe this is OK after all. You just don't know. The room is quiet. A couple of people cough. Then the woman seated at the head of the table looks up. She scans the room as if taking attendance. She says, 'Maybe we should begin.' VI Merleau-Ponty's discussion of the body as flesh is an ontological one. Although he does not see the body as remote from its historical inscription, his discussion does not incorporate the role such inscription plays. For a body to be of the world is also for it to be temporal, to be encrusted in the continuous emerging of the world over time. And this emerging is not abstract; rather, it is concrete. The body/world nexus evolves during particular historical periods. This fold of the flesh, this body, is not nowhere and at any time. It is there, then; or it is here, now. A body is entangled within a web of specific events and relations that, precisely because it is of this world, are inescapably a part of that body's destiny. As Merleau-Ponty tells us in Phenomenology of Perception, 'our open and personal existence rests on an initial foundation of acquired and stabilized existence. But it could not be otherwise, if we are temporality, since the dialectic of acquisition and future is what constitutes time.'5 The medium for the body's insertion into a particular net of events and relations is that of social practices. Our bodies are not first and foremost creatures of the state or the economy, no more than they are atomized wholes distinct from the world they inhabit. Or better, they are creatures of the state and the economy inasmuch as those appear through social practices, through the everyday practices that are the ether of our lives. Social practices are the sedimentation of history at the level of the body. When I teach, when I write this article, when I run a race or teach one of my children how to ride a bicycle, my body is oriented in particular ways, conforming to or rejecting particular norms, responding to the constraints and restraints of those practices as they have evolved in interaction with other practices over time. Through its engagement in these practices, my body has taken on a history that is not of my making but is nevertheless part of my inheritance. It is precisely because, as Merleau-Ponty has written, the body and the world are not separate things but rather in a chiasmic relation that we can think this inheritance. And it is because of Foucault's histories that we can recognize that this inheritance is granted through specific social practices. And of course, as Foucault has taught us, social practices are where the power is. It is not, or not simply, at the level of the state or the modes of production where power arises. It is, as he sometimes puts it, at the capillaries. One of the lessons of Discipline and Punish is that, if the soul is the prison of the body, this is because the body is inserted into a set of practices that create for it a soul. These practices are not merely the choices of an individual whose thought surveys the world from above, but instead the fate of a body that is of a particular world at a particular time and place. Moreover, these practices are not merely in service to a power that exists outside of them; they are mechanisms of power in their own right. It is not because Jeremy Bentham disliked the prison population that the Panopticon became a grid for thinking about penal institutions. It is instead because the evolution of penal practices at that time created an opening for the economy of visibility that the Panopticon represented. When Foucault writes that. . . the soul has a reality, it is produced permanently around, on, within the body by the functioning of a power that is exercised on those punished - and, in a more general way, on those one supervises, trains and corrects, over madmen, children at home and at school, the colonized, over those who are stuck at a machine and supervised for the rest of their lives6 his claim is informed by four other ones that lie behind it: that bodies are of a piece with the world, that the body/world nexus is a temporal one, that the medium of that corporeal temporality is the practices a body is engaged in, and that that medium is political as well as social. The last three claims are, of course, of the framework of Foucault's thought. The first one is the ontological scaffolding provided by Merleau-Ponty. And it is by means of all four that we can begin to conceive things so as to be able to choose both world-changing

and life-celebrating at the same time. VII It could happen yet another way. Increasingly, it does. There is no meeting. There are no tables and no legal pads. Nobody sits down in a room together, at least nobody sits down at a place you know about. There may not even be a leaflet. Maybe you just got an email that was forwarded by someone you know slightly and who thought you might be interested. At the bottom there's a link, in case you want to unsubscribe. If you don't unsubscribe you get more notices, with petitions to sign or times and places for rallies or teach-ins or marches. Maybe there's also a link for feedback or a list for virtual conversations or suggestions. If you show up, it's not to something you put together but to something that was already in place before you arrived. How did you decide on this rally or teach-in? You sat in front of your computer screen, stared at it, pondering. Maybe you emailed somebody you know, asking for their advice. Is it worth going? If it's on campus you probably did. It matters who will see you, whether you have tenure, how much you've published. There are no Tims here. You've decided to go. If it's a teach-in, you've got plausible denia-bility; you're just there as an observer. If it's a rally, you can stand to the side. But maybe you won't do that. The issue is too important. You don't know the people who will be there, but you will stand among them, walk among them. You will be with them, in some way. Bodies at the same time and place. You agree on the issue, but it's a virtual agreement, one that does not come through gestures or words but through sharing the same values and the same internet connections. As you march, as you stand there, nearly shoulder to shoulder with others of like mind, you're already somewhere else, telling this story to someone you know, trying to get them to understand the feeling of solidarity that you felt coursing back into this moment. You say to yourself that maybe you should have brought a friend along. VIII There are many ways to conceive the bond between world-changing and life-celebrating. Let me isolate two: one that runs from Merleau-Ponty to Foucault, from the body's chiasmic relation with the world to the politics of its practices; and the other one running back in the opposite direction. The ontology Merleau-Ponty offers in his late work is one of wonder. Abandoning the sterile philosophical debates about the relation of mind and body, subject and object, about the relation of reason to that which is not reason, or the problem of other minds, his ontology forges a unity of body and world that puts us in immediate contact with all of its aspects. No longer are we to be thought the self-enclosed creatures of the philosophical tradition. We are now in touch with the world, because we are of it. Art, for example, does not appeal solely to our minds; its beauty is not merely a matter of the convergence of our faculties. We are moved by art, often literally moved, because our bodies and the work of art share the same world. As Merleau-Ponty says, 'I would be at great pains to say where is the painting I am looking at. For I do not look at it as I do a thing; I do not fix it in its place. My gaze wanders in it as in the halos of Being. It is more accurate to say that I see according to it, or with it, than that I see it.'7 It is only because my body is a fold of this world that art can affect me so. But this affection is also a vulnerability. As my look can happen according to a work of art, so it can happen according to a social practice. And even more so in proportion as that social practice and its effects are suffused through the world in which I carry on my life, the world my body navigates throughout the day, every day. I do not have a chance to look according to a painting by Cezanne very often; but I do encounter the effects of normalization as it has filtered through the practices of my employment, of my students' upbringing, and of my family's expectations of themselves and one another. The vulnerability of the body, then, is at once its exposure to beauty and its opening to what is intolerable. We might also see things from the other end, starting from politics and ending at the body. I take it that this is what Foucault suggests when he talks about bodies and pleasures at the end of the first volume of the History of Sexuality. If we are a product of our practices and the conception of ourselves and the world that those practices have fostered, so to change our practices is to experiment in new possibilities both for living and, inseparably, for conceiving the world. To experiment in sexuality is not to see where the desire that lies at the core of our being may lead us; that is simply the continuation of our oppression by other means. Rather, it is to construct practices where what is at issue is no longer desire but something else, something that might go by the name of bodies and pleasures. In doing so, we not only act differently, we think differently, both about ourselves and about the world those selves are inseparable from. And because these experiments are practices of our bodies, and because our bodies are encrusted in the world, these experiments become not merely acts of political resistance but new folds in the body/ world nexus. To construct new practices is to appeal to aspects or possibilities of the world that have been previously closed to us. It is to offer novel and perhaps more tolerable, engagements in the chiasm of body and world. Thus we might say of politics what Merleau-Ponty has said of painting, that we see according to it. Here, I take it, is where the idea of freedom in Foucault lies. For Foucault, freedom is not a metaphysical condition. It does not lie in the nature of being human, nor is it a warping, an atomic swerve, in the web of causal relations in which we find ourselves. To seek our freedom in a space apart from our encrustation in the world is not so much to liberate ourselves from its influence as to build our own private prison. Foucault once said: There's an optimism that consists in saying that things couldn't be better. My optimism would consist rather in saying that so many things can be changed, fragile as they are, bound up more with circumstances than with necessities, more arbitrary than self-evident, more a matter of complex, but temporary, historical circumstances than with inevitable anthropological constraints . . . .8 That is where to discover our freedom. IX And what happens from there? From the meetings, from the rallies, from the petitions and the teach-ins? After all, always a next. If you win this time - end aid to the contras, divest from apartheid South Africa, force debt-forgiveness by technologically advanced countries - there is always more to do. There is the de-unionization of workers, there are gay rights, there is Burma, there are the Palestinians, the Tibetans. There will always be Tibetans, even if they aren't in Tibet, even if they aren't Asian. But is that the only question: Next? Or is that just the question we focus on? What's the next move in this campaign, what's the next campaign? Isn't there more going on than that? After all, engaging in political organizing is a practice, or a group of practices. It contributes to making you who you are. It's where the power is, and where your life is, and where the intersection of your life and those of others (many of whom you will never meet, even if it's for their sake that you're involved) and the buildings and streets of your town is. This moment when you are seeking to change the world, whether by making a suggestion in a meeting or singing at a rally or marching in silence or asking for a signature on a petition, is not a moment in which you don't exist. It's not a moment of yours that you sacrifice for others so that it no longer belongs to you. It remains a moment of your life, sedimenting in you to make you what you will become, emerging out of a past that is yours as well. What will you make of it, this moment? How will you be with others, those others around you who also do not cease to exist when they begin to organize or to protest or to resist? The illusion is to think that this has nothing to do with you. You've made a decision to participate in world-changing. Will that be all there is to it? Will it seem to a simple sacrifice, for this small period of time, of who you are for the sake of others? Are you, for this moment, a political ascetic? Asceticism like that is dangerous. X Freedom lies not in our distance from the world but in the historically fragile and contingent ways we are folded into it, just as we ourselves are folds of it. If we take Merleau-Ponty's Being not as a rigid foundation or a truth behind appearances but as the historical folding and refolding of a univocity, then our freedom lies in the possibility of other foldings. Merleau-Ponty is not insensitive to this point. His elusive concept of the invisible seems to gesture in this direction. Of painting, he writes: the proper essence of the visible is to have a layer of invisibility in the strict sense, which it makes present as a certain absence . . . There is that which reaches the eye directly, the frontal properties of the visible; but there is also that which reaches it from below . . . and that which reaches it from above . . . where it no longer participates in the heaviness of origins but in free accomplishments.9 Elsewhere, in The Visible and the Invisible, he says: if . . . the surface of the visible, is doubled up over its whole extension with an invisible reserve; and if, finally, in our flesh as the flesh of things, the actual, empirical, ontic visible, by a sort of folding back, invagination, or padding, exhibits a visibility, a possibility that is not the shadow of the actual but its principle . . . an interior horizon and an exterior horizon between which the actual visible is a partitioning and which, nonetheless, open indefinitely only upon other visibles . . .10 What are we to make of these references? We can, to be sure, see the hand of Heidegger in them. But we may also, and for present purposes more relevantly, see an intersection with Foucault's work on freedom. There is an ontology of freedom at work here, one that situates freedom not in the private reserve of an individual but in the unfinished character of any historical situation. There is more to our historical juncture, as there is to a painting, than appears to us on the surface of its visibility. The trick is to recognize this, and to take advantage of it, not only with our thoughts but with our lives. And that is why, in the end, there can be no such thing as a sad revolutionary. To seek to change the world is to offer a new form of life-celebration. It is to articulate a fresh way of being, which is at once a way of seeing, thinking, acting, and being acted upon. It is to fold Being once again upon itself, this time at a new point, to see what that might yield. There is, as Foucault often reminds us, no guarantee that this fold will not itself turn out to contain the intolerable. In a complex world with which we are inescapably entwined, a world we cannot view from above or outside, there is no certainty about the results of our experiments. Our politics are constructed from the same vulnerability that is the stuff of our art and our daily practices. But to refuse to experiment is to resign oneself to the intolerable; it is to abandon both the struggle to change the world and the opportunity to celebrate living within it. And to seek one aspect without the other - life-celebration without world-changing, world-changing without life-celebration - is to refuse to acknowledge the chiasm of body and world that is the well-spring of both. If we are to celebrate our lives, if we are to change our world, then perhaps the best place to begin to think is our bodies, which are the openings to celebration and to change and perhaps the point at which the war within us that I spoke of earlier can be both waged and resolved. That is the fragile beauty that, in their different ways, both Merleau-Ponty and Foucault have placed before us. The question before us is whether, in our lives and in our politics, we can be worthy of it. XI So how might you be a political body, woven into the fabric of the world as a celebrator and as a changer? You went to the meeting, and then to the demonstration. How was it there? Were the bodies in harmony or in counterpoint? Did you sing with your feet, did your voice soar? Did your mind come alive? Did you see possibilities you had not seen before? Were there people whose words or clothes, or even the way they walked hand in hand (how long has it been since you've walked hand in hand with someone out in public?) offer you a possibility, or make you feel alive as well as righteous? And how about those people off to the side, the ones on the sidewalk watching? Maybe they just stared, or maybe nodded as you went past. Or maybe some of them shouted at you to stop blocking the streets with your nonsense. The illusion is to think that this has nothing to do with you. Did you recoil within yourself, see yourself as in a mirror, or as the person at Sartre's keyhole who's just been caught? Did you feel superior to them, smug in your knowledge? Or did they, too, show you something you might learn from? Are they you at another moment, a moment in the past or in the future? Are they your parents that you have not explained to, sat down beside, or just shared a meal with? That one over there, the old man slightly stooped in the long overcoat: whom does he remind you of? What message might he have unwittingly brought for you? And why does it have to be a demonstration? You go to a few meetings, a few more demonstrations. You write some letters to legislators. You send an email to the President. And then more meetings. The next thing you know, you're involved in a political campaign. By then you may have stopped asking why. This is how it goes: demonstrations, meetings with legislators, internet contacts. Does it have to be like this? Are demonstrations and meetings your only means? Do they become, sooner or later, not only means but ends? And what kinds of ends? In some sense they should always be ends: a meeting is a celebration, after all. But there are other ends as well. You go to the meeting because that fulfills your obligation to your political conscience. Does it come to that? There are other means, other ends. Other means/ends. Some people ride bicycles, en masse, slowly through crowded urban streets. You want environmentalism? Then have it. The streets are beautiful with their tall corniced buildings and wide avenues. To ride a bike through these streets instead of hiding in the armor of a car would be exhilarating. If enough of you do it together it would make for a pleasant ride, as well as a little lived environmentalism. Would you want to call it a demonstration? Would it matter? There are others as well who do other things with their bodies, more dangerous things. Some people have gone to Palestine in order to put their bodies between the Palestinians and the Israeli soldiers and settlers who attack them. They lie down next to Palestinians in front of the bulldozers that would destroy homes or build a wall through a family's olive orchard. They feel the bodies of those they are in solidarity with. They smell the soil of Palestine as they lay there. Sometimes, they are harmed by it. A young woman, Rachel Corrie, was deliberately crushed by a US bulldozer operated by an Israeli soldier as she kneeled in front of a Palestinian home, hoping to stop its demolition. To do politics with one's body can be like this. To resist, to celebrate, is also to be vulnerable. The world that you embrace, the world of which you are a part, can kill you too. And so you experiment. You try this and you try that. You are a phenomenologist and a genealogist. You sense what is around you, attend to the way your body is encrusted in your political involvements. And you know that that sensing has its own history, a

history that often escapes you even as it envelops you. There is always more to what you are, and to what you are involved in, than you can know. So you try to keep vigilant, seeking the possibilities without scorning the realities. It's a difficult balance. You can neglect it if you like. Many do. But your body is there, woven into the fabric of all the other bodies, animate and inanimate. Whether you like it or not, whether you recognize it or not. The only question is whether you will take up the world that you are of, or leave it to others, to those others who would be more than willing to take your world up for you.

Positive Action Good

Taking particular action against wrong you perceive in the world is necessary to overcome ressentiment
Connolly 11

(William E., A World of Becoming, Duke University Press)

A set of pertinent skills and dispositions to the enterprise of theory can be distilled from leading philosophers of time as becoming, particularly if you allow each to be adjusted in the light of considerations advanced by the others. I refer to Priedrich Nietzsche, William James, Alfred North Whitehead, Henri Bergson, and Gilles Deleuze, though, as we have seen, others such as Ilya Prigogine, Smart Kauffman, Marcel Proust, Merleau-Ponty, and Catherine Keller could be added to the list. I will concentrate here, however, on the first group. Taken together, at least four commendations can be distilled from them: i. To work upon the self and the culture to which you belong, amplifying the feeling of attachment to the most fundamental character of existence as such, as you yourself confess those terms in a theistic or nontheistic vein. 2. To cultivate the capacity to dwell sensitively in historically significant, forking moments. 3. To seek periodically to usher new concepts and experimental actions into the world that show promise of negotiating unexpected situations.. To recoil on those interventions periodically to improve the chance that they do not pose more dangers or losses than the maxims they seek to correct. The first task, to amplify attachment to this world, is important to all five thinkers, but it finds perhaps its most fervent expression in the work of Nietzsche and Deleuze. To them, life in a world of becoming carries the obdurate risk of fomenting cultural formations infused with drives to existential revenge seeking available outlets. Both those who embrace and those who deny this image of time face this risk, however. So it is imperative to overcome resentment of the fundamental terms of existence as such, as you understand them, in order to marshal the energy and drive to address the specific dangers and injustices you perceive. Otherwise what starts as a fight in favor of something positive can all too easily be twisted into a crushing demand to punish others for faults you secretly resent about the most fundamental order of being itself (as you understand it). Bergson, James, and Whitehead concur on this point too, though it may find less dramatic expression in their work. Bergson and James embrace a limited God as they cultivate gratitude for being, while Nietzsche and Deleuze, at theft best, exude gratitude for an abundant world of becoming without divinity. Whitehead, whose thought is still relatively new to me, seems to support the idea of an impersonal divinity that absorbs "external objects" and sets limits of the possible in a world of becoming. His stance is perhaps tied to a more beneficent view of the outer reaches of possibility tinn that advanced by Nietzsche, Deleuze, and me. We seek to amplify attachment to the most fundamental character of this world, amidst the tragic possibilities that inhabit a world neither providential in the last instance nor susceptible to consummate human mastery.

***Acting in a world of becoming is life affirming – taking on the role of the seer is powerful
Connolly 11

(William E., A World of Becoming, Duke University Press)

Today, however, it is important for more people to hone some of the capacities of a seer and to exercise them periodically. When a period of turbulence arises in a zone that had been relatively quiescent, you revisit a habitual pattern of thought by slipping into a creative suspension of actionoriented perception, doing so to allow a new insight or tactic to bubble forth if it will, as if from nowhere. You may then intervene in politics on the basis

of that insight, ready to recoil back on the insight in the light of its actual effects. You soon launch another round as you maintain a relation of torsion between following a train of thought, dwelling in duration, and exploring a revised course that has just emerged, until your time runs out. Even those trains of thought will be punctuated by little jumps and bumps, as they ride on rough tracks more akin to those between New York and Washington than the smooth ones on the Kyoto-Tokyo line. Such are the joys, risks, and travails of thinking and action in a world of becoming -composed of multiple force-fields, and marked by small and large moments of real creativity.

We must cultivate a belief in the world that goes beyond merely negative breaks with the features of the world we abhor
Connolly 11

(William E., A World of Becoming, Duke University Press)

Such a characterization, as stated, is broad and not subjected to the pertinent qualifications. But such a condensation may be needed to show how these diverse pressures affect each other. Ewe collect the pertinent shifts in contemporary experience -from altered experiences of time to the minoritization of the world -we also sense how suth pressures can accumulate for many to disconnect participation in the world from an automatic sense of belonging to the world. We can see or at least feel the exaggeration in Merleau-Ponty's sense that the layering of embodiment suffices to secure essential belonging. Today what Nietzsche called ressentiment- a resentment of the most fundamental terms of human existence as you yourself understand them - too readily becomes insinuated into the pores of experience. The distribution of such a disposition is uneven, but it is not confined to the interior souls of individuals. It can haunt entire constituencies; it can even become embedded to varying degrees in institutions of investment, consumption, electoral campaigns, governing, media reporting, church presentations, Internet debates, and military life. It is perhaps at this point that Gilles Deleu.ze can enlarge our grasp of this condition and suggest at least one way to forge the beginnings of a response to it. I refer to Deleu.ze's claim, one that touches the thought of Charles Taylor in advance in a way that may surprise some, that today we need to find ways to "restore belief in this world?' Deleuze contends that today, though not for the first time, the distance between involvement in the world and belief in it has grown. Recent developments in cinema simultaneously express these larger developments, amplify them arid may suggest preliminary strategies of response that supersede existential resentment. To put it another way, both Taylor and Deleuze think that part of our predicament today is existential, even though neither thinks that the predicament can simply be resolved at this level of being. Here area few of Deleuze's formulations about what has been happening, since at least the end of the Second World War: - It is clear from the outset that cinema had a special relationship with belief. There is a Catholic quality to cinema (there are many explicitly Catholic authors...). Cinema seems wholly within Nietzsche's formula: "How we are still pious." Or better, from the outset, Christianity and revolution, the Christian faith and revolutionary faith, were the two poles which attracted the art of the masses. - The modern fact is that we no longer believe in this world. We do not even believe in the events which happen to us... It is not we who make cinema; it is the world which looks to us like a bad film. - The link between man and the world is broken. Henceforth, this link must become an object of belief: it is the impossible which can only be restored within a faith.. . Man is in the world as if in a pure optical or sound situation. The reaction of which man has become dispossessed can be replaced only by belief.. . The cinema must film, not the world, but belief in this world, our only link. - Because the point is to discover or restore belief in the world before or beyond words... It is only, it is simply believing in the body. - Whether we are Christians or atheists, in our universal schizophrenia, we need reasons to believe in this world. 19 Deleuze thus speaks to the element of "schizophrenia" to be addressed by both atheists and theists. He surely would not, then, endorse that group of new atheists who think that simply following the logic of traditional science will dissolve the issues involved. Let me follow Deleuze further down this trail: we will consider Taylor's response more closely in the next chapter. I am, of course, not confident that Taylor, Deleuze, or I can forge a response that is sufficient to the issue. But perhaps it is pervasive and deep enough to warrant making some preliminary attempts. How to restore belief in this world? Some writers, says Deleuze, (e.g., Artaud, Kafka, and Proust), artists (Bacon and Magritte), philosophers (Nietzsche and Kierkegaard), and film directors (Welles, Duras, and Rcantis) help us to think through this issue. They begin by first dramatizing a fugitive sense already there in life of jumps and interruptions in experience, by portraying interruptions in smooth narratives. This is very active in film, and such cinematic experience readily becomes coded into the sensitivity of experience beyond the theater. The depth-of-field shots that conjoin disso-nant elements of past and future, the irrational cuts through which sound and visual experience confound each other, the aberrant

modes of behavior in comedies that convey fugitive experiences exceeding habitual experience, the flashbacks that mark a previous point of bifurcation at which one path was pursued and another was allowed merely to fester as incipient potentiality- these cinema techniques both dramatize features of everyday life already dimly available to us and place them at the forefront of attention for further reflection. The film tactics reviewed by Deleuze anticipate new media experiments presented by Hansen earlier in this chapter. They expose us to experiences of dissonance that cannot readily be submerged again, so that attempts to do so must be more virulent than under other conditions of life. But such cinematic labors of the negative are not sufficient; they certainly do not suffice to promote positive attachment to this world. Even a "negative dialectic" does not suffice. If things are left there, the embers of ressentiment can easily become more inflamed. That is one reason Deleuze is never happy with negative critique alone: the next task is to highlight how our participation in a world of real creativity that also finds expression elsewhere in the universe depends on and draws from such fugitive interruptions. To put it too starkly (for situational nuances and adjustments are pertinent here), the more people who experience a positive connection between modes of interruption and the possibility of our modest participation as individuals, constituencies, states, and a species in creative processes extending beyond us, the more apt we are to embrace the new temporal experiences around us as valuable parts of existence as such. Certainly, absent a world catastrophe or a repressive revolution that would create worse havoc than the conditions it seeks to roll back, these consummate features of late-modem life are not apt to dissipate soon. The fastest zones of late-modem life, for instance, are not apt to slow down in the absence of a catastrophe that transforms everything. So the radical task is to find ways to strengthen the connection between the fundamental terms of late-modem existence and positive attachment to life as such. This should be accomplished not by embracing exploitation and suffering, but by challenging them as we come to terms with the larger trends.

AT Do Nothing/Negativity

Alt fails and leads to ressentiment
Connolly 11

(William E., A World of Becoming, Duke University Press)

But such cinematic labors of the negative are not sufficient; they certainly do not suffice to promote positive attachment to this world. Even a "negative dialectic" does not suffice. If things are left there, the embers of ressentiment can easily become more inflamed. That is one reason Deleuze is never happy with negative critique alone: the next task is to highlight how our participation in a world of real creativity that also finds expression elsewhere in the universe depends on and draws from such fugitive interruptions. To put it too starkly (for situational nuances and adjustments are pertinent here), the more people who experience a positive connection between modes of interruption and the possibility of our modest participation as individuals, constituencies, states, and a species in creative processes extending beyond us, the more apt we are to embrace the new temporal experiences around us as valuable parts of existence as such. Certainly, absent a world catastrophe or a repressive revolution that would create worse havoc than the conditions it seeks to roll back, these consummate features of late-modem life are not apt to dissipate soon. The fastest zones of late-modem life, for instance, are not apt to slow down in the absence of a catastrophe that transforms everything. So the radical task is to find ways to strengthen the connection between the fundamental terms of late-modem existence and positive attachment to life as such. This should be accomplished not by embracing exploitation and suffering, but by challenging them as we come to terms with the larger trends.

Frame the alternative within consequentialism – neoliberalism is most ethical because all *practical* alternatives are worse and cause violecne

-coming up with an alternative economic system *matters*

-don't take a leap of faith

-any alternative is utopian and unachievable

-capitalism can be reformed

Richards 9 – PhD in Philosophy @ Princeton

Jay Richards, PhD with honors in Philosophy and Theology from Princeton, "Money, Greed, and God: Why Capitalism Is the Solution and Not the Problem," pg. 31-32

Myth no. 1: The Nirvana Myth (contrasting capitalism with an unrealizable ideal rather than with its live alternatives) But the myth can have subtle effects even if we reject utopian schemes. To avoid its dangers, we have to resist the temptation to compare our live options with an ideal that we can never realize. When we ask whether we can build a just society, we need to keep the question nailed to solid ground: just compared with what? It doesn't do anyone any good to tear down a society that is "unjust" compared with the kingdom of God if that society is more just than any of the ones that will replace it. Compared with Nirvana, no real society looks good. Compared with utopia, Stalinist Russia and America at its best will both get bad reviews. The differences between them may seem trivial compared to utopia. That's one of the grave dangers of utopian thinking: it blinds us to the important differences among the various ways of ordering society. The Nirvana Myth dazzles the eyes, to the point that the real alternatives all seem like dull and barely distinguishable shades of gray. The free exchange of wages for work in the marketplace starts to look like slavery. Tough competition for market share between companies is confused with theft and survival of the fittest. Banking is confused with usury and exploitation. This shouldn't surprise us. Of course a modern capitalist society like the United States looks terrible compared with the kingdom of God. But that's bad moral reasoning. The question isn't whether capitalism measures up to the kingdom of God. The question is whether there's a better alternative in this life. "Those who condemn the immorality of liberal capitalism do so in comparison with a society of saints that has never existed—and never will." —Martin Wolf, Why Globalization Works If we're going to compare modern capitalism with an extreme, we should compare it with a real extreme—like communism in Cambodia, China, or the Soviet Union. Unlike Nirvana, these experiments are well within our power to bring about. They all reveal the terrible cost of trying to create a society in which ev- eryone is economically equal. If we insist on comparing live options with live options, modern capitalism could hardly be more different, more just, or more desirable than such an outcome. That doesn't mean we should rest on our laurels. It means we need to stay focused on reality rather than romantic ideals. So how should we answer the question that began this chap- ter: can't we build a just society? The answer: we should do everything we can to build a more just society and a more just world. And the worst way to do that is to try to create an egalitarian utopia.

Economic rationality is ethical and solves war – self-interest motivates individuals to sacrifice some autonomy to produce security and protect the rights of others
Aasland '9

(Dag, Prof. of Economics @ U of Agder, Norway, <u>Ethics and Economy: After Levinas</u>, pgs. 65-66)

<u>Business ethics</u>, in the sense of ethics *for* business, illustrates this: its <u>perspective is</u> that of an <u>'enlightened self-interest'</u> <u>where the constraints that are put on the individual, thanks to the ability to see the unfortunate</u> <u>consequences for oneself, postpone</u> the <u>'war'</u>, in a direct or metaphoric sense of the word (*ibid.*: 70-71). This <u>enlightened</u> <u>self-interest forms the base not only of</u> the <u>market economy, but also of</u> a social organization and manifestation of <u>human rights</u>, and even of some ethical theories. <u>It is a calculated</u> and voluntary <u>renunciation of one's own freedom in</u> <u>order to obtain</u> in return <u>security</u> and other common goals (*ibid.*: 72). <u>The fact that economic</u>, political and legal <u>theories</u> <u>appeal to enlightened self-interest does not imply</u>, however, <u>that we should discard them</u>. Nor should we reject proclamations of human rights, legal constraints of individual freedom and, for that matter, business ethics, even if they are based on an enlightened self-interest. <u>It is rather the opposite: such institutions and knowledge are indispensable because</u> <u>the primary quality of</u> the <u>enlightened self-interest is that it restricts egocentricity</u>. Our *practical reason* (which was Kant's words for the reason that governs our acts, where the moral law is embedded as a principle) includes the knowledge that it can be rational to lay certain restrictions on individual freedom. In this way <u>practical reason may postpone</u> (for an indefinite time) <u>violence</u> and murder <u>among people</u>. <u>This has</u> primarily <u>been the raison-d'être of</u> politics and <u>the state, but it is</u> <u>today taken over</u> more and more <u>by corporate organizations</u>, as expressed in the new term for business ethics, as *corporate social responsibility* and *corporate citizenship* (see chapter 2). <u>Thanks to this 'postponement of violence' provided by</u> politics and <u>economic rationality, people may unfold their freedom</u> within the laws and regulations set up by society (Burggraeve, 2003: 77).

Permutation do both

The permutation solves best – neoliberal institutions can be used against themselves – absolute refusal makes structural violence inevitable
Ferguson, Professor of Anthropology at Stanford, 11

(James, The Uses of Neoliberalism, Antipode, Vol. 41, No. S1, pp 166–184)

<u>If we are seeking</u>, as this special issue of Antipode aspires to do, <u>to link our critical analyses to the world of grounded</u> <u>political struggle</u>—not only to interpret the world in various ways, but also to change it—<u>then **there is much to be said for**</u> **<u>focusing</u>**, as I have here, **on mundane, real- world debates around policy and politics, even if doing so** **inevitably puts us on the compromised and reformist terrain of the possible, rather than the seductive** **high ground of revolutionary ideals and utopian desires**. But I would also insist that <u>there is more at stake</u> in the examples I have discussed here <u>than simply a slightly better way to ameliorate the miseries of the chronically</u> <u>poor</u>, or a technically superior method for relieving the suffering of famine victims.¶ My point in discussing the South African BIG campaign, for instance, is not really to argue for its implementation. There is much in the campaign that is appealing, to be sure. But one can just as easily identify a series of worries that would bring the whole proposal into doubt. Does not, for instance, the decoupling of the question of assistance from the issue of labor, and the associated valorization of the "informal", help provide a kind of alibi for the failures of the South African regime to pursue policies that would do more to create jobs? Would not the creation of a basic income benefit tied to national citizenship simply exacerbate the vicious xenophobia that already divides the South African poor,¶ in a context where many of the poorest are not citizens, and would thus not be eligible for the BIG? Perhaps even more fundamentally, is the idea of basic income really capable of commanding the mass

support that alone could make it a central pillar of a new approach to distribution? The record to date gives powerful reasons to doubt it. So far, the technocrats' dreams of relieving poverty through efficient cash transfers have attracted little support from actual poor people, who seem to find that vision a bit pale and washed out, compared with the vivid (if vague) populist promises of jobs and personalistic social inclusion long offered by the ANC patronage machine, and lately personified by Jacob Zuma (Ferguson forthcoming).¶ My real interest in the policy proposals discussed here, in fact, has little to do with the narrow policy questions to which they seek to provide answers. For what is most significant, for my purposes, is not whether or not these are good policies, but the way that they illustrate a process through which specific governmental devices and modes of reasoning that we have become used to associating with a very particular (and conservative) political agenda ("neoliberalism") may be in the process of being peeled away from that agenda, and put to very different uses. Any progressive who takes seriously the challenge I pointed to at the start of this essay, the challenge of developing new progressive arts of government, ought to find this turn of events of considerable interest.¶ As Steven Collier (2005) has recently pointed out, it is important to question the assumption that there is, or must be, a neat or automatic fit between a hegemonic "neoliberal" political-economic project (however that might be characterized), on the one hand, and specific "neoliberal" techniques, on the other. Close attention to particular techniques (such as the use of quantitative calculation, free choice, and price driven by supply and demand) in particular settings (in Collier's case, fiscal and budgetary reform in post-Soviet Russia) shows that the relationship between the technical and the political-economic "is much more polymorphous and unstable than is assumed in much critical geographical work", and that neoliberal technical mechanisms are in fact "deployed in relation to diverse political projects and social norms" (2005:2).¶ As I suggested in referencing the role of statistics and techniques for pooling risk in the creation of social democratic welfare states, social technologies need not have any essential or eternal loyalty to the political formations within which they were first developed. Insurance rationality at the end of the nineteenth century had no essential vocation to provide security and solidarity to the working class; it was turned to that purpose (in some substantial measure) because it was available, in the right place at the right time, to be appropriated for that use. Specific ways of solving or posing governmental problems, specific institutional and intellectual mechanisms, can be combined in an almost infinite variety of ways, to accomplish different social ends. With social, as with any other sort of technology, it is not the machines or the mechanisms that decide what they will be used to do.¶ Foucault (2008:94) concluded his discussion of socialist government- ality by insisting that the answers to the Left's governmental problems require not yet another search through our sacred texts, but a process of conceptual and institutional innovation. "[I]f there is a really socialist governmentality, then it is not hidden within socialism and its texts. It cannot be deduced from them. It must be invented". But invention in the domain of governmental technique is rarely something worked up out of whole cloth. More often, it involves a kind of bricolage (Le'vi- Strauss 1966), a piecing together of something new out of scavenged parts originally intended for some other purpose. As we pursue such a process of improvisatory invention, we might begin by making an inventory of the parts available for such tinkering, keeping all the while an open mind about how different mechanisms might be put to work, and what kinds of purposes they might serve. If we can go beyond seeing in "neoliberalism" an evil essence or an automatic unity, and instead learn to see a field of specific governmental techniques, we may be surprised to find that some of them can be repurposed, and put to work in the service of political projects very different from those usually associated with that word. If so, we may find that the cabinet of governmental arts available to us is a bit less bare than first appeared, and that some rather useful little mechanisms may be nearer to hand than we thought.

Neolib solves war and collapse causes it – historical evidence and studies prove
Tures '3 – Associate Professor of Political Science @ LaGrange College

John A. Tures, Associate Professor of Political Science at LaGrange College, 2003, "ECONOMIC FREEDOM AND CONFLICT REDUCTION: EVIDENCE FROM THE 1970S, 1980S, AND 1990S", Cato Journal, Vol. 22, No. 3. http://www.cato.org/pubs/journal/cj22n3/cj22n3-9.pdf

The last three decades have witnessed an unprecedented expansion of market-based reforms and the profusion of economic freedom in the international system. This shift in economic policy has sparked a debate about whether free markets are superior to state controls. Numerous studies have compared the neoliberal and statist policies on issues of production capacity, economic growth, commercial vol- umes, and egalitarianism. An overlooked research agenda, however, is the relationship between levels of economic freedom and violence within countries. Proponents of the statist approach might note that a strong gov- ernment can bend the market to its will, directing activity toward policies necessary to achieve greater levels of gross domestic product and growth. By extracting more resources for the economy, a pow- erful state can redistribute benefits to keep the populace happy. Higher taxes can also pay for an army and police force that intimidate people. Such governments range from command economies of totali- tarian systems to autocratic dictators and military juntas. Other eco- nomically unfree systems include some of the authoritarian "Asian tigers." A combination of historical evidence, modern theorists, and statis- tical findings, however, has indicated that a reduced role for the state in regulating economic transactions is associated with a decrease in internal conflicts. Countries where the government dominates the commercial realm experience an increase in the level of domestic violence. Scholars have traced the history of revolutions to explain the relationship between statism and internal upheavals. Contemporary authors also posit a relationship between economic liberty and peace. Statistical tests show a strong connection between economic freedom and conflict reduction during the past three decades.

Framework

Force the negative to explain how their alternative produces behavioral change - their alternative may sound good, but it produces no institutions for creating social change
Barnett 10

(Clive, Professor of Geography and Social Theory at the University of Exeter in the UK, "The politics of behaviour change", September 3, 2010, http://clivebarnett.wordpress.com/2010/09/03/the-politics-of-behaviour-change-2/)

Another plug, this time for a Theme Issue of the journal Environment and Planning A, on the topic of Ethical Foodscapes. I was asked to write a short commentary on the papers in this collection, and ended up using this an excuse to try to say something coherent about 'the politics of behaviour change' - the papers in the collection all engage, in different ways, with ongoing attempts to influence individual patterns of consumption by fiddling with the backgrounds of food practices. This is just one field in which <u>the issue of how and whether to influence people's conduct to achieve various 'public goods' has become central to contemporary politics</u> and governance. There is a great research project investigating this phenomenon, based at Aberystwyth, on the time-spaces of soft paternalism. **Behaviour change is all over** the place these days – in **climate change debates**, in obesity agendas, amongst the Research Councils who fund science and social science in the UK - it's all the rage in policy circles, not just in government but also amongst think-tankers and NGOs. The House of Lords Select Committee has just announced an inquiry into how ideas about behaviour change are working in government. <u>What I find most interesting</u> about all this <u>is the challenge this seems to present to styles of 'critical' social science analysis</u> – Elizabeth Shove has an interesting reflection on this issue, also in Environment and Planning A earlier this year, which focusses on how 'attitude-behaviour-change' models of governance tend to marginalise insights of social theory. It is interesting, certainly, to track the ways in which certain <u>scientific and social scientific fields are being 'sourced' for authoritative models of how to intervene to bring about social change</u> – <u>the most obvious example being</u> the <u>selective use of neuroscience</u>, along with the popularisation of behavioural economics by Thaler and Sunstein's Nudge. There is a cross-over here between academic research fields and popular discourse too; think of Malcolm Gladwell's books, the success of Freakonomics, or my favourite, Simon Kuper and Stefan Szymanski's Soccernomics - a book which uses simple statistical analysis to develop some interesting explanations and make some entertaining predictions about how success in national and international football is determined (interestingly, this book was published in the UK under the title Why England Lose: And other curious phenomena explained – the difference in the title between the UK and US version is indicative of the current popularity of this style of popular social science beyond any particular specialised interest).¶
<u>There is an easy default position that this style of thinking about influencing people is inherently sinister, since it explicitly seeks to get at people through less-than-fully-rational means</u> – by either <u>designing change into infrastructures, or by deploying affective styles of communication</u>. This seems to circumvent a basic principle of persuading people of the reasons to change through rational argument. <u>Behaviour change initiatives are all about 'manipulating' the contexts in which people exercise choice and discretion. They seem to be designed to confirm</u> the model of <u>'governmentality'</u> developed by Michel

Foucault, of a mode of power which works by shaping the contexts of individuals' conduct without directly intervening in that conduct. Of course, the question that Foucault doesn't necessarily help us with is how to know when it is a problem that your conduct is being configured, 'nudged', in certain ways, and when it isn't. There is a tendency of course to read Foucault as a theorist of social control, but **I think the proliferation of behaviour change initiatives is one occasion to re-visit the 'politics' of using Foucault**. The anthropologist James Ferguson has recently argued that there is a real political stake at play in seemingly arcane differences between conceptualisations of neoliberalism as a hegemonic project of class-power, informed by Marxist theorists such as David Harvey, and neoliberalization as a contingent assemblage of varied 'arts of government', informed by governmentality theory, in the work of Aihwa Ong for example. **One reason not to reconcile these approaches** – not to think that Foucault provides a nice micro-analysis of the 'how' of neoliberalism, while Marxism still holds the secrets to explaining the real interests driving the 'why' (an argument made by Bob Jessop) – is because the governmentality approach draws into view the 'critical' imperative to think through **the possibilities of alternative 'arts of government'**. Quite **a lot of sexy theory these days doesn't like to do this, preferring stylized images of contestation and disruption**. This is why the default reading of behaviour change, as a sinister way of controlling people's actions in the interests of more neoliberalism, more consumerism, more responsibilization, doesn't seem convincing to me – **it seems to close down the more difficult form of analysis which would ask about the possibility of using devices and discourses of 'behaviour change' for different purposes**, or **in more democratically accountable fashion.**

Link

AT Cyber Public Sphere K

Social media is good and key to mobilization – expands the scale of social dialogue and allows broader participation and coordination
Salanova 12

(Regina, United Nations University Institute in Barcelona, "Social media and political change: The case of the 2011 revolutions in Tunisia and Egypt," ICIP WORKING PAPERS: 2012/7, pgs. 11-12)

The use of social media tools as a means to raise awareness and mobilize the masses against the status quo of a given country or regime is certainly not new. Social and political activism has had very significant episodes throughout the twentieth century, from non-violent civil disobedience in India to civil right movements in the US among many others, yet social media have given social movements useful tools to **coordinate and to undertake collective action**. Clay Shirky's analysis on the power of social media in enhancing democracies is probably one of the best attempts at glorifying social media movements (Shirky 2011). Shirky believes that social media have a key role in echoing public opinion. To him, **access to conversation is far more important than access to information**. In the long run, he argues, social media may help increase freedoms as the printing press, postal service or the telegraph did before.¶Internet has benefited grassroots movements by providing new possibilities for citizens to organize even under authoritarian regimes. As Yochai Benkler argues, with the inclusion of Internet in the framework of social mobilization, there has been a qualitative change "represented in the experience of being **a potential speaker, as opposed to simply a listener**" (Benkler 2006). According to him, Internet has not only reduced the cost of producing and publishing media content but it has also decentralized media production, making it much harder for authoritarian regimes to control and censor media outlets.

Social media leads to public mobilization – decreases information costs and allows expanded participation in public debate and conversation
Wang et al 13

(Cheng-Jun Wang, Department of Media and Communication, City University of Hong Kong, Kowloon, Hong Kong, "Discussing Occupy Wall Street on Twitter: Longitudinal Network Analysis of Equality, Emotion, and Stability of Public Discussion," CYBERPSYCHOLOGY, BEHAVIOR, AND SOCIAL NETWORKING Volume 16, Number 9, 2013)

Social media is believed to play **a revolutionary role** in contentious politics (e.g., revolutions, social movements, and strike waves). The wave of Occupy Wall Street activity

that fought against income inequality swept America during the second half of 2011 and continuously stimulated wide- ranging discussions throughout American society. In particular, we observed that Twitter users actively and voluntarily participated in this movement in a variety of ways, including sharing external links and initiating conversations.

In addition to the obvious advantages of integrating information from all types of mass media, celebrities, and related organizations, online social networks have **great potential for mobilizing people**. Scholars have been interested in the effects of participation in online social networks on political participation and have found correlations with news learning, information sharing, debating, and informal interaction.[1–4] Before the emergence of social media, a similar role played by interpersonal communication and mass media in stirring people's interest was discussed.[5] However, in this era of social media, scholars can better understand how conversational ecosystems operate by tracking online users' activities.[6] For example, Twitter users mention other users using the symbol ''@,'' which indicates their motivations to draw attentions toward a particular topic.

AT Privacy K

Morozov's critique of privacy is a straw person that makes collective anti-neoliberal politics impossible – the neg's suspicion of transparency makes political corruption and inequality inevitable
Sifry 13

(Micah Sifry, Editorial Director, Personal Democracy Media, "Book Review: Evgeny Morozov Doth Protest Too Much," April 9, 2013, http://techpresident.com/news/23708/book-review-evgeny-morozov-doth-protest-too-much)

According to Evgeny Morozov, the world has gone crazy and he's one of the few sane people left. Zynga and Facebook, he writes, in his strange new book, "To Save Everything, Click Here: The Folly of Technological Solutionism," have "become models to think about civic engagement." Yelp and Amazon have "become models to think about criticism." People who believe the open Internet can be a tool for good and who worry about and try to oppose people who are using it to hurt others, actually treat the Internet like a "religion" and believe "it's the ultimate technology and the ultimate network." Like the proverbial engineer with a hammer, they see all of society's quirks, inefficiencies, waste, inequality, corruption and hypocrisy as nails to be smashed with smart tools and big data.¶ If it were up to their ilk, he writes, "The odds are that a perfectly efficient seat-distribution system--abetted by ubiquitous technology, sensors, and facial recognition--would have robbed us of one of the proudest moments in American history." That is, "technosolutionists," the villains of Morozov's book, would have engineered such a perfect bus-seating system balancing the seating claims of white and black riders that Rosa Parks could never have committed her history-making act of civil disobedience. Yes, he imagines that, without a word about the underlying problem of racism. I am not making this up.¶ And it gets worse. Extrapolating from the grandiose statements of people like Google's Eric Schmidt and Facebook's Mark Zuckerberg, Morozov spins up a world **that doesn't exist** and then proceeds to inveigh against it **as if it must be the end-point of** where the technosolutionists are taking **society**. To wit, by 2020, we will live in a world where:¶ "Humanity, equipped with powerful self-tracking devices, finally conquers obesity, insomnia, and global warming as everyone eats less, sleeps better, and emits more appropriately. The fallibility of human memory is conquered too, as the very same tracking devices record and store everything we do. Car keys, faces, factoids: we will never forget them again...."¶ "Politics, finally under the constant and far-reaching gaze of the electorate, is freed from all the sleazy corruption, backroom deals and inefficient horse trading. Parties are disaggregated and replaced by Groupon-like political campaigns, where users come together--once--to weigh in on issues of direct and immediate relevance to their lives, only to disband shortly afterward. Now that every word--nay, sound--ever uttered by politicians is recorded and stored for posterity, hypocrisy has become obsolete as well. Lobbyists of all stripes have gone extinct as the wealth of data about politicians--their schedules, lunch menus, travel expenses--are posted online for everyone to review. As digital media make participation easier, more and more citizens ditch bowling alone--only to take up blogging together. Even those who've never bothered to vote in the past are finally provided with the right incentives--naturally, as a part of an online game where they collect points for saving humanity--and so they rush to use their smartphones to 'check in' at the voting booth."¶ Morozov says he finds much of this future "terrifying," but it's only a nightmare of his own imagining. Sometimes his little jokes--lunch menus?--hint that he himself doesn't quite believe it's going to go down this way. But in his zeal to prop up and demolish the straw ~~man~~ [person] of technosolutionism, he contorts himself into some truly bizarre positions.¶ Take his book's discussion of politics, and the efforts of American reformers to reduce **corruption and political inequality by increasing** the availability of information about who is donating to whom, who is lobbying whom, and what they get in return--also known by the short-hand of **"transparency."**¶ For someone who grew up in dictatorial Belarus (which he wryly refers to as "an oasis of tolerance in the middle of Europe"), Morozov has a surprising dislike of political transparency. He gives us several pages of handwringing over the anti-gay-rights donors to California's Proposition 8 who found their publicly disclosed campaign contributions helpfully aggregated on a civilian-built website called Eightmaps.com, which led to some embarrassment for them. Justice Antonin Scalia's admonishment, in a related case involving the publishing of the names of petition signers, that "the fact is that running a democracy takes a certain amount of civic courage" is not for Morozov.¶ No, Morozov is so caught up in his war on "internet-centrism" and technosolutionism that **he embraces proposals to make it harder for people to know who is attempting to influence the political process**. "Campaign finance records posted online could be 'read-only' so that, while accessible on the FEC website, they would not be easy to download or reproduce elsewhere," he writes, approvingly citing a paper by Deborah

Johnson, Priscilla Regan and Kent Wayland essay on "Campaign Disclosure, Privacy and Transparency." Such data should be made "harder to find" and even posted with "self-destruct" code on it to prevent its use, say, five years after an election. So if you wanted to know just how much money Wall Street had invested in some up-and-coming politician at the beginning of his career when a decade or two later he finally enters the national spotlight decades later and runs for President--Morozov apparently thinks you should have a hard, if not impossible, time finding out.¶ What makes this line of argument even odder is that Morozov says he favors more efforts to tackle hard structural issues that deform society and produce negative personal consequences. Again and again in To Save Everything he rails against technological solutions that atomize consumers and place all the burden on their shoulders for solving their problems--criticizing, for example, people who self-track their way to better health rather than "make it harder for food companies to sell unhealthy food or target children." But while calling for solutions requiring collective political action (he's actually a "solutionist" too!), Morozov opposes uses of technology--like the ability to aggregate vital information about political influence peddlers--that might enhance popular political power against the entrenched interests that currently hold it. It makes no sense. (See John Wonderlich's rebuttal of Morozov's criticisms of the Sunlight Foundation here; and yes, I am proudly a consultant to that institution, which Morozov bashes needlessly.)

AT Knowledge Economy K

The knowledge economy is good – produces individual autonomy and forces large corporations to change business practices – ensures improvements in quality of life
Leberecht 14

(Tim Leberecht, chief marketing officer of global design and architecture firm NBBJ, "HOW THE KNOWLEDGE ECONOMY IS REDEFINING WORK," *Fast Company*, http://www.fastcompany.com/3026566/leadership-now/how-the-knowledge-economy-is-redefining-work)

Somewhere is emblematic of the changing nature of the workplace. Our conceptions of work have shifted from time card and job title to mindset and narrative. Millennials in particular view work as a powerful vehicle for finding meaning in their lives. McMurray is well aware of this generational shift and refers to the rapidly emerging segment of independent workers who prefer independence over permanent, full-time employment. "They definitely present a challenge for large corporations that, if unable to offer extremely **flexible, autonomous, and creative** work environments, simply won't be able to attract the best people," he told me.¶ While business-as-usual used to involve linear narratives of the CV and a more formal notion of transactional business relationships, Somewhere illustrates that we are moving further into more **contextual and nonlinear** portraits of our "selves" at work. The site redefines work as something beautiful, careers as ambiguous and ever-evolving, and a professional's identity as a fluid persona. McMurray says: "People lead such fascinating work lives, and our hope is that we can help open up the world of work, help people see behind the scenes, find inspiration, and find the people they should be working with."

The permutation solves best – a robust knowledge economy and IT innovation are key to transition to an empathetic civilization – solves all their impacts
Rifkin 10

(Jeremy Rifkin, American economic and social theorist, writer, public speaker, political advisor, and activist, "'Empathic Civilization': Is It Time To Replace The American Dream?" *Huffington Post*, May 25, 2011, http://www.huffingtonpost.com/jeremy-rifkin/empathic-civilization-is_b_469546.html)

When we consider these big picture policy issues, what becomes clear, if we bother to read between the lines, is that our long held beliefs about human nature, and by extension, the institutions we have created to express those beliefs, played no small role in precipitating the very crisis that now faces the country. In a nation that has come to think of human nature as competitive, even predatory, self serving, acquisitive and utilitarian, is it any wonder that those very values have led to a "winner take all" syndrome in the marketplace in which the rich get richer while everyone else becomes marginalized, and the well-being of the larger community, including the biosphere, becomes eroded? The US ranks 27th among industrialized countries, in income disparity -- the gap between the very rich and the very poor. Only Mexico, Turkey and Portugal, of the OECD nations, have greater disparity of income. Moreover, the US enjoys the dubious distinction of being one of the two leading contributors to global greenhouse gas emissions in the world. Could it be that the American Dream is becoming the American nightmare?¶ Interestingly, a younger generation of Americans is growing up in a very different world than the one described by the Enlightenment thinkers. Their reality is being lived out on **a digital commons** and in **social spaces on the World**

Wide Web. All across America, our nation's teens are performing hundreds of hours of community service as part of their formal educational requirements. In school, they are learning that every activity they engage in -- the food they eat, the car they drive, the clothes they wear -- comes with a carbon footprint and affects the well-being of every other human being and fellow creature on Earth.¶ Today's youth are **globally connected**. They are Skyping in real time with their cohorts and friends on the far corners of the Earth. They are sharing **information, knowledge, and mutual aid in cyberspace chat rooms**, apparently unaware of the so called "tragedy of the commons." They have little regard for traditional property rights -- especially copyrights, trademarks, and patents -- believing information should run free. They are far more concerned with sharing access than protecting ownership. They think of themselves less as autonomous agents -- an island to oneself -- and more as actors in an ever shifting set of roles and relationships. Personal wealth, while still important, is not considered an endgame, but only a baseline consideration for enjoying **a more immaterial existence**, including more meaningful experiences in diverse communities.¶ Surveys show that the millennial generation in the United States is much more likely than older generations to feel empathy for others. They are far more concerned with the planetary environment and climate change and more likely to favor sustainable economic growth. They are also more likely to believe that government has a responsibility to take care of people who can't care for themselves, and are more supportive of a bigger role of government in providing basic services. They are more supportive of globalization and immigration than older generations. They are also more racially diverse and the most tolerant of any generation in history in support of gender equality and the willingness to champion the rights of the disabled, gays, other minorities, as well as our fellow creatures. In short, they favor a world of inclusivity over exclusivity, and are more comfortable in **distributed networks** than in old fashioned centralized hierarchies that establish boundaries and restrictions separating people from one another.¶ The new sensibilities of the younger generation are beginning to usher in a different idea about human nature and the dream that accompanies it. Today's youth find little value in the Enlightenment caricature of human nature as rational, calculating, detached, and utilitarian. **They prefer to think of human nature as empathic,** mindful, engaged, and driven by the intrinsic value and interconnectedness of life. Homo sapien is being eclipsed by homo empathicus, as they shift their horizon from national markets and nation-state borders to a global economy and a planetary community. Even their preferred indicators of economic progress are shifting, from the crude calculation of gross domestic product and per-capita income to more sensitive social indicators -- like health and longevity, social equality, safe communities, clean environment, etc. -- that measure the well-being of the broader community.

AT State Bad Link

Using the state is the only way to check <u>neoliberal exploitation</u>

Connolly 13 (Krieger-Eisenhower Professor of Political Science at Johns Hopkins University)
(William, The Fragility of Things: Self-Organizing Processes, Neoliberal Fantasies, and Democratic Activism, pg. 40-42)

6) <u>The democratic state</u>, while it certainly cannot alone tame capital or re- constitute the ethos and infrastructure of consumption<u>, must play a significant role in reconstituting our lived relations</u> to climate, weather, re- source use, ocean currents, bee survival, tectonic instability, glacier flows, species diversity, work, local life, consumption, and investment, as it also responds favorably to the public pressures we must generate to forge a new ethos. A new, new left will thus experimentally enact new intersections be- tween role performance and political activity, outgrow its old disgust with the very idea of the state, and remain alert to the dangers states can pose. It will do so because, as already suggested, the fragile ecology of late capital requires state interventions of several sorts. <u>A refusal to participate in the state today cedes too much hegemony to neoliberal markets</u>, either explicitly or by implication. Drives to fascism, remember, rose the last time in capitalist states after a total market meltdown. Most of those movements failed. But a couple became consolidated through a series of resonances (vibrations) back and forth between industrialists, the state, and vigilante groups in neighborhoods, clubs, churches, the police, the media, and pubs. <u>You do not fight the danger of a new kind of neofascism by withdrawing from </u>either micropolitics or <u>state politics</u>. <u>You do so through a multisited politics designed to infuse a new ethos into the fabric of everyday life.</u> Changes in ethos can in turn open doors to new possibilities of state and interstate action, so that an advance in one domain seeds that in the other. And vice versa. A positive dynamic of mutual amplification might be generated here. Could a series of significant shifts in the routines of state and global capital ism even press the fractured system to a point where it hovers on the edge of capitalism itself? We don't know. <u>That is one reason it is important to focus on **interim goals**</u>. Another is that in a world of becoming, replete with periodic and surprising shifts in the course of events, you cannot project far beyond an interim period. Another yet is that <u>activism needs to project concrete, interim possibilities to gain support and propel itself forward</u>. That being said, it does seem unlikely to me, at least, that a positive interim future includes either socialist productivism or the world projected by proponents of deep ecology. 7) To advance such an agenda it is also imperative to negotiate new connec- tions between nontheistic constituencies who care about the future of the Earth and numerous devotees of diverse religious traditions who fold posi- tive spiritualities into their creedal practices. <u>The new, multifaceted move- ment needed today</u>, if it emerges, <u>will take the shape of a vibrant pluralist assemblage acting at multiple sites within and across states</u>, rather than either a centered movement with a series of fellow travelers attached to it or a mere electoral constellation. Electoral victories are important, but they work best when they touch priorities already embedded in churches, uni- versities, film, music, consumption practices, media reporting, investment priorities, and the like. A related thing to keep in mind is that the capitalist modes of acceleration, expansion, and intensification that heighten the fra- gility of things today also generate pressures to *minoritize* the world along multiple dimensions at a more rapid pace than heretofore. A new pluralist constellation will build upon the latter developments as it works to reduce the former effects. I am sure that the forgoing comments will appear to some as "opti- mistic" or "utopian." But optimism and pessimism are both primarily spec- tatorial views. Neither seems sufficient to the contemporary condition. In- deed pessimism, if you dwell on it long, easily slides into cynicism, and cynicism often plays into the hands of a right wing that applies it exclu- sively to any set of state activities not designed to protect or coddle the corporate estate. That is one reason that "dysfunctional politics" redounds so readily to the advantage of cynics on the right who work to promote it. *They want to promote cynicism with respect to the state and innocence with respect to the market.* Pure critique, as already suggested, does not suffice either. Pure critique too readily carries critics and their followers to the edge of cynicism. It is also true that the above critique concentrates on neoliberal capital- ism, not capitalism writ large. That is because it seems to me that we need to specify the terms of critique as closely as possible and think first of all about interim responses. If we lived under, say, Keynesian capitalism, a somewhat different set of issues would be defined and other strategies identified. Capitalism writ large—while it sets a general context that neoliberalism inflects in specific ways—sets too large and generic a target. It can assume multiple forms, as the differences between Swedish and American capitalism suggest; the times demand a set of interim agendas targeting the hegemonic form of today, pursued with heightened militancy at sev- eral sites. The point today is not to wait for a revolution that overthrows the whole system. The "system," as we shall see further, is replete with too many loose ends, uneven edges, dicey intersections with nonhuman forces, and uncertain trajectories to make such a wholesale project plausible. Be- sides, things are too urgent and too many people on the ground are suffer- ing too much now. The need now is to activate the most promising political strategies to the contemporary condition out of a bad set. On top of assessing *probabilities* and predicting them with secret relish or despair—activities I myself pur- sue during the election season—<u>we must define the urgent **needs** of the day in relation to a set of **interim possibilities** worthy of pursuit on several fronts, even if the apparent political odds are stacked against them</u>. We then test ourselves and those possibilities by trying to enact this or that aspect of them at diverse sites, turning back to reconsider their efficacy and side effects as circumstances shift and results accrue. In so doing we may ex- perience more vibrantly how apparently closed and ossified structures are typically punctuated by jagged edges, seams, and fractures best pried open with a mix of public contestation of established interpretations, experimen- tal shifts in multiple role performances, micropolitics in churches, univer- sities, unions, the media, and corporations, state actions, and large-scale, cross-state citizen actions.

Pragmatic use of the law can be successful at fighting back against neoliberalism

Ashar 8 (Associate Professor of Law and Director of the Immigrant and Refugee Rights Clinic, City University of New York (CUNY) School of Law)

(Sameer M., LAW CLINICS AND COLLECTIVE MOBILIZATION, 14 Clinical L. Rev. 355, LN)

Public interest lawyers today represent clients in a period of rapid political and economic change. Poor people are besieged by unprecedented market forces with less protection by the state than at any other time in our recent history. Multinational corporate actors and their collaborators in government have advanced an agenda in both developed and developing nations - described by some as "neoliberal globalization"-with three major tenets: (1) weakening and impoverishment of the state so that it is unable to provide basic social protections; (2) privatization of formerly public functions; and (3) free and rapid movement of capital that facilitates lowered labor and environmental standards. n9 In the United States, the advocates of neoliberalism successfully fought to remove the federal social welfare entitlement in 1996 and to condition access to subsistence relief on participation in enforced labor programs, thus expanding the class of [*361] low-wage workers in the economy. n10 The reserve wage has fallen as our clients have become more vulnerable to their employers and other market actors, including banks and landlords. Previously robust civil society organizations, such as unions and identity-based associations, have weakened n13 and increasingly depend upon corporate and governmental patrons. In response to this environment, a growing number of small groups of poor and working-class people have risen to challenge the reordering of our economy and politics. These resistance movements self-consciously act locally and think globally, allying themselves (actually or symbolically) with grassroots movements outside the United States. n14 This resistance simultaneously opposes neoliberalism and constructs a decentralized "radical democratic" program. n15 In the area in which I work, immigrant workers and organizers have banded together along ethnic, geographic, and occupational lines in "worker centers" to improve their conditions of employment through direct action, litigation, and legislation. n16 These worker centers have drawn [*362] extensively in the course of their campaigns on legal resources provided by a small number of law school clinics. n17 Similarly informed and designed law school clinics have also had highly productive collaborations with environmental justice, n18 welfare rights, n19 and community development organizations n20 that are either directly or indirectly related to global social movements.

The neg's description of a global trajectory towards neoliberalism is de-politicizing and epistemologically flawed – they ignore or subsume contrary empirical evidence, and underestimate the power of representative democracy to constrain influence of economic elites – reject their overwrought impact claims and use the permutation to deploy the state against economic inequality
Barnett 10

(Clive Barnett, Faculty of Social Sciences @ The Open University, "Publics and Markets: What's wrong with Neoliberalism?", *The Handbook of Social Geography*, edited by Susan Smith, Sallie Marston, Rachel Pain, and John Paul Jones III. London and New York: Sage)

In theories of neoliberalism and neoliberalization, the theoretical preference for very high levels of abstraction is associated with a tendency to make a geographical virtue out of the consistent failure to theorize the state as anything other than a functional attribute of the reproductive requirements of capital. Particular state-formations and patterns of political contention are acknowledged only as local, territorialized, contextual factors that help to explain how the universalizing trajectory of neoliberalism, orchestrated from the centre and organised through global networks, nonetheless always generate 'hybrid' assemblages of neoliberalism.¶ This style of theorizing makes it **almost impossible** to gainsay the highly generalised claims about neoliberalism as an ideology and neoliberalization as a state-led project by referring to empirical evidence that might seem to contradict these grand concepts. For example, it is almost taken-for-granted that the hegemony of neoliberalism is manifest in the reduction of state expenditures on welfare in face of external pressures of neoliberal globalization. **Empirical evidence for welfare**

state decline is, in fact, **far from conclusive**. Welfare regimes have actually proved highly resilient in terms of both funding and provisioning (see Taylor-Gooby 2001). At the same time, the extent to which open market economies foster rather than menace high-levels of national welfare provision is also hotly debated (Taylor-Gooby 2003). In both cases, the idea of any straightforward shift from state to market seems a little simplistic (Clarke 2003). But from the perspective of geography's meta-theories of neoliberalization, all of this is so much grist to the contextualizing mill. Contrary evidence can be easily incorporated into these theories precisely because they layer **levels of conceptual abstraction** onto scales of **contextual articulation**.¶ Presenting differential state-formation as a contextual variable is related to a much broader **displacement of political action** in general to a lower level of conceptual abstraction in theories of neoliberalism. One aspect of this is the persistent treatment of a broad range of social movement activity as primarily a secondary response to processes of neoliberalization. But more fundamentally, Marxist political-economies of neoliberalism pay **almost no attention**, at a conceptual level, **to the causal significance of the institutional and organisational forms that shape political action** (Hay 2004). This is indicative of **a broader failure to think through how distinctive forms of contemporary democratic politics shape pathways of economic development** and capital accumulation. Theories of neoliberalism take for granted the capacity of states to implement particular policies in order to put in place the regulatory conditions for particular accumulation strategies. **This overlooks the degree to which** the time-space constitution of **democratic politics in liberal democracies serve as "substantial impediments to the achievement of neo-liberal goals"** (Johnston and Glasmeier 2007, 15). Given the territorialization of party support and the territorialized organization of electoral politics, liberal democracy generates strong pressures that militate against wholly flexible and open labour markets, sustain subsidies and protectionist measures, and support the promotion of investment in particular locations. In theories of neoliberalism, processes of free market reform in the USA and UK since the 1980s are considered models of more general tendential logics. **But these examples might be quite specific outcomes of the balance of political forces in those polities** when compared to the patterns of welfare reform and tax policy in European countries (Prasad 2005; see also Glyn 2007).¶ Taking into account the ways in which state action is constrained by the time-space constitution of electoral, representative democracy is particularly relevant for understanding why relatively wealthy, advanced industrial economies do not conform to the tendential logic predicted by political-economy theories of neoliberalization. These same constraints might be operative elsewhere too. It is routine to suggest that neoliberalism is 'imposed' on developing economies externally, through the Washington Consensus promulgated by the IMF, World Bank, and WTO. However, Stokes (2002) argues that patterns of neoliberalization in Latin America in the 1980s and 1990s can be explained in large part **by analysis of the dynamics between electoral campaigning, party mobilisation, mandate and accountability** as they played themselves out in periods of democratic transition and consolidation. In her account of 'neoliberalism by surprise', democratic governance, party competition, electoral accountability, and responsiveness to constituents' interests all play crucial roles in explaining whether, how, and why neoliberal policies are adopted.¶ Strictly speaking, these sorts of considerations do not need to disturb the secure conceptual vantage-point offered by political-economy theorizations of neoliberalism. This paradigm is, as already suggested, internally attuned to recognize the variety and hybridity of neoliberalisms, and is able to ascribe this to the necessary articulation of generic neoliberal ideology, circulated globally, with territorialized logics operative at 'lower' geographical scales. Whether or not one finds this convincing comes down to a decision between different styles of theory. Political-economy approaches seek after high-level abstractions in order to identify fundamental features of phenomena (the logic of capital accumulation in Harvey, the capitalist state in Jessop, neoliberal ideology in Peck and Tickell). These abstract imperatives are then mapped empirically through a kind of deductive cascade, where they bump into other phenomena, like states, or racial formations, or gender relations. Because of **their distinctive ontological features** (**e.g. their institutional qualities**, their territorial qualities, their discursive qualities, and their identity-based qualities), these phenomena have never been amenable to the same sort of explanatory rationalism that allows the dynamics of capital accumulation to be defined so purely.¶ The effect of these theorizations is to **de-politicize politics**. If the dominant logic of state action can always be discerned

from understanding the logic of capital accumulation and the balance of class forces, then that is really all one ever needs to really know (Clarke 2004a). This de-politicization of politics 'out there' is an effect of **the inflation of the political force ascribed to the academic work of critique**: **analysis of politics is reduced to a matter of understanding how a logic already known in advance is differentially enacted**, so that the critical task of such analysis can be presented as a political act of exposing naturalized forms as social constructs.

Impact D – Structural Violence

UQ

The world is <u>structurally improving</u>—newest and best data

Beauchamp 13 ["5 Reasons Why 2013 Was The Best Year In Human, Zack, Reporter/Blogger for ThinkProgress.org. He previously contributed to Andrew Sullivan's The Dish at Newsweek/Daily Beast, and has also written for Foreign Policy and Tablet magazines. Zack holds B.A.s in Philosophy and Political Science from Brown University and an M.Sc in International Relations from the London School of Economics. He grew up in Washington, DC.History",http://thinkprogress.org/security/2013/12/11/3036671/2013-certainly-year-human-history/#]

Between the brutal civil war in Syria, the government shutdown and all of the deadly dysfunction it represents, the NSA spying revelations, and massive inequality, it'd be easy to for you to enter 2014 thinking the last year has been an awful one. But you'd be wrong. <u>We have every reason to believe that **2013 was**</u>, in fact, **the best year on the planet** for humankind. Contrary to what you might have heard, <u>virtually all of the most important forces that determine what make people's lives good – the things that determine how long they live, and whether they live happily and freely – are trending in an extremely happy direction. While it's possible that this progress **could be reversed**</u> by something like runaway climate change, <u>the effects will have to be dramatic to overcome the extraordinary and growing progress we've made in making the world a better place.</u> Here's the five big reasons why. 1. Fewer people are dying young, and more are living longer. The greatest story in recent human history is the simplest: we're winning the fight against death. "<u>There is not a single country in the world where infant or child mortality today is not lower than it was in 1950</u>," writes Angus <u>Deaton, a Princeton economist</u> who works on global health issues. <u>The most up-to-date numbers on global health, the 2013</u> World Health Organization (<u>WHO</u>) <u>statistical compendium, confirm Deaton's estimation.</u> Between 1990 and 2010, the percentage of children who died before their fifth birthday dropped by almost half. Measles deaths declined by 71 percent, and both tuberculosis and maternal deaths by half again. HIV, that modern plague, is also being held back, with deaths from AIDS-related illnesses down by 24 percent since 2005. In short, fewer people are dying untimely deaths. <u>And that's **not only**</u> true in rich countries: life expectancy has gone up between 1990 and 2011 in every WHO income bracket. The gains are even more dramatic if you take the long view: global life expectancy was 47 in the early 1950s, but had risen to 70 — a 50 percent jump — by 2011. For even more perspective, the average Briton in 1850 — when the British Empire had reached its apex — was 40. The average person today should expect to live almost twice as long as the average citizen of the world's wealthiest and most powerful country in 1850. In real terms, this means millions of fewer dead adults and children a year, millions fewer people who spend their lives suffering the pains and unfreedoms imposed by illness, and millions more people spending their twilight years with loved ones. And the trends are all positive — "progress has accelerated in recent years in many countries with the highest rates of mortality," as the WHO rather bloodlessly put it. What's going on? Obviously, it's fairly complicated, but the most important drivers have been technological and political innovation. The Enlightenment-era advances in the scientific method got people doing high-quality research, which brought us modern medicine and the information technologies that allow us to spread medical breakthroughs around the world at increasingly faster rates. Scientific discoveries also fueled the Industrial Revolution and the birth of modern capitalism, giving us more resources to devote to large-scale application of live-saving technologies. And the global spread of liberal democracy made governments accountable to citizens, forcing them to attend to their health needs or pay the electoral price. We'll see the enormously beneficial impact of these two forces, technology and democracy, repeatedly throughout this list, which should tell you something about the foundations of human progress. But when talking about improvements in health, we shouldn't neglect foreign aid. Nations donating huge amounts of money out of an altruistic interest in the welfare of foreigners is historically unprecedented, and while not all aid has been helpful, health aid has been a huge boon. Even Deaton, who wrote one of 2013's harshest assessments of foreign aid, believes "the case for assistance to fight disease such as HIV/AIDS or smallpox is strong." That's because these programs have demonstrably saved lives — the President's Emergency Plan for AIDS Relief (PEPFAR), a 2003 program pushed by President Bush, paid for anti-retroviral treatment for over 5.1 million people in the poor countries hardest-hit by the AIDS epidemic. So <u>we're outracing the Four Horseman, extending our lives faster than pestilence, war, famine, and death can take them. That alone should be enough to say the world is getting better.</u> 2. <u>Fewer people suffer from extreme poverty</u>, and the world is getting happier. <u>There are fewer people in abject penury than at any other point in human history, and middle class people enjoy their highest standard of living ever.</u> We haven't come close to solving poverty: a number of African countries in particular have chronic problems generating growth, a nut foreign aid hasn't yet cracked. So this isn't a call for complacency about poverty any more than acknowledging victories over disease is an argument against tackling malaria. But make no mistake<u>: as a whole, the world is much richer in 2013 than it was before. 721 million fewer people lived in extreme poverty</u> ($1.25 a day) <u>in 2010 than in 1981, according to a new World Bank study from October. That's astounding – a decline from 40 to about 14 percent of the world's population suffering from abject want</u>. <u>And **poverty rates are declining in every national income bracket:**</u> even in low income countries, the percentage of people living in extreme poverty ($1.25 a day in 2005 dollars) a day gone down from 63 in 1981 to 44 in 2010. <u>We can be fairly confident that these trends are continuing</u>. For one thing, <u>they survived the Great Recession in 2008.</u> For another, the decline in poverty has been fueled by global economic growth, which looks to be continuing: global GDP grew by 2.3 percent in 2012, a number that'll rise to 2.9 percent in 2013 according to IMF projections. The bulk of the recent decline in poverty comes form India and China — about 80 percent from China *alone*. Chinese economic and social reform, a delayed reaction to the mass slaughter and starvation of Mao's Cultural

Revolution, has been the engine of poverty's global decline. If you subtract China, there are actually more poor people today than there were in 1981 (population growth trumping the percentage declines in poverty). But we shouldn't discount China. If what we care about is fewer people suffering the misery of poverty, then it shouldn't matter what nation the less-poor people call home. Chinese growth should be celebrated, not shunted aside. The poor haven't been the only people benefitting from global growth. Middle class people have access to an ever-greater stock of life-improving goods. Televisions and refrigerators, once luxury goods, are now comparatively cheap and commonplace. That's why large-percentage improvements in a nation's GDP appear to correlate strongly with higher levels of happiness among the nation's citizens; people like having things that make their lives easier and more worry-free. Global economic growth in the past five decades has dramatically reduced poverty and made people around the world happier. Once again, we're better off. 3. War is becoming rarer and less deadly.

APTOPIX Mideast Libya CREDIT: AP Photo/ Manu Brabo Another massive conflict could overturn the global progress against disease and poverty. But it appears war, too, may be losing its fangs. Steven Pinker's 2011 book The Better Angels Of Our Nature is the gold standard in this debate. Pinker brought a treasure trove of data to bear on the question of whether the world has gotten more peaceful, and found that, in the long arc of human history, both war and other forms of violence (the death penalty, for instance) are on a centuries-long downward slope. Pinker summarizes his argument here if you don't own the book. Most eye-popping are the numbers for the past 50 years; Pinker finds that "the worldwide rate of death from interstate and civil war combined has juddered downward...from almost 300 per 100,000 world population during World War II, to almost 30 during the Korean War, to the low teens during the era of the Vietnam War, to single digits in the 1970s and 1980s, to less than 1 in the twenty-first century." Here's what that looks like graphed: Pinker CREDIT: Steven Pinker/The Wall Street Journal So it looks like the smallest percentage of humans alive since World War II, and in all likelihood in human history, are living through the horrors of war. Did 2013 give us any reason to believe that Pinker and the other scholars who agree with him have been proven wrong? Probably not. The academic debate over the decline of war really exploded in 2013, but the "declinist" thesis has fared pretty well. Challenges to Pinker's conclusion that battle deaths have gone down over time have not withstood scrutiny. The most compelling critique, a new paper by Bear F. Braumoeller, argues that if you control for the larger number of countries in the last 50 years, war happens at roughly the same rates as it has historically. There are lots of things you might say about Braumoeller's argument, and I've asked Pinker for his two cents (update: Pinker's response here). But most importantly, if battle deaths per 100,000 people really has declined, then his argument doesn't mean very much. If (percentage-wise) fewer people are dying from war, then what we call "war" now is a lot less deadly than "war" used to be. Braumoeller suggests population growth and improvements in battle medicine explain the decline, but that's not convincing: tell me with a straight face that the only differences in deadliness between World War II, Vietnam, and the wars you see today is that there are more people and better doctors. There's a more rigorous way of putting that: today, we see many more civil wars than we do wars between nations. The former tend to be less deadly than the latter. That's why the other major challenge to Pinker's thesis in 2013, the deepening of the Syrian civil war, isn't likely to upset the overall trend. Syria's war is an unimaginable tragedy, one responsible for the rare, depressing increase in battle deaths from 2011 to 2012. However, the overall 2011-2012 trend "fits well with the observed long-term decline in battle deaths," according to researchers at the authoritative Uppsala Conflict Data Program, because the uptick is not enough to suggest an overall change in trend. We should expect something similar when the 2013 numbers are published. Why are smaller and smaller percentages of people being exposed to the horrors of war? There are lots of reasons one could point to, but two of the biggest ones are the spread of democracy and humans getting, for lack of a better word, better. That democracies never, or almost never, go to war with each other is not seriously in dispute: the statistical evidence is ridiculously strong. While some argue that the "democratic peace," as it's called, is caused by things other than democracy itself, there's good experimental evidence that democratic leaders and citizens just don't want to fight each other. Since 1950, democracy has spread around the world like wildfire. There were only a handful of democracies after World War II, but that grew to roughly 40 percent of all by the end of the Cold War. Today, a comfortable majority — about 60 percent — of all states are democracies. This freer world is also a safer one. Second — and this is Pinker's preferred explanation — people have developed strategies for dealing with war's causes and consequences. "Human ingenuity and experience have gradually been brought to bear," Pinker writes, "just as they have chipped away at hunger and disease." A series of human inventions, things like U.N. peacekeeping operations, which nowadays are very successful at reducing violence, have given us a set of social tools increasingly well suited to reducing the harm caused by armed conflict. War's decline isn't accidental, in other words. It's by design. 4. Rates of murder and other violent crimes are in free-fall. Britain Unrest CREDIT: Akira Suemori/AP Photos Pinker's trend against violence isn't limited just to war. It seems likes crimes, both of the sort states commit against their citizens and citizens commit against each other, are also on the decline. Take a few examples. Slavery, once commonly sanctioned by governments, is illegal everywhere on earth. The use of torture as legal punishment has gone down dramatically. The European murder rate fell 35-fold from the Middle Ages to the beginning of the 20th century (check out this amazing 2003 paper from Michael Eisner, who dredged up medieval records to estimate European homicide rates in the swords-and-chivalry era, if you don't believe me). The decline has been especially marked in recent years. Though homicide crime rates climbed back up from their historic lows between the 1970s and 1990s, reversing progress made since the late 19th century, they have collapsed worldwide in the 21st century. 557,000 people were murdered in 2001 — almost three times as many as were killed in war that year. In 2008, that number was 289,000, and the homicide rate has been declining in 75 percent of nations since then. Statistics from around the developed world, where numbers are particularly reliable, show that it's not just homicide that's on the wane: it's almost all violent crime. US government numbers show that violent crime in the United States declined from a peak of about 750 crimes per 100,000 Americans to under 450 by 2009. G7 as a whole countries show huge declines in homicide, robbery, and vehicle theft. So even in countries that aren't at poor or at war, most people's lives are getting safer and more secure. Why? We know it's not incarceration. While the United States and Britain have dramatically increased their prison populations, others, like Canada, the Netherlands, and Estonia, reduced their incarceration rates and saw similar declines in violent crime. Same thing state-to-state in the United States; New York imprisoned fewer people and saw the fastest crime decline in the country. The Economist's deep dive into the explanations for crime's collapse provides a few answers. Globally, police have gotten better at working with communities and targeting areas with the most crime. They've also gotten new toys, like DNA testing, that make it easier to catch criminals. The crack epidemic in the United States and its heroin twin in Europe have both slowed down dramatically. Rapid gentrification has made inner-city crime harder. And the increasing cheapness of "luxury" goods like iPods and DVD players has reduced incentives for crime on both the supply and demand sides: stealing a DVD player isn't as profitable, and it's easier for a would-be thief to buy one in the first place. But there's one explanation The Economist dismissed that strikes me as hugely important: the abolition of lead gasoline. Kevin Drum at Mother Jones wrote what's universally acknowledged to be the definitive argument for the lead/crime link, and it's incredibly compelling. We know for a fact that lead exposure damages people's brains and can potentially be fatal; that's why an international campaign to ban leaded gasoline started around 1970. Today, leaded gasoline is almost unheard of — it's banned in 175 countries, and there's been a decline in lead blood levels by about 90 percent. Drum marshals a wealth of evidence that the parts of the brain damaged by lead are the same ones that check people's aggressive impulses. Moreover, the timing matches up: crime shot up in the mid-to-late-20th century as cars spread around the world, and started to decline in the 70s as the anti-lead campaign was succeeding. Here's close the relationship is, using data from the United States: Lead_Crime_325 Now, non-homicide violent crime appears to have ticked up in 2012, based on U.S. government surveys of victims of crime, but it's very possible that's just a blip: the official Department of Justice report says up-front that "the apparent increase in the rate of violent crimes reported to police from 2011 to 2012 was not statistically significant." So we have no reason to believe crime is making a come back, and every reason to believe the historical decline in criminal violence is here to stay. 5. There's less racism, sexism, and other forms of discrimination in the world. Nelson Mandela CREDIT: Theana Calitz/AP Images Racism, sexism, anti-Semitism, homophobia, and other forms of discrimination remain, without a doubt, extraordinarily powerful forces. The statistical and experimental evidence is overwhelming — this irrefutable proof of widespread discrimination against African-Americans, for instance, should put the "racism is dead" fantasy to bed. Yet the need to combat discrimination denial shouldn't blind us to the good news. Over the centuries, humanity has made extraordinary progress in taming its hate for and ill-treatment of other humans on the basis of difference alone. Indeed, it is very likely that we live in the least discriminatory era in the history of modern civilization. It's not a huge prize given how bad the past had been, but there are still gains worth celebrating. Go back 150 years in time and the point should be obvious. Take four prominent groups in 1860: African-Americans were in

chains, European Jews were routinely massacred in the ghettos and shtetls they were confined to, women around the world were denied the opportunity to work outside the home and made almost entirely subordinate to their husbands, and LGBT people were invisible. The improvements in each of these group's statuses today, both in the United States and internationally, are incontestable. On closer look, we have reason to believe the happy trends are likely to continue. Take racial discrimination. In 2000, Harvard sociologist Lawrence Bobo penned a comprehensive assessment of the data on racial attitudes in the United States. He found a "national consensus" on the ideals of racial equality and integration. "A nation once comfortable as a deliberately segregationist and racially discriminatory society has not only abandoned that view," Bobo writes, "but now overtly positively endorses the goals of racial integration and equal treatment. There is no sign whatsoever of retreat from this ideal, despite events that many thought would call it into question. The magnitude, steadiness, and breadth of this change should be lost on no one." The norm against overt racism has **gone global.** In her book on the international anti-apartheid movement in the 1980s, Syracuse's Audie Klotz says flatly that "the illegitimacy of white minority rule led to South Africa's persistent diplomatic, cultural, and economic isolation." The belief that racial discrimination could not be tolerated had become so widespread, Klotz argues, that it united the globe — including governments that had strategic interests in supporting South Africa's whites — in opposition to apartheid. In 2011, 91 percent of respondents in a sample of 21 diverse countries said that equal treatment of people of different races or ethnicities was important to them. Racism obviously survived both American and South African apartheid, albeit in more subtle, insidious forms. "The death of Jim Crow racism has left us in an uncomfortable place," Bobo writes, "a state of laissez-faire racism" where racial discrimination and disparities still exist, but support for the kind of aggressive government policies needed to address them is racially polarized. But there's reason to hope that'll change as well: two massive studies of the political views of younger Americans by my TP Ideas colleagues, John Halpin and Ruy Teixeira, found that millenials were significantly more racially tolerant and supportive of government action to address racial disparities than the generations that preceded them. Though I'm not aware of any similar research of on a global scale, it's hard not to imagine they'd find similar results, suggesting that we should have hope that the power of racial prejudice may be waning. The story about gender discrimination is very similar: after the feminist movement's enormous victories in the 20th century, structural sexism still shapes the world in profound ways, but the cause of gender equality is making progress. In 2011, 86 percent of people in a diverse 21 country sample said that equal treatment on the basis of gender was an important value. The U.N.'s Human Development Report's Gender Inequality Index — a comprehensive study of reproductive health, social empowerment, and labor market equity — saw a 20 percent decline in observable gender inequalities from 1995 to 2011. IMF data show consistent global declines in wage disparities between genders, labor force participation, and educational attainment around the world. While enormous inequality remains, 2013 is looking to be the worst year for sexism in history. Finally, we've made astonishing progress on sexual orientation and gender identity discrimination — largely in the past 15 years. At the beginning of 2003, zero Americans lived in marriage equality states; by the end of 2013, 38 percent of Americans will. Article 13 of the European Community Treaty bans discrimination on the grounds of sexual orientation, and, in 2011, the UN Human Rights Council passed a resolution committing the council to documenting and exposing discrimination on orientation or identity grounds around the world. The public opinion trends are positive worldwide: all of the major shifts from 2007 to 2013 in Pew's "acceptance of homosexuality" poll were towards greater tolerance, and young people everywhere are more open to equality for LGBT individuals than their older peers. best_year_graphics-04 Once again, **these victories are** partial and **by no means inevitable**. Racism, sexism, homophobia, and other forms of discrimination aren't just "going away" on their own. They're losing their hold on us because people are working to change other people's minds and because governments are passing laws aimed at promoting equality. Positive trends don't mean the problems are close to solved, and certainly aren't excuses for sitting on our hands. That's true of everything on this list. The fact that fewer people are dying from war and disease doesn't lessen the moral imperative to do something about those that are; the fact that people are getting richer and safer in their homes isn't an excuse for doing more to address poverty and crime. But too often, the worst parts about the world are treated as **inevitable**, the prospect of radical victory over pain and suffering dismissed as utopian fantasy. The overwhelming force of the evidence shows that to be false. As best we can tell, the reason humanity is getting better is because humans have decided to make the world a better place. We consciously chose to develop lifesaving medicine and build freer political systems; we've passed laws against workplace discrimination and poisoning children's minds with lead. So far, these choices have more than paid off. It's up to us to make sure they continue to.

Prefer our evidence—their evidence is cognitively biased and ignores long term trends Harvey 13

Philip D., "How the World Is Getting Better" [http://www.huffingtonpost.com/philip-d-harvey/how-the-world-is-getting-_b_2680402.html] February 20 //mtc

We humans thrive on bad news; we're pre-programmed to respond to threats, and predictions of apocalypse. Good news bores us, so we don't hear much about the remarkable improvements in the human condition in recent years. Here's a quick review of significant developments.¶ * **Life expectancy**, perhaps the most objective indicator of human wellbeing, has been rising dramatically. When people live longer it means they have more of life's necessities, and are freer from disease and fatal violence. A few hundred years ago, the average human lived less than 30 years. When I was born, my life expectancy, right here in the U.S., was 63. Babies born today can expect to reach the age of 79, a 25 percent improvement, and more than three times the average life-span in Julius Caesar's time. Worldwide, including all the poorest countries, life expectancy at birth has gone from 46 years in the 1950s to 70 years today. Adding 24 years to the longevity of our species in a mere 60 years is remarkably good news.¶ *Despite food shortages in some places, there's **more food** for everyone today than ever before. For most of human history the daily struggle for food dominated life. People rarely had enough to eat. But even as the world population climbed to 7 billion, daily food supplies per person have gone from 2,250 calories a day in 1960 to 2,800 in 2002. The English, who survived on 2068 calories a day in the late 19th century, consume 3412 today. In India, calories per capita were below 1700 as recently as 1950. Today, the figure is 2459. For comparison, consider the U.S. Department of Agriculture recommendations: 2000-3000 calories per day for adult men; 1600-2400 for adult women. In many countries, including the U.S., poverty is now characterized by too much food rather than too little.¶ * The world's wealth has increased enormously. For tens of thousands of years humans existed at bare subsistence, on the equivalent of $400 or $500 per person per year (in 1990 dollars). But wealth skyrocketed worldwide, starting around 1800 with the Industrial Revolution, and growing with the widespread use of electricity; it was $1500 per capita in 1913 and $10,700 in 2010. Deprivation has not been eradicated, of course, but this kind of economic growth is new to human history.¶ In the U.S., where income per capita zoomed from $5300 in 1913 to $48,112 today, large numbers of Americans are still classified as poor, but

everyone's living standards have improved markedly. Surveys show that 83 percent of the poor say that they have enough to eat; 63 percent have cable or satellite TV; 80 percent have air conditioning; 43 percent have Internet access. But instead of celebrating this progress, we're inclined to find things wrong with it.¶ * There is much **less violence** than there used to be. Harvard's Steven Pinker, who has researched this subject exhaustively, recently concluded that "today we are probably living in the most peaceful moment of our species' time on earth." Wars used to kill millions; now the numbers are way down. In World War II, U.S. forces wiped out hundreds of thousands of civilians as part of our military strategy. Now we pay reparations for accidentally killing civilians. Not long ago witches were burned at the stake, slavery and public hangings were commonplace. Cats were burned alive for entertainment. Those practices are gone for good.¶ What are we to make of the fact that good news is all around us, but we determinedly dwell on the not-so-cheerful? Some blame attaches to politicians, who want us to be afraid of unseen dangers so they can protect us, and some attaches to the media, which revel in violence because it draws eyeballs.¶ But we seem eager to embrace the dark side. Rather than being glad we lead more comfortable lives than our parents or our grandparents did, we tend to grouse that things are worse than they were last year, or last week.¶ It turns out that there's a built-in reason for that. Attention to trouble has been vital to our survival. In a recent essay Marian Tupy of the Cato Institute points out that the information entering the amygdala, the part of our brain responsible for emotions like rage, hate and fear, "gets our first attention because the amygdala 'is always looking for something to fear.' Our species has evolved to prioritize bad news." In the struggle for survival, those who constantly feared danger survived; optimists did not.¶ So the evening news will always lead with violence. There will always be enough bad news to go around. We even create our own bad news with deaths and injuries in many sports and other entertainment.¶ But have a look at the good news once in a while. I know it's boring, but even as we resist, things are likely to keep right on **getting better and better**.

AT Structural Violence

Their description of "structural violence" is flawed – it overdetermines a single line of causality, but lacks the specificity to describe likely scenarios – prefer our empirical impact claims
Thompson 3

William, Professor of Political Science and Director of the Center for the Study of International Relations at Indiana University, "A Streetcar Named Sarajevo: Catalysts, Multiple Causation Chains, and Rivalry Structures," International Studies Quarterly, 47(3), AD: 7-10-9

Richard Ned Lebow (2000–2001) has recently invoked what might be called a streetcar interpretation of systemic war and change. According to him, all our structural theories in world politics both overdetermine and underdetermine the explanation of the most important events such as World War I, World War II, or the end of the Cold War. Not only do structural theories tend to fixate on one cause or stream of causation, they are inherently incomplete because the influence of structural causes cannot be known without also identifying the necessary role of catalysts. As long as we ignore the precipitants that actually encourage actors to act, we cannot make accurate generalizations about the relationships between more remote causation and the outcomes that we are trying to explain. Nor can we test the accuracy of such generalizations without accompanying data on the presence or absence of catalysts. In the absence of an appropriate catalyst (or a ''streetcar'' that failed to arrive), wars might never have happened. Concrete information on their presence (''streetcars'' that did arrive) might alter our understanding of the explanatory significance of other variables. But since catalysts and contingencies are so difficult to handle theoretically and empirically, perhaps we should focus instead on probing the theoretical role of contingencies via the development of ''what if '' scenarios

Impact Turn

Impact Framing/ Ethics

Our aff is the perfect middle ground – we use public institutions to remove collective threats to individual human well-being and flourishing – that balances individual and collective concerns, and avoids both uncritical individualism and technocratic rational planning
Bird 99

(Colin Bird, Assistant Professor in the Department of Government and Foreign Affairs at the University of Virginia, *The Myth of Liberal Individualism*, pgs. 209-211)

There are signs that the kind of expressivist theory I have been sketching is once again taking root. Joseph Raz's perfectionism is a case in point. Although he still describes himself as a liberal, Raz's recent writings present a view containing many of the essential features of the expressivist conception. For example, he shows little interest in any form of utilitarianism. He treats individual well-being as instantiated in the process of human activity: 'the core idea,' he says, 'is controlling one's conduct, being in charge'. For Raz, human beings have the capacity to engage 'wholeheartedly' in the 'successful pursuit' of 'valuable activities'. I take him to be claiming that public agency consists in ensuring that the institutions and practices of society which the public agent oversees and participates in are only justifiable to the extent that they allow or enable individuals to exercise that capacity. Moreover, Raz explicitly connects this claim about well-being with claims about duties to ourselves, duties which he says arise independently of our will. Raz writes, "all who can should meet the conditions which entitle them to self-respect. They should respect their own capacity for rational agency, and should endeavour to exercise it responsibly … those who are responsible agents and are therefore entitled to respect themselves should do so … A person's well-being is the successful pursuit of worthwhile goals. Self-respect is earned by the endeavour to live a life of such pursuits. Self-respect, therefore, is a condition of individual well-being. Only those who deservedly respect themselves can have a successful life. Failing to respect oneself, or to be entitled to such respect, is perhaps the most fundamental way of failing in one's life." Finally, although Raz has been called a 'communitarian liberal', it is clear that he sees principles of the kind mentioned in the above passage as valuable independently of their contribution to the preservation of particular communities or culturally valued practices: 'No one should be denied access to valuable options on the ground that to allow access would lead to the transformation or the disappearance of a much-cherished existing form of a valuable activity or relationship.' Here Raz implies that his view suggests a strong, agent-relative side-constraint against any form of activity which deprives an individual of the opportunities he needs for the successful exercise of the capacities necessary for his well-being. This is a restriction which would presumably trump claims of utility, efficiency *and* community. It is not my intention to signal agreement with Raz's views about specific political issues, nor with his account of what well-being consists in; there is, happily, plenty to dispute in the details of his argument, and a detailed (sympathetic) critique of his proposals seems to me to be already overdue. Rather, the main point is that Raz's recent work seems to me to suggest rather eloquently how the expressivist view might be brought out from under the long shadow that 'liberal individualism' has cast over recent debates in political theory. For Raz, the point of politics is not just to service individuals' values, nor indeed to uphold the values of a community or social identity blindly, but to fight for

individuals' capacity for well-being against the many threats – social, economic, ideological and political – which it faces. We may well disagree with his account of well-being, and of the human capacities that are central to it. But we can do so while agreeing that the main aim of public agency should be to identify and remedy major social threats to the legitimate and proper exercise of individuals' own capacities. And we can at the same time consider the possibility that the ideology of service liberalism, and the technocratic conception of public agency it has sponsored, might be just such a threat. If that expressivist project were to be taken seriously, some leading elements of contemporary philosophical 'liberalism' might eventually evolve into the kind of critical social theory of which liberals have sometimes been deeply suspicious. Such a theory would be free of the scruples about the public evaluation and correction of self-regarding faults; it would be a theory that dropped the idea of neutrality and abjured a static, technocratic consequentialism; it would be a theory that brought the dynamic *processes* of human development and interaction into the foreground as matters of common, public attention; it would be prepared to consider the possibility that an exclusive focus on non-interference could be inimical to, not supportive of, self-development; and it could do all of these things without any point having to invoke problematic claims about the social construction of one's moral identity. Such a theory would certainly contain many elements to which one might apply the label 'liberal'. But because it would provide a vantage-point from which we could both celebrate the undeniable achievements of liberal civilization and identify some of its most serious shortcomings, such a theory would merely tend to confirm the obsolescence of that label and of the ideal towards which it gestures. For ideals and their labels become obsolete, not merely when they fall out of fashion or are deemed *passé*, but because they no longer discriminate between success and failure, or between fulfillment and betrayal.

Neolib Solves War

Every relevant example in the last thirty years suggests that neoliberal market policies dramatically decrease violence

Tures '3

John A. Tures, Associate Professor of Political Science at LaGrange College, 2003, "ECONOMIC FREEDOM AND CONFLICT REDUCTION: EVIDENCE FROM THE 1970S, 1980S, AND 1990S", Cato Journal, Vol. 22, No. 3. http://www.cato.org/pubs/journal/cj22n3/cj22n3-9.pdf

The last three decades have witnessed an unprecedented expansion of market-based reforms and the profusion of economic freedom in the international system. This shift in economic policy has sparked a debate about whether free markets are superior to state controls. Numerous studies have compared the neoliberal and statist policies on issues of production capacity, economic growth, commercial volumes, and egalitarianism. An overlooked research agenda, however, is the relationship between levels of economic freedom and violence within countries. Proponents of the statist approach might note that a strong government can bend the market to its will, directing activity toward policies necessary to achieve greater levels of gross domestic product and growth. By extracting more resources for the economy, a powerful state can redistribute benefits to keep the populace happy. Higher taxes can also pay for an army and police force that intimidate people. Such governments range from command economies of totalitarian systems to autocratic dictators and military juntas. Other economically unfree systems include some of the authoritarian "Asian tigers." A combination of historical evidence, modern theorists, and statistical findings, however, has indicated that a reduced role for the state in regulating economic transactions is associated with a decrease in internal conflicts. Countries where the government dominates the commercial realm experience an increase in the level of domestic violence. Scholars have traced the history of revolutions to explain the relationship between statism and internal upheavals. Contemporary authors also posit a relationship between economic liberty and peace. Statistical tests show a strong connection between economic freedom and conflict reduction during the past three decades.

Neoliberalism makes war and conflict less likely.

Obhof '3

Larry J. Obhof, J.D., Yale Law School, 2003; B.A., Ohio University, 2000. "WHY GLOBALIZATION? A LOOK AT GLOBAL CAPITALISM AND ITS EFFECTS". University of Florida Journal of Law & Public Policy. Fall 2003. Lexis.

Perhaps the strongest argument in favor of global capitalism is based on another "externality": conflict prevention. Many have speculated that international investment may inhibit conflict by promoting economic growth and interdependence. n145 Conflict becomes relatively less attractive as a country reaches higher levels of economic development. As one [*117] scholar put it, "[F]ree trade makes nations too busy and too rich to fight." n146 Increasing economic interdependence compounds this effect. Indeed, the more a country's economy depends on foreign trade or investment, the more self-damaging it is to engage in aggression. n147 This idea is certainly not new. As Montesquieu penned in 1752: "Peace is the natural effect of trade. Two nations who traffic with each other become reciprocally dependent . . . and thus their union is founded on their mutual necessities." n148 The wisdom of Montesquieu's statement has become even more apparent in recent years. As the now-famous "Golden Arches Theory of Conflict Prevention" by Thomas Friedman makes clear, there is a point at which the desire of a country for trade and investment restricts the capacity for war-making by its leadership. n149 Economic integration places strong constraints on countries "plugged into the system": investors may withdraw billions of dollars, not merely retarding economic growth, but in some cases dispatching it altogether. Any chance of a conflict is inhibited by the direct investments that natives have in foreign countries, and the investments that foreigners have in the home country. n150 Perhaps the simplicity of this argument makes it easy to dismiss. Its importance is not lost, however, on world leaders. In 1996, as the first fully democratic elections of Taiwan were approaching, columnist Thomas Friedman travelled Beijing to observe the growing tensions between China and Taiwan. China was threatening to invade if

Taiwan sought total independence from the mainland. When Friedman interviewed a senior economist from the Chinese Academy of Sciences, he asked if China could in fact afford to attack Taiwan. The economist answered, "No - it would stop investment in China, stop growth, stop our last chance to catch up with the rest of the world." n151 With 20% of its total annual investment [*118] coming from foreign sources, and exports to America making up 40% of the total exports of China, the Chinese economy simply could not withstand the shock that a war would cause. The economist was admitting "that China could not attack Taiwan without devastating its own economy." n152 The rest, as they say, is history. Tensions continue, but the Chinese government, eager for growth and aware of the consequences of its actions, remains in check.

Neolib Solves War/Structural Violence

Neoliberalism is key to growth and poverty reduction.

Gresser '7

Edward Gresser, Director of the Project on Trade and Global Markets @ Progressive Policy Institute. "Is 'Free Trade' Working?". Testimony before the Senate Commerce Committee, Subcommittee on Interstate Commerce, Trade and Tourism. April 18, 2007.
http://www.dlc.org/ndol_ci.cfm?kaid=108&subid=206&contentid=254256

Since then the world has opened. Policy is part of it: twelve major multilateral agreements and more recent bilateral agreements and preferences. So are powerful structural changes outside policy: geopolitical change returned Germany and Japan, then our old Cold War adversaries to the global economy; container shipping and air cargo cut the costs of goods trade; fiber-optics, satellite beams and the Internet are doing the same in services. Trade has accordingly grown five-fold relative to the US and world economies since the end of the war. Is it working? Taking Roosevelt's hopes as a guide, on the whole the answer is 'yes.' Open markets abroad let us sell $1.4 trillion in airplanes, wine, high-value commercial services and more to the world last year. Our openness to imports, often cause for anxiety and stress, also raises living standards through wider choice and better prices; and by keeping inflation low, gives us lower unemployment with higher growth. For example, since the trade agreements and the World-Wide Web launch in the early 1990s, unemployment has fallen from an average of 7.1 percent to an average of 5.2 percent. Abroad, an opening world economy helps foster development and reduce poverty. Two recent cases: the African Growth and Opportunity Act has helped create nearly 200,000 jobs in low-income African states; trade normalization with Cambodia in 1996 has helped a war-torn, almost destitute country create an urban manufacturing industry, ease the threat of rural hunger, and find jobs for 300,000 young women.

Neoliberalism leads to economic growth - especially for developing countries.

Obhof '3

Larry J. Obhof, J.D., Yale Law School, 2003; B.A., Ohio University, 2000. "WHY GLOBALIZATION? A LOOK AT GLOBAL CAPITALISM AND ITS EFFECTS". University of Florida Journal of Law & Public Policy. Fall 2003. Lexis.

The effects of globalization have largely been positive for both developed and developing countries. Consider, for example, the effects of the Uruguay Round of trade negotiations, which lasted from 1986 to 1994 and resulted in agreements to reduce tariffs and other non-tariff barriers. Advanced countries agreed to lower their tariffs by an average of 40%, and [*99] the signatories agreed to liberalize trade in the important areas of agriculture and clothing. n32 The effects of the Uruguay Round have been both positive and large. Reducing tariffs and non-tariff barriers has produced annual increases in global GDP of $ 100-300 billion. n33 This figure is five times larger than the total worldwide aid to developing countries. n34 More importantly, a significant share of this increase has gone to the poorest people. The percentage of the population in developing countries living under $ 1 per day has fallen from 30% to 24% in the past decade. n35 The recent experience of Mexico offers an excellent example of global capitalism in action. The extent of poverty in Mexico is shocking; 20 million people live on less than $ 2

per day. n36 This is so for a number of reasons, including government intervention in the market in the form of protectionist measures intended to help ailing or failing industries. Using government interventions to shape the allocation of resources traditionally led to gross inefficiencies and a low pace of innovation and adoption of new technologies. n37 Trade liberalization has helped curb such interventions - indeed, the opening of its markets has become one of the most important and far-reaching reforms in Mexico. The effects of trade liberalization on the Mexican economy have been significant. Exports in Mexico have increased sixfold since 1985, and the GDP of the country has grown at an average rate of 5.4% per year since 1996. n38 Since NAFTA created a "free trade area" among the United States, Canada, and Mexico in 1994, Mexican labor productivity has grown fast in its tradable sectors. n39 Not surprisingly, however, productivity has remained stagnant in nontradable sectors. n40 NAFTA has also improved Mexico's aggregate trade balance and helped to ameliorate the effect of the [*100] peso crisis on capital flows. n41 As most economists predicted during the NAFTA debate, the effects of the agreement have been positive and large for Mexico. n42 The effects have also been positive, although smaller, for the United States. This is also consistent with the pre-NAFTA analyses of most economists. n43 The positive effects of globalization have been consistent throughout the developing world. Dramatic increases in per capita income have accompanied the expansion of trade in countries that have become more globalized. Korea, for example, has seen average incomes increase eightfold since 1960. n44 China has experienced an average growth of 5.1% during the same period, and other countries in Asia, Africa, and Latin America have experienced faster growth than that in advanced countries. n45 The evidence is incredibly one-sided. "[P]romoting openness, and supporting it with sound domestic policies, leads to faster growth." n46 The most successful third of developing countries have lowered average import tariffs by 34% and increased trade relative to income by 104% since 1980. n47 Per capita income in these countries rose by a yearly average of [*101] 3.5% in the 1980s, and a yearly average of 5% in the 1990s. n48 The remaining developing countries, which have lowered tariffs by an average of only 11%, experienced "little or no growth in GDP per capita in the post-1980 period." n49 In countries that have become more open, increased growth has undoubtedly been good for the poor. "Cross-country evidence suggests that the incomes of the poorest 20 percent of the population increase roughly one-for-one with the average per capita income." n50 Some studies have found an even stronger effect: a 1% increase in the average per capita income is associated with a reduction in poverty rates by up to 3.5%. n51 Poverty rates fall, almost always, simultaneously with growth in average living standards. The evidence is clear: increasing integration leads to greater growth, and with it, greater income levels, particularly for the poorest. n52

Neolib Solves Environment

Neolib is key to solve environmental crisis – international coop and economic develop is critical.
Chen '00

Jim Chen, Professor of Law and Julius E. Davis Professor of Law, 2000-2001, University of Minnesota Law School.

"PAX MERCATORIA: GLOBALIZATION AS A SECOND CHANCE AT "PEACE FOR OUR TIME"". November/December 2000. 24 Fordham Int'l L.J. 217. Lexis.

The true nature of the environmental crisis. The most serious environmental problems involve "the depletion and destruction of the global commons." n188 Climate change, ozone depletion, [*247] and the loss of species, habitats, and biodiversity are today's top environmental priorities. n189 None can be solved without substantial economic development and intense international cooperation. The systematic degradation of the biosphere respects no political boundaries. Worse, it is exacerbated by poverty. Of the myriad environmental problems in this mutually dependent world, "persistent poverty may turn out to be the most aggravating and destructive." n190 We must remember "above all else" that "human degradation and deprivation ... constitute the greatest threat not only to national, regional, and world security, but to essential life-supporting ecological systems." n191

Neolib creates conditions that allows for environmental sustainability.
Griswold '1

Daniel. Director of the Center for Trade Policy Studies, Masters in economics from London School of Economics. 8/2/1. http://www.freetrade.org/pubs/pas/tpa-015b.pdf

Expanding trade is not merely compatible with high standards of environmental quality but can lead directly to their improvement. As a country sees its standard of living rise through economic liberalization and trade expansion, its industry can more readily afford to control emissions. Its citizens have more to spend, above what they need for subsistence, on the "luxury good" of improved environmental quality. And as economic growth creates an expanding, better- educated middle class, the political demand rises for pollution abatement. That explains why the most stringent environmental laws in the world today are found in developed countries that are relatively open to trade. Development by itself can have a mixed impact on the environment. All else being equal, an economy that produces more of exactly the same goods and services in exactly the same way will produce more pollution. But development changes not only the size of an economy but also its composition and its level of technology. More sophisticated technology can mean cleaner production processes and more affordable and effective pollution abatement. And as nations progress to higher stages of development, they tend to move away from more resource-intensive activities such as mining, agriculture, and heavy industry and into light manufacturing, information technology, and services. A study by the OECD on globalization and the environment found: "There is some evidence that, once a country begins to industrialize, trade liberalization helps to make the structure of its economy less pollution-intensive than in those countries whose economies remain relatively closed. In particular, freer trade seems to

promote the transition from heavy resource-processing sectors to light manufacturing ones (at least at middle income levels)."

Cap Self Correcting

Capitalism is self-correcting and sustainable

Matthews 11

(Richard Matthews, eco-entrepreneur, eco-investor, sustainable writer, "Is Capitalism Sustainable?", The Green Market, 5-12-2011, http://thegreenmarket.blogspot.com/2011/05/is-capitalism-sustainable.html)

Business has created the environmental crisis and now the same capitalist system that was behind the industrial revolution, is beginning to play a vital role in solving the problems it created. Despite the link between environmental practices and profitable, long-term business sustainability, many believe that capitalism itself is unsustainable. The Earth has finite resources, so their argument goes, but capitalism depends on ever expanding consumption. The truth is that dating back to the origins of our species, we have seen our use of resources evolve, from stone, to bronze and then iron. More recently we entered the information age which may prove to be the gateway to a more sustainable use of resources. Although we should do everything we can to preserve finite resources, human ingenuity is infinite. In this way we are slowly moving away from finite fossil fuels to infinitely renewable fuels such as wind, wave and solar. Market driven solutions can be incredibly powerful as they have the power to extend, promote and invest in sustainable innovation. Although new market based mechanisms like regulation, incentives and tradable permits are still a few years off, it is inevitable that the true cost of carbon will be made absolutely clear. As a tenant of the free market business should pay for the costs they incur. Sustainability will continue because it is an unstoppable mega-trend that is destined to keep growing at even faster rates. With the rise of the green consumer, businesses want to cash-in on the steady and growing demand for green goods and services. Various partnerships are emerging to help in the development of sustainable best practices. One such arrangement involves the new partnerships between corporations and environmental organizations.

AT Cap Collapsing Now

Cap isn't collapsing now – the economic and environmental crisis are not sufficient to dislodge the system

Castree (School of Environment and Development, Manchester University) **10**

(N., Crisis, Continuity and Change: Neoliberalism, the Left and the Future of Capitalism. Antipode, 41: 185–213)

To my mind, <u>the Left should not get its hopes up</u>—at least not yet. It's sad to say, but <u>only the most wild-eyed optimist could believe that the two perceived crises of our time are harbingers of a better future</u>. Taking two cases—one national scale, one international—I want to argue that Gramsci was right. <u>The "old" may be dying, but it's far from dead</u>. The essay comprises four parts. I begin in the heat of the moment, by describing how and why the idea of two concurrent worldwide "crises" became commonplace in a surprisingly short space of time (2007–2009). Following this, I take a theoretical detour intended to explain why these crises have arisen, and how they might play out. Marx, Karl Polanyi and James O'Connor are my guides. Focusing on Britain as an illustrative case, I then explain why <u>the present moment is not, regrettably, a propitious one for left-wing change-makers</u>. My point is to show that <u>even in neoliberalism's heartlands, in the thick of a financial crisis, there is only weak impetus for change</u>. After this examination of how crisis is playing-out at the scale of one notable nation state, I delve into the world of international emissions trading philosophy and practice—with a particular focus on the European Union's still young scheme. I suggest that the myriad practical failures of this and other market approaches to greenhouse gas mitigation belie the abstract logic of "free market environmentalism". Even so, these approaches will be with us for many years to come in all probability. A short conclusion looks to a future hopefully free of those "morbid symptoms" that Gramsci described just after the Great Crash of 1929. It's a future that will, I fear, be very hard to make. If William James were writing today, he probably would not bet on the Left making its ideals flesh any time soon. Not for the first time, some optimism of the will is required—quite a lot, in fact.

AT Monolith DA

Multiple aspects of the current economic system disprove their monolithic thesis
White and Williams (senior lecturer of economic geography at Sheffield Hallam University; professor of public policy in the Management School at the University of Sheffield) **12**
(Richard J. and Cohn C., Escaping Capitalist Hegemony: Rereading Western Economies in The Accumulation of Freedom, pg. 129-31)

Further suspicion about the legitimacy of the capitalist hegemony thesis can be found in the problematic fact that non-exchanged work is extremely prevalent in the Western world. The belief that non-monetized exchange is being systematically overcome by market-based transactions embodied in Harvey's statement that "Monetary relations have penetrated into every nook and cranny of the world and into almost every aspect of social, even private life"28 again begs the obvious question: where is the evidence?

When a concerted attempt is made to gather robust empirical data to support such a central tenet this proves extremely difficult. In many Western countries there is a significant amount of work that takes place on an unpaid basis, whether through more formal, voluntary-based groups or organizations, or through informal networks of reciprocal support, such as mutual aid or unpaid community exchange. In 2001, for example, the Home Office Active Citizenship Survey identified that within the previous twelve months around 3.7 billion hours of volunteering had taken place. Given that twentyseven million people work full-time for an average of thirty-five hours per week, this 3.7 billion hours of volunteering equates to just over two million people being in work on a full-time basis. Alternatively, it indicates that in the UK up to one hour is spent working on a non-monetized basis for every fourteen hours spent working in formal employment.

These statistics quite clearly indicate that the capitalist hegemonic belief that argues that these economic spaces are marginal, residual, and disappearing is at best grossly exaggerated. The reality is that nonmonetized exchange (that is to say unpaid community work, mutual aid, or more formal voluntary work) continues to occupy prevalent and important spaces within the contemporary economic landscapes in Western society.

Not-For-Profit Monetary Transactions

Zelizer observed that Ca power54ideology of our time Us] that money is a single, interchangeable, absolutely impersonal instrument-the very essence of our rationalizing modern civilization."29 Certainly, the assumption that monetas' exchange is principally profit-motivated cuts deep across economic discourses ranging from anarchism to neo-classicaiism.

This crude view of monetized exchange is often promoted across this range too, and is common to those who welcome such a (natural) development, and those who cite this as another reason to resist and push against any farther capitalist advances being made in society. Yet there are many "alternative economic spaces" that exist as sites where not-for-profit monetary transactions are commonplace including, but not limited to, garage sales, car boot sales, charity shops, and local currency experiments such as Local Exchange and Trading Scheme. 33 What quickly becomes apparent when looking at the complexity of monetized exchange in contemporary society is that "money is neither culturally neutral nor socially anonymous"34 and thus as Zeizer writes,

The classical economic inventory of money's functions' and attributes, based on the assumption of a single general-purpose type of money, is unsuitably narrow. By focusing exclusively on money as a market phenomenon, it fails to capture the very complex range of characteristics of money as a social medium.. certain monies can be indivisible (or divisible but not in mathematically predictab1e proportions), nonfungible, nonportable, deeply subjective and qualitatively heterogeneous."

Ft is also worthwhile reflecting on the public sector, a sector which is not oriented towards profit and still accounts for about 30-50 percent of GDP in Western economics. 36 Even if the public sector is no longer as significant as it has been in terms of being a provider of goods and services, it is important not to make the mistake of assuming that the provisions for these goods and services have been taken up by the capitalist sector. The growth of the not-for-profit sector has been seen in many Western economies, which represents around five percent

GDP. Drawing on data gathered by the Johns Hopkins Comparative Nonprofit Sector Project (CNP), Salamon arid Sokolowski examined the not-for-profit sector in twenty-four countries. 37 In terms of economic impact this is a "$1.1 trillion industry that employs 19.5 million frill-time equivalent (FTE) paid workers in the twenty-four countries on which data are so far available."38 As Table 3 shows, on average the nonprofit sector grew by 24 percent between 1990-1995, compared to just an 8 percent rise in employment. In the United States, the growth in employment stood at 8 percent during this time, whereas the growth in employment in the nonprofit sector was 20 percent. In Europe (UK, Netherlands, Germany, France), whereas growth in the total economy grew by 3 percent, the nonprofit sector increased by 24 percent. <u>Given such trends-far from reinforcing the link between the profit-motivated and monetary exchange-it could be more properly suggested that this relationship is diminishing</u>.

<u>Within the private sector, it is unquestioningly assumed by the supreme representation of enterprises</u> (themselves assumed to be coherent, predictable, ordered, organized sites) that any monetary transactions are always and necessarily market-like, and therefore <u>driven principally by profit-motive rationales</u>. <u>Yet this relationship has also come under the critical spotlight, with studies demonstrating that such an assumption is not entirely robust, and there are examples of private-sector enterprises that are not always driven by the necessity to make profit</u> and do retain sub-capitalist economic constructions and practices." To take one example, in seeking to open a conversation about what a corporation is, O'Neill and Gibson-Graham analyzed the Australian-based multinational BHP.4° 'The research questioned the capitalist notions of "the company" in a way that ultimately "[piroduceEd] a decentred, 'disorganized' representation of the enterprise." The researchers highlighted the unpredictable, social and open nature of the enterprise-and decoupled the essentialist arguments of these entities, including the logic that they are only driven by profit-motivated concerns. This itself was seen to be significant not only in undermining popular representations of enterprise discourses, but in the act of producing a more nuanced reading that has "the potential to liberate the political and geographical imagination, and to proliferate alternative possibilities for regional futures and corporate-community relationships.""

The result of this critique is one that argues that <u>it is simply not the case,</u> despite all the popular assumptions to the contrary,<u> to say that we live in a capitalist world</u>. When all the estimates are taken into account, <u>significantly less than half of the Western economies can be properly said to be aligned with commodity production driven by capitalist profit-motivated monetary</u>

AT Neolib Unsustainable

That economic growth will slow doesn't justify its collapse – economic rationality is the only realistic option
Barnhizer, 6

David, Prof of Law, Cleveland State U, 'Waking from Sustainability's "Impossible Dream",' Geo Int'l Envtl L Rev, pg. l/n

In a way disturbingly similar to the sudden inability of the former Soviet Union to support the safety net for its citizens, the Western system's ability to operate on the level it has achieved is in question. [n65] There should be no doubt that basic commitments to the well-being of hundreds of millions of residents are at risk. That the Western systems will decline in both relative and absolute terms in their ability to generate wealth **seems undeniable**. This phenomenon is already evident [*623] in massive job loss, spending cuts, and bankrupt pension plans. The key questions are how far we will allow the decay to go and what if anything can be done to stop it. Many American and European industries are uncompetitive with those outside competitors allowed to follow different rules, not because of the quality of management and productivity factors, but because the Western social model has imposed expensive social obligations on their domestic economic actors. Producers in China, India, and elsewhere enjoy low taxes or special tax breaks, and have lower costs for labor and raw materials. This advantage does not derive from the status of these nations as superior competitors but because their social and economic systems have lagged behind those of western Europe, North America, and Japan. Businesses in the United States, Japan, and western Europe, on the other hand, have been successful to the extent that their wealth generation capacities allowed the development and funding of expensive and fully integrated social and economic systems. The ability to continue funding those moral systems of social justice is being degraded under the rubric of "free trade" and globalization. The competitive advantage those other countries enjoy has little to do with fair competition, but rather relates to the fact that American and western European businesses carry significant social obligations and regulatory costs that the others do not. Many of the arguments extolling free trade in an "unfree" system ignore the moral implications and inherent unfairness of their claims. If it is accepted that businesses have the obligation to pay its workers fair wages in the context of what is fair in this system and to generate wealth and revenues to fund social benefit programs, then penalizing Western businesses by requiring them to compete with producers and suppliers from other regions who are not required to bear those social costs is inherently unfair. We cannot take the chance involved in slowing down our economic system through the imposition of new rules requiring the internalization of heretofore external costs, or through the "friction" that would be applied if we sought to govern economic activity through totally coherent "sustainability" institutions. It will be all we can do if we can even come close to sustaining our ability to fulfill existing social obligations and incrementally contribute to the reduction of poverty and creation of opportunity in the world. Whatever else might be said about the consequences of the Western economic model, there is a clear moral basis to the system it supports and that we now must determine how to sustain. [n66] Although proponents of economic stasis argue in favor of either slow growth that takes all the effects of our activities into account or even for full stasis, **these are not realistic options**. [n67] We are not beginning from a zero point, but one where [*624] expectations, dependency, cultures, and systems are already in place. Consider the enormous public and private deferred debt bills and unfunded obligations undertaken in the United States and Europe in the form of a series of budgetary "IOUs." [n68] In the United States we have incurred massive debt obligations that allow us to make comparatively small payments now but that will require enormous balloon payments later. We would have difficulty meeting those obligations even in a healthy economy due to the demographic shifts we are experiencing as our population ages. But there is no reason to believe that we will be able to "sustain" the health of our economic and social systems. As they come due, the balloon payments will necessitate some combination of higher taxes, abandonment of the promises themselves, or reductions in what can actually be delivered. The Western system of social support may have to change and support lessened social and economic expectations, but there is a great difference **between lessening and complete collapse**.

While a modification of the core social morality of the Western system may become necessary, it is not morally acceptable **if preventable**. We need to understand the impact of the false arguments of free trade which are in many ways veiled justifications for destroying the moral strength of Western culture by penalizing Western productive activities for carrying the social costs governments mandated they sustain, while rewarding competitors for avoiding such obligations and encouraging our productive economic activities to relocate to regions of the world that do not require them to carry the burden of expensive social choices.

Political Philosophy

Liberalism/Collectivism Binary Bad

Their critique's reliance on a binary between individualism and collectivism ensures the alt fails and reinforces the worst excesses of squo liberalism – critiques of individualism reinforce public fears of totalitarianism and collectivist takeover and cede the political to libertarians
Baer 1

(Josette Baer, Zürich University, "BOOK REVIEW Colin Bird: The Myth of Liberal Individualism. Cambridge: Cambridge University Press, 1999," *Ethical Theory and Moral Practice* 4: 191–192, 2001)

In contrast to Grandvilliers, Bird offers a fresh and unique approach to liberal political theory: **by going beyond the limits of 'individualism'** and **'collectivism'** set by recent scholarly debates between communitarians and libertarians (chaps. 3 and 4), he questions individualism as a seemingly intrinsic value of liberalism (chap. 1). He does this by an in-depth analysis of the ideas of self-ownership and individual inviolability (chap. 5). Focusing on the presupposed alliance of individualism and liberalism promoted by liberal thinkers such as Berlin, Rawls, von Mises and Hayek, Bird's analysis reveals not only the general lack of a comprehensive non- a-priori theory of individualism (chap. 2). Furthermore, Bird's study shows how this theoretical gap provoked the negative perception of 'collectivity'. Paraphrasing Grandvilliers, Bird's core argument might be the following: 'How the word 'individualism' is **ambiguously misinterpreted**, first, by those who treat it as synonymous with liberal individualism (libertarians) and, second, by those who regard it as the theoretical fundament of society's atomism (communitarians)!'¶ Ever since the end of the second World War, liberalism was promoted as the main political opponent of totalitarianism and fascism. Due to its immanent values such as toleration, secularity and individualism liberalism granted the protection of the individual's rights from the constraints of the state. The inviolability of the private sphere enabled individuals to pursue the goals of which they conceived of as their distinct life goals. Freedom of the single person, hence, not collective safety, was the goal and basic intention of 20th Century liberalism. In the 1970s and 80s, the alliance of individualism and liberalism was reinforced by two thinkers: Berlin's concept of negative freedom as freedom from oppression and Rawls' critique of social utilitarianism effectively deepened the 'anti-collectivist' arguments of cold war liberals such as Popper and Hayek. The pursuit of collective goals like the establishment of a welfare state seemed incompatible with western type liberal democracy. With the end of the Cold War, Liberalism's distinct individualist conception, upon which the ambiguous relationship of the individual with state and society was based, represented the pièce de résistance of the communitarian-libertarian debate: liberal thought which would be capable of offering solutions against societal atomism keeping to the inviolability of the private sphere failed due to the **overly dominant suspicions of** beginning totalitarianism via **collectivism** by the adherents of libertarian positions. Thinkers promoting the communitarian standpoint, on the other hand, failed to present comprehensive suggestions of **how to combine individualism and collectivism** without infringing the individual sphere.¶ The rich theoretical material covered and the comprehensiveness of Bird's deduction make the book an excellent contribution to current political thought. By asking the crucial question, in virtue of what individuals should be treated as inviolable (p. 178), the author questions the presupposed normative connections between property rights, ownership, individual inviolability and the protection of features of this

inviolability. By doing so, he <u>targets the 'Gordian knot' of the communitarian-libertarian debate</u>. Indeed, his contribution shows us the possibility of a way out: <u>a fresh notion of individualism tames the dangers of the Scylla of libertarian individualism and the Charybdis of communitarian collectivism</u>. Bird, eventually, leads us to view the relationship of individuals, state and society in a new light. His theory could contribute to the renewal of liberalism: it could set the grounds for a theory of the liberal welfare state.

Liberal Individualism Good

Neoliberalism solves disposability and disciplinary power – it avoids categories like "good" and "bad" poor and makes determinations solely on the basis of efficiency – adjustments to the market change the terrain of individual liberty *without* disciplinary regulation of particular individuals by the welfare state
Behrent 9

(Michael C., Department of History, Appalachian State University, "Liberalism without humanism: michel foucault and the free-market creed, 1976–1979", *Modern Intellectual History*, 6, 3 (2009), pgs. 565-567)

Claiming that socialism's political relevance required that it come to terms with economic liberalism was daring enough. But Foucault, in 1979, upped the ante: far from inaugurating a new form of fascism, as some leftist intellectuals were suggesting, **neoliberalism**, he maintained, **should be seen as a distinctly nondisciplinary form of power**. To make his case, he turned to the Chicago School. No doubt surprising his listeners with his sudden interest in economic policy, Foucault explained the provisions of the so-called "negative tax," an idea explored in the early sixties by the Chicago economist Milton Friedman (a guru of the Thatcher and Reagan revolutions), which had also sparked interest in France when the liberal economist Lionel Stol´eru endorsed it in a noted essay published in 1974.100 The negative tax seeks to streamline costly social-service bureaucracies and to eliminate work disincentives created by certain welfare programs. With the negative tax, the government no longer worries about guaranteeing that only the deserving poor receive assistance. The sole criteria for defining poverty, and the only level at which the state intervenes to reduce it, is income. Rich and poor alike file tax returns; however, those whose income falls below a particular threshold receive a cash handout inversely proportional to their means, rather than paying a portion of their income in taxes. What intrigued Foucault about this idea (enacted in the United States as the "earned income tax credit" in 1975, and in France as "le prime pour l'emploi" in 2001) is that **it broke with the tendency of the modern welfare state to link payouts to behavior**. **Eliminating the longstanding distinction between** the **"good" and** the **"bad" poor**, the negative tax is supremely indifferent to the spending choices and work habits of its recipients. What matters is solely that they be guaranteed an income that allows them to be players in the economic game.101 All of which suggests, Foucault maintained, that capitalism has entered a new era. Compared to the dirigiste policies of the postwar years, **neoliberalism of the Chicago variety is "much less bureaucratic," and "much less disciplinary"** (disciplinariste)102—which, coming from Foucault, was no mean compliment. American neoliberalism's nondisciplinary implications were perhaps even more apparent in its approach to a question that had long been one of Foucault's deepest concerns: that of crime and punishment. For **neoliberalism jettisons the oppressive moral categories characteristic of discourses on crime**. The Chicago economist Gary Becker, for instance, demonstrates that to understand criminal behavior, there is no need to define crime as anything more than any individual action that incurs the risk of punishment. The criteria of good and evil, normal and abnormal, and even of legal and illegal can be happily dispensed with. Discussing models that explain how market mechanisms might regulate drug use more effectively than law enforcement, Foucault marvels that, with these approaches, **the criminal undergoes an "anthropological erasure."**103 Furthermore, rather than nursing the fantasy of a crime-proof society, the Chicago School advises that it is more useful for a society to calculate how

much crime and punishment it can afford. In his concluding remarks about the Chicago School, **Foucault presents neoliberalism as an almost providential alternative to the repressive disciplinary model of society**: <u>what appears</u> [in American neoliberalism] <u>is not at all the ideal</u> or the project <u>of an exhaustively disciplinary society</u> in which the legal network encircling individuals would be relayed and prolonged from within by mechanisms that are, let us say, normative. <u>Nor is it a society in which the mechanism of general normalization and of the exclusion of the non-normalizable would be required</u>. **One has**, on the contrary . . . **the image** or the idea or a programmatic theme **of a society in which there would be an optimization of the system of differences**, in which the field would be open to oscillating processes, in which there would be a tolerance accorded to individuals and to minority practices, and in which not the players of the game, but the rules of the game would be acted upon, **and** at last **in which there would not be an intervention of the kind that internally subjugates individuals, but an intervention of the environmental kind**.104 Openness to "differences," "tolerance" of individuals and minority practices, restraint in the practice of subjugation: these are not words that we customarily associate with Foucault's vision of political modernity. That he used them in 1979 to describe the course of power relations in modern societies reveals just how much his understanding of politics had evolved since the publication of Discipline and Punish four years earlier.

Individual Liberty Good

The aff's economic liberalism solves the impacts better than the alt – modifying the law to make the market more efficient *does not* make recourse to humanist metaphysics – our market-based approach requires *maximizing* individual liberty, using contingent claims about administrative efficiency without recourse to the law or natural rights
Behrent 9

(Michael C., Department of History, Appalachian State University, "Liberalism without humanism: michel foucault and the free-market creed, 1976–1979", *Modern Intellectual History*, 6, 3 (2009), pgs. 561-563)

Foucault's efforts to distance himself from the liberal renewal then under way are evident in a startling claim made in his 17 January 1979 lecture. Liberalism is historically significant, he asserts, because it dispenses with the notion that political authority must be founded in law. In the late 1970s this assertion presumably struck many as absurd: liberalism's appeal lay precisely in its efforts to subordinate political authority to the rule of law and the respect of human rights. In refuting law's centrality to liberalism, Foucault was challenging the project of Franc̦ois Furet and his collaborators (including Claude Lefort, Cornelius Castoriadis, Pierre Manent, Marcel Gauchet, and Pierre Rosanvallon84), who at the time were fashioning a non-Marxist account of the French Revolution, while using the categories of liberalism and democracy to build a novel theory of political modernity. According to Foucault, those who associate liberalism with law and rights fail to see that liberalism has developed along **two distinct paths**. The first, rooted in natural law, does indeed deduce the liberal state from the axiomatic assertion of inalienable individual rights. This path ultimately leads to the French Revolution. This form of liberalism rests, he notes, on the problematic assumption that where there is a law, there is a will: law is understood as the "expression of a will," particularly of a "collective will" which decrees (among other things) which rights individuals refuse to cede to the state. **Law**, in this tradition, **is thus inextricably bound up with subjectivity** (insofar as law is taken as expressing a will). The second path to liberalism is, however, grounded in **utilitarianism**: rather than deducing an ideal state from metaphysical principles, it takes the existence of government as a given, and, on the basis of **purely inductive considerations**, concludes that liberalism—that is, **the self-limitation of power**— simply makes the most administrative sense. **This type of liberalism has no truck with the anthropological principles upon which the former is dependent**— and which Foucault had always found suspect. From the utilitarian perspective, law is simply a process of "deal-making" (transaction), whereby individuals negotiate what powers belong to the state, and what freedoms they reserve for themselves. **Where revolutionary liberalism makes law the foundation of politics, utilitarian liberalism sees politics as the origin of law.** Having demonstrated how the tradition of political liberalism that emphasizes human rights and the legal basis of the state remained wedded to a problematic set of anthropological assumptions, Foucault could downplay the French Revolution's importance, dismissing its conception of politics as "retroactive"85 —a charge, presumably, that he would have just as happily leveled against Furet and his cohort.86 In addition to dispensing with unnecessary anthropological hypotheses, utilitarian liberalism—alongside economic liberalism, which he considered to be closely related—impressed Foucault for another reason: it managed to conceptualize a liberal order by relying on no other category than power itself. **For liberalism to work**, Foucault

suggested, **there is no need to hypothesize something outside** or beyond **power**, such as law, rights, or even liberty. Rather than a metaphysical entity or a human attribute, liberty, for the utilitarian, is simply a side effect of power—as Foucault put it, "the independence of the governed in relation to the governing."87 Similarly, **for economic liberals, the paradoxical imperative that power must limit itself is** essentially **a political maxim aimed at optimizing administrative efficiency, not a morally motivated recognition of an inalienable right**. Liberalism, Foucault explained, "is shot through with the principle: 'On gouverne toujours trop'"—one always governs too much.88 As we have seen, such a characterization of liberalism was, in the late 1970s, very much in the air: Foucault's definition echoes, in striking terms, Barre's pronouncement that "the State must do on its own as little as possible."89 But this assessment was also consonant with Foucault's philosophical ambition to emancipate the conceptualization of power from juridical categories—or, as he liked to put it, to cut off the king's head (by abandoning the idea that power must derive from a sovereign, legitimate source). Because utilitarian and economic liberalism attach no special importance to the question of power's origin (unlike the revolutionary and natural-rights tradition), **they effectively dispense with the need for juridical foundations**.90 Consequently, from Foucault's perspective, **they manage to chop off the king's head very ably—more so**, paradoxically, **than the revolutionaries themselves**. Contemporary economic liberalism thus epitomized power as Foucault had come to understand it. Just as for Marx the struggle between the bourgeoisie and the proletariat is both class conflict's latest form and the moment at which class conflict is unveiled as history's driving force, so liberalism is, for Foucault, both one form of power among others, and the form that demonstrates most effectively how little power has to do with law. Economic and utilitarian liberalism thus suggested ways that one might be a liberal **without subscribing to philosophical humanism or to a juridical theory of power**. Economic and utilitarian liberalism thus suggested ways that one might be a liberal without subscribing to philosophical humanism or to a juridical theory of power. But if this explains how Foucault could be a liberal, what made him want to be one—or, in any event, to endorse it in a particular strategic context? The reason lies in Foucault's aversion to the stubborn archaism of the French left, particularly as it was embodied by Mitterrand's Socialist Party. As Michael Scott Christofferson has persuasively argued, the same concern drove many former leftists in these years (including Furet and the nouveaux philosophes) to undertake a public campaign designed to portray the socialists (as well as the communists, their occasional allies) as crypto-totalitarian.91 Foucault's somewhat more furtive intervention in this debate consisted in judging the left from the standpoint of economic liberalism. For if liberalism was the quintessential form of modern governmentality, it soon become clear that France's left was hopelessly antiquated. To make this point, Foucault, in 1979, took the circuitous route of considering Ordoliberalism, the German economic school that theorized the Federal Republic's "social market economy." The school owes its name to the journal Ordo, founded in 1948 by a group of liberal economists who had met at the University of Freiburg before the war. Their finest hour came when they undertook a liberal critique of the economic policies pursued by Allied occupation authorities in the immediate postwar period. Soon, they found their way to the antechambers of finance minister Ludwig Erhard, the architect of West Germany's "economic miracle."92 Despite the devastation in which Germany found itself in these years, the Ordoliberals did not back away from their liberal convictions—if anything, they became even more convinced that humanity's future depended on the renunciation of collectivism in all its forms. They were unsparing in their critique of Keynesianism; according to Foucault, Wilhelm R¨opke, one of their most prominent members, went so far as to dismiss the Beveridge Report, which paved the way for Britain's National Health Service, as warmed-over National Socialism.93 Though firmly committed to the capitalist

economy, the Ordoliberals were not, however, <u>crude free-marketeers</u>. <u>Their beliefs boil down to a single crucial insight:</u> <u>everything that neoclassical economics says about the free market's virtues is true;</u> <u>the problem,</u> however, <u>is that competition is a quasi-mathematical ideal, not an empirical reality.</u> <u>For competition to work its magic, it must first be jump-started by the state</u>. **Specifically, the state needs a robust legal framework**, one **that allows marketplace competition to approximate its ideal form** (though like the utilitarians, it should be noted, the Ordoliberals conceived of law as a political tool, not as the state's metaphysical foundation). What seems to have intrigued Foucault about Ordoliberalism is that it confirmed his intuition that economic liberalism should be thought of as a political and not merely an economic system. **As Foucault put it, it is precisely Ordoliberalism's insistence that intervention in the economy be limited** (such as refraining from economic planning and pricesetting) **that requires intervention in the legal realm**—that is, the legislation and jurisprudence that will grease the market's gears. Trying not to govern toomuch, it turns out, keeps a government rather busy.

Perm

Reform Solves

Solves better – using capitalism to fight itself is more effective

Rothkrug 90

(Paul, Founder – Environmental Rescue Fund, Monthly Review, March, 41(10), p. 38)

No institution is or ever has been a **seamless monolith**. Although the inherent mechanism of American capitalism is as you describe it, oriented solely to profit without regard to social consequences, this does not preclude significant portions of that very system from joining forces with the worldwide effort for the salvation of civilization, perhaps even to the extent of furnishing the **margin of success** for that very effort.

Hybrid strategies like cooperative are crucial to the destruction of capitalism – the alt alone fails

Gordon (PhD from Oxford, teaches environmental politics and ethics at the Arava Institute for Environmental Studies) **12**
(Uri, Anarchist Economics in Practice in The Accumulation of Freedom, pg. 205-7)

There is certainly substance; to these objections. Nevertheless, I have chosen to keep the ten as wide as possible, if only for the reason that readers new to anarchism and less familiar with its internal controversies deserge to be introduced to the entire variety of practices that broadly fall within its sphere and left to make up their own minds. More generally, however, I would like to emphasize that the entire discussion of anarchist economics in practice must take place under the lens of imperfection and experimentation. This has to do with the distinction that Terry Leahy makes between purist and hybrid strategies, that is, between strategies that completely embody anarchist ideals and ones which continue to rely on aspects of capitalism.' Hybrid strategies have always been part of the anarchist repertoire of social resistance; yet the relevant question is whether hybrid strategies are viewed as already embodying the end point of desired social change (that is, a reformed capitalist system), or as necessary but temporary compromises with the ubiquity of capitalist social relations, a stepping-stone towards more comprehensive social change. As Leahy argues, To an extent hybrid strategies are symbiotic with capitalism. They can be seen as productive for the capitalist class in ameliorating some of capitalism's excesses. Yet they are also antithetical to the culture and economy of capitalism as a system. Given enough time and enough proliferation they will replace capitalism with something completely different... For those who ultimately want nothing but the best that an anarchist utopia can offer, the thing to do is to be mobile and seize opportunities for hybrids as they arise and move on as they grow stale.2 It is in this inclusive and experimental spirit that I offer the following examples. While limitations of space mean that the discussion is necessarily cursory, I have referenced some relevant literature throughout the exposition, and the reader is invited to consult it for further information and analysis. Varieties of Anarchist Economic Practice Withdrawal Perhaps better defined as a "non-practice" than as a practice, the term "withdrawal" here indicates the various ways in which anarchists may abstain from participation in central institutions of the capitalist economy-primarily the wage system and the consumption of purchased goods. The goal of such a strategy is to weaken capitalism by sapping its energy, reducing its inputs in terms of both human labor and cultural legitimation. To be sure, the ubiquity of capitalist relations means that the options for withdrawal remain partial at best. Most of us must work for someone else to survive, and buy necessities that are not otherwise available for acquisition. Nevertheless, there are ways in which participation in capitalism can be significantly reduced, or undertaken on its qualitatively different margins. Rather than seeking full employment and aspiring to a lifelong career, anarchists can choose to work

part-time or itinerantly, earning enough to supply their basic needs but not dedicating more time to waged work than is absolutely necessary-perhaps on the way towards the abolition of work as compulsory, alienated production.3 In the area of housing, squatting a living space rather than renting one also abstains from participation in capitalism, though this option is less sustainable in most countfies since it will almost certainly end in eviction. Anarchists may also reduce their participation in the moneyed circulation of commodities by reusing and recycling durable goods, and by scavenging or growing some of their own food rather than purchasing it from the supermarket. 4 <u>Such practices can never by themselves destroy capitalism, since in the final analysis they remain confined to the level of personal lifestyle and rely on capitalism's continued existence in order to inhabit its margins and consume its surpluses</u>. Nevertheless, <u>strategies of withdrawal do complement other practices in carving out a separate space from capitalism</u>, as well as in expressing a rejection of its ideologies of dedication to the workplace and of consumption as the road to happiness.

AT Market Link

Must work with some companies within the market in order to solve transition wars

Lewis and Canaty (executive director of the Center for Community Enterprise; honorary research fellow at the University of Birmingham and a director of Common Futures) **12**
(Michael and Patrick, The Resilience Imperative: Cooperative Transitions to a Steady-state Economy, New Society Publishers, googlebooks)

The agenda of the Great Transition also encompasses three major dimensions of change. Think of them as the 3 Ps: the personal, practical, and political. Simplistic silver-bullet solutions, and sound bites spun for culturally stunted attention spans, will not do. Consciously acting to link up the three Ps with a multi-level agenda guided by the resilience imperative and cooperative transitions is complex. Balkanized movements cannot contend with the scale of the problems and challenges we face, nor the powerful forces that must be resisted and restrained. All kinds of constituencies must be engaged unions, regionally based small and medium-sized businesses, all manner of community and cooperative enterprises and intermediaries, farmers, credit unions and progressive financial institutions, arts and culture organizations, faith organizations, environmental groups, politicians, and academics. We can also work with large companies, though caution and principled shrewdness is necessary. Companies occupying the low-road/high-carbon economy have too much power, are unaccountable, and are so addicted to the capitalist logic of growth that they represent a real and present danger to all of us. However, there are other companies that are committed to building a highroad/low-carbon economy, and we need their know-how and partnership if we are to navigate the Great Transition without violence. So there we have it we are challenged to work consciously from local to global across sectors, engage creatively multiple constituencies, while all the while paying attention simultaneously to the macro and micro features of the transition challenge. Isn't life interesting? We have been acutely conscious, while writing this book, that our concentration has been on the micro side of the transition challenge, though we have attempted to keep the macro side consciously in play as a kind of counterpoint tension. We hope we have shown how crucial change at the macro policy and systems level is for facilitating and easing transition to a low-carbon, more democratic, and fair economy. Indeed, there are a number of key policy questions that we have raised directly or indicated in passing. These evident and practical possibilities can be summarized as: 100 percent debt-free money: Why not mov e step by step toward governments issuing democratic currency free of interest and, indeed, removing from banks the power to freely issue money as high-cost debt?

AT Collapse Good

Letting the system collapse on its own causes extinction – only struggle within the capitalism can end the system

Schwartzman (Professor in the Department of Biology at Howard University, PhD in Geochemistry from Brown University) **11**

(David, Green New Deal: An Ecosocialist Perspective, Capitalism Nature Socialism, Volume 22, Issue 3, 18 Aug, pages 49-56)

And unlike the New Deal, achieving the GND on a global scale in the context of a robust solar transition, by necessityaccompanied by demilitarization, will not end with a reinforcement of militarized capital, as was the case in WWII and the Cold War aftermath. Rather, <u>the GND has real potential for opening up a path out of capitalism</u> into ecosocialism. WWII and the emergence of the MIC postponed the terminal crisis of capitalism to this century. Now we face the welcome project of taking that terminal crisis on and finishing the job.

<u>We need a strategy of transition</u>. This should be a priority in theory and practice for ecosocialists. Any Left worth its label and demonization by Glenn Beck and company must not only confront the immediate needs of the great majority of those exploited and oppressed by big capital, but also be a leader in organizing to fight back. So jobs, affordable housing, health and child care, environmental quality, and environmental justice must be on the left agenda. But what kind of jobs? For unsustainable or sustainable green production? And what about the conditions for the reproduction of labor power, itself a site of multi-dimensional class struggle, as Michael Lebowitz has argued (2003). Thus, the fightback program must confront the ecological crisis and demand solutions that address climate change by embracing clean energy.

<u>We should never advocate or even think that the "worse the better" will deliver socialism by the collapse of capitalism</u>, <u>anticipating its terminal illness as hope</u>. For <u>capitalism's dead weight will kill us all</u>. <u>No slogan or propaganda alone can achieve success</u>, as important as this ideological struggle is. Rather, <u>only multidimensional and local-to-transnational class struggle within capitalism</u> (see Abramsky's illuminating volume 2010) <u>can terminate this system</u>, which unfortunately will not die a natural death on its own accord. It will have to be put to sleep forever. A critical role of the ecosocialist Left is to identify the strategic class sectors—those existing and those in formation—that will be the gravediggers of capitalism. Additionally, <u>the ecosocialist Left must</u> also, of course, <u>participate in the creation of a collective vision and its realization as embryos within capitalism</u> of the new global civilization ending the rule of capital.

We now witness or can soon anticipate ongoing struggles for social governance of production and consumption on all scales from neighborhood to global. <u>Areas of struggle in this fight should include</u> nationalization of the energy, rail, and telecommunications industries; municipalization of electric and water supplies; <u>the creation and maintenance of</u> decentralized solar power, food, <u>energy</u> and farming <u>cooperatives</u>; the encouragement of worker-owned factories (solidarity economy), the replacement of industrial and GMO agriculture with agroecologies; the creation of green cities; and of course organizing the unorganized in all sectors, especially GND workers. All of these objectives should be part of the ecosocialist agenda for struggles around a GND, which of course, must include the termination of the MIC. One outstanding example of how to begin is found in Mike Davis 2010), who argues for the potential of a radical movement for green urbanism (see my commentary, Schwartzman, 2008).

AT Green Cap Link

A Green investment now is crucial to initiate a transition away from capitalism – starting now is key to avoid extinction from warming
Schwartzman (Professor in the Department of Biology at Howard University, PhD in Geochemistry from Brown University) **11**

Indeed, imposing such <u>non-market limits is imperative, but the struggle to impose them must begin in capitalist societies now, and not be posed simply as the policies of future socialism.</u> <u>Yes, aggressive energy conservation is imperative</u>, especially in the United States and other countries of the global North. We can all live better with a sharp reduction of wasteful consumption, breathe clean air, drink clean water, and eat organic food. <u>Nevertheless, there needs to be a global increase in the power capacity, employing clean energy</u> and not fossil fuels or nuclear power, <u>to insure every child born on this planet has the material requirements for the highest quality of life</u> (Schwartzman and Schwartzman 2011).

But <u>should we anticipate that Green Capitalism, even pushed to its limits by class struggle, could indefinitely postpone the final demise of global capitalism</u> and could actually replace the present unsustainable energy base with a renewable power infrastructure fast enough to avoid catastrophic climate change (C3)? I submit <u>this prospect is highly unlikely</u>. The legacy and political economy of real existing capitalism alone makes *global* solar capitalism a delusion (Schwartzman 2009). While the Pentagon pretends to go "green," it remains the servant of the imperial system protecting fossil fuel and strategic metals flowing into the MIC, the Military Industrial (Fossil Fuel, Nuclear, State Terror) Complex. The immense power of the MIC is the biggest obstacle to implementing an effective prevention program that has a plausible chance of avoiding C3. The avoidance of C3 requires an end to coal and fossil fuel addiction, giving up the nuclear option, and a rapid conversion to a high-efficiency solar energy infrastructure.

To summarize, the MIC is at present the biggest single obstacle to preventing C3 because: It is the present core of global capital reproduction with its colossal waste of energy and material resources. The fossil fuel and nuclear industries are integrated within the MIC. The MIC has a dominant role in setting the domestic and foreign policy agenda of the United States and other leading capitalist countries. The Pentagon is the "global oil-protection service" for both the U.S. imperial agenda (Klare 2007) and the transnational capital class itself (e.g., Robinson 2004). The MIC's Imperial Agenda blocks the global cooperation and equity required to prevent C3.

Nevertheless, what <u>the struggle for a</u> GND <u>[Green New Deal] can accomplish is</u> very significant, indeed <u>critical to confronting the challenge of preventing</u> C3 <u>[Catastrophic Climate Change]</u>. **Humanity cannot afford to wait for socialism to replace capitalism to begin implementing this prevention program** [Italics Original]. And I have argued that <u>starting this prevention program under existing capitalism can open up a path toward ecosocialist transition</u>, indeed a 21st century Socialism worthy of its name.

Climate science tells us <u>we must proceed now for any plausible chance of avoiding tipping points plunging us into C3</u>. <u>Green job creation is likewise the creation of a new working-class sector committed to ending the fossil fuel addiction.</u> Such an historic shift to renewable energy supplies would be comparable to the industrial revolution that replaced plant power in the form of wood and agricultural products with coal.

Alt Fails

Reform Key

No revolution against cap possible now – the perm is crucial to avoid rightest takeover
Castree (School of Environment and Development, Manchester University) **10**

(N., Crisis, Continuity and Change: Neoliberalism, the Left and the Future of Capitalism. Antipode, 41: 185–213)

This essay had two major objectives. It sought to describe and explain the temporal coincidence of political economic and environmental crises less than a decade into the twenty-first century; and it offered some reasons for a seeming paradox, taking both a national level and international scale example—the paradox of crisis conditions leading to more of the same rather than a sharp turn away from the neoliberal path. The hopeful lessons of Marx's, Polanyi's and O'Connor's work will not (yet) be borne out: "strong reform", never mind something more radical, is still a long way off. What we call "neoliberalism" in the singular is, in reality, a variegated and uneven global formation constituted differentially at a range of scales. Its existence and multiple incarnations are overdetermined. Even so, I've suggested that this fact does not necessarily render neoliberal policies vulnerable, even at a time of perceived "crisis". If my analysis has any validity, then it calls to mind Gramsci's judgement that the "morbid symptoms" of an existing order unwilling to die may persist for some considerable time.

When might these symptoms disappear? Answers to this question are likely to be as reliable as a long-range weather forecast. NaomiKlein (2009:30), sensing the folly of detailed prophecy, offers some general speculations. Reflecting, as I have done, on the coincident political economic and ecological crisis, she argues that "Capitalism can survive this [double] crisis. But the world can't survive another capitalist comeback". I agree entirely with the first part of this statement, but not necessarily the second. Capitalism will morph and adapt as it has always done: the operating hardware will remain intact, even as the all important details will alter quite profoundly. But at what cost? Leftists have not just to hope for, but work vigorously towards, a future that can set capitalism on a path of much greater social and environmental justice. The legacy of neoliberal capitalism constitutes a sickness that can be cured sooner rather than later: but the Left, in its national and international forms, must do a lot more to administer the necessary medicine. An essential, if not sufficient, condition is to occupy the political space vacated by established political parties that claim to be on the left. Until then, the Left's case will remain marginal to public life worldwide.

No Behavioral Change

The alternative fails – their analysis of neoliberalism precludes any mechanism for behavioral change – the strength of their links overwhelms the possibility of alt solvency
Barnett 10

(Clive Barnett, Faculty of Social Sciences @ The Open University, "Publics and Markets: What's wrong with Neoliberalism?", *The Handbook of Social Geography*, edited by Susan Smith, Sallie Marston, Rachel Pain, and John Paul Jones III. London and New York: Sage)

Theories of neoliberalism go hand in hand with a standard form of criticism that bemoans the decline of public life, active citizenly virtue, and values of egalitarianism and solidarity. These theories project ahead of themselves criteria of evaluation (cf. Castree 2008): neoliberalism reduces democracy, creates poverty and inequality, and is imposed either from the outside or by unaccountable elites. The conceptual analysis of neoliberalism is therefore always already critical, **but at a cost**. They are condemned to invoke their favoured positive values (e.g. the public realm, collective solidarity, equality, democracy, care, social justice) in a moralistic register without addressing normative problems of how practically to negotiate **equally compelling values**. And in so far as theories of neoliberalism dismiss considerations of rational action, motivation, and decentralised coordination as so much 'ideology', they remain **chronically constricted** in their capacity to reflect seriously on questions of **institutional design, political organisation and economic coordination** which, one might suppose, remain an important task for any critical theory.

Protectionism DA

The alternative leads to _developmentalist protectionism_ – causes US _isolationism_ – turns the K because it blocks sustainability and social justice
Hess 12

(David Hess, David J. Hess is a professor in the Sociology Department at Vanderbilt University, Associate Director of the Vanderbilt Institute for Energy and Environment, Director of Environmental and Sustainability Studies, and Director of Undergraduate Studies for the Sociology Department, "The Green Transition, Neoliberalism, and the Technosciences." In Luigi Pellizzoni and Marja Ylönen, eds. _Neoliberalism and Technoscience: Critical Assessments_, Ashgate Press, www.davidjhess.org/GreenTranNeolibEnv.pdf)

The field sociology of neoliberalism also provides new ways to think about its possible future. The fact that there was an historical change during the 1970s and 1980s from the dominance of social liberalism to neoliberalism in many political fields across the world raises the question of what type of ideology might emerge to replace neoliberalism. Historical change tends to create new contradictions and countermovements (Polanyi 2010), but much of the scholarship on a post-neoliberal order is **clouded by nostalgia**, such as belief that increasing within-nation inequality will lead to a swing of the pendulum back toward the happy days of social liberalism, or by **utopianism**, such as belief that a crisis in capitalism and global ecology will lead to a great transition to socialism or localism. I suggest that the historical condition of the relative decline of an economic superpower may be leading to resurgence of a modified form of its past of developmentalism. Developmentalist liberalism can be distinguished from neoliberalism and social liberalism on several grounds, of which the increasingly defensive position on trade and the corresponding invigoration of industrial policy are the most central. Developmentalism remains mainstream because it does not challenge the premise of restricted government intervention into an economy based on large, publicly traded corporations. In contrast with the three mainstream positions, agents in subordinate positions in the political field advance more radical visions of the global economy, such as an economy based on locally owned, independent enterprises or one based on much higher levels of public ownership. Although it is possible that ideologies currently in a subordinate position in the political field may become dominant over the long run, **the likely outcome**, albeit **not** necessarily **desirable from** either **a sustainability or social justice perspective, may be a growing tendency toward developmentalism**. The shift within the American political field in the twenty-first century is consistent with its nineteenth-century past and its **isolationist proclivities**. During the nineteenth century the United States was a secondary economic power with respect to European countries, and it pursued its successful policy of industrialization based on strong tariffs and import substitution. Only after the United States had achieved clear hegemony in the global economy did it shift to a liberalized position on trade, which at that time benefited the country by opening up foreign markets to trade on terms favorable to the United States (Chang 2008). However, as foreign competition increased, sentiment in favor of a more defensive approach to trade increased, first with respect to Japan during the 1980s and then today with respect to China. Thus, the stage is set for the political field in the United States during the twenty-first century to look more like that of the **nineteenth century** than the twentieth century. Because the United States has been the world's leading supporter of

neoliberal policies, <u>a shift toward developmentalism could have **global implications**</u> for the history of neoliberalism as well as **<u>for the global economy</u>**.

Withdrawal DA

Alt doesn't solve cap

Gordon (PhD from Oxford, teaches environmental politics and ethics at the Arava Institute for Environmental Studies) **12**
(Uri, Anarchist Economics in Practice in The Accumulation of Freedom, pg. 205-7)

Withdrawal
Perhaps better defined as a "non-practice" than as a practice, <u>the term "withdrawal" here indicates the various ways in which anarchists may abstain from participation in central institutions of the capitalist economy</u>-primarily the wage system and the consumption of purchased goods. <u>The goal of such a strategy is to weaken capitalism by sapping its energy</u>, reducing its inputs in terms of both human labor and cultural legitimation. To be sure, <u>the ubiquity of capitalist relations means that the options for withdrawal remain partial at best. Most of us must work for someone else to survive, and buy necessities that are not otherwise available for acquisition</u>. Nevertheless, there are ways in which participation in capitalism can be significantly reduced, or undertaken on its qualitatively different margins. Rather than seeking full employment and aspiring to a lifelong career, anarchists can choose to work part-time or itinerantly, earning enough to supply their basic needs but not dedicating more time to waged work than is absolutely necessary-perhaps on the way towards the abolition of work as compulsory, alienated production.3 In the area of housing, squatting a living space rather than renting one also abstains from participation in capitalism, though this option is less sustainable in most countfies since it will almost certainly end in eviction. Anarchists may also reduce their participation in the moneyed circulation of commodities by reusing and recycling durable goods, and by scavenging or growing some of their own food rather than purchasing it from the supermarket. 4 <u>Such practices can never by themselves destroy capitalism, since in the final analysis they remain confined to the level of personal lifestyle and rely on capitalism's continued existence in order to inhabit its margins and consume its surpluses</u>. Nevertheless, <u>strategies of withdrawal do complement other practices in carving out a separate space from capitalism</u>, as well as in expressing a rejection of its ideologies of dedication to the workplace and of consumption as the road to happiness.

1AR Withdrawal DA

Alt fails – movements too small, elite backlash, no material interests

Gordon (PhD from Oxford, teaches environmental politics and ethics at the Arava Institute for Environmental Studies) **12**
(Uri, Anarchist Economics in Practice in The Accumulation of Freedom, pg. 215)

On the one hand, <u>the</u> anarchist <u>movement is so small that even its most consistent and visible efforts are but a drop in the ocean</u>. On the other hand, <u>political elites have proven themselves extremely proficient at pulling the ground from under movements for social change, be it through direct repression and demonization of the activists, diversion of public attention to security and nationalist agendas,</u> or, at best, minimal concessions that ameliorate the most exploitative aspects of capitalism while contributing to the resilience of the system as a whole. It would seem that ethical commitments to social justice and the enhancement of human freedom can only serve as a motivation for a comparatively small number of people, and that <u>without the presence of genuine material interests among large sections of the population there is little hope for a mass movement to emerge that would herald the departure from existing social, economic, and political arrangements</u>.

AT Alternatives to Liberal Subject

Their alternative either ends in violent totalitarianism or doesn't solve – critiques of "liberal individualism" rely on an essentialist binary between "individualism" and "social community" that treats social constitution of identity as an unquestioned good – ensures the success of the worst form of liberalism or devolves into collectivist extermination
Bird 99

(Colin Bird, Assistant Professor in the Department of Government and Foreign Affairs at the University of Virginia, *The Myth of Liberal Individualism*, pgs. 204-207)

In this last section I discuss some of the ways in which assuming the coherence and unity of 'liberal individualism' has cramped the whole effort to get a critical purchase on the liberal project. Finally, I suggest how the arguments given here might point in more fruitful directions. As I mentioned earlier, those critics who take liberalism to be essentially 'individualistic' have been led to assume that alternatives to it must appeal to various supposedly *non-individualistic* conceptions. This is what explains the continuing obsession within anti-liberal circles with notions of community, with the claim that the self is essentially *socially* constituted, with issues about our collective identities and so on. It is not part of my intention to *deny* that community is important, or that the self is always somehow socially constituted, nor do I say that our collective identities are unimportant. But I do think that if critics of liberalism are forced on to (and restricted to) this terrain by an uncritical attitude to the very idea of 'liberal individualism' their attack will be systematically weakened. Assuming that non- or anti-liberal positions must be '*non-individualistic*' has encouraged critics of liberalism to present themselves as partisans of some specific 'collective' identity or to try to define the elusive ideal of community in a broader way. Notoriously, no communitarian has yet made good on the latter project. The problem with the former approach is that it necessarily excludes those who do not belong to the relevant group, including (embarrassingly) partisans of other collective identities. These considerations seem to me to be extremely important in explaining why liberalism so often seems to end up winning by default in the now familiar debates about 'liberal individualism' and communitarianism. Consider—in this regard—the following rather revealing passage from Ludwig von Mises's *Human Action*. Von Mises writes: "all varieties of collectivist creeds are united in their implacable hostility to the fundamental political institutions of the liberal system: majority rule, tolerance of dissenting views, freedom of thought, speech and the press, equality of all men under the law. This collaboration of collectivist creeds in their attempts to destroy freedom has brought about the mistaken belief that the issue in present day political antagonisms is individualism versus collectivism. In fact it is a struggle between individualism on the one hand and a multitude of collective sects on the other hand whose mutual hatred and hostility is no less ferocious than the abomination of the liberal system…A substitution of collectivism for liberalism would result in endless bloody fighting." This passage presupposes many of the hoary myths about individualism and collectivism which have been the major target of this study. Clearly, von Mises has in mind the more spectacular and virulent Fascist, nationalist and totalitarian forms of 'collectivism' of the early and middle parts of this century. Nevertheless, it is not clear that contemporary communitarian critics of liberalism do not face the same problem. This is, of course, not to say that such critics advocate

a return to the totalitarian collectivism of the Nazi or Soviet types; normally they explicitly and rightly distances themselves from these political models. Nonetheless, I take them to be recommending their own proposal that the self is an inherently social entity as a kind of via media between liberal individualism on the one hand and an overbearing collectivism on the other – a view which, far from escaping from the individualist/collectivist dichotomy, trades upon it. The assumption that 'individualism' is the real enemy remains. As long as critics of liberalism make this assumption, they will be committed to the view that a non- or anti-liberal theory must be in some way recognizable sense *non-individualistic*. The theory must put some conception of the *community*, or group identity, first. But the next question is which community? Which social identity? It comes as no surprise that on this point the critics provide no basis for agreement. Instead they have fragmented into a number of different camps representing competitive collective 'identities', identities related to class, nation, race, gender or cultural traditions; they are united only by the claim that communal, social, group-centred values are more important than individualistic ones. That is, after all, why the reject 'liberal individualism'. But here their agreement ends. What is the basis for a *modus vivendi* among these various collective identities? Familiar liberal ideas about pluralism and toleration, suitably adapted to be sensitive to the requirements of cultural and ethnic diversity, offer the most obvious recourse. To my mind, von Mises's comment indicates that this is the completely unsurprising result of taking the notion of 'liberal individualism' for granted. If its opponents are restricted to theories of 'social identity', 'liberal individualism' is likely to end up winning out by default, much as it seems to be doing in the contemporary debate. Such a view is of course grist for my mill: it supports the idea that the construction of liberal individualism inevitably tilts the issues in a liberal direction, and that a more penetrating criticism of liberal politics starts by questioning that construction itself. I want to stress a related reason why indiscriminate attacks on 'liberal individualism' as a whole are unlikely to get very far. As I have suggested, it is the focus on liberal *individualism* that has led to the sustained onslaught on the 'atomistic' assumptions about the individual and the collectivity allegedly associated with liberalism. Instead the critics argue that we should understand that the self is not an isolated atom, free to stand apart from and make independent choices about its collective context. Instead the self is essentially constituted by the concrete social relationships in which it moves. On this view, the fundamental defect of 'liberal individualism' is that it assumes that the self is made prior to social interaction; so, clearly, any viable alternative must claim that the self is made in the context of social interaction. To quote Daniel Bell: "We ordinarily think of ourselves, Michael Sandel says, 'bearers of this family or community or nation or people, as bearers of this history, as sons or daughters of that revolution, as citizens of this republic', social attachments that more often than not are involuntarily picked up during the course of our upbringing, rational choice having played no choice whatsoever. I did not choose to love my mother and father, to care about the neighbourhood in which I grew up, to have special feelings for the people of my country, and it is difficult to understand why anyone would think that I have chosen those attachments, or that I ought to have done so." So communitarians like Bell and Sandel suggest that the good life consists in making peace (war?) with our inescapable social identity: the problem with liberalism is that by emphasizing the importance of choice, it condemns citizens to a perpetual restlessness about their social identity, and so undermines the stability of genuine community on which authentic self-discovery depends. Such platitudes about the unchosen nature of our social identity and about its importance to use are apt to seem hopelessly naïve, however. What is missing is any serious acknowledgement of the elementary fact that the character of social intervention in the construction of the self is radically Janus-faced. It is one thing to say that selves are formed in and through a social

context, quite another to say that this is always a good thing. Social relations may well inevitably form the selves which move within them, but they can also deform them in various ways. No doubt Robespierre's identity was given by his being a 'son of the French Revolution'. But perhaps a reflective Robespierre would—with hindsight—deeply regret that the social forces of the revolution intervened in the formation of his identity in the way they did. He might reflect that being a son of the French Revolution turned him into a monster and made his existence shameful. The remarkable silence of communitarian critics of liberal individualism on this obvious and fundamental point has made it easy for liberals to respond that communitarians have not taken sufficient account of the potentially totalitarian implications of a communitarian conception of politics. So the argument ends up reinstating the familiar dichotomy between liberal individualism and various communal or social alternatives which threaten to disintegrate into a totalitarian collective. Stated in these terms, this is an argument which the liberal individualist seems fated to win.

AT Do Nothing/Negativity

Alt fails and leads to ressentiment
Connolly 11

(William E., A World of Becoming, Duke University Press)

But such cinematic labors of the negative are not sufficient; they certainly do not suffice to promote positive attachment to this world. Even a "negative dialectic" does not suffice. If things are left there, the embers of ressentiment can easily become more inflamed. That is one reason Deleuze is never happy with negative critique alone: the next task is to highlight how our participation in a world of real creativity that also finds expression elsewhere in the universe depends on and draws from such fugitive interruptions. To put it too starkly (for situational nuances and adjustments are pertinent here), the more people who experience a positive connection between modes of interruption and the possibility of our modest participation as individuals, constituencies, states, and a species in creative processes extending beyond us, the more apt we are to embrace the new temporal experiences around us as valuable parts of existence as such. Certainly, absent a world catastrophe or a repressive revolution that would create worse havoc than the conditions it seeks to roll back, these consummate features of late-modem life are not apt to dissipate soon. The fastest zones of late-modem life, for instance, are not apt to slow down in the absence of a catastrophe that transforms everything. So the radical task is to find ways to strengthen the connection between the fundamental terms of late-modem existence and positive attachment to life as such. This should be accomplished not by embracing exploitation and suffering, but by challenging them as we come to terms with the larger trends.

AT Do Nothing/Withdraw/Burn It Down

The alt fails – withdrawing from capitalism/burning it down are incapable of producing an alternative system of governance – prefer specific, institutional alternatives
Srnicek 11

(Nick, PhD candidate in International Relations at the London School of Economics, "Economics and the Left", *The Oxford Left Review*, Issue 5 | November 2011, pgs. 39)

As Alex Andrews notes, none of these approaches is suficient on its own. Yet even¶ more worryingly, I have been present at a number of events where it is argued that leftists needn't worry about such issues right now. Instead, it is suggested that **all we need is to bring about a revolution** (as though revolutions were some clean break with the past, rather than being a complex mixture of diverse social forces). The presumption implicit in this response is that once leftists are given the opportunity to create a new society, the answers will just become clear. Perhaps consensus decisionmaking – against all evidence – will provide a sophisticated answer!¶ But the risk of relying on such unrelective 'people power' is that when the opportunity comes to effectuate change, **the actors involved fall back on habitual ideas** simply **because they can't imagine an alternative**. This is a crisis of imagination, but also – more signiicantly – of cognitive limits. Very few have done the hard work to think through **an alternative economic system**. And as a result, **we remain embedded within capitalist realism** – unable to think outside the socio-economic coordinates established by an all-encompassing capitalist imagination. Slavoj Žižek has been a popular exception here by consistently arguing for the necessity of thinking about 'the day after tomorrow'. Yet few appear to have taken up his call, and he seems to have ignored it himself.

AT Movements

Neoliberalism is resilient and the alternative fails – their optimism that the system will collapse on its own underestimates neoliberalism's ability to re-organize in response to financial crises – aftermath of 2008 recession proves
Mirowski 13

(Phillip, Prof. of Economics @ Notre Dame, *Never Let a Serious Crisis Go to Waste: How Neoliberalism Survived the Financial Meltdown*, pgs. 7-8)

Conjure, if you will, a primal sequence encountered in B-grade horror films, where the celluloid protagonist suffers a terrifying encounter with doom, yet on the cusp of <u>disaster</u> abruptly wakes to a different world, which initially seems normal, but eventually is revealed to be a second nightmare more ghastly than the first.1 Something like that <u>has become manifest in real life since the onset of the crisis</u> which started <u>in 2007</u>. From the crash onward, it was bad enough to endure house prices sinking under water, dangling defaults and foreclosures, the collapse of what remained of manufacturing employment, the reduction of whole neighborhoods to bombed-out shells, the evaporation of pensions and savings accounts, the dismay of witnessing the hope of a better life for our children shrivel up, neighbors stocking up on firearms and people confusing bankruptcy with the Rapture. It was an unnerving interlude, with Nietzschean Eternal Return reduced to an Excel graph with statistics from the Great Depression of the 1930s. <u>Fast forward to 2011</u>. Whether it was true or not, <u>people had just begun to hope</u> that <u>things were</u> finally <u>turning around</u>. Moreover, <u>journalists</u> in mainstream publications <u>bandied about the notion</u> that <u>academic economics had failed</u>, and hinted that our best minds were poised to rethink the doctrines that had led the world astray. <u>Yet, as the year grew to a close, **it**</u> slowly **dawned upon most of us that the** natural **presumption** that **we were capable of rousting ourselves from the gasping nightmare**, that **we might proceed to learn from the mistakes and fallacies of the era of Neoliberal Follies, was** itself **just one more insidious hallucination**. A dark slumber cloaked the land. <u>Not only had the sense of crisis passed without any serious attempts to rectify the flaws</u> that had nearly caused the economy to grind to a halt, but unaccountably, <u>the political right had emerged</u> from the tumult <u>stronger, unapologetic, and even less restrained</u> in its rapacity and credulity than prior to the crash. In 2010, we were ushered into a grim era of confusion and perplexity on the left. It took a rare degree of self-confidence or fortitude not to gasp dumbfounded at the roaring resurgence of the right so soon after the most dramatic catastrophic global economic collapse after the Great Depression of the 1930s. "Incongruity" seems too polite a term to describe the unfolding of events; "contradiction" seems too outmoded. <u>Austerity became the watchword in almost every country</u>; <u>governments</u> everywhere <u>became</u> the <u>scapegoats for dissatisfaction</u> of every stripe, including that provoked by austerity. In the name of probity, the working class was attacked from all sides, even by nominal "socialist" parties. **In the few instances when class mobilization was attempted** by trade unions to counterattack, as in the recall petition for Scott Walker in the state of Wisconsin, the birthplace of American progressivism, **it failed**. <u>The pervasive dominance of neoliberal doctrines</u> and right-wing parties worldwide from Europe to North America to Asia <u>has flummoxed left parties that</u>, just a few short years ago, <u>had been confident they had been</u> finally <u>making headway</u> after decades of neoliberal encroachment. Brazenly, in many cases <u>parties on the left were **unceremoniously voted out**</u> <u>because they had struggled to contain the worst fallout</u>

from the crisis. By contrast, the financial institutions that had precipitated the crisis and had been rescued by governmental action were doing just fine—nay, prospering at precrisis rates—and in a bald display of uninflected ingratitude, were intently bankrolling the resurgent right. Indeed, the astounding recovery of corporate profits practically guaranteed the luxuriant postcrisis exfoliation of Think Tank Pontification. Nationalist protofascist movements sprouted in the most unlikely places, and propounded arguments bereft of a scintilla of sense. "Nightmare" did not register as hyperbolic; it was the banjax of the vanities.

AT Radical Democracy/Commons

The alternative can't solve – critique of neoliberalism idealizes "the commons" and "radical democracy" while denouncing the procedural and institutional mechanisms necessary to realize them – either the permutation solves because legalization is a necessary step in realization of social justice, or the alternative is too vague to solve any of its own impacts

Barnett 10

(Clive Barnett, Faculty of Social Sciences @ The Open University, "Publics and Markets: What's wrong with Neoliberalism?", *The Handbook of Social Geography*, edited by Susan Smith, Sallie Marston, Rachel Pain, and John Paul Jones III. London and New York: Sage)

In accepting the same simplistic opposition between individual freedom and social justice presented by Hayek, but simply reversing the evaluation of the two terms, critics of neoliberalism end up presenting **highly moralistic forms of analysis** of contemporary political processes. In resisting the idealization of the market as the embodiment of public virtue, they end up embracing **an equally idealized view** of the forum as the alternative figure of collective life (see Elster 1986). For example, while Harvey insists that neoliberalism is a process driven by the aim of restoring class power, he ends his analysis by arguing that it is the anti-democratic character of neoliberalism that should be the focal point of opposition (Harvey 2005, 205-206). But **it is far from clear** whether the theories of neoliberalism and neoliberalization developed by political economists, sometimes with the help of governmentality studies, can contribute to reconstructing a theory and practice of radical democratic justice. In Harvey's analysis, the withdrawal of the state is taken for granted, and leads to the destruction of previous solidarities, unleashing pathologies of anomie, anti-social behaviour and criminality (ibid, 81). In turn, the vacuum created by the withdrawal of the state leads to social solidarities being reconstructed around other axes, of religion and morality, associationism, and nationalism. What has been described as the rise of the "movement society", expressed in the proliferation of contentious politics of rights-based struggles and identity politics, Harvey sees as one aspect of a spread of corrosive social forms triggered by the rolling-back of states. In the wake of this rolling-back "[e]verything from gangs and criminal cartels, narco- trafficking networks, mini-mafias and favela bosses, through community, grassroots and non-governmental organizations, to secular cults and religious sects proliferate" (ibid, 171). These are alternative social forms "that fill the void left behind as state powers, political parties, and other institutional forms are actively dismantled or simply wither away as centres of collective endeavour and of social bonding" (ibid.).¶ Harvey suggests his own bundle of rights as an alternative to the neoliberal regime of rights. These include 'the right to life chances', 'control over production by the direct producers', 'to a decent and healthy living environment', and 'to collective control of common property resources' (ibid. 204). He provides **little sense of how the inevitable** tensions and **trade-offs between these sorts of rights would be negotiated** and decided in practice (beyond the reiteration of Marx's comment that 'Between equal rights, force decides' as if this were both a matter of fact and of principle). Harvey's preference for 'substantive' democracy and social justice is associated with **a persistent denigration of procedural issues without which any meaningful practice of democracy is unimaginable**. Harvey casts struggles for cultural, civil, sexual or reproductive rights since the 1960s as inevitably complicit with the 'neoliberal frame' favouring 'individual freedoms' over 'social justice' (ibid., 41-43). Likewise the emergence of international human rights movements and the development of non-governmental politics is damned as complicit with the 'neoliberal frame' of individual rights and privatization (ibid. 176-177). This is a travesty of complex political movements that have pioneered struggles for social justice along diverse fronts, not least when Harvey claims that these movements have not focussed on developing "substantive and open democratic governance structures" (ibid., 176).¶

What's really wrong with neoliberalism, for critics who have constructed it as a coherent object of analysis, is the unleashing of destructive pathologies through the combined withdrawal of the state and the unfettered growth of market exchange. 'Individual freedom' is presented as a medium of uninhibited hedonism, which if given too much free reign undermines the ascetic virtues of self-denial upon which struggles for 'social justice' are supposed to depend. Underwritten by simplistic moral denunciations of 'the market', **these theories cover over a series of analytic, explanatory, and normative questions**. In the case of both the Marxist narrative of neoliberalization, and the Foucauldian analysis of neoliberal governmentality, it remains unclear whether either tradition can provide adequate resources for thinking about **the practical problems of democracy**, rights and social justice. This is not helped by **the systematic denigration** in both lines of thought **of 'liberalism'**, a catch-all term used with little discrimination. There is a tendency to present neoliberalism as the natural end-point or rolling-out of a longer tradition of liberal thought – an argument only sustainable through the implicit invocation of some notion of a liberal 'episteme' covering all varieties and providing a core of meaning. One of the lessons drawn by diverse strands of radical political theory from the experience of twentieth-century history is that struggles for social justice can create new forms of domination and inequality. It is this that leads to a grudging appreciation of liberalism as a potential source for insight into **the politics of pluralistic associational life**. The cost of the careless disregard for 'actually existing liberalisms' is to remain ~~blind~~ to the **diverse strands of egalitarian thought** about the relationships between democracy, rights and social justice that one finds in, for example: post-Rawslian political philosophy; post-Habermasian theories of democracy, including their feminist variants; various postcolonial liberalisms; the flowering of agonistic liberalisms and theories of radical democracy; and the revival of republican theories of democracy, freedom, and justice. No doubt theorists of neoliberalism would see all this as hopelessly trapped within the 'neoliberal frame' of individualism, although if one takes this argument to its logical conclusion, even Marx's critique of capitalist exploitation, dependent as it is on an ideal of self- ownership, is nothing more than a variation on Lockean individual rights. Any serious consideration of democracy, rights and social justice cannot afford to ignore the fields of social science in which issues of rationality, motivation, and agency are most fully theorized. These often turn out to be fields normally considered too 'liberal' for the tastes of critical human geographers (cf. Sayer 1995). These fields can serve as **potential sources for revised understandings of the tasks of critical theory**, ones which do not fall back into ahistorical, overly sociologized criticisms of any appearance of individualism or self-interest as menacing the very grounds of public virtue and the common good. **Problems of coordination, institutional design, and justification are central** to any normatively persuasive and empirically grounded critical theory of democracy. For example, the problem central to social choice theory – the difficulty of arriving at collective preference functions by aggregating individual preferences – is a fundamental issue in democratic theory, around which contemporary theories of deliberative democracy are increasingly focussed (Goodin 2003). Likewise, Amartya Sen's (2002) critique of public choice theory's assumption that people are 'rational fools' provides the most compelling criticism of the one- dimensional understanding of rationality, motivation, and agency upon which orthodox economic and public policy depends. This critique informs the "capabilities approach" which connects key problems in welfare economics to a theory of egalitarian rights and political democracy (Sen 1999; Corbridge 2002). These are just two examples of work which takes seriously the problematization of agency, motivation and rationality in 'rational choice' social science in order to move social theory beyond the consoling idea that rampant individualism can be tamed by moral injunctions of the public good and weak claims about social construction. The ascendancy of 'neoliberalism' as a theoretical object of approbation is symptomatic of the negative interpretation of 'critical' in contemporary critical human geography. Being critical, on this view, requires that one has a clear-sighted view of an object that one is critical of. Theories of neoliberalism provide a compelling picture of such an object, by providing an account of the displacement of socially embedded practices of reciprocity and redistribution by the pathological rationalities of market exchange. This style of theorizing leads to a mode of critical analysis in which **change is always interpreted in zero-sum terms**, as the encroachment of neoliberal rationalities into realms of social solidarity. It is a style of analysis that makes it **impossible to acknowledge diverse dynamics of change**, **and in turn remains ~~blind~~ to emergent public rationalities:** "If you believe in the implacable domination of economic forces, you cannot believe in the possibility of social movements; at the very best, you will see the movement of society as an expression of the systems' internal contradictions, or as a manifestation of objective suffering and poverty" (Touraine 2001, 3). Neoliberalism as an object of analysis is certainly a critics' term. The explicit formulation of neoliberalism into an object of theoretical

analysis in critical human geography <u>has been associated with</u> **the turning-in of intellectual curiosity around a very narrow space**, bounded by Marxist political-economy on the one side and poststructuralist political ontologies on the other. <u>As long as this remains the horizon of normative reflection, critical human geographers will continue to always know in advance what they are expected to be critical of but will remain unable to articulate convincingly what they are being critical for.</u>

AT Reformism Bad/Negativity

Progressive change is possible and effective – the alt fails and leads to authoritarianism
Connolly 11

(William E., A World of Becoming, Duke University Press)

Is it not obligatory to expose and resist the system as such rather than taking cumulative actions to move it? Don't such actions necessarily fold back in on themselves, feeding the dosed system they seek to move? Some theorists on the Left say such things, but they themselves have too dosed a view of the systems they criticize. No system in a world of becoming composed of multiple, interacting systems of different types, with different capacities of self-organization, is entirely dosed. It is both more vulnerable to the outside than the carriers of hubris imagine and periodically susceptible to creative movement from within and without simultaneously. Moreover, pure negativity on the Left does not sustain either critique or militancy for long, but rather, it tends eventually to lapse into resignation or to slide toward the authoritarian practices of the Right that already express with glee the moods of negativity, hubris, or existential revenge. We have witnessed numerous examples of such disappointing transitions in the last several decades, when a negative or authoritarian mood is retained while the creed in which it was set is changed dramatically. We must therefore work on mood, belief; desire, and action together. As we do so we also amplify positive attachment to existence itself amidst the specific political resentments that help to spur us on. To ignore the existential dimension of politics is to increase the risks of converting a noble movement into an authoritarian one and to amplify the power of bellicose movements that mobilize destructive potential. To focus on the negative dimension alone is to abjure the responsibilities of political action during a dangerous time.

To review, none of the role interventions listed above nor all in concert could suffice to break such a global resonance machine. Luck and pregnant points of contact with salutary changes in state actions, other cross-state citizen movements, the policies of international organizations, creative market innovations, and religious organization are needed. But those larger constellations may not themselves move far in a positive direction unless they meet multiple constituencies primed to join them and geared to press them whenever they lapse into inertia, if a world resonance machine of revenge and counter-revenge stretches, twists, and constrains the classical image of sovereign units, regionally anchored creeds, uneven capitalist exchange, and international organizations, while drawing selective sustenance from all of them, a new counter-machine must do so too.

Legalism

Top Shelf

Perm

The permutation is an act of <u>deconstruction</u> – it acknowledges the finitude of calculability as the basis for responsibility and political action

Popke 3 (E. Jeffrey, Department of Geography, East Carolina University. "Poststructuralist ethics: subjectivity, responsibility and the space of community" (2003), Progress in Human Geography vol. 27 no. 3, pp. 298-316, http://myweb.ecu.edu/popkee/Poststructuralist%20Ethics.pdf)

VII The politics of deconstruction Within geography's increasing engagement with poststructuralist theory, there have recently been a number of discussions of deconstruction (see Barnett, 1999). Most accounts describe deconstruction as a means of exposing the paradoxes, contradictions and elisions which undermine the purported coherence of philosophical or conceptual systems (Dear, 1988; Barnes, 1994). Others have drawn on deconstruction to consider the importance of context in the creation of meaning and interpretation (Dixon and Jones, 1998; Barnett, 1999). For the most part, these authors draw upon Derrida's early works, and especially those dedicated to writing and textuality (e.g., Derrida, 1976; 1988). Taken together, <u>they suggest that deconstruction can be seen as a form of intervention, a strategy to highlight the instability of meaning, and thereby to multiply the potential for alternative understandings.</u> As Doel (1994: 1051) puts it, <u>'deconstruction affirms a movement of perturbation, turmoil, and dislocation</u> . . . [it] is <u>the affirmation of destabilization on the move'</u>. Although this destabilizing impulse is undoubtedly important, I want to suggest that <u>deconstruction can be given a more political, and hence ethical, inflection</u> than many authors do. In a series of more recent texts, Derrida has suggested that <u>deconstruction's movement of destabilization can serve as</u> both a critique of the normative foundations of international law and politics and also a <u>means of addressing our responsibility</u> for the other. Indeed, Derrida (1990: 945) has made the provocative claim that 'deconstruction is justice'. We can begin to unpack this by noting that, within the discourses of modernity, the political has become circumscribed, limited to a discrete set of institutional practices, which are themselves supported by juridical and territorial norms. <u>Deconstruction's ethico-political purchase then, like its philosophical effect, is a result of an intervention that aims to destabilize the grounds of authority for these norms, to show that law, constitution, state territorialization, human rights and so on are ultimately founded on what Derrida</u> (1990: 943) <u>terms a 'violence without ground'.</u> For this reason, Derrida notes, law, like any system of grounding or authority, is inherently deconstructible. <u>Deconstruction</u>, by destabilizing the grounds of authority for international politics, <u>opens the terrain to a new definition of the political</u>, which would move beyond the metaphysics of sovereignty. <u>What is needed</u>, Derrida (1999: 221) suggests, <u>is: a dimension of the political divested of everything which</u> – for better but especially for worse, in our modernity – <u>has welded the political to the ontological</u> (in the first place, to a certain conception of effectivity or present being of the universal cast in terms of the state, and of cosmopolitical citizenship or the International cast in terms of the Party). This 'ungrounding' of the political may appear as a form of nihilism, in which all arguments and positions have equal validity, leading to a condition of anarchy or political stasis. Yet I would suggest instead that <u>deconstruction offers the potential to recast the political on the basis of our responsibility to respect the event of the decision.</u> As Derrida puts it (1999: 240): [<u>political commitment</u>] <u>depends</u>, at every instant, <u>on new assessments of what is urgent in</u>, first and foremost, <u>singular situations</u>, and of their structural implications. For such assessment, there is, by definition, no preexisting criterion or absolute calculability; analysis must begin anew every day everywhere, without ever being guaranteed by prior knowledge. It is on this condition, on the condition constituted by this injunction, that there is, if there is, action, decision and political responsibility – repoliticization [emphasis original]. **<u>The lack of any normative grounding for the decision does not mean that we need not decide</u>**. On the contrary, political responsibility is called for only because there is no way to guarantee the justness of the decision, because its outcome remains undecidable. Far from being a foreclosure of the political, then, the ethics of deconstruction would 're- politicize' or, as Derrida says elsewhere (1996: 85), hyper-politicize, disseminating the moment of political decision across infinite contexts (Derrida, 1995: 273): if I speak so often of the incalculable and the undecidable it's not out of a simple predilection for play nor in order to neutralize decision: on the contrary, I believe there is no responsibility, no ethico-political decision, that must not pass through the proofs of the incalculable or the undecidable. Otherwise, everything would be reducible to calculation, program, causality. This point is worth emphasizing: <u>to assert that the decision is ultimately undecidable does not mean that there can be no such thing as truth, right or</u>

good. It means, rather, that if we purport to know in advance the specific content of such notions, then the event of the decision is divested of its political content, it is simply 'deduced from an existing body of knowledge . . . [as] by a calculating machine' (Derrida, 1999: 240). Deconstruction, then, affirms the necessity to judge, to analyse, to make decisions, in the context of an event that is conditioned by our inexhaustible responsibility to the other (Derrida, 1997: 18): That is what gives deconstruction its movement, that is, **constantly to suspect, to criticize the given determinations of culture, of institutions, of legal systems, not in order to destroy them or simply to cancel them,** but to be just with justice, to respect this relation to the other as justice [emphasis added]. A deconstructive ethics would in this way incite a political responsibility that first and foremost opens us to the (face of) the other, in which we surrender our sovereignty in 'a form of vigilant passivity to the call of the other' (Levinas and Kearney, 1986: 29). This passive opening has been denounced by some as simply a form of 'patience' or 'tolerance' which justifies inaction. Thus Bridge (2000: 526) argues that, for Levinas, 'responsibility need not result in action' and Peet (1998: 242) charges that poststruc- turalism advocates 'a passive affirmation . . . [that] waits for an-Other always to come – that is, conveniently never there – so nothing ever needs doing in terms of political practice'. But I read the passivity of ethical responsibility differently, as a form of opening to limitless possibility in the absence of hubris, an orientation that derives, not from indifference, but from the recognition that 'I cannot calculate everything, predict and program all that is coming, the future in general, etc., and this limit to calculability or knowledge is also, for a finite being, **the condition of praxis, decision, action and responsibility'** (Derrida, 1999: 249). This responsibility is an exposure to the event, in its singular and incalculable context, through which the call of the other enjoins an ethics and politics of decision.

Perm solves best---totalizing rejection sacrifices immediate suffering---short-term legal strategies are not mutually exclusive with the alt

Smith 13 (Andrea, UC Riverside media and cultural studies professor, "The Moral Limits of the Law: Settler Colonialism and the Anti-Violence Movement", Settler Colonial Studies, Taylor and Francis)

At the same time, violence against Native women is at epidemic rates. The 1999 Bureau of Justice Statistics report, American Indians and Crime, finds that sexual assault among Native Americans is 3.5 times higher than for all other races living in the US. Unlike other racial groupings, the majority of sexual assaults committed against Native American women are inter-racial.3 In particular, the majority of people who perpetrate sexual assault against Native women are white. Because of the complex jurisdictional issues involving tribal lands, the majority of sexual assaults against Native women are committed with impunity. Depending on the tribe, non-Native perpetrators of sexual assault on Indian reservations may fall out of state, federal and tribal jurisdiction. And tribes themselves have not developed effective means for addressing violence in their communities. The intersections of gender violence and colonialism in Native women's lives force Native anti-violence advocates to operate through numerous contradictions. First, they must work within the continued colonisation of Native nations. Second, they must work with tribal governments that often engage in gender oppressive practices. In addition, as Native studies scholar Jennifer Denetdale argues, many tribal governments act as neo-colonial formations that support tribal elites at the expense of the community.4 Third, they must also address women who need immediate services, even if those services may come from a colonising federal government or a tribal government that may perpetuate gender oppression. Given the logics of settler colonialism, it may seem to be a hopeless contradiction to work within the US legal system at all. In fact, many social justice advocates eschew engaging in legal reform for this reason. Consequently, we are often presented with two dichotomous choices: short-term legal reform that addresses immediate needs but further invests us in the current colonial system or long-term anti-colonial organising that attempts to avoid the political contradictions of short-term strategies but does not necessarily focus on immediate needs. This essay will explore possibilities for rethinking this dichotomous approach by rethinking the role of legal reform in general. The essay foregrounds alternative approaches using a Native feminist analytic towards engaging legal reform that may have a greater potential to undo the logics of settler colonialism from within. As I have argued elsewhere, Native feminism as well as Native studies is not limited in its object of analysis.5 Rather, in its interest in addressing the intersecting logics of heteropatriarchy and settler colonialism, it is free to engage with diverse materials. In looking then towards alternative strategies for undoing settler colonialism through the law, I contend that it is important to engage important work that might not seem to be directly about Native peoples or settler colonialism if this work helps provide new resources for how we could strategically engage the law. Consequently, I engage the work of legal scholars and activists that address very different areas of law as a means to challenge some of the current assumptions that undergird both reformist and revolutionary approaches to the law. DECOLONIAL REALISM Critical race theorist Derrick Bell challenged the presupposition of much racial justice legal reform strategies when he argued that racism is a permanent feature of society. While his work is generally cited as a critical race theoretical approach, I would contend that his work implicitly suggests a settler colonial framework for understanding legal reform. That is, many of the heirs of Derrick Bell do not follow the logical consequences of his work and argue for an approach to race and the law that seeks racial representation in the law.6 However, Bell's analysis points to the inherent contradictions to such an approach. Rather than seeking representation, Bell calls on Black peoples to 'acknowledge the permanence of our subordinate status'.7 Espousing the framework of 'racial realism', Bell disavows any possibility of 'transcendent change'.8 To the contrary, he argues that '[i]t is time we concede that a commitment to racial equality merely perpetuates our disempowerment'.9 The alternative he advocates is resistance for its own sake – living 'to harass white folks' – or short-term pragmatic strategies that focus less on eliminating racism and more on simply ensuring that we do not 'worsen conditions for those we are trying to help'.10 While Bell does not elaborate on what those strategies may be, he points to a different kind of reasoning that could be utilised for legal reform. In his famous story, 'Space Traders', aliens come to planet Earth promising to solve the world's problems if world leaders will simply give up Black people to the aliens. This story narratively illustrates how thin white liberal commitments to social justice are. First, the white people of course do give up Black people to the aliens without much thought. But what more dramatically illustrates this point is that the reader knows that, almost without a doubt, if this were to happen in real life, of course Black people would be given up. Within this story, however, is a little-commented scene that speaks to perhaps a different way to approach legal reform within the context of white supremacy. Gleason Golightly, a conservative black economics professor who serves as an informal cabinet member for the President, becomes embroiled in a fight with the civil rights legal establishment about the best means to oppose the proposed trade. Golightly had previously pleaded with the President and his cabinet to reject it. When his pleas are not heard, he begins to reflect on how his support for conservative racial policies in the interests of attaining greater political power had been to no avail. He realises the strategy behind his appeal to the President was doomed to fail. In retrospect, though [his] arguments were based on morality [...] []nstead of outsmarting them, Golightly had done what he so frequently criticised civil rights spokespersons for doing: he had tried to get whites to do right by black people because it was right that they do so. 'Crazy!' he commented when civil rights people did it. 'Crazy!' he mumbled to himself, at himself.11 Realising the error of his ways, Golightly interrupts this civil rights meeting in which activists are trying to organise a moral crusade to convince white Americans to reject the space traders proposal. Instead, he suggests that they should tell white people that they cannot wait to go on the ship because they have learned they are being transported to a land of milk and honey. White people, argues Golightly, so oppose policies that benefit Black people, even if they benefit white people, that they will start litigating to stop the space traders' proposed plan.12 The civil rights establishment rejects this strategy as a moral outrage and begins a racial justice campaign, ultimately to no avail. What this story troubles is social justice movements' investment in the morality of the law. Despite the US legal system's complicity in settler colonialism, patriarchy, capitalism and white supremacy since its inception, they advocate strategies for change that rest on the presupposition that the law can somehow be made to support the end of sexism, racism and classism. Historically, as more radical racial and social justice organisations were either crushed or co-opted by the US governments during the 1970s, these movements shifted from a focus on a radical restructuring of the political and economic system to a focus on articulating identity based claims that did not necessarily challenge the prevailing power structure.13 If groups were not going to directly challenge the state, they could then call on the state to recognise their claims to equality and redress from harms perpetrated by other social actors. Ironically, then, the same US government that codified slavery, segregation, anti-immigrant racism, and the genocide of indigenous peoples, now becomes the body that will protect people of colour from racism. The fact that the US itself could not exist without the past and continuing genocide of indigenous peoples in particular does not strike liberal legal reformists as a contradiction. Bell suggests that it may be possible to engage in legal reform in the midst of these contradictions if one foregoes the fantasy that the law is morally benevolent or even neutral. In doing so, more possibilities for strategic engagement emerge. For instance, in the 'Racial Preference Licensing Act', Bell suggests that rather than criminalise racial discrimination, the government should allow discrimination, but tax it. Taxes accrued from this discrimination would then go into an 'equality' fund that would support the educational and economic interests of African-Americans.14 As I have argued elsewhere, the law enforcement approach has been similarly limited in addressing the issues of gender violence when the majority of men do, or express willingness to engage in, it.15 As a result, criminalisation has not actually led to a decrease in violence against women.16 Anti-violence activists and scholars have widely critiqued the supposed efficacy of criminalisation.17 As I will discuss later in this essay, Native women in particular have struggled with the contradictions of engaging the legal system to address the legacies of colonial gender violence. While there is growing critique around criminalisation as the primary strategy for addressing gender violence, there has not been attention to what other frameworks could be utilised for addressing gender violence. In particular, what would happen if we pursued legal strategies based on their strategic effects rather than based on the moral statements they propose to make? DISTRUSTING THE LAW Aside from Derrick Bell, because racial and gender justice legal advocates are so invested in the morality of the law, there has not been sustained strategising on what other possible frameworks may be used. Bell provides some possibilities, but does not specifically engage alternative strategies in a sustained fashion. Thus, it may be helpful to look for new possibilities in an unexpected place, the work of anti-trust legal scholar Christopher Leslie. Again, the work of Leslie may seem quite remote from scholars and activists organizing against the logics of settler colonialism. But it may be the fact that Leslie is not directly engaging in social justice work that allows him to disinvest in the morality of the

<u>law</u> in a manner which is often difficult for those who are directly engaged in social justice work to do. This disinvestment, I contend is critical for those who wish to dismantle settler colonialism to rethink their legal strategies. In 'Trust, Distrust, and Anti-Trust', Christopher Leslie explains that while the economic impact of cartels is incalculable, cartels are also unstable.18 Because cartel members cannot develop formal relationships with each other, they must develop partnerships based on informal trust mechanisms in order to overcome the famous 'prisoners' dilemma'. The prisoner's dilemma, as described by Leslie, is one in which two prisoners are arrested and questioned separately with no opportunity for communication between them. There is enough evidence to convict both of minor crimes for a one year sentence but not enough for a more substantive sentence. The police offer both prisoners the following deal: if you confess and implicate your partner, and your partner does not confess, you will be set free and your partner will receive a ten-year sentence. If you confess, and he does as well, then you will both receive a five-year sentence. Similarly, Leslie argues, cartels face the prisoners' dilemma. If all cartel members agree to fix a price, and abide by this price fixing, then all will benefit. However, individual cartel members are faced with the dilemma of whether or not they should join the cartel and then cheat by lowering prices. They fear that if they do not cheat, someone else will and drive them out of business. At the same time, by cheating, they disrupt the cartel that would have enabled them to all profit with higher prices. In addition, they face a second dilemma. Should they confess in exchange for immunity or take the chance that no one else will confess and implicate them? Cartel members can develop mechanisms to circumvent pressures. Such mechanisms include the development of personal relationships, frequent communication, goodwill gestures, etc. In the absence of trust, cartels may employ trust substitutes such as informal contracts and monitoring mechanisms. When these trust and trust substitute mechanisms break down, the cartel members will start to cheat, thus causing the cartel to disintegrate. Thus, Leslie proposes, anti-trust legislation should focus on laws that will strategically disrupt trust mechanisms. Unlike racial or gender justice advocates who focus on making moral statements through the law, Leslie proposes using the law for strategic ends, even if the law makes a morally suspect statement. For instance, in his article, 'Anti-Trust Amnesty, Game Theory, and Cartel Stability', Leslie critiques the federal Anti-Trust's 1993 Corporate Lenience Policy that provided greater incentives for cartel partners to report on cartel activity. This policy provided 'automatic' amnesty for the first cartel member to confess, and decreasing leniency for subsequent confessors in the order to which they confessed. Leslie notes that this amnesty led to an increase of amnesty applications.19 However, Leslie notes that the effectiveness of this reform is hindered by the fact that the ringleader of the cartel is not eligible for amnesty. This policy seems morally sound. Why would we want the ringleader, the person who most profited from the cartel, to be eligible for amnesty? The problem, however, with attempting to make a moral statement through the law is that it is counter-productive if the goal is to actually break up cartels. If the ringleader is never eligible for amnesty, the ringleader becomes inherently trustworthy because he has no incentive to ever report on his partners. Through his inherent trustworthiness, the cartel can build its trust mechanisms. Thus, argues Leslie, the most effective way to destroy cartels is to render all members untrustworthy by granting all the possibility of immunity. While Leslie's analysis is directed towards policy, it also suggests an alternative framework for pursuing social justice through the law, to employ it for its strategic effects rather than through the moral statements it purports to make. It is ironic that an anti-trust scholar such as Leslie displays less 'trust' in the law than do many anti-racist/anti-colonial activists and scholars who work through legal reform.20 It also indicates that it is possible to engage legal reform more strategically if one no longer trusts it. As Beth Richie notes, the anti-violence movement's primary strategy for addressing gender violence was to articulate it as a crime.21 Because it is presumed that the best way to address a social ill is to call it a 'crime', this strategy is then deemed the correct moral strategy. When this strategy backfires and does not end violence, and in many cases increases violence against women, it becomes difficult to argue against this strategy because it has been articulated in moral terms. If, however, we were to focus on legal reforms chosen for their strategic effects, it would be easier to change the strategy should our calculus of its strategic effects suggest so. We would also be less complacent about the legal reforms we advocate as has happened with most of the laws that have been passed on gender violence. Advocates presume that because they helped pass a 'moral' law, then their job is done. If, however, the criteria for legal reforms are their strategic effects, we would then be continually monitoring the operation of these laws to see if they were having the desired effects. For instance, since the primary reason women do not leave battering relationships is because they do not have another home to go, what if our legal strategies shifted from criminalising domestic violence to advocating affordable housing? While the shift from criminalisation may seem immoral, women are often removed from public housing under one strike laws in which they lose access to public housing if a 'crime' (including domestic violence) happens in their residence, whether or not they are the perpetrator. If our goal was actually to keep women safe, we might need to creatively rethink what legal reforms would actually increase safety. REVOLUTIONARY REFORMS As mentioned previously, there has been insufficient evaluation of the strategic effects of legal strategies opposing gender violence. However, the work of Native anti-violence scholar and activist, Sarah Deer, points to possible new directions in engaging legal reform for the purpose of decolonisation. Deer notes that the issues of gender violence cannot be separated from the project of decolonisation. For instance, tribal governments are restricted to sentencing tribal members to three years in tribal prison for even major crimes such as rape. Much of the focus of the anti-violence movement has been on increasing the number of years tribal governments can incarcerate members. Because of this effort, the Tribal Law and Order Act of 2010 increased the length of sentences from one to three years. However, Deer notes that prior to colonisation, violence against women was virtually unheard of, even though tribes did not have prisons.22 Unlike most, tribes utilised a number of social mechanisms to ensure safety for women and children, and none of these mechanisms are prohibited by federal legislation. Because the federal government restricts the amount of prison time allowed for sexual offenders, tribes primarily call on the federal government to expand tribes' ability to incarcerate. However, as a variety of scholars have noted, expanded sentencing has not actually led to decreased violence.23 Thus, rather than focusing their attention simply on incarceration, Deer suggests that tribes look to pre-colonial measures for addressing violence and begin to adapt those for contemporary circumstances.24 At the same time, Deer notes that it is not necessarily a simple process to adapt pre-colonial measures for addressing violence. Unfortunately, many of the alternatives to incarceration that are promoted under the 'restorative justice model' have not developed sufficient safety mechanisms for survivors of domestic/sexual violence. 'Restorative justice' is an umbrella term that describes a wide range of programs that attempt to address crime from a restorative and reconciliatory rather than a punitive framework. As restorative justice frameworks involve all parties (perpetrators, victims, and community members) in determining the appropriate response to a crime in an effort to restore the community to wholeness, restorative justice is opposed to the US criminal justice system, which focuses solely on punishing the perpetrator and removing him (or her) from society through incarceration. These models are well developed in many Native communities, especially in Canada, where the legal status of Native nations allows an opportunity to develop community-based justice programs. In one program, for example, when a crime is reported, the working team that deals with sexual/domestic violence talks to the perpetrator and gives him the option of participating in the program. The perpetrator must first confess his guilt and then follow a healing contract, or go to jail. The perpetrator is free to decline to participate in the program and go through the criminal justice system. In the restorative justice model, everyone (victim, perpetrator, family, friends, and the working team) is involved in developing the healing contract. Everyone is also assigned an advocate through the process. Everyone is also responsible for holding the perpetrator accountable to his contract. One Tlingit man noted that this approach was often more difficult than going to jail: First one must deal with the shock and then the dismay on your neighbors faces. One must live with the daily humiliation, and at the same time seek forgiveness not just from victims, but from the community as a whole [...] A prison sentence] removes the offender from the daily accountability, and may not do anything towards rehabilitation, and for many may actually be an easier disposition than staying in the community.25 These models have greater potential for dealing with crime effectively because, if we want people who perpetrate violence to live in society peaceably, it makes sense to develop justice models in which the community is involved in holding him/her accountable. Under the current incarceration model, perpetrators are taken away from their community and are further hindered from developing ethical relationships within a community context. However, the problem with these models is that they work only when the community unites in holding perpetrators accountable. In cases of sexual and domestic violence, the community often sides with the perpetrator rather than the victim. As Deer argues, in many Native communities, these models are often pushed on communities by survivors in order to pressure them to reconcile with their families and 'restore' the community without sufficient concern for their personal safety.26 In addition, Native advocates have sometime critiqued the uncritical use of 'traditional' forms of governance for addressing domestic violence. They argue that Native communities have been pressured to adopt circle sentencing because it is supposed to be an indigenous traditional practice. However, some advocates contend that there is no such traditional practice in their communities. Moreover, they are concerned that the process of diverting cases outside the court system can be dangerous for survivors. In one example, Bishop Hubert O'Connor (a white man) was found guilty of multiple cases of sexual abuse but his punishment under the restorative justice model was to participate in a healing circle with his victims. Because his crimes were against Aboriginal women, he was able to opt for an 'Aboriginal approach' – an approach, many argue, that did little to provide real healing for the survivors and accountability for the perpetrator. Deer complains that there is a tendency to romanticise and homogenise 'traditional' alternatives to incarceration. First, she notes traditional practices might, in fact, be harsher than incarceration. Many Native people presume that traditional modes of justice focus on conflict resolution. In fact, Deer argues, penalties for societal infractions were not lenient – they entailed banishment, shaming, reparations, physical punishment and sometimes death. Deer notes that revising tribal codes by reincorporating traditional practices is not a simple process. It is sometimes difficult to determine what these practices were or how they could be made useful today. For example, some practices, such as banishment, would not have the same impact today. Prior to colonisation, Native communities were so close-knit and interdependent that banishment was often the equivalent of a death sentence. Today, however, banished perpetrators could simply leave home and join the dominant society. While tribes now have the opportunity to divest from the US colonial system, many Native women remain under violent attack. They may need to use the federal system until such time that more advanced decolonisation becomes possible. Thus Deer advocates a two-fold strategy: 1) The short-term strategy of holding the federal government accountable for prosecuting rape cases; and 2) encouraging tribes to hold perpetrators accountable directly so that they will eventually not need to rely on federal interference. This approach can be misread as a simple formula for reform. However, it is important to remember that the project of prison abolition is a positive rather than a negative project. The goal is not to tell survivors that they can never call the police or engage the criminal justice system. The question is not, should a survivor call the police? The question is: why have we given survivors no other option but to call the police? Deer's recommendation is not inconsistent to reform federal justice systems while at the same time building tribal infrastructures for accountability that will eventually replace the federal system. If we focus simply on community accountability without a larger critique of the state, we often fall back on framing community accountability as simply an add-on to the criminal justice system. Because anti-violence work has focused simply on advocacy, we have not developed strategies for 'due process', leaving that to the state. When our political imaginaries are captured by the state, we can then presume that the state should be left to administer 'justice' while communities will serve simply as a supplement to this regime. To do so, however, recapitulates the fundamental injustice of a settler state that is founded on slavery, genocide and the exploitation of immigrant labour. Further, we are unable to imagine new visions for liberatory nationhood that are not structured on hierarchical logics, violence and domination. We face a dilemma: on the one hand, the incarceration approach for addressing sexual/domestic violence promotes the repression of communities of colour without really providing safety for survivors. On the other hand, restorative justice models often promote community silence and denial under the rhetoric of community restoration without concern for the safety of survivors. Thus, our challenge is to develop community-based models that respond to gender violence in ways that hold perpetrators accountable. Unfortunately, in this discussion advocates often assume only two possibilities: the criminal justice system or restorative justice. When anyone finds faults with the restorative justice model, it is assumed that the traditional criminal justice approach must be the back-up strategy. Deer's approach, by contrast, is to work with the criminal justice system while continuing to develop effective strategies for addressing violence. These will eventually eliminate the need to rely on the criminal justice system. Of course, the trap of pursuing reforms is that they can create investment in the current US legal system and detract from building new systems of governance that are not based on violence, domination and control. At the same time, we are not going to go from where we are now to revolution tomorrow. Thus, it becomes important to strategise around what may be called 'revolutionary' reforms. Other abolitionists have argued that the only reform that should be supported are those that diminish the criminal justice apparatus. Other abolitionists have argued that this approach leaves people vulnerable to the 'crimes of the powerful', such as rape and domestic violence.27 It is in this context that we can understand Deer's current projects. She has focused on preventing tourists from visiting the area so that the ski resort will not be forced to develop economically viable. According to their promotional material on TrueSnow.org: For the last decade defenders of the peaks have used every legitimate way they could think of to try to stop the US Forest Service from allowing treated sewage effluent to be sprayed on the Peaks to make snow. More than 20,000 people took part in the Forest Service Environmental Impact Statement process with letters and appeals asking them not to spray treated sewage effluent on the peaks to make snow. Thousands of us went to Flagstaff City Council meetings to voice our opposition to the sale of treated sewer water for the project. Yet still they approved it – before even an environmental impact statement was done. They were the most clueless of all. Currently the Hopi tribe is seeking lawsuit against the city because of this treated sewage effluent sale. A group of tribes and environmental and social justice organizations took a lawsuit all the way to the steps of the Supreme Court. The lawsuits have only called into question the legitimacy of what is loosely termed the 'justice' system. For it seems there is no justice in this system. It is just us, IN this system. There is also yet another lawsuit in play which I have termed 'Save the Peaks Coalition vs The Snowbowl Movement' which may have the possibility of stopping this project in the long term. But if we wait for a verdict, all the trees will be cut and the pipeline installed. This has not stopped the politically connected ski area from going ahead with their project right now and they have already clear-cut 100,000 trees (or more) and have already buried a few miles of pipeline along Snowbowl road. If they lose in court they would be expected to repair the damages. How do you get back 400 year old trees? Greed and hatred seems to be Snowbowl's only motivation [...]. But isn't there some way to stop it? Well we could hit them where it hurts! In the pocketbook. If you live in the Fort Valley area of Flagstaff you must see by now how little Arizona Snowbowl really cares about the 'economic benefits' it brings our fair town. I know some of us had a good deal of trouble even going to work when the snow was good and Snowbowl was busy. The traffic jam was incredible. Stretching more than 15 miles. They took our livelihood away and hope to make that a daily occurrence by having a 'predictable' ski season using sewer water to make snow. This jam up gave us an idea! Why don't we do the same thing? Arizona Snowbowl does not own the mountain, and it is perfectly legal to drive up to the area for any permitted public lands use. This means hiking, camping, praying, skiing, sitting, loving, mushroom hunting, etc. So what do I do? It is time to stop waiting for a government entity, an environmental group, or any of the people you have come to expect to save the peaks for us. The time has come to show them how much power the people have! And believe me, you are the most powerful people in all of the world! You! Yep you! Go to it! All summer the Arizona Snowbowl is open Friday, Saturday, and Sunday for scenic skyrides, food, and alcohol. They do get a pretty good business up there and it would have an impact if the mountain was just 'too busy' with people doing all the other things our Public Forests are for. There is nothing illegal about it and it would send a clear message to the forest service that we don't need Snowbowl to 'recreate on the mountain'. Heck, we don't even need a ski area up there to ski! In essence, take a vacation. Just do it up on the peaks and don't use Snowbowl. Our government officials are forgetting what 'all power to the people' really means. You cannot wait any longer for someone else to save the peaks for you. It will take all of us together to do this. So what are you waiting for? Pack a lunch this Saturday morning and Converge on the Peaks!33 What these activists suggest is that we can challenge the US government's decision to allow this development. This will affect not only what legal reforms we may pursue, but what revolutionary strategies we might engage in.

central focus for organising.31 **Those who call for decolonisation often do not effectively engage** in **any short-term reformist strategy,** even though they may save the lives of indigenous peoples who are currently under immediate attack. **As a result, the immediate needs of people** often **get sacrificed in favour of articulating seemingly** politically-pure ideals. Conversely, those who do engage in short-term reform strategies often decry the goal of decolonisation as 'unrealistic'. In doing so, they do not critique the manner in which these strategies often retrench rather than challenge the colonial status quo. Lyons affirms the need for decolonisation, but notes that decolonization happens with pre-existing materials and institutions. He calls on Native peoples to think creatively about these institutions and about the ways in which they can be deployed not just for short-term gains but for a long-term vision of liberation. BEYOND SHAMING THE SYSTEM Legal reformists who often focus on shaping the law to reflect their moral values and those who focus on extra-legal revolutionary strategies often share the same goal. Often the presumed 'radical' strategy adopted by social justice groups is to engage in civil disobedience. While these groups ostensibly break the law, they often do so in rather ceremonial fashion; they essentially want to shame the system. People are supposed to get arrested, and those in power are supposed to be so shamed by the fact that an unjust system required people to break the law. The expectation is that they will then change the laws. Acts of civil disobedience often are not targeted toward changing a policy directly or building alternative systems to the current one. Many Native groups in the southwest US, however, have developed an alternative framework for extra-legal social change. Rather than breaking the law to change the system, they propose to make Native communities ungovernable. For instance, during the passage of SB1070, Native groups with the Taala Hooghan Infoshop, O'odham Solidarity Across Borders, and others occupied the Border Patrol Office.32 However, rather than engaging in the occupation with the expectation of getting arrested, they chained themselves to the building so that the office could not perform its work. Native groups have continued with their efforts to stop the US government's desecration of the San Francisco Peaks through the construction of a ski resort. While there have not eschewed legal strategies for stopping this desecration, they have focused on preventing tourists from visiting the area so that the ski resort will no longer be economically viable.

revolution. The reality of gender violence in Native communities highlights the untenability of these positions**. Native women's lives are at stake now – they cannot wait for the revolution** to achieve some sort of safety. At the same time, the short-term strategies often adopted to address gender violence have often increased violence in Native women's lives by buttressing the prison industrial complex and its violent logics. While this reformist versus revolutionary dichotomy suggests two radically different positions, in reality they share a common assumption: that the only way to pursue legal reform is to fight for laws that that reinforce the appropriate moral statement (for instance, that the only way to address violence against Native women is through the law and to make this violence a 'crime'). Because the US legal system is inherently immoral and colonial, however, attempts to moralise the law generally fail. It is not surprising that the response to these failures is to simply give up on pursuing legal strategies. However, the works of Derrick Bell, Christopher Leslie, and Sarah Deer, while working in completely different areas of the law, point to a different approach. **We can challenge the assumption that the law will reflect our morals and instead seek to use the law for its strategic effects**. In doing so, we might advocate for laws that might in fact contradict some of our morals because we recognize that the law cannot mirror our morals anyway. **We might then be free to engage in a relationship with the law which would free us to change our strategies as we assess its strategic effects.** At the same time, **by divesting from the morality of the law, we then will also simultaneously be free to invest in building our own forms of community accountability and justice outside the legal system.** Our extra-legal strategies would go beyond ceremonial civil disobedience tactics designed to shame a system that is not capable of shame. Rather, we might focus on actually building the political power to create an alternative system to the heteropatriarchal, white supremacist, settler colonial state.

The perm is the <u>only</u> ethical solution – our excessive responsibility to the Other compels us to risk using the law to approach justice

Buonamano 98 (Roberto, lecturer at University of Technology, Sydney. "The Economy of Violence: Derrida on Law and Justice" (June 1998), Ratio Juris vol. 11 no. 2, http://onlinelibrary.wiley.com/doi/10.1111/1467-9337.00083/pdf)

3. The third proposition explicates three assertions: the law as force, the silence of this force, and the self-preserving quality of the silence. Derrida remarks that the phrase "to enforce the law" or "enforceability of the law" reminds us that "law is always authorised force, a force that justifies itself or is justified in applying itself" (Derrida 1992b, 15). The auxiliary verb "is" in the quote ("law is always authorised force") is crucial: The relation is not one of law in the service of force, as Derrida makes clear, nor of force in the service of law; it is rather that of law as founding, justifying and preserving force (the force "in," "of" and "as" law, simultaneously). It is for this reason that legality and legitimacy are interdependent: The law functions to legitimise itself, and legitimacy is only meaningful in the context of, and necessarily presupposes, a system of laws. Law, in its instituting and founding moment—the origin of authority—consists of "a performative and therefore interpretative violence that is itself neither just nor unjust" (Derrida 1992b, 13). Derrida sees this as its "mystical foundation": the silence in the violent structure of the founding act. The instituting violence of law defies the justice discourse, for it is ungrounded violence, authority that rests upon itself—the legality, hence legitimacy, of itself. One cannot ground (legitimise) what is the very act of self-legitimating. This mystical silence, mystical in the sense that as silence it nonetheless reiterates and propagates law, speaks the law over and over again, exists at the origin of law and its conditions. So, and this is the beginning and very condition of justice and deconstruction, law is deconstructible, either because "it is founded, constructed on interpretable textual strata," or because "its ultimate foundation is by definition unfounded" (Derrida 1992b, 14). A deconstruction of law, Derrida explicates, does not aim at an effacement of law "before the ethico-politico-juridical question of justice"; instead, it positively **renders justice possible by adopting an excessive and incalculable responsibility to the question.** This responsibility is that of memory or recollection: a recollection of law as history, the origins and directions of laws, rights and norms, the grounds of our "conceptual, theoretical or normative apparatus surrounding justice"; hence, an understanding of **the limits of law and right and what is at stake** (what is being asked of us, what justice demands) in speaking of the just and unjust (Derrida 1992b, 19–20). This responsibility, this purposive stance towards the ethical, can only exist "with the experience and experiment of the aporia" (Derrida 1992c, 41). The aporetic experience is necessarily experimental: Where knowledge precedes the path it is illuminating, our actions are merely programmatic; one can act responsibly only because knowledge has not heralded its arrival, because we are faced with an impasse that must be tested. To do justice, therefore, is to test the aporetic experience of justice, that is, to assume a responsibility for it. To deconstruct the law is to take seriously the incestuous relation between law and justice, rather than to attempt to justify the division and thus master the opposition. Law and justice must be understood as inexorably and nonsystematically linked: "It turns out that droit claims to exercise itself in the name of justice and that justice is required to establish itself in the name of a law that must be enforced" (Derrida 1992b, 22). Derrida provides us with some of the aporias involved in this (dis-)juncture of law and justice. First, the exercise of justice presupposes freedom to act and self-willed behaviour. So, the judge, who in judging is required to follow a law or prescription, qualities inherent in the very definition of "decision" (there is a sense in which every decision is necessarily legal, though in hierarchical conflict) is nonetheless expected to create a "fresh judgment": that is, ~~he is~~ [they are] expected to both follow a law and confirm and reaffirm it by a free adoption, a "reinstituting act of interpretation" that treats each case as idiomatic and not peremptorily decidable (Derrida 1992b, 22–23). A decision cannot be considered just if it unproblematically follows rules, nor if there is no reference to particular rules or the prescience of general principles; the former amounts to mechanistic calculation, whilst the latter amounts to suspending the decision, since it is confined to the judge's interpretation. Paradoxically, at no moment can we say in the present (Derrida emphasises these words) that a decision is just, only that it is "legal or legitimate, in conformity with a state of law, with the rules and conventions that authorise calculation but whose founding origin only defers the problem of justice" (Derrida 1992b, 23). If law cannot be exercised without a decision (which necessarily "cuts" and "divides"), and if the decision is rightly understood as the multiplicitous programme of learning, reading, understanding, interpreting and calculating the rule, the decision to decide (to invoke the law in the name of justice, and **to risk a conclusion with inevitably legal and justiciable consequences)** must belong to the incalculable, the undecidable. Derrida understands this undecidable as an experience heterogeneous and independent of calculation and the rule, whilst obliged to take account of law and the rule in submitting itself to the "impossible decision" (the just decision). The free decision, that which is not merely the "application or unfolding of a calculable process," presupposes the "ordeal of the undecidable" (Derrida 1992b, 24). And so we have a second form of the aporia: This ordeal of the undecidable lurks behind every decision, impelling itself as the possibility of justice in the impossibly just decision. It is aptly represented as a "ghost" to reflect its double-binded relation to

the present: As the spectre it exists only in the present, and yet in the present it constitutes the memory of an experience that cannot fulfil itself, in the present. The just decision cannot derive from the realised or unfolded calculation process, but it also cannot derive from the suspension of the undecidable, since "only a decision is just." The moment of the undecidable cannot be "past" or "passed"—it exists, recurs, in the present but only as the presentiment of its reality. It perpetually puts in doubt the achievement of the presently just decision.

Institutional analysis key to deconstruction

Caputo 97 (John D., Thomas J. Watson Professor of Religion Emeritus at Syracuse University, "Deconstruction in a Nutshell: A Conversation with Jacques Derrida" (1997), Fordham University Press, pp. 61-62)

Deconstruction is an analytic operation aimed at keeping thinking and writing alive, keeping them open to surprise, by keeping on the alert to the institutions in which they are housed. If language is the house of being, institutions are the house of language. That is why Derrida describes deconstruction as "an institutional practice for which the concept of institution remains a problem" (DP 88). Indeed, we are apt to be misled by speaking of "housing" as if the institution were merely external. Deconstruction is integrally, and not merely passingly or incidentally, devoted to an analysis of the way philosophy functions in an institutional setting, of philosophy and literature in the "institu- tion," as an institution or "establishment," as a socio-politico-juridico- institutional structure. For institutional structures tend to harden over and to protect philosophy from the restlessness and anarchic freedom of writing in which philosophy is inscribed. Instead of protecting phi- losophy, institutions can easily end up protecting us from philosophy. It has never been true that deconstruction consisted in some merely "internal" and "apolitical" analysis of texts, isolated and insulated from the institutions in which these texts are read and by which these read- ings are monitored. **For the institutional "context" belongs integrally to the "general" text**, the archi-textuality of which deconstruction is. the analysis. Institutions reach all the way down into the so-called internal structure of the text, making the very distinction between in- ternal and external questionable, turning the inside out and letting the outside in. The classical idea that institutions are merely external structures having nothing to do with philosophy itself, in its internal essence, **is a conservative illusion.** Deconstruction has always been a political and institutional analysis.

Legal reform is a crucial part of striving toward justice – we must deconstruct, then reconstruct the law

Buonamano 98 (Roberto, lecturer at University of Technology, Sydney. "The Economy of Violence: Derrida on Law and Justice" (June 1998), Ratio Juris vol. 11 no. 2, http://onlinelibrary.wiley.com/doi/10.1111/1467-9337.00083/pdf)

C. The Question of Revolt What are the implications of the economy of violence for the notion of law reform, taken in its broadest sense (re-formation, re-institution of laws or a legal system)? I wish to address this question in only a cursory way by merely raising the problematic relation of justice and revolt. It should not surprise that at the heart of each of Derrida's treatments of law is the question of revolt. We may interpret his reading of Kafka's Before the Law as, amongst other things, an attempt to conceptualise the impossibility of direct engagement with law in its pure form as implicating the necessary task of challenging, revolting against, its very presence. Similarly, we may consider Derrida's dedication to Nelson Mandela as a discussion of the stakes involved in bringing the premises of a political-legal system into question, in an attempt to effect a transformation which seeks to efface its foundations whilst aware of the inability to transcend the history of the existing and former political-legal systems. More recently, we can read in Specters of Marx (Derrida 1994) an explicit desire to account for the legacy of Marx's philosophical revolution, seeing it as indispensable to any critique of current political, legal and moral domains, particularly in light of the

hegemonic presence of global-economic and neo-liberal discourses. However, **we should avoid the** elementary conclusion that revolt is the practice of justice. It is true that Derrida maintains a relation between justice and revolution, but this relation cannot be reduced to the dominant "theory-praxis" paradigm. It may be that the act of revolt is, in certain circumstances, a condition for the exercise of justice, perhaps even a pre-condition; nonetheless, they cannot be simplistically reconciled. Revolt exists within law, albeit at its limit, rather than beyond it. In this sense, the revolution is never anarchic, if this term is understood in its ideological connotations.2 One cannot overturn fundamental laws or overthrow a legal system from without, not because one cannot be outside a legal system, but because one cannot be outside the order of law; at least, one cannot act (speak and decide with social ramifications) from beyond legal order. We might say that revolt is at the end, not in a teleological sense but as a final act in a process of affirmation of discontent, of a certain questioning of law. That is to say, revolt is the last point of this questioning process, perhaps the final question itself. Revolution is neither the beginning nor the end of counter-violence (whether or not this counter-violence is interpreted as Benjamin's divine violence); it is rather the possibility of an event which, as possibility, mediates the violence. And so, the act of revolt attacks the violent structure of law as it surrenders itself to the violence and appropriates it for its own use. We are reminded of a statement Foucault makes on the topic of revolt: that the man who revolts is outside as well as inside history (Foucault 1981, 6). We can replace the word "history" in this proposition with the history of law as violence. Of course, the importance for Foucault of the man of revolt existing inside and outside history is that revolt introduces subjectivity into history: "A delinquent puts his life into the balance against absurd punishments; a madman can no longer accept confinement and the forfeiture of his rights; a people refuses the regime which oppresses it" (Foucault 1981, 8). The revolting person or people becomes a subject of history whilst suspending the history that oppresses it. Although Derrida doesn't explicitly treat the issue of subjectivity, one can rethink the act of deconstruction, in its concern with the adoption of responsibility towards history, as tracing the relation between a subject and the presence of law within that subject, and thereby putting into question the justness of the subject's law-making actions, and ultimately the institution of law in its subject-forming mode. The problematic of revolt is conterminous with that of justice. Just as there is no pure justice, justice purified of juridical and state (mythical) power, there is no pure revolution. This is not to deny the force of revolt in challenging law and state; in fact, it is forceful precisely because it cannot be divorced from its relation to the self-preserving violence of authority, and so is able to strike at this authority with the latter's weapons. If we accept, even tentatively, Derrida's aporias on justice, we must appreciate that to revolt is not to re-make history but to understand **the history of law that survives and is revived** in each act of revolution and reconstruction.

Alt fails

Alt fails---the Surveillance State is inevitable---logical successor to the Security State

Balkin 8 (Jack M., Knight Professor of Constitutional Law and the First Amendment, Yale Law School, 1/1/08, "The Constitution in the National Surveillance State", Minnesota Law Review 93.1, Accessed 7/5/15)//LD

Late in 2005, the New York Times reported that the Bush administration had ordered the National Security Agency (NSA) to eavesdrop on telephone conversations by persons in the United States in order to obtain information that might help combat terrorist attacks.1 The secret NSA program operated outside of the restrictions on government surveillance imposed by the 1978 Foreign Intelligence Surveillance Act (FISA)2 and is thought to be only one of several such programs. 3 In 2007, Congress temporarily amended FISA to increase the President's power to listen in on conversations where at least one party is reasonably believed to be outside the United States. 4 In June 2008, Congress passed a new set of amendments to FISA, which allow the President to engage in a broad range of electronic surveillance without seeking warrants against particular individual targets of surveillance.5 At the same time, Congress effectively immunized telecommunications companies that had participated in the secret NSA program. 6 In July 2007, New York City announced that it planned to mount thousands of cameras throughout Lower Manhattan to monitor vehicles and individuals. 7 Some cameras will be able to photograph and read license plates and send out alerts for suspicious cars.8 The system of cameras will link to a series of pivoting gates installed at critical intersections, giving government officials the ability to block off traffic through electronic commands. 9 New York's new plan-called the Lower Manhattan Security Initiative-is based on London's "Ring of Steel," a security and surveillance system around London's central core that features thousands of surveillance cameras. 10 New York is hardly alone;11 the Department of Homeland Security has been quietly channeling millions of dollars to local governments around the country to create hi-tech camera networks that can be linked with private surveillance systems. 12 Security Initiative reflect a larger trend in how governments do their jobs that predates the September 11, 2001 attacks and the Bush administration's declaration of a "war on terror."13 During the last part of the twentieth century, the United States began developing a new form of governance that features the collection, collation, and analysis of information about populations both in the United States and around the world. This new form of governance is the National Surveillance State. In the National Surveillance State, the government uses surveillance, data collection, collation, and analysis to identify problems, to head off potential threats, to govern populations, and to deliver valuable social services. The National Surveillance State is a special case of the Information State-a state that tries to identify and solve problems of governance through the collection, collation, analysis, and production of information. The war on terror may be the most familiar justification for the rise of the National Surveillance State,14 but it is hardly the sole or even the most important cause. Government's increasing use of surveillance and data mining is a predictable result of accelerating developments in information technology. 15 As technologies that let us discover and analyze what is happening in the world become ever more powerful, both governments and private parties will seek to use them. 16 The question is not whether we will have a surveillance state in the years to come, but what sort of surveillance state we will have. Will we have a government without sufficient controls over public and private surveillance, or will we have a government that protects individual dignity and conforms both public and private surveillance to the rule of law? The National Surveillance State is a way of governing. It is neither the product of emergency nor the product of war. War and emergency are temporary conditions. **The National Surveillance State is a permanent feature of governance**, and will become as ubiquitous in time as the familiar devices of the regulatory and welfare states. 17 Governments will use surveillance, data collection, and data mining technologies not only to keep Americans safe from terrorist attacks but also to prevent ordinary crime and deliver social services.' 8 In fact, even today, providing basic social services-like welfare benefits-and protecting key rights-like rights against employment discrimination-are difficult, if not impossible, without extensive data collection and analysis. 19 Moreover, much of the surveillance in the National Surveillance State will be conducted and analyzed by private parties. 20 The increased demand for-and the in- creased use of-public and private surveillance cannot be explained or justified solely in terms of war or emergency. 21 The National Surveillance State **grows naturally** out of the Welfare State and the National Security State; it is their logical successor. The Welfare State governs domestic affairs by spending and transferring money and by creating government entitlements, licenses, and public works. 22 The National Security State 23 promotes foreign policy

through investments in defense industries and defense-related technologies, through creating and expanding national intelligence agencies like the CIA and the NSA, and through the placement of American military forces and weapons systems around the globe to counter military threats and project national power.

Alt can't solve---technological and bureaucratic imperatives make the Surveillance State inevitable

Balkin 8 (Jack M., Knight Professor of Constitutional Law and the First Amendment, Yale Law School, 1/1/08, "The Constitution in the National Surveillance State", Minnesota Law Review 93.1, Accessed 7/5/15)//LD

One of the most important developments in American constitutionalism is the gradual transformation of the United States into a National Surveillance State. This National Surveillance State is characterized by a significant increase in government investments in technology and government bureaucracies devoted to promoting domestic security and (as its name implies) gathering intelligence and surveillance using all of the devices that the digital revolution allows. Government agencies like the NSA can collect, collate, and analyze vast amounts of conversations, e-mails, and Internet traffic between individuals within the United States and foreign countries, and, it now appears, substantial amounts of such communications within the United States. 114 A series of technological developments have made this data collection and data mining possible. High-speed computers, lower costs of telecommunication and computer storage, and complex mathematical algorithms allow computers to "recognize" patterns in speech, telephone contact information, e-mail messages, and Internet traffic that might indicate possible terrorist or criminal activity. Government officials can combine all of this information with vast amounts of consumer data collected by the government and the private sector. Various private companies now employ business models based on collecting, collating, and analyzing consumer data from a wide variety of sources; they then sell this data and analysis to other private parties and to the government. The National Surveillance State arose from a number of different features whose effects are mutually reinforcing. The most obvious causes are changes in how nations conduct war and promote their national security. As Philip Bobbitt has eloquently explained, the geopolitical demands of war and foreign policy often provide the impetus for changes in domestic political arrangements, because the way that the state faces the world outside is often reflected in the way that it faces its citizens., 15 With the United States a likely target for future terrorist attacks, electronic surveillance, data mining, and the construction of what Daniel Solove has called "digital dossiers,"' 16 have become increasingly important. Terrorist organizations can form loosely connected, geographically amorphous collectivities that present formidable threats to the United States; they can employ weapons of mass destruction or, as in the case of the September 11 attacks, relatively low-tech weaponry with suicidal zeal. New digital communications technologies allow terrorist organizations to band and disband at will, hide their identities, encrypt their communications, transfer funds and resources, and gather allies in many different places around the world. Traditional, geographically organized adversaries in the form of nation-states have fixed locations that the United States can threaten in order to deter attacks. Terrorist organizations, because they lack such fixed addresses, cannot be similarly deterred. They must be stopped as soon as their activities and plans can be identified. This necessitates constant surveillance and processing of vast amounts of information because of the expected costs of making even a single mistake in failing to identify a threat. We caution, however, that the National Surveillance State is not simply a product of the September 11 attacks. Nor is it necessarily a product of war. To begin with, it is by no means clear that the "War on Terror" is a war in the traditional sense. It is not even a long-term engagement with a small group of identifiable adversaries as in the Cold War. Rather, what people now call the "War on Terror" is a sustained set of interlocking strategies for dealing with new forms of global threats and new technologies of attack by a host of different organizations, some sponsored by nation-states, and others acting more or less on their own. 117 Equally important to the rise of the National Surveillance State are new technologies of surveillance, data storage, and computation that arrived on the scene in the latter part of the twentieth century. These would have been produced whether or not the United States was attacked on September 11, 2001. As soon as these technologies became widely available, it was **inevitable** that governments would seek to employ them, both to enjoy their advantages and to counter the dangers of the same tools in private hands. In particular, the Internet and digital information technologies have created new opportunities for crime and new vulnerabilities for the general public, for financial institutions, and for government itself. The digitally networked environment makes possible new types of crimes, like breaches of electronic security and electronic identity theft, while facilitating more traditional crimes like embezzlement, theft, and conspiracy. The digital age has altered the technologies of crime and, concomitantly, the way that the state can respond to crime. Focusing on war as the primary cause of the National Surveillance State overlooks the fact that surveillance technologies that help the state track down terrorists can also be used to track and prevent domestic crime. Once the state has these technologies in place for collecting foreign intelligence, it can use the same technologies to protect its people from crime, attacks on the information infrastructure, and virtually any other domestic problem. After the state compiles data on its citizenry-or purchases it from the private sector-it can use the information to promote a wide range of governmental policies, ranging from the delivery of health care services to tracking down deadbeat dads and people who have failed to pay their license renewal fees and state property taxes. Increased use of information in governance makes governments and those who control information flows more powerful, which makes

the information ever more valuable to governments; this causes governments to invest even more heavily in the collection, storage, and collation of data. These tendencies are spurred on by technological advances that increasingly lower the cost of telecommunications, surveillance technology, data storage, and computation power. Thus, although the transition to the National Surveillance State has been accelerated by the September 11 attacks and the Bush Administration's proclaimed War on Terror, its rise is overdetermined by a host of different **technological and bureaucratic imperatives**.

Link Turn

Only reducing surveillance can reverse the tide of biopower permeating status quo governmentality

Douglas 9 (Jeremy, peer-reviewed independent researcher, "Disappearing Citizenship: surveillance and the state of exception", Surveillance & Society 6.1 (2009), pp. 32-42, Accessed 7/6/15)//LD

There are a few sections of the Patriot Act that are worth discussing in order to demonstrate the modern state of exception, as well as its link to surveillance and the camp. Under Section 412 of the Act, entitled "Mandatory detention of suspected terrorists", the Attorney General has the power "to certify that an alien meets the criteria of the terrorism grounds of the Immigration and Nationality Act, or is engaged in any other activity that endangers the national security of the United States, upon a 'reasonable grounds to believe' standard, and take such aliens into custody". The Attorney General must review the detention every six months and determine if the alien is to remain in detention because of a continued risk to security. But what remains ambiguous, and allows for the indistinction between law and violence and between police and sovereignty, is this "reasonable grounds to believe standard". Suffice it to say, without going into greater depth, this 'standard' is grounds for racial profiling and the detention of political opponents. Also, the detention of aliens on a 'belief' is the production of bare life, since it is the stripping of rights without reference to a violation under 'normal' law; in other words, these "suspected terrorists" are detained without having done anything wrong, but must be situated in the state of exception camp for those who may threaten the 'normal' force of the law – this is the aforementioned void, or 'nonplace', of the law. Since these aliens cannot be detained under the normal law, a camp of suspects must emerge in a national security emergency. What is also telling about this Act is that the ten Titles may be seen as different governmental tactics, networked in one state of emergency act; Titles include, "Enhancing Domestic Security against Terrorism", "Protecting the Border", "Strengthening the Criminal Laws against Terrorism", and "Increased Information Sharing for Critical Infrastructure Protection". Foucault would be quick to point out that this Act characterizes the population conducting tactics that define governmentality: policing, disciplining, and security. However, Title II, "Enhanced Surveillance Procedures", not only becomes implicit in many of the other areas of the act that discuss "intelligence" and "security", but also allows the Act to go beyond the protection of the 'norm' in a sovereign nation-state through foreign surveillance provisions. Section 214 functions in collaboration with and amends several parts of the Foreign Intelligence Service Act 1978 (FISA) in order to allow for international surveillance activities in order identify suspected terrorists: during periods of emergency (i.e. state of exception), the US invests itself with the power to collect "foreign intelligence information not concerning a United States person or information to protect against international terrorism or clandestine intelligence activities" (Sec. 214(b) (1)). The detention and surveillance of aliens continues though other mechanisms of jurisprudence, which, as mentioned, are becoming normalised through bills, acts, etc. that are not designed as state of emergency 'law' per se. On 13th November 2001, George W. Bush issued a military order for the "Detention, Treatment, and Trial of Certain Non-Citizens in the War Against Terrorism"; by 'certain' this order means anyone "believed" to be associated with al Qaida (PoTUS, 2001). Like with Section 412 of the Patriot Act, suspected terrorists are to be detained without a court order. Similarly, under the Terrorism Act 2000 in the UK, "A constable may arrest without a warrant a person whom he reasonably suspects to be a terrorist" (Section 41(1)). As with the US, any person detained under this Act can remain in detainment following and pending a review (Schedule 8, Part II). The Disappearance of Citizenship4 What we have been discussing thus far applies to the "indefinite" and "mandatory" detention of aliens, but the Patriot Act and the Terrorism Act contain various sections on increased surveillance measures that target aliens and native citizens alike. These surveillance activities include the collection of DNA from anyone detained for any offence or suspected of terrorism, phone taps, wiretaps for electronic communications, the collection of individual library records (Section 215; this Section in particular has received heavy criticism and debate), the collection of banking and financial records, and other indirect surveillance methods, such as the collection of biometric data at US borders (as Agamben experienced). However, these universal surveillance methods become much more significant when we consider the proposed increased governmental powers outlined in the Domestic Security Enhancement Act 2003 (alias, Patriot Act II). Under Section 501 of Patriot Act II the "mandatory dentition" of aliens suspected of terrorism extends to include Americans, who can also be stripped of their citizenship and made stateless detainees. As Gore Vidal remarks, "under Patriot Act I only foreigners were denied due process of law as well as subject to arbitrary deportation... Patriot Act II now includes American citizens in the same category, thus eliminating in one great erasure the Bill of Rights" (Vidal 2003). Section 501, "Expatriation of Terrorists", of the Act states: This provision (i.e. Section 501) would amend 8 U.S.C. § 1481 to make clear that, just as an American can relinquish his citizenship by serving in a hostile foreign army, so can he relinquish his citizenship by serving in a hostile terrorist organization. Specifically, an American could be expatriated if, with the intent to relinquish nationality, he becomes a member of, or provides material support to, a group that the United States has designated as a "terrorist organization," if that group is engaged in hostilities against the United States. With the power proposed in this section of the Patriot Act II, the government would be able to produce bare life with both aliens and American citizens – "a process leading to the disappearance of citizenship by transforming the residents into 'foreigners within', a new sort of untouchable [homo sacer], in the transpolitical and anational state where the living are nothing more than the 'living dead'" (Virilio 2005, 165). We have seen how a permanent state of emergency creates a situation in which foreign residents or visitors can be detained without a court order for an indefinite period of time;

even greater governmental powers are now aiming at expanding this exposure to the pure power of the juridical-political system to citizens as well. Citizenship and political significance are becoming less fundamental and inalienable rights and more categorizations that are only maintained though **blind adherence to so-called democratic polices**, which look more and more like a dictatorial structure (see: Arendt 1973).

Surveillance is key to modern governmentality---curtailment ruptures the state of exception

Douglas 9 (Jeremy, peer-reviewed independent researcher, "Disappearing Citizenship: surveillance and the state of exception", Surveillance & Society 6.1 (2009), pp. 32-42, Accessed 7/6/15)//LD

Before we can even ask why a state uses surveillance mechanisms, we need to define what state structure we are talking about. Following Foucault, governmentality best describes our current political situation, as it is above all concerned with managing the internal structure of the state according to a biopoliticization of the population, rather than maintaining the power over life and death, as is characteristic of sovereign politics. Governmentality is literally an 'art' of governing, in which the population is 'conducted' through various relations and tactics employed by the state, such as institutions, security, statistics, and surveillance. So, governmentality is the structure in which surveillance can operate as one of the arms of state power. When we move towards the juridical-political situation of the state of exception, we see another area in which surveillance plays a crucial biopolitical role. The use of exceptional legal measures in order to protect the 'normal' force of law is what defines the state of exception. The 'normal' law that is suspended is often that which guarantees the rights and the citizenship of foreign and national citizens; thus, under an exceptional juridical situation, individuals with no political significance are produced: bare life. The USA Patriot Act (among other documents) embodies this loss of rights, production of bare life, and increased surveillance based on a perceived national threat. The state of exception, Agamben argues, is becoming more and more the normal course of politics – this is nowhere more exemplary than in the camp. The camp is the place where bare life is produced and the exception becomes the rule. Yet, the Roman camp in Judea shows us that the emersion of surveillance in a camp-'state of exception'- territory structure is nothing new. What is primarily 'modern' is not biopolitics (Foucault) or the camp (Agamben), but the governmental control of the disappearance of citizenship. With digital technology, the erasure of a definite 'here' or 'there' means that the localised camp is no longer a paradigmatic 'place' where the limit of the state of exception is realised; rather, the non-place of a population in constant movement is what defines the new non-place of the city camp. Thus, **surveillance is deeply imbedded in and necessary for** the governmental system that seeks to be instantly aware of any potential threats to the state so that it can quash those threats by depoliticizing 'dangerous' portions of the population and exposing them to the pure potentiality of the 'management' of life.

Surveillance allows management of life---reducing surveillance closes the potentiality for universalization of bare life

Douglas 9 (Jeremy, peer-reviewed independent researcher, "Disappearing Citizenship: surveillance and the state of exception", Surveillance & Society 6.1 (2009), pp. 32-42, Accessed 7/6/15)//LD

One particular Jewish work camp in the Judea Desert, occupied and run by the Romans, was actually a complex of pre-existing structures from the Hellenistic and Islamic periods. The site consists of one large watchtower structure and two smaller structures downhill from the watchtower. The layout of this Hellenistic site functioned as an ideal work camp quarry for the Romans, although it had originally been constructed as an Islamic burial ground and temporary shelter for travellers. A recent excavation of the camp (Yekutieli et al. 2006) revealed a number of potsherds and heaths that were carbon-dated to the first and second century CE. Some of these remains were found along the slope of the tower, which contained a number of small (1x2m) rock shelters, while other remains were discovered on the summit of the tower, which, through a crevice, looks down over the slope and the other structures; these findings reveal that people were living in the shelters as well as at the summit. What is unique about this camp is the way in which the territory is manipulated in order to allow for the surveillance of the

workers. From the lookout crevice at the top of the tower, one can see the entire landscape, including the quarry, workers' shelters, cooking areas, etc., without being seen by anyone in those locations. Further, the layout of the shelters on the slope allowed one to see no more than two other shelters at a time (ibid, 76). From these observations, we can see that the architecture of the camp was designed so as to allow for a panoptic power structure in which the Romans could achieve the subjectivization of the detainees through their awareness of a potential observer. This type of structure, which allows for an unseen seer to watch over individuals occupying a given territory, is nothing new – in fact, such surveillance structures have been recorded from as far back as the Early Bronze Age (3000-2650 BC) (ibid, 78-85). However, these earlier surveillance systems were used in order to guard a territory against an attack, as with the lookout towers constructed at the top of castles. What distinguishes the Roman work camp from other ancient surveillance mechanisms is the way in which is it integrated into, and in many ways the precondition for, the political structure that creates the camp. The encampment of rebellious Jews characterizes the state of emergency, in which 'normal' law is suspended in order to use any means necessary to protect the interest of the sovereign. Thus, the Jews in the camp must be removed from the political realm and treated as bare life that must be constantly monitored and exposed to the potentiality of violence. As we shall see, this camp serves a paradigmatic example of affects of surveillance, insofar as it is the amalgamation of the state of exception, bare life, violence, law, biopolitics, territory, and governmentality; not to mention that evidence of surveillance and camp structures that existed thousands of years ago demonstrates that none of these concepts are new and modern phenomena. Governmentality is able to function as the control of the population and the creation of bare life because it employs **surveillance as a crucial tactic in the management of life** – this is clearly presented in the Roman camp example. However, although many of the concepts and techniques we see at work in the camp are not fundamentally different today, not everything has remained the same. The importance of a juridical political system that acts according to the state of exception, or suspension of the law, is evident in the emergence of recent totalitarian and 'democratic' permanent states of emergency; for example, the UK and the US have normalised the exception through the passing of 'laws' (Terrorism Act, Patriot Act, etc.) that essentially nullify the application of normal laws protecting human rights, while still holding them technically 'in force'. We see also that these 'exceptional' laws go **hand in hand with increased surveillance**, both of which are tactics that establish control of the population. Yet what remains to be analysed is the relation(s) between surveillance, territory, and the state of exception – how does surveillance allow for the rise of the state of exception and the camp? And, more broadly, how are all there concepts integrated in an art of government? Surveillance must be regarded as the point at which the camp and the bare of the state of exception intersect in the governmental control of the population. Defining the Terms: Foucault and Agamben Although Michel Foucault wrote a book (Discipline and Punish) that dealt extensively with one method of surveillance, the panoptic, his more useful contribution to the theory of surveillance comes from his study of 'governmentality', or the 'art' of governing. In the course of his 1970s lectures at the College de France, Foucault underwent a significant shift in the emphasis of his theory, moving from the power-territory relationship of sovereignty to the politico-economic governmentality of population; the concept of sovereignty concerned with maintaining power and territory is a dated pre-modern concept, and what needs to be analysed now is the governing of a population though various circulatory (that is, relational) mechanisms: "it is not expanse of land that contributes to the greatness of the state, but fertility and the number of men" (Fleury quoted in Foucault 2007, 323). In other words, what is emerging in Foucault's writings, beginning with The History of Sexuality Vol 1, is the concept of biopolitics: "the management of life rather than the menace of death" (Foucault 1990, 143). Broadly, what is taking place in Foucault's works and lectures in the mid to late 1970s is his description of the differences (not transitions) between "sovereignty, discipline, and governmental management" (Foucault 2007, 107). The essential goal of sovereignty is to maintain power, which is achieved when laws are obeyed and the divine right of the throne is reaffirmed. 'Power' is the essential defining component of sovereignty, while 'government' is more or less just an administrative component within the sovereign state – a component that is the function of the family; the family, oikos, in ancient Greece was the private management (government) of economic matters where the father ensured the security, health, wealth, and goods of his wife and children, while the polis was the public realm where man realised his political significance in striving for "the good life". The rise of government in the sixteenth century is marked by this family government model being "applied to the state as a whole" (ibid, 93), as well as by the rise of "mercantilism" - the former not realizing its full scope and application until the eighteenth century and the latter being a stage of rason d'état between sovereignty and governmentality. However, when the art of governing becomes the predominant 'goal' of the state in the eighteenth century, the family is relegated to the position of an "instrument" and population emerges as the "main target" (ibid, 108) of the government (territory is the main target of sovereignty insofar as a sovereign defines itself according to its territory, while government defines itself in term of its population). With population as the central concern for government, other institutions and sites - such as territory, the family, security (military), police, and discipline - all become "elements" or "instruments" in the management of the population – these biopolitical tactics are what primarily distinguish governmentality from sovereignty. Conduct and Subjectivization Foucault wants to situate bio-power in the multiplicity of relations within the overarching structure of the state, and therefore not discard the notion of 'power' but instead couch it in terms of governmentality. Biopolitics is produced in the relations between biological life and political power (bio-power), which is possible when a population is confronted with and in relation to the biopoliticizing (not to be confused with disciplining) techniques of institutions, territory, police, security, and surveillance; rather than positing a sovereign-people dialectic (which Agamben tends to do), Foucault wants to complicate the notion of biopolitics by accounting for a state that "spreads it tentacles" (Virilio 1997, 12) through its various instruments and tactics. It seems as though, with the beginning of a governmentality discourse developing in the Security, Territory, Population course, Foucault feels he has said enough about biopolitics as such and can now move towards the art and techniques of governmental and subjective "conduct", in which biopolitics is implicit. Yet what emerges is, on the one hand, a theory of the **top-down management** of a population that is controlled through governmental mechanisms such as statistics-guided surveillance and police practices, and, on the other hand, the bottom-up subjectivization of population through the regulation of actions confronted with state power relations; this may also be regarded as biopolitical population control and individualizing discipline, respectively. These two streams of governmentality surface in Foucault's later writings from time to time, but he never clearly reconciles the art of government and subjectivization. This subjective 'conduct' or 'governing the self' is a self-disciplining that is made possible through the knowledge of oneself as 'the other', as the object of an unseen seer (as is discussed with the panoptic model in Discipline and Punish). This self-conduct, however, is framed in terms of the problematic of government that uses the power relation techniques of governing others to govern themselves (Foucault 2000, 340-342); but again, where do these two points converge and differ? It seems as though we must look to surveillance to answer this question. We know that surveillance is certainly a governmental 'technique' for the management and control of the population, but we also see that subjectivization is only possible via surveillance, as just mentioned with the panoptic model. However, panoptic surveillance is an ancient notion, developed at least as far back as EBII, sometime around 3000-2650BC (Yekutieli 2006, 78). The relation between the seer and the subject is no longer that of a physical perspective from a point fixe, nor is it localised in a contained space, as with Bentham's prison model. Rather, as Paul Virilio would argue, surveillance is making the traditionally confined space of the camp the very centre of the city. However, before examining the juridical-political applications of this notion, we must understand Giorgio Agamben's conception of biopolitics in terms of "bare life" and "the state of exception". Redefining Biopolitics Following and 'completing' Foucault's discussion of biopolitics, Agamben seeks to further explore the relation between state power and life, not in terms of governmentality, but rather, in terms of sovereign power. That is, what affect(s) does the state have upon the lives of citizens in relations of

power and control? In a sense, Agamben's position is formulated in accordance with what Arendt and Foucault failed to do: Agamben completes Arendt's discussion of totalitarian power, "in which a biopolitical perspective is altogether lacking" (Agamben 1998, 4), and completes Foucault's discussion of biopolitics, which fails to address the most paradigmatic examples of modern biopolitics, such totalitarianism and the camp. This revision of Arendt and Foucault is achieved through the exemplification of the state of exception and bare life, which find their ultimate realization in modern examples of the camp. But first, it is necessary to understand how Agamben arrives at this conclusion. In Politics, Aristotle distinguishes between natural, simple life1 , Zoë, and political life, bios. Zoe is private life confined to the home, oikos, while bios is life that exists in the public (political) realm of the city, the polis; the former is life regulated by the economy of the family, while the latter is "good life" regulated by the state. It appears, then, that Zoë and bios are mutually exclusive, and man moves from an animal life to a distinct political life, as Aristotle seems to argue. Foucault picks up on this Aristotelian animal/political life when he writes of the "threshold of biological modernity" (Foucault 1990, 143), in The History of Sexuality, and modifies it to reflect the transition from a politics of the power-limit of death to the politicization of biological (or, more accurately, zoological – i.e. Zoë-logical) life: "For millennia, man remained what he was for Aristotle: a living animal [Zoë] with the additional capacity for a political existence [bios]; modern man is an animal whose politics places his existence as a living being in question" (ibid). The distinction between Zoë and bios is called into question; what were once two distinct forms of life are now indistinguishable – biology has become political and politics has become biological, giving rise to biopolitics. Agamben's claim, however, is that Foucault, Arendt, and others have misread Aristotle; in interpreting Aristotle, they believe that "the human capacity for political organization is not only different from but stands in direct opposition to that natural association whose center is the home (oikia) and the family" (Arendt 1998, 24, author's italics). On the contrary, the simultaneous inclusion and exclusion of life in politics – that is, the production of a biopolitcal life - is the "original activity of sovereign power" (Agamben 1998, 6). Although Aristotle appears to present zoe and bios as polar forms of life – animal versus political – he provides indications that the supposed exclusion of natural life from the political realm is at the same time its inclusion, and therefore the originary biopolitical act: "we may say that while [the polis] grows for the sake of mere life, it exists for the sake of a good life" (Aristotle quoted in Politics, Metaphysics, and Death, 3). This implies, as Agamben notes, that natural life had to "transform" itself into political life; political life is not "in direct opposition" to natural life, then, but is born of it. The very notion of bios is itself only possible through its inclusion of zoe – "Nation-state means a state that makes nativity or birth (that is, naked human life) the foundation of its own sovereignty" (Agamben 1998, 20); biopolitics is this indistinction between private life and public life, an "undecidability…between life and law" (Agamben 2005, 86). Bare Life and the State of Exception This conception of biopolitics as an ancient and founding notion of sovereignty needs to be distinguished from what Agamben terms "bare life" or "homo sacer" (life that may be killed but not sacrificed). Biopolitical life, as mentioned above, is still within the juridical-political realm, but bare life is that which is banished from the polis. It is not pure political life as such, but a life that exists at the threshold between zoe and bios. Bare life is the indistinguishability between natural life and political life – a life that exists neither for the sake of politics nor for the sake of life: "bare life…dwells in the no-man's-land between the home and the city" (Agamben 1998, 90). It is a life that is banished from politics – outside of law – but included in its exclusion – still within the 'force of law': The ban is essentially the power of delivering something over to itself, which is to say, the power of maintaining itself in relation to something presupposed as nonrelational [i.e. bare life]. What has been banned is delivered over to its own separateness and, at the same time, consigned to the mercy of the one who abandons it – at once excluded and included, removed and at the same time captured. (ibid, 110) How is this possible? How can bare life be excluded and included? What implications would this have? In order to understand how bare life is produced and how it can exists both within and outside of the polis, it is necessary to introduce another concept: state of exception. This notion is derived, by in large, from Carl Schmitt's book Political Theology, as well as from a fairly extensive debate between Walter Benjamin and Schmitt concerning the nature of the state of exception. The state of exception is a "suspension of law", which is usually instituted during a period of war or another state of emergency: "The exception, which is not codified in the existing legal order, can at best be characterized as a case of extreme peril, a danger to the existence of the state, or the like" (Schmitt 1922, 6). Under the state of exception there becomes a 'threshold' between law that is in the norm but is suspended and law that is not the norm – i.e. not necessarily part of the juridical order – but is in force; so, in the state of exception there appears this "ambiguous and uncertain zone in which de facto proceedings, which are themselves extra- or antijuridical, pass over into law, and juridical norms blur with the mere fact – that is, a threshold where fact and law seem to become undecidable" (Agamben 2005, 29). What needs to be underlined here is the relation between the state of exception and bare life. This point is absolutely crucial for Agamben and for understanding the role of governmental surveillance: **the state of exception opens up the possibility of bare life** and of the camp, where bare life is outside law but constantly exposed to violence and "unsanctionable killing" (Agamben 1994, 82). Agamben's position can be understood in the triadic relation 'state of exception-camp-bare life'; the ultimate power of the sovereign, and the complete dissolution of democracy into totalitarianism – two political systems that, according to Agamben, already have an "inner solidarity" (ibid, 10) – happens at the point when the state of exception becomes the rule and the camp emerges as the permanent realization of the indistinguishability between violence and law, to which we all, as homines sacri, are exposed. The paradigmatic example is, of course, Nazi Germany; but what remains to be seen is how this triad can be applied to our current political milieu. The Potentiality of/for Violence Perhaps the closest Agamben comes to discussing the relations between the state of exception and surveillance is his 11th January 2004 article in Le Monde, entitled, "No to Bio-Political Tattooing" (Agamben, 2004). This article comes as a result of Agamben's cancellation of a course he was scheduled to teach at New York University that March. The reason he cancelled the course was because he was denied entry to the US as a result of his refusal to provide biometric data as part of post-9/11 US security measures. The resulting article is mostly a brief, simplistic version of his book Homo Sacer, but Agamben does imply that modern security and surveillance techniques are emerging as the new paradigm (though not to the extent of the camp) of the state of exception, in which the exception has become the rule: There has been an attempt the last few years to convince us to accept as the humane and normal dimensions of our existence, practices of control that had always been properly considered inhumane and exceptional. Thus, no one is unaware that the control exercised by the state through the usage of electronic devices, such as credit cards or cell phones, has reached previously unimaginable levels. (Agamben 2004) Electronic and biometric surveillance are the tactics through which the government is creating a space in which the exception is routine practice. **The biopolitical implication of surveillance is the universalization of bare life**: "History teaches us how practices first reserved for foreigners find themselves applied later to the rest of the citizenry" (ibid). These new control measures have created a situation in which not only is there no clear distinction between private and political life, but there is no fundamental claim, or right, to a political life as such – not even for citizens from birth; thus, the originary biopolitical act that inscribes life as political from birth is more and more a potential depoliticization and ban from the political realm. We are all exposed to the stateless potentiality of a bare life excluded from the political realm, but not outside the violence of the law (and therefore still included): "states, which should constitute the precise space of political life, have made the person the ideal suspect, to the point that it's humanity itself that has become the dangerous class" (ibid). Making people suspects is equivalent to making people bare life – it is the governmental (a Foucauldian governmentality rather than an Agambenian sovereignty I would argue) production of a life exposed to the pure potentiality of the state of exception: "the sovereign ban, which applies to the exception in no longer applying, corresponds to the structure of potentiality, which maintains itself in relation to actuality precisely through its ability not to be" (Agamben 1994, 46). **Surveillance is the technique that opens up this potentiality**, which allows for the normalization of the exception. In this particular instance – i.e. biometric data collection and surveillance in the US – **the state of exception as a permanent form of governmentality** and the universalization of homines sacri has been brought into existence though the USA Patriot Act2 and the Patriot Act II3. I have used the term 'potentiality' a number of times precisely to point to the state in which the citizens (or, more broadly, the population) of a

number of countries find themselves. The potentiality I want to analyse can follow two directions: it is the potentiality to be stripped of citizenship, to be banned, to be abandoned to the law, and to be subjected to political violence, or it is the potentiality for the government to exercise violence and exceptional law upon the population. So, this potentiality can be both negative and positive. Although violence becomes indistinguishable from law – or, more specifically, indistinguishable from surveillance and control in the state of exception, what needs to be emphasised is that it is not a power relation of pure violence, but rather, of potential violence. It is important, as Benjamin notes in "Critique of Violence", to understand that violence is a function of the power mechanisms of the government (although Benjamin would probably say 'sovereign'): "the law's interest in a monopoly of violence vis-à-vis individuals is not explained by the intention of preserving legal ends but, rather, by that of preserving the law itself; that violence, when not in the hands of the law, threatens it not by the ends that it may pursue but by its mere existence outside the law" (Benjamin 1933, 136). The state of exception arises when the population threatens to take violence away from the law – the population (rather than individuals per se) are regulated by surveillance methods, in order to ensure that the 'norm' of the law is not threatened; and for this norm to remain 'in force' an indefinite period of state of exception is often exercised, as we see with the example of the USA Patriot Act. The American State of Exception Surveillance and the External 'Threat' This politics of potentiality is created through the de facto 'laws' of state of exception legislation like the Patriot Act. Looking at actual parts of the Act, we can see that it exemplifies the state of emergency referred to by Agamben et al.; the 'normal' law of the state is not abolished but its "application is suspended" so that it still technically "remains in force" (Agamben 2003, 31). As such, the suspension of the normal application of the law is done "on the basis of its right of self-preservation" (Schmitt 1985, 12), so that the exception is that which must produce and guarantee the norm. Obviously then the state of exception is not intended to be anything more than a temporary safeguarding of normal law. In fact, there can be no 'normal' law without the state of exception: "the state of exception allows for the foundation and definition of the normal legal order" (Agamben 1999, 48). The use of the state of emergency to protect the normality of the legal order dates back at least as far as the Roman Empire. Whenever the Senate believed the state to be in danger, they could implement the iustitium, which allowed for the consuls "to take whatever measures they considered necessary for the salvation of the state" (Agamben 2005, 41).

AT: Law Bad

Law Good

Reforms are possible and desirable---tangible change outweighs the risk of cooption and is still a better strategy than the alt

Omi 13 (Michael, Berkeley ethnic studies professor, "Resistance is futile?: a response to Feagin and Elias", Ethnic and Racial Studies, 36.6, Taylor and Francis)

In Feagin and Elias's account, white racist rule in the USA appears unalterable and permanent. There is little sense that the 'white racial frame' evoked by systemic racism theory changes in significant ways over historical time. They dismiss **important rearrangements and reforms** as merely 'a distraction from more ingrained structural oppressions and deep lying inequalities that continue to define US society' (Feagin and Elias 2012, p. 21). Feagin and Elias use a concept they call 'surface flexibility' to argue that white elites frame racial realities in ways that suggest change, but are merely engineered to reinforce the underlying structure of racial oppression. Feagin and Elias say the phrase 'racial democracy' is an oxymoron – a word defined in the dictionary as a figure of speech that combines contradictory terms. If they mean the USA is a contradictory and incomplete democracy in respect to race and racism issues, we agree. If they mean that people of colour have no democratic rights or political power in the USA, we disagree. The USA is a racially despotic country in many ways, but in our view it is also in many respects a racial democracy, **capable of being influenced** towards more or less inclusive and redistributive economic policies, social policies, or for that matter, imperial policies. What is distinctive about our own epoch in the USA (post-Second World War to the present) with respect to race and racism? Over the past decades there has been a steady drumbeat of efforts to contain and neutralize civil rights, to restrict racial democracy, and to maintain or even increase racial inequality. Racial disparities in different institutional sites – employment, health, education – persist and in many cases have increased. Indeed, the post-2008 period has seen a dramatic increase in racial inequality. The subprime home mortgage crisis, for example, was a major racial event. Black and brown people were disproportionately affected by predatory lending practices; many lost their homes as a result; race-based wealth disparities widened tremendously. It would be easy to conclude, as Feagin and Elias do, that white racial dominance has been continuous and unchanging throughout US history. But such a perspective misses the dramatic twists and turns in racial politics that have occurred since the Second World War and the civil rights era. Feagin and Elias claim that we overly inflate the significance of the changes wrought by the civil rights movement, and that we 'overlook the serious reversals of racial justice and persistence of huge racial inequalities' (Feagin and Elias 2012, p. 21) that followed in its wake. We do not. In Racial Formation we wrote about 'racial reaction' in a chapter of that name, and elsewhere in the book as well. Feagin and Elias devote little attention to our arguments there; perhaps because **they are in substantial agreement with us**. While we argue that the right wing was able to 'rearticulate' race and racism issues to roll back some of the gains of the civil rights movement, we also believe that there are limits to what the right could achieve in the post-civil rights political landscape. So we agree that the present prospects for racial justice are demoralizing at best. But we do not think that is the whole story. US racial conditions have changed over the post-Second World War period, in ways that Feagin and Elias tend to downplay or neglect. Some of the major reforms of the 1960s have proved irreversible; they have set powerful democratic forces in motion. These racial (trans)formations were the results of unprecedented political mobilizations, led by the black movement, but not confined to blacks alone. Consider the desegregation of the armed forces, as well as key civil rights movement victories of the 1960s: the Voting Rights Act, the Immigration and Naturalization Act (Hart- Celler), as well as important court decisions like Loving v. Virginia that declared anti-miscegenation laws unconstitutional. While we have the greatest respect for the late Derrick Bell, we do not believe that his 'interest convergence hypothesis' effectively explains all these developments. How does Lyndon Johnson's famous (and possibly apocryphal) lament upon signing the Civil Rights Act on 2 July 1964 – 'We have lost the South for a generation' – count as 'convergence'? The US racial regime has been transformed in significant ways. As Antonio Gramsci argues, hegemony proceeds through the incorporation of opposition (Gramsci 1971, p. 182). The civil rights reforms can be seen as a classic example of this process; here the US racial regime – under movement pressure – was exercising its hegemony. But Gramsci insists that such reforms – which he calls 'passive revolutions' – **cannot be merely symbolic** if they are to be effective: **oppositions must win real gains in the process.** Once again, **we are in the realm of politics, not absolute rule.** So yes, we think there were important if partial victories that shifted the racial state and transformed the significance of race in everyday life. And yes, we think that further victories can take place both on the **broad terrain of the state** and on the more immediate level of social interaction: in daily

interaction, in the human psyche and across civil society. Indeed we have argued that in many ways the most important accomplishment of the anti-racist movement of the 1960s in the USA was the politicization of the social. In the USA and indeed around the globe, race-based movements demanded not only the inclusion of racially defined 'others' and the democratization of structurally racist societies, but also the recognition and validation by both the state and civil society of racially-defined experience and identity. These demands broadened and deepened democracy itself. They facilitated not only the democratic gains made in the USA by the black movement and its allies, but also the political advances towards equality, social justice and inclusion accomplished by other 'new social movements': second-wave feminism, gay liberation, and the environmentalist and anti-war movements among others. By no means do we think that the post-war movement upsurge was an unmitigated success. Far from it: all the new social movements were subject to the same 'rearticulation' (Laclau and Mouffe 2001, p. xii) that produced the racial ideology of 'colourblindness' and its variants; indeed all these movements confronted their mirror images in the mobilizations that arose from the political right to counter them. Yet even their incorporation and containment, even their confrontations with the various 'backlash' phenomena of the past few decades, even the need to develop the highly contradictory ideology of 'colourblindness', reveal the transformative character of the 'politicization of the social'. While it is not possible here to explore so extensive a subject, it is worth noting that it was the long-delayed eruption of racial subjectivity and self-awareness into the mainstream political arena that set off this transformation, shaping both the democratic and anti-democratic social movements that are evident in US politics today.

Commitment to objective legal reasoning is the only way to constrain violence – any alternative paints the law as indeterminate which justifies illegality

Ristroph 9 (Alice, Associate Professor of Law, Seton Hall University School of Law, "Is Law? Constitutional Crisis and Existential Anxiety," Constitutional Commentary Vol. 25, 431-459. http://scholarship.law.georgetown.edu/cgi/viewcontent.cgi?article=1457&context=facpub)

One reason to care whether law is in "crisis" concerns our own expectations of the function of law. A possible achievement is to offer an alternative to violence —as we saw in Levinson and Balkin's account of the Constitution as enabling nonviolent dispute resolution.66 This might be called the anti-Thrasymachus view of law. Early in Plato's Republic (before Socrates has tamed him), a young man called Thrasymachus describes justice as "the advantage of the stronger."67 The claim is that might makes right, and Western political and legal thought has produced many efforts to prove Thrasymachus and his heirs wrong. If law distinguishes right from might, then it becomes important to say what law is, and to show that it exists. Hence, many ongoing jurisprudential debates about the criteria for a valid and functional system of law (including worries about legal indeterminacy) are motivated by worries about arbitrary power and violence.68 To show Thrasymachus to be mistaken, we want to show that the rule of law is really different from the rule of (the strongest) men. In legal theory, we could view John Austin's positivism— law as commands backed by threats of punishment—as a descendant of Thrasymachus's claim.69 Here, I want to examine briefly one of the most influential, and most plausible, efforts to show that law is something more and different from the commands of a gunman: H. L. A. Hart's response to Austin. Hart framed his discussion around the question, "What is law?".70 But perhaps, as the Stoppard passage that opened this essay suggests, beginning with this question led us to conjure an image of law with various predicates that do not, as it turns out, include existence. A second form of existential anxiety, one that I suspect shapes present talk of crisis, is the anxiety that Thrasymachus and Austin were right and law, if it is anything more than command and force, does not exist. For my purposes here, the critical features of Hart's account are the rule of recognition and the internal point of view. Since, in most of The Concept of Law, Hart takes law's existence for granted, it is helpful to look at the passages where law's existence, or at least the existence of a particular form of law, is up for grabs. In his classic discussion of the question, "Is international law really law?", H. L. A. Hart deployed the concepts of a rule of recognition and the internal point of view to conclude that international law was at most in a state of transition toward fully legal law, moving toward law properly so called but certainly not yet there.71 At the time he wrote The Concept of Law, Hart believed that international law departed from domestic (or "municipal") law in that it lacked a widely accepted rule of recognition and in that states could not be said to take the internal point of view toward international obligations. (Hart's argument has been challenged by many contemporary scholars of international law, but that particular dispute need not occupy us here.72) For law qua law to exist, Hart argued, there must be a rule of recognition under which the authoritative status of other rules was accepted or denied, and the officials who would apply the rule of recognition must themselves take the internal point of view toward it. That is, the officials needed to view the rule of recognition as a binding, authoritative guide to their own decisions. Suppose Hart was right and the rule of recognition and the internal point of view are conditions for the existence of law. Two questions arise: what is the rule of recognition for constitutional law, and who must hold the internal standpoint toward that rule? The Constitution itself initially seems a candidate for the rule of recognition, though the fact that the Constitution must itself be interpreted leads some theorists to amend this account and say that the rule of recognition must include authoritative statements of the meaning of the Constitution, under prevailing interpretive standards.73 As for the internal point of view, we might hope that all state officials would take this point of view toward constitutional rules.74 In other words, we might hope that every state actor would comply with the U.S. Constitution because it is the Constitution, not simply to avoid injunctions, or judicial invalidation of legislative action, or liability under 42 U.S.C. § 1983. But Hart's theory does not demand universal adherence to an internal point of view. Even if legislators and other public officials complied with First or Fourth or Fourteenth Amendment doctrine only to avoid invalidation or § 1983 liability —even if these public officials were the equivalent of Holmes's bad man— Hart might find that constitutional law still existed in a meaningful sense so long as the judges applying constitutional rules believed themselves to be bound by a constitutional rule of recognition.75 Here is a possibility, one I believe we must take seriously and one that prompts anxiety about the existence of constitutional law itself: there is no common rule of recognition toward which judges and other officials take an internal point of view.76 Individual judges may adhere to their particular understandings of the rule of recognition and the Constitution as interpreted by proper originalist methods, for example, or the Constitution as elucidated by popular understandings. But the fact that individual state actors follow their own rules of recognition in good faith does not satisfy Hart's account of law, and it does not provide a satisfying alternative to Thrasymachus. (There is no reason, on the might-makes-right account, that the mighty cannot hold the good faith belief that they are pursuing a common good or acting pursuant to rule-governed authority. What matters is that their power is in fact traceable to their superior strength.) There is reason for academic observers to doubt the existence of a single rule of recognition in American constitutional law. There are too many core interpretive disputes, as discussed in Part I, and it is now widely accepted that constitutional rules are at least underdeterminatc. Should there be doubt about this claim, consider this feature of constitutional law textbooks: they include majority and dissenting opinions, and questions after each case frequently ask the reader which opinion was more persuasive. Those questions are not posed as rhetorical. For most constitutional decisions, we can say, it could have been otherwise. With a few votes switched, with a different line-up of Justices, the same precedents (and in some cases, the same interpretive methodology) could have produced a different outcome. Moreover, these suspicions of indeterminancy or underdetermi-nancy are not the unique province of the academy. Think of the discussions of Supreme Court appointments in presidential elections. Many voters, law professors or not, understand their vote for president to be also a vote for a certain kind of Justice and for certain kinds of constitutional outcomes. Discussions of Supreme Court appointments are often framed in terms of judicial methodology —"I will appoint judges who are faithful to the text of the Constitution" —but that language may be more a matter of decorum than of real constitutional faith. Judges, of course, are not ignorant of the charges of indeterminancy or of the politicization of judicial appointments. And it seems possible that the erosion of constitutional faith has reached the judiciary itself.771 claim no special insight into judicial psychology, but it seems implausible that the reasons for constitutional skepticism—the discussions of underdetermined rules, the contingency of outcomes based on 5-4 votes, and the great attention to swing justices such as Sandra Day O'Connor or Anthony Kennedy—have not influenced judges themselves. Here again it seems worthwhile to consider dissenting opinions. Justice Scalia's polemics come to mind immediately; he has often accused his colleagues of acting lawlessly.78 When he keeps his point and continues to participate in a system that treats as law the determinations of five (potentially lawless) Justices. It is possible, I suppose, that Justice Scalia's dissents express earnest outrage, that he is shocked (shocked) by decisions like Lawrence v. Texas79 and Boumediene. It is possible that he believes himself to be the last best hope of constitutional law properly so called. But it seems more likely that he shares the skepticism of academic observers of the Court. Though one can't help but wonder whether judges are still constitutionally devout, I should emphasize here that my argument does not turn on a claim that judges are acting in good or bad faith. Individual judges may well take the internal point of view, in Hart's terms, and strive faithfully to apply the principles they recognize as law. But it seems clear that American judges do not all hold the internal point of view toward a single, shared rule of recognition, given the nature of disagreements among judges themselves. If there are multiple rules of recognition, varying from judge to judge, then legal outcomes will depend on which judge is empowered to make the critical decision, and Thrasymachus is not so far off the mark. Contemporary judicial disagreement is profound, and it is not just a matter of Justice Scalia's flair for colorful rhetoric. Consider Scott v. Harris, the recent decision granting summary judgment (on the basis of qualified immunity) to a police officer who had rammed a passenger car during a high-speed chase, causing an accident that left the driver a quadriplegic.80 Like most use-of-force opinions, the decision applies a deferential Fourth Amendment standard that gives police officers wide leeway. What is unusual about Harris is that, because the case arose as a civil suit under 42 U.S.C. § 1983, the critical question (whether the driver, Victor Harris, posed a sufficient threat to others' bodily safety such that the use of deadly force was

reasonable) was nominally a jury question, and at summary judgment, the court should have taken the facts in the light most favorable to the non-moving party—the injured driver. Thus, in earlier use-of-force cases that reached the Court as § 1983 claims, the Court articulated the Fourth Amendment standard and then remanded the case to the trial court.81 But in Harris, the Court had access to videotapes of the chase recorded by cameras on the dashboards of the police vehicles involved.82 In the view of the eight-Justice majority, the videotape "spoke for itself": it made Harris's threat to the public so clear that no reasonable juror could conclude that the officer's use of force was unreasonable.83 Accordingly, the Supreme Court found the officer to be entitled to summary judgment.84 Doubtless there are many instances in which a court grants summary judgment to one party though non-judicial observers believe a reasonable juror could find for the other party. Harris is of particular interest, though, because the "reasonable juror" who might have found in favor of Victor Harris was clearly visible to the majority—in fact, this juror had a spokesman on the Court. Justice Stevens, the lone dissenter in Scott v. Harris, viewed the same videotape and found it to confirm the factual findings of the district court (which had denied the police offic-er's motion for summary judgment).85 Though Justice Stevens was careful not to base his argument on an actual determination of the substantive Fourth Amendment question (chiding his colleagues for doing just that and thereby acting as "jurors" rather than judges),86 he viewed the video evidence and explained how one might conclude, perfectly reasonably, that Scott had used excessive force.87 In order for the eight Justices in the Harris majority to believe their own opinion, they would have to conclude that Justice Stevens lived outside the realm of reason. Harris is nominally a dispute about what reasonable jurors could conclude, rather than a direct argument about the meaning of a particular constitutional provision. But the two reactions to the videotape should call to mind Larry Tribe's worry that American constitutional law is plagued by "deep and thus far intractable divisions between wholly different ways of assessing truth and experiencing reality."88 It is not just abortion and assisted suicide that reveal profound disagreement about what is true and real. A videotape that "speaks for itself" in the eyes of eight Justices says something entirely different to the ninth. Looking beyond the judiciary, consider the consequences of constitutional disagreement and constitutional indeterminacy for other government officials and for would-be critics of those officials. Earlier I noted that with sufficient constitutional indeterminacy, there's no such thing as an unconstitutional president. A more extreme version of this argument is that **with sufficient legal indeterminancy, there's no such thing as illegality**. When John Yoo wrote the Office of Legal Counsel memos that defend practices formerly known as torture, he was simply doing to bans on torture what critics had long argued it was possible to do for any law: he was trashing them.89 This was the spawn of CLS put to work in the OLC; **deconstructions on the left are now deconstructions on the right**.90 And that, of course, is cause for anxiety among those who would like to argue that George W. Bush or members of his administration acted illegally. As I suggested in the Introduction, **this may be the Pyrrhic victory of critical legal studies: If the crits were correct, then there is no distinctively legal form of critique. About torture, indefinite detention, warrantless wiretapping, and so on, we can say I don't like it or it doesn't correspond to my vision of the good, but we cannot say it's illegal.** To argue that the Bush administration violated the rule of law, we need to believe that the rule of law exists. But for 30 years or more, we have found reasons to doubt that it does.91 Perhaps it will seem that I am overstating the influence of legal realism and critical legal studies, or the doubts about law's existence. I'm willing to entertain those possibilities, but I do want to emphasize that the focus is on constitutional law. It's easy enough to believe in law when we see it applied and enforced by figures of authority in a recognized hierarchy. That is, the sentencing judge or the prison warden can believe in law—he has applied it himself. And the criminal should believe in law—he has felt its force. But these examples illustrate Austinian law: commands backed by force. What remains elusive, on my account, are laws that are truly laws given to oneself, and especially law given by a state to itself.92 That is why, in Part I of this essay, I suggested that brute force is a poor candidate to distinguish ordinary politics, or ordinary legal decisions, from extraordinary moments of crisis. What would be truly extraordinary is not the use of force, but its absence: a system of law truly based on consent and independent of sanction. The Constitution, in theory, is a law given unto oneself. By this I mean not simply that the Founders gave the Constitution to future generations, but that each successive generation must give the Constitution to itself: each generation must adopt the internal point of view toward the Constitution in order for it to be effective. Even once we have accepted the written text as authoritative, all but the strictest constructionists acknowledge that many meanings can plausibly be extracted from that text. (And even the strict constructionists must acknowledge that as a factual matter many meanings have been extracted; they deny only the plausibility of those varied readings.) Any law given unto oneself requires what Hart called the internal point of view, and what one more cynical might describe as self-delusion: it requires a belief that one is bound though one could at any minute walk away. It is possible, I think, that we have outwitted the Constitution: that we have become too clever, too quick to notice indeterminancy, even too post-modern to believe ourselves bound. A third possible explanation for contemporary references to crisis is professional malaise. It could be, as I suggested earlier, that after too many years of chewing what judges had for breakfast, professors have lost their appetites. It could be that the problems of originalists and historicists and popular constitutionalists don't amount to a hill of beans in this crazy world. And if these possibilities have not crossed the law professor's mind, they probably should. We might consider again Larry Tribe's explanation of his decision to stop work on his treatise of American constitutional law. There are two questions of meaning there, one of which Tribe confronts directly and the other which he brushes off quickly. Most obviously, there is the search for constitutional meaning, as Tribe acknowledges, a search that cannot be concluded within the Constitution's own text. "I see no escape from adopting some perspective… external to the constitution itself from which to decide questions not indisputably resolved one way or the other by the text and structure-------"9* Tribe goes on to wonder where these extra-constitutional criteria come from, and "who ratified the meta-constitution that such external criteria would comprise?".94 Supreme Court Justices (and other judges) must struggle with these questions, given "the public authority that they have the enormous responsibility and privilege to wield."95 But Tribe need not. He can simply decline to finish the treatise. If he declines to finish the treatise, though, we can't help asking ourselves what was at stake, and what remains at stake. If the law professor lacks the responsibility of a judge, is his constitutional theory just an amusing hobby? What was the point of the constitutional law treatise, or of other efforts to discern coherent principles of constitutional law? The significance of a treatise is the question of meaning that Tribe brushes off quickly: he says a treatise is an "attempt at a synthesis of some enduring value" and insists that his decision is not based on doubts about whether constitutional treatises are ever worthwhile.96 But Tribe's letter leaves the "enduring value" of a treatise rather underspecified, and it is possible that current references to constitutional crisis in the academy stem from uncertainty about such questions of value. Is constitutional theory good for absolutely nothing? Only if we believe that the effort to resist Thrasymachus is futile or pointless. Constitutional theory is a species of legal and political theory, and the most intriguing forms of such theory are produced by worries that law and violence are too closely intertwined.97 Thus I suggested at the outset of this essay that existential anxiety is not always to be regretted, cured, or mocked. Such anxiety may be an important indication that we have noticed the ways in which Thrasymachus seems right, and we still care enough to try to prove him wrong.98 After so much talk of crisis and anxiety, consider an illustration from the dramatic genre. Tom Stoppard's play Jumpers features a troupe of philosophy professors who double as acrobats: "Logical positivists, mainly, with a linguistic analyst or two, a couple of Benthamite utilitarians … lapsed Kantians and empiricists generally… and of course the usual Behaviorists… a mixture of the more philosophical members of the university gymnastics team and the more gymnastic members of the Philosophy School."99 The Jumpers seem to practice what we would now identify as post-modern nihilism. One shoots and kills another, then conceals the murder with cheerful aplomb. Against these intellectually and physically adroit colleagues, the clumsy and old-fashioned Professor George Moore struggles to defend "the irreducible fact of goodness,"100 the possibility of a "moral conscience," and the claim that "there is more in me than meets the microscope."101 "Is God?" Moore wonders. **He can neither shake nor defend his faith.** Law schools, I think, are filled with moral sympathizers to Professor Moore who possess the skills of modern-day Jumpers.102 The current discourse of crisis is the latest manifestation of an old struggle between faith and doubt, and it is not one that we will resolve. On one hand, we have observed too much to believe (in law) unquestioningly. And on the other hand, we are determined to have law, even if we must make it ourselves. There was at least a smidgen of truth in John Finnis's claim that scholars of critical legal studies were "disappointed … absolutists."103 But it is not just crits that are disappointed when they look for law and see nothing Few scholars of any stripe want to vindicate Thrasymachus. All of this is just to reiterate the difficulty, and perhaps the necessity, of giving a law unto oneself. If constitutional law did not exist, it would be necessary to invent it.

Schlag Indict

Schlag is wrong about normativity – his theory recreates the norms it criticizes

Carlson 99 (David Gray, Professor of Law at the Cardozo School of Law, Yeshiva University. "Duellism in Modern American Jurisprudence" (November 1999), Columbia Law Review vol. 99, no. 7)

F. Law is Normative Perhaps Pierre Schlag's most famous point is his imperative, "Don't be normative." The values of the legal academy are little better than advertising purveyors--hypocrites who try "to achieve strategic advantages largely (if not entirely) unrelated to the observance or realization of those professed values."193 Values are used as totems or tools to induce guilt or shame.194 Stifling and narrow,195 normativity is not even a thought--only an unthinking habit.196 Normativity argues that, if it does not hold sway, terrible social consequences would follow.197 Normative thought is designed to shut down critical inquiry into the nothingness of law.198 Not only are values deceitfully strategic, but they are ineffective.199 They are too vague to be self-determining.200 "Normative legal thought's only consumers are legal academics and perhaps a few law students-- persons who are virtually never in a position to put any of its wonderful normative advice into effect."201 Judges are not listening.202 Even if judges had the time to read and study all of academia's suggestions, they would be unlikely to implement any which would require radical changes in the status quo, since, Schlag notes, "[o]nly those kinds of norms that already conform to the audience's belief are likely to meet with any sort of wide-scale approval."203 Thus, Schlag concedes, sometimes normativity is empirically effective after all--but not because of intrinsic authenticity. Normativity is effective because it tracks and incorporates "folk-ontologies," such as order, salvation, or progress.204 Like Antony, norms tell the people only what they already know. Norms and values are lies, Schlag says, when proffered by legal academics, but it was otherwise with Sophocles205 or the Warren court,206 who were authentically in touch with real pain. By implication, values are authentic when immediately connected to feelings.207 Values, properly used, are worthy of commendation.208 But the mere invocation of values does not guarantee their authenticity. The proof of values is in context.209 At first impression, Schlag's imperative against normativity seems startlingly contradictory. Is it not a norm that one should not be normative? If so, how is it that the norms of the legal academy are lies, while Schlag's **very meta-norm is legitimate**? Schlag's view is not at all contradictory within the context of romantic psychology. Norms and values are defined by Schlag as concepts which are severed from what Schlag likes to call "context"--understood as nature, or the state that precedes the introduction of legal distortion.210 In fact, norms and values are the same non-thing or non-sense as law. They are the corruptions and mutilations that destroy context. They are castration itself.211 If, however, context could speak directly, what it would say would not be a norm.212 When context says, "Don't be normative," then context is not itself normative. Rather, context would be speaking a natural, wellgrounded, immediate truth?not a mere norm.213 This is, I think, what organizes Schlag's critique of norms. The norms offered by legal academics are inauthentic because they are universals, standing apart from context. Schlag, Sophocles, and Chief Justice Earl Warren, however, are in touch with context (through sensecertainty or immediate feeling), and what they speak is the concrete truth, not a norm. In short, Schlag appeals to a natural law which is, while other legal academics appeal to mere "ontological identities," which merely ought to be. This is precisely the claim of the romantic, who, "exempt from public haunt, Finds tongues in trees, books in the running brooks, Sermons in stones, and good in every thing."214 In the world of the romantic, things speak directly. Thus, when Schlag reports what natural context says, no thought or "norm" enters to distort the message sent by nature itself. Schlag thus puts himself forth as what has been called a "rational observer" of natural law215?a vanishing mediator, in Zizekian terms.216 Schlag complains that positive lawyers are empty vessels. Thus, Dworkin's Hercules is said to be a "vacuous fellow."217 Ironically, it turns out that Schlag himself is just as vacuous. In order for context to speak, Schlag must erase himself and be the vanishing mediator between nature (i.e., context) and legal audience. In short, Schlag, who vociferously opposes the Kantian subject,218 puts himself forth as the perfect Kantian.219 Although Schlag accuses legal academics of being anti-intellectual, it appears as if their thoughts and norms--intellectual products--are the very scalpels by which law castrates the natural self. It is possible, then, to turn the charge around on Schlag and accuse him of being the anti-intellectual. I will, however, let Hegel do the dirty work: Those who speak philosophically of right, morality, and ethics and at the same time seek to exclude thought, appealing instead to feeling . . . bear witness to the profound contempt into which thought and science have fallen; for in their case, science itself, having sunk into despair and total lassitude, even adopts barbarism and thoughtlessness as its principle and does everything it can to rob mankind of all truth, worth, and dignity.220

Schlag's theory of the bureaucratic subject denies the existence of personality

Carlson 99 (David Gray, Professor of Law at the Cardozo School of Law, Yeshiva University. "Duellism in Modern American Jurisprudence" (November 1999), Columbia Law Review vol. 99, no. 7)

B. The Free Self Can Choose to Be Bound Schlag criticizes legal academics for unwitting indulgence in a contradiction. The self is supposed to be sovereign. Yet the self bows down to the rule of law.244 The choice to be bound is supposed to be a contradiction in terms.245 From what has been said, it should be clear that there is no contradiction here. The self that stands against the natural world, and the animal inclinations that afflict its body, is a negative entity. At heart, the subject is nothing at all.246 Yet, if it is to "exist," it must have externally observable properties. It must do something, and the things it does be? come an attribute of the self. We are what we do.247 The subject that lawfully follows its passion achieves existence and so perpetuates itself.248 This is the positive freedom of the self. Any self choosing to conform to the law has put forth its moral character in the world. It was the free choice of the self to do this.249 Hence, the free self can choose to be bound, without contradiction.250 This concrete subject is likewise free to violate the law and to perpetuate itself by crime. This is the negative freedom of the concrete subject. It is not properly freedom at all, but slavery to inclination. Crime consti? tutes inclination speaking in defiance of the moral side, thereby committing a crime on the subject's own self. The particularity of the criminal is therefore not freedom but slavery.251 In fact, tied into the very idea of following the law is the idea of a free will that might choose not to follow the law. The free will that aspires to follow the law never truly binds itself. A subject that puts itself forward as lawful could give into impulse tomorrow and is therefore "free" (in the negative sense) to violate the law. Lawfulness is therefore a constant struggle?the ongoing achievement of the concrete self. Furthermore, it is a struggle in which the subject must fail: [F]reedom realizes itself through a series of failures: every par? ticular attempt to realize freedom may fail; from its point of view, freedom remains an empty possibility; but the very contin- uous striving of freedom to realize itself bears witness to its "actuality."252 Freedom is thus "powerful." It exhibits the "primacy of possibility over actuality."253 Forever potential, it is nevertheless a possibility that transforms the world. In contrast to this view, Professor Schlag wants to say that freedom means the concrete self can do what it feels like. But he should know better than to exalt the authenticity of the **pre-legal natural self,** and he has on occasion **chastised others for doing just that.**254 To exalt the sovereignty of such a self (that may be in the thrall of criminal passion) instead of the liberal self is to permit the contingent side of the self to govern in its moral arbitrariness.255 In other words, the essence of personality is the rationality of the liberal self. Negative freedom denies the essence of personality and therefore ends up destroying its own self.256 To summarize, Schlag's work is based on a romantic psychology. If only the concrete self were freed from law, Schlag implies, it would know what to do. Law offers mere "norms" and presents the subject with empty choices. Such a theory of the self ignores the fact that human nature has two sides--the natural and the moral. One side cannot be privileged at the expense of the other. To be sure, many of Schlag's criticisms of liberal psychology257 are well taken. Liberal psychology absolutely denies a place for the unconscious and irrational. His accusation that liberal philosophy does not consider the challenge of deconstruction to liberal psychology is an excellent contribution. Liberal philosophy in recent times deserves criticism for not peering very deeply into the soul of the legal subject.258 But liberal philosophy is also on to something: The moral dimension of personality is constitutive and cannot be abolished **without destroying personality entirely.**

Schlag's paranoid construction of the bureaucracy creates passivity and cynicism

Carlson 99 (David Gray, Professor of Law at the Cardozo School of Law, Yeshiva University. "Duellism in Modern American Jurisprudence" (November 1999), Columbia Law Review vol. 99, no. 7)

IV. The Bureaucracy Schlag presents a dark vision of what he calls "the bureaucracy," which crushes us and controls us. It operates on "a field of pain and death."259 It deprives us of choice, speech,260 and custom.261 As bureaucracy cannot abide great minds, legal education must suppress greatness through mind numbing repetition.262 In fact, legal thought is the bureaucracy and cannot be distinguished from it.263 If legal thought tried to buck the bureaucracy, the bureaucracy would instantly crush it.264 Schlag observes that judges have taken "oaths that require subordination of truth, understanding, and insight, to the preservation of certain bureaucratic governmental institutions and certain sacred texts."265 Legal scholarship and lawyers generally266 are the craven tools of bureaucracy, and those who practice law or scholarship simply serve to justify and strengthen the bureaucracy. "[I]f there were no discipline of American law, the liberal state would have to invent it."267 "[L]egal thinkers in effect serve as a kind of P.R. firm for the bureaucratic state."268 Legal scholarship has sold out to the bureaucracy: Insofar as the expressions of the state in the form of [statutes, etc] can be expected to endure, so can the discipline that so helpfully organizes, rationalizes, and represents these expressions as intelligent knowledge. As long as the discipline shows obeisance to the authoritative legal forms, it enjoys the backing of the state. . . . [D]isciplinary knowledge of law can be true not because it is true, but because the state makes it true.269 Scholarship produces a false "conflation between what [academics] celebrate as 'law' and the ugly bureaucratic noise that grinds daily in the [ ] courts . . . ."27? Scholarship "becomes the mode of discourse by which bureaucratic institutions and practices re-present themselves as subject to the rational ethical-moral control of autonomous individuals."271 "The United States Supreme Court and its academic groupies in the law schools have succeeded in doing what

many, only a few decades ago, would have thought impossible. They have succeeded in making Kafka look naive."272 Lacanian theory allows us to interpret the meaning of this anti-Masonic vision precisely. Schlag's bureaucracy must be seen as a "paranoid construction according to which our universe is the work of art of unknown creators."273 In Schlag's view, the bureaucracy is in control of law and language and uses it exclusively for its own purposes. The bureaucracy is therefore the Other of the Other, "a hidden subject who pulls the strings of the great Other (the symbolic order)."274 The bureaucracy, in short, is the superego (i.e., absolute knowledge of the ego),275 but rendered visible and projected outward. The superego, the ego's stern master, condemns the ego and condemns what it does. Schlag has transferred this function to the bureaucracy. As is customary,276 by describing Schlag's vision as a paranoid construction, I do not mean to suggest that Professor Schlag is mentally ill or unable to function. Paranoid construction is not in fact the illness. It is an attempt at healing what the illness is?the conflation of the domains of the symbolic, imaginary, and real.277 This conflation is what Lacan calls "psychosis." Whereas the "normal" subject is split between the three domains, the psychotic is not. He is unable to keep the domains sepa? rate.278 The symbolic domain of language begins to lose place to the real domain. The psychotic raves incoherently, and things begin to talk to him directly.279 The psychotic, "immersed in jouissance,"280 loses desire itself. Paranoia is a strategy the subject adopts to ward off breakdown. The paranoid vision holds together the symbolic order itself and thereby prevents the subject from slipping into the psychotic state in which "the concrete T loses its absolute power over the entire system of its determinations."281 This of course means--and here is the deep irony of paraonia--that bureaucracy is the very savior of romantic metaphysics. If the romantic program were ever fulfilled--if the bureaucracy were to fold up shop and let the natural side of the subject have its way-- subjectivity would soon be enveloped, smothered, and killed in the night of psychosis.282 Paranoid ambivalence toward bureaucracy (or whatever other fantasy may be substituted for it) is very commonly observed. Most recently, conservatives "organized their enjoyment" by opposing communism.283 By confronting and resisting an all-encompassing, sinister power, the subject confirms his [their] existence as that which sees and resists the power.284 As long as communism existed, conservatism could be perceived. When communism disappeared, conservatives felt "anxiety"285--a lack of purpose. Although they publicly opposed communism, they secretly regretted its disappearance. Within a short time, a new enemy was found to organize conservative jouissance--the cultural left. (On the left, a similar story could be told about the organizing function of racism and sexism, which, of course, have not yet disappeared.) These humble examples show that **the romantic yearning for wholeness is always the opposite of what it appears to be.**286 We paranoids need our enemies to organize our enjoyment. Paranoid construction is, in the end, a philosophical interpretation, even in the clinical cases.287 As Schlag has perceived, the symbolic order of law is artificial. It only exists because we insist it does. We all fear that the house of cards may come crashing down. Paradoxically, it is this very "anxiety" that shores up the symbolic. The normal person knows he [they] must keep insisting that the symbolic order exists precisely because the person knows it is a fiction.288 The paranoid, however, assigns this role to the bureaucracy (**and thereby absolves** himself **[themself] from the responsibility**). Thus, paranoid delusion allows for the maintenance of a "cynical" distance between the paranoid subject and the realm of mad psychosis.289 In truth, cynicism toward bureaucracy shows nothing but the **unconfronted depth to which the cynic is actually committed** to what ought to be abolished.

CLS Bad

CLS scholarship patronizes minorities and ignores the necessity of legal reforms for the marginalized

Hardwick 91 (John, "The Schism Between Minorities and the Critical Legal Studies Movement: Requiem for a Heavyweight?" (1991), Boston College Third World Law Journal vol. 11 no. 1)

The principal Minority Scholars participating in the dialogue are Mari Matsuda, Richard Delgado, Harlon Dalton, Robert Wil- Iiams, Andrew Haines, and Kimberle Crenshaw,95 all of whom teach law at various schools across the country. Similar to the CLS proponents, these scholars do not embody exclusively all minority scholars critiquing CLS. Rather they stand out as representative spokespersons, some of whom vividly illustrate their critiques of the Movement with intensely personal experiences concerning race and society.96 The Minority Scholars are virtually uniform in their assessment of CLS: they find all three major CLS themes-the indeterminacy argument, the rights discourse critique, and the CLS egalitarian agenda-problematic. They note first, however, several positive aspects to CLS: specifically, the Movement's "descriptive"97 and "prescriptive power."98 Professor Matsuda writes that "[the] central descriptive message [of CLS]-that legal ideals are manipulable and that law serves to legitimate existing mal distributions of wealth and power-rings true for anyone who has experienced life in non-white America."99 The mechanism of trashing in particular, one Minority Scholar writes, is irreverent and incisive enough to penetrate "the apocryphal legal texts ... and myths," and various other reifications (ideology operating in statutory or common law form) that restrict choices and dialogue. lOo As Professor Matsuda further observes, "[k]nowing when doctrine sticks, when it doesn't, and why ... are major intellectual contributions of the CLS movement."101 Thus, both the Minority Scholars and CLS recognize that political motives guide the use of legal rules that are premised upon normatively incorrect doctrine to justify predetermined outcomes. The Minority Scholars find equally noteworthy the "prescriptive power" of CLS.102 The quest for an egalitarian society without oppression, hierarchy, and maldistribution of wealth in a broad sense presents an inspiring and attractive endeavor.103 This egali- tarian ideal is quintessentially the vision of the future held by many people of color and people of limited means. The origination of these descriptive and prescriptive contributions within the prestigious and exclusionary walls of mainstream legal academia, where most CLS scholars reside, lends legitimacy to ultra-leftist jurisprudence in general. Although reluctant to agree substantively with CLS, the legal community must at least acknowledge the cogent critical theories put forth by their academic peers. Arguably, this legitimacy would not exist if the CLS Movement originated from elsewhere in the legal community, such as from practicing minority lawyers. In reference to the general legitimation of critical scholarship, the Minority Scholars acknowledge that CLS has indeed even stimulated minority scholarship: "[s]ignificantly, this [commitment to ultra-leftist jurisprudence] ... underscores the liberating impact that the CLS analysis has had on the victims of racism, propelling them to explore its barriers."lo4 For the Minority Scholars, however, the realization that the composition of CLS is predominately white and male tempers the value of these descriptive and prescriptive contributions. 105 The absence of a significant minority voice integrated in the Movement's theory signals the unattractiveness of the CLS agenda. Vividly capturing this bittersweet realization, and introducing a major criticism of CLS, one Minority Scholar writes, "Like a pack of super-termites, these scholars eat away at the trees of legal doctrine and liberal ideals, leaving sawdust in their paths. That they do it so well, and so single-mindedly, is compelling; it suggests that this is what the smartest are doing. Never mind that no one knows what to do with all the sawdust."i06 Despite CLS's presentation of insightful and critical social commentary and jurisprudence, substantively its three major themes remain troubling to Minority Scholars. First, regarding the indeterminacy of law argument, the Supreme Court's recent rulings do illustrate the validity of the CLS idea that legal rules are manipulable and legal outcomes are subject to the ideology and motivations of the politically powerful. 107 But CLS fails to address the possibility that racism is the motivation underlying legal decisions which perpetuate oppressive social and institutional conditions. IOB Through recognition of the non-objective, non-formalistic forces influencing legal outcomes (which CLS generally terms "ideology"), CLS incidentally raises the possibilitya very real and intellectually compelling possibility for people of color-that racism is one of the non-objective, non-formalistic forces. As the Minority Scholars assert, the failure of CLS scholarship to pinpoint and to integrate discussion of the problem of racism as a principle reason for inconsistent and discriminatory decisions ignores the issue over which most of the exploratory energies of minorities are spent. 109 In its very few works discussing the issue of racism, CLS, because of its Marxist roots, attributes the occurrence of discriminatory and status quo-perpetuating legal outcomes primarily to classbased and economic-based discrimination. 110 Racism receives merely tangential treatment as an incidental product of class and economic strife. In contrast to the CLS view, the Minority Scholars assert that class-based and economic-based discrimination as suffered by many minorities results from race-based discrimination, not vice versa. III The phenomenon of racism manifests itself in a variety of contexts, including public housing, employment, and education and in many ways fuels the process

whereby some unfortunate citizens change in the eyes of society from people of color to people of limited means. 1J2 The Minority Scholars posit cogent theoretical support for their belief that regardless of changes made to the institutional structure of our society, racism will persist as a social-psychological phenomenon.113 It occurs in both overt and covert forms and in both micro-and macro-legal contexts. 114 Accordingly, for these scholars, any analysis of the role of law in society necessarily must consider the law not only as a means for protecting against racism, but also as a means for perpetuating racism. CLS runs afoul of minority interests by giving merely tangential treatment to a problem that historically has threatened the stability of an entire population of African-Americans. Second, the Minority Scholars find the CLS critique of liberal rights discourse problematic. II5 In short, CLS asserts that rights and rights discourse legitimate unfair distributions of wealth and power by focusing on the individual rather than the community, providing piecemeal reform, and limiting the overall possibility of reform by circumscribing the boundaries of dialogue. 116 False consciousness, the belief in the legitimacy of the existing system of liberal rights discourse, deludes minorities into accepting and reconciling their deprived status. ll7 The Minority Scholars acknowledge the plausibility of this theory, but assert that false consciousness is not the primary mechanism with which the majority culture stymies and diffuses minority reformist activity.IIB The Minority Scholars find troubling the idea that "[through] absorption of self-defeating ideologies (rights discourse) ... " minorities participate in their own oppression. 119 They argue that it "smacks" of the very paternalism that CLS purports to disdain by suggesting that minorities are unable to comprehend fully their own plight and discern who (the majority culture) and what (frequently racism) propagates that plight. 120 Other forces, they argue, combine to paralyze minority reformist efforts and to inject a sense of hopelessness into an already daunting endeavor. Forces such as political and economic "coercion by the dominant group; exclusion from clubs, networks, information, and needed help at crucial times; [and] microaggressions .... "121 CLS focuses inappropriately on minority rather than majority culture. The Minority Scholars also take issue with the rights discourse critique corollary which holds that faithfully staying within the system and engaging in rights discourse results in inadequate piecemeal reform (the patchwork quilt metaphor).122 CLS argues that "[t]hose who control the system weaken [infrasystem] resistance by pointing to the occasional concession to, or periodic court victory of, a Black plaintiff or worker as evidence that the system is fair and just."123 This corollary contradicts the reality that incremental, within-the-system reforms have proven to be the most successful reforms. Even the American Civil War, the passage of the Thirteenth, Fourteenth and Fifteenth Amendments of the United States Constitution, the passage of the Civil Rights Acts of the 19th Century, ... the civil rights demonstrations, the urban revolutions of the 1960's, the passage of the Civil Rights Acts of the 20th Century ... demonstrate that [minorities] benefit from glacial not seismic changes in the operation of American law. 124 According to CLS, achieving reform in the area of civil rights requires endlessly litigating narrow technical issues at great cost to the plaintiff-endeavoring against the considerable inertia of the status quo. For Minority Scholars, however, the reality of these victories awarding substantive rights squarely refutes the CLS arguments that conventional liberal rights concepts and discourse are disutile for minorities. 125 Finally, the Minority Scholars attribute the problematic aspects of CLS theory to the perceived elitist,121> negative,127 and informaP28 character of the Movement. With respect to elitism and informality, the Minority Scholars argue that the trashing of rights discourse is plausible for CLS scholars because they reside in privileged positions in our society. These are positions from which theoretically disposing of rights and creating an informal community premised upon good will and sharing carries no threat of harm. 129 Implicit in this criticism is the suspicion that CLS simply does not take itself or its proposed agenda seriously. What is missing, Minority Scholars argue, is a measure of reality. 130 Turning to the issue of negativism, the Minority Scholars find that cynicism pervades the CLS Movement's writings and its agenda. 131 The process of deconstructing virtually all of society's accepted institutional and jurisprudential norms involves considerable negative energy and razes the foundations of a capitalistic and democratic society. Minority Scholars believe this process inhibits the CLS Movement's ability to generate positive enthusiasm for legal and social change. 132

Critical legal scholars' shoddy defense of the movement belies disregard for minorities

Hardwick 91 (John, "The Schism Between Minorities and the Critical Legal Studies Movement: Requiem for a Heavyweight?" (1991), Boston College Third World Law Journal vol. 11 no. 1)

B. Critical Legal Scholars' Responses to the Minority Scholar Critiques The CLS responses come principally from Alan Freeman 133 and Morton Horowitz. 134 Significantly, only two of over one hundred Critical Legal Scholars responded, despite considerable energies expended by the Minority Scholars in engaging the Critical Legal Scholars in dialogue. This small number of respondents begs the question: **"How seriously does CLS, as a movement, take the concerns of minorities?"** Perhaps many of the Critical Legal Scholars considered the two responses adequately representative of the CLS position. More likely, given that CLS members typically do not retreat from an opportunity to express their views on a controversial subject, most Critical Legal Scholars were simply not sufficiently aroused by the subject of minority concerns to respond meaningfully. Moreover, the responses fail to engage the Minority Scholars' critiques of CLS directly. Rather than give the critiques systematic and comprehensive treatment (the manner in which they were presented), the CLS responses evaded much of the substance presented by the Minority Scholars, amounting to a general defense of CLS theory. The Critical Legal Scholars defend the indeterminacy argument and the trashing of liberal rights theory, while only **subtextually incorporating the problem of racism in these defenses.** The CLS scholars also argue that they are experientially qualified to critique rights and rights discourse. Professor Freeman in particular argues that their extensive involvement in the civil rights movement in the 1960s establishes an intimate familiarity with the territory and texture of liberal rights discourse. He further argues that this intimate familiarity creates a genuinely serious, and not just intellectually curious, interest in the minority agenda. 13s

CLS represents critique without responsibility – entrenches minority tokenization, fails to decolonize law

Dhanda and Parashar 12 (Amita, Professor of Law at Nalsar University of Law, Hyderabad, and Archana, Associate Professor in Law at Macquarie University. "Decolonisation of Legal Knowledge" (April 2012), Taylor & Francis)

Most CLS scholars are explicitly or indirectly left leaning, and the implications of their critiques of law are that it falls short of being principled, general or predictable, among other things. It has been suggested that such critique seems to assume that these are achievable, and more importantly, desirable goals for legal knowledge (Fish 1993: 168-73). There is, however, another critique of CLS that they provide no alternative vision for law. 14 PM/PS critiques similarly deny the possibility of authoritative knowledge and thus of directed social change. In this regard, CLS and PM/PS legal critiques seem to have similar focus on deconstructing legal concepts, doctrine and self images. This turn to semiotics is where a lot of contemporary legal theory is, but the issue for us is whether this means that legal theorists may only 'deconstruct' an already existing legal reality, be it (the) judgments, legislation, legal doctrine or analytical concepts. Duncan Kennedy's work is an apt example of the CLS writing. In his book, A Critique of Adjudication: Fin de Siecle (1997), he elaborates how judges are denied the option of admitting the influence of ideological and non-policy factors in reaching their decisions. He calls it the practice of 'denial' of their power by the judges. The judges are in this way engaged in legitimating the status quo. The point of this meticulous deconstruction of judicial activity, however, is not so much to change the style of judicial decisions and reasoning as to encourage the recognition of the control that decision-makers actually exercise.15 We accept that such recognition of the power of decision-makers is an important step, but not enough in itself to change the practices under discussion. Peter Goodrich takes issue with Kennedy and argues that he does no more than repeat the critique of reason, that is, examine the judicial arguments for their persuasiveness and logic (Goodrich 2001: 989). He further

criticises Kennedy for not taking deconstruction seriously enough and argues that though the politics of writing is the subject matter of grammatology, while Kennedy discusses deconstruction, he `neither places it in the context of grammatology nor understands it as a Nietzschean exercise in philological disruption'(ibid.). However, even if Kennedy had done so, our concern remains that deconstruction over-emphasises the importance of academic readings of legal texts. **This emphasis on semiotics allows these thinkers to make no serious effort at exploring the alternative possibilities of what adjudication could be**. In fact, Stanley Ash's insistence that law is interpretation seems to suggest that whichever 'interpretation' finds acceptance becomes the 'law' (see Fish 1993). In a nuanced argument, Fish suggests that the doctrine of formalism does not manage to obviate the necessity of interpretation. Moreover, which interpretation is acceptable is not decided by reference to some universal moral principles, but is dependent on the rhetorical force of the argument. According to him, this `rhetoricity' is not a bad thing at all because it invokes the conventions of legal interpretation. In other works he has developed the argument that judges are not free to give any interpretation but are constrained by the conventions of the judicial process as well as other legal institutions.16 That is, whether an inter-pretation will be accepted is dependent on it conforming to the expect-ations of the relevant community rather than because it represents the truth." However, feminists have, for a long time now, argued that com-munity standards so often invoked in law are the problem for women and other disadvantaged sections of society.18 An understanding of judicial pronouncements as representing conventional beliefs leaves no room for criticising them, or for ensuring that 'progressive' inter-pretations are more acceptable than other interpretations (West 1987: 278). This PM/PS insistence on anti-foundational knowledge and against 'closure' implies that relativism can be the ally of conservatism, although it need not be (Benhabib 1996). Have we made much pro-gress through enlightenment, critical theory and PM/PS, if the point we are reaching is that knowledge can be constituted wisely or not wisely? When critical theorists take the high moral ground that it is not possible to postulate the future shape of cultural practices, that may be so (see Spann 1984). But if the implication of the critique is that one can only describe what is happening, it becomes part of the problem. Moreover, **it is contrary to the** idea that the **function of theory is to destabilise power** (see Foucault and Deleuze 1977). Proceeding with this expectation that the function of theory is to destabilise power, it is possible to ask how far contemporary critical theory has the potential to do that.° We wish to emphasise the context of choice and the cultural con-notations of making the 'right choice'. J.M. Balkin has addressed this very issue in his writings and has argued that one can be just with deconstruction (1994).20 He says that deconstruction has to be understood as a rhetorical practice that can be used for good or ill. Anyone engaging in deconstruction for a normative purpose chooses to say that there is a better way of looking at things. To the extent that deconstructive arguments are forms of rhetoric, the ethics of deconstruction also become very similar to the ethics of rhetoric. Both rhetoric and deconstruction can be used for good and bad purposes, and to that extent, each of us becomes responsible for the ways in which we use deconstruction. In this way, deconstruction can form part of the critical theory of law. Cotterrell reminds us that even despite the fact that ideology and organisational interests are closely interrelated in a formalised, seemingly closed legal system, it is nevertheless the case that the individual actors (for example, lawyers, judges, lay citizens) think and communicate (Cotterrell 1995: 107-8). Zygmunt Bauman has made a similar argument, saying that postmodern thinking takes away the certainty of universal ethics, but at the same time, it makes each individual absolutely responsible for his or her choices and actions (1993). And it is this agency of the individual that must be kept firmly in focus. The fad that ideas are thought and communicated by indi-viduals and some gain wider acceptance than others means that knowledge is forever a matter of negotiation and persuasion. The indi-viduals are, of course, not entirely free to decide how to act, what goals to pursue etc. They are constrained or at least influenced by the prevailing systems of thought, discourse and societal structures. None of this is a new insight, but our aim here is to refocus on the context for every situation and shift it away from reifying discourse. We hope to thereby make critique accountable and the critics acknowledge their role in legitimising either the status quo or change. This is an important task as we believe that contemporary critical theory has become insular from the wider concerns of those who are at the margins of society, usually without a voice, relegated to being the 'other' — in short, the disadvantaged. The markers of disadvantage vary, but include race, gender, age, ability and sexuality, among other factors. All these bases of oppression have been analysed extensively, but the advent of PM/PS legal analyses has created a peculiar situation. On the one hand, it is on the insistence of PM/PS analyses that differences be recognised that legal theory is called upon to be inclusive of those on the margins of society. At the same time, the antipathy to 'closure' of definitions and analytical concepts also results in the valorisation of 'difference'. That is, difference comes to be celebrated for its own sake, and it seems no longer imperative to ask how the celebration of difference justifies relativism of the most debilitating kind. For example, the cultural or ethnic differences maintained in the name of pluralism can, and do, create problems for gender parity.21 **These reactionary outcomes of PM/PS theory can be avoided if knowledge and responsibility are coupled together.** In legal scholarship the necessity of such a link between knowledge and responsibility must be obvious: decolonisation of knowledge entails asking what follows from conceptualising legal concepts in a certain manner or in theorising law as irrelevant to the aims of social

justice or non-oppression. For example, the violence of law analyses have shifted away the conventional focus from asking how law can regulate violence to showing how the very existence of law itself is violence (Sarat 2001). This is a very pertinent challenge to the mainstream understanding of law as the guarantor of fairness, order and even justice. However, the critiques that merely challenge the mainstream understanding but do no more, end up justifying the violence of law. For, the conclusion of such analyses that it could be no other way, itself, becomes the legitimation of all contemporary inequities perpetuated via law. We wish to challenge the determinism of this kind of analysis and to do that by invoking the PM/PS insight that all knowledge is con-stituted by discourse and practice. It is, therefore, imperative that everyone carries the responsibility of being self-reflective about their role in creating and maintaining the contemporary social structures. If they turn out to be oppressive for some, then we cannot absolve ourselves of responsibility for that either. **That is, critique must be re-sponsible critique, otherwise it is a self-serving activity of intellectuals, who can presume that they can do nothing to change the world** (Calinicos 1989: 170).

The critical legal studies movement is a bastion of whiteness – it talks about, rather than talking with, people of color

Haines 87 (Andrew W., Professor of Law, William Mitchell College of Law. "The Critical Legal Studies Movement and Racism: Useful Analytics and Guides for Social Action or an Irrelevant Modern Legal Scepticism and Solipsism?" (1987), William Mitchell Law Review, vol. 13 no. 4)

Moreover, I note the influence of Freeman, Klare, and others in the CLSM on the analyses and writings of persons of color. One discovers traces of the CLS analyses in the state- ments" I and writings" 12 of persons of color. No one really knows how many other such influences have appeared and will appear. Significantly, this discussion underscores the liberating impact that the CLS analyses have had on the victims of racism, propelling them to explore its barriers. Focusing on the limitations and negative dimensions, I note the lingering exclusionary character of the CLSM. Despite the obvious efforts of some within the CLSM to encourage wider participation by persons of color, the movement remains a largely ethnocentric, radical intellectual movement. Perhaps the genesis' 1 3 and the constant reference 1 4 to this exclusionary beginning has some bearing on the reluctance 15 of persons of color to participate fully. Outsiders may interpret this emphasis as the unspoken message about the exclusivity of this intellectual movement; they may see it as an ethnocentric radical intellectual reification of the European radical intellectual tradition. Unwittingly, **the emphasis may result in a polarity between two important groups who need each other, radical intellectuals and persons of color,** with a fair number of the latter wondering whether this movement merely signifies the self-absorption in the other group's virtuosic intellectual displays to the exclusion of truly grappling with the pressing social problems of persons of color. Perhaps other reasons can explain the exclusionary character. Persons of color may find the ideas, the methodology, and the conduct of the participants disincentives for participation. Whatever the root causes, the CLSM maintains its exclusionary character; it continues to talk to and not dialogue with (or talk about and not talk with) persons of color.

Multivalent Oppression K

AT: Perm

Starting points matter – all of our link evidence prove they foreclose multivalent analysis of oppressions, means the perm cant solve

Perm is severance - Their 1ac made exclusive/prioritizing claims about Blackness like (examples) _____

The method of the aff doesn't take into account for violence between communities - marginalization and disavowal of agency are DAs to the perm
Alcoff 2 Linda Martín, , Professor of Philosophy at Hunter College and the CUNY Graduate Center, "Latino/as, Asian-Americans and the Black-White Binary," http://www.jstor.org/discover/10.2307/25115747?uid=3739256&uid=2&uid=4&sid=21102494840991

Critics of the black/white paradigm have argued that, although all communities of color have shared the experience of political and economic disenfranchisement in the U.S., there are **significant differences** between the **causes** and the **forms** of this disenfranchisement. Bong Hwan Kim, a Korean American community leader who has worked both as the Director of the Korean Community Center of East Bay in Oakland, CA, and as Director of the Korean Youth and Community Center in Los Angeles, blames the black/white binary for **disabling relationships among people of color** and even for creating the conditions leading to the Los Angeles **civil disaster** of April 1992, in which 2,300 small Korean owned busi nesses were destroyed by mostly Latino/a and African American looters. Kim cites the xenophobia marshaled by **African American leader Danny Bakewell** before the looting occurred, and argues that the Korean American community had been and continues to be systematically rendered **incapable of responding** to such rhetoric because they are **not recognized** in the media **as a player in racial politics.**20 Elaine Kim explains: It is difficult to describe how disempowered and frustrated many Korean Americans felt during and after the sa-i-ku p'ok-dong (the April 29 "riots"). Korean Americans across the country shared the anguish and despair of the Los Angeles tongp'o (community), which everyone seemed to have abandoned - the police and fire departments, **black and white political leaders**, the Asian and Pacific American advocates who tried to dissociate themselves from us because our tragedy **disputed** their narrow and risk-free focus on **white violence against Asians** … the Korean Americans at the center of the storm were mostly voiceless and all but invisible (except when stereotyped as hysterically inarticulate, and mostly female, ruined shopkeepers .. .).21 Similar to the **Mexicans** in Texas, the Koreans have been **denied** the legal or socially recognized category of being a **politicized group** at the same time that they are made subject to **group based scapegoating.** Moreover, as this event demonstrates, the black/white paradigm of race is **incapable** of theoretically or politically addressing **racism among communities of color**, or racism, in other words, which is not all about white people. A response to this line of reasoning might be that it is white supremacy which is at the root of the conflictual relations among communities of color, and responsible for their acceptance of stereotypes manufactured by a white dominant power structure. Thus, on this reading, what occurred in Los Angeles can be reductively analyzed as caused by white supremacy. Although I do find explanatory arguments that focus on political economy often compelling, it is far too simplistic, as I think Karl Marx himself knew, to imagine cultural conflict as the mere epiphenomenon of economic forces with no life or grounding of their own. To blame only **white supremacy** for what occurred in Los Angeles would also **deny power and agency** to any groups but the dominant, which is **increasingly untrue.** We must all accept our rightful share of the blame, whatever that turns out to be in particular instances, and resist explanations that would a priori reduce that blame to zero for communities of color. Supporting the arguments of both Elaine Kim and Bong Hwan Kim, Juan Perea argues that because of the wide acceptance of the black/white paradigm, "other racialized groups like Latino/as,

Asian Americans, and Native Americans are often **marginalized** or **ignored altogether."**22 He points out that the concerns of Asian Americans and Latino/as cannot be addressed through immigration legislation because all are not immigrants, which is one of the reasons to reject the claim of some ethnic theorists that these groups will follow the path of European immigrants in gradual assimilation and economic success (the other reason to reject this claim is their racialization).23

Turn – Permutation footnotes other oppressions, repeats inclusions/exclusions

Perea 97 (Juan , Professor of Law, University of Florida College of Law, Race, Ethnicity & Nationhood: Article: The Black/White Binary Paradigm of Race: The "Normal Science" of American Racial Thought, California Law Review, October, 1997, 85 Calif. L. Rev. 1213, p. 1257-1258]

Paradigmatic descriptions and study of White racism against Blacks, with only cursory mention of "other people of color," marginalizes all people of color by grouping them, without particularity, as somehow analogous to Blacks. "Other people of color" are deemed to exist only as unexplained analogies to Blacks. Thus, **scholars encourage uncritical readers to continue to assume the paradigmatic importance of the Black/White relationship and to ignore the experiences of other Americans who also are subject to racism in profound ways**. **Critical readers are left with many important questions: Beyond the most superficial understanding of aversion to non-White skin color, in what ways is White racism against Blacks explanatory of or analogous to White racism against Latinos/as, Asian Americans, Native Americans, and others**? Given the unique historical legacy of slavery, what does a deep understanding of White-Black racism contribute to understanding rac-isms against other "Others?" **Why are "other people of color" consistently relegated to parenthetical status and near-nonexistence in treatises purporting to cover their fields comprehensively?** It is time to ask hard questions of our leading writers on race. **It is** also **time to demand better answers to these questions about inclusion, exclusion, and racial presence, than perfunctory references to "other people of color**." **In the midst of profound demographic changes, it is time to question whether the Black/White binary paradigm of race fits our highly variegated current and future population. Our "normal science" of writing on race, at odds with both history and demographic reality, needs reworking**.

AT: "No Link – we're not politics of recognition"

Aff is form of politics of recognition- demanding recognition of white or the state

Snyder 12 (Greta Fowler, Ph.D. Candidate in the Department of Politics, University of Virginia, "Multivalent Recognition: Between Fixity and Fluidity in Identity Politics", The Journal of Politics, Vol. 74, No. 1, January, jstor)

I will end by highlighting some additional contributions this article makes to the political theoretical literature on recognition. Too often, the encounter between dominant and marginalized groups has been rendered in overly simplistic ways: marginalized groups demand recognition from privileged groups; marginalized groups demand recognition from the state. In this article, I offer a broader conception of where and how the politics of recognition occurs. We are right to be skeptical of the argument that the Black Panthers were really demanding recognition of whites or of the state: the Panthers were primarily directing their message to black people and young, urban black men in particular. Yet the Panthers did seek to change the white authority structure and the (intentional) publicization of the Panthers' symbolic mediations of black identity (Ongiri 2009) made it a force in the struggle over what blackness meant to the American public. Instead of a unidirectional struggle for recognition, this examination of cultural politics shows that demands for recognition are part of a multidirectional struggle for influence over the dominant cultural order, a struggle that occurs in multiple mediums and multiple sites, at multiple levels and between multiple parties. While the cultural studies literature enhances political theory by encouraging political theorists to widen their vision of the politics of recognition thereby altering calculations about the possibilities and pitfalls of this politics, I also believe that greater interaction between the two disciplines can benefit cultural studies. Integrating the insights of cultural studies into the political theoretical framework of recognition enables us to specify the links between representation and power/resistance in a way that those engaged in the discipline of cultural studies often fail to do (see Alvarez et al. 1997, 6). In this article, I have developed and offered a normative argument for a standard of political cultural production—multivalent recognition—that is more nuanced than "positive imagery" (Alexander 2004) and less problematic than "representational correctness" (Shiappa 2008). Despite the United States' commitment to formal equality, racial identity continues to matter. Being identified as black means one is significantly more likely to face demeaning and constraining stereotypes, suspicion, distrust, poverty, illness, discrimination, and violence. The hegemony of colorblindness has effectively reconstituted white power by undercutting political claims made by marginalized groups even as the cultural representations that underwrite racial inequality continue to circulate (Bonilla-Silva 2009; Snyder 2011). In this context, a politics of multivalent recognition has an important role to play: challenging white dominance without incurring the significant costs of internal repression and exclusion.

AT: Coalitions Bad, Erase Blackness

Their ev on coalitions doesn't account for multivalent analysis that functions not to erase or subsume difference, but to highlight diversity within identities while maintaining ability to foreground Blackness

Snyder 12 (Greta Fowler, Ph.D. Candidate in the Department of Politics, University of Virginia, "Multivalent Recognition: Between Fixity and Fluidity in Identity Politics", The Journal of Politics, Vol. 74, No. 1, January, jstor)

Critics of identity politics warn that the politics of difference undermines cross-identity coalitions by emphasizing difference (Brown 1995; Gitlin 1996; Wolin 1993). Yet a politics of multivalent recognition is actually poised to "unburden groups of excessive ascribed or constructed distinctiveness" (Fraser and Honneth 2003, 47) like the universalist politics of recognition from which I distinguished it earlier. Highlighting the diversity within identities brings points of similarity across identities to light. Put otherwise, as the symbolic boundaries of identities are widened—as more and different people are accepted as "really black"—identities once seen as distinct from one another are now seen as overlapping. While a multivalent politics of recognition centers on a single collective identity, it necessarily has implications across identities. When black feminist men demand recognition, for instance, this demand has implications for the categories of black, male and female. Moreover, inasmuch as identity categories are interrelated—think, for example, of the dependence of whiteness on blackness—a multivalent politics of recognition as engaged in by one identity group will affect another. Participation by one identity group in the politics of recognition may be catalyzed by the participation of another identity group: witness the men's movement springing from the successes of feminism. But cooperation between identity groups in a politics of multivalent recognition can be secured by agreement that more capacious notions of identity can benefit members of all identity groups—including the privileged within identity groups and members of privileged identity groups.

AT: Alt Denies Blackness

Our alt is not some vague universalization or emptying of identity, but rather opens spaces for particular differences within and among Blackness

Snyder 12 (Greta Fowler, Ph.D. Candidate in the Department of Politics, University of Virginia, "Multivalent Recognition: Between Fixity and Fluidity in Identity Politics", The Journal of Politics, Vol. 74, No. 1, January, jstor)

Identity claims are integral to this negation of the negation. Yet these demands are neither for recognition of a universal identity (i.e., human, citizen) nor for recognition of a political identity that cuts across identity groups (i.e., "the left"). Unlike these forms of recognition politics—wherein actors deemphasize the identity that marks them as particular—those who seek multivalent recognition explicitly identify themselves as particular (i.e., as "black"). In other words, for those engaged in multivalent recognition, "it is not the existence of [identity] categories that is the problem, but rather the meaning and particular values attached to them" (Crenshaw 1991, 1297; also see Hancock 2007). Contesting the meaning and values attached to an identity category requires working with, within, and through a particular identity: it requires offering "racialized but not delimited" visions of identity.5 While black people engaged in a politics of multivalent recognition demand recognition as black, they demand recognition as not only black. They simultaneously demand recognition for other salient aspects of their identity—demanding recognition as black and…. This "and" can draw attention to the membership of black individuals other categorical identity groups (black and woman, black and gay, black and poor, etc.)6 But it also strategically links blackness with traits, values, abilities, talents, and predilections with which the collective identity has not previously been predominantly associated. In a politics of multivalent recognition, black feminist lower-class men, black gay Jews, and rural black working-class single mothers demand recognition of their embodiments of and claim to blackness, and in turn strategically de-essentialize blackness. They demand to be recognized as "black" despite the fact that they contradict stereotypes of/about blackness. If a politics of monovalent recognition aims for fixity and thus transparency (Markell 2003) in identity, then a politics of multivalent recognition is about unfixing an identity.7

Real visions of blackness come from multivalent views- not only demanding one category but define themselves

Snyder 12 (Greta Fowler, Ph.D. Candidate in the Department of Politics, University of Virginia, "Multivalent Recognition: Between Fixity and Fluidity in Identity Politics", The Journal of Politics, Vol. 74, No. 1, January, jstor)

Some might say that such a politics "dilutes" black identity. But those who would do well to remember that although strong visions of "real blackness" do have significant effects, they do not have an anchor in a metaphysical reality. The politics of recognition cannot achieve a "mimetic correspondence with the 'real'" in either its monovalent or in its multivalent incarnations, for, as Cornel West notes, no one has "unmediated access to the 'real Black community'" (1993, 18). Seeking to broaden public perception of an identity is not to betray it, but to recognize the diversity that was always already inherent in it. Alexander has pointed to the diversity that bubbles under the surface of anthologies that aim to present the black arts and politics of a time as unified. And as Madhavi Sunder (2001) argues, this diversity is

increasingly breaking the surface: individuals engaged in "cultural dissent" are demanding not only membership within a particular category, but the right to define it on their own terms.

AT: Alt = Vacating Identity

Alt is not deconstruction of identity

Snyder 12 (Greta Fowler, Ph.D. Candidate in the Department of Politics, University of Virginia, "Multivalent Recognition: Between Fixity and Fluidity in Identity Politics", The Journal of Politics, Vol. 74, No. 1, January, jstor)

The unfixing that a politics of multivalent recognition aims to accomplish, however, should be distinguished from the deconstruction that some anti-identity theorists hope to achieve. Unlike an anti-identity politics such as that recommended by Monique Wittig (1985), the ultimate purpose of a politics of multivalent recognition is not to do away with those collective identities that have been subject to oppression. Whereas Wittig envisions a world without identity (more specifically, gender) distinctions, those who engage in a politics of multivalent recognition aim for a world in which identity categories are more capacious. Highlighting the "multivalence" of the identity category—its multiple meanings, the diversity within—stretches its symbolic boundaries. Disparate individuals' demands for recognition of their claim to blackness prompt group members and members of other identity groups to broaden their understanding of black identity. In doing so, they complicate the distinctions drawn between black and white, distinctions that help reproduce inequality. A politics of multivalent recognition operates on the assumption that we need not do away with identity categories to break down hierarchical symbolic distinctions and transform identity relations. Unfixing is distinct from deconstruction that goes "all the way down." In fact, there are good reasons for sustaining particular identities as actors engaged in a politics of multivalent recognition seek to do. Certainly, the concept of race and racial identity has justified the unjust treatment of black Americans. Yet while implicated in oppression, categorical distinctions like "black" and "white" have a critical role to play in addressing oppression, enabling individuals to talk about racial injustice and to develop a sense of "we" (Crenshaw 1991, 1297). Second, even those who do not understand racial distinctions as natural may view them as inextricable (Young 1990). A politics of multivalent recognition is premised on the assumption that identities are resignifiable, but not infinitely reconstructable. Finally and perhaps most importantly, these identities are not simply sites of oppression but sources of pride and meaning (Bickford 1997; Kompridis 2007, 286). Monovalent movements insist that black Americans are talented cultural creators; multivalent movements reinforce this point, while suggesting that multiple and disparate black identities spring from the cultures created by black Americans. In light of the inherent and strategic importance of black identity, not to mention its indelibility, those engaged in a politics of multivalent recognition are not only concerned with demonstrating the contingency of identity as are those engaged in a strategy like parodic subversion (Butler 1999). A politics of multivalent recognition is equally concerned with the revaluation of an identity category as a whole. Elizabeth Alexander, for example, refrains from presenting certain poems in certain spaces due to her sense that the poems would reinforce problematic stereotypes. Those engaged in a politics of multivalent recognition seek to change blackness' valence by changing its connotative field of reference. To delegitimize a symbolic system that marginalizes black people, they must bring greater visibility to specific ways of realizing black identity.

The idea of multivalent thinking forces us to challenge assumptions of identity

Snyder 12 (Greta Fowler, Ph.D. Candidate in the Department of Politics, University of Virginia, "Multivalent Recognition: Between Fixity and Fluidity in Identity Politics", The Journal of Politics, Vol. 74, No. 1, January, jstor)

As I hope this argument demonstrates, <u>even those actors who agree that demands for recognition are simply a means to the end of equality can deploy these demands in different ways, with different effects: even if essentialism is deployed strategically, it invites a monovalent reading of identity and the problems associated with it. The distinction between multivalent and monovalent recognition offers a more nuanced picture of what Iris Young calls the "politics of positional difference" (2007), thereby enabling political theorists</u> and actors <u>to specify and attend to the range of problems facing those who engage in the politics of recognition.</u> Additionally, <u>the idea of a politics of multivalent recognition forces us to rethink our assumptions about recognition politics and identity politics.</u> While presenting the politics of recognition as a kind of identity politics, I have resisted Nancy Fraser's conclusion that identity politics reifies identities. <u>The concept of multivalent recognition not only distinguishes the politics of recognition from the politics of authenticity and the politics of essentialism</u>, it presents recognition as a means to address their problematic consequences. On the other hand, I present <u>multivalent recognition as distinct from deconstructive anti-identity approaches. In its multivalent form, the politics of recognition has the potential to transform identity relations while maintaining identities.</u>

AT Black white Binary Good/Necessary

Binary structure is wrong – Look through a lens of multivalent oppression Westmoreland 13'

Peter Westmoreland Doctrine Race political and social professor at the university of Miami Area of specialization in Continental Early Modern Rousseau "Racism in a Black White Binary: On the Reaction to Trayvon Martin's Death"

Can this outcome be right? Does racism require a binary structure? Let us consider three proposals. First, we may make choices to reject the binary (as Perea and Alcoff do). We can attack it in at least two ways philosophically. First, we can recognize that Foucault's argument is subject to rebuttal. One approach would question whether the texts he examines are representative of the dominant race paradigm of the time. In the philosophical discourse on the formation of the race concept, for example, we have influential thinkers such as Kant, Hegel, and de Gobineau who reject binary thinking. Rousseau, on whom Foucault relies, models the people as sovereign-subjects in an explicit attempt to subvert binaries in the state's structure. We could perhaps write a counter-history of the relationship between race and the state that eschews the binary; possibly it shows up but does not have the influence Foucault suggests. Another version of the first proposal would emphasize the black-white binary's arbitrariness and contingency. Once we diagnose the paradigm, distinguishing races outside its terms according to their own voices and concerns can mitigate the binary's force. Similarly, I would note that the binary structure is a contingent feature of our race discourse's history, even on Foucault's scheme, and we can move against binary race thinking through practical advancement of the concerns of races outside the terms of the binary. This response assumes that the binary, while powerful, is not incontrovertible and can be separated from the "us versus them" war structure. Let us now pursue a second proposal: we accept the binary structure of racism. We have seen there are positions, evidence, and arguments indicating that race discourse has a binary paradigm and that this has been the case since the origins of modern racism. If race discourse is binary and we act to destroy the binary, then, we may not be opening the door to identifying new forms of racism. Instead, we destroy the historical meaning of race altogether with the result that all oppression is detached from racialization (for better or worse). Conversely, we may rigidly circumscribe the boundaries of racism to one binary structure or another, which allows us to think some oppression outside of racialization. Either way, we may then move beyond thinking oppression predominately in racial terms. We may ask whether some forms of oppression, although taken as forms of racism, may be better addressed through nonracial discourses. (I have already indicated that nativism may not fit the concepts of racial oppression.)19 Now, though, we may uncover a new conceptual tension. The first proposal lets race remain a hegemonic concern (as it is for Perea and Alcoff), which means that forms of oppression that do not suit the race model of discourse may be covered over. The second proposal protects nonracial oppressions from racialization, but it deemphasizes race discourse and the binary so that actually racist oppression may be overlooked. I do not believe there is a resolution to this tension. However, I also do not believe that we need one. Thus, a third proposal: What we need to do is recognize that there is a tension. Rather than empowering the reduction of forms of oppression to racisms or rejecting the binary or tightly limiting its scope, we realize that there are many forms of oppression. Some will suit racial analyses completely or partly; others will not. We must actively reflect on sites and instances of oppression to determine which modes of oppression are in operation and provide the best resources we can manage. We have many possible modes of analysis for the Trayvon Martin case: anti-black racism, racism between minorities, cultural insensitivity, Stand Your Ground laws, the culture of fear, the culture of policing, the voicelessness of

children, and so on. All of these topics and others deserve our consideration if we are truly to generate justice for Trayvon Martin and other victims. <u>Some concerns may merit racialization and others may not. Reflection on such diverse concerns is not easy or failsafe, but at the least it means that we may take advantage of all available resources to identify effectively victims, modes of oppression, and options for relief</u>. <u>The third proposal is a significant advance beyond previous positions. If pursued rigorously it has the potential to delimit what counts as racial and nonracial oppression so that we may recognize and pursue proper responses</u>. <u>The racism pluralist's move to expand the concept of racism does not give nonracial oppressions focused consideration, which leaves open the problem of giving race hegemonic status; that is, pluralist analyses raise the fear that all forms of oppression may be coded as racial</u>. At least, <u>the third proposal requires us to consider strategically where race begins and ends so that we do not overlook or crush into the discourse of race nonracial oppression</u>. What proposal three does, in effect, is <u>open the air for the voices of victims to speak and be heard with more clarity</u>, which I believe is the intent of racism pluralists. What proposal three does not do is concretely demarcate racial and nonracial forms of oppression, which is both a strength and a weakness. <u>Salient details will vary case to case. Firm determinations may not be possible in many cases, but recognizing that difficulty is itself something that the third proposal helps to enable by calling our attention to the multivalent nature of oppression.</u> As thinkers have recognized that race discourse in the United States is pluralistic, the black-white binary paradigm has become both untenable and common. By taking the binary seriously, the structure of race and racism will fundamentally change. What comes is uncertain, and may not be for the better, but <u>if we are sensitive to both racial and nonracial considerations we have a chance to attend to once hidden modes of victimization</u>. We owe this to all victims, including Trayvon Martin.20

Black/white binary fails- 4 reasons
Nakagawa 13'

Scot nakagawa, 9-4-2013,Nakagawa is a Lifelong political activist, community organizer, organization builder."Race Beyond Black and White: Four Reasons to Move Beyond the Racial Binary,"

With that in mind, here are four reasons to move beyond the black-white racial binary: <u>1. Ignorance of our multi-racial history is the enemy of civil rights.</u> Here's an example. In the 1990s<u>, the evangelical right rose to power in part through exploiting widespread homophobia. But, while they appeared to be narrowly targeting LGBT people, they were using those attacks on LGBT rights to simultaneously talk about civil rights more generally.</u> They did so by contrasting LGBT people with blacks who they said have a "legitimate" claim to civil rights because, they argued, blacks were able to pass a litmus test of suffering and morality without which civil rights cannot be conferred. Therefore, civil rights are special rights. The success of that argument relied upon the widespread belief among what we nowadays refer to as "low-information voters," that civil rights are black rights, not American rights that have historically been withheld from black people. Right wingers exploited this confusion and doubled down on it, inciting anti-black racism by claiming these (black) rights were being taken too far by a civil rights lobby LGBT people wanted a piece of because it had captured control of Congress. <u>2. We are all profiled differently by race, but all of the different ways in which we are profiled serve the same racial hierarchy</u>. For instance, in the 1960s, just as the civil rights movement was cresting <u>and black urban uprisings were dominating the news cycle, news stories appeared profiling Asian Americans as a model minority. That profile, which privileged Asians as a super-minority that was "out-whiting the whites," claimed that Asians in the U.S. had managed to climb to success not through protest nor by way of "riots," but</u>

through hard work and quiet cooperation with the powers that be. This story of Asian success begged the question, if Asian Americans can do it, why can't black people? The media provided the answer: blacks aren't succeeding because they're a "problem minority." Ever since, the model minority myth has been used as a lever of racial injustice on the fulcrum of anti-black racism. 3. Race is central to the struggle over citizenship in America. The contest over voting rights, for instance, is a fight about citizenship rights, who has them, and who gets to decide in the matter just as much as is the question of the right to citizenship of new immigrants, including those without documents. At the center of these fights is a struggle over nationality, power, and control that revolves around race. We will never resolve these questions until we are able to grapple broadly with the issue of race and citizenship as regards all people of color. Until then, we are all just fighting different battles in the same war, but without the common cause necessary to build a winning coalition. 4. In order to achieve racial equity, we need to complicate our understanding of race. The black-white racial binary is as much a part of the fiction of race in America as dubious science about brain size and intelligence. The truth may not, by itself, set us free, but it might at least get us headed in that direction. As we head toward a "majority-minority" future, we'd do well to acknowledge the complexity of the story of race in America. Just ignoring it might be good for ratings, but it won't make it go away.

AT: Binary is Correct

7 reasons wrong with the white/black binary
Alcoff 6'

Linda Alcoff a philosopher at the City University of New York who specializes in epistemology, feminism, race theory and existentialism. "Visible identities Race Gender And the Self" 2006 Oxford Press

Just as the protection of the∂ right of property advantages the propertied, and the protection of free speech∂ ''increases the influence of those who are articulate and can afford microphones,∂ TV air time, and so on ... the Equal Protection Clause produces a social good,∂ namely equality, for those falling under its coverage—blacks and whites. These it∂ genuinely helps—at least on occasion. But it leaves everyone else unprotected∂ (1998, 370–71).∂ Put in more general terms, these arguments can be summarized as follows:∂ 1) The black/white paradigm has disempowered various racial and ethnic∂ groups from being able to define their own identity, to mark their difference and∂ specificity beyond what could be captured on this limited map. Instead of naming∂ and describing our own identity and social circumstance, we have had descriptions∂ foisted on us from outside.∂ 2) Asian Americans and Latinos (among others) have historically been ignored∂ or marginalized in the public discourse in the United States on race and racism.∂ This is a problem for two reasons, first, because it is simply unfair to be excluded∂ from what concerns one, and second, because it has considerably weakened the∂ analysis of race and racism in the mainstream discussions. To explain the social∂ situation of Asian Americans or Latinos simply in terms of their de jure and de∂ facto treatment as nonwhites is to describe our condition only on the most shallow∂ terms. We must be included in the discussions so that a more adequate account∂ can be developed.∂ 3) By eliminating specificities within the large ''black'' or nonwhite group, the∂ black/white binary has undercut the possibility of developing appropriate and effective∂ legal and political solutions for the variable forms that racial oppression can∂ take. A broad united movement for civil rights does not require that we ignore the∂ specific circumstances of different racial or ethnic identities, nor does it mandate∂ that only the similarities can figure into the formulation of protective legislation. I∂ will discuss an example of this problem, one that concerns the application of∂ affirmative action in higher education, at the end of this chapter.∂ 4) Eliminating specificities within the large ''black'' or nonwhite group also∂ makes it difficult to understand or address the real conflicts and differences within∂ this amalgam of peoples. The black/white paradigm proposes to understand all∂ conflicts between communities of color through antiblack racism and white supremacy,∂ when the reality is more complex.∂ 5) For all these reasons, the black/white paradigm seriously undermines the∂ possibility of achieving coalitions. It is obvious that keeping us in conflict with each∂ other and not in coalition is in the interests of the current power structure.∂ I would add to these arguments the following two.∂ 6) The black/white binary and the constant invocation of all race discourses∂ and conflicts as between blacks and whites has produced an imaginary of race in∂ this country in which a very large white majority confronts a relatively small black∂ Latinos, Asian Americans, and the Black-White Binary 255∂ minority. This imagery has the effect of reenforcing the sense of inevitability to∂ white domination.∂ This is not the reality of racial percentages in almost any major urban center∂ in the country today. Nonwhites outnumber whites in New York, Miami, Chicago,∂ Atlanta, and Los Angeles, and come very close in San Francisco, Dallas, and∂ Washington, D.C. There is thus a real potential for a major shift in political power,∂ but there are two main challenges before this shift can take place. The first is the∂ ability of nonwhites to unite and to also make common cause with progressive antiracist∂ whites. The second is the Electoral College. The original intent of the∂ Electoral College was to protect small states and also to create a buffer between∂ the hoi polloi and the government, but the current effect of the Electoral College,∂ given these changed demographics, has the added ''advantage'' of disenfranchising∂ the occupants of cities generally and people of color specifically from influencing∂ national electoral outcomes. The fact is that if the popular vote determined∂ elections, the cities would have the determining numbers of votes, since this is∂ where the majority of U.S. citizens now live and where the trend of movement is∂ toward. The numbers and concentrations of people of color in the United States∂ means that we are quickly moving past the politics of recognition, in which people of∂ color must clamor for recognition from the all-powerful majority, and reaching the∂ politics of power negotiation, in which we can negotiate from a position of power∂ rather than having to rely exclusively on moral appeals. The white majority will not∂ maintain its near hegemonic

political control as new configurations of alliances∂ develop.4 Moreover, the white majority is far from monolithic, splintering most∂ notably along gender and class lines: the gender gap has widened in electoral∂ politics along with the gap between union and nonunion households, with droves∂ of white women and white union members voting the same as the majority of∂ people of color.∂ Thus, thinking of race only in terms of black and white produces a sense of∂ inevitability to white domination and thus a sense of fatalism, even though the facts∂ call for the opposite. I believe this issue of imagery is very significant: it affects∂ people's choices, voting (or nonvoting) practices, and the level of energy they are∂ willing to devote to political activism. By opening up the binary imagery to rainbow∂ images and the like, as Jesse Jackson did with great effect in his presidential∂ campaign, we can more accurately and thus helpfully present the growing and∂ future conditions within which political action and contestations will occur. This∂ is in everyone's interests (or at least, the majority's).∂ 7) The next argument that I would make in regard to the black/white binary is∂ that it mistakenly configures race imagistically as exclusively having to do with∂ color, as if color alone determines racial identity and is the sole object of racism.∂ Equating race with color makes it seem as if all the races other than black and∂ white must be lined up between them since they clearly represent the polar extremes.∂ There is certainly a racist continuum of color operating in this and in∂ many countries, but my point is that this continuum is not the only axis by which∂ racism operates.∂ Some have taken the horrific hierarchy of adoption preferences in the United∂ States, that runs basically from white to Asian to Latino to black, as representative∂ 256 Latino/a Particularity∂ of a continuum of color. Related to this idea is the claim that Asian Americans and∂ Latinos are closer to white and will eventually ''become'' white. Let me address this∂ latter idea first. The claim that Asian Americans and Latinos will become white is∂ first of all premised on the assumption that we have two choices of racialized∂ identities: white and black. The assumption presupposed is then that if a group is not∂ economically and politically located at or near the bottom of the society, which the∂ black/white paradigm associates exclusively with ''blackness,'' then such a group is∂ assumed to have achieved ''whiteness.'' But class does not perfectly map onto race:∂ the poor come in all colors. Moreover, there is significant racial and class variety∂ within each of these large amalgamated groups with highly variant median incomes.∂

Binary is wrong-doesn't account for any other races other than black and white Alcoff 6'

Linda Alcoff a philosopher at the City University of New York who specializes in epistemology, feminism, race theory and existentialism. "Visible identities Race Gender And the Self" 2006 Oxford Press

Wanting to avoid this outcome, however unlikely it∂ Latinos, Asian Americans, and the Black-White Binary 249∂ might be, the court decided to embellish on the arguments made in appeal. Justice∂ Charles J. Murray interpreted legal precedent to argue that the terms ''black'' and∂ ''white'' are oppositional terms, from which he concluded that black must mean∂ nonwhite and white must exclude all people of color. Thus, by the law of binary∂ logic, Chinese Americans, after having become Native American, then also became∂ black.∂ Of the many questions that one might like to go back and pose to Charles∂ Murray, perhaps the most obvious is the following: if black and white are oppositional∂ terms, then, instead of black meaning nonwhite, doesn't it just as logically∂ follow that white could mean nonblack, in which case all people of color except∂ African Americans would be white? This conclusion is no more or less fallacious or∂ absurd than Murray's conclusion that black means nonwhite. That such an idea∂ was, apparently, beyond the imagination of the court at that time begins to reveal∂ the strategy at work here. Defining whites as only those without one drop of ''other''∂ blood has been a tool to maintain a clear and distinct border around white identity.∂ On the other hand, the borders of other identities—their distinctiveness from each∂ other—are not important for the law to define and maintain. The

controlling termð here is not race but whiteness. To be black is to be nonwhite, but this equation isð not reversible if one is using the usual meaning of ''black'' today, since for Murrayð ''black'' includes virtually every Asian American, Latino, Native American, andð mixed race person as well as all those of African origin. Although this case beganð with a strategy to link the Chinese to American Indians, it ends in a ruling thatð prescribes a black/white binary. The ruling essentially allowed the state to makeð one all-purpose argument against the civil and political rights of nonwhites, thusð increasing the efficiency with which it could maintain discrimination.ð Asian Americans and Latinos have been tossed back and forth across thisð black/white binary for 150 years (see Haney Loʹpez 1996; Lee 1993; G. Martinezð 1998; Okihiro 1994; Omi and Winant 1986; C. Rodrıʹguez, 2000). To continue withð the example of Chinese Americans, in 1860 Chinese Americans were classified asð white in Louisiana. By 1870 they were classified as Chinese. But in 1900, theð children of Chinese and non-Chinese parents were reclassified as either white orð black. Other states had similarly convoluted histories of classification. In 1927 theð U.S. Supreme Court ended this confusion and defined the Chinese as nonwhite,ð thus more firmly subjecting them to all the segregationist and Jim Crow legislationð then in effect. Similar stories of variable racial classification can be told aboutð Mexicans in Texas and in New Mexico, Japanese in California, and other groups.ð Needless to say, the variable classifications tell a story of strategic reasoning inð which arguments for legal discriminations are deployed against people of color byð whatever opportune classification presents itself in the context.ð Contrary to what one might imagine, it has not always or even generally beenð to the advantage of Asian Americans and Latinos to be legally classified as white.ð An illustration of this is found in another important legal case decided by the U.S.ð Supreme Court in 1954, just two weeks before they issued the decision in Brown vs.ð Board of Education. The case of Hernandez v. Texas involved a Mexican Americanð man convicted of murder by an all-white jury and sentenced to life imprisonmentð (G. Martinez 1998; Suro 1999). His lawyer appealed the conviction by arguing thatð 250 Latino/a Particularityð the absence of Mexican Americans on the jury was discriminatory, making referenceð to the famous Scottsboro case in which the U.S. Supreme Court overturnedð (after many years) the conviction of nine African American men on the grounds ofð an absence of African Americans from the jury. But in the Hernandez case, theð Texas Supreme Court ruled that Mexicans were white people of Spanish descent,ð and therefore that there was no discrimination in the all-white makeup of the jury.ð Forty years later, Hernandez's lawyer, James DeAnda, recounted how he made hisð argument appealing this ruling:ð Right there in the Jackson County Courthouse, where no Hispanic had served onð any kind of a jury in living memory because Mexicans were white and so it wasð okay to bring them before all-white juries, they had two men's rooms. One had að nice sign that just said MEN on it. The other had a sign on it that said COLOREDð MEN and below that was a hand-scrawled sign that said HOMBRESð AQUI [men here]. In that jury pool, Mexicans may have been white, but when itð came to nature's functions, they were not. (Suro 1999, 85)ð In fact, in Texas not only were Mexicans subject to Jim Crow in public facilitiesð from restaurants to bathrooms, they were also excluded from business and communityð groups, and children of Mexican descent were required to attend a segregatedð school for the first four grades, whether they spoke fluent English or not.ð Thus, when they were classified as nonwhite, Latinos were overtly denied certainð civil rights; when they were classified as white, the de facto denial of their civil rightsð could not be appealed.ð Although the U.S. Supreme Court overturned the Texas court's decision inð the Hernandez case, its final decision indicated a perplexity regarding Mexicanð American identity. The court did not want to classify Mexicans as black, and itð didn't want to alter the legal classification of Mexicans as white; since these wereð the only racial terms the justices thought were available, they ended up explainingð the discrimination Mexicans

faced as based on ''other differences,'' left undefined.ð Thus, oddly, the court upheld that there was racial discrimination against Mexicans,ð but it denied that Mexicans constituted a race (Haney Lo´pez 1998, 182–83).ð **One clear lesson to be learned from this legal history is that race is a constructionð that is variable enough to be stretched opportunistically as the need arisesð in order to maintain and expand discrimination.** Racism, in other words, moldsð racial categories to fit its design. And the legal history also shows that white supremacyð has moved Latinos and Asian Americans around the classification schemað for its own benefit. Nonetheless, one might take these legal cases to indicate thatð discrimination against African Americans was the paradigm case that U.S. courtsð stretched when they could to justify discrimination against other nonwhites, andð thus to provide support for the black/white paradigm of race.ð Modeling Argumentsð The distinguished historian John Hope Franklin made such an argument at the firstð official meeting of the Race Relations Commission, which was convened by formerð U.S. President Bill Clinton to advance his initiative for a national dialogue on race.ð Latinos, Asian Americans, and the Black-White Binary 251ð Franklin maintained that ''racism in the black/white sphere'' developed first inð North America when slavery was introduced in the Jamestown colony in 1619 andð has served as a model for the treatment of race in the United States. Attorney Angelað Oh, also serving on the commission, argued against Franklin on this point, usingð the example of the uprising of April 29, 1992, in Los Angeles to show that the specificð history and racist treatment of Asian Americans needs to be accounted for in orderð to understand the complex varieties of racism that sparked that event. ''I just want toð make sure we go beyond the black-white paradigm ... because the world is aboutð much more than that,'' she said (see Wu 2002, 32–35). Frank Wu, commenting onð this exchange, tries diplomatically to unite both Oh and Franklin's points. Heð affirms that ''African Americans bear the greatest burden of racial discrimination''ð but adds that the Los Angeles uprising needs to be understood in relation both toð African American history as well as Korean American history (and, I would add,ð Latino history, since Latinos were the largest number of persons arrested). Wuð advocates the following commonsense approach:ð Whatever any of us concludes about race relations, we should start by including allð of us. ... Our leaders should speak to all individuals, about every group, and forð the country as a whole. A unified theory of race, race relations, and racial tensionsð must have whites, African Americans, and all the rest, and even within groupsð must include Arab Americans, Jewish Americans, white ethnicities, and so forth.ð Our theory is an inadequate account otherwise. (Wu 2002, 36)ð The question Wu does not address directly is whether the continued acceptance ofð the black/white paradigm, what Oh is contesting and Franklin is defending, willð allow such a comprehensive account.ð To say that racism has been modeled on slavery might or might not entail a black/ð white binary, depending on how much is presumed in the concept of ''modeling.'' Butð the reality of race and racism in the North American continent has been moreð complicated than black/white since the initial conquest of native peoples by Europeanð Americans. Slavery was itself an idea put forward by Columbus when he suggestedð that the indigenous population could be enslaved in order to bring profits to theð Spanish crown because the amount of gold and silver here was initially found wanting.ð The concept of race itself was inspired in large measure without a doubt by theð ''discovery'' of native peoples and the subsequent debates among learned Europeansð about their nature, their humanity, and their rights. Later on, emerging legal practiceð developed typologies of rights based on typologies of peoples, such as the exclusionaryð laws concerning testimony in court, as mentioned earlier, which grouped ''blacks,ð mulattoes, and Native Americans.'' The Chinese laborers brought to the West in theð 1800s were subjected to very specific rulings restricting their rights not only to vote orð own property but even to marry other Chinese. This latter ruling outlasted slavery andð was

justified by invoking images of Asian overpopulation, another quite specific racist ideology. To control their reproduction, Chinese women were allowed to come as prostitutes but not as wives, a restriction no other group faced. The Mexicans defeated in the Mexican-American War were portrayed as cruel and cowardly barbarians, and although the Treaty of Guadalupe-Hidalgo ratified in 1848 guaranteed for the Mexicans who stayed in the United States full rights of 252 Latino/a Particularity citizenship, like the treaties with Native Americans neither local governments nor the federal courts upheld the Mexicans' right to vote or respected the land deeds they held before the treaty (see Acun˜a 1988; Shorris 1992). By the time of the Spanish-American War of 1898 the image of barbarism used against Mexicans was consistently attributed to a Latin Catholic heritage and expanded for use throughout Latin America and the Caribbean, thus subsequently affecting the immigrant populations coming from these areas as well as justifying U.S. claims of hegemony in the region (Mignolo 2000). The so-called Zoot Suit riots in Los Angeles in 1943 targeted Mexican Americans and their ethnically specific style of dress. The attempts made to geographically sequester and also to forcibly assimilate Native American groups were not experienced by any other group, and had their own ideological justifications that combined contradictory images of the Great Chain of Being with the romanticized Noble Savage.

AT: Black/White IS Origin

Even if their history lesson is correct, white supremacy is not a zero sum game, their focus makes tackling other aspects of racism impossible

Perea 97 (Juan, Professor of Law, University of Florida College of Law, RACE, ETHNICITY & NATIONHOOD: ARTICLE: The Black/White Binary Paradigm of Race: The "Normal Science" of American Racial Thought, California Law Review, October, 1997, 85 Calif. L. Rev. 1213, p. 1254-1255]

One could object to my conclusions **on the grounds that White racism against Blacks has operated for a much longer time than racism against Latinos/as or Asians, and therefore the former problem needs to be studied and remedied first**. English enslavement of Blacks can be traced to the early 1600s, well before the nationhood of the United States. n207 Encounters between Anglo and Mexican people did not begin on a large scale until the 1830s, as Whites moved west into Texas and other parts of the Southwest that, at the time, were parts of Mexico. n208 To a large extent, the Black/White binary paradigm of race has developed precisely because of the historical priority in time of White racism against Blacks and because of the nature of the exploitation that slavery caused. **The question is whether the earlier deployment of White racism against Blacks in the United States justifies the binary approach in race scholarship and thinking today**. **I cannot see scholarly efforts to understand and remedy White racism in all its forms as a "zero-sum game," in which efforts to understand other forms of White racism somehow take away from efforts to understand and remedy White racism against Blacks. My goal** is not to take away anything from the study of White racism against Blacks. Rather, it **is to identify** some **limitations of this study** and to add to these studies the study of White racism against other racialized American groups. **Stated simply, we must study and understand White racism in all its forms**. Indeed, here lie some of the possibilities for coalition and for solving some of the problems that resist solution under our current scholarship. n209

AT: Panthers not Monovalent

Panthers are monovalent-Panthers reduced to a single dominant essence

Snyder 12 (Greta Fowler, Ph.D. Candidate in the Department of Politics, University of Virginia, "Multivalent Recognition: Between Fixity and Fluidity in Identity Politics", The Journal of Politics, Vol. 74, No. 1, January, jstor)

Critics may say that the vision of the Panthers, US, and BAM I offered above is reductive. In response, I want to revisit the Panthers. While <u>Panther leaders are</u> in part <u>responsible for</u> promulgating <u>the monovalent identity widely associated with them,</u> I agree that this characterization does not do justice to a dynamic organization. <u>The popularity of this characterization points to structural obstacles to the politics of multivalent recognition</u>. In contrast to the group's image as hypersexualized, hypermasculine aggressive revolutionaries, women constituted a significant portion of the Panthers' membership. Sacrifices by women like Ericka Huggins and Angela Davis prompted a transformation in the gender politics of the Panthers (Matthews 1998, 282); a woman—Elaine Brown—ultimately headed the Panthers. <u>The sexual politics of the Panthers also evolved over time.</u> In August 1970, Huey P. Newton preached solidarity with the Gay Liberation Movement, saying "the term 'faggot'…should be deleted from our vocabulary, and especially we should not attach names normally designed for homosexuals to men who are enemies of the people." (Newton 1970). Nor was the agenda of the Party static. Although originally styled as a paramilitary organization—the Black Panther Party for Self-Defense—over time the group became increasingly concentrated on its "survival programs." <u>Survival programs included free breakfast for children</u>, free health clinics, transport to visit relatives in prison, political education programs, and more. Unlike paramilitary operations, the types of activities involved in the survival programs have traditionally been coded as feminine. <u>Few if any would agree that the Black Panther Party achieved a feminist or queer ideal. Even when the official rhetoric of the party cut across the image of black identity initially projected by leaders, the diversity within black identity continued to be glossed over—in his 1970 speech concerning the women and gay liberation movements, for instance, Newton presented woman, gay and black as separate rather than overlapping identities. Yet at the same time, the Party was certainly more complicated—and presented a more complicated image of black identity</u>—than was widely projected. <u>In a content analysis of 163 articles about the Panthers found in major national magazines and newspapers over an 11- year time span, Edward Morgan found that the "the Panthers are reduced to a single, dominant essence" (2006, 331). The mainstream media—including some 300 journalist cooperating with COINTELPRO efforts (Morgan 2006, 329–30)—broadcast images of "brash, gun-toting, profanity-spewing blacks" (Ogbar 2004, 67). <u>By freezing the Black Panthers at their origin, the mainstream media were deeply complicit in promoting the monovalent conception of identity initially projected by the Panthers. The media itself is not monolithic and certainly alternative stories about the Panthers were told</u> through outlets like The Black Panther (the Party's community news service). Despite this, it remains the case that those engaged in the politics of multivalent recognition are likely to face significant challenges <u>not only in establishing support for and in strategizing how to promote a multivalent view of identity, but also in the dissemination process. That the mainstream media would present a predominantly monovalent view of black identity rather than a multivalent one should not be surprising</u>. Many media formats privilege the simple and the sensational over the complex and challenging. Moreover, gatekeepers and decision makers in the culture industry are often members of the hegemonic racial (gender, sexual) identity group with vested interests in maintaining their power. <u>The example of the Black Panthers is a potent reminder that the success of a</u>

politics of multivalent recognition depends not only on political actors' intentions, but also on media outlets. In other words, while cultural, this politics is not without its structural prerequisites.

AT: Snyder Only about Race

Snyder talks about recognition and feminist recognition not only about race

Snyder 12 (Greta Fowler, Ph.D. Candidate in the Department of Politics, University of Virginia, "Multivalent Recognition: Between Fixity and Fluidity in Identity Politics", The Journal of Politics, Vol. 74, No. 1, January, jstor)

To conclude, I want to clarify several aspects of my argument and offer some final thoughts about how it contributes to the literature on recognition and identity politics. First, though I have focused on one identity group in elaborating the distinction between monovalent and multivalent recognition politics, I believe it to be useful in the interpretation and assessment of the cultural identity politics of other groups. Shane Phelan (1989), for instance, offers a detailed description and trenchant critique of a monovalent lesbian feminist recognition politics, for instance. On the other hand, the early gay pride movement exemplifies the politics of multivalent recognition in its commitment to "unity through diversity" (Armstrong 2002, 26).

Perm

Do Both: mono- and multi- valent shift over time

Snyder 12 (Greta Fowler, Ph.D. Candidate in the Department of Politics, University of Virginia, "Multivalent Recognition: Between Fixity and Fluidity in Identity Politics", The Journal of Politics, Vol. 74, No. 1, January, jstor)

Though the gay pride movement was committed to "unity through diversity" in theory, however, it was homogenous (overwhelmingly white, male, middle-class, etc.) in practice (Armstrong 2002, 136). While the Black Panthers initially projected a monovalent view of black identity, both the theory and the practice of the organization transformed over time -- yet these changes were not reflected in predominant representations of the Panthers. These points highlight the following considerations in the categorization and assessment of recognition politics. First, both political ideology and political practice are important in determining whether an example of recognition politics is monovalent or multivalent; both should be considered. Second, attention should be paid both to the nature of the demands for recognition as well as the way in which these demands are interpolated by the culture industry. Finally, recognition movements are not static: the nature of demands for recognition made by a group may change over time, moving nearer to or farther from the multivalent or monovalent pole.

Alt fails

Alternative fails 2 reasons- civil rights and inside outsider binary
Brooks and Widner 12'

Roy L. Brooks and Kirsten Widner,Brooks is a senior editor of the Yale Law Journal, clerked for the Honorable Clifford Scott Green of the U.S. District Court in Philadelphia, and practiced corporate law with Cravath, Swaine & Moore in New York City. He joined the USD School of Law faculty in 1979. Widner is a Post fellow in law worked as a director of policy and advocacy at Emory law and got a degree in law form University of San Diego∂In Defense of the Black/White Binary: Reclaiming a Tradition of Civil Rights Scholarship, 12 Berkeley J. Afr.-Am. L. & Pol'y 107 (2010). ∂Available at: http://scholarship.law.berkeley.edu/bjalp/vol12/iss1

Furthermore, by arguing that black scholars should abandon the black/white binary (i.e., not focus on white-on-black racial problems), critical theorists, most of whom are non-black, 3 are unintentionally disrespecting a venerable tradition of black scholarship.14 African American scholars as diverse as (at times) Derrick Bell, the "father" of Critical Race Theory,' 5 Michael Eric Dyson and Cornel West, civil rights liberals,' 6 Glenn Loury, a civil rights moderate-conservative, 17 and John Hope Franklin, perhaps the greatest African American scholar of the last half of the twentieth century18 (whose public disagreement with an Asian scholar over the black/white paradigm was highly publicized), 19 not only write within this tradition but also have helped to shape it. Equally essential to this scholarly tradition are the enduring works of the late Judge A. Leon Higginbotham, the nation's first scholarly African American judge and the seminal writings of W. E. B. Du Bois, the nation's first (and still greatest) civil rights scholar. 2 ' This tradition of African American scholarship laid the foundation for the NAACP's successful litigation strategy against school segregation. 22 In addition to civil rights scholarship, criticism of the black/white binary extends to civil rights law. Delgado and Stefancic explore the following scenario: Imagine, for example, that Juan Dominguez, a Puerto Rican worker, is told by his boss, 'You're a lazy Puerto Rican just like the rest. You'll never get ahead as long as I'm supervisor.' Juan sues for discrimination under a civil rights-era statute designed with blacks in mind. He wins because he can show that an African American worker, treated in a similar fashion, would be entitled to redress. But suppose that Juan's coworkers and supervisor make fun of him because of his accent, religion, or place of birth. An African American subjected to these forms of discrimination would not be able to recover, and so Juan would go without recourse.23 Thus, the critique of the black/white binary proceeds on two levels-civil rights scholarship and civil rights law. This article considers both critiques. We consider the critique based on civil rights law in Part II. There, we contend that the critics of the binary have misread the extant law. As one of the authors has noted in a previous work, "Courts generally recognize that discrimination on the basis of a foreign trait, such as accent, is actionable under Title VII as discrimination on the basis of national origin.' 24 The point is, our most important civil rights laws apply to all racial groups, including whites, without any precondition that non-black racial groups analogize their situation to that of blacks. The Reconstruction Amendments to the Constitution-the Thirteenth, Fourteenth, and Fifteenth Amendments 25-which provide the foundation for modem civil rights law,26 the 1964 Civil Rights Act,27 and modem-day case law 28 all reach far beyond the black/white binary. To the extent that asymmetrical civil rights statutes have been enacted in the decades after the 1964 Civil Rights Act, these laws have been responsive to non-blacks, including the disabled,29 women,30 and older workers. 3' Civil rights law recognizes multiple binaries rather than a single binary. We turn in Part III to the theoretical arguments regarding the black/white binary. Here, we argue that African-American scholars have not suggested that non-black racial groups should be accorded second-class civil rights

status. Rather, <u>African-American scholars of any stature embrace the multiple-binary approach reflected in civil rights law. The fact that black scholars focus on white-on-black racial problems in their scholarship is natural given their experiences as black Americans and the tradition of black scholarship.</u> Yet, critical theorists have attacked this tradition of black scholarship on anti-binary grounds. <u>We address the three most compelling anti-binary criticisms offered by critical theorists: (1) the binary ignores the histories of other racial groups, thereby distorting our understanding of civil rights history; 32 (2) it ignores interest convergence and thus threatens natural alliances among outsiders, especially people of color; 33 and, related to the latter criticism, (3) it is predicated upon a false notion of "black uniqueness."3 4 In considering each of these criticisms, we argue that the black/white binary-which, again, is most properly understood to mean the focus on white-on-black racial problems makes very good sense to African Americans based on their racial reality. Those who would reject the binary, and would have black scholars do likewise; have simply ignored this fact of life.</u> Why can 't binaries co-exist in civil rights scholarship as they do in civil rights law? We conclude with two arguments in Part IV. <u>First, contrary to what they claim, critics of the black/white binary are, in reality, not arguing for the dissolution of all binaries, but, instead, are arguing for a particular binary. They seek to replace the black/white binary in civil rights scholarship with an insider/outsider binary.</u> The latter not only reflects a monolithic view of racial identity, 5 it also subordinates African Americans by trivializing the black ethos and presuming to tell African-American scholars what to write about<u>. Second, criticism of the black/white binary is, at bottom, a claim regarding racial priority. While some critics of the black/white binary may have hoped that the priority issue could be avoided by simply moving beyond the black/white binary</u>, 36 that simply has not been the case. Among outsider groups, competing claims and conflicts have not and will not disappear. 37 Hence, <u>the questions become: Does it make moral, historical, political, or sociological sense to give priority to African Americans in the realm of civil rights when their interests clash with the interests of other civil rights groups? Have the descendants of slaves earned the right to claim priority because they have suffered the longest and still remain at "the very bottom of the well," to borrow a metaphor from critical theory?</u> Former President Bill Clinton, a liberal, and James Q. Wilson, a conservative scholar, answer these questions in the affirmative. Clinton states, <u>"If we can address the problems between black and white Americans, then we will be better equipped to deal with discrimination in other areas."</u> 38 Similarly, Wilson writes in the aftermath of Katrina that: "The main domestic concern of policy-engaged intellectuals, liberal and conservative, ought to be to think hard about how to change these social weaknesses. Lower-class blacks are numerous and fill our prisons, and among all blacks the level of financial assets is lower than it is for whites. any blacks have made rapid progress, but we are not certain how." 39 <u>While saving until another day the construction of a formula that might facilitate the ranking of civil rights claims in particular situations, we do argue here that any such formula should not necessarily favor African Americans because of the simple fact that they are not at the very bottom of the well across the board. However, such a formula should take into account the relative severity and duration of each group's deprivation of rights or equality in various situations.</u>

The idea that African Americans should incorporate other racial histories in their scholarship so as not to ignore those histories is thinly supported. Asian and Latino/a scholars, for example, do not need African-American scholars to validate their work, which is exceptionally good. [2] Similarly, although incorporating other racial histories into African-American scholarship may enrich one's perspective on racism, this exercise is typically not a prerequisite for understanding civil rights or the black ethos-nor is it necessary for addressing black issues. To illustrate the point, we refer to Mendez v. Westminister School District of Orange County.[103] This case is often cited by LatCrits to illustrate the indispensability of Latino/a history in understanding the history of school desegregation that culminated in Brown .[104] In Mendez, the court overturned a school segregation statute applicable to Mexican-American students, a decision that predated Brown I by a few years. While interesting, the case is neither necessary nor sufficient in explaining Brown I or in understanding the NAACP's legal strategy. Mendez was a Ninth Circuit opinion, so its precedential value is low compared to that of the Supreme Court cases traditionally regarded as the predecessors of Brown 1.[105] Nor was Mendez as significant as the scholarship that informed the NAACP briefs. [06] Furthermore, even these Supreme Court cases and scholarly works have little probative valu in explaining why the Court decided Brown I the way it did.'[07] Indeed, contemporary scholarship on Brown I that omits the geopolitical and other extra-legal factors that underpin the opinion is insufficiently theorized. [08] Authors who write about their own racial experiences are not necessarily signaling ignorance about other racial experiences. These writers are merely taking advantage of their unique position to get the story out more accurately and with greater insight. In fact, Professor Delgado himself rather enthusiastically embraced this position in his influential article, "The Imperial Scholar:" [I]t is possible to compile an a priori list of reasons why we might look with concern on a situation in which the scholarship about group A [outsiders] is written by members of group B [insiders]. First, members of group B may be ineffective advocates of the rights and interests of persons in group A. They may lack information; more important, perhaps, they may lack passion, or that passion may be misdirected. B's scholarship may tend to be sentimental, diffusing passion in useless directions, or wasting time on unproductive breast-beating. Second, while the B's might advocate effectively, they might advocate the wrong things. Their agenda may differ from that of the A's, they may pull their punches with respect to remedies, especially where remedying A's situation entails uncomfortable consequences for B. Despite the best of intentions, B's may have stereotypes embedded deep in their psyches that distort their thinking, causing them to balance interests in ways inimical to A's. Finally, domination by members of group B may paralyze members of group A, causing the A's to forget how to flex their legal muscles for themselves.'

AT other race oppressions

Prefer white black binary biggest problem and has happened for the longest

Critical theorists reject the black/white binary in large part because they reject the notion that African Americans have always been and continue to be the most racially subordinated group in America. 144 Professor Delgado, for example, argues that all racial minorities must avoid "the [s]iren [slong of [u]niqueness. ' According to Delgado, the seductive idea of uniqueness can "predispose a minority group to believe that it is uniquely victimized and entitled to special consideration from iniquitous whites.' 46 However, this argument runs contrary to history, as documented by a large body of research. Although rarely stated in public, 4 7 there is substantial empirical evidence strongly suggesting that African Americans are unique and, hence, warrant separate (but not necessarily dominant) attention. 148 We shall focus on a few pieces of this evidence: slavery and Jim Crow; the subordination of African Americans versus Native Americans; lynching; and what can be termed, "the lost American dream." To begin with, African Americans are the only group to arrive in this country not on, but under Plymouth Rock. African Americans have encountered and continue to encounter unique disadvantages that stem from the very way they were brought into American society. 1 49 Unlike most immigrants who came to the United States voluntarily, blacks were imported in huge numbers as slaves. Although slavery had existed for thousands of years, the Atlantic slave trade was not slavery as usual: Slavery in the Americas introduced the troubling element of race into the master/slave relationship. For the first time in history, dark skin became the social marker of chattel slavery. And, as a means of justifying this new face-a black face-given to an ancient practice, the slavers and their supporters created a race-specific ideology of condemnation.150 This new form of slavery was so much a part of colonial America that the founders addressed it in multiple provisions of the U.S. Constitution.' 5 1 Thus, the subjugation of African Americans was written into the fabric of our nation from the very beginning-a situation that no other group has faced. Although slavery officially ended with the Civil War and the adoption of the Thirteenth Amendment, the systematic economic exploitation of African Americans continued well into the twentieth century. As Douglas Blackmon chronicles in his Pulitzer Prize winning book, "Slavery by Another Name," southern states used an elaborate system of laws "specifically enacted to intimidate blacks." They also used a variety of other slave-like practices such as opportunistic arrests, sham trials, convict leasing, and coercive "contracts" to continue supplying white farms and industry with the cheap black labor on which they relied. 152 In spite of this, critical theorists often dismiss African American uniqueness by noting that other racial minorities have experienced many of the injustices blacks have faced. For example, Professor Perea asserts: Mexican Americans were also segregated in separate but unequal schools, were kept out of public parks by law, were refused service in restaurants, were prohibited from attending 'White' churches on Sundays, and were denied burial in 'White' cemeteries, among all of the other horrors of the separate but equal scheme.153 While it is true that all racial minorities, particularly Latinos/as, have been victims of white oppression, these racialized experiences are nonetheless quite different from what African Americans have experienced. 54 In our view, the differences between African Americans and other racial minorities are so great as to outweigh the similarities. As one of the authors said on a previous occasion: [Bilacks were the main target of slavery and Jim

Crow. No other American group inhabited the peculiar institution. No other American group sustained more casualties or lengthier suffering from slavery and Jim Crow... [T]his gives blacks a connection to slavery and Jim Crowboth familial and psychological-that no other racial minority has. There is a collective memory here that only blacks have.... [U]nlike Asians and Latinos, blacks did not volunteer for this tour of duty. Blacks were kidnapped from their homeland and brought to this country by brutal force, the likes of which we have not seen before or since in American history. In short, although blacks, Asians, Latinos, Native Americans, Indians, and other people of color are victims of what Joe Feagin calls 'systemic racism' (or the "white-created" paradigm of racial subordination), they do not experience and hence do not react to racial subordination in exactly the same way.... White-on-black oppression is just different from other white-oppression syndromes, whether racial or gender. Patricia Rodriguez has observed, 'White means mostly privilege and black means overcoming obstacles, a history of civil rights. As a Latina, I can't try to claim one of these.'" 55 Black Americans carry the weight of the atrocities-slavery and Jim Crow.... 1 56

A2: Delgado

Focus on blackness the problem is growing and decreasing for other races- other races have seen increases in education and success

Brooks and Widner 12'

Roy L. Brooks and Kirsten Widner, Brooks is a senior editor of the Yale Law Journal, clerked for the Honorable Clifford Scott Green of the U.S. District Court in Philadelphia, and practiced corporate law with Cravath, Swaine & Moore in New York City. He joined the USD School of Law faculty in 1979. Afr.-Am. L. & Pol'y 107 (2010). Available at: http://scholarship.law.berkeley.edu/bjalp/vol12/iss1

Professor Richard Delgado argues that binary thinking can harm the group whose interest it places at the center. It can, for example, pit one disadvantaged group against another to the detriment of both. This opposition can impair a group's ability to forge useful coalitions and to leam from other groups' successes and failures.,I I What minority groups should do instead, Delgado argues, is set up a secondary market in which they negotiate selectively with each other. This market would take the form of exchanging support for issues important to various groups, creating win-win solutions whenever possible. Thus, a non-binary framework allows for racial minorities to approach whites in full force."12 Although Professor Delgado's arguments are not without merit, they are based on an unproven assumption that identities among racial minorities are sufficiently monolithic so as to make interracial alliances natural. "The idea would be," Professor Delgado asserts, "for minority groups to assess their own preferences and make tradeoffs that will, optimistically, bring gains for all concerned."' 1 3 However, as Professor Carbado points out, "Non-Black people of color have not always been interested in identifying themselves with the Black or marginalized side of the Black/White paradigm. In fact, there are moments in American history when certain Asian Americans and Latinas/os have attempted to achieve equality by asserting that they are not Black or like Blacks, and/or that they are White." 14 There are costs as well as advantages associated with occupying both ends of the polarity-the black (or subordinated) end as well as the white (or privileged) end-and non-black racial groups have often been able to avoid the costs and exploit the advantages.' 15 Self-interest is a powerful motivating force. Thus, it may be, as Professor Delgado maintains, that all binaries, including the black/white binary, are narrow nationalisms calculated to cutting the most favorable possible deal with whites'6-a possibility that African Americans can ill-afford to ignore. Therefore it is important to explore this possibility more closely to get a sense of how risky it would be for African Americans to abandon the black/white binary-which spawned the scholarly tradition and political strategy that together have been responsible for destroying Jim Crow and forging a racial consciousness from which all racial groups have benefitted." 7 When one looks closely at the natural-alliance theory-more accurately, the presumed-alliance theory-one comes to the unhappy conclusion that the theory founders on the shoals of racial reality. In a world of limited resources, achieving progress on one group's agenda can come at the expense of another group's agenda. 1 1 8 The game is, indeed, often zero-sum. The racial dynamic between blacks and Latinos/as, the latter of whom have been the most persistent critics of the black/white binary,' 19 well illustrates this point. Let us begin with education. Blacks and Latinos/as both hope to see dramatic improvements in the quality of schools their children attend. For blacks, this means increasing educational funds to their schools and providing curricular services that address issues of racial pride, self-esteem, and the other unique needs of African-American students, especially those of young black

males. 20 Likewise, for Latinos/as, improving the quality of education for their children means focusing on the special needs of Latino/as children, including bilingual education and expanded coverage of Latin-American history, which is often tied to immigration concerns.' 21 With the nationwide crisis in public school funding, the pool of state and federal funds as well as other resources available to meet these goals is extremely limited. <u>Consequently, funds possibility more closely to get a sense of how risky it would be for African Americans to abandon the black/white binary-which spawned the scholarly tradition and political strategy that together have been responsible for destroying Jim Crow and forging a racial consciousness from which all racial groups have benefitted</u>." 7 When one looks closely at the natural-alliance theory-more accurately, the presumed-alliance theory-one comes to the unhappy conclusion that the theory founders on the shoals of racial reality. In a world of limited resources, achieving progress on one group's agenda can come at the expense of another group's agenda. 1 1 8 The game is, indeed, often zero-sum. <u>The racial dynamic between blacks and Latinos/as, the latter of whom have been the most persistent critics of the black/white binary,' 19 well illustrates this point. Consequently, funds Angeles have almost entirely replaced the unionized African-Americanð workforce with a non-unionized immigrant workforce.' 6 Even whenð unionization is not an issue, the results are the same. As Jack Miles observes:ð If the Latinos were not around to be [gardeners, busboys, chambermaids,ð nannies, janitors, construction workers], nonblack employers would beð forced to hire blacks-but they'd rather not. They trust Latinos. Theyð fear or disdain blacks. The result is unofficial but widespread preferentialð hiring of Latinos-the largest affirmative action program in the nation,ð and one paid for, in effect, by blacks. 127ð Because of the employment implications of undocumented immigration,ð the NAACP, as well as the AFL-CIO, supported the employer sanctionsð provision under the Immigration Reform and Control Act of 1986. As oneð NAACP official said, the sanctions were a way "to keep undocumented aliensð from taking the food from black children."1' 28 African Americans "wereð competing more directly with Latinos than with any other ethnic group."' 2 9ð In addition there have been various political struggles between Africanð Americans and Latinos/as in Los Angeles. A case in point is the 2001 mayoralð race in which blacks voted for a white candidate instead of the Latino candidateð whom they believed to be more interested in strengthening Latino/a politicalð and economic power than in improving the plight of blacks. For similarð reasons, the NAACP objected to the inclusion of Latinos/as in the 1975 Votingð Rights Extension.' 30 A black columnist positioned the matter in a broaderð context: "Though we pride ourselves on our leadership role in civil rights,ð paradoxically, we guard the success jealously. 'We're the ones who marchedð in the streets and got our heads busted. Where were they? But now they wantð to get in on the benefits."" 13ð 'ð Similar differences exist between African Americans and other racialð minorities. For example, <u>some Asians have sought to exploit the privilege poleð of the black/white binary at the expense of African Americans.</u> As Professorð Frank Wu observes, "Racial groups are conceived of as white, black, honoraryð whites, or constructive blacks."' 32 He also reminds us <u>that some Asians haveð benefited from their "honorary whiteness" and,</u>

in so doing, may haveð "perpetuat[ed] the problem of race."' Professor Wu's use of the terms "honorary whiteness" and "constructive blacks" underscores both the constructedness of race and the poles of privilege and subordination in the black/white binary within which Asians have operated. The latter racial dynamic forms the basis for the uneasy relationship that has developed between the African-American and the Asian-American civil rights agendas since the end of the 1960s. Janine Young Kim aptly describes this situation: Asian Americans have stood on unstable ground between 'black' and 'white,' falling under the honorary white category in anti-affirmative action arguments, but considered constructive blacks for the purposes of school segregation or antimiscegenation laws. To say that Asian Americans have been perceived as honorary whites or constructive blacks is, however, slightly misleading in that it tends to convey a notion of race specificity. It is important to keep in mind that although the status of honorary white does affect identity, recognition, and appellation, its more insidious function is cooptation. For example, within the economy of affirmative action policy, 'whiteness' encompasses victimization through 'reverse racism' and race-based disadvantage in certain educational or occupational opportunities. Insofar as a conservative like Newt Gingrich treats Asian Americans as honorary whites, he refers to common experience under affirmative action, not racial similarity. 34 African Americans do not have this kind of racial flexibility. Phenotype and experience prevent African Americans from benefitting as much as other racial minorities from the pole of privilege. African Americans constitute the social marker for disadvantage, stuck at the pole of subordination. Indeed, African Americans have watched as other racial and ethnic groups with whom they have aligned in the past 135 have leapfrogged past them in resources and power, often distancing themselves from African Americans (what Professor Carbado calls "interracial distancing"' 36) once they obtained a certain level of success. There is palpable concern among African Americans that Latinos/as, with their increasing numbers and desire for acceptance, are poised to repeat this process. Like Asians in the context of affirmative action,' 37 Latinos/as might find interracial distancing to be within their self-interest. To ask African Americans to put aside this racial history and risk being a stepping-stone for yet another racial group's advancement may be overly optimistic. This is not to say that African Americans and other racial groups have never successfully collaborated or can never form mutually beneficial coalitions. As Professor Perea correctly points out, Keyes v. School District No. 1, Denver, Colorado, 38 a school desegregation case, provides an example of interest convergence. 39 Likewise, Mendez v. Westminister School District of Orange County,140 a Mexican-American school desegregation discussed earlier,' 4 ' shows that African Americans can support Latino/a interests when those interests converge with African-American interests. 142 But the crucial question is what happens when the interests clash rather converge? As Latinos/as continue to gain political strength and as both Latinos/as and Asians continue to become more integrated into the mainstream culture (becoming more "white" 43), will they find it more advantageous to forge coalitions with whites, whose experiences and interests they now share, than with African Americans, whose experiences and interests have become contraposed?

Offense

Calls to "move beyond" black/white binary replicate anti-Blackness

Deilovsky and Kitossa 13 (Katerina Deliovsky, Department of Sociology. Brock University, Ontario and Tamari, "Beyond Black and White: When Going Beyond May Take Us Out of Bounds", Journal of Black Studies 44; 158, http://jbs.sagepub.eom/content/44/2/158)

At first impression, critiques of the so-called Black/White binary paradigm appear persuasive—but only if one accepts a priori that race scholarship is dominated by this paradigm and that it functions to restrict how race is understood, theorized, and addressed. What is more, many claimants of this position contend that African and European American scholars who employ the so-called Black/White binary paradigm obscure the histories and claims making of Asian, Native, and Latina/o Americans. There are problems, however, with proposing a multiracial coalition based on a critique of the so-called Black/White binary paradigm. One such problem is identified by Jared Sexton (2010), who argues that this call is premised on the belief "of an 'endemic* black-white model of racial thought" (p. 90). For Sexton, this notion is "something of a social fiction—one might say a misreading—that depends upon a reduction of the sophistication of the paradigm in question" (Sexton, 2010, p. 90). If Sexton is correct, and we believe he is, then the call to move beyond is fundamentally flawed because it is built on an inadequate understanding of power relations that structure what is, in fact, a black/white Manicheanism. A Manicheanism is a moral and symbolic framework that constructs the world as polarized by forces of good and evil, represented in the oppositions between lightness and darkness and between black and white (see Bastide, 1967; Fanon, 1967; Hoch, 1979; Stone, 1981). Contrary to moving beyond advocates' claim of a Black/White binary paradigm, the black/white Manicheanism is an incorporative racial matrix in the psychosocial world of European culture that gives meaning to a broad range of identities. Furthermore, this misreading and reduction rests on the presupposition that this call is warranted and that one can move beyond what is posited as a simple binary. This assumption and call to action needs to be interrogated and deconstructed not only because the former is erroneous but also because the latter implicitly reproduces anti-blackness as a presupposition for multiracial coalition building. We argue in this essay that a deconstruction of the move beyond discourse reveals that knowledge about racism, but more specifically, anti-black racism, is not substantively advanced and, in fact, creates two distinct problems. First, by misreading and misnaming a real historical and contemporary experience as a paradigm, the discourse creates the false dilemma of needing to move beyond. Second, the discourse sets up blackness (interestingly enough, not whiteness), and by extension, those people socially defined as "black," as an impediment to the laudable goals of a multiracial coalition and complex understanding of race relations in North America. In this way, moving beyond, in terms of praxis (action, epistemology, and politics), is a discourse based on "bad faith" (Gordon, 1994) toward African-descended peoples. As noted by Gordon (1994), bad faith is denial of the humanity of the black body and the consistent imputation of a negative value to it as a means of defining the (non-black) self.

Turn – Excludes Black from the coalition of the alt

Deilovsky and Kitossa 13 (Katerina Deliovsky, Department of Sociology. Brock University, Ontario and Tamari, "Beyond Black and White: When Going Beyond May Take Us Out of Bounds", Journal of Black Studies 44; 158, http://jbs.sagepub.eom/content/44/2/158)

In closing, moving beyond advocates argue that alternatives to the Black/ White binary paradigm are needed to account for changing experiences of race and racism (Martinez, 1993; Omi & Winant, 1994). Uncritical acceptance of the Black/White binary paradigm situates the call to move beyond as questionable and problematic and all the more urgently in need of challenge. Perhaps, in the laudable quest for multiracial alliances, the call to move beyond has been uncritically accepted as a necessary tactic in the antiracist struggle. Sexton (2008) warns against the "unexamined desire for new analyses and the often anxious drive for political alliance" (p. 252). Moreover, he calls into "question the

motive force of a nominally critical intervention on the 'black-white paradigm'" (Sexton, 2008, p. 252). If an integral part of this move beyond postulates that blackness is an epistemic obstacle to effective antiracism politics, does this not imply that multiracial alliances are "a social formation for which the exclusion of the category of racial blackness is a sine qua non" (Sexton, 2010, p. 89)? And to exclude racial blackness means, ultimately, to excise those defined as black from this coalition. In other words, the black body may be counted for more than three fifths of a person for the antiracist cause, but African people's history and narratives must be checked at the door. Not only does this (implied) excision do a gross disservice to those victimized by this Manicheanism; it erases their history and obscures how other non-African people of color are affected by it as well as contribute to it. This situates moving beyond as a faulty and politically harmful episte-mological framework for African-descended people, and what is more, it is an act of bad faith.1 Without question, there is a need for a complex reading and analysis of racial oppression; however, the refusal to grant primacy to this "visible epis-temology of black skin" suggests there is more to this call than an academic pursuit. Put another way, it is one thing to argue that we need a complex understanding of the multiracial makeup of North America; it is quite another to frame the black/white Manicheanism as the reason for this lack of scholarly work. To reiterate, pointing the finger at the black/white Manicheanism creates, in general, two fundamental errors. One, it creates a false problem by confusing and misnaming a real historical and contemporary experience and, as such, grossly simplifies its complexity. Michael Steinberg (2001) argues. Putting the wrong name on a problem is worse than having no name at all. In the latter instance, one is at least open to filling the conceptual void. In the first instance, however, words lead us down a blind alley. They divert us from the facets of the problem that should command our attention and . . . lead to remedies that are ineffectual or worse, (p. 2) As we see it, in our case, the "worse" leads us to the second fundamental problem: It sets up blackness (interestingly enough, not whiteness), and by extension those people socially defined as black, as an impediment to the laudable goals of a multiracial coalition and complex understanding of race relations in the United States. It is disconcerting how the articulation of moving beyond implicitly (and sometimes explicitly) situates blackness as an obstacle or, as Sexton (2008) argues, "[standing] in the way of future progress, silencing the expression of much needed voices on the political and intellectual scene" (p. 252). It appears that "the force of anti-blackness consistently troubles the myriad efforts at mediation and amelioration among the nonwhite" (Sexton, 2008, p. 253). It goes without saying the challenge is not to move beyond but to theorize the black/white Manicheanism through a critical inquiry that captures its complexity. This complexity must bear in mind how thoroughly saturated is the sociosymbolic structure of racial difference with the determinants of the black/white Manicheanism.9 The black/white Manicheanism "has and continues to situate every subject in U.S. culture within the panoptic vision of racial meanings" (Weigman, 1995, p. 40). These racial meanings were and are often configured in relation to and against black (and white) racial designations. Thus, rather than calling to move beyond, it would be more conceptually creative and politically advantageous to work toward analyzing the black/white Manicheanism in a way that makes clear the relationship between this Manicheanism and other racially marginalized groups. Thus, to develop an epistemologically deep understanding of race, racialization, and racism in the North America, the significance of anti-blackness must be apprehended, not as a superior form of oppression but as a form that gives shape and context to the oppression of other racially marginalized groups, while creating a qualitatively distinct oppression for African-descended peoples. As Jared Sexton (2008) cogently argues, anti-blackness is longstanding and ongoing but also . . . unlike other forms of racial oppression in qualitative ways—differences of kind, rather than degree, a structural singularity rather than an empirical anomaly. But all of this is not...to participate in the ranked determination of suffering. It is, instead, to properly locate the political dynamics and to outline the ethical stakes at hand. (p. 245)

Neoliberalism K

AFF – AT Alternative/Framework

Specific policy proposals are good and key – cyber-boosterism and glorification of the Internet are the result of a lack of concrete institutional proposals – only the state has the institutional power to overcome neoliberal cyberspace

Morozov 11

(Evgeny Morozov, contributing editor at the New Republic and the author of To Save Everything, Click Here: The Folly of Technological Solutionism, "Two decades of the web: a utopia no longer," *Prospect Magazine*, June 22, 2011, http://www.prospectmagazine.co.uk/science-and-technology/morozov-web-no-utopia-twenty-years-short-history-internet)

Perhaps the mismatch between digital ideals and reality can be ascribed to the naivety of the technology pundits. But the real problem was that the internet's early visionaries never translated their aspirations for a shared cyberspace into **a set of concrete principles** on which online regulation could be constructed. It's as if they wanted to build an exemplary city on the hill, but **never bothered to spell out how** to keep it exemplary once it started growing.¶Some fundamental questions about the communal aspects of the internet were sidestepped. Who would take out the trash—that is, deal with spamming and scamming? Who would be in charge of preserving historical memorabilia: the ephemeral tweets and blog posts that tend to disappear into the digital void? Who would deal with the problem of pollution—insidious practices such as "search engine optimisation," or content farms that produce trivial content to earn advertising revenue? Who would protect the dignity of online citizens? Who would secure their privacy and protect them from defamation and libel?¶These issues were perhaps not so pressing or evident in a decade when search engines were rudimentary and tweets and blogs didn't exist. But it's not so obvious that John Perry Barlow's call on governments to exit cyberspace was a good one. **In the absence of strong public institutions with oversight, corporations felt they could do what they wanted**. In most cases, **they just pretended these problems didn't exist**.

AFF – AT Technology Focus Bad

Technology focus is good – it's a crux of anti-privacy debates – their condemnations that we should "focus on democracy instead" ignore the importance of specific technologies in shaping the content of democracy

Snowden 15

(Edward Snowden, a former Central Intelligence Agency officer and National Security Agency contractor, is a director of the Freedom of the Press Foundation, "Edward Snowden: The World Says No to Surveillance," June 4, 2015, *The New York Times*, http://mobile.nytimes.com/2015/06/05/opinion/edward-snowden-the-world-says-no-to-surveillance.html?action=click&pgtype=Homepage&module=opinion-c-col-left-region&region=opinion-c-col-left-region&WT.nav=opinion-c-col-left-region&_r=2&referrer)

Beyond the frontiers of law, progress has come even more quickly. Technologists have worked tirelessly to re-engineer the security of the devices that surround us, along with the language of the Internet itself. Secret flaws in critical infrastructure that had been exploited by governments to facilitate mass surveillance have been **detected and corrected**. **Basic technical safeguards** such as encryption — once considered esoteric and unnecessary — are now **enabled by default** in the products of pioneering companies like Apple, ensuring that even if your phone is stolen, your private life remains private. Such **structural technological changes** can ensure access to basic privacies beyond borders, insulating ordinary citizens from the arbitrary passage of anti-privacy laws, such as those now descending upon Russia.

AFF – AT Privacy Bad Link/Morozov Indict

Morozov's critique of privacy is a straw person that makes collective anti-neoliberal politics impossible – the neg's suspicion of transparency makes political corruption and inequality inevitable

Sifry 13

(Micah Sifry, Editorial Director, Personal Democracy Media, "Book Review: Evgeny Morozov Doth Protest Too Much," April 9, 2013, http://techpresident.com/news/23708/book-review-evgeny-morozov-doth-protest-too-much)

According to Evgeny Morozov, the world has gone crazy and he's one of the few sane people left. Zynga and Facebook, he writes, in his strange new book, "To Save Everything, Click Here: The Folly of Technological Solutionism," have "become models to think about civic engagement." Yelp and Amazon have "become models to think about criticism." People who believe the open Internet can be a tool for good and who worry about and try to oppose people who are using it to hurt others, actually treat the Internet like a "religion" and believe "it's the ultimate technology and the ultimate network." Like the proverbial engineer with a hammer, they see all of society's quirks, inefficiencies, waste, inequality, corruption and hypocrisy as nails to be smashed with smart tools and big data.¶ If it were up to their ilk, he writes, "The odds are that a perfectly efficient seat-distribution system--abetted by ubiquitous technology, sensors, and facial recognition--would have robbed us of one of the proudest moments in American history." That is, "technosolutionists," the villains of Morozov's book, would have engineered such a perfect bus-seating system balancing the seating claims of white and black riders that Rosa Parks could never have committed her history-making act of civil disobedience. Yes, he imagines that, without a word about the underlying problem of racism. I am not making this up.¶ And it gets worse. Extrapolating from the grandiose statements of people like Google's Eric Schmidt and Facebook's Mark Zuckerberg, Morozov spins up a world that doesn't exist and then proceeds to inveigh against it as if it must be the end-point of where the technosolutionists are taking society. To wit, by 2020, we will live in a world where:¶ "Humanity, equipped with powerful self-tracking devices, finally conquers obesity, insomnia, and global warming as everyone eats less, sleeps better, and emits more appropriately. The fallibility of human memory is conquered too, as the very same tracking devices record and store everything we do. Car keys, faces, factoids: we will never forget them again...."¶ "Politics, finally under the constant and far-reaching gaze of the electorate, is freed from all the sleazy corruption, backroom deals and inefficient horse trading. Parties are disaggregated and replaced by Groupon-like political campaigns, where users come together--once--to weigh in on issues of direct and immediate relevance to their lives, only to disband shortly afterward. Now that every word--nay, sound--ever uttered by politicians is recorded and stored for posterity, hypocrisy has become obsolete as well. Lobbyists of all stripes have gone extinct as the wealth of data about politicians--their schedules, lunch menus, travel expenses--are posted online for everyone to review. As digital media make participation easier, more and more citizens ditch bowling alone--only to take up blogging together. Even those who've never bothered to vote in the past are finally provided with the right incentives--naturally, as a part of an online game where they collect points for saving humanity--and so they rush to use their smartphones to 'check in' at the voting booth."¶ Morozov says he finds much of this future "terrifying," but it's only a nightmare of his own imagining. Sometimes his little jokes--lunch menus?--hint that he himself doesn't quite believe it's going to go down this way. But in his zeal to prop up and demolish the straw ~~man~~ [person] of technosolutionism, he contorts himself into some truly bizarre positions.¶ Take his book's discussion of politics, and the efforts of American reformers to reduce corruption and political inequality by increasing the availability of information about who is donating to whom, who is lobbying whom, and what they get in return--also known by the short-hand of "transparency."¶ For someone who grew up in dictatorial Belarus (which he wryly refers to as "an oasis of tolerance in the middle of Europe"), Morozov has a surprising dislike of political transparency. He gives us several pages of handwringing over the anti-gay-rights donors to California's Proposition 8 who found their publicly disclosed campaign contributions helpfully aggregated on a civilian-built website called Eightmaps.com, which led to some embarrassment for them. Justice Antonin Scalia's admonishment, in a related case involving the publishing of the names of petition signers, that "the fact is that running a democracy takes a certain amount of civic courage" is not for Morozov.¶ No, Morozov is so caught up in his war on "internet-centrism" and technosolutionism that he embraces proposals to make it harder for people to know who is attempting to influence the political process. "Campaign finance records posted online could be 'read-only' so that, while accessible on the FEC website, they would not be easy to download or reproduce elsewhere," he writes, approvingly citing a paper by Deborah Johnson, Priscilla Regan and Kent Wayland essay on "Campaign Disclosure, Privacy and Transparency." Such data should be made "harder to

find" and even posted with "self-destruct" code on it to prevent its use, say, five years after an election. So if you wanted to know just how much money Wall Street had invested in some up-and-coming politician at the beginning of his career when a decade or two later he finally enters the national spotlight decades later and runs for President--Morozov apparently thinks you should have a hard, if not impossible, time finding out.¶ What makes this line of argument even odder is that Morozov says he favors more efforts to tackle hard structural issues that deform society and produce negative personal consequences. Again and again in To Save Everything he rails against technological solutions that atomize consumers and place all the burden on their shoulders for solving their problems--criticizing, for example, people who self-track their way to better health rather than "make it harder for food companies to sell unhealthy food or target children." But while calling for solutions requiring **collective political action** (he's actually a "solutionist" too!), **Morozov opposes uses of technology**--like the ability to aggregate vital information about political influence peddlers--**that might enhance popular political power against** the **entrenched interests** that currently hold it. It makes no sense. (See John Wonderlich's rebuttal of Morozov's criticisms of the Sunlight Foundation here; and yes, I am proudly a consultant to that institution, which Morozov bashes needlessly.)

AFF – Knowledge Economy Good

The knowledge economy is good – produces individual autonomy and forces large corporations to change business practices – ensures improvements in quality of life

Leberecht 14

(Tim Leberecht, chief marketing officer of global design and architecture firm NBBJ, "HOW THE KNOWLEDGE ECONOMY IS REDEFINING WORK," *Fast Company*, http://www.fastcompany.com/3026566/leadership-now/how-the-knowledge-economy-is-redefining-work)

Somewhere is emblematic of the changing nature of the workplace. Our conceptions of work have shifted from time card and job title to mindset and narrative. Millennials in particular view work as a powerful vehicle for finding meaning in their lives. McMurray is well aware of this generational shift and refers to the rapidly emerging segment of independent workers who prefer independence over permanent, full-time employment. "They definitely present a challenge for large corporations that, if unable to offer extremely **flexible, autonomous, and creative** work environments, simply won't be able to attract the best people," he told me.¶While business-as-usual used to involve linear narratives of the CV and a more formal notion of transactional business relationships, Somewhere illustrates that we are moving further into more **contextual and nonlinear** portraits of our "selves" at work. The site redefines work as something beautiful, careers as ambiguous and ever-evolving, and a professional's identity as a fluid persona. McMurray says: "People lead such fascinating work lives, and our hope is that we can help open up the world of work, help people see behind the scenes, find inspiration, and find the people they should be working with."

AFF – Knowledge Economy Perm Solvency

The permutation solves best – a robust knowledge economy and IT innovation are key to transition to an empathetic civilization – solves all their impacts

Rifkin 10

(Jeremy Rifkin, American economic and social theorist, writer, public speaker, political advisor, and activist, "'Empathic Civilization': Is It Time To Replace The American Dream?" *Huffington Post*, May 25, 2011, http://www.huffingtonpost.com/jeremy-rifkin/empathic-civilization-is_b_469546.html)

When we consider these big picture policy issues, what becomes clear, if we bother to read between the lines, is that our long held beliefs about human nature, and by extension, the institutions we have created to express those beliefs, played no small role in precipitating the very crisis that now faces the country. In a nation that has come to think of human nature as competitive, even predatory, self serving, acquisitive and utilitarian, is it any wonder that those very values have led to a "winner take all" syndrome in the marketplace in which the rich get richer while everyone else becomes marginalized, and the well-being of the larger community, including the biosphere, becomes eroded? The US ranks 27th among industrialized countries, in income disparity -- the gap between the very rich and the very poor. Only Mexico, Turkey and Portugal, of the OECD nations, have greater disparity of income. Moreover, the US enjoys the dubious distinction of being one of the two leading contributors to global greenhouse gas emissions in the world. Could it be that the American Dream is becoming the American nightmare?¶ Interestingly, a younger generation of Americans is growing up in a very different world than the one described by the Enlightenment thinkers. Their reality is being lived out on **a digital commons** and in **social spaces on the World Wide Web**. All across America, our nation's teens are performing hundreds of hours of community service as part of their formal educational requirements. In school, they are learning that every activity they engage in -- the food they eat, the car they drive, the clothes they wear -- comes with a carbon footprint and affects the well-being of every other human being and fellow creature on Earth.¶ Today's youth are **globally connected**. They are Skyping in real time with their cohorts and friends on the far corners of the Earth. They are sharing **information, knowledge, and mutual aid in cyberspace chat rooms**, apparently unaware of the so called "tragedy of the commons." They have little regard for traditional property rights -- especially copyrights, trademarks, and patents -- believing information should run free. They are far more concerned with sharing access than protecting ownership. They think of themselves less as autonomous agents -- an island to oneself -- and more as actors in an ever shifting set of roles and relationships. Personal wealth, while still important, is not considered an endgame, but only a baseline consideration for enjoying **a more immaterial existence**, including more meaningful experiences in diverse communities.¶ Surveys show that the millennial generation in the United States is much more likely than older generations to feel empathy for others. They are far more concerned with the planetary environment and climate change and more likely to favor sustainable economic growth. They are also more likely to believe that government has a responsibility to take care of people who can't care for themselves, and are more supportive of a bigger role of government in providing basic services. They are more supportive of globalization and immigration than older generations. They are also more racially diverse and the most tolerant of any generation in history in support of gender equality and the willingness to champion the rights of the disabled, gays, other minorities, as well as our fellow creatures. In short, they favor a world of inclusivity over exclusivity, and are more comfortable in **distributed networks** than in old fashioned centralized hierarchies that establish boundaries and restrictions separating people from one another.¶ The new sensibilities of the younger generation are beginning to usher in a different idea about human nature and the dream that accompanies it. Today's youth find little value in the Enlightenment caricature of human nature as rational, calculating, detached, and utilitarian. **They prefer to think of human nature as empathic,** mindful, engaged, and driven by the intrinsic value and interconnectedness of life. Homo sapien is being eclipsed by homo empathicus, as they shift their horizon from national markets and nation-state borders to a global economy and a planetary community. Even their preferred indicators of economic progress are shifting, from the crude calculation of gross domestic product and per-capita income to more sensitive social indicators -- like health and longevity, social equality, safe communities, clean environment, etc. -- that measure the well-being of the broader community.

Answers: Nietzsche

Only evaluate arguments based off the plan text-any alternatives are self-serving and regressive which makes 2AC predictability and offense impossible-evaluate the consequences of the AFF and alternative because it is the only holistic way to evaluate prior questions.

Permutation do the plan and _____

Perm: do both – hyperfocus on suffering is only bad if it is at the expense of pursuit of personal projects – some empathy can be life-affirming
Conway '99

David Conway, Middlesex University. "Nietzsche's Revaluation of Schopenhauer as Educator". June 5, 1999. http://www.bu.edu/wcp/Papers/MPsy/MPsyConw.htm

Nonetheless, Nietzsche was mistaken in supposing that it was contrary to the interests of an individual who is otherwise free from suffering to feel sympathy and pity for those who do suffer (through no fault of their own). Pity is not the baneful emotion which Nietzsche claims it to be. This verdict leaves unresolved the ultimate issue. In a world which does as a matter of fact contain the enormous amount of suffering that ours contains, is not an individual who is open through sympathetic identification to this suffering bound like Schopenhauer says to be revolted by the world to the point of revulsion with it? Nietzsche, of course, thought the strong can and should disengage their sympathies from the suffering of the weak. I think this is a mistake. **One's world is impoverished by such disengagement** of sympathies. Yet how can one continue to affirm the will when one feels with all the suffering there is? Nietzsche is correct that existence could only be tolerable if we were able to live without being constantly affected by the suffering of others. However, it was wrong to think that in order to achieve this enviable state, pity should be condemned and avoided. No, on this matter I think we are entitled to place more trust in life itself than did Nietzsche. The fact is that there are strict psychological limits on our susceptibility to feel pity. Pity is in part a function of our attention. To what we attend is a function of our will. Our sentiments very largely determine to what we attend. Consequently, it is only where people have disengaged themselves from pursuit of personal projects, like appreciating and producing art or caring for loved ones, and so on, that there can be scope for a degree of pity of the sort that alone can give rise to denial of will. Where denial of will becomes psychologically possible, therefore, it can hardly be thought of as unwarranted. Nietzsche himself spoke approvingly of taking leave of life at the time before one became a burden and life lost its point. Surely, he would not have wished to frown on Sannyasis who give up all attachments at that stage in life after they have made their way through it. In conclusion, therefore, I wish to say that their are elements of truth and error in both Schopenhauer and Nietzsche on the matter of greatest divide between them. Schopenhauer is right to see denial of will where it occurs in such figures as religious recluses as a legitimate response to the suffering of the world. Nietzsche is right to see denial of the will as not always a legitimate response to the world's suffering. Nietzsche is right that life need not contain suffering of the magnitude Schopenhauer claims is integral to it. Schopenhauer is right that an attitude of sympathy for all suffering creatures is a benefit and not a bane to the person who has the attitude. If my

conclusion is untidy in not coming down unambiguously in favour of one philosopher or the order, I think I can take some comfort from Nietzsche's observation that "one repays a teacher badly if one remains only a pupil". (9)

The alt is impossible—anxiety and fear of suffering are psychologically inevitable

Pyszczynski et al '6 (Tom, Prof. Psych. – U. Colorado, Sheldon Solomon, Prof. Psych. – Skidmore College, Jeff Greenberg, Prof. Psych. – U. Arizona, and Molly Maxfield, U. Colorado, Psychological Inquiry, "On the Unique Psychological Import of the Human Awareness of Mortality: Theme and Variations" 17:4, Ebsco)

Kirkpatrick and Navarette's (this issue) first specific complaint with TMT is that it is wedded to an outmoded assumption that human beings share with many other species a survival instinct. They argue that natural selection can only build instincts that respond to specific adaptive challenges in specific situations, and thus could not have designed an instinct for survival because staying alive is a broad and distal goal with no single clearly defined adaptive response. Our use of the term survival instinct was meant to highlight the general **orientation toward continued life** that is expressed in many of an organism's bodily systems (e.g., heart, liver, lungs, etc) and the diverse approach and avoidance **tendencies that promote its survival** and reproduction, ultimately leading to genes being passed on to fu- ture generations. Our use of this term also reflects the classic psychoanalytic, biological, and anthropological influences on TMT of theorists like Becker (1971, 1973, 1975), Freud (1976, 1991), Rank (1945, 1961, 1989), Zilborg (1943), Spengler (1999), and Darwin (1993). We concur that natural selection, at least initially, is unlikely to design a unitary survival instinct, but rather, a series of specific adaptations that have tended over evolutionary time to promote the survival of an organism's genes. However, whether one construes these adaptations as a series of discrete mechanisms or a general overarching tendency that encompasses many specific systems, we think it hard to argue with the claim that natural selection usually orients organisms to approach things that facilitate continued existence and to avoid things that would likely cut life short. This is not to say that natural selection doesn't also select for characteristics that facilitate gene survival in other ways, or that all species or even all humans, will always choose life over other valued goals in all circumstances. Our claim is simply that a general orientation toward continued life exists because staying alive is essential for reproduction in most species, as well as for child rearing and support in mammalian species and many others. Viewing an animal as a loose collection of independent modules that produce responses to specific adaptively-relevant stimuli may be useful for some purposes, but it overlooks the point that adaptation involves a variety of inter-related mechanisms working together to insure that genes responsible for these mechanisms are more numerously represented in future generations (see, e.g., Tattersall, 1998). For example, although the left ventricle of the human heart likely evolved to solve a specific adaptive problem, this mechanism would be useless unless well-integrated with other aspects of the circulatory system. We believe it useful to think in terms of the overarching function of the heart and pulmonary-circulatory system, even if specific parts of that system evolved to solve specific adaptive problems within that system. In addition to specific solutions to specific adaptive problems, over time, natural selection favors integrated systemic functioning(Dawkins, 1976; Mithen, 1997). It is the improved survival rates and reproductive success of lifeformspossessing integrated systemic characteristics that determine whether those characteristics become widespread in a population. Thus, we think it is appropriate and useful to characterize a glucose-approaching amoeba and a bear-avoiding salmon as oriented toward self-preservation and reproduction, even if neither species possesses one single genetically encoded mechanism designed to generally foster life or insure reproduction, or cognitive representations of survival and reproduction. This is the same position that Dawkins (1976) took in his classic book, The selfish gene: **The obvious first priorities of a survival machine, and of the brain that takes the decisions for it, are individual survival and reproduction**. … Animals therefore go to elaborate lengths to find and catch food; to avoid being caught and eaten themselves; to avoid disease and accident; to protect themselves from unfavourable climatic conditions; to find members of the opposite sex and persuade them to mate; and to confer on their children advantages similar to those they enjoy themselves. (pp. 62–63) All that is really essential to TMT is the proposition that humans fear death. Somewhat ironically, in the early days of the theory,we felt compelled to explain this fear by positing a very basic desire for life, because many critics adamantly insisted, for reasons that were never clear to us, that most people do not fear death. Our explanation for the fear of death is that knowledge of the inevitability of death is frightening because people know they are alive and because they want to continue living. **Do Navarrete and Fessler** (2005) **really believe that humans do not fear death**? **Although people sometimes claim that they are not afraid of death**, and on rare occasions volunteer for suicide missions and approach their death, **this requires extensive psychological work, typically a great deal of anxiety, and preparation and immersion in a belief system that makes this possible** (see TMT for an explanation of how belief systems do this). Where this desire for life comes from is an interesting question, but not essential to the logic of the theory. Even if Kirkpatrick and Navarete (this issue) were correct in their claims that a unitary self-preservation instinct was not, in and of itself, selected for, it is indisputable that many discrete and integrated mechanisms that keep organisms alive were selected for. A desire to stay alive, and a fear of anything that threatens to end one's life, are likely emergent properties of these many discrete mechanisms that

result from the <mark>evolution</mark> of sophisticated cognitive abilities for symbolic, future- oriented, and self-reflective thought. As Batson and Stocks (2004) have noted, it is because we are so intelligent, and hence so aware of our limbic reactions to threats of death and of our many systems oriented toward keeping us alive that we have a general fear of death. Here are three quotes that illustrate this point. First, for psychologists, Zilboorg (1943), an important early source of TMT: **"Such <mark>constant</mark> <mark>expenditure of psychological energy on the business of preserving life would be impossible if the fear of death were not as constant</mark>"** (p. 467). For literature buffs, acclaimed novelist Faulkner (1990) put it this way: If aught can be more painful to any intelligence above that of a child or an idiot than a slow and gradual confronting with that which over a long period of bewil- derment and dread it has been taught to regard as an irrevocable and unplumbable finality, I do not know it. (pp. 141–142) And perhaps most directly, for daytime TV fans, from The Young and the Restless (2006), after a rocky plane flight: Phyllis: I learned something up in that plane Nick: What? Phyllis: I really don't want to die. An important consequence of the emergence of this general fear of death is that **humans are susceptible to anxiety due to events or stimuli that are not <mark>immediately present</mark> and novel threats to survival that did not exist for our ancestors, <mark>such as</mark>** AIDS, guns, or **<mark>nuclear weapons</mark>**. Regardless of how this fear originates, it is abundantly clear that <mark>humans do fear death</mark>. <mark>Anyone who has ever faced a man with a gun</mark>, a doctor saying that the lump on one's neck is suspicious and requires further diagnostic tests, <mark>or a drunken driver</mark> swerving into one's lane <mark>can attest to that</mark>. If humans only feared evolved specific death-related threats like spiders and heights, then a lump on an x-ray, a gun, a crossbow, or any number of weapons pointed at one's chest would not cause panic; but obviously these things do. Of what use would the sophisticated cortical structures be if they didn't have the ability to instigate fear reactions in response to such threats?

Prioritize survival over ontology focus
Wapner '3

Paul, Associate professor and director of the Global Environmental Policy Program at American University, DISSENT, Winter, http://www.dissentmgazine.org/menutest/artiles/wi03/wapner.htm

The third response to eco-criticism would require critics to acknowledge the ways in which they themselves silence nature and then to respect the sheer otherness of the nonhuman world. Postmodernism prides itself on criticizing the urge toward mastery that characterizes modernity. But isn't mastery exactly what postmodernism is exerting as it captures the nonhuman world within its own conceptual domain? Doesn't postmodern cultural criticism deepen the modernist urge toward mastery by eliminating the ontological weight of the nonhuman world? What else could it mean to assert that there is no such thing as nature? I have already suggested the postmodernist response: yes, recognizing the social construction of "nature" does deny the self-expression of the nonhuman world, hut how would we know what such self-expression means? Indeed, nature doesn't speak; rather, some person always speaks on nature's behalf, and whatever that person says is, as we all know, a social construction. All attempts to listen to nature are social constructions-except one. Even the most radical postmodernist <mark>must acknowledge the distinction between physical existence and non-existence.</mark> As I have said, postmodernists accept that there is a physical substratum to the phenomenal world even if they argue about the different meanings wc ascribe to it. This acknowledgment of physical existence is crucial. <mark>We can't ascribe meaning to that which doesn't appear What doesn't exist can manifest no character</mark>. Put differently, yes, the postmodernist should rightly worry about interpreting nature's expressions. And all of us should be wary of those who claim to speak on nature's behalf (including environmentalists who do that). But <mark>we need not doubt the simple idea that a prerequisite of expression is existence.</mark> This in turn <mark>suggests that preserving the nonhuman world</mark>-in all its diverse embodiments-<mark>must be seen by eco-critics as a fundamental good.</mark> Eco-critics must be supporters, in some fashion, of environmental preservation.

Suffering is life negating
Mayerfeld '99

Jamie Mayerfeld, Associate Professor of Political Science at the University of Washington. Suffering and Moral Responsibility. P. 158-159.

If there is resistance to this claim, it may be tied to the view that suffering has an improving effect on us. It makes us wiser or more virtuous or cleanses us morally.' I have two things to say in reply. First, not all suffering makes us better. How is an abused child or a tormented animal improved by her suffering? Much suffering makes us worse. It makes us bitter or vengeful or manipulative or crazy, or renders impossible the activities and experiences that mould improve us. Second, if suffering sometimes makes us better, **that doesn't disprove the claim that suffering is bad for us in itself**. It is important, as I have mentioned, to distinguish the intrinsic evil of suffering from whatever instrumental value it may possess.

Suffering is not inevitable
Mayerfeld '99

Jamie, Associate Professor of Political Science at the University of Washington. Suffering and Moral Responsibility. P. 86.

Pessimists sometimes explain their attitude by saying that life is never free from suffering. Life is suffering, the Buddhists tell us; their view is echoed by Schopenhauer, who held that we endure pain and frustration for most of our lives, and that when we succeed in overcoming adversity we succumb instantly to boredom, which too is a form of suffering. But the claim that suffering never lets go of us is an obvious distortion; the most cursory observation reveals that a great many people are happy a great deal of the time, or at least aren't suffering. The claim may stem from the failure to separate suffering from the frustration of desire. Frustration may be close to a constant in our lives, but it need not be accompanied by suffering. We might even say that, for many people, happiness is characterized by the generation of new desires faster than they can be satisfied.

The alternative is anti-political – only engagement with politics is life affirming
May '5

(Todd, Professor of Philosophy at Clemson University, "To change the world, to celebrate life," Philosophy and Social Criticism, 31(5-6), p. 527-529)

And what happens from there? From the meetings, from the rallies, from the petitions and the teach-ins? What happens next? There is, after all, always a next. If you win this time – end aid to the contras, divest from apartheid South Africa, force debt-forgiveness by technologically advanced countries – there is always more to do. There is the de-unionization of workers, there are gay rights, there is Burma, there are the Palestinians, the Tibetans. There will always be Tibetans, even if they aren't in Tibet, even if they aren't Asian. But is that the only question: Next? Or is that just the question we focus on? What's the next move in this campaign, what's the next campaign? Isn't there

more going on than that? After all, engaging in political organizing is a practice, or a group of practices. It contributes to making you who you are. It's where the power is, and where your life is, and where the intersection of your life and those of others (many of whom you will never meet, even if it's for their sake that you're involved) and the buildings and streets of your town is. This moment when you are seeking to change the world, whether by making a suggestion in a meeting or singing at a rally or marching in silence or asking for a signature on a petition, is not a moment in which you don't exist. It's not a moment of yours that you sacrifice for others so that it no longer belongs to you. It remains a moment of your life, sedimenting in you to make you what you will become, emerging out of a past that is yours as well. What will you make of it, this moment? How will you be with others, those others around you who also do not cease to exist when they begin to organize or to protest or to resist? The illusion is to think that this has nothing to do with you. You've made a decision to participate in world-changing. Will that be all there is to it? Will it seem to you a simple sacrifice, for this small period of time, of who you are for the sake of others? Are you, for this moment, a political ascetic? Asceticism like that is dangerous. X Freedom lies not in our distance from the world but in the historically fragile and contingent ways we are folded into it, just as we ourselves are folds of it. If we take Merleau-Ponty's Being not as a rigid foundation or a truth behind appearances but as the historical folding and refolding of a univocity, then our freedom lies in the possibility of other foldings. Merleau-Ponty is not insensitive to this point. His elusive concept of the invisible seems to gesture in this direction. Of painting, he writes: the proper essence of the visible is to have a layer of invisibility in the strict sense, which it makes present as a certain absence . . . There is that which reaches the eye directly, the frontal properties of the visible; but there is also that which reaches it from below . . . and that which reaches it from above . . . where it no longer participates in the heaviness of origins but in free accomplishments.9 Elsewhere, in The Visible and the Invisible, he says: if . . . the surface of the visible, is doubled up over its whole extension with an invisible reserve; and if, finally, in our flesh as the flesh of things, the actual, empirical, ontic visible, by a sort of folding back, invagination, or padding, exhibits a visibility, a possibility that is not the shadow of the actual but its principle . . . an interior horizon and an exterior horizon between which the actual visible is a partitioning and which, nonetheless, open indefinitely only upon other visibles . . . What are we to make of these references? We can, to be sure, see the hand of Heidegger in them. But we may also, and for present purposes more relevantly, see an intersection with Foucault's work on freedom. There is an ontology of freedom at work here, one that situates freedom not in the private reserve of an individual but in the unfinished character of any historical situation. There is more to our historical juncture, as there is to a painting, than appears to us on the surface of its visibility. The trick is to recognize this, and to take advantage of it, not only with our thoughts but with our lives. And that is why, in the end, there can be no such thing as a sad revolutionary. To seek to change the world is to **offer a new form of life celebration**. It is to articulate a fresh way of being, which is at once a way of seeing, thinking, acting, and being acted upon. It is to fold Being once again upon itself, this time at a new point, to see what that might yield. There is, as Foucault often reminds us, no guarantee that this fold will not itself turn out to contain the intolerable. In a complex world with which we are inescapably entwined, a world we cannot view from above or outside, there is no certainty about the results of our experiments. Our politics are constructed from the same vulnerability that is the stuff of our art and our daily practices. But to refuse to experiment is to resign oneself to the intolerable; it is to abandon both the struggle to change the world and the opportunity to celebrate living within it. And to seek one aspect without the other – life-celebration without world-changing, world-changing without life-celebration – is to refuse to acknowledge the chiasm of body and world that is

the wellspring of both. If we are to celebrate our lives, if we are to change our world, then perhaps the best place to begin to think is our bodies, which are the openings to celebration and to change, and perhaps the point at which the war within us that I spoke of earlier can be both waged and resolved. That is the fragile beauty that, in their different ways, both Merleau- Ponty and Foucault have placed before us. The question before us is whether, in our lives and in our politics, we can be worthy of it.

Their impacts are inevitable and wrong—the ONLY way humans can deal with the terror of death is to manage it with order and denial. The alternative LITERALLY makes life unlivable.

Pyszczynski '4 (Tom, Prof. Psych. – U. Colorado, Social Research, "What are we so afraid of? A terror management theory perspective on the politics of fear", Winter, http://findarticles.com/p/articles/mi_m2267/is_4_71/ai_n13807478/)

TMT starts with a consideration of how human beings are both similar to, and different from, all other animals. We start with the assumption that, ==like all other animals, humans are born with a very basic evolved proclivity to stay alive and== that ==fear, and all the biological structures of the brain that produce it, evolved==, at least initially, ==to keep the animal alive.== This, of course, is highly adaptive, in that it facilitates survival, and an animal that does not stay alive very long has little chances of reproducing and passing on its genes. But as ==our== species evolved, it developed a wide range of other adaptations that helped us survive and reproduce, the most important being a set of highly sophisticated intellectual ==abilities== that enable us ==to==: a) think and communicate with symbols, which of course is the basis for language, b) project ourselves in time and imagine a future including events that have never happened before, and c) ==reflect back on ourselves==, and take ourselves as an object of our own attention--self-awareness. These are all very adaptive abilities that play central roles in the system through which humans regulate their behavior--usually referred to as the self (cf. Carver and Scheier, 1998). These abilities made it possible for us to survive and prosper in a far wider range of environments than any other animal has ever done, and accomplish all that we humans have done that no other species ever has been capable of doing. However, these unique intellectual abilities also created a major problem: they ==made us aware== that, **although we are biologically programmed to stay alive** and avoid things that would cut our life short, the one absolute certainty in life is that ==we must die.== We are also forced to realize that death can come at any time for any number of reasons, none of which are particularly pleasant--a predator, natural disaster, another hostile human, and an incredible range of diseases and natural processes, ranging from heart attacks and cancer to AIDS. If we are "lucky" we realize that our bodies will just wear out and we will slowly fade away as we gradually lose our most basic functions. Not a very pretty picture. TMT posits that this clash of a core desire for life with awareness of the inevitability of death created the potential for paralyzing terror. Although all animals experience fear in the face of clear and present dangers to their survival, only humans know what it is that they are afraid of, and that ultimately there is no escape from this ghastly reality. We suspect that ==this potential for terror would have greatly interfered with ongoing goal-directed behavior, and **life itself**, if it were left unchecked.== It may even have made the intellectual abilities that make our species special unviable in the long run as evolutionary adaptations--and there are those who think that the fear and anxiety that results from our sophisticated intelligence may still eventually lead to the extinction of our species. So

humankind used their newly emerging intellectual abilities to manage the potential for terror that these abilities produced by calling the understandings of reality that were emerging as a result of these abilities into service as a way of controlling their anxieties. The potential for terror put a "press" on emerging explanations for reality, what we refer to as cultural worldviews, such that any belief system that was to survive and be accepted by the masses needed to manage this potential for anxiety that was inherent in the recently evolved human condition. **Cultural worldviews manage existential terror by providing a meaningful,** orderly, and **comforting conception of the world** that helps us come to grips with the problem of death. Cultural worldviews provide a meaningful explanation of life and our place in the cosmos; **a set of standards** for what is valuable behavior, **good and evil**, that give us the potential of acquiring self-esteem, the sense that we are valuable, important, and significant contributors to this meaningful reality; and the hope of transcending death and attaining immortality in either a literal or symbolic sense. Literal immortality refer to those aspects of the cultural worldview that promise that death is not the end of existence, that some part of us will live on, perhaps in an ethereal heaven, through reincarnation, a merger of our consciousness with God and all others, or the attainment of enlightenment--beliefs in literal immortality are **nearly universal**, with the specifics varying widely from culture to culture. Cultures also provide us with the hope of attaining symbolic immortality, by being part of something larger, more significant, and more enduring than ourselves, such as our families, nations, ethnic groups, professions, and the like. Because these entities will continue to exist long after our deaths, we attain symbolic immortality by being valued parts of them.

ST Pan K

A/T: Objective

Their supposedly objective portrayal of China translates threat into reality, legitimizing US power politics.
Pan 04—School of International and Political Studies @ Deakin University (Chengxin, 2004, Alternatives: Global, Local, Political Vol. 29, No. 3, "The "China Threat" in American Self-Imagination: The Discursive Construction of Other as Power Politics," rmf)

While U.S. China scholars argue fiercely over "what China precisely is," their **debates have been underpinned by** some common ground, especially in terms of **a positivist epistemology**. Firstly, **they believe that China is ultimately a knowable object,** whose reality can be, and ought to be, empirically revealed by scientific means. For example, after expressing his dissatisfaction with often conflicting Western perceptions of China, David M. Lampton, former president of the National Committee on U.S.-China Relations, suggests that "it is time to step back and look at where China is today, where it might be going, and what consequences that direction will hold for the rest of the world."2 Like many other China scholars, **Lampton views his object of study as essentially "something we can stand back from and observe with clinical detachment."3** Secondly, associated with the first assumption, **it is commonly believed that China scholars merely serve as "disinterested observers"** and that their studies of China are neutral, passive descriptions of reality. And thirdly, in pondering whether China poses a threat or offers an opportunity to the United States, they rarely raise the question of "what the United States is." That is, the meaning of the United States is believed to be certain and beyond doubt. I do not dismiss altogether the conventional ways of debating China. It is not the purpose of this article to venture my own "observation" of "where China is today," nor to join the "containment" versus "engagement" debate per se. Rather, I want to contribute to a novel dimension of the China debate by questioning **the seemingly unproblematic assumptions shared by most China scholars in the mainstream IR community in the United States**. To perform this task, I will focus attention on a particularly significant component of the China debate; namely, the "China threat" literature. More specifically, I want to argue that **U.S. conceptions of China as a threatening other are always intrinsically linked to how U.S. policymakers/mainstream China specialists see themselves** (as representatives of the indispensable, security-conscious nation, for example). As such, **they are not value-free, objective descriptions** of an independent, preexisting Chinese reality out there, **but are better understood as a kind of normative, meaning-giving practice that often legitimates power politics in U.S.-China relations and helps transform the "China threat" into social reality.** In other words, **it is self-fulfilling in practice,** and is always part of the "China threat" problem it purports merely to describe. In doing so, I seek to bring to the fore two interconnected themes of self/other constructions and of theory as practice inherent in the "China threat" literature - themes that have been overridden and rendered largely invisible by those common positivist assumptions

A/T: Authors

Be skeptical of their authors—positing China as a "real threat" is what legitimizes their claims in the first place.

Pan 04—School of International and Political Studies @ Deakin University (Chengxin, 2004, Alternatives: Global, Local, Political Vol. 29, No. 3, "The "China Threat" in American Self-Imagination: The Discursive Construction of Other as Power Politics," rmf)

Certainly, I do not deny China's potential for strategic misbehavior in the global context, nor do I claim the "essential peacefulness" of Chinese culture.40 Having said that, my main point here is that <u>there is no such thing as "Chinese reality" that can automatically speak for itself,</u> for example, as a "threat." Rather, **the "China threat" is essentially a specifically social meaning given to China by its U.S. observers, a meaning that cannot be disconnected from the dominant U.S. self-construction**. Thus<u>, to fully understand the U.S. "China threat" argument, it is essential to recognize its autobiographical nature. Indeed, the construction of other is not only a product of U.S. self-imagination, but often a necessary foil to it</u>. For example, **by taking this particular representation of China as Chinese reality** <u>per se, those</u> **scholars are able to assert their self-identity as "mature," "rational" realists capable of knowing the "hard facts" of international politics, in distinction from those "idealists" whose views are said to be grounded more in "an article of faith" than in "historical experience."**41 On the other hand, given that history is apparently not "progressively" linear, <u>the invocation of a certain other not only helps explain away such historical uncertainties or "anomalies" and maintain the credibility of the allegedly universal path trodden by the United States, but also serves to highlight U.S. "indispensability."</u> As Samuel Huntington puts it, "If being an American means being committed to the principles of liberty, democracy, individualism, and private property, and if there is no evil empire out there threatening those principles, what indeed does it mean to be an American, and what becomes of American national interests?"42 In this way, it seems that **the constructions of the particular U.S. self and its other are always intertwined and mutually reinforcing.** Some may suggest that there is nothing particularly wrong with this since psychologists generally agree that "individuals and groups define their identity by differentiating themselves from and placing themselves in opposition to others."43 This is perhaps true. As the Swiss linguist Ferdinand de Saussure tells us, meaning itself depends on difference and differentiation.44 Yet, **to understand the U.S. dichotomized constructions of self/other in this light is to normalize them and render them unproblematic**, <u>because it is also apparent that not all identity-defining practices necessarily perceive others in terms of either universal sameness or absolute otherness and that difference need not equate to threat.</u>

A/T: Threats real

Their impact is constructed—the fact that threat perception has changed over time and that countries with similar political and economic profiles are *not* considered threats proves.

Turner 13—Research Associate at the Brooks World Poverty Institute at the University of Manchester (Oliver, 2013, Review of International Studies, "'Threatening' China and US security: the international politics of identity," rmf)

China's military and economic strengths are far greater today than at any point in the history of Sino-US relations. Yet, the 'threat' it presents to American security is no less a social construction than in the past. The modern day proliferation of popular and academic 'China threat' literatures in particular is reflective of the increasingly widespread conviction that a 'rising' China inevitably constitutes a real or potential danger.97 Robert Kaplan explains that 'the American military contest with China in the Pacific will define the twenty first century'.98 He does not question if or even when China might become a threat. He emphasises its inevitability. Babbin and Timperlake provide a fictional narrative of future Sino-American tensions in which, among other things, China uses cyber warfare to shut down American defence systems. The hostile scenario they present, it is argued, 'could easily become fact . . . The Verdict: China means war.'99 Certainly, and as has been the case throughout history, China is not uniformly perceived in these terms. Among a significant proportion of the American population, however, the China 'threat' is an accepted and relatively unproblematic phenomenon. China now has the **world's largest population, the fastest growing economy, the largest army**, the largest middle class, a permanent seat on the UN Security Council, a manned space program **and a nuclear arsenal.**100 Yet, all of these things **do not necessarily make China a threat**. Countries which share variations of these, notably the possession of nuclear weapons, a permanent presence in the Security Council and significant standing armies are not perceived in this way. Indeed, and as Director Clapper revealed in the Senate in early 2011, states like Russia with far greater stockpiles of nuclear weapons and significant additional military hardware can be viewed in less threatening terms, even when capability is cited as the critical factor.101 Furthermore, the PRC has had a large population and a substantial army since its founding in 1949, nuclear weapons since 1964 and a seat on the Security Council since 1971 without consistently being interpreted as a threat. Accordingly, **forces additional to those of China's capabilities must still be implicated in understandings about the dangers it is said to present.**

Pessimism Answers

AT: Pessimism – General

Negativity as a starting point is necessary but insufficient – constructive building is necessary to create tangible changes.
Brand-Jacobsen, TRANSCEND Co-Director and Coalition for Global Solidarity and Social Development Director, 2005

[Kai Frithjof, "Peace by Peaceful Means"
https://web.archive.org/web/20050404102302/http://www.globalsolidarity.org/articles/peace_means_kai.html]

Peace by Peaceful Means Dear Friends, The discussions which have taken place over e-mail over the past few days have been extremely interesting. I have just returned from Oslo where the 100th anniversary of the Nobel Peace Prize was being celebrated. The obvious contrast between the rather elite 'suit' dominated celebrations in Oslo and the realities of what is occurring in the world today was stark. Questions of **strategy, tactics and visions** for how we work to bring about change, to transform all forms of violent conflict -- direct, structural, and cultural -- and to empower, mobilise, and involve people in a mass, broad-based movement for peace and to build the alternatives we are looking for, **are vital**. In Norway alone, to take one example, perhaps 80% of people think what is happening now in and over Afghanistan is wrong, either completely or at least in part, and yet all they hear from the media, academics and politicians is constant support and acclaim for the 'justness' of this war (or indeed, any war in which it is 'we' against 'them'). Small groups of people and 'NGOs', in Norway as in every single country, are trying to bring forward alternatives, to raise their voices, and to protest/oppose what they think is wrong. While these organisations are in every case much smaller than our governments and militaries going to war, they often represent the social majority. A major challenge they face, however, is how to reach out to people, how to involve people, and how to develop alternatives which make sense to people tired of war and violence (whether of the kind we are seeing in Afghanistan, or of a global economic system killing 100,000 a day). Negative slogans and opposition to what is wrong is not enough however. It is not enough, but it is necessary. 'Basta!', 'Enough!' was perhaps the most 'revolutionary' cry of the last decade, and still is in many parts of the world. The simple, courageous act, of standing up when we see that something is wrong, and stating that it is wrong, not cooperating with it, can be a powerful and evocative symbol. When we are having our conferences, discussions and meetings in whichever city, town or village of the world we may be found, we should always remember that the vast majority of people in our own city, town or village, as well as the entire rest of the world, have no idea that we are there, meeting. The vision, hope and ideas which bring people to these conferences are, in the vast majority of cases, kept marginalised, on the periphery. Yet that is also part of our own responsibility, technique and methods. Basta! became a cry to inspire millions, because those who said it lived it, refusing to cooperate any longer with what they know to be wrong. While Basta! may be the most revolutionary cry or word today, transforming all forms of direct, structural, and cultural violence is the greatest challenge. The two are inclusive and complementary, not exclusive. We need to state clearly our opposition to violence, war, injustice and exploitation (the 'peace movement' has often been willing to do the first two, not always as willing on the last two), and we need also to build a constructive, positive programme. It is not only a question of what we are against, but what we are for. When we criticize what we think is wrong, people will also want to know what we think could be done instead. In these cases, our answers must seem real and viable to people. The 'anti-globalisation' movement is therefore also a social justice movement; 'non-governmental organisations' should also be people's organisations or people's movements; and one of our challenges today will be to build upon the growing 'anti-war' movement, transforming it also into a peace movement. A step further, as many social and peace activists have recognised, will be to link the peace and social justice movements. Slogans and messages are important, as are practice and vision. **It will not be possible today to unite broad numbers of people around issues which they feel are too abstract and divorced from them**. The 'abolish the debt' campaign/movement was successful because people were able to see the clear linkages between debt and the effective colonisation and enslavement of countries and people across the south, as well as the incredible suffering and destruction it brought. The Jubilee 2000 'campaign' however, unlike the Jubilee South movement which continues today, did not reach its objective of having the debt cancelled. Instead, while many people around the world believe the problem has been solved, the debt-system and the burden it places upon countries has become even more extreme. Going from 'campaigns' to movements will also be important, though even here **it is not a question of 'either/or' but 'both/and'** with individual campaigns extremely useful and effective at times for involving people, raising awareness and mobilising around specific issues,

strengthening further the broader movements of which they may be a part. Today, a movement for demos kratos is necessary, and vital for any movement or work towards peace. To speak about the United States or any government in the world today as a 'democracy' is a ridiculous farce. They are highly elite dominated systems built upon massive structures and cultures of violence, and willing to use overwhelming (Powel Doctrine) violence when necessary to enforce their needs and/or interests. At best they may be demagogia's, where elites maintain power by promising the people what they will do for them (we call this 'elections'), but they are not system's or societies built upon people's power, demos kratos. Decisions to go to war are made by tiny numbers of people. Our economic and political policies are constructed for us, often to the detriment of the social majorities who are told to 'leave well enough alone' and trust in the experts. This is sometimes as true of politicians as it is of non-governmental organisations who themselves frequently prefer the conference halls and well-funded projects to actually working democratically with people as part of the people themselves. An alternative today, what Johan Galtung has called for, with 10,000 dialogues, meetings, discussions at every level, focussing not only on what is wrong, but also on what we want therapy, ideas, alternatives. In one form or another many of these dialogues are taking place. In a way they are therapy for the massive amounts of violence we are all being exposed to today, in our cultures, in our world, on our television sets or in the speeches of our 'democratically elected' rulers (the question, for those who do not support their policies, should not be 'who put them in power' -- though this is also important -- but why haven't we removed them from power yet?). They are also empowering, if we take the step beyond saying what is wrong to what could be done?, what should be done?, and then go further to discussing what I/we can do about it. Mobilising people for peace today is not simply about a slogan (though coming up with clearly expressed messages in a few words will of course help us to link people together and raise awareness). What is necessary, beyond any single issue or top-level strategy for how to change the world, is the process. The way is the goal. Perhaps the greatest achievement of the social justice/anti-globalisation movement is that it has mobilised, involved, and empowered millions of people around the world in discussing, thinking about, and acting upon the realities around them. On the streets of Seattle, Praha, Okinawa, Melbourne, Gotheburg, Washington, Quebec, Genoa, Ottawa, people, many of whom refuse to vote, have been discussing foreign policy, domestic politics, people to people movements, and all the issues which politicians and well-established NGOs are not able and often not willing to discuss with people. We have our 'manifestos', our policies and plans which we wish to put forward in the name of people, often addressing them to 'politicians' and 'elites' believing, in a fundamentally undemocratic way, that they will be the ones to bring about and implement change for us. This is not to say that that is not an important level which we also need to work at. The broader vision here is both/and, not either or, in terms of strategy as well often of vision. We also need, however, to be willing to take part in the much slower, more timely, and more empowering process, of tens of thousands of dialogues together with people, communities, and organisations at every level. Solidarity today is being built upon and carried further into alliances not just supporting people in their struggles for social justice, peace and freedom, but carrying forward those struggles ourselves in our own communities, our own towns, cities and villages. If we wish to change the injustices taking place in the world today we must of course work on a global level, but we must also work, just as importantly, within our communities. Again, both/and rather than either or. We should also be wary when we say 'we must begin here', or 'this must be done first!', even when the message is very positive and constructive. 'We must begin with the individual!'. 'We must begin by changing society'!. 'We must begin with a culture of peace!'. 'We must begin by ending the debt!'. All of these, and the many others put forward, are extremely important issues. They are also all linked together. Again, both/and. Exclusive and elitist visions will only serve to further fragment our efforts, creating division and separation where what is needed is dialogue, solidarity, cooperation and alliances between movements/organisations which often take diverse strategies and approaches to addressing deeply interlinking injustices and structures and cultures of violence. Conscientisation (raising awareness, often political awareness -- but also social, cultural, economic), organisation (we can do more together than we can apart, and it is necessary to organise -- though in many different ways -- to be able to bring about changes, both against what we think is wrong and for what we think is right), mobilisation (bringing in more and more people, involving people in dialogues, discussion, action, and work for change/transformation), and empowerment (I/we can, rather than 'I/we can't'; also important recognising the power we have to bring about change, rather than simply accepting existing, often extremely violent, power structures and believing that change can/should/must be implemented by those 'in power', whether slave owners, men, politicians, or fuhrers) are all necessary. A guide for this, and for ourselves as movements, organisations and individuals might be to be Critical -- not simply accepting what is happening but questioning it, recognising what we think is wrong, and also open to criticism of ourselves and what we are doing from others, not simply accepting things as 'given', 'natural', unchangeable ('TINA' -- there is no alternative, is one of the most deeply undemocratic and disempowering messages, frequently given by our 'democratically' elected elites/rulers); Radical -- according to the original etymology 'to go to the roots'. Often NGOs (as well as much western medicine and political strategies) are satisfied with dealing with 'effects', 'symptoms' and fail to go to the roots of the problems or structures we are dealing with. We cannot afford this today, or we will simply serve to reproduce sickness, disease, and injustice on ever broader scales. It is necessary, therefore, to go to the roots, to see what lies beneath, behind,

if we are to be able to bring about true transformation, healing; Creative -- also very important today. Not simply accepting old methods, techniques, slogans, ways of organising (though these are also all very important and should be learned from), but willing to be creative, to search for new approaches, new ideas, and also new therapies to transform direct, structural and cultural violence; Constructive -- as many have suggested, we need to go beyond what we are against, and also create what we are for. Part of being constructive is recognising our own power. It is itself an empowering act. Recognising, realising, building our ability to think, dream, create ourselves the type(s) of communities/world we want. Mobilising people for what we can do together, not simply for what we are opposed to being done by others. And; Honest -- with ourselves, with each other, to our goals, aims, vision. Unity of means and ends. People can feel when their is honesty in a movement/organisation. If it is not there, they will be sceptical and will not become involved. If we wish to be truly democratic, and truly empowering, we must also be honest, in our goals, our methods, our vision, and with ourselves and each other. Speaking all day at a conference about poverty and then eating a US$100 meal is not necessarily honest. Opposing the horrible poverty 3000 km away while ignoring the horrible poverty many live in in our own towns/cities/villages is not necessarily honest. Talking about 'democracy' but expecting people to simply join our movements and accept our slogans without dialogue, discussion, and mutual respect/empowerment, is not necessarily honest.

The challenges are great, and they are ones we must live up to. Also, for I will not say finally, **we cannot simply wait** until the end of the road for our alternatives, just as we cannot wait until wars or violence have ended before we begin peacebuilding and conflict transformation. True empowerment will come from building our alternatives, our alternative visions, social orders (or lack of order/structure), communities, and way in our lives, in our communities, in our struggles and movements, here and now. This is being done in every corner of the world. It is part of the regeneration, revitalisation, and empowerment of people -- demos kratos and peace by peaceful means.

AT: Pessimism – Race

Critique alone fails – it never puts something in its place.
Pyle, Boston College Law School JD, 1999

[Jefferey, 40 B.C.L. Rev. 787, "Race, Equality and the Rule of Law: Critical Race Theory's Attack on the Promises of Liberalism"
http://lawdigitalcommons.bc.edu/cgi/viewcontent.cgi?article=2124&context=bclr, p.808-9]

At bottom, <u>CRT fails because of its single-mindedly "critical" character</u>. Race-crits bewail minority disadvantage, blame liberal values for "constructing" this disadvantage and dismiss any defense of them as a legitimation of white supremacy.262 But here endeth their analysis. As CLS scholar Mark Tushnet admitted: "<u>Critique is all there is</u>." 263

"<u>Critique</u>," however, <u>never built anything, and liberalism, for all its shortcomings, is at least constructive. It provides broadly-accepted, reasonably well-defined principles to which political advocates may appeal in ways that transcend sheer power,</u> with at least some hope of incremental success:26' <u>Critical race theory would "deconstruct" this imperfect tradition, but offers nothing in its place.</u>

AT: Pessimism – Afro-Pess

The absolutism of afro-pessimism fails – dogmatism reifies social death and slips into cynicism.

Marriott, University of California Santa Cruz History of Consciousness professor, 2012

[David, Years Work Crit Cult Theory (2012) 20 (1): 37-66, "Black Cultural Studies" EBSCO]

However, this is also not the entire story of Red, White, and Black, as I hope to show. For example, in Chapter One ('The Structure of Antagonisms'), written as a theoretical introduction, and which opens explicitly on the Fanonian question of why ontology cannot understand the being of the Black, Wilderson is prepared to say that black suffering is not only beyond analogy, it also refigures the whole of being: 'the essence of being for the White and non-Black position' is non-niggerness, consequently, '[b]eing can thus be thought of, in the first ontological instance, as non-niggerness, and slavery then as niggerness' (p. 37). It is not hard when reading such sentences to suspect a kind of absolutism at work here, and one that manages to be **peculiarly and dispiritingly dogmatic**: throughout Red, White, and Black, despite variations in tone and emphasis, there is always the desire to have black lived experience **named as the worst**, and the politics of such a desire inevitably collapses into a kind of **sentimental moralism**: for the claim that 'Blackness is incapacity in its most pure and unadulterated form' means merely that **the black has to embody this abjection** without reserve (p. 38). This logic—and the denial of any kind of 'ontological integrity' to the Black/Slave due to its endless traversal by force does seem **to reduce ontology to logic**, namely, a logic **of non-recuperability**—moves through the following points: (1) Black non-being is not capable of symbolic resistance and, as such, falls outside of any language of authenticity or reparation; (2) for such a subject, which Wilderson persists in calling 'death', the symbolic remains foreclosed (p. 43); (3) as such, Blackness is the record of an occlusion which remains ever present: 'White (Human) capacity, in advance of the event of discrimination or oppression, is parasitic on Black incapacity' (p. 45); (4) and, as an example of the institutions or discourses involving 'violence', 'antagonisms' and 'parasitism', Wilderson describes White (or non-Black) film theory and cultural studies as incapable of understanding the 'suffering of the Black—the Slave' (they cannot do so because they are erroneously wedded to humanism and to the psychoanalysis of Jacques Lacan, which Wilderson takes as two examples of what the Afro-pessimist should avoid) (p. 56); as a corrective, Wilderson calls for a new language of abstraction, and one centrally concerned with exposing 'the structure of antagonisms between Blacks and Humans' (p. 68). Reading seems to stop here, at a critique of Lacanian full speech: Wilderson wants to say that Lacan's notion of the originary (imaginary) alienation of the subject is still wedded to relationality as implied by the contrast between 'empty' and 'full' speech, and so apparently cannot grasp the trauma of 'absolute Otherness' that is the Black's relation to Whites, because psychoanalysis cannot fathom the 'structural, or absolute, violence' of Black life (pp. 74; 75). 'Whereas Lacan was aware of how language ''precedes and exceeds us'', he did not have Fanon's awareness of how violence also precedes and exceeds Blacks' (p. 76). The violence of such abjection—or incapacity—is therefore that it cannot be communicated or avowed, and is always already delimited by desubjectification and dereliction (p. 77). Whence the suspicion of an ontology reduced to a logic (of abjection). Leaving aside the fact that it is quite mistaken to limit Lacan's notion of full speech to the search for communication (the unconscious cannot be confined to parole), it is clear that, according to Wilderson's own 'logic', his description of the Black is working, via analogy, to Lacan's notion of the real but, in his insistence on the Black as an absolute outside Wilderson can only duly **reify this void at the heart of universality**. The Black is 'beyond the limit of contingency'—but it is worth saying immediately that this 'beyond' is indeed a foreclosure that defines a violence whose traces can only be thought violently (that is, analogically), and whose nonbeing returns as the theme for Wilderson's political thinking of a non-recuperable abjection. The Black is nonbeing and, as such, is more real and primary than being per se: given how much is at stake, this insistence on a racial metaphysics of injury implies a fundamental irreconcilability between Blacks and Humans (there is really no debate to be had here: irreconcilability is the condition and possibility of what it means to be Black).

AT: Pessimism – AT: Ethics DA

Impossible demands fail – strategic and specific demands are more subversive than "withdraw from the system" – the alt links comparatively more to the "ethics DA."
Zizek, University of Ljubljana Institute for Sociology and Philosophy senior researcher, 2007

[Slavoj, 11-15-07, " Resistance Is Surrender" http://www.lrb.co.uk/v29/n22/print/zize01_.html]

The response of some critics on the postmodern Left to this predicament is to call for a new politics of resistance. Those who still insist on fighting state power, let alone seizing it, are accused of remaining stuck within the 'old paradigm': the task today, their critics say, is to resist state power by withdrawing from its terrain and creating new spaces outside its control. This is, of course, the obverse of accepting the triumph of capitalism. The politics of resistance is nothing but the moralising supplement to a Third Way Left. Simon Critchley's recent book, Infinitely Demanding, is an almost perfect embodiment of this position. * For Critchley, the liberal-democratic state is here to stay. Attempts to abolish the state failed miserably; consequently, the new politics has to be located at a distance from it: anti-war movements, ecological organisations, groups protesting against racist or sexist abuses, and other forms of local self-organisation. It must be a politics of resistance to the state, of bombarding the state with impossible demands, of denouncing the limitations of state mechanisms. The main argument for conducting the politics of resistance at a distance from the state hinges on the ethical dimension of the 'infinitely demanding' call for justice: no state can heed this call, since its ultimate goal is the 'real-political' one of ensuring its own reproduction (its economic growth, public safety, etc). 'Of course,' Critchley writes, history is habitually written by the people with the guns and sticks and one cannot expect to defeat them with mocking satire and feather dusters. Yet, as the history of ultra-leftist active nihilism eloquently shows, one is lost the moment one picks up the guns and sticks. Anarchic political resistance should not seek to mimic and mirror the archic violent sovereignty it opposes. So what should, say, the US Democrats do? Stop competing for state power and withdraw to the interstices of the state, leaving state power to the Republicans and start a campaign of anarchic resistance to it? And what would Critchley do if he were facing an adversary like Hitler? Surely in such a case one should 'mimic and mirror the archic violent sovereignty' one opposes? Shouldn't the Left draw a distinction between the circumstances in which one would resort to violence in confronting the state, and those in which all one can and should do is use 'mocking satire and feather dusters'? The ambiguity of Critchley's position resides in a strange non sequitur: if the state is here to stay, if it is impossible to abolish it (or capitalism), why retreat from it? Why not act with(in) the state? Why not accept the basic premise of the Third Way? Why limit oneself to a politics which, as Critchley puts it, 'calls the state into question and calls the established order to account, not in order to do away with the state, desirable though that might well be in some utopian sense, but in order to better it or attenuate its malicious effect'? These words simply demonstrate that today's liberal-democratic state and the dream of an 'infinitely demanding' anarchic politics exist in a relationship of mutual parasitism: anarchic agents do the ethical thinking, and the state does the work of running and regulating society.

Critchley's anarchic ethico-political agent acts like a superego, comfortably bombarding the state with demands; and the more the state tries to satisfy these demands, the more guilty it is seen to be. In compliance with this logic, the anarchic agents focus their protest not on open dictatorships, but on the hypocrisy of liberal democracies, who are accused of betraying their own professed principles. The big demonstrations in London and Washington against the US attack on Iraq a few years ago offer an exemplary case of this strange symbiotic relationship between power and resistance. Their paradoxical outcome was that both sides were satisfied. The protesters saved their beautiful souls: they made it clear that they don't agree with the government's policy on Iraq. Those in power calmly accepted it, even profited from it: not only did the protests in no way prevent the already-made decision to attack Iraq; they also served to legitimise it. Thus George Bush's reaction to mass demonstrations protesting his visit to London, in effect: 'You see, this is what we are fighting for, so that what people are doing here – protesting against their government policy – will be possible also in Iraq!' It is striking that the course on which Hugo Chávez has embarked since 2006 is the exact opposite of the one chosen by the postmodern Left: far from resisting state power, he grabbed it (first by an attempted coup, then democratically), ruthlessly using the Venezuelan state apparatuses to promote his goals. Furthermore, he is militarising the barrios, and organising the training of

armed units there. And, the ultimate scare: now that he is feeling the economic effects of capital's 'resistance' to his rule (temporary shortages of some goods in the state-subsidised supermarkets), he has announced plans to consolidate the 24 parties that support him into a single party. Even some of his allies are sceptical about this move: will it come at the expense of the popular movements that have given the Venezuelan revolution its élan? However, this choice, though risky, should be fully endorsed: the task is to make the new party function not as a typical state socialist (or Peronist) party, but as a vehicle for the mobilisation of new forms of politics (like the grass roots slum committees). What should we say to someone like Chávez? 'No, do not grab state power, just withdraw, leave the state and the current situation in place'? Chávez is often dismissed as a clown – but wouldn't such a withdrawal just reduce him to a version of Subcomandante Marcos, whom many Mexican leftists now refer to as 'Subcomediante Marcos'? Today, it is the great capitalists – Bill Gates, corporate polluters, fox hunters – who 'resist' the state. The lesson here is that the truly subversive thing is not to insist on 'infinite' demands we know those in power cannot fulfil. Since they know that we know it, such an 'infinitely demanding' attitude presents no problem for those in power: 'So wonderful that, with your critical demands, you remind us what kind of world we would all like to live in. Unfortunately, we live in the real world, where we have to make do with what is possible.' The thing to do is, on the contrary, to bombard those in power with strategically well-selected, precise, finite demands, which can't be met with the same excuse.

AT: Pessimism – AT: Cooption DA

Fear of cooption and concerns with authenticity is ivory tower oppositionalism – it never gets off the ground.
Pyle, Boston College Law School JD, 1999

[Jefferey, 40 B.C.L. Rev. 787, "Race, Equality and the Rule of Law: Critical Race Theory's Attack on the Promises of Liberalism"
http://lawdigitalcommons.bc.edu/cgi/viewcontent.cgi?article=2124&context=bclr, p.808-9]

For all their talk of "realism,"''' race-crits are strangely unrealistic in their proposals for reform. 1 m7 Most probably realize that radical measures like racial or ethnic reparations are not likely to be granted, especially by a court. But even unrealistic proposals are rare, because race-crits generally prefer not to suggest solutions, but to "resist" the dominant legal thought, doctrine and policy, whatever that happens to be.'" As Derrick Bell has put it, "most critical race theorists are committed to a program of scholarly resistance, and most hope scholarly resistance will lay the groundwork for wide-scale resistance."'" How this **ivory tower oppositionalism** would foment grassroots revolt is unclear, because CRT professors rarely suggest anything practical. Rather, their exhortations are meant, as Bell says, to "harass white folks" and • thereby "make life bearable in a society where blacks are a permanent, subordinate class."'"

One of the race-crits' few practical programs of "resistance" is Paul Butler's proposal that inner-city juries practice racially-based jury nullification.' 91 jurors of color, Butler argues, have the "moral responsibility" not to apply the criminal law to blacks and whites equally, but to "etnancipate some guilty black outlaws" because "the black community" would be "better off" if there were fewer black men in prison.'" If enough juries were hung or not-guilty verdicts rendered, he imagines, the white-dominated government would change its excessive reliance on incarceration.'" Butler rejects the ordinary democratic process of legal reform.' Democracy, he says, ensures a "permanent, homogenous majority" of whites that "dominat[es]" African Ainericans.w 5 Butler is probably correct that occasional acts of jury nullification might well express the resentment that many African Americans justifiably feel towards discriminatory law enforcement.'"`' As Randall Kennedy has pointed out, however, black Americans are disproportionately the victims of crimes,' 97 and therefore tend to favor more, not less, criminal prosecution and punishment. 1 "8

The race-crits' preference for "resistance"' 99 over democratic participation seems to flow from a fear of losing their status as "oppositional scholars] "200 to the game of mainstream law and politics, which they regard as "an inevitably co-optive process?"' Better to be radically opposed to the "doniinant political discourse""2 and remain an out than to work within the current system and lose one's "authenticity?" In rejecting the realistic for the "authentic," however, race-crits begin to look like academic poseurs—ideological purists striking the correct radical stance, but doing little within the confines of the real world, so sure are they that nothing much can be done."

EXTN – AT: Pessimism

It is better to have faith in incrementalism – cynicism breeds ineffectiveness. Tannenbaum, University of Illinois Urbana-Champaign social psychology PhD candidate, 10-10-13

[Melanie, MA in social psychology, "Lady Gaga, You Shouldn't Be Doing It For The Applause." http://blogs.scientificamerican.com/psysociety/2013/10/10/lady-gaga-applause/]

Moving to a slightly different (yet related) domain, <u>research on goal theory also reveals that there are two broad types of goal orientations. You might have a mastery</u> (or learning) <u>goal, in which your primary focus is on mastering difficult material, learning and understanding complex topics, and truly improving at a task. Or, you might have a performance (or ego) goal, in which your primary focus is on demonstrating competence, avoiding negative evaluations, and publicly showing that you are "good" at something. In the former, your focus is internal</u> — you are presumably trying to master some kind of skill or material for your own benefit, so you can genuinely learn and grow, regardless of what others happen to think of your ability or performance. <u>In the latter, your focus is external</u> — you are presumably focused on the evaluations of others, and worrying more about what they think or say than about your actual progress. In other words, you might be doing it all for something like applause.¶ Perhaps unsurprisingly, those two different outlooks on personality & skills mentioned two paragraphs above predict how people come to form mastery or performance goal orientations. <u>People with entity views typically prioritize "looking good" over actually developing competence, leading them to focus on performance</u> (rather than mastery) <u>goals. After all, if you believe that you are born with a set ability level and it can't really be altered, it makes more sense to focus on how you appear</u> (trying to maximize your positive evaluations from others) <u>rather than wasting your time in a futile attempt to change</u> your innate ability level. Incremental theorists, on the other hand, are more likely to set goals that revolve around learning and increasing competence. Generally, **this becomes a sort of self-fulfilling prophesy: People who believe that they can improve** their abilities with hard work <u>usually end up working harder, and they **gain mastery and become better**</u> in that domain as a result.¶ <u>In fact, studies consistently link mastery</u> (or learning) <u>goals to more adaptive outcomes than performance goals</u>. For example, MBA students who set learning goals (like mastering complex course material) outperform MBA students who set performance goals (like getting a high GPA). <u>Teenagers who hold entity beliefs about athletic ability tend to be less motivated to pursue athletic goals, whereas teens with incremental beliefs are more likely to enjoy sports and genuinely want to increase their athletic abilities</u>. Holding incremental beliefs is significantly more adaptive for both learning and performance — **believing that you can improve is better for both motivation and enjoyment** than believing that you must be "born" into greatness. This is because people with mastery goals also exhibit higher levels of intrinsic motivation, self-regulation, persistence in the face of challenge or possible failure, and metacognition (an overarching term for the ways in which we plan, monitor, and evaluate our progress on important goals to help us ensure that we're always engaging in the best possible strategies).¶ <u>As Carol Dweck (one of the leading researchers on this topic) explains in the video above, all of this put together makes a lot sense. Even though you might not see the differential effects of these goals in the face of success, they certainly emerge in the face of failure. People with incremental theories believe that they are always capable of learning, growing, and improving. As a result, failing on a difficult task is not necessarily a personal threat</u>. Rather, it might just be a cue that this is a task on which he/she needs to work harder — <u>it is an opportunity to learn and grow. People with entity theories, however, do not believe that they can truly change their abilities. Thus, there is no point in responding to criticism or negative feedback</u> by working harder or persisting on a difficult task — <u>after all, if you can't improve, what's the point? As a result, any negative feedback is seen a threat. Therefore, they are more likely to seek out situations in which they are likely to excel</u> and "appear" smart or talented. <u>This can be fine for a while, but it severely limits entity theorists' capacities to grow and reach their full potential</u>. After all, if you

are terrified of negative feedback, **you are more likely to give up on a task when faced with failure and less likely to persist** in the face of a challenge.

Optimism is a prerequisite to solvency.
Levine, practicing psychologist and prominent author, 2011

[Bruce, 9-28-11, "How Anti-Authoritarians Can Transcend their Sense of Hopelessness and Fight Back" http://www.alternet.org/print/story/152565/how_anti-authoritarians_can_transcend_their_sense_of_hopelessness_and_fight_back]

Critical thinking anti-authoritarians see the enormity of the military-industrial complex, the energy-industrial complex and the financial-industrial complex. They see the overwhelming power of the U.S. ruling class. They see many Americans unaware of the true sources of their oppression or with little knowledge of the strategies and tactics necessary to overcome it. They see American society lacking the psychological and cultural building blocks necessary for democratic movements—the self-respect required to reject the role as a mere subject of power, the collective self-confidence that success is possible, courage, determination, anti-authoritarianism, and solidarity. They see how the corporatocracy pays back those few Americans who do question, challenge, and resist illegitimate authority with economic and political marginalization.¶ Critical Thinking, Depression, and Political Passivity¶ Research shows that a more accurate notion of one's powerlessness can result in a greater feeling of helplessness and is associated with depression. Several classic studies show that moderately depressed people are more critically thinking than those who are not depressed. Researchers Lauren Alloy and Lyn Abramson, studying nondepressed and depressed subjects who played a rigged game in which they had no actual control, found that nondepressed subjects overestimated their contribution to winning, while depressed subjects more accurately evaluated their lack of control.¶ If you are critical thinking enough to see the reality of just how much influence the corporatocracy has and how little power you have, then you are going to experience more pain than those who do not see these truths. To dull this pain, in addition to drugs and other diversions, human beings use depression and apathy. But these "shutdown strategies" weaken us and create passivity, immobilization and what Bob Marley called "mental slavery," which in itself can be humiliatingly painful. And in this vicious cycle, human beings use even more diversions and shutdown strategies to dull this ever-increasing pain.¶ When one is in such a debilitating vicious cycle, painful truths about the cause of one's malaise—the truths of how we are getting screwed—are not positively energizing. Instead, one may take such truths as confirmation that pessimism and hopelessness are warranted. The vicious cycle continues.¶ When one is already in pain and immobilized, there is a reflexive negative reaction to any proposed solution. Solutions demand effort, and a demand for effort is painful for those with little energy. So, it's much easier to reflexively dismiss any solution. Of course, many solutions do deserve to be dismissed, as they may well be naïve.¶ The feeling of hopelessness is a legitimate one. And hopeless people are turned off by attempts to invalidate their feelings. Is it possible to validate that feeling of hopelessness while at the same time challenging the wisdom of inactions based on hopelessness? And is it possible to challenge it in a way that doesn't insult the intelligence of critical thinkers?¶ Critical Thinking about Critical Thinking¶ The battle against the corporatocracy demands critical thinking, which results in seeing many ugly truths about reality. This critical thinking is absolutely necessary. Without it, one is more likely to engage in tactics that can make matters worse. Critical thinking also means the ability to think critically about one's pessimism—realizing that pessimism can cripple the will. Critical thinkers who reflect on their own critical thinking recognize how negativism can cause inaction, which results in maintaining the status quo.¶ Critical thinking anti-authoritarians who move into hopelessness can forget that while they may in fact be better at seeing ugly truths than are many other people, they cannot see everything. Simply put, critical thinkers

sometimes lose their humility.¶ Abraham Lincoln, considered by many historians to be our most critical thinking president, was also a major depressive. When he was a young man, he became so depressed that twice his friends had to form suicide watches for him. In the 1850s in the United States, the major battle was less over abolishing slavery than merely stopping the spread of it. Lincoln, who fought politically to stop the spread of slavery, wrote in 1856 a pessimistic analysis of the North's chances of winning this fight:¶ This immense, palpable pecuniary interest, on the question of extending slavery, unites the Southern people, as one man. But it can not be demonstrated that the North will gain a dollar by restricting it. Moral principle is all, or nearly all, that unites us of the North. Pity 'tis, it is so, but this is a looser bond, than pecuniary interest. Right here is the plain cause of their perfect union and our want of it.¶ That slavery would be abolished in the United States less than a decade after Lincoln's pessimistic analysis of the difficulty of merely stopping its spread was one of those seeming impossibilities that became possible because of unforeseen historical events. In the North, there was certainly not enough concern for African Americans to result in the end of slavery. But less than a decade after Lincoln's pessimistic analysis about merely stopping the spread of slavery, one unforeseen event after another resulted in the abolition of slavery.¶ <u>There are many examples from history of seeming impossibilities actually happening, examples that compel critical thinkers to rethink whether they are actually seeing all the possibilities</u>. One recent example is, of course, the Arab spring. Many critical thinkers from that part of the world remain amazed at the huge revolts in Egypt that toppled the Mubarak tyranny.¶ The collapse of the Soviet empire seemed impossible to most Americans up until shortly before it occurred. Most Americans saw only mass resignation within the Soviet Union and its sphere of control. But the shipyard workers in Gdansk, Poland, did not see their Soviet and Communist Party rulers as the all-powerful forces that Americans did. And so Polish workers' Solidarity, by simply refusing to go away, provided a strong dose of morale across Eastern Europe at the same time other historical events—such as the Soviet Union's Afghanistan war—weakened their empire.¶ Why Not Just Wait for the Collapse?¶ History tells us that not just the Soviet empire but all empires ultimately collapse, and so why not just wait for their fall? It is pretty safe to say that the U.S. military-industrial complex and other oppressive U.S. industrial complexes will ultimately fall. These may be transformed by our own efforts or, more likely—given Americans' current state of political passivity—they will fall owing mostly under the weight of their own stupidity. So, if it is more likely that these will fall under the weight of their own stupidity, why bother with activism?¶ One reason for democratic movements is that history tells us that not all empires and oppressive institutions fall under the weight of their own stupidity, as some are transformed by a combination of democratic movements and empire stupidity.¶ There is another reason to work each day on the democracy battlefields at our workplace, schools, the media, the marketplace, etc. Whether an empire and its oppressive institutions fall under the weight of their own stupidity or with help from a democratic movement, there must be people around in the aftermath who have what it takes to create and maintain a democratic society. There must be people who have retained their individual self-respect, collective self-confidence, courage, determination, anti-authoritarianism, and solidarity.¶ <u>The lesson from history is that tyrannical and dehumanizing institutions are often more fragile than they appear. We never really know until it happens whether or not we are living in that time when historical variables are creating opportunities for seemingly impossible change</u>. Maybe in our lifetime, or our kids' lifetime, or their kids' lifetime, the current corporatocracy will fall. It may fall because of the efforts of democratic movements or because of its own stupidity or some combination.¶ But <u>when it does fall, the likelihood that it will be replaced by an enduring democratic society rests on whether there are enough of us with practice in democracy, enough of us who took seriously the psychological and cultural building blocks of self-respect, collective self-confidence, courage, determination, anti-authoritarianism, and solidarity. And democratic movements are the best place to practice creating those psychological and cultural building blocks required for an enduring democracy</u>.¶ That's why "Occupy Wall Street" makes sense, and that's why I will be at "October 2011" at Freedom Plaza, Washington D.C. beginning next Thursday, October 6.

Even illusory agency is productive. Imagining possible changes is necessary to motivate action.
Shove, Lancaster University sociology professor, and Walker, Lancaster University geography professor, 2007

[Elizabeth and Gordon, "CAUTION! Transitions ahead: politics, practice, and sustainable transition management" http://eprints.lancs.ac.uk/761/2/A_cautionary_note_on_transition_managementv5.pdf, p.8]

For academic readers, our commentary argues for loosening the intellectual grip of 'innovation studies', for backing off from the nested, hierarchical multi-level model as the only model in town, and for exploring other social scientific, but also systemic theories of change. <u>The</u>

more we think about the politics and practicalities of reflexive transition management, the more complex the process appears: for a policy audience, our words of caution could be read as an invitation to abandon the whole endeavour. If agency, predictability and legitimacy are as limited as we've suggested, this might be the only sensible conclusion.¶ However, we are with Rip (2006) in recognising the value, productivity and everyday necessity of an 'illusion of agency', and of the working expectation that a difference can be made even in the face of so much evidence to the contrary. The outcomes of actions are unknowable, the system unsteerable and the effects of deliberate intervention inherently unpredictable and, ironically, it is this that sustains concepts of agency and management. As Rip argues 'illusions are productive because they motivate action and repair work, and thus something (whatever) is achieved' (Rip 2006: 94). Situated inside the systems they seek to influence, governance actors – and actors of other kinds as well - are part of the dynamics of change: even if they cannot steer from the outside they are necessary to processes within.¶ This is, of course, also true of academic life. Here we are, busy critiquing and analysing transition management in the expectation that somebody somewhere is listening and maybe even taking notice. If we removed that illusion would we bother writing anything at all? Maybe we need such fictions to keep us going, and maybe – fiction or no - somewhere along the line something really does happen, but not in ways that we can anticipate or know.

Race K Answers

2ac – No Root Cause – Whiteness

Whiteness not the root cause of the aff – it's too sweeping.

Shelby, Harvard University African and African American Studies professor, 2005

[Tommie, also a philosophy professor at Harvard, "We Who Are Dark: The Philosophical Foundations of Black Solidarity" http://books.google.com/books?id=8W7W6F3fCPkC&q=others+might+challenge#v=snippet&q=others%20might%20challenge&f=false, p.147-8]

Others might challenge the distinction between ideological and structural causes of black disadvantage, on the grounds that we are rarely, if ever, able to so neatly separate these factors, an epistemic situation that is only made worse by the fact that these causes interact in complex ways with behavioral factors. These distinctions, while perhaps straightforward in the abstract, are difficult to employ in practice. For example, it would be difficult, if not impossible, for the members of a poor black community to determine with any accuracy whether their impoverished condition is due primarily to institutional racism, the impact of past racial injustice, the increasing technological basis of the economy, shrinking state budgets, the vicissitudes of world trade, the ascendancy of conservative ideology, poorly funded schools, lack of personal initiative, a violent drug trade that deters business investment, some combination of these factors, or some other explanation altogether. Moreover, it is notoriously difficult to determine when the formulation of putatively race-neutral policies has been motivated by racism or when such policies are unfairly applied by racially biased public officials.

There are very real empirical difficulties in determining the specific causal significance of the factors that create and perpetuate black disadvantage; nonetheless, it is clear that these factors exist and that justice will demand different practical remedies according to each factor's relative impact on blacks' life chances. We must acknowledge that our social world is complicated and not immediately transparent to common sense, and thus that systematic empirical inquiry, historical studies, and rigorous social analysis are required to reveal its systemic structure and sociocultural dynamics. There is, moreover, no mechanical or infallible procedure for determining which analyses are the soundest ones. In addition, given the inevitable bias that attends social inquiry, legislators and those they represent cannot simply defer to social-scientific experts.

We must instead rely on open public debate—among politicians, scholars, policy makers, intellectuals, and ordinary citizens—with the aim of garnering rationally motivated and informed consensus. And even if our practical decision procedures rest on critical deliberative discourse and thus live up to our highest democratic ideals, some trial and error through actual practice is unavoidable. These difficulties and complications notwithstanding, a general recognition of the distinctions among the ideological and structural causes of black disadvantage could help blacks refocus their political energies and self-help strategies. Attention to these distinctions might help expose the superficiality of theories that seek to reduce all the social obstacles that blacks face to contemporary forms of racism or white supremacy. A more penetrating, subtle, and empirically grounded analysis is needed to comprehend the causes of racial inequality and black disadvantage. Indeed, these distinctions highlight the necessity to probe deeper to find the causes of contemporary forms of racism, as some racial conflict may be a symptom of broader problems or recent social developments (such as immigration policy or reduced federal funding for higher education).

AT: Race – Debates/Implementation Key

Debates about the implementation and consequences of policies are critical to fighting racism.
Bracey, Washington University law professor and African and African American studies professor, 2006

[Christopher, 79 S. Cal. L. Rev. 1231, "THE CUL DE SAC OF RACE PREFERENCE DISCOURSE" http://lawreview.usc.edu/wp-content/uploads/slideshow/Bracey_Christopher_79_6.pdf, p.1318]

Second, reducing conversation on race matters to an ideological contest allows opponents to elide inquiry into whether the results of a particular preference policy are desirable. Policy positions masquerading as principled ideological stances create the impression that a racial policy is not simply a choice among available alternatives, but the embodiment of some higher moral principle. Thus, the "principle" becomes an end in itself, without reference to outcomes. Consider the prevailing view of colorblindness in constitutional discourse. Colorblindness has come to be understood as the embodiment of what is morally just, independent of its actual effect upon the lives of racial minorities. This explains Justice Thomas's belief in the "moral and constitutional equivalence" between Jim Crow laws and race preferences, and his tragic assertion that "Government cannot make us equal [but] can only recognize, respect, and protect us as equal before the law."281 For Thomas, there is no meaningful difference between laws designed to entrench racial subordination and those designed to alleviate conditions of oppression. Critics may point out that colorblindness in practice has the effect of entrenching existing racial disparities in health, wealth, and society. But in framing the debate in purely ideological terms, opponents are able to avoid the contentious issue of outcomes and make viability determinations based exclusively on whether racially progressive measures exude fidelity to the ideological principle of colorblindness. Meaningful policy debate is replaced by ideological exchange, which further exacerbates hostilities and deepens the cycle of resentment.282

Policy debates over how to fight racism are critical.
Bouie, The American Prospect, 2013

[Jamelle, "Making (and Dismantling) Racism" http://prospect.org/article/making-and-dismantling-racism]

Over at The Atlantic, Ta-Nehisi Coates has been exploring the intersection of race and public policy, with a focus on white supremacy as a driving force in political decisions at all levels of government. This has led him to two conclusions: First, that anti-black racism as we understand it is a creation of explicit policy choices—the decision to exclude, marginalize, and stigmatize Africans and their descendants has as much to do with racial prejudice as does any intrinsic tribalism. And second, that it's possible to dismantle this prejudice using public policy. Here is Coates in his own words: Last night I had the luxury of sitting and talking with the brilliant historian Barbara Fields. One point she makes that very few Americans understand is that racism is a creation. You read Edmund Morgan's work and actually see racism being inscribed in the law and the country changing as a result. If we accept that racism is a creation, then we must then accept that it can be destroyed. And if we accept that it can be destroyed, we must then accept that it can be destroyed by us and that it likely must be destroyed by methods kin to creation. Racism was created by policy. It will likely only be ultimately destroyed by policy.

2ac – Race Traitors Perm

Whiteness is hegemonic but not monolithic – pragmatic redeployment of some forms of whiteness can be strategic.
Winant, University of California Santa Clara sociology professor, 1997

[Howard, New Left Review, "Behind Blue Eyes: Contemporary White Racial Politics"
http://www.soc.ucsb.edu/faculty/winant/whitness.html]

On the practical level, the argument goes, whites can become "race traitors" by rejecting their privilege, by refusing to collude with white supremacy. When you hear that racist joke, confront its teller. When you see the police harassing a nonwhite youth, try to intervene or at least bear witness. In short, recognize that white supremacy depends on the thousands of minute acts that reproduce it from moment to moment; it must "deliver" to whites a sense of their own security and superiority; it must make them feel that "I am different from those "others." Single gestures of this sort, Race Traitor's editors say, ...would [not] in all likelihood be of much consequence. But if enough of those who looked white broke the rules of the club to make the cops doubt their ability to recognize a white person merely by looking at him or her, how would it affect the cops' behavior (Editorial 1993, 4-5)? Thus the point is not that all whites recognize the lie of their privilege, but that enough whites do so, and act out their rejection of that lie, to disrupt the "white club's" ability to enforce its supremacy.

It is easy to sympathize with this analysis, at least up to a point. The postwar black movement, which in the US context at least served as the point of origin for all the "new social movements" and the much-reviled "politics of identity," taught the valuable lesson that politics went "all the way down." That is, meaningful efforts to achieve greater social justice could not tolerate a public/private, or a collective/individual distinction. Trying to change society meant trying to change one's own life. The formula "the personal is political," commonly associated with feminism, had its early origins among the militants of the civil rights movement (Evans 1980).

The problems come when deeper theoretical and practical problems are raised. Despite their explicit adherence to a "social construction" model of race (one which bears a significant resemblance to my own work), theorists of the abolitionist project do not take that insight as seriously as they should. ¶ They employ it chiefly to argue against biologistic conceptions of race, which is fine; but they fail to consider the complexities and rootedness of social construction, or as we would term it, racial formation. Is the social construction of whiteness so flimsy that it can be repudiated by a mere act of political will, or even by widespread and repeated acts aimed at rejecting white privilege? I think not; whiteness may not be a legitimate cultural identity in the sense of having a discrete, "positive" content, but it is certainly an overdetermined political and cultural category, having to do with socioeconomic status, religious affiliation, ideologies of individualism, opportunity, and citizenship, nationalism, etc. Like any other complex of beliefs and practices, "whiteness" is imbedded in a highly articulated social structure and system of significations; rather than trying to repudiate it, we shall have to rearticulate it.

That sounds like a daunting task, and of course it is, but it is not nearly as impossible as erasing whiteness altogether, as the abolitionist project seeks to do. Furthermore, because whiteness is a relational concept, unintelligible without reference to nonwhiteness -- note how this is true even of Roediger's formulation about "build[ing] an identity based on what one isn't" -- that rearticulation (or reinterpretation, or deconstruction) of whiteness can begin relatively easily, in the messy present, with the recognition that whiteness already contains substantial nonwhite elements. Of course, that recognition is only the beginning of a large and arduous process of political labor, which I shall address in the concluding section of this paper.

Notwithstanding these criticisms of the abolitionist project, we consider many of its insights to be vital components in the process of reformulating, or synthesizing, a progressive approach to whiteness. Its attention is directed toward prescisely the place where the neo-liberal racial project is weak: the point at which white identity constitutes a crucial support to white supremacy, and a central obstacle to the achievement of substantive social equality and racial justice.

CONCLUDING NOTES: WHITENESS AND CONTEMPORARY POLITICS

In a situation of racial dualism, as Du Bois observed more than¶ 90 years ago, race operates both to assign us and to deny us our¶ identity. It both makes the social world intelligible, and¶ simultaneously renders it opaque and mysterious. Not only does¶ it allocate resources, power, and privilege; it also provides¶ means for challenging that allocation. The contradictory¶ character of race provides the context in which racial dualism --¶ or the "color-line," as Du Bois designated it, has developed as¶ "the problem of the 20th century."

So what's new? Only that, as a result of incalculable human¶ effort, suffering, and sacrifice, we now realize that these¶ truths apply across the board. Whites and whiteness can no¶ longer be exempted from the comprehensive racialization process¶ that is the hallmark of US history and social structure.

This is the present-day context for racial conflict and thus for¶ US politics in general, since race continues to play its¶ designated role of crystallizing all the fundamental issues in US¶ society. As always, we articulate our anxieties in racial terms:¶ wealth and poverty, crime and punishment, gender and sexuality,¶ nationality and citizenship, culture and power, are all¶ articulated in the US primarily through race.

So what's new? It's the problematic of whiteness that has¶ emerged as the principal source of anxiety and conflict in the¶ postwar US. Although this situation was anticipated or¶ prefigured at earlier moments in the nation's past -- for¶ example, in the "hour of eugenics" (Stepan 1991, Kevles 1985,¶ Gould 1981) -- it is far more complicated now than ever before,¶ largely due to the present unavailability of biologistic forms of¶ racism as a convenient rationale for white supremacy.[7]

Whiteness -- visible whiteness, resurgent whiteness, whiteness as¶ a color, whiteness as difference -- this is what's new, and newly¶ problematic, in contemporary US politics. The reasons for this¶ have already emerged in my discussion of the spectrum of racial¶ projects and the particular representations these projects assign¶ to whiteness. Most centrally, the problem of the meaning of¶ whiteness appears as a direct consequence of the movement¶ challenge posed in the 1960s to white supremacy. The battles of¶ that period have not been resolved; they have not been won or¶ lost; however battered and bruised, the demand for substantive¶ racial equality and general social justice still lives. And¶ while it lives, the strength of white supremacy is in doubt.

The racial projects of the right are clear efforts to resist the¶ challenge to white supremacy posed by the movements of the 1960s¶ and their contemporary inheritors. Each of these projects has a¶ particular relationship to the white supremacist legacy, ranging¶ from the far right's efforts to justify and solidify white¶ entitlements, through the new right's attempts to utilize the¶ white supremacist tradition for more immediate and expedient¶ political ends, to the neoconservative project's quixotic quest¶ to surgically separate the liberal democratic tradition from the¶ racism that traditionally underwrote it. The biologistic racism¶ of the far right, the expedient and subtextual racism of the new¶ right, and the bad-faith anti-racism of the neoconservatives have¶ many differences from each other, but they have at least one¶ thing in common. They all seek to maintain the long-standing¶ association between whiteness and US political traditions,¶ between whiteness and US nationalism, between whiteness and¶ universalism. They all seek in different ways to preserve white¶ identity from the particularity, the difference, which the 1960s¶ movement challenge assigned to it.

The racial projects of the left are the movements' successors (as¶ is neoconservatism, in a somewhat perverse sense). Both the¶ neoliberal racial project and the abolitionist project seek to¶ fulfill the movement's thwarted dreams of a genuinely (i.e.,¶ substantively) egalitarian society, one in which significant¶ redistribution of wealth and power has taken place, and race no¶ longer serves as the most significant marker between winners and¶ losers, haves and have nots, powerful and powerless. Although¶ they diverge significantly -- since the neoliberals seek to¶ accomplish their ends through a conscious diminution of the¶ significance of race, and the abolitionists hope to achieve¶ similar ends through a conscious reemphasizing of the importance¶ of race -- they also have one very important thing in common. ¶ They both seek to rupture the barrier between whites and¶ racially-defined minorities, the obstacle which prevents joint¶ political action. They both seek to associate whites and¶ nonwhites, to reinterpret the meaning of whiteness in such a way¶ that it no longer has the power to impede class alliances.

Although the differences and indeed the hostility -- between the¶ neoliberal and abolitionist projects, between the reform-oriented¶ and radical conceptions of whiteness -- are quite severe, we¶ consider it vital that adherents of each project recognize that¶ they hold part of the key to challenging white supremacy in the¶ contemporary US, and that their counterpart project holds the¶ other part of the key. Neoliberals rightfully argue that a¶ pragmatic approach to transracial politics is vital if the¶ momentum of racial reaction is to be halted or reversed. ¶ Abolitionists properly emphasize challenging the ongoing¶ commitment to white supremacy on the part of many whites.

Both of these positions need to draw on each other, not only in¶ strategic terms, but in theoretical ones as well. The¶ recognition that racial identities -- all racial identities,¶ including whiteness -- have become

implacably dualistic, could be far more liberating on the left than it has thus far been. For neoliberals, it could permit and indeed justify an acceptance of race-consciousness and even nationalism among racially-defined minorities as a necessary but partial response to disenfranchisement, disempowerment, and superexploitation. There is no inherent reason why such a political position could not coexist with a strategic awareness of the need for strong, class-conscious, transracial coalitions. We have seen many such examples in the past: in the anti-slavery movement, the communist movement of the 1930s (Kelley 1994), and in the 1988 presidential bid of Jesse Jackson, to name but a few. This is not to say that all would be peace and harmony if such alliances could come more permanently into being. But there is no excuse for not attempting to find the pragmatic "common ground" necessary to create them.

Abolitionists could also benefit from a recognition that on a pragmatic basis, whites can ally with racially-defined minorities without renouncing their whiteness. If they truly agree that race is a socially constructed concept, as they claim, abolitionists should also be able to recognize that **racial identities are not either-or matters, not closed concepts** that must be upheld in a reactionary fashion or disavowed in a comprehensive act of renunciation. To use a postmodern language I dislike: **racial identities are deeply "hybridized"**; they are not "sutured," but remain open to rearticulation. "To be white in America is to be very black. If you don't know how black you are, you don't know how American you are" (Thompson 1995, 429).

EXTN – Implementation Details Key

Vague alts fail – utopianism doesn't hit the ground.
Farber, City University of New York Brooklyn College political science professor, 9-13-12

[Samuel, "Occupy Wall Street and the Art of Demanding" http://truth-out.org/opinion/item/11507-occupy-wall-street-and-the-art-of-demanding]

The OWS reluctance to formulate demands might have been beneficial initially in that it might have created a more welcoming atmosphere to newly radicalized people. But as movements develop and mature, they need to state more clearly what they stands for and not only what they stand against. Movements need to develop some kind of theory to guide their actions, not as an obscure, technical body of thought only accessible to the select few, but as the clearest possible ideas about the nature of the enemy and of the movement. Movements must address the problems they are likely to confront as they go from point A – where they are – to point B – where they want to be.

Concrete alts are key – either the perm solves OR the alt does nothing.
Bryant, Collin College philosophy professor, 2012

[Levi, "Critique of the Academic Left" http://larvalsubjects.wordpress.com/2012/11/11/underpants-gnomes-a-critique-of-the-academic-left/]

The problem as I see it is that this is the worst sort of abstraction (in the Marxist sense) and wishful thinking. Within a Marxo-Hegelian context, a thought is abstract when it ignores all of the mediations in which a thing is embedded. For example, I understand a robust tree abstractly when I attribute its robustness, say, to its genetics alone, ignoring the complex relations to its soil, the air, sunshine, rainfall, etc., that also allowed it to grow robustly in this way. This is the sort of critique we're always leveling against the neoliberals. They are abstract thinkers. In their doxa that individuals are entirely responsible for themselves and that they completely make themselves by pulling themselves up by their bootstraps, neoliberals ignore all the mediations belonging to the social and material context in which human beings develop that play a role in determining the vectors of their life. They ignore, for example, that George W. Bush grew up in a family that was highly connected to the world of business and government and that this gave him opportunities that someone living in a remote region of Alaska in a very different material infrastructure and set of family relations does not have. To think concretely is to engage in a cartography of these mediations, a mapping of these networks, from circumstance to circumstance (what I call an "onto-cartography"). It is to map assemblages, networks, or ecologies in the constitution of entities.¶Unfortunately, the academic left falls prey to its own form of abstraction. It's good at carrying out critiques that denounce various social formations, yet very poor at proposing any sort of realistic constructions of alternatives. This because it thinks abstractly in its own way, ignoring how networks, assemblages, structures, or regimes of attraction would have to be remade to create a workable alternative. Here I'm reminded by the "underpants gnomes" depicted in South Park:¶The underpants gnomes have a plan for achieving profit that goes like this:¶Phase 1: Collect Underpants¶Phase 2: ?¶Phase 3: Profit!¶They even have a catchy song to go with their work:¶Well this is sadly how it

often is with the academic left. Our plan seems to be as follows:¶Phase 1: Ultra-Radical Critique¶Phase 2: ?¶Phase 3: Revolution and complete social transformation!¶Our problem is that we seem perpetually stuck at phase 1 without ever explaining what is to be done at phase 2. Often the critiques articulated at phase 1 are right, but there are nonetheless all sorts of problems with those critiques nonetheless. In order to reach phase 3, we have to produce new collectives. In order for new collectives to be produced, people need to be able to hear and understand the critiques developed at phase 1. Yet this is where everything begins to fall apart. Even though these critiques are often right, we express them in ways that only an academic with a PhD in critical theory and post-structural theory can understand. How exactly is Adorno to produce an effect in the world if only PhD's in the humanities can understand him? Who are these things for? We seem to always ignore these things and then look down our noses with disdain at the Naomi Kleins and David Graebers of the world. To make matters worse, we publish our work in expensive academic journals that only universities can afford, with presses that don't have a wide distribution, and give our talks at expensive hotels at academic conferences attended only by other academics. Again, who are these things for? Is it an accident that so many activists look away from these things with contempt, thinking their more about an academic industry and tenure, than producing change in the world? **If a tree falls in a forest and no one is there to hear it, it doesn't make a sound!** Seriously dudes and dudettes, what are you doing?¶But finally, and worst of all, us Marxists and anarchists all too often act like assholes. We denounce others, we condemn them, we berate them for not engaging with the questions we want to engage with, and we vilify them when they don't embrace every bit of the doxa that we endorse. We are every bit as off-putting and unpleasant as the fundamentalist minister or the priest of the inquisition (have people yet understood that Deleuze and Guattari's Anti-Oedipus was a critique of the French communist party system and the Stalinist party system, and the horrific passions that arise out of parties and identifications in general?). This type of "revolutionary" is the greatest friend of the reactionary and capitalist because they do more to drive people into the embrace of reigning ideology than to undermine reigning ideology. These are the people that keep Rush Limbaugh in business. Well done!¶But this isn't where our most serious shortcomings lie. Our most serious shortcomings are to be found at phase 2. We almost never make concrete proposals for how things ought to be restructured, for what new material infrastructures and semiotic fields need to be produced, and when we do, our critique-intoxicated cynics and skeptics immediately jump in with an analysis of all the ways in which these things contain dirty secrets, ugly motives, and are doomed to fail. How, I wonder, are we to do anything at all when we have no concrete proposals? We live on a planet of 6 billion people. These 6 billion people are dependent on a certain network of production and distribution to meet the needs of their consumption. That network of production and distribution does involve the extraction of resources, the production of food, the maintenance of paths of transit and communication, the disposal of waste, the building of shelters, the distribution of medicines, etc., etc., etc.¶What are your proposals? How will you meet these problems? How will you navigate the existing mediations or semiotic and material features of infrastructure? Marx and Lenin had proposals. Do you? Have you even explored the cartography of the problem? Today we are so intellectually bankrupt on these points that we even have theorists speaking of events and acts and talking about a return to the old socialist party systems, ignoring the horror they generated, their failures, and not even proposing ways of avoiding the repetition of these horrors in a new system of organization. Who among our critical theorists is thinking seriously about how to build a distribution and production system that is responsive to the needs of global consumption, avoiding the problems of planned economy, ie., who is doing this in a way that gets notice in our circles? Who is addressing the problems of micro-fascism that arise with

party systems (there's a reason that it was the Negri & Hardt contingent, not the Badiou contingent that has been the heart of the occupy movement). At least the ecologists are thinking about these things in these terms because, well, they think ecologically. Sadly we need something more, a melding of the ecologists, the Marxists, and the anarchists. We're not getting it yet though, as far as I can tell. Indeed, folks seem attracted to yet another critical paradigm, Laruelle.¶ I would love, just for a moment, to hear a radical environmentalist talk about his ideal high school that would be academically sound. How would he provide for the energy needs of that school? How would he meet building codes in an environmentally sound way? How would she provide food for the students? What would be her plan for waste disposal? And most importantly, how would she navigate the school board, the state legislature, the federal government, and all the families of these students? What is your plan? What is your alternative? I think there are alternatives. I saw one that approached an alternative in Rotterdam. If you want to make a truly revolutionary contribution, this is where you should start. Why should anyone even bother listening to you if you aren't proposing real plans? But we haven't even gotten to that point. Instead we're like underpants gnomes, saying "revolution is the answer!" without addressing any of the infrastructural questions of just how revolution is to be produced, what alternatives it would offer, and how we would concretely go about building those alternatives. **Masturbation**.¶ "Underpants gnome" deserves to be a category in critical theory; a sort of synonym for self-congratulatory masturbation. We need less critique not because critique isn't important or necessary– it is –but because we know the critiques, we know the problems. We're intoxicated with critique because it's easy and safe. We best every opponent with critique. We occupy a position of moral superiority with critique. But do we really do anything with critique? What we need today, more than ever, is composition or carpentry. Everyone knows something is wrong. Everyone knows this system is destructive and stacked against them. Even the Tea Party knows something is wrong with the economic system, despite having the wrong economic theory. None of us, however, are proposing alternatives. Instead we prefer to shout and denounce. Good luck with that.

Structures Not Individuals

The law is problematic but it is a lived reality – there is nothing outside of it - the only effective method is redeploying institutional logic against contradictions.
Crenshaw, University of California Los Angeles law professor, 1988

[Kimberle, Harvard law review, "RACE, REFORM, AND RETRENCHMENT: TRANSFORMATION AND LEGITIMATION IN ANTIDISCRIMINATION LAW"
http://www.jstor.org/stable/pdfplus/1341398.pdf?acceptTC=true&jpdConfirm=true, JSTOR, p.1366-8]

<u>The Critics' product is of limited utility to Blacks in its present form</u>. The implications for Blacks of trashing liberal legal ideology are troubling, even though it may be proper to assail belief structures that obscure liberating possibilities. Trashing legal ideology seems to tell us repeatedly what has already been established -- that legal discourse is unstable and relatively indeterminate. Furthermore, <u>trashing offers no idea of how to avoid the negative consequences of engaging in reformist discourse or how to work around such consequences</u>. Even if we imagine the wrong world when we think in terms of legal discourse, **we** must nevertheless **exist in a present world where legal protection has at times been a blessing -- albeit a mixed one**. The fundamental problem is that, <u>although Critics criticize law because it functions to legitimate existing institutional arrangements, it is precisely this legitimating function that has made law receptive to certain demands in this area</u>.

The Critical emphasis on deconstruction as the vehicle for liberation leads to the conclusion that engaging in legal discourse should be avoided because it reinforces not only the discourse itself but also the society and the world that it embodies. Yet Critics offer little beyond this observation. Their focus on <u>delegitimating rights rhetoric seems to suggest that, once rights rhetoric has been discarded, there exists a more productive strategy for change, one which does not reinforce existing patterns of domination.</u>

<u>Unfortunately, no such strategy has yet been articulated, and it is difficult to imagine that racial minorities will ever be able to discover one.</u> As Frances Fox Piven and Richard Cloward point out in their [*1367] excellent account of the civil rights movement, popular struggles are a reflection of institutionally determined logic and a challenge to that logic. 137 **People can only demand change in ways that reflect the logic of the institutions that they are challenging. 138 Demands for change that do not reflect the institutional logic** -- that is, demands that do not engage and subsequently reinforce the dominant ideology -- **will probably be ineffective**. 139

The possibility for ideological change is created through the very process of legitimation, which is triggered by crisis. <u>Powerless people can</u> sometimes <u>trigger</u> such a <u>crisis by challenging an institution internally, that is, by using its own logic against it. 140 Such crisis occurs when powerless people force open and politicize a contradiction between the dominant ideology and their reality. The political consequences [*1368] of maintaining the **contradictions may sometimes force an adjustment** -- an attempt to close the gap or to make things appear fair. 141 Yet, because the adjustment is triggered by the political consequences of the contradiction, circumstances will be adjusted only to the extent necessary to close the apparent contradiction</u>.

This approach to understanding legitimation and change is applicable to the civil rights movement. Because Blacks were challenging their exclusion from political society, the only claims that were likely to achieve recognition were those that reflected American society's institutional logic: legal rights ideology. Articulating their formal demands through legal rights ideology, civil rights protestors exposed a series of contradictions -- the most important being the promised privileges of American citizenship and the practice of absolute racial subordination. <u>Rather than using the contradictions to suggest that American citizenship was itself illegitimate or false, civil rights protestors proceeded as if American citizenship were real, and demanded to exercise the "rights" that citizenship entailed. By seeking to restructure reality to reflect American mythology, Blacks</u>

relied upon and ultimately benefited from politically inspired efforts to resolve the contradictions by granting formal rights. Although it is the need to maintain legitimacy that presents powerless groups with the opportunity to wrest concessions from the dominant order, it is the very accomplishment of legitimacy that forecloses greater possibilities. In sum, **the potential for change is both created and limited by legitimation**.

Institutional macropolitical policy engagement is vital to solve – any alternative results in failure to actualize change, cooption, and moot activism
Lobel, University of San Diego assistant law professor, 2007

[Orly, Harvard law review, "THE PARADOX OF EXTRALEGAL ACTIVISM: CRITICAL LEGAL CONSCIOUSNESS AND TRANSFORMATIVE POLITICS" http://cdn.harvardlawreview.org/wp-content/uploads/pdfs/lobel.pdf, p.983-7]

Both the **practical failures and** the **fallacy of rigid boundaries** generated by extralegal activism rhetoric permit us to broaden our inquiry to the underlying assumptions of current proposals regarding transformative politics — that is, attempts to produce meaningful changes in the political and socioeconomic landscapes. The suggested alternatives produce a new image of social and political action. This vision rejects a shared theory of social reform, rejects formal programmatic agendas, and embraces a multiplicity of forms and practices. Thus, it is described in such terms as a plan of no plan,211 "a project of pro-jects,"212 "anti-theory theory,"213 politics rather than goals,214 presence rather than power,215 "practice over theory,"216 and chaos and openness over order and formality. As a result, the contemporary message rarely includes a comprehensive vision of common social claims, but rather engages in the description of fragmented efforts. As Professor Joel Handler argues, the commonality of struggle and social vision that existed during the civil rights movement has disappeared.217 **There is no unifying discourse or set of values**, but rather an aversion to any metanarrative and a resignation from theory. Professor Handler warns that this move away from grand narratives is **self-defeating** precisely because only certain parts of the political spectrum have accepted this new stance: "[T]he opposition is not playing that game . . . . [E]veryone else is operating as if there were Grand Narratives . . . ."218 Intertwined with the resignation from law and policy, the new bromide of "neither left nor right" has become axiomatic only for some.219 The contemporary critical legal consciousness informs the scholarship of those who are interested in progressive social activism, but less so that of those who are interested, for example, in a more competitive securities market. Indeed, an interesting recent development has been the rise of "conservative public interest lawyer[ing]."220 Although "public interest law" was originally associated exclusively with liberal projects, in the past three decades conservative advocacy groups have rapidly grown both in number and in their vigorous use of traditional legal strategies to promote their causes.221 This growth in conservative ad-vocacy is particularly salient in juxtaposition to the decline of traditional progressive advocacy. Most recently, some thinkers have even suggested that there may be "something inherent in the left's conception of social change — focused as it is on participation and empowerment — that produces a unique distrust of legal expertise."222

Once again, this conclusion reveals flaws parallel to the original disenchantment with legal reform. Although the new extralegal frames present themselves as apt alternatives to legal reform models and as capable of producing significant changes to the social map, in practice they generate very limited improvement in existing social arrangements. Most strikingly, the cooptation effect here can be explained in terms of the most profound risk of the typology — that of legitimation. The common pattern of extralegal scholarship is to describe an inherent instability in dominant structures by pointing, for example, to grassroots strategies,223 and then to assume that specific instances of counterhegemonic activities translate into a more complete transformation. This celebration of multiple micro-resistances seems to rely on an aggregate approach — an idea that the

multiplication of practices will evolve into something substantial. In fact**, the myth of engagement obscures the actual lack of change being produced**, while the broader pattern of equating extralegal activism with social reform produces a false belief in the potential of change**. There are few instances of meaningful reordering of social and economic arrangements and macro-redistribution**. Scholars write about decoding what is really happening, as though the scholarly narrative has the power to unpack more than the actual conventional experience will admit.224 Unrelated efforts become related and part of a whole through mere reframing. At the same time, **the elephant in the room** — the rising level of economic inequality — **is left unaddressed** and comes to be understood as natural and inevitable.225 This is precisely the problematic process that critical theorists decry as losers' self-mystification, through which marginalized groups come to see systemic losses as the product of their own actions and thereby begin to focus on minor achievements as representing the boundaries of their willed reality.

The explorations of micro-instances of activism are often fundamentally performative, obscuring the distance between the descriptive and the prescriptive. The manifestations of extralegal activism — the law and organizing model; the proliferation of informal, soft norms and norm-generating actors; and the celebrated, separate nongovernmental sphere of action — all **produce a fantasy** that change can be brought about through small-scale, decentralized transformation. The emphasis is local, but the locality is described as a microcosm of the whole and the audience is national and global. In the context of the humanities, Professor Carol Greenhouse poses a comparable challenge to ethnographic studies from the 1990s, which utilized the genres of narrative and community studies, the latter including works on American cities and neighborhoods in trouble.226 The aspiration of these genres was that each individual story could translate into a "time of the nation" body of knowledge and motivation.227 In contemporary legal thought, a corresponding gap opens between the local scale and the larger, translocal one. In reality, although there has been a recent proliferation of associations and grassroots groups, few new local-state-national federations have emerged in the United States since the 1960s and 1970s, and many of the existing voluntary federations that flourished in the mid-twentieth century are in decline.228 There is, therefore, an absence of links between the local and the national, an absent intermediate public sphere, which has been termed "the missing middle" by Professor Theda Skocpol.229 New social movements have for the most part failed in sustaining coalitions or producing significant institutional change through grassroots activism. Professor Handler concludes that this failure is due in part to the ideas of contingency, pluralism, and localism that are so embedded in current activism.230 Is the focus on small-scale dynamics simply an evasion of the need to engage in broader substantive debate?

It is important for next-generation progressive legal scholars, while maintaining a critical legal consciousness, to recognize that **not all extralegal associational life is transformative**. We must differentiate, for example, between inward-looking groups, which tend to be self-regarding and depoliticized, and social movements that participate in political activities, engage the public debate, and aim to challenge and reform existing realities.231 We must differentiate between professional associations and more inclusive forms of institutions that act as trustees for larger segments of the community.232 As described above, extralegal activism tends to operate on a more divided and hence a smaller scale than earlier social movements, which had national reform agendas. Consequently, within critical discourse there is a need to recognize the limited capacity of small-scale action. We should question the narrative that imagines consciousness-raising as directly translating into action and action as directly translating into change. **Certainly not every cultural description is political**. Indeed, it is questionable whether forms of activism that are opposed to programmatic reconstruction of a social agenda should even be understood as social movements. In fact, when groups are situated in opposition to any form of institutionalized power, they may be simply mirroring what they are fighting against and merely producing **moot activism** that settles for what seems possible within the narrow space that is left in a rising convergence of ideologies. **The original vision is consequently coopted**, and contemporary discontent is legitimated through a process of self-mystification.

Local resistance to power is not enough – a focus on structures that produce privilege is more important.
Darcy, Huron University College philosophy professor, 2014

[Steve, "The Rise of the Post-New Left Political Vocabulary" publicautonomy.org/2014/01/27/the-rise-of-the-post-new-left-political-vocabulary/]

Second, however, it is also true that <u>the series of shifts from the old vocabulary to the new one has entailed certain losses</u>. In particular, the relative de-emphasizing of system-level causation, in favour of a new <u>emphasis on the importance of individual action or inaction, tends to weaken the integration of everyday Left discourse with the theoretical analysis of systems like capitalism and colonialism</u>. It is true that, in exchange, <u>we have a vocabulary that better enables us to focus on class privilege and settler privilege. But if we are to defeat colonialism and capitalism, we cannot do so one person at a time, or one interaction or relationship at a time. The systems themselves have to be named, understood, attacked and overthrown.</u> This issue is, obviously, closely connected to the loss of a focus on liberation. <u>A liberation focus and a systems focus share a common understanding: that the purpose of the Left is to defeat systems of exploitation and oppression.</u> **Challenging immediate impacts is important, but not enough. It is necessary, but by no means sufficient.** Moreover, <u>the way we challenge everyday impacts should be informed by our understanding that they are not produced simply by individual actions, but by the operation of large-scale systems</u>. The Left needs a vocabulary, and a self-understanding, that highlights and foregrounds the importance of constructing and expanding anti-systemic movements that aim to defeat systems of oppressive and exploitative power. It is hard not to think that the older vocabulary better expresses this insight, even as it obstructs our access to other critical insights that are also indispensable. One could certainly say more about the gains and losses associated with adopting either of these two vocabularies. But perhaps it is enough, in the context of a blog post, to have sketched an approach to thinking about the question. Both vocabularies have been formed to address indispensably important concerns, so we should be reluctant to give up on either one. The most important thing, I would suggest, is to refuse to allow either of these two ways speaking, writing and thinking about Left activism to evade the challenge raised by its counterpart. Personally, I would be reluctant to give up an expression like, 'the people,' and to take up 'folks' in its place. But I hope that the way I talk about the people is disciplined by a certain amount of sensitivity to the motivation that has led some activists to drop it from their vocabulary. On the other hand, <u>I hope that people who have embraced the newer way of articulating Left politics will</u> (<u>begin to</u>, or continue to) <u>see the importance of highlighting issues of system dynamics, large-scale alliance-building, and ultimate liberation, rather than letting these urgently important matters disappear from view entirely</u>.

Structures are more important than individuals in terms of locuses of oppression.
Smith, University of California Riverside cultural studies professor, 12-13-13

[Andrea, "The Problem with Privilege" http://andrea366.wordpress.com/author/andrea366/]

<u>The politics of privilege have made the important contribution of signaling how the structures of oppression constitute who we are as persons</u>. However, <u>as the rituals of confessing privilege have evolved, they have shifted our focus from building social movements for global transformation to individual self-improvement. Furthermore, they rest on a white supremacist/colonialist notion of a subject that can constitute itself over and against others through self-reflexivity. While trying to keep the key insight made in activist/academic circles that personal and social transformation are interconnected, alternative projects have developed that focus less on privilege and more the structures that create privilege</u>. These new models do not hold the "answer," because the genealogy of the politics of privilege also demonstrates that our activist/intellectual projects of liberation must be

constantly changing. Our imaginations are limited by white supremacy, settler colonialism, etc., so all ideas we have will not be "perfect."   The ideas we develop today also do not have to be based on the complete disavowal of what we did yesterday because what we did yesterday teaches what we might do tomorrow.   Thus, as we think not only beyond privilege, but beyond the sense of self that claims privilege, we open ourselves to new possibilities that we cannot imagine now for the future.

Structures key.
Tonn, University of Maryland communication professor, 2005

[Mari Boor, Rhetoric & Public Affairs 8.3, "Taking Conversation, Dialogue, and Therapy Public" Project Muse]

Approaching public controversies through a conversational model informed by therapy also **enables political inaction** in two respects. First, an **open-ended process** lacking mechanisms for closure **thwarts progress toward resolution.** As Freeman writes of consciousness raising, an unstructured, informal discussion [End Page 418] "leaves people with no place to go and the lack of structure leaves them with no way of getting there."70 Second, the therapeutic impulse to emphasize the self as both problem and solution **ignores structural impediments constraining individual agency.** "Therapy," Cloud argues, "offers consolation rather than compensation, **individual adaptation rather than social change,** and an experience of politics that is impoverished in its **isolation from structural critique and collective action.**" Public discourse emphasizing healing and coping, she claims, "locates blame and responsibility for solutions **in the private sphere.**"71¶ Clinton's Conversation on Race not only exemplified the frequent wedding of public dialogue and therapeutic themes but also illustrated the **failure of a conversation-as-counseling model to achieve meaningful social reform.** In his speech inaugurating the initiative, Clinton said, "Basing our self-esteem on the ability to look down on others is not the American way . . . Honest dialogue will not be easy at first . . . Emotions may be rubbed raw, but we must begin." Tempering his stated goal of "concrete solutions" was the caveat that "power cannot compel" racial "community," which "can come only from the human spirit."72¶ Following the president's cue to self-disclose emotions, citizens chiefly aired personal experiences and perspectives during the various community dialogues. In keeping with their talk-show formats, the forums showcased what Orlando Patterson described as "performative 'race' talk," "public speech acts" of denial, proclamation, defense, exhortation, and even apology, in short, performances of "self" that **left little room for productive public argument.**73 Such **personal evidence overshadowed the "facts" and "realities"** Clinton also had promised to explore, including, for example, statistics on **discrimination patterns** in employment, lending, and criminal justice or expert testimony on **cycles of dependency, poverty, illegitimacy, and violence.**¶ Whereas Clinton had encouraged "honest dialogue" in the name of "responsibility" and "community," Burke argues that "The Cathartic Principle" often produces the reverse. "[C]onfessional," he writes, "contains in itself a kind of 'personal irresponsibility,' as we may even **relieve ourselves of private burdens by befouling the public medium.**" More to the point, "a thoroughly 'confessional' art may enact a kind of **'individual salvation at the expense of the group,'** performing **a "sinister function**, from the standpoint of overall-social necessities."74 Frustrated observers of the racial dialogue—many of them African Americans—echoed Burke's concerns. Patterson, for example, noted, "when a young Euro-American woman spent nearly five minutes of our 'conversation' in Martha's Vineyard . . . publicly confessing her racial insensitivities, she was directly unburdening herself of all sorts of racial guilt feeling. **There was nothing to argue about.**"75 Boston Globe columnist Derrick Z. Jackson invoked the game metaphor communication theorists often link to [End Page 419] skills in conversation,76 voicing suspicion of a talking cure for racial ailments that included neither exhaustive **racial data nor concrete goals.** "The game," wrote Jackson, **"is to get 'rid' of responsibility for racism while doing nothing to solve it."**77

Individuals fail.

Tonn, University of Maryland communication professor, 2005

[Mari Boor, Rhetoric & Public Affairs 8.3, "Taking Conversation, Dialogue, and Therapy Public" Project Muse]

Fourth, a communicative model that views public issues through a relational, personal, or therapeutic lens nourishes hegemony by inviting political inaction. Whereas the objective of conventional public argument is achieving an instrumental goal such as a verdict or legislation, the aim of social conversation generally stops with self-expression. As Schudson puts it, **"Conversation has no end outside itself."** 39 Similarly, modeling therapeutic paradigms that trumpet "talking cures" can **discourage** a search for political solutions to public problems by casting **cathartic talk as sufficient remedy.** As Campbell's analysis of consciousness-raising groups in the women's liberation movement points out, **"[S]olutions must be structural, not merely personal**, and **analysis must move beyond personal experience and feeling** . . . Unless such transcendence occurs, there is no persuasive campaign . . . [but] only the very limited realm of therapeutic, small group interaction."40¶ Finally, and related, a therapeutic framing of social problems threatens to locate the source and solution to such ills solely within the individual, the "self-help" on which much therapy rests. A postmodern therapeutic framing of conflicts as relational misunderstandings occasioned by a lack of dialogue not only assumes that familiarity inevitably breeds caring (rather than, say, irritation or contempt) but, more importantly, **provides cover for ignoring the structural dimensions of social problems** such as disproportionate black [End Page 412] poverty. If objective reality is unavoidably a fiction, as Sheila McNamee claims, all suffering can be dismissed as psychological rather than based in real, material circumstance, enabling defenders of the status quo to admonish citizens to "heal" themselves.

AT: Color-blindness

Even if they win a link, that doesn't warrant rejection.
Winant, University of California Santa Clara sociology professor, 1997

[Howard, New Left Review, "Behind Blue Eyes: Contemporary White Racial Politics" http://www.soc.ucsb.edu/faculty/winant/whitness.html]

THE NEOLIBERAL RACIAL PROJECT: Neoliberal discourse seeks to limit white advantages through denial of racial difference. The overlap with neoconservatism is, of course, hardly accidental. Yet **there are significant differences** in political orientation between the two projects.

Neoliberalism recognizes the cross-cutting and competitive dynamics of race- and class-based forms of subordination in the post-industrial, post-civil rights era. It seeks systematically to narrow the differences which divide working and middle-class people as a strategy for improving the "life-chances" of minorities, who are disproportionately poor. It thus attempts to appeal to whites with arguments about the medium- and long-term consequences upon their living standards of downward mobility and greater impoverishment of nonwhites. The neoliberal racial project can thus be described as social democratic, focused on social structure (as opposed to cultural representation a la the various right-wing racial projects), and somewhat class reductionist in its approach to race.

The most effective, as well as controversial, spokesperson for the neoliberal racial project has undoubtedly been William Julius Wilson. In a series of prominent scholarly works and political interventions, Wilson has argued for the use of class-based criteria (and consequently, against the use of racial logics) in formulating social policy aimed at achieving greater substantive equality in US society. He has contended that this reorientation of social policy priorities is both better suited to the contemporary dynamics of capitalist development, and that it is politically strategic in ways that explicit racially oriented policies are not.

While Wilson does not dismiss the effects of historical racial discrimination, he argues that since the late 1960s capital has been "color-blind," and that consequently the large-scale demographic, economic, and political changes which have negatively affected the ghettos and barrios do not have their origins in racial discrimination. Therefore, "group-specific" policies such as affirmative action in all its incarnations, cannot improve the situation experienced by the African-American "underclass." Wilson thus calls for "universal programs," rather than group-targeted ones, to halt the deterioration of inner-city communities, arguing that such measures will disproportionately help the minority poor:

The hidden agenda is to improve the life chances of groups such as the ghetto underclass by emphasizing programs to which the more advantaged groups of all races can positively relate (Wilson 1987, 120).

This "hidden agenda," of course, justifies a pragmatic attempt to woo white, middle-class voters. Their needs -- for more and better jobs, access to education and health care, and reductions in drug trafficking and crime -- can be linked to those of the minority poor if the "wedge issue" of race can be blunted. To this end Wilson has urged political actors (notably President Clinton, whom he has served as an advisor) to create "biracial coalitions" by promoting programs which unite, as opposed to divide, racial minorities (particularly blacks) and whites. [I]f the message emphasizes issues and programs that concern the families of all racial and ethnic groups, whites will see their mutual interests and join in a coalition with minorities to elect a progressive candidate (Wilson, 1992; A15).

A similar argument has been proposed by Michael Lind, who argues that ...the American elites that subsidize and staff both the Republican and the Democratic parties have steadfastly waged a generation-long class war against the middle and working classes (Lind 1995a, 35), using race, as well as other divisions, to achieve unprecedented levels of power and concentrated wealth. Affirmative action, and other race-based initiatives aimed at achieving greater substantive social equality, only contribute, according to Lind, to the effectiveness of the "overclass's" divide-and-conquer strategy:

...the overclass shores up its defense against genuinely representative democracy (i.e., a popular coalition uniting middle-class and working-class Americans of all races and regions) by adopting a strategy of divide and rule expressed in the language of multiculturalism.... Unified along the lines of economic interest, the wealthy American minority hold the fragmented majority at bay by pitting blacks against whites in

zero-sum struggles for government patronage and by bribing potential black and Hispanic leaders, who might otherwise propose something other than rhetorical rebellion, with the gifts of affirmative action (Lind 1995a, 44).

Both Wilson and Lind call for a nationalism of the left, a populist alliance of the have-nots, regardless of race, against the haves. Lind's version is perhaps more radical and certainly more explicitly nationalist: he proposes specific measures to tax corporate flight, restrict immigration, and establish a "common high-wage trading bloc." Like Wilson, he proposes to eliminate affirmative action, which he would replace with a ...transracial America..., [where] a color-blind, gender neutral regime of individual rights would be combined with government activism promoting a high degree of substantive social and economic equality (Lind 1995b, PAGE?).

Wilson's proposals, though more circumspect, conform in all their essentials to this perspective. He too identifies deindustrialization and the continuing influx of new migrants to the depressed cities as key sources of ghetto and barrio poverty; he too calls for government activism in support of a high-wage economy and tight labor market, as the recipe for achieving substantive, transracial social justice.

The neoliberal project actively promotes a pragmatic vision of greater substantive equality, linking class and race, and arguing for the necessity of transracial coalition politics. These themes **seem to us worthy of support**, and receive more discussion below in this essay's concluding section.

For the present I wish simply to register some uneasiness with the neoliberal project in respect to its treatment of race. Most specifically, I question the argument that race-specific policies should receive less attention in a progressive political agenda (Wilson 1987, 10-12). Despite protestations that the neoliberal approach is more hardheaded, more willing to face up to the difficult questions of "the rise of social pathologies in the ghetto," it is also noteworthy that the neoliberal project tends to deny, sometimes explicitly and sometimes implicitly, the ongoing relevance of white supremacy to ghetto and barrio poverty. It tends to deemphasize the "dirty little secret" of continued racial hostility, segregation, and discrimination of all sorts.

Powerful as some of Wilson's, Lind's, and others' arguments are, they do not succeed in demonstrating the demise of racism or white privilege. They largely fail to recognize the ongoing racial dualism that prevails in the contemporary period, perceiving post-civil rights era conflicts between whites and racially-defined minorities merely as strategic problems, and paying less attention to the deep-seated structural racial conflicts endemic to US society.

This weakness is more noticeable in some areas than others, for example in respect to residential segregation or criminal justice issues, which simply cannot be understood as outcomes of "color-blind" capitalist development imperatives or deindustrialization, and are certainly not the product of affirmative action. Rather, the imperviousness of these problems to political reform testifies to the continuing viability of old-fashioned white supremacy, and to the competitive advantages whiteness still has to offer.

What drops out of the neoliberal project, then, is precisely the cultural and moral dimensions of white supremacy. The neoliberal project does not challenge whites on their willingness to receive a "psychological wage," which amounts to a tangible benefit acquired at the expense of nonwhites (Du Bois 1977 [1935], Roediger 1991, Harris 1993). Indeed, the neoliberal project does not challenge whites to abjure the real wage subsidies, the artificially low unemployment rates, or the host of other material benefits they receive in virtue of their whiteness (Lipsitz 1995).

Nevertheless, the neoliberal project does undertake a crucial task: the construction of a transracial political agenda, and the articulation of white and minority interests in a viable strategic perspective. This is something which has been missing from the US political scene since the enactment of civil rights legislation thirty years ago.

AT: Reformism Fails

Sweeping reformism K is wrong. Increases oppression through isolation.
Hahnel, American University economics professor, 2005

[Robin, "Fighting For Reforms Without Becoming Reformist" http://zcomm.org/znetarticle/fighting-for-reforms-without-becoming-reformist-by-robin-hahnel/]

What To Avoid¶ ¶ We need look no further than to the history of twentieth century social democracy to see how fighting for reforms can make a movement reformist. Social democrats began the twentieth century determined to replace capitalism with socialism — which they understood to be a system of equitable cooperation based on democratic planning by workers, consumers, and citizens. Long before the century was over social democratic parties and movements throughout the world had renounced the necessity of replacing private enterprise and markets with fundamentally different economic institutions, and pledged themselves only to pursue reforms geared toward making a system based on competition and greed which they accepted as inevitable more humane. As a result social democrats were doomed to grappled with two dilemmas: (1) What to do when leaving the system intact makes it impossible to further promote economic justice and democracy, much less environmental sustainability. (2) What to do when further reforms destabilize a system one has agreed to accept while the system constantly threatens to undermine hard won gains. Social democrats struggled unsuccessfully with these dilemmas, all too often abandoning important components of economic justice and democracy and denouncing political tendencies to their left whose programs they considered politically or economically destabilizing.¶ ¶ We need look no further than to the history of twentieth century libertarian socialism to see how failing to embrace reform struggles can isolate a movement and make it irrelevant. The principle failure of libertarian socialists during the twentieth century was their inability to understand the necessity and importance of reform organizing. When it turned out that anti-capitalist uprisings were few and far between, and libertarian socialists proved incapable of sustaining the few that did occur early in the twentieth century, their reticence to throw themselves into reform campaigns, and ineptness when they did, doomed libertarian socialists to more than a half century of decline after their devastating defeat during the Spanish Civil War of 1936-1939. What too many libertarian socialists failed to realize was that any transition to a democratic and equitable economy has no choice but to pass through reform campaigns, organizations, and institutions however tainted and corrupting they may be. The new left tried to exorcise the dilemma that reform work is necessary but corrupting with the concept of non-reformist reforms. According to this theory the solution to the dilemma was for activists to work on non-reformist reforms, i.e. reforms that improve people's lives while undermining the material, social, or ideological underpinnings of the capitalist system. There is nothing wrong with the notion of winning reforms while undermining capitalism. As a matter of fact, that is a concise description of pecisely what we must be about! What was misleading was the notion that there are particular reforms that are like silver bullets and accomplish this because of something special about the nature of those reforms themselves.¶ ¶ The Myth of the Non-Reformist Reform¶ ¶ There is no such thing as a non-reformist reform. Social democrats and libertarian socialists did not err because they somehow failed to find and campaign for this miraculous kind of reform. Nor would new leftists prove successful where others had failed before them because new leftists found a special kind of reform different from those social democrats championed and libertarian socialists shied away from. Some reforms improve peoples lives more, and some less. Some reforms are easier to win, and some are harder to win. Some reforms are easier to defend, and some are less so. And of course, different reforms benefit different groups of people. Those are ways reforms, themselves, differ. On the other hand, there are also crucial differences in how reforms are fought for. Reforms can be fought for by reformers preaching the virtues of capitalism. Or reforms can be fought for by anti-capitalists pointing out that only by replacing capitalism will it be possible to fully achieve what reformers want. Reforms can be fought for while leaving institutions of repression intact. Or a reform struggle can at least weaken repressive institutions, if not destroy them. Reforms can be fought for by hierarchical organizations that reinforce authoritarian, racist, and sexist dynamics and thereby weaken the overall movement for progressive change. Or reforms can be fought for by democratic organizations that uproot counter productive patterns of behavior and empower people to become masters and mistresses of their fates. Reforms can be fought for in ways that leave no new organizations or institutions in their aftermath. Or reforms can be fought for in ways that create new organizations and institutions that fortify progressive forces in the next battle. Reforms can be fought for through alliances that obstruct possibilities for further gains. Or the alliances forged to win a reform can establish the basis for winning more reforms. Reforms can be fought for in ways that provide tempting possibilities for participants, and particularly leaders, to take unfair personal advantage of group success. Or they can be fought for in ways that minimize

the likelihood of corrupting influences. Finally, reform organizing can be the entire program of organizations and movements. Or, recognizing that reform organizing within capitalism is prone to weaken the personal and political resolve of participants to pursue a full system of equitable cooperation, reform work can be combined with other kinds of activities, programs, and institutions that rejuvenate the battle weary and prevent burn out and sell out.¶ ¶ In sum, any reform can be fought for in ways that diminish the chances of further gains and limit progressive change in other areas, or fought for in ways that make further progress more likely and facilitate other progressive changes as well. But if reforms are successful they will make capitalism less harmful to some extent. There is no way around this, and even if there were such a thing as a non-reformist reform, it would not change this fact. However, the fact that every reform success makes capitalism less harmful does not mean successful reforms necessarily prolong the life of capitalism — although it might, and this is something anti-capitalists must simply learn to accept. But if winning a reform further empowers the reformers, and whets their appetite for more democracy, more economic justice, and more environmental protection than capitalism can provide, it can hasten the fall of capitalism.¶ ¶ In any case, it turns out we are a more cautious and social species than twentieth century libertarian socialists realized. And it turns out that capitalism is far more resilient than libertarian socialists expected it to be. More than a half century of libertarian socialist failures belie the myth that it is possible for social revolutionaries committed to democracy to eschew reform work without becoming socially isolated. Avoidance of participation in reform work is simply not a viable option and only guarantees defeat for any who opt out. Moreover, no miraculous non-reformist reform is going to come riding to our rescue. Though many twentieth century libertarian socialists failed to realize it, their only hope was to throw themselves wholeheartedly into reform struggles while searching for ways to minimize the corrupting pressures that inevitably are brought to bear on them as a result.

AT: Can't Use the Master's Tools

Working from within the system can produce change. Proves solvency and addresses K of civil society.

James, University of North Carolina Charlotte philosophy professor, 2009

[Robin, Hypatia Volume 24, Issue 2, "Autonomy, Universality, and Playing the Guitar: On the Politics and Aesthetics of Contemporary Feminist Deployments of the "Master's Tools"" Wiley]

Norma Coates expresses here an ethical and aesthetic quandary we might term a "feminist guilty pleasure": liking something one knows one just shouldn't like, since one considers its politics problematic, if not disgusting. Why would an avowed feminist like this clearly misogynistic work? How can one have an aesthetic taste for something that is politically disgusting? This is not a new question by any means, but it is still a contested one. Indeed, Audre Lorde has famously argued that the "the master's tools will never dismantle the master's house," just as Laura Mulvey has equally famously called for the necessity for feminists to abandon mainstream cinematic pleasure as coercive (Mulvey 1975; Lorde 1983). I contend, however, that we should not be too quick to dismiss either the "master's tools" or some of the "pleasures" we might experience from them. Indeed, when appropriately hacked, the master's tools in certain situations and under certain criteria might even be very effective tools for feminist, anti-racist work.¶Examining two cases—one political, one aesthetic—from the perspective of non-ideal theory, I will demonstrate concrete instances in which multiply-underprivileged individuals have utilized, for liberatory ends, the concepts, rhetoric, and methodologies characteristic of what bell hooks terms "the white supremacist capitalist patriarchy."1 Judith Butler's recent appeals for "autonomy" and "universality," and indie-electro artist Peaches's use of conventionally racist and sexist art forms are all instances in which "the master's tools" have been productively reappropriated for progressive ends. I argue that non-ideal theory also helps clarify two conditions that help to distinguish a successful resignification from a hegemonic rearticulation: first, reappropriation is successful when, as Butler argues, the very process of an "outsider's" appropriation of "insider" privilege collapses the insider/outsider or master/marginalized distinction, so the procedure is itself transformative; second, success is achieved in instances where nothing else does quite what the master's tools "do," when nothing is as accessible, effective, affective—or, as in the case of Coates and the Stones, as "sexy"—as mainstream/conventional discourse.

There is no alternative to the master's tools – they are always already working in and through us – reappropriation reverses the dynamic of power.

James, University of North Carolina Charlotte philosophy professor, 2009

[Robin, Hypatia Volume 24, Issue 2, "Autonomy, Universality, and Playing the Guitar: On the Politics and Aesthetics of Contemporary Feminist Deployments of the "Master's Tools"" Wiley]

In its adoption and modification of Foucaultian–Nietzschean genealogy as the preferred philosophical methodology, Judith Butler's work can be seen as itself a form of non-ideal theory. Butler's work relies heavily on Foucault's theory of power, which is itself a non-ideal critique of classical liberal notions of power. Via an examination of historical documents on education, the military, the penal system, and

'the clinic,' Foucault argues that <u>power is not juridical</u> (as liberalism tells us power is/should be<u>), but also normative and disciplinary</u>. That is to say, Foucault examined how power actually worked in real-world institutions, and from this analysis concluded that the liberal story of power qua "repression" was a hegemonic misrepresentation. Butler picks up on this reconceptualization of power as "disciplinary" and "productive," but, more importantly, on Foucault's commitment to genealogical analysis. Asking of a concept "how it plays, what investments it bears, what aims it achieves, what alterations it undergoes" (Butler 2004, 180) does not inquire into the truth of the concept so much as ask about its consequences—that is, how it is mobilized in the real world. <u>Rather than asking what the concept "is,"</u> <u>Butler wants to know what it does, and what meaning(s) it has in a particular situation. Insofar as it</u> <u>inquires into how an idea "works</u>," this is yet another way in which Butler's notion of theory is never far from concrete engagement with praxis—and, accordingly, from a version of non-ideal theorizing. In my reading, <u>Butler utilizes this form of non-ideal theory to argue that since nothing can "do"—that is,</u> <u>function as powerfully or effectively—quite what terms such as "universality" or "autonomy" can do,</u> <u>they can, have been, and must be appropriated by progressive theory and activism.</u>7 <u>When this</u> <u>appropriation is performed by those conventionally excluded by or from that idea</u> (l), <u>Butler claims that</u> <u>the term itself is transformed in its "repetition"; when utilized by the oppressed in this fashion, the</u> <u>"master's tools" are never quite the "master's tools</u>."¶It is this commitment to real-world conditions and consequences, and, indeed, an often pragmatic framework, that leads Butler to embrace the very "ideals" of classical liberalism that her earlier work can be seen as deconstructing and critiquing.8 In Undoing Gender (2004), Butler brings this genealogical methodology to bear on the concept universality—one of those liberal ideals that have, historically, functioned to mask the marginalization of underprivileged groups. Since our present moment of both (post–Post) Modernity and feminism is marked most significantly by issues concerning the global and the multicultural, the notion of "universality" is placed under particular scrutiny. Is "universality" necessarily and inevitably monocultural (the supposedly "universal" norm can be a norm in reference to only one privileged culture); put differently, is "absolute" a necessary co-predicate of "universality," or can there be such a thing as a plural or internally polyphonous universal? Following Paul Gilroy's analysis of the limitations of postmodernism,9 <u>Butler finds the binary opposition of the postmodern privileging of plurality and the</u> <u>modern privileging of unity to be inadequate. Butler's frustration here with both "modernism" and</u> <u>"postmodernism" is that "passions for foundations</u> [in the case of the former] <u>and methods</u> [in the case of the latter] <u>sometimes get in the way of an analysis of contemporary political culture</u>" (Butler 2004, 181). <u>Her commitment is clearly to the concrete world of lived experience, in the sense that foundations</u> <u>and methods are subordinated to, in a sense, utility: "What can this do for me?" seems to be her</u> <u>underlying practical concern</u>. Thus, "[a]lthough many feminists have come to the conclusion that the universal is always a cover for a certain epistemological imperialism, insensitive to cultural texture and difference," Butler argues that "<u>the rhetorical power of claiming universality for rights of sexual</u> <u>autonomy and related rights of sexual orientation within the international human rights domain appears</u> <u>indisputable</u>" (182). <u>In real political contexts such as the United Nations' declarations on the rights of</u> <u>women, the language of "universality" might do what no other language can—thus, it would be</u> <u>advantageous to keep some form of it in play</u>. Accordingly, <u>even though standard liberal norms about</u> <u>universality and autonomy might be empirically inadequate, Butler argues that "we had better be able</u> <u>to use that language to secure legal protections and entitlements</u>" (20; emphasis mine), <u>since,</u> <u>practically, this is the only language institutions of power presently speak.</u>10 <u>Notions such as individual</u> <u>or civil rights do have a strategic value; problems arise, however, "if we take the definitions of who we</u>

are, legally, to be adequate descriptions of what we are about" (20). Political myths such as "universality" or "autonomy" are, as myths, useful, because it makes one intelligible to present structures of power; it must not be forgotten that these are useful fictions, and that problems arise when they are taken as non-fiction. Thus, while "autonomy" as commonly figured in mainstream liberalism is, for Butler, clearly a myth, its political salience therein is cause for resignifying (rather than chucking) the term.¶This is possible, for Butler, only because "universality" has no necessary or inherent function—the meaning of a term derives not from some signifier-signified referential logic, but from consensus … and people can always change their minds and rewrite agreements. Thus, Butler explains that terms such as universality"are never finally and fully tethered to a single use. The task of reappropriation is to illustrate the vulnerability of these often compromised terms to an unexpected progressive possibility" (Butler 2004, 179). Universality can do lots of different things for us, and we can give it lots of different meanings. When we include in the conversation about universality those who historically have been excluded from it, this theoretical/practical exercise itself reconfigures the scope, function, and denotation of the term. "[T]he struggle against those exclusions very often ends up reappropriating those very terms from modernity" (179) via performative resignification.¶For Butler, political and theoretical progress occurs when the master's discourse is not merely expanded to include more people, but is "rearticulated" when "the excluded speak to and from such a category" (Butler 2004, 13). This resignification is performative: in Butler's example, the fact that Fanon writes, that is, assumes a "human" task, "he is in and through the utterance opening up the category to a different future" (13). By "doing" an activity reserved for "humans," a category from which Fanon was excluded, Fanon "undoes" the hegemonic sense of the "human." As Butler puts it, "[t]hose deemed illegible, unrecognizable, or impossible nevertheless speak in the terms of the 'human,' opening up the term to a history not fully constrained by the existing differentials of power" (13–14). When those whose exclusion from the full scope of the "universal" or the "human" speak with reference to and in the name of these very ideals, these terms become something other than what they were originally. Thus, for Butler, one never uses precisely the same "tool" as the master does, for this performative resignification by those whose exclusion from the term renders it consistent doesn't "stretch" the boundaries of the term to make it more inclusive so much as it makes the term do what, in its conventional formulation, is logically impossible. While Mills argues that "it cannot be claimed that from the possibility of the extension of ideal theory to previously excluded populations that this shows the ideal theory is really not exclusionary" (Mills 2004, 177), we can see that this is not Butler's claim at all. For Butler, this reappropriation is transformative and not merely assimilative because "when the unreal lays claim to reality … the norms themselves can become rattled, display their instability, and become open to resignification" (Butler 2004, 27–28). When those excluded from the system suddenly put themselves in it, this challenges the foundations of the system, and produces an imperfect reproduction of its imperative.11¶Butler's notion of autonomy, with its emphasis on interdependence and the necessary commerce across a very unclear boundary between individual and society, has highly significant implications for her call to use the "master's tools." If, as she argues, all agency arises from one's insertion in networks of power relations, then one must be "recognizable" to the "master's" system(s) in order to participate in the working(s) of power in the first place. That is to say, in order to "do" anything, I must necessarily work with the master's tools and let them work on me. "We come into the world on the condition that the social world is already there, laying the groundwork for us. This implies," Butler argues, "that I cannot persist without norms of recognition that support my persistence" (Butler 2004, 32). I have no choice to use or not use the master's tools—they have been working on and through me

since before I was even born; they constitute the field in and through which I act. This does not, however, mean that I must use them as they were intended. Indeed, Butler argues that when one makes appeals to "rights" for a marginalized group, one is not—or should not be—seeking the extension of the same old concept to a new group (that is, the colonization of the outside, a domestication), but instead is/should be challenging the very assumptions behind that term, transforming it in the process of demanding or claiming it.¶Butler qualifies her call to use the master's tools with what she calls a "double path": "we must use this language to assert an entitlement to conditions of life in ways that affirm the constitutive role of sexuality and gender in political life, and we must also subject our very categories to critical scrutiny" (Butler 2004, 37–38). This double path sounds a lot like the more conventional notion of "critique"—a self-reflexive meta-narrative concerned with the limits of the discourse under question—but it goes beyond this traditional sense of "critique" insofar as the "limits" it scrutinizes are not only discursive, but also political. If it is the case that norms "are invoked and cited by bodily practices that also have the capacity to alter norms in the course of their citation" (52), then it is clear that Butler finds revolutionary capacity in reactionary norms. If this is the case, then, we must ask "what departures from the norm constitute something other than an excuse or rationale for the continuing authority of the norm?" (53), for not every instantiation of the norm, obviously, will be revolutionary. By what criteria do we determine reactionary from revolutionary reworkings of gender norms? Moreover, "what departures from the norm disrupt the regulatory process itself?" (53)—that is, what sorts of subversive repetitions don't just reinstall the terms of the norm, but call the norm itself and its modus operandi into question?12 In response to these questions, I turn to the case of Peaches's reappropriation of patriarchal gender norms. Her work, read alongside Butler's, fleshes out the two criteria we can use to distinguish a successful reworking of the "master's tools" from a hegemonic rearticulation of them. Because her work deals with many of the same themes (sex, sexuality, sexually empowered women) as Madonna's superficially (but not really) "feminist" work from the 1980s–90s, Peaches's oeuvre is particularly helpful in distinguishing a genuinely transformative use of the master's tools from one that, although superficially radical, in fact maintains the status quo. More importantly, if, as Deleuze and Guattari say, domination "is not an ideological problem" but "a problem of desire" (Deleuze and Guattari 1983, 104), then power functions, at least in part, by making us want and be satisfied by structures that are counter to our interests; as Coates demonstrates in the epigraph, structures of feeling (such as musical conventions) are often resistant to intellectual critique, even in politicized intellectuals. As a musician, Peaches is engaging the "master's tools"—the guitar, cock rock, binary gender—precisely at the level of desire and structures of feeling. Accordingly, her work helps me move my analysis beyond the more ideologically oriented work of Mills and Butler toward consideration of problems of desire and affect. Indeed, it is precisely because power functions at these levels that the second criterion (accessibility, affectivity) is so important in distinguishing a successful from an unsuccessful reappropriation.

AT: Coalitions Bad

Reforms are key – critical to mobilization – by focusing on suffering as the basis for identity, they preclude mobilization.
Bhambra, University of Warwick sociology professor, and Margree, University of Brighton cultural studies professor, 2010

[Gurminder and Victoria, "Identity Politics and the Need for a 'Tomorrow'" http://www.academia.edu/471824/Identity_Politics_and_the_Need_for_a_Tomorrow_, p.64-5]

Political mobilisation around suffering engenders solidarities between those who are suffering and those who afford recognition of (and then action around) that suffering. Those who suffer generally claim their common humanity with others in asking for people to look beyond the specific circumstances of their suffer-ing, and in doing so, the request is to address those specific circumstances on the basis of a humanity not bound to the circumstances. The mistake of some forms of identity politics, then, is to associate identity with suffering. While a recognition of historical (and contemporary) suffering is an important aspect of the political process of seeking redress for the conditions of suffering, it does not constitute identity singularly. ¶ "Wounded attachments", we would argue, do not represent the general condition of politicised identities, but rather, are prob-lematic constructions of identities which fail to recognise (or accept) the processes of change associated with movements. The accumulation of different sorts of challenges around similar issues generally leads to the gradual amelioration of the condi-tions which generated the identity (and the associated move-ment) in the first instance. If the emphasis in the movement is on identity then successful reform (even partial reform) reduces the injury and thus diminishes the power of the identity claim based upon that injury. This is because reform is necessarily uneven in terms of the impact it has. This then poses a problem for those within the movement who would wish the reforms to go further and who see in the reforms a weakening of the identity that they believe is a necessary prerequisite for political action. As they can no longer mobilise the injured identity – and the associated suffering – as common to all (and thus requiring address because of its generalised effect), there is often, then, a perceived need to privilege that suffering as particular and to institute a politics of guilt with regard to addressing it – truly the politics of ressentiment. ¶ The problems arise by insisting on the necessity of political action being constituted through pre-existing identities and soli-darities (for example, those of being a woman). If, instead, it was recognised that equality for women is not separable from (or achievable separated from) wider issues of justice and equality within society then reforms could be seen as steps towards equality. A movement concerned with issues of social justice (of which gender justice is an integral aspect) would allow for provisional reforms to prevailing conditions of injustice without calling into question the basis for the movement – for there would always be more to be achieved . 8 Each achievement would itself necessitate further revision of what equality would look like. And it would also necessitate revision of the particular aims that constitute the "identity" afforded by participating in that movement. In this way, identity becomes more appropriately understood as being, in part at least, about participating in a series of dialogues about what is desired for the future in terms of understandings of social justice. ¶ Focusing on the future, on how we would like things to be tomorrow, based on an understanding of where we are today, would allow for partial reforms to be seen as gains and not threats. It is only if one believes that political action can only occur in the context of identification of past injustices as opposed to future justice that one has a problem with (partial) reforms in the present. Political identity which exists only through an enunciation of its injury and does not seek to dissolve itself as an identity can lead to the ossification of injured relations. The "wounded attachment" occurs when the politicised identity can see no future without the injury also constituting an aspect of that future. Developing on the work of Brown, we would argue that not only does a "reformed" identity politics need to be based upon desire for the future, but that that desire should actually be a desire for the dissolution (in the future) of the identity claim. The complete success of the femi-nist movement, for instance, would mean

that feminists no longer existed, as the conditions that caused people to become feminist had been addressed. Similarly, with the dalit movement, its success would be measured by the dissolution of the identity of "dalit" as a salient political category. There would be no loss here, only a gain.¶ As we have argued, following Mohanty ([1993] 2000) and Nelson (1993), it is participation in the processing of one's own and other's experiences into knowledge about the world, in the context of communities that negotiate epistemological premises, which confers a notion of politicised identity. Since it is an under-standing of "tomorrow" (what that would be, and how it is to be achieved) that establishes one as, for example, a feminist, such an identity claim does not exclude others from participation, and it does not solicit the reification of identity around the fact of historical or contemporary suffering. By removing these obstacles to progress, the "tomorrow" that is the goal, is more readily achievable. Identity politics, then, "needs a tomorrow" in this sense: that the raison d'être of any politicised identity is the bringing about of a tomorrow in which the social injustices of the present have been overcome. But identity politics also needs that tomorrow – today – in the sense that politicised identities need to inscribe that tomorrow into their self-definition in the present, in order to avoid consolidating activity around the maintenance of the identity rather than the overcoming of the conditions that generated it. That the tomorrow to be inscribed – today – in the self-definition of one's political identity, is one in which that identity will no longer be required, is not a situation to be regretted, since it is rather the promise of success for any movement for justice.

Coalitions are necessary to solve and possible – this evidence assumes their indicts – rallying around particular goals like the plan overcomes the problems with coalitions. Wing, University of Iowa law professor, 2003

[Adrien Katherine, 63 La. L. Rev. 717, "Civil Rights in the Post 911 World: Critical Race Praxis, Coalition Building, and the War on Terrorism" Lexis]

Because of the various problems with coalition building, several scholars do not endorse it. For example, Delgado advocates laboring within your own group for the social justice goals you support. "For some projects, justice turns out to be a solitary though heroic quest, and the road to justice is one that must be traveled alone, or with our deepest, most trusted companions." n204 Haunani-Kay Trask states that real organizing of native Hawaiians takes place outside of coalitions. n205 She supports Malcolm X's claims that whites need to tackle racism within their own communities, rather than in coalition. n206 "Work in conjunction with us-each working among our own kind." n207¶ Despite the frictions and problems between various traditional and nontraditional groups, coalition building can be a useful tool of critical race praxis in the current period. African Americans have been used to being the dominant minority in the United States, able to keep their concerns at the center of the civil rights movement. Latinos are now surpassing Blacks numerically, n208 and are the majority in California already. n209 They will be 25% of the U.S. population by 2050. n210 [*746] Blacks will have to learn to work in coalition with Latinos to ensure that Black concerns are not lost in a new dispensation of "favored minority." While the Latinos are becoming the majority minority, they are not as politically organized as the Blacks yet, with many being recent immigrants or noncitizens, who may not speak English. n211 Thus in some instances, Latinos will need to learn from African Americans, and with them, to achieve various goals.¶ Coalition is good for Asians because although they score higher on standardized tests and have a higher income level than the other minority groups, history has already shown that they remain regarded as perpetual foreigners, n212 once subject to internment. n213 Native Americans constitute only two million people, n214 and can benefit from linking with the larger groups, some of whom may resent those tribes, who now profit from gambling casino wealth. n215 Arabs and Muslims need to join in coalition with the other groups because they are too small and too recent as immigrants in comparison to the other groups to go it alone. As the current personification of evil of the moment, they need to draw upon the resources of other groups for support.¶ coalition building does not happen in a vacuum. It must coalesce around particular projects where there is commonality of interest. For instance, Frank Valdes has noted that Latinos and Asians share a common

interest in legal issues that involve "immigration, family, citizenship, nationhood, language, expression, culture, and global economic restructuring." n216¶ [*747] ¶ <u>Racial profiling is a potential issue for cooperation as it affects all the major minority groups</u>. I will use it for illustrative purposes in the remainder of this section, even though it is only one of various issues that could be the basis for coalition building. Asian scholars have noted how both the recent mistreatment of Chinese American scientist Dr. Wen Ho Lee n217 and the interning of 120,000 Japanese and Japanese Americans in World War II could both be regarded as cases of racial profiling. n218 Kevin Johnson has called for Asians and Latinos to form political coalitions to challenge arbitrary INS conduct. n219 He also wants Blacks and Latinos to form coalitions to work on issues of racial profiling, as well. n220¶ <u>In the war against terrorism, racial profiling is particularly affecting Blacks, Latinos and South Asians who look Arab, creating an ideal intersectional issue for coalition building. n221 Coalescing</u> around profiling in these times <u>will not be easy</u>. In his timely book, Justice at War: Civil Liberties and Civil Rights in a Time of Crisis, Richard Delgado, a founder of CRT, queries, "Will the establishment insist on Americanism and toeing the line in the war on terrorism, and demand that minorities demonstrate loyalty, in return for a symbolic concession or two?...Will it choose one minority group for favored [*748] treatment, in hope of keeping the others in line." n222 There are several foreseeable scenarios in this regard. For example, the Bush administration could reconfigure rather than terminate various federal affirmative action programs after an expected hostile Supreme Court decision in the upcoming Michigan cases, n223 to attempt to ensure Black support for the war efforts. The administration's rejection of the pro-affirmative action position of the University of Michigan may have attracted some Asian support. n224 The perpetuation of the forty year old blockade against Cuba despite U.S. business opposition ensures Cuban American loyalty, n225 and the rumored appointment of a Hispanic for the next U.S. Supreme Court vacancy may attract other Latinos. n226 Delgado wonders whether people of color will "be able to work together toward mutual goals- or [will] the current factionalism and distrust continue into the future, with various minority groups competing for crumbs while majoritarian rule continue[s] unabated?" n227¶ In order to ensure that issues like racial profiling do become an effective rallying point for multiethnic coalition building in the war against terrorism era, it is necessary to develop a more complete theorization of the process. <u>Critical race scholars have provided some insights that could be useful. According to Mari Matsuda, "when we work in coalition . . . . we compare our struggles and challenge one another's assumptions. We learn of the gaps and absence in our knowledge. We learn a few tentative, starting truths, the building blocks of a theory of subordination." n228 If traditional minority civil rights groups joined together with Arabs and Muslims, they would learn how little they truly understood about the other.</u> I am one of the few African Americans that I know who deals with Arab and Muslim organizations as well as African American ones. I am astounded at how little accurate information each has about the other, even though some Blacks are Muslim, and there may be some degree of overlap between groups. In dealing with Latino-based entities, for example, I find they have very little basis for understanding Arabs and Muslims. I have tried to translate Catholic or Christian principles [*749] into Muslim ones and vice versa, but my own knowledge of Christian theology is inadequate to the task. Since I teach Islamic law, I actually know more about that faith than the Christianity in which I was socialized. <u>Attempting to fill in the gaps in knowledge between Muslim and Arab groups and various organizations of color might reveal the similarities and differences in racial profiling and perhaps other issues as well. These issues might become the focus for joint action.</u>¶ Chuck Lawrence has a more elaborate position on coalition building, which requires:¶ (1) understanding the complex interrelatedness of our racial subjugation;¶ (2) confronting our own internalized racist beliefs and the ways in which we participate in the maintenance of white supremacy;¶ (3) resisting constructions of race that divide and demean us;¶ (4) learning to talk and listen to one another, to share experience, to empathize with and understand one another; and¶ (5) finding ways to sustain ourselves as we do the difficult, and often thankless work of coalition building. n229¶ <u>It is very difficult to imagine various groups agreeing on the interrelatedness of racial subjugation</u>. Some minorities still socially construct themselves as white, and would not want to characterize their position as "Black." They might view their problems through the prism of religion or culture or ideology, rather than be forced to fit into America's racial categorizations.¶ With respect to Lawrence's second point, <u>I have found many groups of color are unable to recognize that they too could be participants in maintaining white supremacy, not merely victims</u>. Demonizing another group of color may be a vain attempt to be better or more "American" than others, failing to recognize that all will be seen as perpetual permanent outsiders in a hierarchy where white is still at the top. Addressing the third issue, seeking white status may be more important than alliances with groups of color.¶ I have participated in coalitions where it would have been better for groups not to talk too much with each other, because more points of dissimilarity may come out. For example, a Black civil rights group may be able to march against racial profiling with an Asian group. Engaging in dialogue may reveal the Asian group is anti- affirmative action. Thus Lawrence's fourth point about talking together and developing empathy may not occur. As a matter of fact, [*750] coalition building can create strange bedfellows, according to Delgado. Skinheads, survivalists, and anti-gun control elements all concerned with government surveillance may not be otherwise compatible with Asian and Latino groups concerned with the government treatment of immigrants after September 11. n230¶ Sustaining ourselves as we build coalitions, Lawrence's fifth point, is critical. I have seen too many legal activists burn out in frustration or depression from the lack of positive results from both ends of coalition building. Some will merely drop out of the coalition aspect, while others will drop out of organizational work altogether, preferring to focus on individual personal, professional or family pursuits.¶ <u>Lawrence</u> also <u>emphasizes trust</u>. "Coalition work requires time and space to build trust. It requires creating methods and models for conversation, collaboration, and sharing. Engaging in collective action and

careful reflection means starting small and building on the trust that we create in the process of doing this difficult work together." n231 My attitude toward trust is the opposite of Lawrence's. Using a personal hypothetical example, I would trust my husband, until I catch him cheating, and then might forgive him and stay with him, but would not trust him again. If I would not always trust a husband to whom I have made a life commitment in such circumstances, I see no reason why trust is necessary in coalition. We may work together within my group, and I may not trust other group members to do all the work as promised. I am usually prepared with a back up plan that requires that I may have to fill in to do the work of a colleague who is inefficient, incompetent, lazy, overworked or who has a personal or medical issue or a family matter. If I do not readily trust those in my own group, especially based on long term experiences with them, I would not extend trust to others operating perhaps on even fewer points of commonality. This lack of trust does not mean being hostile to the other group, it just means being aware of the pitfalls, and that their other priorities may not make them worthy of trust on any but the most superficial level.¶ In The Miner's Canary: Enlisting Race, Resisting Power, Transforming Democracy, n232 Lani Guinier and Gerald Torres see those raced as Blacks as having the potential to lead or be at the center of coalitions of outgroups, who exemplify the notion of "political race," n233 which might include various nonblack groups. [*751] According to the authors, all U.S. society would benefit if it would notice when Blacks are hurting; they serve in the role of the miner's canary signaling problems that will ultimately affect everyone in the mine. n234 Their framework involves reconceptualizing meta-narratives, working from the bottom up, and tackling hierarchy. n235 Unfortunately, I do not think it is likely that various outgroups would accept the leadership or centrality of Black groups in the current atmosphere. An issue like racial profiling, for example, does not affect poor whites or many white-looking women to the same degree it affects Blacks, Arabs and Muslims, and those who look like them. Derrick Bell's theory of white self-interest indicates that poor whites have not historically rallied together with people of color. n236 Outgroups who are used to being dominant due to white privilege n237 or relative privilege vis-a-vis Blacks, are unlikely to take a back seat to Blacks in the war against terrorism, an issue on which they would feel Blacks have no special expertise in any event. Delgado postulates that various outgroups of color would abandon their coalition with each other if they can get concessions from white power elites. n238¶ Critical Latina/o Theory (LATCRIT), a more recent CRT offshoot, has generated an analysis of coalition across minority ethnic groups. n239 LATCRIT founder Frank Valdes calls for "'critical coalitions' . . . 'alliances based on a thoughtful and reciprocal interest in the goal(s) or purpose(s)' of a collaborative and collective project." n240 This definition would not require embracing of trust, but would be pragmatic, i.e., we will cooperate in publicizing these egregious cases in our respective communities.¶ [*752] ¶ Mary Romero posits that "the ways in which race based movements and racialized communities construct their identities has enormous implications for setting social justice agendas and for coalition building." n241 Returning to an example we have mentioned before, n242 some groups may construct themselves as white and think perhaps that they are above being in coalition with a group of color. They may unconsciously feel entitled to dominate the coalition.¶ Lisa Iglesias has stated, "we need to learn how to articulate our intergroup comparisons in ways that energize new solidarities and promote more fluid and inclusive political identities by revealing new interconnections and commonalities among the oppressed, despite and perhaps because of our differences." n243 Her plea is an optimistic one, and perhaps could help with the problem of finding out too much information about a coalition partner, leading to less desire to work together. For example, the previously mentioned Black pro-affirmative action and Asian anti-affirmative action group might be able to become closer while mutually addressing the racial profiling issue. Blacks and Asians who look like "Arabs" will both be subject to profiling as terrorists. A good working relationship on this issue might enable some members of each group to hear each other from time to time on the divisive and potentially explosive affirmative action question.¶ At the annual LATCRIT conferences, one issue is chosen that is designed to appeal to nonLatino attendees, as a means of rotating centers of emphasis. n244 In this regard, Athena Mutua has called for what she terms "shifting bottoms and rotating centers" to acknowledge the fact that Blacks and Latinos can both be at the bottom of the white power hierarchy in different ways, and there is the need for a shifting emphasis on the various groups. Whereas Blacks are at the bottom of a color hierarchy, many Latinos can be at the bottom of the language hierarchy. n245 Unfortunately, it may be difficult to rally around this theme, as the number of nonLatinos at the conferences does not constitute a big enough cohesive faction to offset the dominance of the Latinos. The dynamic manifests as one center of the universe, i.e. Latino issues, with a shooting star flashing past, i.e. other minority issues. The environment can be particularly uncomfortable for some African Americans who are used to their concerns taking center stage. While some Latinos may be at the [*753] bottom in terms of language hierarchy in the U.S., Blacks remain there as well for their failure to master standard English despite having no other first language. n246 At the LATCRIT conferences, nonspanish speakers may feel isolated as there is frequent lapsing in and out of Spanish, with accompanying joking or shaking of heads, that others who do not speak Spanish can not follow.¶ Cho and Westley provide an insight that is critically important. They call for a "structure of political organizing that unites contingent, transitory, and relationally defined individuals on the basis of interests rather than putative fixed group identities." n247 In other words, we can not essentialize the interests of various minority groups, and assume that all the Asians will have the same position, for example. n248 There are Asian groups which are against affirmative action, and groups that are for it. n249 Conservative Cuban groups may not have much in common with the Puerto Rican Legal Defense Fund. The NAACP rarely agrees with the positions taken by Justice Clarence Thomas or African American University of California regent, Ward Connerly, who led the call to dismantle affirmative action in the UC system. n250¶

<u>Some groups of color may resent racial profiling of their own ethnic group members, but welcome its use against Arabs and Muslims as potential terrorists</u>. n251 Catching young Black juveniles who rob convenience stores or poor Mexicans crossing the Texas border looking for work may be regarded as qualitatively different by Blacks and Latinos than catching Muslim supporters of Al Qaeda, who destroyed the World Trade Centers, damaged the Pentagon, and killed thousands in one day. They are people who have declared war on America, literally and figuratively.¶ [*754] ¶ Yamamoto posits four understandings about situated group power when we move beyond the black-white binary: simultaneity, positionality, differentiation, and dominance transformation. n252 Interpreting the points, <u>a group could simultaneously be both oppressed and an oppressor, depending on its position to other groups, which relates to how that group has been treated differently historically. If the group is dominating others, it requires the desire to transform that dynamic in a positive manner so the groups can work together in healthy coalition</u>. n253 Applying Yamamoto's concepts to Black legal groups, <u>it is necessary for some of these organizations to realize that they have been filling up a disproportionate amount of space in many coalitions of color, "acting white," so to speak. Working together effectively in the war on terror era will require an acknowledgment of this reality.</u> Given how longstanding the dominance of Black groups has been, it will not be easy for them to transform, particularly as their numerical dominance fades as well.

AT: Subversive Strategies Good

Being subversive has no intrinsic value absent pre-conceived norms – that flips subversion on its head.

Nussbaum, University of Chicago law professor, 1999

[Martha, "The Professor of Parody" http://www.akad.se/Nussbaum.pdf]

Butler departs in this regard from earlier social-constructionist feminists, all of whom used ideas such as non-hierarchy, equality, dignity, autonomy, and treating as an end rather than a means, to indicate a direction for <mark>actual politics</mark>. Still less <mark>is</mark> she <mark>willing to elaborate any positive normative notion</mark>. Indeed, it is clear that Butler, like Foucault, is adamantly opposed to normative notions such as human dignity, or treating humanity as an end, on the grounds that they are inherently dictatorial. <mark>In her view, we ought to wait to see what the political struggle itself throws up, rather than prescribe in advance</mark> to its participants. Universal normative notions, she says, "colonize under the sign of the same."¶This idea of waiting to see what we get--in a word, this <mark>moral passivity--seems plausible</mark> in Butler <mark>because she tacitly assumes an audience of like-minded readers who agree</mark> (sort of) about what the bad things are-- discrimination against gays and lesbians, the unequal and hierarchical treatment of women--and who even agree (sort of) about why they are bad (they subordinate some people to others, they deny people freedoms that they ought to have). But <mark>take that assumption away, and the absence of a normative dimension becomes a severe problem</mark>.¶Try teaching Foucault at a contemporary law school, as I have, and you will quickly find that subversion takes many forms, not all of them congenial to Butler and her allies. As a perceptive libertarian student said to me, <mark>Why can't I use these ideas to resist the tax structure, or the antidiscrimination laws, or perhaps even to join the militias?</mark> Others, less fond of liberty, might engage in the subversive performances of making fun of feminist remarks in class, or ripping down the posters of the lesbian and gay law students' association. These things happen. They are parodic and subversive. Why, then, aren't they daring and good?¶Well, there are good answers to those questions, but you won't find them in Foucault, or in Butler. Answering them requires discussing which liberties and opportunities human beings ought to have, and what it is for social institutions to treat human beings as ends rather than as means--in short, a normative theory of social justice and human dignity. <mark>It is one thing to say that we should be humble about our universal norms,</mark> and willing to learn from the experience of oppressed people. <mark>It is</mark> quite <mark>another thing to say that we don't need any norms at all</mark>. Foucault, unlike Butler, at least showed signs in his late work of grappling with this problem; and all his writing is animated by a fierce sense of the texture of social oppression and the harm that it does.¶Come to think of it, justice, understood as a personal virtue, has exactly the structure of gender in the Butlerian analysis: it is not innate or "natural," it is produced by repeated performances (or as Aristotle said, we learn it by doing it), it shapes our inclinations and forces the repression of some of them. These ritual performances, and their associated repressions, are enforced by arrangements of social power, as children who won't share on the playground quickly discover. Moreover, the parodic subversion of justice is ubiquitous in politics, as in personal life. But there is an important difference. Generally we dislike these subversive performances, and we think that young people should be strongly discouraged from seeing norms of justice in such a cynical light. Butler cannot explain in any purely structural or procedural way why the subversion of gender norms is a social good while the subversion of justice norms is a social bad. Foucault, we should remember, cheered for the Ayatollah, and why not? That, too, was resistance, and there was indeed nothing in the text to tell us that that struggle was less

worthy than a struggle for civil rights and civil liberties.¶There is a void, then, at the heart of Butler's notion of politics. This void can look liberating, because the reader fills it implicitly with a normative theory of human equality or dignity. But let there be no mistake: for Butler, as for Foucault, <mark>subversion is subversion, and it can in principle go in any direction</mark>. Indeed, Butler's <mark>naively empty politics is especially dangerous</mark> for the very causes she holds dear. For every friend of Butler, eager to engage in subversive performances that proclaim the repressiveness of heterosexual gender norms, there are dozens who would like to engage in subversive performances that flout the norms of tax compliance, of non-discrimination, of decent treatment of one's fellow students. To such people we should say, you cannot simply resist as you please, for there are norms of fairness, decency, and dignity that entail that this is bad behavior. But then we have to articulate those norms--and this Butler refuses to do.

Performative politics is a private act that doesn't challenge systemic oppression – two implications. A- all your offense on framework is solved by reading a book and B- you don't solve your impacts, your speech act is an act of nihilism.
Nussbaum, University of Chicago law professor, 1999

[Martha, "The Professor of Parody" http://www.akad.se/Nussbaum.pdf]

The idea of gender as performance is Butler's most famous idea, and so it is worth pausing to scrutinize it more closely. She introduced the notion intuitively, in Gender Trouble, without invoking theoretical precedent. Later she denied that she was referring to quasi-theatrical performance, and associated her notion instead with Austin's account of speech acts in How to Do Things with Words. Austin's linguistic category of "performatives" is a category of linguistic utterances that function, in and of themselves, as actions rather than as assertions. When (in appropriate social circumstances) I say "I bet ten dollars," or "I'm sorry," or "I do" (in a marriage ceremony), or "I name this ship...," I am not reporting on a bet or an apology or a marriage or a naming ceremony, I am conducting one.¶Butler's analogous claim about gender is not obvious, since the "performances" in question involve gesture, dress, movement, and action, as well as language. Austin's thesis, which is restricted to a rather technical analysis of a certain class of sentences, is in fact not especially helpful to Butler in developing her ideas. Indeed, though she vehemently repudiates readings of her work that associate her view with theater, thinking about the Living Theater's Austin.¶Nor is Butler's treatment of Austin very plausible. She makes the bizarre claim that the fact that the marriage ceremony is one of dozens of examples of performatives in Austin's text suggests "that the heterosexualization of the social bond is the paradigmatic form for those speech acts which bring about what they name." Hardly. Marriage is no more paradigmatic for Austin than betting or ship-naming or promising or apologizing. He is interested in a formal feature of certain utterances, and we are given no reason to suppose that their content has any significance for his argument. It is usually a mistake to read earth-shaking significance into a philosopher's pedestrian choice of examples. Should we say that Aristotle's use of a low-fat diet to illustrate the practical syllogism suggests that chicken is at the heart of Aristotelian virtue? Or that Rawls's use of travel plans to illustrate practical reasoning shows that A Theory of Justice aims at giving us all a vacation?¶Leaving these oddities to one side, Butler's point is presumably this: <mark>when we act and speak</mark> in a gendered way<mark>, we are</mark> not simply reporting on something that is already fixed in the world, we are actively <mark>constituting it</mark>, replicating it, and reinforcing it. By behaving as if there were male and female "natures," we co-create the social

fiction that these natures exist. They are never there apart from our deeds; we are always making them be there. At the same time, by carrying out these performances in a slightly different manner, a parodic manner, we can perhaps unmake them just a little.¶Thus the one place for agency in a world constrained by hierarchy is in the small opportunities we have to oppose gender roles every time they take shape. When I find myself doing femaleness, I can turn it around, poke fun at it, do it a little bit differently. Such reactive and parodic performances, in Butler's view, never destabilize the larger system. She doesn't envisage mass movements of resistance or campaigns for political reform; only personal acts carried out by a small number of knowing actors. Just as actors with a bad script can subvert it by delivering the bad lines oddly, so too with gender: the script remains bad, but the actors have a tiny bit of freedom. Thus we have the basis for what, in Excitable Speech, Butler calls "an ironic hopefulness."

Their reading of power ignores material conditions – slavery never would have been challenged if this was the abolitionist strategy.
Nussbaum, University of Chicago law professor, 1999

[Martha, "The Professor of Parody" http://www.akad.se/Nussbaum.pdf]

What precisely does Butler offer when she counsels subversion? She tells us to engage in parodic performances, but she warns us that the dream of escaping altogether from the oppressive structures is just a dream: it is within the oppressive structures that we must find little spaces for resistance, and this resistance cannot hope to change the overall situation. And here lies a dangerous quietism.¶If Butler means only to warn us against the dangers of fantasizing an idyllic world in which sex raises no serious problems, she is wise to do so. Yet frequently she goes much further. She suggests that the institutional structures that ensure the marginalization of lesbians and gay men in our society, and the continued inequality of women, will never be changed in a deep way; and so our best hope is to thumb our noses at them, and to find pockets of personal freedom within them. "Called by an injurious name, I come into social being, and because I have a certain inevitable attachment to my existence, because a certain narcissism takes hold of any term that confers existence, I am led to embrace the terms that injure me because they constitute me socially." In other words: I cannot escape the humiliating structures without ceasing to be, so the best I can do is mock, and use the language of subordination stingingly. In Butler, resistance is always imagined as personal, more or less private, involving no unironic, organized public action for legal or institutional change.¶Isn't this like saying to a slave that the institution of slavery will never change, but you can find ways of mocking it and subverting it, finding your personal freedom within those acts of carefully limited defiance? Yet it is a fact that the institution of slavery can be changed, and was changed--but not by people who took a Butler-like view of the possibilities. It was changed because people did not rest content with parodic performance: they demanded, and to some extent they got, social upheaval. It is also a fact that the institutional structures that shape women's lives have changed. The law of rape, still defective, has at least improved; the law of sexual harassment exists, where it did not exist before; marriage is no longer regarded as giving men monarchical control over women's bodies. These things were changed by feminists who would not take parodic performance as their answer, who thought that power, where bad, should, and would, yield before justice.¶Butler not only eschews such a hope, she takes pleasure in its impossibility. She finds it exciting to contemplate the alleged immovability of power, and to envisage the ritual subversions of the slave who is convinced that

she must remain such. She tells us--this is the central thesis of The Psychic Life of Power--that we all eroticize the power structures that oppress us, and can thus find sexual pleasure only within their confines. It seems to be for that reason that she prefers the sexy acts of parodic subversion to any lasting material or institutional change. Real change would so uproot our psyches that it would make sexual satisfaction impossible. Our libidos are the creation of the bad enslaving forces, and thus necessarily sadomasochistic in structure. Well, parodic performance is not so bad when you are a powerful tenured academic in a liberal university. But here is where Butler's focus on the symbolic, her proud neglect of the material side of life, becomes a fatal blindness. For women who are hungry, illiterate, disenfranchised, beaten, raped, it is not sexy or liberating to reenact, however parodically, the conditions of hunger, illiteracy, disenfranchisement, beating, and rape. Such women prefer food, schools, votes, and the integrity of their bodies. I see no reason to believe that they long sadomasochistically for a return to the bad state. If some individuals cannot live without the sexiness of domination, that seems sad, but it is not really our business. But when a major theorist tells women in desperate conditions that life offers them only bondage, she purveys a cruel lie, and a lie that flatters evil by giving it much more power than it actually has.

AT: Black Scholarship

The aff is a form of selling out – they produce black knowledge in a space they have already criticized as being white – that de-radicalizes black thought – the alternative is negation of whiteness, not an affirmation of debate.
Curry, Texas A&M African studies and philosophy professor, 2013

[Tommy, "Reflections on College Debate as a Black Man in the 1990s"
http://drtjc.tumblr.com/post/63012232390/reflections-on-college-debate-as-a-black-man-in-the]

See I was a problem. Back then, no one talked about race seriously in debate rounds. Even in a year when the topic was title seven, racism was secondary to the cases that won constantly that year on sex. I lost rounds to white people for running impacts on race, was called a token by white women, I even lost a round to a two woman white team on the neg after they dropped a counterplan and disadvantage because I ran extension evidence in the 2NC. There was a moratorium on Blackness, especially Black maleness in CEDA/NDT. When I proposed an all-Black debate tournament on the list-serv I was called hateful, despite the celebration of white women doing one. I say this to say that debate has a peculiar-pre-determined morality.¶ The UDL were just beginning in the mid to late 90's when I started college. I was involved in them around my junior year when Emory and UMKC started recruiting me, and I certainly think they have been a success, however, with the allure of progress (more Blacks, more Black judges, more conceptual debates about Blackness) comes a **de-radicalization** of what Black theory and what Black people are supposed to do and represent. Despite our pretense, debate is still a privileged world; a pretend world where Black people can have their queerness, their femaleness, their **faux radicality** recognized, for actual oppressed peoples, who are not recognized, these qualities mean death. So in debate rounds we get to act as if we are the conduit of this Black suffering. In demographic increase in the population of Black debaters, has brought about a new morality committed to fighting for inclusion, intellectual space or expanded ideas of home, but in this we miss the extent of our dependency on white recognition—that white judge—in the back of the room **comprehending and assimilating our goals** with their own liberal/progressive existence. In other words, it is through our appeal to white men and women, our need for their recognition, for their ballot, that frames the ultimate message of our pessimism, or gender critiques, or colonial analysis. We are fundamentally dependent on how the white mind situates itself conceptually to the project of diversification. We appeal to the sympathies, or worse yet intersectional empathy of whites, as the gauge of the transformative potency.¶ In these spaces, real radicality comes not from the appeal to white recognition, but the rejection of it. Of the declaration that Black knowledge, Black theory, and Black accounts of existence (in all is economic and sexual plurality) can be found in Black people thinking Black thought. It need not depend on our alliances/allegiances with white liberals rationalizing their existence as justifiable through alliances. Black debate should ultimately move to the rejection of white adjudication. If Black theory is about the liberation of Black people and a move to definitions of knowledge/selves/concepts that don't currently exist, how can we expect the dilapidated ideas of white sentimentality projected from archaic racialized whiteness to understand or comprehend the interrelatedness of propositions that are beyond their present being. The true radicality of Black people debating points to the negation of white comprehension of Black ideas of liberation, not their assimilation or recognition of them.

AT: White Feminists who Talk about Race

White feminists should not use Audre Lorde.
Smith, University of California Riverside cultural studies professor, 12-26-13

[Andrea, "Sympathy, Outrage and White Humanity: Reflections on BDS, Anti-Black Racism and Justine Sacco" http://andrea366.wordpress.com/2013/12/26/sympathy-outrage-and-white-humanity-reflections-on-bds-anti-black-racism-and-justine-sacco/]

The disappearance of Black suffering in these defenses indicates the extent to which Black peoples become marked as property within even progressive circles. The legacy of anti-Black racism is that Black struggle gets deemed the property of all other social justice struggles. The symbols and tactics of Black struggle are deemed the common property of all. Black people are required to show solidarity with other oppressed communities, without other struggles owing solidarity to Black communities. Black oppression is always analogized to other forms of oppression in a manner that disappears Black oppression itself. It is presumed we already know everything about Black oppression, so we can just use it as an empty signifier to explain other oppressions. Thus, once again, while the defenses of Sacco do not defend her remarks per se, Black suffering becomes an empty signifier to talk about the ethics of twitter outrage. We supposedly know all about anti-Black racism, so we do not need to concern ourselves further with that. We just need to concern ourselves with the plight of those who make anti-Black statements. That is why many white feminists have no trouble using quotes from Audre Lorde against women of color because they see Black feminist critique as their property. As Saidiya Hartman describes in Scenes of Subjection, Black peoples are seen either as property or as criminals when they resist their designation as property. Thus, it is not surprise that white feminists attempt to designate some forms of Black feminist critique (Audre Lorde) as their property in order to attack and criminalize other forms of Black feminist critique they deem threatening (as can be seen by recent white feminist attacks on Mikki Kendall and #solidarityisforwhitewomen)¶ As Hartman further demonstrates, the logics of slavery that render Black peoples as the property of white supremacy required the disappearance of Black outrage. Slaveowners required Black peoples to sing and dance in order to affirm the naturalness of their slave condition. Outrage by contrast, would have asserted the humanity of Black peoples by underscoring the violence needed to maintain plantation slavery, thus challenging the presumption that white supremacy should be the natural order of things.¶ Today, dissent against white supremacy and settler colonialism remains constantly policed. Black peoples are not supposed to complain, get outraged or "riot" when they are subjected to premature death. Indigenous peoples are supposed to be happy when the nation-states that continue to colonize them then issue official "apologies" for residential/boarding school abuse. As Glen Coulthard notes, Indigenous peoples become pathologized when they refuse these official apologies and choose to remain angry about settler colonialism. Palestinian peoples are supposed to forego their struggles for self-determination and even just to survive in order to support academic freedom for Israelis. We are supposed to obsess about whether Palestinians are excessively "violent" while ignoring the violence of Israeli state. Peoples subjected to colonization and white supremacy cannot be outraged because outrage would indicate they are no longer willing to accept these conditions. ¶ These calls to monitor twitter outrage mirror the admonitions made after the George Zimmerman verdict to Black peoples to be "peaceful" to ensure they wouldn't riot. Racialized and colonized peoples are supposed to be the victims of outrage. Twitter outrage is a problem only when racialized and colonized peoples express outrage against conditions of colonialism and white supremacy. Sure, it is acceptable to feel sympathy when racialized and colonized peoples are victimized – but only as long as they remain victims to be rescued by others under the terms and conditions set by those in the dominant position. However, insofar as outrage indicates a desire to fundamentally change conditions, it becomes strictly policed, even by those who claim to support racial justice. ¶ It is also telling that the reaction against Sacco gets described as a form of "lynching" or mob violence. This depiction is a legacy of the gendered racial histories of Black lynching in which the imperiled white woman becomes the justification for anti-Black violence. White women, both then and in this case, become imagined as imperiled by black violence. This transforms them into people requiring protection and obscures their role as active perpetrators of oppression and violence from which Black peoples need protection.¶ The question is not whether Sacco has been dehumanized – rather the question is how has white humanity

itself been fundamentally constructed through the transformation of Black peoples into non-persons. The question is, how has the continuing colonization of the peoples in Africa as well as trans-Atlantic slavery – and the millions of Black deaths that continue as a result - disappear as things that deserve our outrage. As the work of Denise Da Silva, Katherine McKittrick, Sylvia Wynter, Rinaldo Walcott, Alexander G. Weheliye and many others have shown us, white humanity does not need to be recovered. Rather the racial logics of who gets deemed to be human need to be dismantled.   And as Jared Sexton notes, white humanity is premised on the "obscurity of Black suffering."

AT: Domestic Racism Trade-off

To claim that domestic racism should proceed the "international" violence the US commits against foreign bodies is unethical—their overly broad focus on white supremacy cannot explain particulars of interethnic conflicts and undermines effective racial politics

Sunstrom, University of San Francisco philosophy professor, 2008

[Ronald, "The Browning of America and the Evasion of Social Justice" http://books.google.com/books?id=W-Szh1o4CB8C&pg=PA3&lpg=PA3&dq=sundstrom,+It+would+be+odd+and+troubling+for+the+nation+to+merrily+work+toward+justice+at+%E2%80%9Chome,%E2%80%9D&source=bl&ots=Okube3k_gR&sig=PGTWRaNb86KhCXpxx0g1RwdNg4M&hl=en&sa=X&ei=gbAsU-ONLsaS0AHDz4BA&ved=0CCoQ6AEwAA#v=onepage&q=sundstrom%2C%20It%20would%20be%20odd%20and%20troubling%20for%20the%20nation%20to%20merrily%20work%20toward%20justice%20at%20%E2%80%9Chome%2C%E2%80%9D&f=false, pp. 3-4]

It would be odd and troubling for the nation to merrily work toward justice at "home," all the while neglecting the demands of those whom the nation regarded as perpetual foreigners (and not really being at "home" in the nation) and the demands of global justice. Such a vision of justice is **self-serving and morally hollow.** Long-existing civil rights claims **should not delimit the nation's moral boundaries and its conception of civil rights**, thus ipso facto severing them from internationally determined human rights. The reactions of some citizens to the browning of America, unfortunately, open up this possibility, which is yet another evasion of social justice.7 ¶ When I broach these issues, or any of the particular issues discussed in this book, the response I frequently receive is that these issues are red herrings that divert our attention away from the real enemy, that of white supremacy.8 I am dubious about this complaint; after all, focusing on "white supremacy" **does not directly address the particulars of the interethnic confl icts** that arise from the browning of America. Perhaps, though, these critics mean that we should focus on how "white supremacy," in the form of institutionalized racism or white power, divides minority groups, so as to conquer them and leave them to fi ght over a limited set of resources. Alternatively, these critiques would have us focus on how Latinos, Asian Americans, Americans who identify as multiracial, and immigrants adopt anti-black racism and the privileges of whiteness as they assimilate into American society. I think **the latter argument is bogus,** and chapter 3 is devoted in part to explaining why. As for the former, I think "white supremacy" is too broad and vague a category to be helpful, and that focusing on such a fl awed category of power **can be positively harmful**. Such moves simply sidestep the particular issues that are raised in interethnic confl icts and may even contribute to the evasions I outlined earlier. The people of the United States, as they experience and participate in the browning of America, should resist both types of evasions. The Browning of America and the Evasion of Social Justice argues, in contrast, that the people of the United States should see in its demographic change the transformation of social justice. They should welcome that transformation and view it as an opportunity to satisfy old debts and expand in a cosmopolitan direction the very idea of social justice.

Doesn't export violence.
Chandler, University of Westminster international relations professor, 2010

[David, "The uncritical critique of 'liberal peace'"
http://www.davidchandler.org/pdf/journal_articles/RIS%20Critiques%20of%20Liberal%20Peace.pdf,
p.144-9]

In the critiques of the liberal peace, this growing consensus on the problematic nature of liberalism appears to cross the political and policy spectrum. The fundamental and shared claim of the critics is that the lack of success of external interventions, designed not only to halt conflict but to help reconstruct the peace, is down to the liberalism of the interveners. If only they were not, in various ways, so liberal, then it is alleged external intervention or assistance may potentially be much less problematic. It can appear that the main academic and political matter of dispute is whether the liberal peace discourse is amenable to policy change. Here the divide seems to roughly approximate to the division highlighted above, in terms of the heuristic categories of 'power-' and 'ideas-based' liberal peace critics. The more radical, 'power-based', critics, with a more economically deterministic approach to the structural dynamics or the needs of 'neo-liberalism' are less likely to be optimistic of reform. On the 'ideas-based' side, those critics of liberal peace frameworks who tend to be more engaged in policy related work are more optimistic with regard to a shift away from the policy emphasis of liberal peace.

In a recent article, Endre Begby and Peter Burgess argue that the majority of the critics of the liberal peace seem to share two key assumptions about external intervention: firstly, that external Western intervention (of some kind) is necessary, and secondly, that the goal of this intervention should be the liberal one of human freedom and flourishing.33 They state that, in which case, the problem is not so much with the aspirations or goals of 'liberal peace' but with the practices of intervention itself. They have a valid point regarding the limited nature of much of this 'critical' discourse, but do not reflect adequately on the diminished content of the 'liberalism' of the policy interventions themselves nor the 'liberal' aspirations of those who advocate for the reform of practices of external intervention. It seems that the common ground in the broad and disparate critiques of the liberal peace, is not the critique of the external practices of intervention as much as the classical assumptions of liberalism itself.

The critique of liberalism as a set of assumptions and practices seems to be driving the approach to the study of post-Cold War interventions in ways which have tended to produce a fairly one-sided framework of analysis in which the concept of liberalism is ill-equipped to bear the analytical weight placed upon it and appears increasingly emptied of theoretical or empirical content. Liberalism appears to be used promiscuously to explain a broad range of often contradictory policy perspectives and practices across very differing circumstances and with very differing outcomes. In this sense, it appears that liberalism operates as a 'field of adversity'34 through which a coherent narrative of post-Cold War intervention has been articulated both by critical and policy orientated theorists. The promiscuous use of liberalism to explain very different policy approaches is, of course, facilitated by the ambiguous nature of the concept itself.

It is this ambiguity which enables liberalism to be critiqued from opposing directions, sometimes by the same author at the same time. Good examples of this are Roland Paris and Timothy Sisk who criticise 'liberal' peacebuilding for being both too laissez-faire and too interventionist in its approach to the regulation and management of conflict. In the peacebuilding literature today, the experience of the early and mid-1990s and the 'quick exit' policies of the 'first generation' peacebuilding operations in Nambia, Nicaragua, Angola, Cambodia, El Salvador, Mozambique, Liberia, Rwanda, Bosnia, Croatia and

Guatemala has been repackaged¶ as evidence that Western interveners had too much faith in the liberal¶ subject.35 Similarly, the ad hoc responses to the problems of the early 1990s in the¶ development of 'second generation' peacebuilding with protectorate powers in Bosnia, Kosovo and East Timor, has been criticised as liberal hubris, on the¶ assumption that international overlords could bring democracy, development and¶ security to others. It seems that, rather than adding clarity, **the critique of the¶ 'liberalism' of intervention tells us very little**.

The mechanism through which these liberal framings have been facilitated and¶ critiqued is that of the discursive centring of the non-liberal Other; on whose behalf¶ the policy critics assert the need for different policy practices. In this way, the¶ policy critics of past policy approaches evade a direct critique of liberal¶ assumptions about equality, autonomy, and transformative capacity, instead,¶ arguing that the non-liberal Other (in various ways) invalidates, challenges or¶ resists (passively as well as actively) policy practices which may otherwise have¶ been less problematic.

Rather than a critique of liberalism for its inability to overcome social,¶ economic and cultural inequalities, both the policy, 'ideas-based', critique of the¶ liberal peace and the more radical, 'power-based', critiques argue that social,¶ economic and cultural inequalities and differences have to be central to policy¶ practices and invalidate universalising liberal attempts to reconstruct and rebuild¶ post-conflict societies. In this context – in which the dichotomy between a liberal¶ policymaking sphere and a non-liberal sphere of policy intervention comes to¶ the fore – there is an inevitable tendency towards a consensual framing of the¶ problematic of statebuilding or peacebuilding intervention as a problem of the¶ relationship between the liberal West and the non-liberal Other.

The rock on which the liberal peace expectations are held to crash is that of the¶ non-liberal Other. The non-liberal Other increasingly becomes portrayed as the¶ barrier to Western liberal aspirations of social peace and progress; either as it lacks¶ the institutional, social, economic and cultural capacities that are alleged to be¶ necessary to overcome the problems of liberal peace or as a subaltern or resisting¶ subject, for whom liberal peacebuilding frameworks threaten their economic or¶ social existence or fundamental values or identities. **The 'critique' becomes apology¶ in that this discursive focus upon the non-Western or non-liberal Other is often¶ held to explain the lack of policy success** and, through this, suggest that democracy¶ or development are somehow not 'appropriate' aspirations or that expectations¶ need to be substantially lowered or changed to account for difference.

International statebuilding and the critique of liberalism¶ It would appear that the assumptions held to be driving liberal peace approaches¶ are very much in the eye of their critical beholders. The most obvious empirical¶ difficulty is that international policy regarding intervention and statebuilding seems¶ to have little transformative aspiration: far from assumptions of liberal universalism,¶ it would appear that, with the failure of post-colonial development, especially¶ from the 1970s onwards, international policymakers have developed historically¶ low expectations about what can be achieved through external intervention and¶ assistance. The lack of transformative belief is highlighted by one of the key¶ concerns of the policy critics of the liberal peace – the focus on capacity-building¶ state institutions and intervening to construct 'civil' societies. The focus on institutional solutions (at both the formal and informal levels) to the problems of¶ conflict and transition is indicative of the narrowing down of aspirations from¶ transforming society to merely regulating or managing it – often understood¶ critically as the 'securitising' of policymaking. This is a long way from the promise¶ of liberal transformation and the discourse of 'liberating' societies economically¶ and politically.

In fact, it is the consensus of opinion on the dangers of democracy, which has informed the focus on human rights and good governance. For the policy and radical critics of liberal peace, liberal rights frameworks are often considered problematic in terms of the dangers of exclusion and extremism. Today's 'illiberal' peace approaches do not argue for the export of democracy – the freeing up of the political sphere on the basis of support for popular autonomy. The language of illiberal institutionalist approaches is that of democratisation: the problematisation of the liberal subject, held to be incapable of moral, rational choices at the ballot box, unless tutored by international experts concerned to promote civil society and pluralist values. In these frameworks, the holding of elections serves as an examination of the population and the behaviour of electoral candidates, rather than as a process for the judgement or construction of policy (which it is assumed needs external or international frameworks for its production).

The focus on institutionalism does not stem from a critique of liberal peace programmes; institutionalist approaches developed from the 1970s onwards and were rapidly mainstreamed with the end of the Cold War.36 From 1989 onwards, Western governments and donors have stressed that policy interventions cannot just rely on promoting the freedoms of the market and democracy, but need to put institutional reform and 'good governance' at the core.37 Even in relation to Central and Eastern Europe it was regularly stressed that the people and elected representatives were not ready for freedom and that it would take a number of generations before it could be said that democracy was 'consolidated'.38 The transitology literature was based on the critique of liberal assumptions – this was why a transitional period was necessary. Transition implied that markets and democracy could not work without external institutional intervention to prevent instability. While markets needed to be carefully managed through government policymaking it was held that civil society was necessary to ensure that the population learnt civic values to make democracy viable.39

It was through the engagement with 'transition' and the problematic negotiation of EU enlargement that the discursive framework of liberal institutionalism – where human rights, the 'rule of law', civil society, and anti-corruption are privileged over democracy – was programmatically cohered. It was also through the discussion of 'transition' that the concept of sovereign autonomy was increasingly problematised, initially in relation to the protections for minority rights and then increasingly expanded to cover other areas of domestic policymaking. 40 It would appear that the key concepts and values of the 'liberal peace' held to have been promoted with vigour with the 'victory of liberalism' at the end of the Cold War were never as dominant a framing as their radical and policy critics have claimed.41

Rather than attempting to transform non-Western societies into the liberal self-image of the West, it would appear that external interveners have had much more status quo aspirations, concerned with regulatory stability and regional and domestic security, rather than transformation. **Rather than imposing or 'exporting' alleged liberal Western models**, international policy making has revolved around the promotion of regulatory and administrative measures which suggest the problems are not the lack of markets or democracy but rather the culture of society or the mechanisms of governance. Rather than promoting democracy and liberal freedoms, the discussion has been how to keep the lid on or to manage the 'complexity' of non-Western societies, usually perceived in terms of fixed ethnic and regional divisions. The solution to the complexity of the non-liberal state and society has been the internationalisation of the mechanisms of governance, removing substantive autonomy rather than promoting it.

While it is true that the reconstruction or rebuilding of states is at the centre¶of external projects of intervention, it would be wrong to see the project of¶ statebuilding as one which aimed at the construction of a liberal international¶ order.42 This is not just because external statebuilding would be understood as a contradiction in liberal terms but, more importantly, because the states being¶ constructed in these projects of post-conflict and failed state intervention are not¶ liberal states in the sense of having self-determination and political autonomy. The¶ state at the centre of statebuilding is not the 'Westphalian state' of classical¶ International Relations (IR) theorising. Under the internationalised regulatory¶mechanisms of intervention and statebuilding the state is increasingly reduced to an¶ administrative level, in which sovereignty no longer marks a clear boundary line¶ between the 'inside' and the 'outside'.43 Whether we consider European Union¶(EU) statebuilding, explicitly based on a sharing of sovereignty, or consider other¶statebuilding interventions, such as those by the international financial institutions¶in sub-Saharan Africa, it is clear that the state is central as a mechanism for¶ external coordination and regulation rather than as a self-standing actor in¶ so-called 'Westphalian' terms.44

No tradeoff – perm solves.
Hardt, Duke University literature professor, and Negri, Collège International de Philosophie professor, 2000

[Michael, phd in comparative literature from the Univ Washington, and Antonio, Univ Vincennes, "Empire" p.44-5]

We are well aware that in affirming this thesis we are swimming against the current of our friends and comrades on the Left. In the long decades of the current crisis of the communist, socialist, and liberal Left that has followed the 1960s, **a large portion of ==critical thought==**, both in the dominant countries of capitalist development and in the subordinated ones, **==has sought to recompose sites of resistance== that ==founded on the identities of social subjects or national and regional groups, often grounding political analysis on the localization of struggles==**. Such arguments are sometimes constructed in terms of "place-based" movements or politics, in which the boundaries of place (conceived either as identity or as territory) are posed against the undifferentiated and homogeneous space of global networks.2 At other times such political arguments draw on the long tradition of Leftist nationalism in which (in the best cases) the nation is conceived as the primary mechanism of defense against the domination of foreign and/or global capital.3 Today the operative syllogism **at the heart of the various forms of "==local== Leftist strategy seems to be entirely reactive: ==If capitalist domination is becoming ever more global, then our resistances to it must defend the local==** and construct barriers to capital's accelerating flows. From this perspective, the real globalization of capital and the constitution of Empire must be considered signs of dispossession and defeat. We maintain, however, that today **==this localist position==**, although we admire and respect the spirit of some of its proponents, **==is both false and damaging. It== is false first of all because the problem is poorly posed.** In many characterizations the problem **==rests on a false dichotomy between the global and the local, assuming that the global entails homogenization and undifferentiated identity whereas the local preserves heterogeneity and difference==**. Often implicit in such arguments is the assumption that the differences of the local are in some sense natural, or at least that their origin remains beyond the question. Local differences preexist the present scene and

must be defended or protected against the intrusion of globalization. It should come as no surprise, given such assumptions, that many defenses of the local adopt the terminology of traditional ecology or even identify this "local" political project with the defense of nature or biodiversity. This view can easily devolve into a kind of primordialism that fixes and romanticizes social relations and identities. **What needs to be addressed, instead, is precisely the production of locality, that is, the social machines that create and recreate the identities and differences that are understood as the local**.4 The differences of locality are neither preexisting nor natural but rather effects of a regime of production. Globality similarly should not be understood in terms of cultural, political, or economic homogenization. **Globalization**, like localization, **should be understood instead as a regime of the production** of identity and difference, or really of homogenization and heterogenization. **The better framework, then, to designate the distinction between the global and local might refer to different networks of flows and obstacles in which the local moment or perspective gives priority to the reterritorializing barriers or boundaries and the global moment privileges the mobility of deterritorializing flows. It is false, in any case, to claim that we can (re)establish local identities that are in some sense outside and protected against the global flows of capital and Empire**.

The perm is black internationalism – that solves.
Bush, St. John's University sociology associate professor, No Date

[Roderick, At least written by 2004 if not later, "Reflections on Black Internationalism As Strategy" http://sdonline.org/38/reflections-on-black-internationalism-as-strategy/]

But the rising tide of decolonization in the post-World War II period was to reinforce the radical elements within the African American population who linked civil rights with liberation movements and with radical states such as China, Cuba, Algeria, and Ghana. ==The modern civil rights movement had been a product of the post-World War II world== which gave us both the American Century and decolonization. During this period, ==movements for national liberation were prominent in every part of the formerly colonized world==. The collapse of colonial empires dominated by the British, French, and Dutch gave rise to new nations composed of people of color. While the Japanese defeat of the Russians in 1905, and the Ethiopian defeat of Italy in 1896 were signals of the increasing vulnerability of white power, the postwar decline of world white supremacy seemed to presage the long dreamed "rise of the dark world." though often combined with forms of ==Black nationalism==, is central to this effort, and compromise on this position is ==a dead-end for progressive social change, pure and simple. At the same time, however, to dismiss== the ==nationalist aspirations== of those inside our borders as do some elements even among the Black Left ==is equally unacceptable,== not only because dogma is counterproductive but because it undermines the agency of those groups. At the same time the U.S. had become the new hegemonic power ironically clothing itself in the language of its anti-colonial heritage. To win the allegiance of these new nations of color required that the U.S. eliminate its official sanction of segregation and adopt a posture of support for civil rights. But the collapse of the European empires vindicated the notion of the inevitable rise of the dark world, which was a part of the folklore of the Black working class communities from which Malcolm Little had come, and thus contributed to the mobilization of these communities. So during the flowering of the civil rights movement, Malcolm X was saying that we had arrived at the end of white world supremacy. While the civil rights movement drew inspiration from the challenge to the

white world, they did not develop a position so frankly oppositional. They hoped that their movement might redeem the soul of America. **But the movements operated in a common social space, interpenetrated one another, and generated an increasingly powerful internationalist discourse that resonated with other emancipatory voices within the United States and from many parts of the earth**. Many viewed the rebellion of the inner cities and the resistance to the increasing violence of U.S. intervention in Vietnam as the onset of a sea change in power relations not only within the United States but on a world scale. **This was a remarkable evolution, with a substantial section of the movements arguing for global solidarity with those whom Dr. Martin Luther King, Jr. called "the barefoot people of the earth**."   The agenda was to complete the Great American Revolution, and to transform the American Century into something more akin to a "People's Century."   The triumph of the right in the 1980s was part of a global reversal of these trends, but this was not a sign of strength requiring another retreat of the Left. It should be no mystery that this movement aimed its fire at women, people of color, the underclass, and gays and lesbians. These are precisely sites of greatest resistance and of those dreaming of a new society. Since this was also the period of the rising of the women, it should not be surprising that Black feminists have argued most forcefully for a strategy based on race, class, gender, and sexuality as interlocking forms of oppression. This contribution by Patricia Hill Collins, Angela Davis, Rose Brewer and others deepens the contribution of **Black internationalism**, which **is an uncompromising break with the U.S.-centric perspective** that the ruling class labored so hard to install across the political spectrum from the Right to the social democratic Left during the postwar period. It was **Malcolm X**'s insight which most effectively demolished the power of that consensus when he **argued that the Negro problem was not simply an American problem or a Black problem, but that it was an issue of the haves against the have-nots on a global scale** an issue not of civil rights but of human rights.

AT: Structural Violence – Omolade

There is no tradeoff in focus which means the perm solves – also understanding nuclear disarmament as a means of fighting racism is not mutually exclusive with the aff.
Omolade, City College Center for worker education worker, 1984

[Barbara, historian of black women and organizer for women's and civil rights/black power movements, Women's Studies Quarterly, Vol. 12, No. 2, Teaching about Peace, War, and Women inthe Military, "Women of Color and the Nuclear Holocaust" JSTOR]

As women of color, who are warriors in continual struggle to reclaim our lands and liberate our peoples, resistance to war has been¶ our heritage. **Women of color are the survivors** of the holocausts¶ visited upon our people through the centuries.

Five hundred years ago a group of light-skinned men left their¶European homelands as they had for centuries before. This time,¶however, they left to conquer the land, the resources, and the other¶ people of the world. They described the people of the world as "colored,"¶and defined themselves as "white." They defined "whiteness"¶as pure, superior, right. They defined the "blackness" of those they¶ conquered as evil, dirty, and inferior. Their journeys changed the¶world from a diverse, autonomous group of tribes, villages, nation-states,¶feudal empires- with varying world views and practices.¶Even if we agree that all of these societies were patriarchal, we must¶also admit that the forms of patriarchy varied widely, from the almost¶non-existent variety among the Arawaks to the highly structured¶ Japanese culture. Overall, the world was not at war with¶itself, though territorial disputes and religious crusades continued¶to take place. People in areas outside of those involved in disputes¶could live largely unaffected by and in ignorance of these events.

My Indian and African ancestors were generally at peace 500¶years ago. The white men who came to conquer them were not.¶These white men were able to conquer not because they were superior¶or more intelligent or more civilized, but because they were¶armed and prepared for war. Indeed, the movement of these white¶men changed world history because the primary lines that divided¶the world henceforth became racism and the biological distinctions¶of skin color. Military terrorism became the method of world domination;¶capitalism, the method of social organization; and racism¶became the ideology and world view that held together a cohesive¶system of exploitation and oppression for the world's people and¶their lands.

A direct historical line of military terrorism can be drawn from the¶guns used during the slave trade against Africans and American Indians¶to the building of nuclear arsenals by the world's current superpowers.¶During the nineteenth century, the repeating Winchester¶rifle precipitated a holocaust against the Sioux and the Comanches,¶which massacred their people, destroyed the buffalo which had sustained¶them, and destroyed the land as they knew, protected, and¶cared for it. It was, in that sense, neither an accident of history, nor¶a surprise, when similar white men dropped atomic bombs on the¶ Japanese citizens of Hiroshima and Nagasaki.

Military terror has also been used to destroy resistance to racism,¶capitalism, and militarism, for the fear of violent reprisals has taught¶people to feel powerless to attempt to change the world. Too often¶ the statistics and other information on nuclear arsenals have¶merely reinforced the military's power to

terrorize people into submission¶ or into "doomsday" protests against death. The question¶ of nuclear disarmament is not a psychological question or a technological¶ question, but rather a political question.

Nuclear arsenals and nuclear power are part of a rational and holistic system in which those in power hold power over all aspects¶ of world society. It is irrelevant whether they are called "mad" or¶ "sane" by protestors and critics of the system. The fact remains that¶ they are men, initiating and carrying out the dictates of a rational¶ system of military terror. Calling them "mad," or considering them¶ military "male chauvinists," assures only that the rational system¶ they are part of will remain obscure, and that the responsibility of¶ each man in the Pentagon will never be understood clearly enough¶ to wage an effective political struggle against it. Nuclear disarmament¶ and peace are political questions requiring political solutions of accountability and struggle around who has the power to determine¶ the destiny of the earth. The demand for unconditional U.S.¶ disarmament holds that the U.S. government is responsible for its¶ actions and should be held accountable for them.

To raise these issues effectively, the movement for nuclear disarmament must overcome its reluctance to speak in terms of power,¶ of institutional racism, and imperialist military terror. The issues of¶ nuclear disarmament and peace have been mystified because they¶ have been placed within a doomsday frame which separates these¶ issues from other ones, saying, "How can we talk about struggles¶ against racism, poverty, and exploitation when there will be no¶ world after they drop the bombs?" The struggle for peace cannot¶ be separated from, nor considered more sacrosanct than, other¶ struggles concerned with human life and change.

In April, 1979, the U.S. Arms Control and Disarmament Agency released a report on the effects of nuclear war that concludes that,¶ in a general nuclear war between the United States and the Soviet¶ Union, 25 to 100 million people would be killed. This is approximately¶ the same number of African people who died between 1492¶ and 1890 as a result of the African slave trade to the New World.¶ The same federal report also comments on the destruction of urban¶ housing that would cause massive shortages after a nuclear war,¶ as well as on the crops that would be lost, causing massive food¶ shortages. Of course, for people of color the world over, starvation¶ is already a common problem, when, for example, a nation's crops¶ are grown for export rather than to feed its own people. And the¶ housing of people of color throughout the world's urban areas is¶ already blighted and inhumane: families live in shacks, shanty¶ towns, or on the streets; even in the urban areas of North America,¶ the poor may live without heat or running water.

For people of color, the world as we knew it ended centuries ago. Our world, with its own languages, customs and ways, ended. And¶ we are only now beginning to see with increasing clarity that our¶ task is to reclaim that world, struggle for it, and rebuld it in our, own¶ image. The "death culture" we live in has convinced many to be¶ more concerned with death than with life, more willing to demonstrate¶ for "survival at any cost" than to struggle for liberty and peace¶ with dignity. Nuclear disarmament becomes a safe issue when it is¶ not linked to the daily and historic issues of racism, to the ways in¶ which people of color continue to be murdered. Acts of war, nuclear¶ holocausts, and genocide have already been declared on our¶ jobs, our housing, our schools, our families, and our lands.

As women of color, we are warriors, not pacifists. We must fight as a people on all fronts, or we will continue to die as a people.¶ We have fought in people's wars in China, in Cuba, in Guinea-¶ Bissau, and in such struggles as the civil rights movement, the¶ women's movement, and in countless daily

encounters with landlords, welfare departments, and schools. These struggles are not abstractions, but the only means by which we have gained the ability to eat and to provide for the future of our people.

We wonder who will lead the battle for nuclear disarmament with the vigor and clarity that women of color have learned from participating in other struggles. Who will make the political links among racism, sexism, imperialism, cultural integrity, and nuclear arsenals and housing? Who will stand up?

Afro-Pessimism Answers

AT: Afro-Pess – Top Level

Optimism and solidarity are our only hope---their strategy of negativity accepts the foundational premises of racism as its starting point for politics.
Hooks, City Univeristy New York English professor, 1996

[bell, "Killing Rage: Ending Racism" http://books.google.com/books?id=3JlNFYKLheUC&q=unitary+representations#v=snippet&q=unitary%20representations&f=false, p.249-50]

269More than ever before in our history, black Americans are succumbing to and internalizing the racist assumption that there can be no meaningful bonds of intimacy between blacks and whites. It is fascinating to explore why it is that black people trapped in the worst situation of racial oppres sion—enslavement—had the foresight to see that it would be disempowering for them to lose sight of the capacity of white people to transform themselves and divest of white supremacy, even as many black folks today who in no way suffer such extreme racist oppression and exploitation are convinced that white people will not repudiate racism. Con temporary black folks, like their white counterparts, have passively accepted the internalization of white supremacist assumptions. Organized white supremacists have always taught that there can never be trust and intimacy between the superior white race and the inferior black race. **When black people internalize these sentiments, no resistance to white supremacy is taking place; rather we become complicit in spreading racist notions.** It does not matter that so many black people feel white people will never repudiate racism because of being daily assaulted by white denial and refusal of accountability. We must not allow the actions of white folks who blindly endorse racism to determine the direction of our resistance. Like our white allies in struggle we must consistently keep the faith, by always sharing the truth that 270white people can be anti-racist, that racism is not some immutable character flaw. ¶ **Of course** many white people are comfortable with a rhetoric of race that suggests racism cannot be changed, that all white people are "inherently racist" simply because they are born and raised in this society. Such misguided thinking socializes white people both to remain ignorant of the way in which white supremacist attitudes are learned and to assume a posture of learned helplessness as though they have no agency—no capacity to resist this thinking. Luckily we have many autobiographies by white folks committed to anti-racist struggle that provide documentary testimony that many of these individuals repudiated racism when they were children. Far from passively accepting It as inherent, they instinctively felt it was wrong. Many of them witnessed bizarre acts of white racist aggression towards black folks in everyday life and responded to the injustice of the situation. Sadly, in our times so many white folks are easily convinced by racist whites and bLack folks who have internalized racism that they can never be really free of racism.¶ These feelings aíso then obsc]re the reality of white privi lege. As long as white folks are taught to accept racism as 'natura]" then they do not have to see themselves as con sciously creating a racist society by their actions, by their political choices. This means as well that they do not have to face the way in which acting in a racist manner ensures the maintenance of white privilege. Indeed, denying their agency allows them to believe white privilege does not exist even as they daily exercise it. If the young white woman who had been raped had chosen to hold all black males account able for what happened, she would have been exercising white privilege and reinforcing the structure of racist thought which teaches that all black people are alike. Unfortunately,¶ 271so many white people are eager to believe racism cannot be changed because internalizing that assumption downplays the issue of accountability. No responsibility

need be taken for not changing something ¡fit is perceived as immutable. To accept racism as a system of domination that can be changed would demand that everyone who sees him- or herself as embracing a vision of radai social equality would be required to assert anti-racist habits of being. We know from histories both present and past that white people (and everyone else) who commit themselves to living in anti-racist ways need to make sacrifices, to courageously endure the uncomfortable to challenge and change.¶ Whites, people of color, and black folks are reluctant to commit themselves fully and deeply to an anti-racist struggle that is ongoing because there is such a **pervasive feeling of hopelessness—a conviction that nothing will ever change**. **How any of us can continue to hold those feelings when we study the history of racism in this society and see how much has changed makes no logical sense.** Clearly we have not gone far enough. In the late sixties, Martin Luther King posed the question "Where do we go from here." To live in anti-racist society we must **collectively** renew our commitment to a democratic vision of racial justice and equality. Pursuing that vision we create a culture where beloved community flourishes and is sustained. Those of us who know the joy of being with folks from all walks of life, all races, who are fundamentalls' anti-racist in their habits of being. need to give public testimony. Ve need to share not only what we have experienced but the conditions of change that make such an experience possible. The interracial circle of love that I know can happen because each individual present in it has made his or her own commitment to living an anti- racist life and to furthering the struggle to end white supremacy 272 will become a reality for everyone only if those of us who have created these communities share how they emerge in our lives and the strategies we use to sustain them. Our devout commitment to building diverse communities is cen tral. These commitments to anti-racist living are just one expression of who we are and what we share with one an other but they form the foundation of that sharing. Like all beloved communities we affirm our differences. It is this generous spirit of affirmation that gives us the courage to challenge one another, to work through misunderstandings, especially those that have to do with race and racism. In a beloved community solidarity and trust are grounded in profound commitment to a shared vision. Those of us who are always anti-racist long for a world in which evezyone can form a beloved community where borders can be crossed and cultural hybridity celebrated. Anyone can begin to make such a community by truly seeking to live in an anti-racist world. If that longing guides our vision and our actions, the new culture will be born and anti-racist communities of resis tance will emerge everywhere. That is where we must go from here.

AT: Modern-Day Slavery/Michelle Alexander

Claiming racial progress is impossible obfuscates class as the underlying ideology perpetuating racism.

- Specific answer to Michele Alexander.

Reed, University of Pennsylvania political science professor, 2013

[Adolph, "The Help: How "Cultural Politics" Is Worse Than No Politics at All, and Why" http://nonsite.org/feature/django-unchained-or-the-help-how-cultural-politics-is-worse-than-no-politics-at-all-and-why]

That sort of Malcolm X/blaxploitation narrative, including the insistence that Birth of a Nation and Gone With the Wind continue to shape Americans' understandings of slavery, also is of a piece with a line of anti-racist argument and mobilization that asserts powerful continuities between current racial inequalities and either slavery or the Jim Crow regime. This line of argument has been most popularly condensed recently in Michelle Alexander's The New Jim Crow, which analogizes contemporary mass incarceration to the segregationist regime. But even she, after much huffing and puffing and asserting the relation gesturally throughout the book, ultimately acknowledges that the analogy fails.37 And it would have to fail because the segregationist regime was the artifact of a particular historical and political moment in a particular social order. Moreover, the rhetorical force of the analogy with Jim Crow or slavery derives from the fact that those regimes are associated symbolically with strong negative sanctions in the general culture because they have been vanquished. In that sense all versions of the lament that "it's as if nothing has changed" **give themselves the lie.** They are effective only to the extent that **things have changed significantly**. The tendency to craft political critique by demanding that we fix our gaze in the rearview mirror appeals to an **intellectual laziness**. Marking superficial similarities with familiar images of oppression is less mentally taxing than attempting to parse the multifarious, often contradictory dynamics and relations that shape racial inequality in particular and politics in general in the current moment. Assertions that phenomena like the Jena, Louisiana, incident, the killings of James Craig Anderson and Trayvon Martin, and racial disparities in incarceration demonstrate persistence of old-school, white supremacist racism and charges that the sensibilities of Thomas Dixon and Margaret Mitchell continue to shape most Americans' understandings of slavery do important, **obfuscatory ideological work**. They lay claim to a moral urgency that, as Mahmood Mamdani argues concerning the rhetorical use of charges of genocide, enables disparaging efforts either to differentiate discrete inequalities or to generate historically specific causal accounts of them as irresponsible dodges that abet injustice by temporizing in its face.38 But more is at work here as well.

Narratives of "modern forms of slavery" are misleading and undermine the efficacy of actions against racism.

Reed, University of Pennsylvania political science professor, 2013

[Adolph, "The Help: How "Cultural Politics" Is Worse Than No Politics at All, and Why" http://nonsite.org/feature/django-unchained-or-the-help-how-cultural-politics-is-worse-than-no-politics-at-all-and-why]

Once established, stereotypes and the folk taxonomies that legitimize them may die hard, but their significance as props for a regime of class hierarchy can change along with the political-economic foundations of the class order. Persistence of familiar narratives of hierarchy can evoke the earlier

associations, but that evocation can be misleading and counterproductive for making sense of social relations in both past and present. In particular the "just like slavery" or "just like Jim Crow" proclamations that are intended as powerful criticism of current injustices are more likely to undermine understanding of injustice in the past as well as the present than to enable new insight. Another version of the trope of the damaged ex-Confederate is illustrative.

AT: Libidinal Economy/Psychoanalysis

Psychoanalysis puts the cart before the horse and distracts from widescale change necessary to solve.

Rosen-Carole, Bard College philosophy professor, 2010

[Adam, Psychoanalytic Quarterly, Vol. LXXIX, No. 1, "Menu Cards in Time of Famine: On Psychoanalysis and Politics" Wiley, p.205-7]

On the other hand, though in these ways and many others,¶ psychoanalysis seems to promote the sorts of subjective dispositions¶ and habits requisite for a thriving democracy, and though¶ in a variety of ways psychoanalysis contributes to personal emancipation—¶ say, by releasing individuals from self-defeating, damaging,¶ or petrified forms action and reaction, object attachment,¶ and the like—in light of the very uniqueness of what it has to¶ offer, one cannot but wonder: to what extent, if at all, can the¶ habits and dispositions—broadly, the forms of life—cultivated by¶ psychoanalytic practice survive, let alone flourish, under modern¶ social and political conditions? If the emancipatory inclinations¶ and democratic virtues that psychoanalytic practice promotes¶ are systematically crushed or at least regularly unsupported by¶ the world in which they would be realized, then isn't psychoanalysis¶ implicitly making promises it cannot redeem? Might not¶ massive social and political transformations be the condition for¶ the efficacious practice of psychoanalysis? And so, under current¶ conditions, can we avoid experiencing the forms of life nascently¶ cultivated by psychoanalytic practice as something of a¶ tease, or even a source of deep frustration?

(2) Concerning psychoanalysis as a politically inclined theoretical¶ enterprise, the worry is whether political diagnoses and proposals¶ that proceed on the basis of psychoanalytic insights and¶ forms of attention partake of a fantasy of interpretive efficacy¶ (all the world's a couch, you might say), wherein our profound¶ alienation from the conditions for robust political agency are¶ registered and repudiated?¶

Consider, for example, Freud and Bullitt's (1967) assessment¶ of the psychosexual determinants of Woodrow Wilson's political¶ aspirations and impediments, or Reich's (1972) suggestion that¶ Marxism should appeal to psychoanalysis in order to illuminate¶ and redress neurotic phenomena that generate disturbances in working capacity, especially as this concerns religion and bourgeois¶ sexual ideology. Also relevant are Freud's, Žižek's (1993,¶ 2004), Derrida's (2002) and others' insistence that we draw the¶ juridical and political consequences of the hypothesis of an irreducible¶ death drive, as well as Marcuse's (1970) proposal that¶ we attend to the weakening of Eros and the growth of aggression¶ that results from the coercive enforcement of the reality¶ principle upon the sociopolitically weakened ego, and especially¶ to the channeling of this aggression into hatred of enemies.¶ Reich (1972) and Fromm (1932) suggest that psychoanalysis be¶ employed to explore the motivations to political irrationality, especially¶ that singular irrationality of joining the national-socialist¶ movement, while Irigaray (1985) diagnoses the desire for the¶ Same, the One, the Phallus as a desire for a sociosymbolic order¶ that assures masculine dominance.

Žižek (2004) contends that only a psychoanalytic exposition of the¶ disavowed beliefs and suppositions of the United States political elite can¶ get at the fundamental determinants of the Iraq War. Rose (1993) argues¶ that it was the paranoiac paradox of sensing both that there is every¶ reason to be frightened and that everything is under control that allowed¶ Thatcher "to make this paradox the basis of political identity so that subjects¶ could take pleasure in violence as force and legitimacy while always¶ locating 'real' violence somewhere else—illegitimate violence and illicitness¶ increasingly made subject to the law" (p. 64). Stavrakakis (1999)¶ advocates that we recognize and traverse the residues of utopian fantasy¶ in our contemporary political imagination.1 Might not the psychoanalytic interpretation of powerful figures¶ (Bush, Bin Laden, or whomever), collective subjects (nations, ethnic¶ groups, and so forth), or urgent "political" situations register an anxiety¶ regarding political impotence or "castration" that is pacified and modified¶ by the fantasmatic frame wherein the psychoanalytically inclined¶ political theorist situates him- or herself as diagnosing or interpretively intervening in the lives of political figures, collective political subjects, or complex political situations with the idealized efficacy of a successful¶ clinical intervention? If so, then the question is: are the contributions¶ of psychoanalytically inclined political theory anything more than tantalizing¶ menu cards for meals it cannot deliver?

As I said, the worry is twofold. These are two folds of a related¶ problem, which is this: might the very seductiveness of psychoanalytic¶ theory and practice—specifically, the seductiveness of its political¶ promise—register the lasting eclipse of the political and the objectivity¶ of the social, respectively? In other words, might not everything that¶ makes psychoanalytic theory and practice so politically attractive indicate¶ precisely the necessity of wide-ranging social/institutional transformations¶ that far exceed the powers of psychoanalysis?

And so, might not the politically salient transformations of subjectivity to which psychoanalysis can contribute overburden subjectivity as¶ the site of political transformation, blinding us to the necessity of largescale¶ institutional reforms? Indeed, might not massive institutional transformations¶ be necessary conditions for the efficacy of psychoanalytic¶ practice, both personally and politically? Further, might not the so-called¶ interventions and proposals of psychoanalytically inclined political¶ theory similarly sidestep the question of the institutional transformations¶ necessary for their realization, and so conspire with our blindness to the¶ enormous institutional impediments to a progressive political future?

No solvency and not falsifiable.
Bunge, McGill University philosophy professor, 2010

[Mario, "Should Psychoanalysis Be in the Science Museum?" http://stirling-westrup-tt.blogspot.com/2010/11/tt-ns-2780-robert-bud-and-mario-bunge.html]

WE SHOULD congratulate the Science Museum for setting up an¶ exhibition on psychoanalysis. Exposure to pseudoscience greatly¶ helps understand genuine science, just as learning about tyranny¶ helps in understanding democracy.¶ Over the past 30 years, psychoanalysis has quietly been displaced in¶ academia by scientific psychology. But it persists in popular¶ culture as well as being a lucrative profession. It is the¶ psychology of those who have not bothered to learn psychology, and¶ the psychotherapy of choice for those who believe in the power of¶ immaterial mind over body.¶ Psychoanalysis is a bogus science because its practitioners do not¶ do scientific research. When the field turned 100, a group of¶ psychoanalysts admitted this gap and endeavoured to fill it. They¶ claimed to have performed the first experiment showing that patients¶ benefited from their treatment. Regrettably, they did not include a¶ control group and did not entertain the possibility of placebo¶ effects. Hence, their claim remains untested (The International¶ Journal of Psychoanalysis, vol 81, p 513).¶ More recently, a meta-analysis published in American Psychologist¶ (vol 65, p 98) purported to support the claim that a form of¶ psychoanalysis called psychodynamic therapy is effective. However,¶ once again, the original studies did not involve control groups.¶ In 110 years, psychoanalysts have not set up a single lab. They do¶ not participate in scientific congresses, do not submit their papers¶ to scientific journals and are foreign to the scientific community -¶ a marginality typical of pseudoscience.¶ This does not mean their hypotheses have never been put to the test.¶ True, they are so vague that they are hard to test and some of them¶ are, by Freud's own admission, irrefutable. Still, most of the¶ testable ones have been soundly refuted.¶ For example, most dreams have no sexual content. The Oedipus complex¶ is a myth; boys do not hate their fathers because they would like to¶ have sex with their mothers. The list goes on.¶ As for therapeutic efficacy, little is known because psychoanalysts¶ do not perform double-blind clinical trials or follow-up studies.¶ Psychoanalysis is a pseudoscience. Its concepts are woolly and¶ untestable yet are regarded as unassailable axioms. As a result of¶ such dogmatism, psychoanalysis has

remained basically stagnant for more than a century, in contrast with scientific psychology, which is thriving.

Psychoanalysis overdetermines – it's too simplistic to explain the world.
Lear, University of Chicago philosophy professor, 2000

[Jonathon, "Happiness, Death, and the Remainder of Life" http://www.amazon.com/Happiness-Remainder-Tanner-Lectures-Values/dp/0674006747, p.131-2]

By 1920 Freud is ready to break up what he has come to see as a fantasied unity of mental functioning. The mind can no longer be understood in terms of the pleasure principle, but instead of living with the gap, he posits a "beyond." It is in this way that Freud takes himself to be explaining aggression. Aggression is now interpreted as the death drive diverted outward.20 It is precisely this move which locks us into an inescapably negative teleology. Let us just assume (for the sake of argument, though I think it true) that humans are aggressive animals, and that dealing with human aggression is a serious psychological and social problem. The question remains: how might one deal with it? But if, as Freud does, one interprets aggression as the most obvious manifestation of one of the two primordial forces in the universe, the answer would seem to be: there is no successful way. My first inclination is to say that this leads to a pessimistic view of the human condition; but this isn't really the issue. My second inclination is to say that this leads to a limited view of the human condition; but even this doesn't get to the heart of the problem. The point here is not to endorse an ontic optimism – that if we didn't adopt that view, we could shape life in nonaggressive ways – but to confront an ontological insight: that Freud's interpretation is an instance of bad faith. The metaphysical basicness of the death drive implies a kind of metaphysical intractability to the phenomenon of human aggression. As a matter of empirical fact, humans may be aggressive animals – and the fact of human aggression may be difficult to deal with. It may even be experienced as intractable. But to raise this purported intractability to a metaphysical principle is to obliterate the question of responsibility. And it is to cover over – by precluding – what might turn out to be significant empirical possibilities.

Violence isn't monocausal.
Muro-Ruiz, London School of Economics, 2002

[Diego, Politics Volume 22, Issue 2, pages 109–117, May 2002, "The Logic of Violence" Wiley]

Violence is, most of the time, a wilful choice, especially if it is made by an organi-sation. Individuals present the scholar with a more difficult case to argue for. Scholars of violence have now a wide variety of perspectives they can use – from sociology and political science, to psychology, psychiatry and even biology – and should escape easy judgements. However, the fundamental difficulty for all of us is the absence of a synthetic, general theory able of integrating less complete theories of violent behaviour. In the absence of such a general theory, researchers should bear in mind that violence is a complex and multifaceted phenomenon that resists mono-causal explanations. Future research on violence will have to take in account the variety of approaches, since they each offer some understanding of the logic of violence.

AT: Social/Ontological Death – Theory

No ontological antagonism---conflict is inevitable in politics, but does not have to be demarcated around whiteness and oppression---the alt's ontological fatalism recreates colonial violence.

Hudson, University of the Witwatersrand political studies professor, 2013

[Peter, Social Dynamics, "The state and the colonial unconscious" Taylor and Francis]

Thus the self-same/other distinction is necessary for the possibility of identity itself. There always has to exist an outside, which is also inside, to the extent it is designated as the impossibility from which the possibility of the existence of the subject derives its rule (Badiou 2009, 220). But although the excluded place which isn't excluded insofar as it is necessary for the very possibility of inclusion and identity may be universal (may be considered "ontological"), its content (what fills it) – as well as the mode of this filling and its reproduction – are contingent. In other words, the meaning of the signifier of exclusion is **not determined** once and for all: the place of the place of exclusion, of death is itself over-determined, i.e. the very framework for deciding the other and the same, exclusion and inclusion, is **nowhere engraved in ontological stone** but is political and never terminally settled. Put differently, the "curvature of intersubjective space" (Critchley 2007, 61) and thus, the specific modes of the "othering" of "otherness" are nowhere decided in advance (as a certain ontological fatalism might have it) (see **Wilderson** 2008). **The social does not have to be divided into white and black**, and the meaning of these signifiers is never necessary – because they are signifiers. To be sure, colonialism institutes an ontological division, in that whites exist in a way barred to blacks – who are not. But this ontological relation is really on the side of the **ontic** – that is, of all contingently constructed identities, rather than the ontology of the social which refers to the ultimate unfixity, the indeterminacy or lack of the social. In this sense, then, the white man doesn't exist, the black man doesn't exist (Fanon 1968, 165); and neither does the colonial symbolic itself, including its most intimate structuring relations – division is constitutive of the social, not the colonial division. "Whiteness" may well be very deeply sediment in modernity itself, but respect for the "ontological difference" (see Heidegger 1962, 26; Watts 2011, 279) shows up its ontological status as ontic. It may be so deeply sedimented that it becomes difficult even to identify the very possibility of the separation of whiteness from the very possibility of order, but from this it does not follow that the "void" of "black being" functions as the ultimate substance, the transcendental signified **on which all possible forms of sociality** are said to **rest.** What gets lost here, then, is the **specificity** of colonialism, of its constitutive axis, its "ontological" differential. A crucial feature of the colonial symbolic is that the real is not screened off by the imaginary in the way it is under capitalism. At the place of the colonised, the symbolic and the imaginary give way because non-identity (the real of the social) is immediately inscribed in the "lived experience" (vécu) of the colonised subject. The colonised is "traversing the fantasy" (Zizek 2006a, 40–60) all the time; the void of the verb "to be" is the very content of his interpellation. The colonised is, in other words, the subject of anxiety for whom the symbolic and the imaginary never work, who is left stranded by his very interpellation.4 "Fixed" into "non-fixity," he is eternally suspended between "element" and "moment"5 – he is where the colonial symbolic falters in the production of meaning and is thus the point of entry of the real into the texture itself of colonialism. Be this as it may, whiteness and blackness are (sustained by) determinate and **contingent practices** of signification; the "structuring relation" of colonialism thus itself comprises a knot of significations which, no matter how tight, can always be undone. **Anti-colonial** – i.e., anti-"white" – modes of struggle are not (just) "psychic" 6 but involve the "**reactivation**" (or "de-sedimentation")7 **of colonial objectivity** itself. No matter how sedimented (or global), colonial objectivity is not ontologically immune to antagonism. Differentiality, as Zizek insists (see Zizek 2012, chapter 11, 771 n48), immanently entails antagonism in that differentiality both makes possible the existence of any identity whatsoever and at the same time – because it is the presence of one object in another – undermines any identity ever being (fully) itself. Each element in a differential relation is the condition of possibility and the condition of impossibility of each other. It is this dimension of antagonism that the Master Signifier covers over transforming its outside (Other) into an element of itself, reducing it to a condition of its possibility.8 All symbolisation produces an ineradicable excess over itself, something it can't totalise or make sense of, where its production of meaning falters. This is its internal limit point, its real:9 an errant "object" that has no place

of its own, isn't recognised in the categories of the system but is produced by it – its "part of no part" or "object small a."10 Correlative to this object "a" is the subject "stricto sensu" – i.e., as the empty subject of the signifier without an identity that pins it down.11 That is the subject of antagonism in confrontation with the real of the social, as distinct from "subject" position based on a determinate identity.

Reflexivity on history dooms present-day action.
Farber, University of Minnesota law professor, 1998

[Daniel, 15 T.M. Cooley L. Rev. 361, "KRINOCK LECTURE SERIES: IS AMERICAN LAW INHERENTLY RACIST?" Lexis]

And finally, what I fear the most is the response that seemed to be implied by one of the audience questions earlier. If it is true that American society is inherently racist, doesn't that mean that it is essentially hopeless? Now this conclusion does not logically follow from that premise, any more than it logically follows that if certain character traits have a genetic basis then it is hopeless to do anything about them. But nevertheless, we all recognize that when we are talking about individuals and biology, these genetic theories tend to discourage the idea of reform, and tend to reinforce, as a matter of social reality, the view that any bad behavior that we see is just inherent. I think we can expect to see the same kind of thing when we are dealing with the sociological equivalent involving the claim that there is this inherent genetic flaw in American society. You can see this most clearly in Derrick Bell's writings, which are redolent of despair and which, in that respect, curiously resemble Robert Bork's writings, who is similarly convinced that the genetic flaws of American society will prevent it from ever achieving his vision of justice.¶It is true that we cannot afford to forget our history. It is true that much of that history is unfortunate, if not worse. But it is also true that if we remain totally obsessed with the flaws of the past, fixated on their inevitability, we are unlikely to be able to move past them and move forward. And in particular, it seems to me that if we approach today's problems primarily as an issue in finger-pointing, in blaming somebody or another, or in finding the culprit, then we are not likely to be able to unite our society in a quest toward attacking those serious problems.

They're wrong about ontological freedom – it is reductionist.
Macedo, University of Massachusetts Boston Applied Linguistics Master of Arts program graduate program director, 2000

[Donaldo, writes the new introduction to the anniversary edition to *Pedagogy of the Oppressed*, Pedagogy of the Oppressed, p.32-3]

Freire is able to do this because he operates on one basic assumption: that man's ontological vocation (as he calls it) is to be a Subject who acts upon and transforms his world, and in so doing moves toward ever new possibilities of fuller and richer life individually and collectively. This world to which he relates is not a static and closed order, a given reality which man must accept and to which he must adjust; rather, it is a problem to be worked on and solved. It is the material used by man to create history, a task which he performs as he overcomes that which is dehumanizing at any particular time and place and dares to create the qualitatively new. For Freire, the resources for that task at the

present time are provided by the advanced technology of our Western world, but the social vision which impels us to negate the present order and demonstrate that history has not ended comes primarily from the suffering and struggle of the people of the Third World. **Coupled with this is Freire's conviction (now supported by a wide background of experience) that every human being, no matter how** "ignorant" or **submerged in the "culture of silence" he or she may be, is capable of looking critically at the world in a dialogical encounter with others**. Provided with the proper tools for such encounter, **the individual can** gradually **perceive** personal and **social reality** as well as the contradictions in it, **become conscious of his or her own perception of that reality, and deal critically with it**, in this process, the old, paternalistic teacher-student relationship is overcome. A peasant can facilitate this process for a neighbor more effectively than a "teacher" brought in from outside. "People educate each other through the mediation of the world." As this happens, the word take on new power. It is no longer an abstraction or magic but a means by which people discover themselves and their potential as they give names to things around them. As Freire puts it, **each individual wins back the right to say his or her own word, to name the world.**

[We don't endorse any gender language within this card]

Social death doesn't make sense as a theory – nothing is always something, not the absence of anything.
Moten, Duke University professor, 2013

[Fred, The South Atlantic Quarterly 112:4, Fall 2013, "Blackness and Nothingness (Mysticism in the Flesh)" EBSCO, p.774]

Nevertheless, my first impulse in reading Wilderson's long, Trane-like¶ recitation in Incognegro of his exchange with his friend and colleague Naima¶ was to ask, in a kind of Quinean rebuttal, <u>why are we something rather than¶ nothing?</u> But <u>the real task</u>, and I follow in the footsteps of Sexton in taking it¶ up, <u>is to think about the relation between something and nothing or, if you'd¶ rather, life and death.</u> Is life surrounded by death, or does each move in and¶ as the constant permeation of the other? But this is not even precise enough.¶ <u>The question is, Where would one go or how would one go about studying¶ nothing's real presence, the thingly presence, the facticity, of the nothing¶ that is? What stance, what attitude, what comportment? If pessimism allows¶ us to discern that we are nothing, then optimism is the condition of possibility¶ of the study of nothing as well as what derives from that study. We are the¶ ones who engage in and derive from that study: blackness as black study as¶ black radicalism.</u> In the end, precisely as the end of an analysis, <u>the payment¶ of a set of social costs will have coalesced into the inability properly to assess¶ the nothingness that one claims. Blackness is more than exacted cost. Nothing¶ is not absence. Blackness is more and less than one in nothing. This,¶ informal, informing, insolvent insovereignty is the real presence of the nothing¶ we come from, and bear, and make</u>.

Wilderson misreads Fanon into a Husserlian mysticism – social life is all blackness is.
Moten, Duke University professor, 2013

Insofar as I am concerned, by way of a certain example to which Sexton appeals in order to explain (away) the difference that lies between us, with what surrounds, with what the nature is of surrounding and enclosure, I am also, of necessity, concerned with the relation between the inside and the outside, the intramural and the world. The difference that is not one is, for Sexton, a matter of "ontological reach." Perhaps he thinks of that difference as set-theoretic, a matter of calculating over infinities with the understanding that the infinity of social death is larger, as it were, than that of social life;

that the world is bigger than the other world, the underworld, the outer world of the inside song, the radical extension and exteriority that animates the enclosed, imprisoned inner world of the ones, shall we say, who are not poor in world but who are, to be more precise, poor-in-the-world. Black people are poor in the world. We are deprived in, and somehow both more and less than deprived of, the world. The question is how to attend to that poverty, that damnation, that wretchedness. I invoke Martin Heidegger's formulation regarding the animal, that it is poor in world, up against the buried contour of his question concerning the way that technology tends toward the displacement of world with a world-picture, in order to make the distinction between the animal's status and our own, which some might call even more distressing. What is it to be poor in the world? What is this worldly poverty, and what is its relation to the otherworldliness that we desire and enact, precisely insofar as it is present to us and present in us? Sexton characterizes this worldly poverty as attenuated ontological reach, but to say this is tricky and requires care. Poverty in this world is manifest in a kind of poetic access to what it is of the other world that remains unheard, unnoted, unrecognized in this one. Whether you call those resources tremendous life or social life in social death or fatal life or raw life, it remains to consider precisely what it is that the ones who have nothing have. What is this nothing that they have or to which they have access? What comes from it? And how does having it operate in relation to poverty? At the same time, for Sexton, recognition of this attenuation (which marks that fact that the tone world is, as it were, surrounded by the deaf world) is already understood to indicate possession, as it were, of ontological reach. Maybe there's another implicit distinction between ontic extension and ontological grasp. But who but the transcendental subject can have that grasp or attain the position and perspective that corresponds to it? Husserl, at the end of his career, when his own attainment of it is radically called into question, speaks of this exalted hand-eye coordination as the phenomenological attitude; a few years earlier, when his career was much nearer to its fullest height and he could claim to be master of all he surveyed—modestly, on the outer edges of his work, under the breath of his work in a way that demands a more general attunement to the phenomenological whisper—Husserl spoke of it in these terms: "I can see spread out before me the endlessly open plains of true philosophy, the 'promised land,' though its thorough cultivation will come after me" (Husserl 1982: 429). Marianne Sawicki is especially helpful, here, because she so precisely teases out the implications of his imagery. "By means of this spatial, geographical metaphor of

crossing over into the 'new land,' Husserl conveys something of the adventure and pioneer courage that should accompany phenomenological work. This science is related to 'a new field of experience, exclusively its own, the field of "transcendental subjectivity,"' and it offers 'a method of access to the transcendental-phenomenological sphere.' Husserl is the 'first explorer' of this marvelous place" (Sawicki n.d.). We should be no less forthright in recognizing that such positionality is the desire that Fanon admits, if only, perhaps, to disavow, when he conducts his philosophical investigations of the

lived experience of the black. Two questions arise: Does he disavow it? Or is it, in its necessity, the very essence of what Wilderson calls "our black capacity to desire"? Certain things about the first few paragraphs of Fanon's phenomenological analysis seem clearer to me now than when I was composing "The Case of Blackness" (Moten 2008). The desire to attain transcendental subjectivity's self-regard is emphatic even if it is there primarily to mark an interdiction, an antagonism, a declivity, a fall into the deadly experiment that will have been productive of "a genuine new departure" (Fanon 2008: xii), the end of the world and the start of the general dispossession that will have been understood as cost and benefit. But that desire returns, as something like the residual self-image of the phenomenologist that he wants to but cannot be, to enunciate the (political) ontology he says is outlawed, in what he would characterize as the neurotic language of the demand, called, as he is, to be a witness in a court in which he has no standing, thereby requiring us to reconsider, by way of and beyond a certain Boalian turn, what it is to be a specta(c)tor. Elsewhere, I misleadingly assert, Fanon is saying that there is no and can be no black social life. I now believe he says that is all there can be (Moten 2008: 177). The antephenomenology of spirit that constitutes Black Skin, White Masks prepares our approach to sociological or, more precisely, sociopoetic grounding, as Du Bois, say, or later Walter Rodney would have it, by way of the description of the impossibility of political life, which is, nevertheless, at this moment and for much of his career, Fanon's chief concern. The social life of the black, or of the colonized, is, to be sure, given to us in or through Fanon, often in his case studies, sometimes in verse, or in his narrative of the career of the revolutionary cadre. It is as if Fanon is there to remind us that the lunatic, the (revolutionary) lover, and the poet are of imagination all compact. They occupy and are preoccupied with a zone of the alternative, the zone of nonbeing (antic disposition's tendency to cut and displace organic position) that asks and requires us to consider whether it is possible to differentiate a place in the sun, a promised land, a home—or merely a place and time—in this world, from the position of the

settler. Is it possible to desire the something other than transcendental subjectivity that is called nothing? What if blackness is the name that has been given to the social field and social life of an illicit alternative capacity to desire? Basically, that is precisely what I think blackness is. I want it to be my constant study. I listen for it everywhere. Or, at least, I try to. If I read Sexton correctly, after trying to get underneath the generous severity of his lesson, he objects, rightly and legitimately, to the fact that in the texts he cites I have not sufficiently looked for it in the Afro-pessimistic texts toward which I have sometimes gestured. In the gestures I have made here I hope I have shown what it is that I have been so happy to find, that projection or relay or amplification carried out by the paraontological imagination that animates and agitates Afro-pessimism's antiregulatory force. Black optimism and Afro-pessimism are asymptotic. Which one is the curve and which one is the line? Which is the kernel and which is the shell? Which one is rational, which one is mystical? It doesn't matter. Let's just say that their nonmeeting is part of an ongoing manic depressive episode called black radicalism / black social life. Is it just a minor internal conflict, this intimate nonmeeting, this impossibility of touching in mutual radiation and permeation? Can pessimists and optimists be friends? I hope so. Maybe that's what friendship is, this bipolarity, which is to say, more precisely, the commitment to it. To say that we are friends is to say that we want to be friends. I want to try to talk about the nature and importance of the friendship I want, that I would like us to have, that we are about to have, that in the deepest sense we already more than have, which is grounded in and enabled by that commitment even as it is continually rethought and replayed by way of our differences from one another, which is held within and holds together our commonness. The difference has to do with the proper calibration of this

bipolarity. Sexton is right to suggest that the far too simple opposition between pessimism and optimism is off, and that I was off in forwarding it, or off in forwarding an imprecision that made it seem as if I were, having been seduced by a certain heuristic and its sound, thereby perhaps inadvertently seducing others into mistaking an alternating current for a direct one. The bipolarity in question is, at every instance, way too complicated for that, and I really want you to hear what we've been working on, this under-riff we've been trying to play, to study, to improvise, to compose in the hyperreal time of our thinking and that thinking's desire. There is an ethics of the cut, of contestation, that I have tried to honor and illuminate because it instantiates and articulates another way of living in the world, a black way of living together in the other world we are constantly making in and out of this world, in the alternative planetarity that the intramural, internally differenti

ated presence—the (sur)real presence—of blackness serially brings online as persistent aeration, the incessant turning over of the ground beneath our feet that is the indispensable preparation for the radical overturning of the ground that we are under.

AT: Social/Ontological Death – Empirics

**Slavery doesn't prove social death – generations of data disprove their argument.
Brown, Harvard University African American studies professor, 2009**

[Vincent, American Historical Review, "Social Death and Political Life in the Study of Slavery"
http://history.fas.harvard.edu/people/faculty/documents/brown-socialdeath.pdf, p.1235-41]

1235-1241¶ Specters of the Atlantic is a compellingly sophisticated study of the relation between¶ the epistemologies underwriting both modern slavery and modern capitalism,¶ but the book's discussion of the politics of anti-slavery is fundamentally incomplete.¶ While Baucom brilliantly traces the development of "melancholy realism" as an oppositional¶ discourse that ran counter to the logic of slavery and finance capital, he¶ has very little to say about the enslaved themselves. Social death, so well suited to¶ the tragic perspective, stands in for the experience of enslavement. While this heightens¶ the reader's sense of the way Atlantic slavery haunts the present, Baucom largely fails to acknowledge that the enslaved performed melancholy acts of accounting not¶ unlike those that he shows to be a fundamental component of abolitionist and human¶ rights discourses, or that those acts could be a basic element of slaves' oppositional¶ activities. In many ways, **the effectiveness of his text depends upon the silence of¶ slaves—it is easier to describe the continuity of structures of power when one downplays¶ countervailing forces such as the political activity of the weak**. So Baucom's¶ deep insights into the structural features of Atlantic slave trading and its afterlife¶ come with a cost. Without engagement with the politics of the enslaved, slavery's¶ history serves as an effective charge leveled against modernity and capitalism, but not as an uneven and evolving process of human interaction, and certainly not as a¶ locus of conflict in which the enslaved sometimes won small but important victories.11¶ Specters of the Atlantic is self-consciously a work of theory (despite Baucom's¶ prodigious archival research), and social death may be largely unproblematic as a¶ matter of theory, or even law. In these arenas, as David Brion Davis has argued, "the¶ slave has no legitimate, independent being, no place in the cosmos except as an¶ instrument of her or his master's will."12 But the concept often becomes a general¶ description of actual social life in slavery. Vincent Carretta, for example, in his authoritative¶ biography of the abolitionist writer and former slave Olaudah Equiano,¶ agrees with Patterson that because enslaved Africans and their descendants were¶ "stripped of their personal identities and history, [they] were forced to suffer what¶ has been aptly called 'social death.' " The self-fashioning enabled by writing and print¶ "allowed Equiano to resurrect himself publicly" from the condition that had been¶ imposed by his enslavement.13 The living conditions of slavery in eighteenth-century¶ Jamaica, one slave society with which Equiano had experience, are described in rich¶ detail in Trevor Burnard's unflinching examination of the career of Thomas Thistlewood,¶ an English migrant who became an overseer and landholder in Jamaica, and¶ who kept a diary there from 1750 to 1786. Through Thistlewood's descriptions of his¶ life among slaves, Burnard glimpses a "world of uncertainty," where the enslaved¶ were always vulnerable to repeated depredations that actually led to "significant¶ slave dehumanization as masters sought, with considerable success, to obliterate¶ slaves' personal histories." Burnard consequently concurs with Patterson: "slavery¶ completely stripped slaves of their cultural heritage, brutalized them, and rendered¶ ordinary life and normal relationships extremely difficult."14 This was slavery, after¶ all, and much more than a transfer of migrants from Africa to America.15 Yet one¶ wonders, after reading Burnard's indispensable account, how slaves in Jamaica organized¶ some of British America's greatest political events during Thistlewood's¶ time and after, including the Coromantee Wars of the 1760s, the 1776 Hanover¶ conspiracy, and the Baptist War of 1831–1832. Surely they must have found some¶ way to turn the "disorganization, instability, and chaos" of slavery into collective¶ forms of belonging and striving, making connections when confronted with alienation¶ and finding dignity in the face of dishonor. Rather than pathologizing slaves¶ by allowing the condition of social death to stand for the experience of life in slavery,¶ then, **it might be more helpful to focus on what the enslaved actually made of their¶ situation**. Among the most insightful texts to explore the experiential meaning of Afro-¶ Atlantic slavery (for both the slaves and their descendants) are two recent books by¶ Saidiya Hartman and Stephanie Smallwood. Rather than eschewing the concept of¶ social death, as might be expected from writing that begins by considering the perspective¶ of the enslaved, these two authors use the idea in penetrating ways. Hartman's¶ Lose Your Mother: A Journey along the Atlantic Slave Route and Smallwood's¶ Saltwater Slavery: A Middle Passage from Africa to American Diaspora extend social¶ death beyond a general description of slavery as a condition and imagine it as an¶ experience of self. Here both the promise and the problem with the concept are most¶ fully apparent.16¶ Both authors seek a deeper understanding of the experience of enslavement and¶ its consequences for the past, present, and future of black life than we generally find¶ in histories of slavery. In Hartman's account especially, slavery is not only an object¶ of study, but also the focus of a personal memoir. She travels along a slave route in¶ Ghana, from its coastal forts to the backcountry hinterlands, symbolically reversing¶ the

first stage of the trek now commonly called the Middle Passage. In searching prose, she meditates on the history of slavery in Africa to explore the precarious nature of belonging to the social category "African American." Rendering her remarkable facility with social theory in elegant and affective terms, Hartman asks the question that nags all identities, but especially those forged by the descendants of slaves: What identifications, imagined affinities, mythical narratives, and acts of remembering and forgetting hold the category together? Confronting her own alienation from any story that would yield a knowable genealogy or a comfortable identity, Hartman wrestles with what it means to be a stranger in one's putative motherland, to be denied country, kin, and identity, and to forget one's past—to be an orphan.17 Ultimately, as the title suggests, Lose Your Mother is an injunction to accept dispossession as the basis of black self-definition. Such a judgment is warranted, in Hartman's account, by the implications of social death both for the experience of enslavement and for slavery's afterlife in the present. As Patterson delineated in sociological terms the death of social personhood and the reincorporation of individuals into slavery, Hartman sets out on a personal quest to "retrace the process by which lives were destroyed and slaves born."18 When she contends with what it meant to be a slave, she frequently invokes Patterson's idiom: "Seized from home, sold in the market, and severed from kin, the slave was for all intents and purposes dead, no less so than had he been killed in combat. No less so than had she never belonged to the world." By making men, women, and children into commodities, enslavement destroyed lineages, tethering people to owners rather than families, and in this way it "annulled lives, transforming men and women into dead matter, and then resuscitated them for servitude." Admittedly, the enslaved "lived and breathed, but they were dead in the social world of men."19 As it turns out, this kind of alienation is also part of what it presently means to be African American. "The transience of the slave's existence," for example, still leaves its traces in how black people imagine and speak of home: We never tire of dreaming of a place that we can call home, a place better than here, wherever here might be . . . . We stay there, but we don't live there . . . Staying is living in a country without exercising any claims on its resources. It is the perilous condition of existing in a world in which you have no investments. It is having never resided in a place that you can say is yours. It is being "of the house" but not having a stake in it. Staying implies transient quarters, a makeshift domicile, a temporary shelter, but no attachment or affiliation. This sense of not belonging and of being an extraneous element is at the heart of slavery.20 "We may have forgotten our country," Hartman writes, "but we haven't forgotten our dispossession."21 <u>Like Baucom, Hartman sees the history of slavery as a constituent part of a tragic present. Atlantic slavery continues to be manifested in black people's skewed life chances, poor education and health, and high rates of incarceration, poverty, and premature death. Disregarding the commonplace temporalities of professional historians, whose literary conventions are generally predicated on a formal distinction between past, present, and future</u>, Hartman addresses slavery as a problem that spans all three. The afterlife of slavery inhabits the nature of belonging, which in turn guides the "freedom dreams" that shape prospects for change. "If slavery persists as an issue in the political life of black America," she writes, "it is not because of an antiquated obsession with bygone days or the burden of a too-long memory, but because black lives are still imperiled and devalued by a racial calculus and a political arithmetic that were entrenched centuries ago."22 A professor of English and comparative literature, Hartman is in many respects in a better position than most historians to understand events such as the funeral aboard the Hudibras. This is because for all of her evident erudition, her scholarship is harnessed not so much to a performance of mastery over the facts of what happened, which might substitute precision for understanding, as to an act of mourning, even yearning. She writes with a depth of introspection and personal anguish that is transgressive of professional boundaries but absolutely appropriate to the task. <u>Reading Hartman, one wonders how a historian could ever write dispassionately about slavery without feeling complicit and ashamed</u>. For dispassionate accounting—exemplified by the ledgers of slave traders—has been a great weapon of the powerful, an episteme that made the grossest violations of personhood acceptable, even necessary. This is the kind of bookkeeping that bore fruit upon the Zong. "It made it easier for a trader to countenance yet another dead black body or for a captain to dump a shipload of captives into the sea in order to collect the insurance, since it wasn't possible to kill cargo or to murder a thing already denied life. Death was simply part of the workings of the trade." The archive of slavery, then, is "a mortuary." Not content to total up the body count, Hartman offers elegy, echoing in her own way the lamentations of the women aboard the Hudibras. Like them, she is concerned with the dead and what they mean to the living. "I was desperate to reclaim the dead," she writes, "to reckon with the lives undone and obliterated in the making of human commodities."23 It is this mournful quality of Lose Your Mother that elevates it above so many histories of slavery, but the same sense of lament seems to require that Hartman overlook small but significant political victories like the one described by Butterworth. Even as Hartman seems to agree with Paul Gilroy on the "value of seeing the consciousness of the slave as involving an extended act of mourning," she remains so focused on her own commemorations that her text makes little space for a consideration of how the enslaved struggled with alienation and the fragility of belonging, or of the mourning rites they used to confront their condition.24 <u>All of the questions she raises about the meaning of slavery in the present—both highly personal and insistently political— might as well be asked about the meaning of slavery to slaves themselves, that is, if one begins by closely examining their social and political lives rather than assuming their lack of social being</u>. Here Hartman is undone by her reliance on Orlando Patterson's totalizing definition of slavery. She asserts that "no solace can be found in the death of the slave, no higher ground can be located, no perspective can be found from which death serves a greater good or becomes anything other than what it is."25 **If she is correct, the events on the Hudibras were of negligible importance. And indeed, Hartman's understandable** ==emphasis on the personal damage wrought by slavery encourages== her to ==disavow two generations of social history that have demonstrated slaves'==

remarkable capacity to forge fragile communities, preserve cultural inheritance, and resist the predations of slaveholders. This in turn precludes her from describing the ways that violence, dislocation, and death actually generate culture, politics, and consequential action by the enslaved.26

Social death isn't useful for changing material conditions for black people.
Brown, Harvard University African American studies professor, 2009

[Vincent, American Historical Review, "Social Death and Political Life in the Study of Slavery" http://history.fas.harvard.edu/people/faculty/documents/brown-socialdeath.pdf, p.1241-3]

THE PREMISE OF ORLANDO PATTERSON'S MAJOR WORK, that enslaved Africans were natally alienated and culturally isolated, was challenged even before he published his influential thesis, primarily by scholars concerned with "survivals" or "retentions" of African culture and by historians of slave resistance. In the early to mid-twentieth century, when Robert Park's view of "the Negro" predominated among scholars, it was generally assumed that the slave trade and slavery had denuded black people of any ancestral heritage from Africa. The historians Carter G. Woodson and W. E. B. Du Bois and the anthropologist Melville J. Herskovits argued the opposite. Their research supported the conclusion that while enslaved Africans could not have brought intact social, political, and religious institutions with them to the Americas, they did maintain significant aspects of their cultural backgrounds.32 Herskovits examined "Africanisms"—any practices that seemed to be identifiably African—as useful symbols of cultural survival that would help him to analyze change and continuity in African American culture.33 He engaged in one of his most heated scholarly disputes with the sociologist E. Franklin Frazier, a student of Park's, who emphasized the damage wrought by slavery on black families and folkways.34 More recently, a number of scholars have built on Herskovits's line of thought, enhancing our understanding of African history during the era of the slave trade. Their studies have evolved productively from assertions about general cultural heritage into more precise demonstrations of the continuity of worldviews, categories of belonging, and social practices from Africa to America. For these scholars, the preservation of distinctive cultural forms has served as an index both of a resilient social personhood, or identity, and of resistance to slavery itself.35 **Scholars of slave resistance have never had much use for the concept of social death**. The early efforts of writers such as Herbert Aptheker aimed to derail the popular notion that American slavery had been a civilizing institution threatened by "slave crime."36 Soon after, studies of slave revolts and conspiracies advocated the idea that resistance demonstrated the basic humanity and intractable will of the enslaved—indeed, they often equated acts of will with humanity itself. As these writers turned toward more detailed analyses of the causes, strategies, and tactics of slave revolts in the context of the social relations of slavery, they had trouble squaring abstract characterizations of "the slave" with what they were learning about the enslaved. 37 Michael Craton, who authored Testing the Chains: Resistance to Slavery in the British West Indies, was an early critic of Slavery and Social Death, protesting that what was known about chattel bondage in the Americas did not confirm Patterson's definition of slavery. "If slaves were in fact 'generally dishonored,' " Craton asked, "how does he explain the degrees of rank found among all groups of slaves—that is, the scale of 'reputation' and authority accorded, or at least acknowledged, by slave and master alike?" How could they have formed the fragile families documented by social historians if they had been "natally alienated" by definition? Finally, and perhaps most tellingly, if slaves had been uniformly subjected to "permanent violent domination," they could not have revolted as often as they did or shown the "varied manifestations of their resistance" that so frustrated masters and compromised their power, sometimes "fatally."38 The dynamics of social control and slave resistance falsified Patterson's description of slavery even as the tenacity of African culture showed that enslaved men, women, and children had arrived in the Americas bearing much more than their "tropical temperament." The cultural continuity and resistance schools of thought come together powerfully in an important book by Walter C. Rucker, The River Flows On: Black Resistance, Culture, and Identity Formation in Early America. In Rucker's analysis of slave revolts, conspiracies, and daily recalcitrance, African concepts, values, and cultural metaphors play the central role. Unlike Smallwood and Hartman, for whom "the rupture was the story" of slavery, Rucker aims to

reveal the "perseverance of¶ African culture even among second, third, and fourth generation creoles."39 He looks¶ again at some familiar events in North America—New York City's 1712 Coromantee¶ revolt and 1741 conspiracy, the 1739 Stono rebellion in South Carolina, as well as¶ the plots, schemes, and insurgencies of Gabriel Prosser, Denmark Vesey, and Nat¶ Turner—deftly teasing out the African origins of many of the attitudes and actions¶ of the black rebels. Rucker outlines how the transformation of a "shared cultural¶ heritage" that shaped collective action against slavery corresponded to the "various¶ steps Africans made in the process of becoming 'African American' in culture, orientation,¶ and identity."40

The alt fails – too totalizing – it makes resistance impossible and misreads history. Walker, Graduate of Psychosocial studies, 12

(Tracey, Graduate of Psychosocial Studies at Birbeck University of London, Graduate Journal of Social Science July 2012, Vol. 9, Issue 2, " The Future of Slavery: From Cultural Trauma to Ethical Remembrance" pg. 165-167, http://gjss.org/images/stories/volumes/9/2/Walker%20Article.pdf)

To argue that there is more to the popular conception of slaves as victims who experienced social death within the abusive regime of transatlantic slavery is not to say that these subjectivities did not exist. When considering the institution of slavery we can quite confidently rely on the assumption that it did indeed destroy the self-hood and the lives of millions of Africans. Scholar Vincent Brown (2009) however, has criticised Orlando Patterson's (1982) seminal book Slavery and Social Death for positioning the slave as a subject without agency and maintains that those who managed to dislocate from the nightmare of plantation life 'were not in fact the living dead', but 'the mothers of gasping new societies' (Brown 2009, 1241).¶ The Jamaican Maroons were one such disparate group of Africans who managed to band together and flee the Jamaican plantations in order to create a new mode of living under their own rule. These 'runaways' were in fact 'ferocious fighters and master strategists', building towns and military bases which enabled them to fight and successfully win the war against the British army after 200 years of battle (Gotlieb 2000,16). In addition, the story of the Windward Jamaican Maroons disrupts the phallocentricism inherent within the story of the slave 'hero' by the very revelation that their leader, 'Queen Nanny' was a woman (Gotlieb 2000). As a leader, she was often ignored by early white historians who dismissed her as an 'old hagg' or 'obeah' woman (possessor of evil magic powers) (Gotlieb 2000, xvi). Yet, despite these negative descriptors, Nanny presents an interesting image of an African woman in the time of slavery who cultivated an exceptional army and used psychological as well as military force against the English despite not owning sophisticated weapons (Gotlieb 2000). As an oral tale, her story speaks to post-slavery generations through its representation of a figure whose gender defying acts challenged the patriarchal fantasies of the Eurocentric imaginary and as such 'the study of her experiences might change the lives of people living under paternalistic, racist, classist and gender based oppression' (Gotlieb 2000, 84).¶ The label of 'social death' is rejected here on the grounds that it is a narrative which is positioned from the vantage point of a European hegemonic ideology. Against the social symbolic and its gaze, black slaves were indeed regarded as non-humans since their lives were stunted, diminished and deemed less valuable in comparison to the Europeans. However, Fanon's (1967) assertion that 'not only must the black man be black; he must be black in relation to the white man' (Fanon 1967, 110) helps us to understand that this classification can only have meaning relative to the symbolic which represents the aliveness of whiteness against the backdrop of the dead black slave (Dyer 1997). Butler (2005) makes it clear that the 'death' one suffers relative to the social symbolic is imbued with the fantasy that having constructed the Other and interpellated her into 'life', one now holds the sovereignty of determining the subject's right to live or die.¶ this death, if it is a death, is only the death of a certain kind of subject, one that was never possible to begin with, the death of the fantasy of impossible mastery, and so a loss of what one never had, in other words it is a necessary grief (Butler 2005,

65).¶ The point to make here is that although the concept of <mark>social death</mark> has proved useful for theorists to describe the metaphysical experience of those who live antagonistically in relation to the social symbolic, it <mark>is nevertheless a colonial narrative within which the slaves are confined to a one dimensional story of terror</mark>. In keeping with Gilroy's (1993b) argument that the memory of slavery must be constructed from the slaves' point of view, <mark>we might instead concentrate</mark>, not on the way in which the slaves are figured within the European social imaginary, but <mark>on how they negotiated their own ideas about self and identity.</mark> We might therefore find some value in studying a group like <mark>the Maroons</mark> who not only <mark>managed to create an autonomous world</mark> outside of the hegemonic discourse which negated them, but also, due to their unique circumstances, were forced to create new modes of communication which would include a myriad of African cultures, languages and creeds (Gottlieb 2000). <mark>This creative and resistive energy</mark> of slave subjectivity not only <mark>disrupts the colonial paradigm</mark> of socially dead slaves, but also implies the ethical tropes of creation, renewal and mutual recognition.¶ In contrast, the passive slave proved to feature heavily in the 2007 bicentenary commemorations causing journalist Toyin Agbetu to interrupt the official speeches and exclaim that it had turned into a discourse of freedom engineered mostly by whites with stories of black agency excluded8. Young's argument that 'one of the damaging side effects of the focus on white people's role in abolition is that Africans are represented as being passive in the face of oppression', appears to echo the behaviour in the UK today given that a recent research poll reveals that the black vote turnout is significantly lower than for the white majority electorate and that forty percent of second generation 'immigrants' believe that voting 'doesn't matter'.9 Yet, Gilroy (1993a) argues that this political passivity may not simply be a self fulfilling prophecy, but might allude to the 'lived contradiction' of being black and English which affects one's confidence about whether opinions will be validated in a society that, at its core, still holds on to the fantasy of European superiority (Gilroy 1993a). <mark>Without considering the slaves' capacity for survival</mark> and their fundamental role in overthrowing the European regime of slavery, <mark>we limit the use–value of the memory and risk becoming overly attached to singular slave subjectivities</mark> seeped in death and passivity. The Maroons story however, enables slave consciousness to rise above the mire of slavery's abject victims and establishes an ethical relation with our ancestors who lived and survived in the time of slavery.

Social death is empirically wrong – explicit policies created racism and explicit policies can fight it.
Bouie, The American Prospect, 2013

[Jamelle, "Making (and Dismantling) Racism" http://prospect.org/article/making-and-dismantling-racism]

But Coates is making a more precise claim: That there's nothing natural about the black/white divide that has defined American history. White Europeans had contact with black Africans well before the trans-Atlantic slave trade without the emergence of an anti-black racism. It took particular choices made by particular people—in this case, plantation owners in colonial Virginia—to make black skin a stigma, to make the "one drop rule" a defining feature of American life for more than a hundred years. By enslaving African indentured servants and allowing their white counterparts a chance for upward mobility, colonial landowners began the process that would make white supremacy the ideology of America. The position of slavery generated a stigma that then justified continued enslavement—blacks are lowly, therefore we must keep them as slaves. Slavery (and later, Jim Crow) wasn't built to reflect racism as much as it was built in tandem with it. And later policy, in the late 19th and 20th centuries, further entrenched white supremacist attitudes. Block black people from owning homes, and they're forced to reside in crowded slums. Onlookers then use the reality of slums to deny homeownership to blacks, under the view that they're unfit for suburbs. In other words, create a prohibition preventing a marginalized group from

engaging in socially sanctioned behavior—owning a home, getting married—and then blame them for the adverse consequences. Indeed, in arguing for gay marriage and responding to conservative critics, Sullivan has taken note of this exact dynamic. Here he is twelve years ago, in a column for The New Republic that builds on earlier ideas: Gay men--not because they're gay but because they are men in an all-male subculture--are almost certainly more sexually active with more partners than most straight men. (Straight men would be far more promiscuous, I think, if they could get away with it the way gay guys can.) Many gay men value this sexual freedom more than the stresses and strains of monogamous marriage (and I don't blame them). But this is not true of all gay men. Many actually yearn for social stability, for anchors for their relationships, for the family support and financial security that come with marriage. To deny this is surely to engage in the "soft bigotry of low expectations." They may be a minority at the moment. But with legal marriage, their numbers would surely grow. And they would function as emblems in gay culture of a sexual life linked to stability and love. [Emphasis added] What else is this but a variation on Coates' core argument, that society can create stigmas by using law to force particular kinds of behavior? Insofar as gay men were viewed as unusually promiscuous, it almost certainly had something to do with the fact that society refused to recognize their humanity and sanction their relationships. The absence of any institution to mediate love and desire encouraged behavior that led this same culture to say "these people are too degenerate to participate in this institution." If the prohibition against gay marriage helped create an anti-gay stigma, then lifting it—as we've seen over the last decade—has helped destroy it. There's no reason racism can't work the same way.

Claiming racial progress is impossible is intellectual laziness.
Reed, University of Pennsylvania political science professor, 2013

[Adolph, "The Help: How "Cultural Politics" Is Worse Than No Politics at All, and Why" http://nonsite.org/feature/django-unchained-or-the-help-how-cultural-politics-is-worse-than-no-politics-at-all-and-why]

That sort of Malcolm X/blaxploitation narrative, including the insistence that Birth of a Nation and Gone With the Wind continue to shape Americans' understandings of slavery, also is of a piece with a line of anti-racist argument and mobilization that asserts powerful continuities between current racial inequalities and either slavery or the Jim Crow regime. This line of argument has been most popularly condensed recently in Michelle Alexander's The New Jim Crow, which analogizes contemporary mass incarceration to the segregationist regime. But even she, after much huffing and puffing and asserting the relation gesturally throughout the book, ultimately acknowledges that the analogy fails.37 And it would have to fail because the segregationist regime was the artifact of a particular historical and political moment in a particular social order. Moreover, the rhetorical force of the analogy with Jim Crow or slavery derives from the fact that those regimes are associated symbolically with strong negative sanctions in the general culture because they have been vanquished. In that sense all versions of the lament that "it's as if nothing has changed" give themselves the lie. They are effective only to the extent that things have changed significantly. The tendency to craft political critique by demanding that we fix our gaze in the rearview mirror appeals to an intellectual laziness. Marking superficial similarities with familiar images of oppression is less mentally taxing than attempting to parse the multifarious, often contradictory dynamics and relations that shape racial inequality in particular and politics in general in the current moment. Assertions that phenomena like the Jena, Louisiana, incident, the killings of James Craig Anderson and Trayvon Martin, and racial disparities in incarceration demonstrate persistence of old-school, white supremacist racism and charges that the sensibilities of Thomas Dixon and Margaret Mitchell continue to shape most Americans' understandings of slavery do important, obfuscatory ideological work. They lay claim to a moral urgency that, as Mahmood Mamdani argues concerning the rhetorical use of charges of genocide, enables disparaging efforts either to differentiate discrete inequalities or to generate historically specific causal accounts of them as irresponsible dodges that abet injustice by temporizing in its face.38 But more is at work here as well.

AT: Social Death – Wilderson Indict

Black social death is based on cherry-picked data that doesn't accurately explain the world.

Bâ, Race and Postcolonial theorist, 11

(Saer Maty, "The US decentered: From Black Social Death to Cultural Transformation," Cultural Studies Review 17(2), September p. 385-387)

And <mark>yet **Wilderson's highlighting is problematic because it overlooks the** 'Diaspora' or 'African Diaspora'</mark>, a key component in Yearwood's thesis that, crucially, neither navel-gazes (that is, at the US or black America) nor pretends to properly engage with black film. Furthermore, Wilderson separates the different waves of black film theory and approaches them, only, in terms of how a most recent one might challenge its precedent. Again, **his approach is problematic because it does not mention or emphasise the inter-connectivity of/in black film theory**. As a case in point, Wilderson does not link Tommy Lott's mobilisation of Third Cinema for black film theory to Yearwood's idea of African Diaspora. (64) Additionally, of course, **Wilderson seems unaware that Third Cinema itself has been fundamentally questioned since Lott's 1990s' theory of black film was formulated. Yet another consequence of ignoring the African Diaspora is that it exposes Wilderson's corpus of films as unable to carry the weight of the transnational argument he attempts to advance**. Here, beyond the US-centricity or 'social and political specificity of [his] filmography', (95) I am talking about Wilderson's choice of films. For example, Antwone Fisher (dir. Denzel Washington, 2002) is attacked unfairly for failing to acknowledge 'a grid of captivity across spatial dimensions of the Black "body", the Black "home", and the Black "community"' (111) while films like Alan and Albert Hughes's Menace II Society (1993), overlooked, do acknowledge the same grid and, additionally, problematise Street Terrorism Enforcement and Prevention Act (STEP) policing. The above examples expose the fact of Wilderson's dubious and questionable conclusions on black film. <mark>**Red, White and Black is particularly undermined by Wilderson's propensity for exaggeration and blinkeredness**</mark>. In chapter nine, '"Savage" Negrophobia', he writes: The philosophical anxiety of Skins is all too aware that through the Middle Passage, African culture became Black 'style' ... Blackness can be placed and displaced with limitless frequency and across untold territories, by whoever so chooses. Most important, there is nothing real Black people can do to either check or direct this process ... Anyone can say ~~'nigger'~~ [the n word] because anyone can be a ~~'nigger'~~ [n word]. (235)7 Similarly, in chapter ten, 'A Crisis in the Commons', Wilderson addresses the issue of 'Black time'. **Black is irredeemable, he argues, because, at no time in history had it been deemed, or deemed through the right historical moment and place.** In other words**, the black moment and place are not right because they are 'the ship hold of the Middle Passage': 'the most coherent temporality ever deemed as Black time' but also 'the "moment" of no time at all on the map of no place at all'.** (279) Not only does Pinho's more mature analysis expose this point as preposterous (see below**), I** also <mark>**wonder what Wilderson makes of the countless historians' and sociologists' works on slave ships**, **shipboard insurrections and/during the Middle Passage**,8 **or of groundbreaking jazz-studies books on cross-cultural dialogue**</mark> like The Other Side of Nowhere (2004). Nowhere has another side, but <mark>**once Wilderson theorises blacks as socially and ontologically dead while**</mark>

dismissing jazz as 'belonging nowhere and to no one, simply there for the taking', (225) there seems to be no way back. It is therefore hardly surprising that Wilderson ducks the need to provide a solution or alternative to both his sustained bashing of blacks and anti- Blackness.9 Last but not least, Red, White and Black ends like a badly plugged announcement of a bad Hollywood film's badly planned sequel: 'How does one deconstruct life? Who would benefit from such an undertaking? The coffle approaches with its answers in tow.' (340)

AT: Social Death – Sexton Indict

Sexton's entire K is de-contextual and based on poor evidence.
Spickard, University of California Santa Barbara history and Asian American studies professor, 2009

[Paul, American Studies Volume 50, Number 1/2, Spring/Summer 2009, "Amalgamation Schemes: Antiblackness and the Critique of Multiracialism. Jared Sexton. Minneapolis: University of Minnesota Press. 2008." Project Muse]

Sexton does point out, as do many writers, the flawed tendencies in multiracial advocacy mentioned in the second paragraph above. But he imputes them to the whole movement and to the subject of study, and that is not a fair assessment.¶ The main problem is that Sexton argues from conclusion to evidence, rather than the other way around. That is, he begins with the conclusion that the multiracial idea is bad, retrograde, and must be resisted. And then he cherry-picks his evidence to fit his conclusion. He spends much of his time on weaker writers such as Gregory Stephens and Stephen Talty who have been tangential to the multiracial literature. When he addresses stronger figures like Daniel, Root, Nash, and Kennedy, he carefully selects his quotes to fit his argument, and misrepresents their positions by doing so.¶ Sexton also makes some pretty outrageous claims. He takes the fact that people who study multiracial identities are often studying aspects of family life (such as the shaping of a child's identity), and twists that to charge them with homophobia and nuclear family-ism. That is simply not accurate for any of the main writers in the field. The same is true for his argument by innuendo that scholars of multiraciality somehow advocate mail-order bride services. And sometimes Sexton simply resorts to ad hominem attacks on the motives and personal lives of the writers themselves. **It is a pretty tawdry exercise**.

2ac – Essentialism Turn

Ontological blackness relies on whiteness – that makes liberation illusory – it is also too totalizing a view of black existence to be useful.
Pinn, Macalester College Professor of Religious Studies, 4

(Anthony, Dialog: A Journal of Theology, Volume 43, Number 1, Spring 2004, '''Black Is, Black Ain't'': Victor Anderson, African American Theological Thought, and Identity', pg.57-58, Wiley online Library)

This connection between ontological blackness and religion is natural because: ''ontological blackness signifies the totality of black existence, a binding together of black life and experience. In its root, *religio*, religion denotes tying together, fastening behind, and binding together. Ontological blackness renders black life and experience a totality.''13 According to Anderson, Black theological discussions are entangled in ontological blackness. And accordingly, discussions of black life revolve around a theological understanding of Black experience limited to suffering and survival in a racist system. The goal of this theology is to find the ''meaning of black faith'' in the merger of black cultural consciousness, icons of genius, and post-World War II Black defiance. An admirable goal to be sure, but here is the rub: Black theologians speak, according to Anderson, in opposition to ontological whiteness when they are actually dependent upon whiteness for the legitimacy of their agenda. Furthermore, ontological blackness's strong ties to suffering and survival result in blackness being dependent on suffering, and as a result social transformation brings into question what it means to be black and religious. Liberative outcomes ultimately force an identity crisis, a crisis of legitimation and utility. In Anderson's words: Talk about liberation becomes hard to justify where freedom appears as nothing more than defiant self-assertion of a revolutionary racial consciousness that requires for its legitimacy the opposition of white racism. Where there exists no possibility of transcending the blackness that whiteness created, African American theologies of liberation must be seen not only as crisis theologies; they remain theologies in a crisis of legitimation.14 This conversation becomes more ''refined'' as new cultural resources are unpacked and various religious alternatives acknowledged. Yet the bottom line remains racialization of issues and agendas, life and love. Falsehood is perpetuated through the ''hermeneutic of return,'' by which ontological blackness is the paradigm of Black existence and thereby sets the agenda of Black liberation within the ''postrevolutionary context'' of present day USA. One ever finds the traces of the Black aesthetic which pushes for a dwarfed understanding of Black life and a sacrifice of individuality for the sake of a unified Black 'faith'. Yet differing experiences of racial oppression (the stuff of ontological blackness) combined with varying experiences of class, gender and sexual oppression call into question the value of their racialized formulations. Implicit in all of this is a crisis of faith, an unwillingness to address both the glory and guts of Black existence—nihilistic tendencies that, unless held in tension with claims of transcendence, have the potential to overwhelm and to suffocate. At the heart of this dilemma is friction between ontological blackness and ''contemporary postmodern black life''—issues, for example related to ''selecting marriage partners, exercising freedom of movement, acting on gay and lesbian preferences, or choosing political parties.''15 How does one foster balance while embracing difference as positive? Anderson looks to Nietzsche.

Essentializing black identity takes out solvency.
Hooks, City Univeristy New York English professor, 1996

[bell, "Killing Rage: Ending Racism"
http://books.google.com/books?id=3JlNFYKLheUC&q=unitary+representations#v=snippet&q=unitary%2
0representations&f=false, p.249-50]

Unitary representations of black identity do not reflect the real lives of African Americans who struggle to create self and identity. Psychoanalytically, it is clear that the unitary self is sustained only by acts of coercive control and repression. Collectively African Americans fear the loss of a unitary representation of blackness because they feel we will lose a basis for organized resistance. ¶In retheorizing black subjectivity we have to also revise our understanding of the conditions that are needed for black folks to join together in a politics of solidarity that can effectively oppose white supremacy. Breaking with essentialist thinking that insists all black folks inherently realize that we have something positive to gain by resisting white supremacy allows us to collectively acknowledge that radical politiciza-tion is a process—that revolutionary black thinkers and activists are made, not born. Progressive education for critical consciousness then is automatically understood to be necessary to any construction of radical black subjectivity. Whether the issue is construction of self and identity or radical politici-zation, African-American subjectivity is always in process. Fluidity means that our black identities are constantly changing as we respond to circumstances in our families and communities of origin, and as we interact with a larger world. Only by privileging the reality of that changing black identity will we be able to engage a prophetic discourse about subjectivity that will be liberatory and transformative.

2ac – Black/White Binary Turn

Anti-blackness is <u>not the master-key</u>—the focus on it as such skews discussions of racial justice and promotes nationalistic and xenophobic forms of racism
Sunstrom, University of San Francisco philosophy professor, 2008

[Ronald, "The Browning of America and the Evasion of Social Justice" http://www.usfca.edu/fac-staff/rrsundstrom/selected-articles/black-white-binary.pdf, pp. 65-6]

<u>The future of race</u> in the United States, or elsewhere, <u>will not be determined</u> solely <u>through</u> the American instinct to return to <u>black white politics</u>—as if the question of the conservation or elimination of race and racial justice is in the hands of whites and blacks who need to hash out their issues for the sake of all of us. <u>That somehow American racial problems are primarily black and white</u> problems **is the conceit** of too many Americans. ¶ This conceit is rooted in an image of an America defi ned by Protestantism, the English language, and its ties to Europe and populated by fading yet romantic "Indians," a few Mexicans, and "Orientals" but dominated by whites and blacks. In this fantasy, <u>the racial problems that we have are determined by the</u> painful yet interesting <u>history between whites and blacks.</u> From here, liberals and conservatives part company, but <u>the central vision holds</u>—both sides affirm that black-white division is the United States' core racial problem, and <u>that solving black-white confl ict is **the master key to all of its racial problems**</u>. ¶ The result of this assumption has been that the concerns, problems, and questions, specific to blacks and whites and the relationship between them, have historically dominated discourse over race in the United States. <u>The domination of this focus</u>, often <u>called the blackwhite binary, has colored the U.S. reaction toward</u>, and policies about, <u>Native Americans, Asians, Latinos, and its colonial subjects, such as Puerto Ricans and Filipinos.</u>1 <u>The color line</u>, which W. E. B. Du Bois famously claimed marked the twentieth century and spanned the globe, <u>was imagined in the cast of the black-white binary</u>. ¶ In the following sections I clarify various conceptions of the black-white binary and consider their relative merits and failings. I then turn to the host of objections against this binary. I support the primary complaint against <u>the binary</u>, that it **does not engender accurate descriptions of the United States' racial past** or present, <u>and</u> **it skews discussions of the future** of race **and racial justice** toward the <u>perspectives and interests of blacks and whites</u>. <u>Some readers</u> may <u>think that the problems with the black-white binary are so obvious and great that the subject is not worth a chapter-length study</u>. I urge such readers to momentarily suspend their incredulity about the blackwhite binary so that they can consider the demands for justice that motivate its proponents. I argue that the black-white binary should not simply be dismissed, for incautious dismissals of it end up casting off the demands of justice that frequently motivate statements that seemingly support the binary. Nonetheless, <u>there are troubling aspects of the black-white binary that go beyond the usual objections, leading</u>, fi nally, <u>to its total rejection</u>. <u>The black-white binary is **rooted in** a peculiar conception of black-white American nationalism and xenophobia</u> that is ultimately hostile to American multiculturalism. <u>Such a view is fundamentally illiberal,</u> and the **people of the United States should not capitulate to its desire that the false image of America as black and white not be upset**.

2ac – Black/White Binary Turn – Model Minority

The deployment of the 1nc reifies the black white binary – even if the Sapphire is a heuristic for understanding oppression, the presentation of the 1nc is divisive. If it is a heuristic, the perm is best.

Hutchinson 4 (Darren Lenard, JD from Yale, BA in Political Science and Economics from the University of Pennsylvania, "Critical Race Histories: In and Out", http://digitalcommons.wcl.american.edu/cgi/viewcontent.cgi?article=1102&context=aulr&sei-redir=1&referer=http%3A%2F%2Fscholar.google.com%2Fscholar_url%3Fhl%3Den%26q%3Dhttp%3A%2F%2Fdigitalcommons.wcl.american.edu%2Fcgi%2Fviewcontent.cgi%253Farticle%253D1102%2526context%253Daulr%26sa%3DX%26scisig%3DAAGBfm2VQ7OWExXQKB8eDDBDqMjVp-xseg%26oi%3Dscholarr#search=%22http%3A%2F%2Fdigitalcommons.wcl.american.edu%2Fcgi%2Fviewcontent.cgi%3Farticle%3D1102%26context%3Daulr%22)

A third area of critical race innovation involves multiracial politics. Internal critics have argued that racial discourse in the United States fixates upon black/white racial issues, thereby marginalizing Latino, Native American, and Asian American experiences.95 Empirically, this observation is indisputable. Race theorists lack a full understanding of the breadth of racial injustice. The inclusion of the experiences of Latinos, Native Americans, and Asian Americans in racial discourse can improve CRT in several ways. First, a multiracial discourse permits a full accounting of the problem of racial inequality and allows for the construction of adequate remedies for racial subordination.96 Although all people of color suffer racism, often in similar ways, racial hierarchies impact communities of color in diverse ways. A narrow focus on black/white subjugation severely limits the reach of antiracist remedies. The black/white paradigm also prevents persons of color from engaging in coalition politics.97 By treating racism as a problem that affects blacks primarily (or exclusively), racial discourse in the United States **divides persons of color** who could align to create formidable political forces in the battle for racial justice. Binary racial discourse also causes persons of color to compete for the attention of whites, as marginalized racial groups treat racial justice as a zero-sum game.98 Instead of recognizing the pervasiveness and complexity of racial injuries, binary racial discourse leads to the tyranny of oppression ranking and to competing demands for centrality in a marginalized space of racial victimization. Recently, Critical Race Theorists, responding to the multiracial critics, have attempted to contextualize binary racial discourse. Devon Carbado, for example, recognizes the existence of the so-called black/white paradigm but pushes its critics to consider that this paradigm privileges whites and subordinates blacks.99 Because blacks and whites are situated differently with respect to the black/white paradigm, their investment in binary racial discourse likely serves diverging interests.100 If whites created the paradigm, then directing multiracial critiques toward black scholars might be misguided. Furthermore, several scholars, including those who reject binary racial politics, have documented the unique experiences of blacks in the construction of racism in the United States.101 "Black exceptionalism"102 might provide a historical and sociological explanation for the predominance of black/white racial discourse. Also, resistance to multiracial discourse among blacks might exist because non-black persons of color often benefit from white supremacy. That is, non-black persons of color sometimes align themselves ideologically and culturally with whites to elevate their status in a racially hierarchical society.103 The embrace of racial hierarchy among people of color and white-supremacist privileging (even if shifting and extremely limited) of non-black communities of color impede the willingness of blacks to engage in multiracial discourse. Furthermore, black experiences are relevant to the experiences of other persons of color for two reasons. First, anti-black racism provides an institutional and historical framework for the subordination of non-black persons of color.104 Much of the racial hierarchy in the United States was concretized during slavery—though not exclusively.105 The formation of a rigid racial caste structure in the black/white context legitimizes racist practices against all persons of color.106 Second, persons of color do not exist in mutually exclusive groups. Latino communities, for example, have large populations of persons of African descent; thus, it is difficult to bifurcate Latino and black experiences.107 Abolishing the black/white paradigm, therefore, might preclude analysis of the unique experiences facing black Latinos. Ultimately, however, the exclusive deployment of a binary black/white paradigm artificially narrows racial discourse and harms racial justice efforts. In order to construct adequate antiracist theories and to develop effective remedies for racial injustice, Critical Race Theorists must excavate the multidimensional harms that racial injustice causes, including harms that are racial but not endured by blacks. Furthermore, progressive racial politics can only survive with broad political support. The most likely support for progressive racial change comes from persons of color. Yet, the deep divisions that

result from binary racial politics hinders the formation of helpful antiracist alliances. Finally, a multiracial discourse may help blacks demonstrate the pervasiveness of racial inequality. Whites tend to view racism as a relic of prior generations, and they often respond to blacks' claims of ongoing racial injustice with suspicion.108 Moreover, in a white-supremacist culture, binary racial discourse obscures the experiences of discrimination experienced by Latinos and Asian Americans.109 As a result, whites argue that blacks should emulate "model minorities," usually Asian Americans, who either do not suffer from racism or do not believe that racism injures them enough to oppose it on a political level.110 Binary racial discourse therefore allows whites to discredit blacks' claims of racism by offering Asian Americans as proof that the United States has eradicated racial injustice, or that blacks can easily overcome what "little" racism still exists. Multiracial discourse, however, offers a powerful rebuttal to this negative and deceitful discourse. By portraying the complexity of racial inequality, Critical Race Theorists can counter a white-supremacist narrative that disparages blacks' assertions of racial injustice by deploying model minority constructs.111

2ac – Black/White Binary Turn – Islamophobia

The K doesn't solve – focus on the black-white binary papers over how Arabs and Muslims are not only looked at as black BUT also foreign – the world of the alt in no way guarantees a world without Islamophobia.
Wing, University of Iowa law professor, 2003

[Adrien Katherine, 63 La. L. Rev. 717, "Civil Rights in the Post 911 World: Critical Race Praxis, Coalition Building, and the War on Terrorism" Lexis]

As we await the decisions in the University of Michigan affirmative action cases, n1 this symposium raises a timely and important query: is civil rights law dead? This article answers that query by asserting that there is a need for a thorough reconceptualization in the 21st century. Historically, civil rights in the United States has been synonymous with the struggle of African Americans to attain racial equality with white Americans. n2 The battles of other ethnic minorities, such as Latinos, Asians and Native Americans, not to mention the struggles of other victims of discrimination such as women, gays, the disabled or the aged, have often received secondary attention. n3 Some scholars and activists would assert that, given the unique history of Blacks as slaves [*718] in this country, the continuation of the so-called black-white binary or emphasis is still justified. n4 In my view, we must expand our civil rights efforts beyond all the above mentioned groups to include those that do not easily fit into historic racial categories: specifically Arabs and Muslims, who have faced especially increased discrimination since September 11, 2001. n5 That day clearly changed the United States, if not the world, in very profound ways. n6 Since then, the War on Terrorism has taken precedence in both U.S. foreign and domestic policy. In late 2001, the foreign policy aspect manifested itself as a literal war in Afghanistan that overthrew the globally despised Taliban regime. n7 Shortly after the symposium for which this paper was composed took place, the U.S. launched a war against Iraq to overthrow its long term leader Saddam Hussein and destroy any weapons of mass destruction. n8 On the domestic front, these wars have had profound effects on the civil liberties of both noncitizens and citizens, particularly Arabs, Muslims, and those who resemble them. n9 Part II of this article details how the civil rights of Arabs and Muslims have been restricted both before and after September 11, 2001. n10 Using a Critical Race Theory (CRT) n11 analysis, we shall see how these groups have been socially constructed as "Black," with the negative legal connotations historically attributed to that designation. For example, racial profiling, which originated as a term synonymous with Blacks and police traffic stops, n12 now equally applies to both Arabs and Muslims in many contexts. [*719] Part III draws upon CRT for answers for how to solidify a new, more inclusive civil rights movement. n13 Critical Race Praxis, combining theory and practice, will be detailed as a means to create solutions to the civil rights dilemmas facing all groups, including Arabs and Muslims. Part IV suggests a specific form of praxis, coalition building, as a problematic but appropriate means for the new and old components of the civil rights movement to intersect and perhaps join forces from time to time. n14 Part V concludes with specific proposals for coalitions that may help alleviate the bleak situation currently facing Arabs and Muslims. n15

This epistemological exclusion does more than just excluding cultural forms of racism from our discussion, it <u>actively replicates them</u>—the view of American racism as a black/white issue helped solidify xenophobic violence against Arab bodies in the war on terror as foreign issues outside the American schema
Sunstrom, University of San Francisco philosophy professor, 2008

[Ronald, "The Browning of America and the Evasion of Social Justice" http://www.usfca.edu/fac-staff/rrsundstrom/selected-articles/black-white-binary.pdf, pp. 77-9]

To underline this fi nal point, <u>the critiques of the binary</u> offered by legal scholars, such as Juan Perea and Richard Delgado, <u>underscore the dangers that Alcoff's critique exposes</u>.34 Delgado in particular distinguishes three ways that <u>the binary negatively affects Latinos and Asian Americans</u>. First, <u>it has framed the legal conception of equal protection **in terms of the struggle for equal black citizenship.** That frame aids in **discrimination against nonwhite immigrants** and undermines the equal protection of Latino/a and Asian American citizens</u>. Second, <u>the binary **plays into contractarian justifications for the national self-determination of citizenship** and thus **cements past race-based (and racist) definitions of citizenship**</u>. Third, <u>the binary places Latinos, Asian Americans, and Native Americans "**out of sight" and thus out of the discourse of racial justice**</u>. The consequence of the normative force of the binary is that African Americans, according to Delgado, are trained to pursue, and are recognized as the primary legitimate recipients of, benefi ts and protections that fl ow from antidiscrimination laws. ¶ <u>The black-white binary, as a "template" or master key, demarcates who is a proper subject of our thoughts about race, racism, and civil rights</u>. Consequently, <u>some individuals and groups, and their respective interests, are left out of public deliberations</u> of race and social justice, <u>and are typifi ed as</u>, quite literally, **foreign issues**. Legal scholar Juan Perea put it this way: ¶ <u>If Latinos/as and Asian Americans are presumed to be White</u> by both White and Black writers . . . then <u>our claims to justice will not be heard or acknowledged</u>. Our <u>claims can be ignored by Whites, since we are not Black and therefore are not subject to real racism.</u> And our claims can be ignored by Blacks, since we are presumed to be, not Black, but becoming White, and therefore not subject to real racism. Latinos/as do not fi t the boxes supplied by the paradigm.35 ¶ <u>In the wake of the reaction of the United States to the terrorist</u> strikes against the World Trade Center towers, **the black-white binary's role as principle of exclusion in the service of American nationalism took on an ugly clarity**.36 It **assuaged American worries about racism** as it targeted Arabs, Middle Easterners, and Muslims in the war against Al-Qaeda in Afghanistan, the war against Iraq, and the everlasting war on terror.37 <u>Whatever the role of racism</u> in the rounding up, questioning, detention, and expulsion of Arabs, Muslims, and people from the Middle East, **the United States was comforted by the "United We Stand" rhetoric, and a rainbow coalition of Americans helped author and justify the United States' reactions to terrorism**. Thus <u>practices such as the racial profi ling of Arabs, Muslims,</u> and those who look like them, to our eyes, <u>met with 60 percent approval ratings</u>, while before the war 80 percent of Americans disapproved of racial profi ling, a sentiment that George Bush and even John Ashcroft supported before the war. ¶ **It is of great consequence that this exclusion is a result of a particular black-white normative vision of the American nation as being properly and primarily black and white**. The implication is that <u>the black-white binary is **a nativist idea that aids the continued exclusion** of Latinos, Asian Americans, and other nonwhite immigrant groups, **such as Arabs and Muslims, from full citizenship and equal protection**</u>.38

EXTN – Black/White Binary Turn

The 1NC and Block's argument will almost entire rely on a historical narrative of slavery—"the founding of America is tied to antiblackness and means it comes first"— even it's factually accurate, it is not a defense of their politics—their historic analysis doesn't respond to the complexities of <u>Modern America</u> which undermines effective racial politics and specifically marginalizes indigenous oppression

Sunstrom, University of San Francisco philosophy professor, 2008

[Ronald, "The Browning of America and the Evasion of Social Justice" http://www.usfca.edu/fac-staff/rrsundstrom/selected-articles/black-white-binary.pdf, pp. 81-2]

<u>The</u> sixth form of the <u>binary is justifi ed</u> for some <u>because of the historical precedence of the African American experience, as well as the relative severity of the confl ict</u> between African Americans and whites. For others, such as Mary Frances Berry, Andrew Hacker, and Toni Morrison, <u>the sixth form has additional justifi cation because</u>, as Toni Morrison put it, <u>assimilation and integration into the United States happen upon the "backs of blacks."</u> My objection to the fourth form of the binary (that it names prescriptive patterns of racial organization) undermines the latter claim, and without it the fi rst claim is not as signifi cant. <u>Mainstream African American demands for justice deserve satisfaction, and those claims</u> **do not need the black-white binary as justifi cation**. Worse, <u>the black-white binary</u> in the contemporary multiethnic United States, <u>with the complexities of its history in which the confl ations of the black-white binary are invalid</u>, <u>undermines the realization of social justice</u> for all <u>because it,</u> as Alcoff argued, "**seriously undermines the possibility of achieving coalitions**."42 Therefore, <u>public deliberations</u> that <u>commence</u> by professions of the black-white binary <u>are</u> **anti-political** **and either imperil or end public communication** on race and social justice. ¶ Additionally, <u>the basic historical claim</u> of the sixth form of the binary is **suspicious when Native American claims are considered.** <u>Native Americans possess their own history</u> as a group defi ned as a national other and enemy of the United States. <u>The history of Native Americans</u>, since 1492, <u>has been interwoven with that of the descendents of Africans</u> brought to the Americas by European powers, <u>but their history is distinct</u> in terms of geography, language, culture, international political treaties, and the formation of sovereign nations within North and South America and the Caribbean. **The claims of the black-white binary are so totalizing that it would erase the importance of this history by assimilating Native Americans in the black-white system.** This is the reason <u>Native Americans scholars</u>, such as Vine Deloria and David Wilkins, <u>need to remind Americans that Native Americans are members of "sovereign nations" and are not minorities</u>; or, in the words of Will Kymlicka, indigenous Americans are "national minorities" rather than a "polyethnic" group.43 <u>The black-white binary does violence to that distinction by erasing Native Americans' claims of precedence</u> and envisioning a state of national racial harmony that is at odds with Native American sovereignty.

You make other minorities invisible which makes anti-blackness inevitable.

Espinoza, Boston College law professor, Harris, University of California Berkeley law professor, 1997

[Leslie and Angela, 85 Calif. L. Rev. 1585, "AFTERWORD: Embracing the Tar-Baby - LatCrit Theory and the Sticky Mess of Race" Lexis]

The argument for black exceptionalism is usually not articulated in mixed company in the interests of interracial solidarity. I have set out the argument, not because I believe it to be right, but because I believe that Perea's direct challenge to the black-white paradigm and the power and promise of LatCrit theory more generally forces it into the open. The claim of black exceptionalism presents both an intellectual and a political challenge to LatCrit theory. As an intellectual claim, black exceptionalism answers Perea's criticism of the black-white paradigm by responding that the paradigm, though wrongly making "other nonwhites" invisible, rightly places black people at the center of any analysis of American culture or American white supremacy. In its strongest form, black exceptionalism argues that what "white" people have done to "black" people is at the heart of the story of America; indeed, the story of "race" itself is the story of the construction of blackness and whiteness. In this story, Indians, Asian Americans, and Latino/as do exist. But their roles are subsidiary to, rather than undermining, the fundamental binary national drama. As a political claim, black exceptionalism exposes the deep mistrust and tension among American ethnic groups racialized as "nonwhite."

Even after having issued my disclaimers, I feel queasy writing these words. Not only does black exceptionalism present a serious threat of [*1604] political division; the fact that I write about it in a symposium on LatCrit theory is politically suspect. Trina Grillo and Stephanie Wildman have written perceptively about the ways in which people who are members of a dominant group expect always to be given center stage, and will attempt to take back the center if they are momentarily denied it. n60 In these circumstances, I am a member of the dominant group. Until very recently, African Americans have numerically dominated critical race theory. To turn the subject back to African Americans at the end of a symposium devoted to Latino/as is a perfect example of taking back the center.

Nevertheless, I think I can justify this politically suspicious move, at least to myself. First, the claim of black exceptionalism represents something larger than the narrow interests of African Americans: it is an example of the conflicts that emerge from what Eric Yamamoto calls "differential racialization" and "differential disempowerment." n61 LatCrit theory is emerging at a time when the United States is rapidly becoming more multiracial than ever before. As the preceding examples of conflict among "people of color" suggest, contemporary race theory must come to terms with tensions among "nonwhite" groups as well as the ever-present tension with "whites." Indeed, LatCrit theory's attack on the black/white paradigm itself engages the problem of developing a multidimensional race theory. On its own terms, then, LatCrit theory demands an understanding of white supremacy that goes beyond the binary of oppressed/oppressor. [*1605]

Black/white binary papers over different ways of experiencing oppression – it is not useful for countering whiteness.
Espinoza, Boston College law professor, Harris, University of California Berkeley law professor, 1997

[Leslie and Angela, 85 Calif. L. Rev. 1585, "AFTERWORD: Embracing the Tar-Baby - LatCrit Theory and the Sticky Mess of Race" Lexis]

What, then, of the claim to black exceptionalism? Is the LatCrit attack on the black/white paradigm, as Leslie suggests, a veiled attack on African Americans? Certainly one scenario of the decades to come is a

struggle for intellectual as well as political and economic power between African Americans and Latinos, the struggle that Jack Miles names "blacks against browns." n174₁ The message of black exceptionalism is that this struggle can have only one outcome. Consider a model of American race relations in which "whiteness" is at the top and "blackness" at the bottom. Ethnic groups lacking a stable identification with either category have a choice: [*1637] they may struggle to be accepted as white; they may proclaim themselves "black"; or they may struggle to be accepted as neither. n175 Of course, both color categories are metaphysical rather than biological: achieving whiteness may be accomplished through cultural assimilation rather than plastic surgery, and people visually identified as "black" may nevertheless strive to distance themselves from niggers [the n word]. The prize here is not physical conformity but social status.₁ The claim of black exceptionalism reveals the fear that nonwhite, nonblack people will choose not to challenge the hierarchy that places white over black but to accomodate it. Haney Lopez describes the lure of "ethnicity" for Latino/as, who, in rejecting a racial designation for themselves, are implicitly rejecting blackness, just as in earlier generations Latino/as protected their status as "white." Similarly, many African Americans suspect that Asian Americans will find the "model minority" myth a convenient way to achieve social, economic, and political power: a way to distance themselves from, indeed contrast themselves to, black people. Even if this is not the conscious intent of nonwhite, nonblack people, the power of the opposition between white and black may be such that any attempt to distinguish oneself from black people simply reinforces the degraded status of blackness. n176 Thus, whether Latino/as and Asian Americans seek to profit from the black-white paradigm by struggling to be accepted as white or simply by struggling to be accepted as not black, the result for African Americans is the same: once again, as with the Irish and other formerly "not yet white" ethnic groups, African Americans serve as the stepstool that other groups stand on as they advance in achieving social power and status.₁ What this model leaves out, however, is the complexity that LatCrit theory can bring to the analysis of blackness itself. Take, for example, LatCrit's shift in focus from viewing "race" as an immutable trait to viewing it as a conflation of biology, culture, and nation. At first glance, this shift may appear to have little relevance for African Americans. After all, white supremacy against African Americans has been based for the most part on color discrimination, supplemented by notions of "blood," rather than on cultural or national origin discrimination. Moreover, since the passage of the Fourteenth Amendment, African [*1638] Americans have been citizens, not subject to the sovereign exclusionary power of the United States. n177 But just as it would be a mistake for Latino/as to accept the current bifurcation of discrimination into that based on "immutable" traits versus that based on "mutable" ones - and the attendant bifurcation of racialism into "race" and "ethnicity" - it would be a mistake for African Americans as well. The move beyond color begins to acknowledge the cultural bases of African-American identity in other, more subtle ways. Not all African Americans look "black" or experience color discrimination. n178 Not all black people in the United States are African Americans; there are important, if often unacknowledged, divisions between African and Caribbean immigrants and native-born African Americans. Many African Americans feel the pressure to assimilate to white culture, a pressure that leaves them struggling to "pass" socially if not physically. n179 The project of black liberation is left incomplete if employers are prevented from refusing to hire or promote African Americans but are free to force them to look and act as "white" as possible. n180₁ Finally, the Supreme Court's increasingly vehement denial that race is anything other than skin color threatens the political strength of African-American communities. n181 As Alex Johnson has noted, for African Americans, blackness is not simply an accident of birth but the [*1639] focus of an ethnicity - a distinct way of being in the world. n182 To the extent that white supremacy maintains itself by attacking the

cultural practices that sustain blackness as an ethnicity, African Americans and Latino/as have a shared interest in questioning the bright line between mutable and immutable traits, biology and culture.¶ African Americans also have an interest in recognizing a larger geopolitical context for white supremacy. For instance, to the extent that African Americans are concerned about Africa and its relations with the West, it is necessary to understand that white supremacy is not solely a domestic phenomenon, but is inextricable from the colonial practices that gave it birth. n183 Finally, the concept of nativist racism shines a different sort of light on the claim of black exceptionalism. Focusing on the unique oppression of blacks obscures both the global and the local complexities of white supremacy. From a global perspective, the perpetuation of nativist racism puts American whites and blacks into collusion against foreign, nonwhite Others. From a local perspective, the exclusive focus on black oppression obscures the fact that African Americans are not always the ~~niggers~~ [n word]. In some areas in the Southwest where few black people live, it is Mexicans, or Indians, who are treated as ~~niggers~~[the n word].Black exceptionalism takes the part for the whole, and in so doing not only damages the material interests of African Americans but also enlists them in the project of preserving white supremacy.¶Consider, then, a different model of United States race relations: a box with the mystical Other (perhaps a ~~nigger~~ [n word]; perhaps a threatening foreigner) at the bottom and perfectly transparent, cultureless whiteness at the top. African Americans still have a unique liability in their historic association with the ~~nigger~~ [n word], but each ethnic group has ways and means, some more powerful than others, of strengthening its position within the box. People who speak unaccented Standard English, people with pale skins, round eyes, and straight hair, and people who are citizens all have the opportunity to profit by distancing themselves from the Other. Some groups have the opportunity to access white privilege through language, others through color, still others through familiarity with the [*1640] dominant culture. This model is slightly more complex than the previous one, in that it does not suggest that blacks and no others are locked into the bottom position. Which group wins the competition for power and status depends in part on local conditions.

Privilege K Answers

AT: Privilege – Reductive

Privilege theory is reductive and elitist – it collapses into idealism and recreates liberalism.
Choonara and Prasad, International Socialism Journal, 2014

[Esme and Yuri, "What's wrong with privilege theory?" http://www.isj.org.uk/?id=971]

Most privilege theorists would also agree that <u>the "privileged" should not be called on to give up their advantages</u>—though primarily <u>because</u> they believe that <u>privilege is something that cannot be got rid of</u>, not because of a need for wider solidarity. As Michael Kimmel puts it, "<u>One can no more renounce privilege than one can stop breathing</u>".40 This is a very pessimistic theory—just as someone cannot renounce their privilege, they cannot avoid being complicit in oppressing others. <u>They can only aspire to greater awareness of their "privilege"</u> and attempt to curb or legislate against the worst expressions of it. Ironically <u>the idea that we can't escape our "privileges"</u> <u>seems</u> to echo the Marxist notion that "being determines consciousness"—someone's ideas and behaviours flow directly from their position of "privilege" or "penalty". But this <u>highly reductive and deterministic</u> view <u>of how oppressive ideas are formed is</u>, as we have seen, a long way from Marxism. First, <u>someone's "being" in this sense cannot just be reduced to a sum of what oppressions they do or don't suffer. Second, there is a range of ideas across society, including among the oppressed—and there is no direct correlation between ideas and the level of oppression an individual faces. People's ideas are not fixed—otherwise why bother with argument</u>, political organisation and so on? <u>Finally people are not just passive objects—we constantly act on and interact with the world around us</u>. In particular the antagonism at the heart of capitalism compels people to fight back, creating a situation in which <u>human agency</u> <u>changes</u> not just the world around them, but also the <u>people themselves</u>. <u>Privilege theory also expresses a form of elitism—we are all seen to be inescapably bound to innate bias and oppressive ideas except the theorists themselves</u> who have been able to reach a degree of enlightened self-awareness. <u>Those who see us all as prisoners of our unearned advantages can only ever expect to persuade a minority to acknowledge their privileges. In this way, despite superficially appearing to be rooted in material reality, **privilege theory actually collapses into idealism**—seeing ideas as the crucial factor.</u> That is why for privilege theory the key focus is education and awareness. <u>This approach has a lot in common with liberalism—a focus on educating individuals and a moral imperative to strive for justice</u>, without believing that inequality can be completely overcome (presumably without wiping out men or white people or heterosexuals at least).

AT: Privilege – Structures Key

Pointing out privilege isn't useful – it distracts from structures that perpetuate privilege.
Smith, University of California Riverside cultural studies professor, 12-13-13

[Andrea, "The Problem with Privilege" http://andrea366.wordpress.com/author/andrea366/]

In my experience working with a multitude of anti-racist organizing projects over the years, I frequently found myself participating in various workshops in which participants were asked to reflect on their gender/race/sexuality/class/etc. privilege. These workshops had a bit of a self-help orientation to them: "I am so and so, and I have x privilege." It was never quite clear what the point of these confessions were. It was not as if other participants did not know the confessor in question had her/his proclaimed privilege. It did not appear that these individual confessions actually led to any political projects to dismantle the structures of domination that enabled their privilege. Rather, the confessions became the political project themselves. The benefits of these confessions seemed to be ephemeral. For the instant the confession took place, those who do not have that privilege in daily life would have a temporary position of power as the hearer of the confession who could grant absolution and forgiveness. The sayer of the confession could then be granted temporary forgiveness for her/his abuses of power and relief from white/male/heterosexual/etc guilt. Because of the perceived benefits of this ritual, there was generally little critique of the fact that in the end, it primarily served to reinstantiate the structures of domination it was supposed to resist. One of the reasons there was little critique of this practice is that it bestowed cultural capital to those who seemed to be the "most oppressed." Those who had little privilege did not have to confess and were in the position to be the judge of those who did have privilege. Consequently, people aspired to be oppressed. Inevitably, those with more privilege would develop new heretofore unknown forms of oppression from which they suffered. "I may be white, but my best friend was a person of color, which caused me to be oppressed when we played together." Consequently, the goal became not to actually end oppression but to be as oppressed as possible. These rituals often substituted confession for political movement-building. And despite the cultural capital that was, at least temporarily, bestowed to those who seemed to be the most oppressed, these rituals ultimately reinstantiated the white majority subject as the subject capable of self-reflexivity and the colonized/racialized subject as the occasion for self-reflexivity.¶ These rituals around self-reflexivity in the academy and in activist circles are not without merit. They are informed by key insights into how the logics of domination that structure the world also constitute who we are as subjects. Political projects of transformation necessarily involve a fundamental reconstitution of ourselves as well. However, for this process to work, individual transformation must occur concurrently with social and political transformation. That is, the undoing of privilege occurs not by individuals confessing their privileges or trying to think themselves into a new subject position, but through the creation of collective structures that dismantle the systems that enable these privileges. The activist genealogies that produced this response to racism and settler colonialism were not initially focused on racism as a problem of individual prejudice. Rather, the purpose was for individuals to recognize how they were shaped by structural forms of oppression. However, **the response to structural racism became an individual one – individual confession at the expense of collective action**. Thus the question becomes, how would one collectivize individual transformation? Many organizing projects attempt and have attempted to do precisely this, such Sisters in Action for Power, Sista II Sista, Incite! Women of Color Against Violence, and

Communities Against Rape and Abuse, among many others. Rather than focus simply on one's individual privilege, they address privilege on an organizational level. For instance, they might assess – is everyone who is invited to speak a college graduate? Are certain peoples always in the limelight? Based on this assessment, they develop structures to address how privilege is exercised collectively. For instance, anytime a person with a college degree is invited to speak, they bring with them a co-speaker who does not have that education level. They might develop mentoring and skills-sharing programs within the group. To quote one of my activist mentors, Judy Vaughn, "You don't think your way into a different way of acting; you act your way into a different way of thinking." Essentially, the current social structure conditions us to exercise what privileges we may have. If we want to undermine those privileges, we must change the structures within which we live so that we become different peoples in the process.¶ This essay will explore the structuring logics of the politics of privilege. In particular, the logics of privilege rest on an individualized self that relies on the raw material of other beings to constitute itself. Although the confessing of privilege is understood to be an anti-racist practice, it is ultimately a project premised on white supremacy. Thus, organizing and intellectual projects that are questioning these politics of privilege are shifting the question from what privileges does a particular subject have to what is the nature of the subject that claims to have privilege in the first place.

Pointing out privilege becomes an end in itself – it never challenges the structures that produce that privilege.
Choonara and Prasad, International Socialism Journal, 2014

[Esme and Yuri, "What's wrong with privilege theory?" http://www.isj.org.uk/?id=971]

In many ways privilege theory reflects much older narratives about who benefits from oppression—arguments for example that men benefit from women's oppression and that all white people gain from racism. Those who allegedly hold privilege are seen to benefit automatically from, and to be complicit in, the oppression of others. Privilege theorist and diversity consultant Frances Kendall argues, for example: "Any of us who has race privilege, which all white people do, and therefore the power to put our prejudices into law, is racist by definition, because we benefit from a racist system".5 This is a very pessimistic and disarming theory—seeing individuals as unable to escape their prejudices or their role in the oppression of others. The best that can be hoped for in such circumstances is for increased self-awareness and mitigation of the worst forms of individually oppressive behaviour in order to become suitable allies of those facing oppression, though to what end is generally not clear. Once you accept a framework of understanding inequalities in society as forms of privilege, the concept itself can become very imprecise. So, while many privilege theorists focus on clear questions of oppression such as racism, gender, sexuality or disability, some expand the concept to practically all social phenomena. The Transformative Justice Law Project of Illinois, for example, lists many forms of privilege that activists should check including education privilege, body size privilege, "life on the outside" privilege (the "privilege" of not being in prison) and "passing privilege…the privilege to be able to 'pass' as a more privileged group, such as a light skinned person of colour passing as white".6 This approach confuses symptoms with problems. Inequalities and prejudices around body size are not factors that exist independently; they are a direct consequence of sexism and concepts of gender. Similarly the vast inequalities in the likelihood of being in prison or of being able to access education are the consequence of racism and social inequality. Reeling off a list of "privileges" in this way simply states the existence of

an unequal society—**it does not help us to understand it or to challenge it**. In fact the recognition of inequalities becomes an end in itself.

Privilege theory looks at challenging individuals – this trades off with institutional focus which takes out solvency.
Choonara and Prasad, International Socialism Journal, 2014

[Esme and Yuri, "What's wrong with privilege theory?" http://www.isj.org.uk/?id=971]

Many of the core ideas of privilege theory reflect—directly or indirectly—the ideas of the post-Marxists that gave such a boost to identity politics. Post-Marxists rejected classical Marxism's concerns with class and class struggle as the central driving force of history and the working class as the agent of socialist change. Influential writers such as Ernesto Laclau and Chantal Mouffe explicitly argued for the left to reject Marxist notions of class as reductionist, conjuring a highly distorted version of Marxism in order to bolster their argument.11 They saw the rise of social movements based on identity as the foundation for a new radical politics that rejected attempts to explain "totality" in favour of "partial discourses" and a focus on subjectivity. Thus for Laclau and Mouffe society is divided by "various subject positions" and "diverse antagonisms and points of rupture" that "cannot be led back to a point from which they could all be embraced and explained by a single discourse".12 In other words, they were arguing that it is wrong and futile to attempt to understand how the variety of oppressions fit together into a wider picture of how society works. If Laclau and Mouffe were the theoretical backbone of the identity politics of the 1980s, it is another post-Marxist, the French theorist Michel Foucault, whose ideas have arguably had the most lasting influence on debates around power and oppression. Foucault is in many ways a more complex and contradictory theorist than Laclau or Mouffe. His writings on the social construction of sexuality, for example, are thought provoking and inform much of current theory around LGBT oppression.13 However, he shares with Laclau and Mouffe a rejection of attempts to see society as a totality. Foucault's distinctive concept of power is hugely influential on theorists and activists dealing with questions of oppression. His central argument is that "power is everywhere"—it is omnipresent. Alex Callinicos summarises Foucault's theory thus: Rather than being unitary power is a multiplicity of relations infiltrating the whole of the social body. Consequently no causal priority can be assigned as it is by Marxism, to the economic base. Moreover, power is productive: it does not operate by repressing individuals…but rather by constituting them… Finally, power necessarily evokes resistance, albeit as fragmentary and decentralised as the power-relations it contests.14 So what does this mean? It means that power is not something that some people have and some people don't have. According to Foucault, it is not concentrated in the hands of the capitalist class or the state as the classical Marxist tradition would have it, but is something that is distributed throughout society and exists therefore in all social and interpersonal relationships. Clearly, this has implications for how to understand and to challenge injustice and inequality. Foucault explicitly argues that power does not reside in the ruling class or the state: "Neither the caste which governs, nor the groups which control the state apparatus, nor those who make the most important economic decisions direct the entire network of power that functions in a society." He argues that there must be a "multiplicity of points of resistance" and therefore "there is no single locus of great Refusal, no soul of revolt, source of all rebellions, or pure law of the revolutionary. Instead there is a plurality of resistances, each of them a special case…by definition, they can only exist in the strategic field of power relations".15 This outlook informs the notion running throughout privilege theory that every individual is inescapably part of a multiplicity of oppressive relationships—what Patricia Hill Collins calls a "matrix of domination". Collins is best known for her writings on intersectionality and black feminism, concepts that we will return to later. While she is at times critical of postmodernist concepts of oppression, her theory of power also embraces notions of individual privilege and interpersonal domination arguing that "each one of us derives varying amounts of penalty and privilege from the multiple systems of oppression that frame our lives".16 Anyone encountering or reading material on privilege theory will be struck by the overwhelming focus on the individual—the many confessionals of the "privileged" describing how they came to terms with their privileges17 or the exhorting of others to check theirs. Yet despite the focus on individual change, most privilege theorists acknowledge that there are wider and structural inequalities behind the privileges that individuals are alleged to have bestowed upon them. Michael Kimmel, for example, argues that **individual solutions are not enough**: "Inequality is structural and systematic as well as individual and attitudinal. Eliminating inequalities involves more than changing everyone's attitudes".18

Challenging privilege fails micro and macro politically.
Choonara and Prasad, International Socialism Journal, 2014

[Esme and Yuri, "What's wrong with privilege theory?" http://www.isj.org.uk/?id=971]

Much of the privilege theory literature focuses not just on challenging others, but on challenging oneself. Even an author with such a broad historical scope as Collins argues that "change starts with self, and relationships that we have with those around us must always be the primary site for social change".41 There is, of course, nothing wrong with individuals being self-critical about their attitudes and interactions with others. And it is right to challenge all manifestations of oppressive behaviour, language and attitudes. But the struggle against huge systemic divisions such as racism, sexism and homophobia cannot rely on the individual self-reflection of a number of progressive individuals. These arguments are not new. Writing more than 20 years ago, Ambalavaner Sivanandan pointed to the dangers of an approach that focused primarily on the personal and interpersonal: "By personalising power, 'the personal is political' personalises the enemy: the enemy of the black is white as the enemy of the woman is the man. And all whites are racist like all men are sexist".42 Privilege theory tends to reduce political argument to moral appeal and personal feelings, in which who is saying something often becomes more important than what they are saying. This is one reason that the notion of privilege is potentially corrosive to debate and actually risks letting oppressive behaviour off the hook. If someone speaks or behaves in a racist or sexist way, it is surely better, and more educative for all concerned, to challenge them by explaining that what they do or say is racist or sexist, rather than attributing it to an automatic expression of their "privileged" gender, race, sexuality and so on.

Bringing privilege into conflict against structural change is the best way to challenge both interpersonal and structural oppression.
Choonara and Prasad, International Socialism Journal, 2014

[Esme and Yuri, "What's wrong with privilege theory?" http://www.isj.org.uk/?id=971]

Even when supporters of privilege theory move away from the relentless focus on individuals and involve themselves in wider campaigns they insist that the "privileged" can play at most a supporting role to the oppressed. Frances Kendall, for example, argues that the point of checking our privileges is to become "an ally", able to build "authentic relationships" with those who do not share our privileges.43 The focus on trying to change ideas in ourselves and others before a meaningful challenge to wider structural inequalities is possible is getting things the wrong way round. Most people who enter into struggle, whether for better rights at work, to stop a war, against racism, sexism or some other campaign, bring with them a **mixture of contradictory ideas**. They may accept some reactionary ideas, and reject others. It is precisely in the struggle for change that most people learn new insights into how capitalism functions, and old assumptions and prejudices can be broken down. This is because in battling for change, people's direct experiences come into the sharpest conflict with the view of the world propagated by the institutions of capitalism.

JDI Plague Reps

2NC – AT: No Racism

The outbreak of SARS proves the link- fear of disease/reps translates into the demarcation of racialized bodies
Eichelberger 07

(Laura, University of Arizona, Department of Anthropology, Social Science and Medicine, "SARS and New York's Chinatown: The politics of risk and blame during an epidemic of fear," 2007, Science Direct) //jdi-mm

During the height of the severe acute respiratory syndrome (SARS) epidemic in spring 2003, stories of infection and warnings (such as the e-mail above) to avoid Asian areas circulated throughout the United States. News media speculated on the possibility of a domestic epidemic, despite the fact that only eight people nationally had laboratory evidence of SARS—and most of these had contracted the virus abroad (Schrag et al., 2004). Fourteen percent of Americans reported avoiding Asian businesses (Blendon et al., 2003), and New York City's Chinatown experienced heightened anxiety and fear of stigmatization (Chen & Tsang, 2003). The above rumor and its news coverage caused a tremendous drop in business and tourism in Chinatown. Even without a single case of SARS, the community was identified quickly as a site of contagion and risk. The American public, including Chinatown, had become infected with an epidemic of fear, not of disease. This research draws on anthropology, sociology, history, and media studies to examine the production of the dominant American risk discourses during the 2003 SARS epidemic, focusing specifically on those who blamed the disease on Chinese culture. I then use ethnographic research to investigate how these discourses played out in New York City's Chinatown. I use the term discourse in the Foucauldian sense to refer to the contested field of possible ideas, images, and metaphors that structure the ways in which people understand diseases. Many informants rejected community association with infection while simultaneously deploying dominant discourses to blame recent Chinese immigrants as potential infectors. This discursive strategy distances the self from biological and social risk, echoes discourses produced globally and disseminated by the media, and reflects local concerns related to the community's changing demography. The collected narratives illustrate that many historical, political and economic factors shape responses to an epidemic, even in places without infection.

2NC – AT: Impact Real

Be skeptical of their impacts – the medical industrial must maintain the threat of outbreak to exempt themselves from responsibility and justify ever-increasing consumption
Illich 76

Ivan, Ph.D from the University of Salzburg, *Medical Nemesis,* 1976 SJE

Advanced industrial societies have a **high stake** in maintaining the epistemological legitimacy of disease entities. As long as disease is something that takes possession of people, something they "catch" or "get," the victims of these natural processes can be exempted from responsibility for their condition. They can be pitied rather than blamed for sloppy, vile, or incompetent performance in suffering their subjective reality; **they can be turned into manageable and profitable assets** if they humbly accept their disease as the expression of "how things are"; **and** they can be **discharged from any political responsibility** for having collaborated in increasing the sickening stress of high-intensity industry. An advanced industrial society is sick-making because it disables people from coping with their environment and, when they break down, substitutes a "clinical," or therapeutic, prosthesis for the broken relationships. People would rebel against such an environment if medicine did not explain their biological disorientation as a defect in their health, rather than as a defect in the way of life which is imposed on them or which they impose on themselves.33 The assurance of personal political innocence that a diagnosis offers the patient serves as a **hygienic mask that justifies further subjection to production and consumption.**

2NC – AT: Bioterror Threat Real

Empirically bioterrorism and its potential for epidemics and disease pandemics have served as the justification to demarcate entire populations, pushing them to the margins, resulting in unending, perpetual stigma and violence- the impact has global racial impacts- SARs proves
Eichelberger 07

(Laura, University of Arizona, Department of Anthropology, Social Science and Medicine, "SARS and New York's Chinatown: The politics of risk and blame during an epidemic of fear," 2007, Science Direct) //jdi-mm

Most studies of SARS coverage document that mainstream Western media sensationalized "the world war against SARS" (US News & World Report, May 5, 2003) and painted a grim picture of a deadly disease that threatened national borders (cf. Bergeron & Sanchez, 2005; Person, Sy, Holton, Govert, & Liang, 2004; Schram, 2003; Washer, 2004; Wilson, Thomson, & Mansoor, 2004). Several noted that this sensationalization resulted in the stigmatization of Asians around the world (Person et al., 2004; Schram, 2003), and poor care for those suspected of carrying SARS (Karlberg & Lai, 2003). Wallis and Nerlich (2005) provide a detailed review of the metaphors used throughout the epidemic in British media. They conclude that the usual stigmatizing metaphors and militaristic language were largely absent, perhaps marking a shift in how the media covers disease. In contrast, Washer's study (2004), which samples only articles from March 2003, identifies many instances of othering directed toward Chinese people. My review of American media coverage throughout 2003 more closely mirrors Washer's data. As I will illustrate in the subsequent section, understanding the media's role in risk perception requires identifying the media discourses contained in individuals' explanations of risk and precautionary measures, and connecting these to the local historical and political-economic context. Though the media identified many factors that contributed to the epidemic, I argue that othering discourses that fit personal experience and local concerns have more influence on social responses during a frightening epidemic. In American mainstream media, discourses of risk and blame reflected heightened fears of foreign threats to national health and security. Indeed, since the 9/11 attacks, metaphors of the diseased immigrant "Other" have increased (Fairchild, 2004). **When the epidemic was identified in mid-March 2003, Americans were in the midst of debates over Iraq's weapons of mass destruction. News media abounded with stories of "Dr. Germ's" bio-weapons and smallpox vaccines for military and medical personnel. The public was primed for a frightening epidemic of foreign origin.** China was defined as a diseased threat to the modern healthy world. Descriptions of SARS's origin echoed those of the early 1900s that blamed the plague on the Chinese rice-centered diet (Edelson, 2003) and agricultural practices such as "the promiscuous manner in which the cattle, fowls, and domestic animals are permitted to live in close association with human beings" (Simpson, 1905, p. 177). Almost identical descriptions identified Chinese farms as culpable for SARS: Pigs, ducks, chickens and people live cheek-by-jowl on the district's primitive farms, exchanging flu and cold germs so rapidly that a single pig can easily incubate human and avian viruses simultaneously. (Newsweek 5/5/2003) The solution to infection thus becomes cultural change, as evidenced by this quote from Newsweek in December of 2003, when the world was waiting to see if the epidemic would re-emerge: One thing China hasn't learned from its SARS experience is that its eating habits—particularly the taste for freshly killed meat—might have to change. Scientists found that civets, a cat-size creature and a local delicacy, can harbor the SARS virus…This winter the battle will be shaping up between China's tradition and the world's safety. (Newsweek, 12/8/2003, pg. 79) Scientists are still debating the origin of SARS—some believe that it may have originated from horseshoe bats (Li et al., 2005). Although how the virus jumps species is unclear, the press still explained this new finding through the lens of culture: In Asia, many people eat bats or use bat feces in traditional medicine for asthma, kidney ailments and general malaise. (New York Times, 9/30/05, emphasis added.) Some cultural factors do facilitate the spread of disease. However, the focus on "tradition" obfuscates the many political and economic factors that create at-risk populations, as well as the "modern" Western practices that contribute to emerging infectious diseases and antibiotic resistance (Weiss & McMichael, 2004). At the same time, they provide a sense of security and control by identifying a responsible "primitive" Other (Joffe, 1999) **while asserting Western superiority**.

Be skeptical of their impacts – the medical industrial must maintain the threat of outbreak to exempt themselves from responsibility and justify ever-increasing consumption
Illich 76

Ivan, Ph.D from the University of Salzburg, *Medical Nemesis,* 1976 SJE

Advanced industrial societies have a **high stake** in maintaining the epistemological legitimacy of disease entities. As long as disease is something that takes possession of people, something they "catch" or "get," the victims of these natural processes can be exempted from responsibility for their condition. They can be pitied rather than blamed for sloppy, vile, or incompetent performance in suffering their subjective reality; **they can be turned into manageable and profitable assets** if they humbly accept their disease as the expression of "how things are"; **and** they can be **discharged from any political responsibility** for having collaborated in increasing the sickening stress of high-intensity industry. An advanced industrial society is sick-making because it disables people from coping with their environment and, when they break down, substitutes a "clinical," or therapeutic, prosthesis for the broken relationships. People would rebel against such an environment if medicine did not explain their biological disorientation as a defect in their health, rather than as a defect in the way of life which is imposed on them or which they impose on themselves.33 The assurance of personal political innocence that a diagnosis offers the patient serves as a **hygienic mask that justifies further subjection to production and consumption.**

2NC – AT: No Impact

The impact is empirically proven- plague reps have been used throughout history as a justification to marginalize and otherize
Washer 05

(Peter, Social Science and Medicine, Academic Centre for Medical Education, University College London, "Representations of mad cow disease," 2005, Science Direct) /jdi-mm

The motivation for the choice of existing concepts is primarily to do with identity protection, which refers simultaneously to the protection of the in-group and self-identity (and to building its cohesion by negatively identifying the 'other' from it). Notions of risk and blame are therefore used to construct boundaries between self and 'other', with misfortunes understood to be the price paid by people who are bad, dirty, bizarre, promiscuous; people who are 'not like us'. Joffe's work draws on that of the cultural anthropologist Mary Douglas. For Douglas (1992), the same blaming mechanisms are evident when we 'moderns' are faced with a new threat as there are in so-called 'primitive' societies. When a new disease appears, boundaries are constructed between 'self' and 'other' which function to apportion blame. Therefore the people in the category of 'other' are seen as responsible for the genesis of the disease; and/or for bringing it on themselves; and/or it's spread, because they are portrayed, for example, as dirty; because they eat disgusting food; have bizarre rituals and customs; or because they are sexually perverted or promiscuous (Douglas, 1992). In this risk/blame model, 'foreigners', or already marginalised out-groups from within a society, are blamed for new epidemics of diseases. The model works well to explain many different epidemics, both modern and historical. There is a large body of literature on how different groups are blamed for so-called 'emerging infectious diseases'. See, for example, Watney (1987), Sabatier (1988), Joffe and Haarhoff (2002), Ungar (1998) and Washer (2004). In this sense this risk/blame model connects with reactions to plagues stretching back through history.

2NC – AT: We =/= Misrepresent

Even if you don't misrepresent people, the media does
Green et. al 11

(Eva, Pascal Wagner-Egger, Adrian Bangerter, Ingrid Gilles, David Rigaud, Franciska Krings, Christian Staerklé and Alain, Public Understanding of Science, "Lay perceptions of collectives at the outbreak of the H1N1 epidemic: heroes, villains and victims," 2011, Sage Publications) //jdi-mm

Clémence, Lay perceptions of risks are dramatized on the stage of various mass media (Bauer et al., 2001), making them more concrete and thus more real. As a special class of risk, emerging infectious diseases (EIDs) are also subject to media dramatization, as has been documented in several studies (Ungar, 1998, 2008; Wallis and Nerlich, 2005). Who are the dramatis personae on the stage of the disease threat drama? In this article, we argue that the main actors are collectives, in other words large social systems that are constituted by demographic and cultural factors, or institutionalization based on shared values and norms (Brewer and Chen, 2007; Etzioni, 1968). These characteristics empower collectives to act as coherent units. Collectives may include nations, organizations, or even informal groups and other social categories. An analysis of the social history of disease outbreaks supports the idea of collectives as actors. For example, in many cases, nations, not individuals, are depicted as being threatened by disease. Thus, disease spreads from one nation to another, much as the Black Death plague advanced through Europe from Asia in the Middle Ages and avian influenza advanced through Europe some years ago. Nations can seal their borders to outsiders or block imports of contaminated foreign foodstuffs, as many did with British beef in the wake of the BSE scare. Many other collectives are actors. There are political authorities, who act to contain the disease, initiate public health measures or disseminate disease-relevant information. There are private corporations like pharmaceutical companies who manufacture vaccines and drugs for a profit. And there are groups defined by ethnicity, sexual orientation and other dimensions, who are often perceived as vulnerable to disease threat or as carriers of disease. For example, in the history of AIDS, gays, intravenous drug users, prostitutes and scientists have variously shared the dubious honour of being originators or propagators of the disease in the public eye (Joffe, 1999; Kalichman, 2009). Finally, all of these collectives are orchestrated through depictions in the mass media. Although the media have classically been treated as an "invisible environment" (Glessing and White, 1976), i.e., as part of the scenery, increasing evidence suggests they are perceived by the public as key characters in the drama. Such perceptions are not inconsequential epiphenomena, because the symbolism with which collectives are construed has cognitive, affective and behavioural consequences. Social psychological research shows that trust in institutions constitutes an important psychological buffer against anxiety caused by fear of death (Solomon, Greenberg and Pyszczynski, 1991) or loss of control (Kay et al., 2009), both feelings often associated with a sudden disease outbreak. Traumatic collective events can lead individuals to increase trust in institutions (Chanley, 2002), while individuals' distrust of institutions like health authorities is associated with various forms of risky health behaviour (e.g., Bird and Bogart, 2005). Despite the importance of collectives as actors in the drama of EIDs, little systematic attention has been devoted to their study. In this article, we investigate collectives mentioned by Swiss laypersons at the outbreak of the H1N1 ("swine flu") pandemic in May 2009 and the themes associated with them. Before describing our study, we review research on lay perceptions of disease threat and on individuals' symbolic relationship to collectives in times of crisis.

2NC – AT: Simulation Good

Simulation and prediction of a viral apocalypse relies heavily on low-probability modeling that is epistemically suspect. Their policy simulation renders the entire global population to bare life

Lisa **Keränen** (Associate Professor in the Department of Communication at the University of Colorado, Denver) **2011** ["Concocting Viral Apocalypse: Catastrophic Risk and the Production of Bio(in)security" Western Journal of Communication Vol. 75, No. 5, October–December 2011, pp. 451–472, loghry]

''Readers should imagine the possibilities [of attack] for themselves, because the most serious constraint on current policy is lack of imagination,'' declared the Catastrophic Terrorism report in 1998 (Carter et al., 1998a, p. 5). This statement indexes the growing role of anticipatory imagining (Vogel, 2008) in biopreparedness efforts. As I have written elsewhere (Kera¨nen, 2008, 2011b), <u>simulation and spectacle</u> (Baudrillard, 1983, 1994=2004) <u>comprise</u> **key mechanisms** <u>that make concrete the otherwise invisible threat of biological weapons</u> across a wide swath of political, technical, and cultural texts. <u>Since the major bioterrorism event of the last century killed but five people and since few among us will ever see a manufactured biological weapon, the potential for wide-scale epidemic</u> **must be rendered in terms accessible to decision-makers** <u>through a commonly imagined</u> **vision of the future** that I call viral apocalypse (Kera¨nen, 2008, 2011b). <u>Rhetorically, viral apocalypse makes the invisible visible and</u> **the unlikely likely**. It traffics in widespread contagion anxieties, putting a postmodern spin on longstanding human concerns about epidemic. As a recurrent form, <u>viral apocalypse</u> comprises two features. First, it <u>appeals to deep-seated cultural memories about ''the plague''</u> (Alcabes, 2009) <u>by employing a grotesque rhetoric of viral abjection</u> (see Van Loon, 2002, p. 147, on the virulent abject). Second, <u>it emphasizes</u> **widespread casualties**, international market collapse, and the near-demise of the civilized world.3 As a postmodern apocalyptic rhetoric (see Brummett, 1991, and O'Leary, 1994, for canonical rhetorical treatments of apocalyptic rhetoric), one that is at once secular (Schoch-Spana, 2004) and sublime (Gunn & Beard, 2000), <u>this cultural form</u> **invigorates anxieties** <u>about globalization and its increasing contact with the Other into a vivid but distressing postpandemic future</u> (Lopez-Lavigne et al. & Fresnadillo, 2007; MacDonald & Boyle, 2002). <u>It</u> thus <u>signifies concerns that a combination of explosive population growth, ecological pressure, and biological-research-gone-awry will</u> **extinguish life as we know it**. The viral apocalyptic form further heralds the failure of the Cold War logic of containment (Wald, 2008), as germs quickly overwhelm response capabilities and infect the global citizenry. <u>Within this vision, noninfected human survivors struggle against the now unhuman-like infected;</u> <u>depictions of widespread violence and global breakdown conclude in desolated daytime streets and despairing citizens</u>. Films such as the 2003 biothriller 28 Days Later (MacDonald & Boyle, 2002) and its equally haunting sequel 28 Weeks Later (Lopez-Lavigne et al. & Fresnadillo, 2007), animate this vision as the Rage virus transforms humans into rabid, flesh-hungry mutants. In both films, governments collapsed, civilization ceased, the streets of the world's major cities stood eerily still; **humans were reduced to bare life**. The scene recurs in I Am Legend (Goldsman et al. & Lawrence, 2007), a remake of the Cold War–era Omega Man, where a beleaguered Will Smith valiantly struggles to find a cure for a deadly virus that sends flesh-hungry hoards nightly to his doorstep. It further grounds the popular zombie horror television series, The Walking Dead. In most of these depictions—and scores more like them—<u>economic and cultural life terminates, cuing audiences to the interlinking of pathogenic risk and international stability. Visions of viral apocalypse also figure widely in popular accounts of biopreparedness simulations</u> and the scripts

for the simulations themselves. In her widely cited Foreign Affairs essay, ''The Nightmare of Bioterrorism,'' Garrett (2001) drew from a Johns Hopkins Center for Civilian Defense bioterrorism role-playing scenario, in which more than 15,000 people die of smallpox worldwide within two months, and epidemics rage out of control in 14 nations... the global economy teeters on the brink of collapse as nations close their borders and sink into isolation ... utter chaos Western Journal of Communication 461 reigns, and the National Guard enforces martial law over the city's two million residents. Similarly, government authority either breaks down or reverts to military-style control in cities all over the world as smallpox claims lives and pits terrified citizens against one another. (p. 81) Similarly, in 2004, in what was then the largest-ever international ministerial smallpox simulation exercise (Smith et al., 2005), the Atlantic Storm tabletop exercise employed epidemiological modeling to project 666,000 infections, global economic demise, and strife between countries that had and did not have smallpox vaccines (Drogin, 2005). According to an article in the International Herald Tribune, the exercise ''destructive and disruptive as it was—could have been much worse'' (Hamilton & O'Toole, 2005). That the outcomes of their fictional scenario could have been much worse is somewhat beside the point, for most situations could usually be worse; such rhetoric reflects the penchant for catastrophizing that characterizes so many of these exercises. However, this amplified rhetoric resonates with that of many other biopreparedness exercises, such as TOPOFFs 2, 3, and 4, the exercises initially mandated by the Clinton Administration (see Erickson & Barratt, 2004). Each TOPOFF exercise entailed at least 2 years of planning and more than 10,000 volunteers representing hundreds of international, national, state, tribal, and local agencies at a cost of up to $15 million apiece, and each predicting, according to unclassified estimates, similar portraits of widespread **death and unrest** (Erickson & Barratt, 2004; Kera¨nen, 2008, 2011b; Schoch-Spana, 2004). Thus, highly unlikely, ''low-probability'' simulated scenarios are granted **epistemic privilege** via vivid viral apocalyptic imaginations.

2NC – AT: Discourse =/= First

Discourse first – speech acts that legitimize security create the only scenario for extinction

John **Collins**, Ass. Prof. of Global Studies at St. Lawrence, **and** Ross **Glover**, Visiting Professor of Sociology at St. Lawrence University, 20**02**, Collateral Language, p. 6-7

The Real Effects of Language

As any university student knows, theories about the "social construction" and social effects of language have become a common feature of academic scholarship. Conservative critics often argue that those who use these theories of language (e.g., deconstruction) are "just" talking about language, as opposed to talking about the "real world." The essays in this book, by contrast, begin from the premise that language matters in the most concrete, immediate way possible: its use, by political and military leaders, leads directly to violence in the form of war, mass murder (including genocide), the physical destruction of human communities, and the devastation of the natural environment. Indeed, if the world ever witnesses a nuclear holocaust, it will probably be because leaders in more than one country have succeeded in convincing their people, through the use of political language, that the use of nuclear weapons and, if necessary, the destruction of the earth itself, is justifiable. From our perspective, then, every act of political violence—from the horrors perpetrated against Native Americans to the murder of political dissidents in the Soviet Union to the destruction of the World Trade Center, and now the bombing of Afghanistan—is intimately linked with the use of language. Partly what we are talking about here, of course, are the processes of "manufacturing consent" and shaping people's perception of the world around them; people are more likely to support acts of violence committed in their name if the recipients of the violence have been defined as "terrorists," or if the violence is presented as a defense of "freedom." Media analysts such as Noam Chomsky have written eloquently about the corrosive effects that this kind of process has on the political culture of supposedly democratic societies. At the risk of stating the obvious, however, the most fundamental effects of violence are those that are visited upon the objects of violence; the language that shapes public opinion is the same language that burns villages, besieges entire populations, kills and maims human bodies, and leaves the ground scarred with bomb craters and littered with land mines. As George Orwell so famously illustrated in his work, acts of violence can easily be made more palatable through the use of euphemisms such as "pacification" or, to use an example discussed in this book, "targets." It is important to point out, however, that the need for such language derives from the simple fact that the violence itself is abhorrent. Were it not for the abstract language of "vital interests" and "surgical strikes" and the flattering language of "civilization" and 'just" wars, we would be less likely to avert our mental gaze from the physical effects of violence.

2NC – AT: Framework – Serial Policy Failure

Their framework results in serial policy failure

Biswas 7 (Shampa, Professor of Politics – Whitman College, "Empire and Global Public Intellectuals: Reading Edward Said as an International Relations Theorist", Millennium, 36(1), p. 117-125)

The ==**most serious threat to**== the ==**'intellectual vocation'**==, he argues, ==**is**== 'professionalism' and mounts a pointed attack on the proliferation of 'specializations' and **the '**==**cult of expertise' with**== **their** ==**focus on**== 'relatively narrow areas of knowledge', 'technical formalism', '==**impersonal**== theories and ==**methodologies', and**== most worrisome of all, their ability and **willingness to be seduced by power**.17 Said mentions in this context the funding of academic programmes and research which came out of the exigencies of the Cold War18, an area in which there was considerable traffic of political scientists (largely trained as IR and comparative politics scholars) with institutions of policy-making. Looking at various influential US academics as 'organic intellectuals' involved in a dialectical relationship with foreign policy-makers and examining the institutional relationships at and among numerous think tanks and universities that create convergent perspectives and interests, Christopher Clement has studied US intervention in the Third World both during and after the Cold War made possible and justified through various forms of 'intellectual articulation'.19 **This is** not simply a matter of scholars working for the state, but indeed a larger **question of intellectual orientation**. It is not uncommon for IR ==**scholars**== to ==**feel the need to formulate**== their scholarly ==**conclusions**== in terms of its relevance for global politics, where 'relevance' is measured ==**entirely in terms of**== ==**policy wisdom**==. Edward Said's searing indictment of US intellectuals – policy-experts and Middle East experts - in the context of the first Gulf War20 is certainly even more resonant in the contemporary context preceding and following the 2003 invasion of Iraq. The space for a critical appraisal of the motivations and conduct of this war has been considerably diminished by the expertise-framed national debate wherein certain kinds **of** ==**ethical questions irreducible to formulaic**== **'for or against' and '**==**costs and benefits' analysis can**== simply ==**not be raised**==. In effect, what Said argues for, and IR scholars need to pay particular heed to, is an understanding of '==**intellectual relevance'**== that is larger and more worthwhile, that ==**is about**== **the** ==**posing**== of ==**critical, historical, ethical**== and perhaps unanswerable ==**questions rather than**== the ==**offering**== of recipes and ==**solutions,**== that **is about politics (rather than techno-expertise**) in the most fundamental and important senses of the vocation.21

2NC – AT: Language Doesn't Matter

Language creates, reaffirms and empowers hegemonic institutions while excluding other forms of knowledge.
Nimmer 11

[Livio Nimmer, Master's student in the University of Tartu,ENDC Proceedings, "DE-CONTEXTUALIZATION IN THE ¶ TERRORISM DISCOURSE:¶ A SOCIAL CONSTRUCTIONIST VIEW", ¶ Volume 14, 2011, pp. 223–240.¶ http://www.ksk.edu.ee/wp-content/uploads/2012/12/KVUOA_Toimetised_14_10_livio_nimmer.pdf, \\wyo-bb]

Norms and institutions are not things existing objectively out there, but ¶ are created in and by particular communities that exist in particular contexts. ¶ And these institutions again shape those communities. There are no objective ¶ measures of good or bad, right or wrong. Rather what is considered to be good ¶ or bad, right or wrong depends on what viewpoint one takes. Our perception of reality depends on the community one identifies oneself with. Norms ¶ and institutions change with time, taking multiple forms in different contexts. ¶ What might seem right in one community might be wrong in another; what is ¶ considered normal for one community might be abnormal to another. In sum, ¶ different communities have different sets of norms, goals and aspirations.¶ Language has an important role in creating worlds that communities identify themselves with. Language functions as an instrument for creating, normalizing and reinforcing particular worldviews, affixing certain knowledge ¶ and institutions in society; at the same time alternative worldviews and ¶ knowledge are excluded and de-legitimatized. Through language identities ¶ are created and maintained, and as such, language is never neutral. Groups ¶ struggling for power and trying to reaffirm their identities use language to ¶ create and maintain a hegemonic regime of truth.18

Discourse shapes reality- Engenders solutions, problems and invoke social history
Jackson 05

[Richard Jackson, Lecturer in International Security at The University of Manchester, "Language power and politics: critical discourse analysis and the War on Terrorism", 49th Parallel, 2005, http://www.49thparallel.bham.ac.uk/back/issue15/jackson1.htm#_edn1,\\wyo-bb]

Second, language plays an active role in creating and changing perceptions, cognition and emotions. As something particularly human, language moulds how we see the world; it is the main determinant of our perceptions and our access to concrete reality. From knowing the difference between an apple and a hand grenade, to knowing what to do with each in relevant situations, language shapes our understanding of the world around us.[9] More than affecting perceptions, language also structures cognition—it affects the way we think, and particularly how we make strategic choices. By using a restricted set of words and word formations, some choices can appear perfectly reasonable and commonsensical while others appear absurd. Expressed another way, the language we use at any given moment privileges one viewpoint over others, naturalising some understandings as rational and others as nonsensical.[10] As a consequence, language also affects our emotions. It is in an important sense, the place where our psychic and social lives intersect. Certain words or combinations of words can make us feel anxious, fearful, angry or joyful. This generates immense power for those that deploy them. Politicians, propagandists and advertisers have known this for a long time, and in fact, we see it almost every day in people's reactions to the use of certain words in the media, such as

'paedophile', 'AIDS', 'humanitarian disaster', 'murder', 'weapons of mass destruction' and 'terrorist'.¶ ¶ A third reason why words cannot be considered neutral is because words have histories. In themselves, words have no inherent meaning; rather, they have to acquire meaning in their own discursive setting.[11] The process by which words obtain meaning is often lengthy and takes place through repetition and their careful and selective use in specific contexts. For example, the use of the terms 'civilised' and 'barbarous' cannot avoid invoking the history of these words as they were applied by Christian Europe in the Middle Ages, and by imperialists and colonists in the nineteenth century. There is a history to their meaning that affects their usage in a contemporary context. In other cases, words can take on new meanings through specific forms of usage.[12] Because words have histories, the act of naming things is always a highly charged process that can have serious political and social consequences. This effect of naming is especially powerful in terms of political violence because, for example, to 'call an act of political violence terrorist is not merely to describe it but to judge it.'[13] Consider the difference between calling the killing of an abortion doctor 'a murder' and calling it 'an act of terrorism'; the two names for the same act have very contrasting meanings and would likely elicit very different responses from both the public and the authorities.¶ ¶ The methodological approach I have employed to examine the official language of the 'war on terrorism' is known broadly as critical discourse analysis. This approach is at once both a technique for analysing specific texts or speech acts, and a way of understanding the relationship between discourse and social and political phenomena. By engaging in concrete, linguistic textual analysis—that is, by doing systematic analyses of spoken and written language—critical discourse analysis aims to shed light on the links between texts and societal practices and structures, or, the linguistic-discursive dimension of social action.[14]¶ ¶ The approach is based on a number of crucial assumptions. It assumes that discourse is a form of social practice which both makes or constitutes the social world, and is at the same time constituted by other social practices. Discourses both contribute to the shaping of social structures and are also shaped by them; there is a dialectical relationship between the two. Of even greater import, critical discourse analysis assumes that discursive practices are never neutral, but rather they contribute to the creation and reproduction of unequal power relations between social groups. That is, discourses possess a clear ideological character; they are the construction and deployment of 'meaning in the service of power.'[15] Or, more specifically, discourses act as constructions of meaning that contribute to the production, reproduction and transformation of relations of domination in society.[16] Thus, a central aim of critical discourse analysis lies in revealing the means by which language is deployed to maintain power. What makes critical discourse analysis 'critical' is its normative commitment to positive social change.

Language is key when discussing disease/pandemics
Beemer 11

(Jeffrey, University of Massachusetts, Dissertation, "Social Meanings of Mortality: The Language of

Death and Disease in 19th Century Massachusetts," 2011,
http://scholarworks.umass.edu/cgi/viewcontent.cgi?article=1425&context=open_access_dissertations)
//jdi-mm

Language exhibits its social significance by drawing distinctions that divide the world into manageable pieces. It reduces complexity by distinguishing one thing from another, it provides a shared framework for meaningful discourse, and it regulates our interactions in predictable and acceptable ways. We use language to identify objects and events against a backdrop of other objects and events, to coherently express ourselves under presumptions of mutual understanding, and to coordinate everyday interactions through shared expectations. Language also functions as a means for expressing difference, disagreement, and for generating conflict. But even within such divergent or oppositional modes, language never abandons its integrative role because it can never do so. Using language to mark difference or shatter boundaries can only be accomplished by conversely denoting sameness and establishing limits – to exclude on the one hand is to include on the other. Language use, whether integrative or oppositional in practice, inherently imposes order on our experiences. It is

the means by which we classify ordinary interactions, objects and events as self-evident, invisible configurations. Pierre Bourdieu (1984, 470) speaks of our "sense of limits" and "principles of division" as internalized cognitions that are forgotten but nevertheless reproduced in our everyday experiences. In whatever fashion we use language, we use it from within communities of language practitioners where meaning and identities emerge as a result of such communicative, self-evident practices. Medicine like any other profession defines itself through its communicative practices. The professionals who carry out those practices use language to distinguish their activities from other professionals and nonprofessionals alike. Professional identities depend on carving out proprietary boundaries that mark distinctions which extend beyond the practitioners themselves, e.g., teacher/student, priest/parishioner, doctor/patient, and so on. Consequently, all professions are understandably jealous of their distinctions. As Paul Starr notes, "Doctors and other professionals have a distinctive basis of legitimacy that lends strength to their authority. They claim authority, not as individuals, but as members of a community that has objectively validated their competence" (Starr 1985, 12). Competency is a feature of collective recognition and validity. I will return to this idea in more detail in a later chapter, but for now I want to highlight Starr's point that professional authority rests not on an individual's demonstrated competency per se but on the professional community's validation of competency as a collective practice. Language functions in the same manner. Its authority as a medium for communication rests not on an individual's demonstrated competency to successfully use it but on a community's validation of competency as a collective practice. Language does its work by tying individual experiences, events, and thoughts together into a broader set of collective practices.

Representations are key to political coherence- makes sense of political reality

Jourde 6 – Cedric Jourde   * Ph.D., Political Science, University of Wisconsin-Madison, Madison, 2002 * M.A., Political Science, University of Wisconsin-Madison, Madison, 1996   * B.Sc., Political Science, Université de Montréal, Montréal, 1995 Hegemony or Empire?: The redefinition of US Power under George W Bush Ed. David and Grondin p. 182-3 2006

Relations between states are, at least in part, constructed upon representations. Representations are interpretative prisms through which decision-makers make sense of a political reality, through which they define and assign a subjective value to the other states and non-state actors of the international system, and through which they determine what are significant international political issues.2 For instance, officials of a given state will represent other states as 'allies', 'rivals', or simply 'insignificant', thus assigning a subjective value to these states. Such subjective categorizations often derive from representations of these states' domestic politics, which can for instance be perceived as 'unstable*, 'prosperous', or 'ethnically divided'. It must be clear that representations are not objective or truthful depictions of reality; rather they are subjective and political ways of seeing the world, making certain things 'seen' by and significant for an actor while making other things 'unseen' and 'insignificant'.3 In other words, they are founded on each actor's and group of actors' cognitive, cultural-social, and emotional standpoints. Being fundamentally political, representations are the object of tense struggles and tensions, as some actors or groups of actors can impose on others their own representations of the world, of what they consider to be appropriate political orders, or appropriate economic relations, while others may in turn accept, subvert or contest these representations. Representations of a foreign political reality influence how decision-making actors will act upon that reality. In other words, as subjective and politically infused interpretations of reality, representations constrain and enable the policies that decision-makers will adopt vis-a-vis other states; they limit the courses of action that are politically thinkable and imaginable, making certain policies conceivable while relegating other policies to the realm of the unthinkable.4 Accordingly, identifying how a state represents another state or non-state actor helps to understand how and why certain foreign policies have been adopted while other policies have been excluded. To take a now famous example, if a transnational organization is represented as a group of 'freedom fighters', such as the multi-national mujahideen in Afghanistan in the 1980s, then military cooperation is conceivable with that organization; if on the other hand the same organization is represented as a 'terrorist network', such as Al-Qaida, then military cooperation as a policy is simply not an option. In sum. the way in which one sees, interprets and imagines the 'other* delineates the course of action one will adopt in order to deal with this 'other'.

Our discourse is key: it shapes reality and we can't separate it from how we act. Bosworth 10

(Kai A., Macalester College, "Straws in the Wind: Race, Nature and Technoscience in Postcolonial South Dakotan Wind Power Development," 2010, http://digitalcommons.macalester.edu/cgi/viewcontent.cgi?article=1007&context=envi_honors&sei-redir=1&referer=http%3A%2F%2Fscholar.google.com%2Fscholar%3Fstart%3D40%26q%3D%2522grid%2522%2B%2522electricity%2522%2Band%2B%2B%2522PTC%2522%2B%2522bad%2522%2B%2522politics%2522%26hl%3Den%26as_sdt%3D0%2C51#search=%22grid%20electricity%20PTC%20bad%20politics%22)

Academic writing is a critical node in knowledge production, and thus I am cognizant of the worlds, narratives, and objects further enacted in the performance of this paper. As John Law notes, "methods, their rules, and even more methods' practices, not only describe but also help to produce the reality that they understand" (2004, 5). There is no singular world to be solely "discovered" or "understood." There are only multiple worlds enacted and performed. I have a responsibility to the communities which I describe and discuss. For Donna Haraway, response-ability is "a relationship crafted in intra-action through which entities, subjects and objects, come into being...Responders are themselves co-constituted in the responding" (2008, 71; see also Barad 2007). In responding to the various humans and non-humans in my story, I am constituted as subject and author. Therefore, I additionally deploy a method for response-able enactment, in order that this paper can help create space for new and diverse possibilities.

Representations are key to policy making
Doty '96

(Roxanne Lynn. Imperial Encounters: The Politics of Representations in North-South Relations. 1996. Pg 170-171)

The political stakes raised by this analysis revolve around the question of being able to "get beyond" the representations or speak outside of the discourses that historically have constructed the North and the South. I do not believe that there are any pure alternatives by which we can escape the infinity of traces to which Gramsci refers. Nor do I wish to suggest that we are always hopelessly imprisoned in a dominant and all-pervasive discourse. **Before this question can be answered – indeed, before we can even proceed to attempt an answer – attention must be given to the politics of representation. The price that international relations scholarship pays for its inattention to the issue of representation is perpetuation of the dominant modes of making meaning and deferral of its responsibility and complicity in dominant representations.**

2NC – AT: Realism

Realism has gaps that destroys its explanatory ability --- recognizing social influences <u>enriches</u> and <u>sustains</u> the theory
Niarguinen 1

(Dmitri, Professor of International Relations and European Studies – Central European University, Rubikon, December, http://venus.ci.uw.edu.pl/~rubikon/forum/dmitri.htm)

Morgenthau's state-centric theory is clearly set, but it is not to say he envisages it as being pre-destined and unchangeable. The political, cultural and strategic environment will largely determine the forms of power a state chooses to exercise, just as the types of power which feature in human relationships change over time. In addition, Realists should not be wedded to a perennial connection between interest and the nation-state which is 'a product of history, and therefore bound to disappear'[19]. Later (in 1970) Morgenthau anticipated that the forces of globalization would render the nation-state no longer valid: "the sovereign nation-state is in the process of becoming obsolete"[20]. He stresses that a final task that a theory of international relations can and must perform is to prepare the ground for a new international order radically different from that which preceded it[21]. Kenneth Waltz's neo-realism is both a critique of traditional realism and a substantial intellectual extension of a theoretical tradition which was in danger of being outflanked by rapid changes in the contours of global politics[22]. The international system (anarchy) is treated as a separate domain which conditions the behavior of all states within it. <mark>Paradoxically, with</mark> the advent of <mark>neo-realism, the **scope** and **flexibility** of Realism have **significantly** diminished. The theory has become deterministic, linear, and culturally poor.</mark> For neo-realists, culture and identity are (at best) derivative of the distribution of capabilities and have no independent explanatory power. Actors deploy culture and identity strategically, to further their own self-interests[23]. Nevertheless, it is wrong to assert that neo-realist perspectives do not acknowledge the importance of social facts. Gilpin has developed a compelling argument about war and change[24]. While his book is built on (micro)economic premises, he does not neglect sociological insights as necessary for understanding the context of rational behavior. "Specific interests or objectives that individuals pursue and the appropriateness of the means they employ are dependent on prevailing social norms and material environment…In short, the economic and <mark>sociological approaches must be integrated to explain</mark> political <mark>change</mark>"[25]. Waltz was implicitly talking about identity when he argued that anarchic structures tend to produce "like units"[26]. He allows for what he calls 'socialization' and 'imitation' processes. Stephen Krasner suggested that regimes could change state interests[27]. Regimes are an area where knowledge should be taken seriously. If regimes matter, then <mark>cognitive understanding can matter as well</mark>[28]. Realism is not necessarily about conflict; material forces may as well lead to cooperation. However, the minimalist treatment of culture and social phenomena increasingly proved neo-realism as losing ground empirically and theoretically. It was the suspicion that the international system is transforming itself culturally faster than would have been predictable from changes in military and economic capabilities that triggered the interest in problems of identity[29]. <mark>Reconstruction of the theory was vital</mark> in order <mark>to save Realism from becoming obsolete.</mark> The realization of this fact has triggered a shift in Realist thinking and gave way to the emergence of a 'constructivist' re-incarnation of Realism. Friedrich Kratochwil has once observed that no theory of culture can substitute for a theory of politics[30]. At least, nobody has ventured to accomplish such an enterprise so far. To disregard culture in politics, it seems obvious today, is inappropriate, not to say foolish. There remain opportunity costs incurred by Realism in its asymmetric engagement with cultural phenomena. Thus, Realism, notwithstanding its concern with parsimony, should make a serious commitment to building analytical bridges which link identity- and culture-related phenomena to its explanatory apparatus (like anarchy, sovereignty, the security dilemma, self-help, and balancing)[31]. Alexander Wendt in his seminal article "Anarchy Is What States Make of It" has masterfully shown how power politics is socially constructed[32]. Salus populi supreme lex. This classical metalegal doctrine of necessity is associated with raison d'etat, the right of preservation, and self-help. Wendt is convinced that the self-help corollary to anarchy does enormous work in Realism, generating the inherently competitive dynamics of the security dilemma and collective action problem[33]. What misses the point, however, is that self-help and power politics follow either logically or causally from anarchy. They do not; rather, they are just among other institutions (albeit significant ones) possible under anarchy. Consequently, provided there is relatively stable practice, international institutions can transform state identities and interests. Let me focus on two concrete security issues - the security dilemma and nuclear deterrence - to illustrate the point. A central tenet of Realism, the security dilemma[34], arises for the situation when "one actor's quest for security through power accumulation ... exacerbates the feelings of insecurity of another actor, who in turn will respond by accumulating power"[35]. As a result of this behavior, a vicious circle or spiral of security develops, with fear and misperception exacerbating the situation[36]. Nevertheless, <mark>security dilemmas</mark>, as Wendt stresses, <mark>are not given by anarch</mark>y or nature[37]. <mark>Security dilemmas are constructed because identities</mark> and interests <mark>are **constituted by collective meanings** which are **always in**</mark>

process. This is why concepts of security may differ in the extent to which and the manner in which the self is identified cognitively with the other. Because deterrence is based on ideas about threat systems and conditional commitments to carry out punishment, it has proved particularly congenial to the strategic studies scholarship within the Realist tradition[38]. Deterrence is a conditional commitment to retaliate, or to exact retribution if another party fails to behave in a desired, compliant manner. Thus defined, deterrence has been invoked as the primary explanation for the non-use of nuclear weapons. The nuclear case, in contrast to chemical weapons, for example, is definitely problematic for challenging traditional deterrence theory because it is widely felt that the tremendous destructive power of thermonuclear weapons does render them qualitatively different from other weapons. Yet, the patterns of the non-use of nuclear weapons cannot be fully understood without taking into account the development of norms that shaped these weapons as unacceptable. By applying social constructivist approach, it is possible to emphasize the relationship between norms, identities, and interests and try to provide a causal explanation of how the norms affect outcomes[39]. Norms shape conceptualizations of interests through the social construction of identities. In other words, a constructivist account is necessary to get at 'what deters,' and how and why deterrence 'works' [40]. International relations theory cannot afford to ignore norms. Demonstrating the impact of norms on the interests, beliefs, and behavior of actors in international politics does not and must not invalidate Realism. Rather, it points to **analytical blind spots** and gaps in traditional accounts. In so doing, it not only **casts light into the shadows** of existing theory but raises new questions as well.[41] However, with all the 'constructivist' adjustments made (which are absolutely credible), it is important to keep in mind 'pure rationalist' tools as well. Krasner points out that whenever the cost-benefit ratio indicates that breaking its rules will bring a net benefit that is what states will do[42]. Wendt introduces a correction that instrumentalism may be the attitude when states first settle on norms, and "continue(s) to be for poorly organized states down the road"[43]. States obey the law initially because they are forced to or calculate that it is in their self-interest. Some states never get beyond this point. Some do, and then obey the law because they accept its claims on them as legitimate[44]. This is truly an excellent observation. The problem here, however, could be that even when states remove the option of breaking the law from their agenda, this already implies that benefits overweight costs. And even if this is not the case, how can we know where exactly this point is, beyond which states respect law for law's sake? Furthermore, states that supposedly have stepped over this point might break the law, when it has become least expected, if they consider this of their prime interest. Powerful illustration of this is France, which resumed its nuclear testing to the great surprise of the world[45]. Another interesting example is the case of NATO. Traditional alliance theories based on Realist thinking provide insufficient explanations of the origins, the interaction patterns, and the persistence of NATO. The 'brand new' interpretation is that the Alliance represents an institutionalized pluralistic community of liberal democracies. Democracies not only do not fight each other, they are likely to develop a collective identity facilitating the emergence of cooperative institutions for specific purposes[46]. Thus presented, old questions get revitalized. Why is NATO the strongest among the other post-Cold War security institutions – as compared to, the WEU, not even to mention the EU's Common Foreign and Security Policy? Why is not the OSCE given a chance to turn into a truly pluralistic European 'Security Architecture'? Why was NATO so eager to bomb Kosovo, which was a clear breach of international law? Because it is 'an institutionalized pluralistic community of liberal democracies'? Or yet because it is a predominantly military organization? Why do public opinion polls in Russia[47] repeatedly show that NATO is an aggressive organization (and which can also be observed in official rhetoric, as in the national security conception and the military doctrine[48])? All these questions suggest that to claim that Realist explanation of NATO existence can be thrown into a dustbin at minimum inappropriate. Social sciences do not evolve via scientific revolutions, as Thomas Kuhn argues is the case for the natural sciences. Not paradigm shifts but rather style and fashion changes are what characterize social science[49]. Thus posed, paradigm development promises Realism a bright future. In this respect, recent success of constructivism has, metaphorically speaking, **breathed in a new life** into Realism. Realism is in much debt to constructivism for being revitalized. Yet, paying full credit to the contribution of constructivism, it should be noted that to a large extent constructivists take off from the Realist positions.

Aff Answers

2AC – No Link/Perm Solves

Their link is describing reactionary responses to pandemics and emergencies- Aff creates a new model of decision-making that's net better than the status quo, by create cooperation and prevention strategies- erodes uncertainty and marginalization– means perm is desirable and solves the link
Smith 06

(Richard, Health Economics Group, School of Medicine, Health Policy & Practice, Social Science and Medicine, "Responding to global infectious disease outbreaks: Lessons from SARS on the role of risk perception, communication and management," 2006, Science Direct) //jdi-mm

Serious infectious disease outbreaks need to be identified and dealt with quickly**. Adverse health and economic effects can be reduced by early detection and response**. Clearly, this will require taking action before all the facts are known and investigations are completed, and thus acting on incomplete information**. In this respect, a concrete development could be to invest in epidemiological and economic modelling**. Indeed, there has been a recent call for the development of such an integrated epidemiological and economic modelling approach, stemming directly from the SARS outbreak (Smith, Drager, & Hardimann, 2006). Key in this development will be the integration of the impact of risk perception upon actions by actors (population, government, nations and so forth), and the effect of different strategies on this perception, and hence action. At present little is known about how uncertainty concerning the outbreak in question, or its level of risk, affects behavioural response. For instance, how do people determine their own risk of exposure? How does this perceived risk affect behaviour? Assessment of these factors in modelling the likely impact of an outbreak is therefore crucial. In addition, **there is need for better understanding and managing of risk surrounding infectious disease outbreaks.** For example, **understanding the relationship between infectious disease flows and flows of goods, services and people can help decision makers assess the relative risk of and to specific countries during an outbreak**. This can contribute to more informed decisions that are taken proactively, rather than reactively, prior to and during emergencies. Risk assessment can also be used to improve public communication. Research shows that some hazards or events deemed by experts as presenting a low risk become the focus of social and political concern, or amplification (Department of Health, 2003). In other cases, where experts perceive there to be a high risk, there can sometimes be insufficient social or political concern, or attenuation (Sandman 2004). An understanding of what drives the perception of risk is therefore sorely needed.

No link- Even if the aff isn't perfect, it doesn't result in the same fear-mongering as status quo emergency-responses to disease outbreaks- trust in the healthcare industry fundamentally shifts the nature of disease outbreaks by focusing on prevention strategies first
Smith 06

(Richard, Health Economics Group, School of Medicine, Health Policy & Practice, Social Science and Medicine, "Responding to global infectious disease outbreaks: Lessons from SARS on the role of risk perception, communication and management," 2006, Science Direct) //jdi-mm

There are also several other lessons for policy concerning risk and infectious disease that may be learnt from the SARS experience. First, a change in attitude from emergency responsiveness to preventive preparedness is needed, as part of a more holistic and strategic approach to planning for infectious disease outbreaks. By definition, emergencies offer a limited timeframe for taking action, and would thus

benefit from a clear chain of command, strong coordination among relevant institutions, and strong political leadership. Clarity of responsibility, authority and accountability during outbreaks, from local to the global levels, is imperative for effective action. This includes institutions beyond the health sector, such as transportation, immigration, communications, finance, water and sanitation, defence, housing and education. When multiple sectors are involved, when there is scientific uncertainty, and when the timeframe is urgent, political leadership becomes especially important. Further, when an outbreak occurs, decisions need to be taken by a diverse range of actors, from different perspectives and at varying points in the policy making process. Given the nature of public health emergencies, in terms of timeframe, potential unknowns and geographic reach, this decision making process can be complex and highly challenging. Yet the effectiveness of the emergency response can ultimately hinge on the quality of decision-making. For example, during the SARS outbreak there were different ways of organising health controls for incoming passengers in the EU which had a negative effect on the trust placed by the public on the responsible official bodies. Such reductions in trust 'make a suspicious public sceptical of official health warnings' (Pickles & Goodwin, 2006; p. 11). Effective decision-making is characterised by such features as timeliness, accuracy, appropriateness, feasibility and clarity of purpose and message. It is therefore essential to reflect on how decision-making can best be carried out during public health emergencies. Second, as a part of this decision-making process, there is a need for understanding more fully the costs and benefits of effective responses. Economic data is currently focused on direct and immediate costs, such as drugs, other interventions, health care services, to the relevant national health sector. A fuller and wider account of macroeconomic costs will underpin a more strategic approach to decision making, and contribute to more informed decisions that are taken proactively, rather than reactively, prior to and during emergencies. Although macroeconomic modelling of health issues is very novel, with only a few applications (e.g. Lee & McKibbin, 2004; Smith et al., 2005), a current European Union Framework 6 project is developing this approach, using the case of SARS (http://icadc.cordis.lu/fep-cgi/srchidadb?CALLER=FP6_PROJ&ACTION=D&RCN=73835&DOC=5&CAT=PROJ&QUERY=1). Work such as this is required to provide the foundations for recommending how such economic information may best be assessed and best incorporated in to the decision-making process for outbreak response. Third, SARS demonstrated the importance of a worldwide surveillance and response capacity to address emerging risks through timely reporting, rapid communication and evidence-based action (Greaves, 2004). Since international infectious disease outbreaks may arise in resource poor countries, international agencies and wealthy countries must be encouraged to support policies, mechanisms and technologies that help resource poor countries to tackle these threats, whilst at the same time ensuring that national public health priorities are not distorted. One clear lesson from SARS and other outbreaks is the need for a more effective incentive system to encourage countries to notify these outbreaks. Fourth, it will be critical to ensure that interventions respect public health ethics and fundamental human rights. Many of the public health measures used during the SARS outbreaks, especially isolation and quarantine, may conflict with certain human rights. In order to plan a response to global infectious disease outbreaks it will therefore be important to consider a range of issues concerning the nexus between containment and human freedoms. For example, taking isolation and quarantine, there needs to be consideration of the level of transparency with which such policies are enacted and enforced, proportionality in the imposition of these policies compared with the benefits they offer and the assurance of a safe and habitable environment for persons subject to these measures (Gostin, Bayer, & Fairchild, 2003). Finally, SARS emphasised the importance of communications with domestic and international policy makers, financial markets, the travel industry and other key sectors. However, perhaps the most important lesson from SARS was the importance of effective communication to the public. For example, social cohesion and compliance with quarantine in Toronto may be attributed to, at least in part, clear communication and practical guidance by authorities (Health Canada, 2003). However, the constant coverage by the press, and the manner with which some of the travel advisories were handled, were linked by some to 'over reaction' (Gatehouse, 2003; Hurst, 2003; Lam & Hong, 2003). It is therefore important in the future to accompany advisories with educational messages designed to help the public understand the risks of infection, and an appropriate response. To assist this there is a need for research to identify how the public responds to such a public health threat and what may be done to better manage this.

2AC – Disease Threats Real

New emerging diseases are real and proliferating rapidly- the alternative doesn't account for new diseases. Only the affirmative takes steps towards resolving disease pandemics growing in the most marginalized populations
Singer 09

(Merill, Medical Anthropology: Cross-Cultural Studies in Health and Illness, "Pathogens Gone Wild? Medical Anthropology and the "Swine Flu" Pandemic," 2009, Taylor and Francis) //jdi-mm

The anthropological study of epidemics, as Lindenbaum (2001:380) observed, "provides a unique point of entry for examining the relationships among cultural assumptions, particular institutional forms, and states of mind." At the same time, it offers a window on the underlying structures of social relationship within and across group boundaries, including the mechanisms used to sustain complex social architectures of inequality over time. In this, it is clear that in addition to the existence of a microbiopolitics, in which, as Paxson (2008:16) argued, social disagreements "over how to live with microorganisms reflect disagreement about how humans ought live with one another," there is also a macrobiopolitics in which the cultural construction of infectious disease reflects structures and contestations in human social relationships. These dual and mutually influencing biopolitical processes are of particular note of late in that the enduring threat from infectious diseases creates a world very different from the one imaged 50 years ago by many health experts. As Binder et al. (1999:1311) indicated, the widespread optimism in developed countries after World War II that "good sanitation, vaccines, and antimicrobial agents would conquer infectious diseases" was followed "by ominous developments, such as the recognition of the extent of the HIV/AIDS epidemic and the resurgence of diseases such as tuberculosis." **Globally**, in fact, **infectious diseases remain the leading cause of death almost ten years into the 21st century, and even in highly developed nations like the United States infections rank third among causes of mortality**. Moreover, the danger posed by infectious agents has been growing. There has, for example, been a mounting concern among public health officials, health care providers, and the general public about an increasingly long list of "emerging diseases." The discovery of new pathogens, some of which are already widespread in human populations by the time they are recognized, is now occurring at a **rapid** pace. On average, three new human infectious diseases are identified every two years, with a new pathogen being reported in the health literature every week. One indicator of the level of attention now being given to the new "killer germs" is the launch by Springer Publishing Company of a book series titled Emerging Infectious Diseases of the 21st Century with ten new titles. Of historic note, the series editor is I. W. Fong, Chief of Infectious Disease at St. Michael's Hospital in Toronto, a facility that during the SARS epidemic of 2003 (which caused 43 deaths in Toronto and cost the city about 15% of its annual economy) was forced to cancel all elective surgery for three months. As a consequence of the lingering memory of this frightening experience, which "created an air of anxiety" at St. Michael's (Sullivan 2004), the hospital quickly posted on its Web site a reassuring message informing would-be patients that the current swine flu outbreak "is not SARS" and that St. Michael's is "taking every precaution to ensure the health and safety" of patients, staff, and students. Similar reassurances have been issued by many hospitals, the Centers for Disease Control and Prevention, the World Health Organization, state and provincial health departments, ministries of health, and the President of the United States (while asking Congress for an increase of $1.5 billion in influenza-related funding). Truly we live in a time of perplexing vulnerability and high anxiety. From a crashing global economy linked in part to the self-serving deeds of corporate criminals, to shadowy bomb-wielding terrorists, to would-be pirates on the high seas, to raging microbes, there are enemies at the gate everywhere we look. It bears asking: Are these phenomena linked together in some fashion—by underlying cultural assumptions, social practices, and particular states of mind, as Lindenbaum might suggest—or do they represent a mere temporal coincidence? From the perspective of anthropology, the current rapid appearance and spread of emerging diseases among human populations (as well as other challenges we face) appears in no small part to be a consequence of major environmental changes like deforestation and reforestation, intensification of agriculture, dam construction and irrigation, housing and road building, concentration of people in overcrowded and densely packed cities, the fast-paced movement of people around the planet, the global reorganization of food production following an industrial model, the development of pathogenic resistance to overused and misused antibiotics, unregulated and unsustainable economic activities, and global climate change. Because all of these anthropogenic global changes are expected to continue and even to accelerate in coming years, the threat of new and renewed pathogens is significant, particularly in developing nations, where comorbid old and new infectious diseases are common; immunohealth may be compromised by dietary deficiencies, prior infection, and stress; and

<u>health prevention and intervention infrastructures are weakest</u>. So too with the poor of rich countries, people who often experience a novel infection as yet another encounter with a prevailing pattern of socially produced health disparities. In short, while emergent pathogens are components of nature, their appearance among humans and their health and social impacts are mediated by microsocial processes embedded within large-scale inegalitarian social structures and their environment-shaping influences. Thus, so-called risk behaviors, <u>common targets of epidemiological response to the spread of disease, are shaped by social environments and relationships more so than they are products of individual acts, attitudes, and understandings</u>. Moreover, as seen in the HIV/AIDS pandemic, social and biomedical responses, from stigmatization to the inadequate allocation of intervention resources, reflect underlying social patterns and socially constituted attitudes. Consequently, in a world in which pathogens seemingly have gone wild (i.e., act in ways that frustrate human initiative and desire), a field like medical anthropology that brings unifying biosocial and micro-/macrobiopolitical perspectives to the on-the-ground examination of social and contextual factors in health may be of particular value. It is in this light that we can ask: What can medical anthropology bring to the (epidemiologically titled) novel strain H1N1 influenza A (popularly named "swine flu") pandemic? The answer, I suggest, involves three responses: (1) field monitoring of the pandemic as a biosocial phenomenon; (2) assessment of the biosocial origins and ongoing social influences on the pandemic; and (3) research-based and culturally informed involvement in public health applications.

2AC – Simulation Good

Bioterror simulations are good – engender new epistemologies and practices that help protect the population against any future crises

Melanie **Armstrong** (B.A., Communications, Brigham Young University, 2001 M.A., Telecommunications, Ohio University, 2003 Ph.D., American Studies, University of New Mexico, 2011) December **2011** ["BIO+TERROR: SCIENCE, SECURITY, SIMULATION" DISSERTATION Submitted in Partial Fulfillment of the Requirements for the Degree of Doctor of Philosophy American Studies @The University of New Mexico, loghry]

In order for citizens to do their work to ready themselves for the catastrophe, the uncertain future threat must be brought into a space where it can be acted upon in the present. Large-scale simulations create the crisis in the present moment, not only staging a rehearsal, but teaching participants what their roles should be during the imagined future event. **These simulations have consequence**, for they will shape how future incidents are understood and managed.5 Furthermore, scenarios **change the calculation of risk**, for they produce expertise grounded in **"imaginative enactment"** rather than **statistics and probability**.6 As Collier has argued, these enactments are producing **new knowledge** about our ways of living in society, using an imagined future **instead of a calculated past** to determine what threatens our social being and how.7 The information gleaned from a scenario might be used in the same way as knowledge produced through the analysis of past events, rationalizing legislation or determining funding allocations. Unlike the insurance of risk produced through the careful study of the past, however, simulation trends towards an expansive response, one focused on increasing the capacity of the nation to respond to an ever-growing range of threats. Simulation thereby becomes a mechanism for **managing the unthinkable**. Because biological agents act upon individual bodies differently than chemical or nuclear weapons, planning the emergency response to a bioterrorist attack draws particular attention to the networks that constitute community. Unlike "duck and cover" or "shelter in place" guidelines which focus upon shielding the body during an attack of limited duration, the response to a biological event takes place over time as bodies are protected against disease by access to medical treatment. Bioterrorism preparedness plans largely focus upon medical infrastructure and access to bodies in order to provide medical care. Through rehearsal, planners seek to identify barriers that inhibit the flow of pharmaceuticals into the population, interactions that increase the transmission of disease, and weaknesses within the existing health infrastructure which would become critical if the system were stressed by the rapid onset of disease within the population. Further, because the bioterror attack may not be accompanied by explosions or other indicators of a violent event, there may be no immediate change of behavior at the onset of the event. Thus, **the everyday interactions** that define the community—the movements and meetings of individuals—must be evaluated in terms of the crisis. Not only does the scenario have the potential to identify certain behaviors as damaging to people's ability to survive an attack, as might be the case in a nuclear simulation, but the bioterror rehearsal seeks to pinpoint certain actions which constitute the event itself, revealing behaviors that spread disease and showing how citizens essentially become the weapon through those actions. Preparedness practices rationalized through bioterrorism simulation have a particular capacity to advocate changes in the daily activities that constitute community, for these are the acts that transmit disease.

2AC – Disease Reps Good

disease representation are crucial to cross-discipline collaboration, incorporating the best of activism, theory and politics shapes public policy

Nancy **Tomes** (History Prof. @ Stony Brook University) **2002**

["Disease and Popular Culture in Early-Twentieth-Century America" *American Literary History* 14.4 muse, log]

Exploiting the news and entertainment potential of deadly diseases encouraged new kinds of collaborations among scientific researchers, politicians, activists, journalists, and advertisers. Powerful synergisms grew up among these five groups, so that arguments and claims made in one arena were replicated and amplified in others. Through reading in a wide range of sources, such as popular magazines, advertising agency records, and trade journals, I have eavesdropped, so to speak, on their insider conversations about how to "sell" disease. These conversations provide revealing insights into the assumptions that publishers and advertisers used to guide their coverage of infectious diseases. Although not necessarily accurate, their beliefs about what attracted or entertained the "masses" played a crucial role in shaping the flow of information and images available in popular domains of culture.

By exploring their conceptions of what made epidemics entertaining, I hope to offer more than the historian's customary gesture of insisting that phenomena considered new and unique have important precursors in the past. **For theoretical as well as policy reasons, we need to better understand the underlying dynamics of cultural attention as they operate in modern consumer societies.** Too often critics implicitly contrast the sad state of contemporary media and entertainment industries with some mythic [End Page 628] good old days, when supposedly the dividing lines between fiction and nonfiction, information and advertising, advocacy and objectivity were sharp and clear. But a closer look at the history of disease-related journalism, advertising, and entertainment reveals that these boundaries have never been firm. Moreover, **past practices of writing about and visualizing disease risks have considerable persistence; disease templates forged at the turn of the last century continue to shape popular culture and public policy to this day. Understanding historical continuities in the selling of stories about dread disease serve to remind us how deeply the dynamics of consumer culture shape perceptions of what is—and is not—a "real problem."** With that knowledge in hand, we can better comprehend our own predilections for turning epidemics into entertainments.

Privacy K-Northwestern

AT: Perm

The perm still links – any endorsement of privacy as an individual right or freedom strengthens capitalist social relations. Relying on the rhetoric and concept of privacy co-opts and prevents alternative movements from solving

Aaron **Henry 2013**, Carleton University Sociology and Political Economy PhD candidate, Winter 2013, "Perpetual Object of Regulation: Privacy as Pacification," Socialist Studies/Études socialistes 9-2, http://socialiststudies.com/article/view/23507/17392

We have established the idea that 'privacy' has the effect of disassociating security from the fabrication of private life or, rather, privacy creates the conception that security is distinct and balanced by liberalism. What does any of this have to do with privacy and the further alienation of our collective social power? It is not enough to state that privacy is the means whereby security extends itself into social life and assures us of its own proportionality or reasonableness. Rather, privacy not only fails to challenge capital, as Neocleous has demonstrated (2002, 106) but, further still, lends itself to the reification of capitalist social relations and the further separation of the individual to their own social power and objective conditions of life. Privacy not only numbs us to the logics of security and its reasonable agreement to let certain areas of our lives occur seemingly unencumbered by security projects. Rather, it ensures, through the limits privacy sets on our experiences of collective life, the forms of political activity and social engagement that appear possible to us, that in advancing privacy we only further reinforce security and its colonization of "all aspects of human practices and thinking" (Rigakos, 2011, 62). As Marx noted "labour is, therefore, the objectification of [human] species life," reality is constructed through and mediates upon the social, economic, and biological conditions through which humans contemplate their own objectively constituted existence (Marx, 1975, 76). It follows that species being, as both the object and will of one's practical activity and as the objective reality contained and represented in the products of labour, is estranged by the condition of labour in capitalist society. Thus, in the course of making the worker's product nothing more than the "means to our physical existence" in equal measure species-life itself becomes [merely] a means" as well (Marx, 1975, 77). The estrangement of life and labour from nature and other people force both nature and other people to "appear as objects other than and differentiated from" [the labourer] (Marx, 1975, 78). As such, relations that one confronts independently of one's own particular labour, forces of 'nature' and other individuals appear "as something alien and objective, confronting [individuals] not as their relations to one another but as our subordination to relations which exist independently of [us]" developing merely from the collisions between mutually indifferent individuals (Marx, 1973, 157). To this end, with the advent of capitalist relations, the individual's understanding of themselves as part of a species life dissipates and instead the predominant social bond between individuals is that of "a spontaneous interconnection, [a] material and mental metabolism...independent of the knowing and willing individuals [which] presupposes their "reciprocal independence and indifference" (Marx, 1973, 161). Consequently, as the contemplation of social life of life-activity as a shared social product wanes and in its place individuals increasingly find themselves "ruled by abstractions" as objective relations of dependency, the reciprocal relations of production appear separate and autonomous to the individuals who constitute these very relations (Marx, 1973, 164). My point is not that 'privacy' produces these conditions; the estrangement of individuals from species-life is innate to capitalist production. My point is that privacy serves to further acclimatize us to this reification of species-life as nothing more than the atomized world of the 'individual'. Which is a way of saying that privacy is part and parcel of the process of pacification, a key mechanism in the fabrication of bourgeois order. In particular, it is only in the absence of species-life, when our relations of our social dependence take on the fantastic form of relations between things and relations between people appear as forces alien to us, that the partitioning of social life into private isolated, 'natural' individuals becomes feasible; "liberty is... the right to do everything which does not harm others" it is essentially "the right of the circumscribed individual, withdrawn into him/herself" (Marx, 1975, 42). Thus, **the demand for privacy is not merely forever circumscribed by the logics of security but it entrenches the very separations between people presupposed by capitalist social relations that security is used to enforce and maintain**. Privacy, then, promises a life apart, a mode of existence separate from others and to this end is presupposed by our appearance as individuals who are autonomous from another and can, therefore, 'choose' to be further detached and apart. Before concluding I think there is an overarching political implication from this relation between privacy, security and capital. This appearance of choice, of course, serves only to further obfuscate the social nature of human existence and our inextricable tie to unequal class, gender and race relations. By agreeing to live in the form of privacy that is carved out by security projects, we live as individuals who perceive their primary social bond with society to be nothing more than a spontaneous, indifferent and independent set of connections. Any social forces we are confronted by are, by definition, abstractions of the concrete real relations of society. As such, increasingly structural forces such as unemployment, ecological catastrophe, fears about old-age or even general depression or dissatisfaction have the appearance of existing completely suspended from our society and our mode of social (re) production. In this sense, adhering to

privacy, as a mode of resistance does not just leave one apart from society but it 'displaces' the social with the 'personal'. In this sense, it is only partially true, as Tocqueville claimed, "as the extent of political society expands, one must expect the sphere of private life to contract" (1968, [1840], 782-3). It may be true that as political society grows, it develops to include new apparatuses to consolidate and legitimate dominant relations of rule (Abrams, 1977, 58); but in capitalist society the growth of political society in any substantive sense (i.e. the common deliberation on life in its totality not merely in its forms of abstraction) is utterly antithetical to conditions of accumulation in capitalist society; after-all, the egotistical person "is [in capitalist society] the foundation and presupposition of the political state" (Marx, 1975, 45). However, the opposite holds; as political society shrinks the larger the sphere of 'private social life' looms. In particular, the less leave we are given collectively to contemplate and organize the objective conditions of social reproduction (education, labour, health-care, old-age) and the more private market relations come to dominate our social experience, the more private life becomes our only mode of contemplation and action. Indeed, although we should not conflate privacy and privatization, the latter historically presupposes the emergence of the former, privacy has increasingly become a force of further commodification. Not solely in terms of direct commodification but in eschewing one's existence as a social being, individuals are increasingly left with no other expression or mode of contemplation outside their own private milieu. As such, when confronted by social, economic and political forces the recourse of the private individual is not to confront these forces as the products of our own objective activity or even as incidents that can be challenged collectively but as personal threats or risks. Thus, each, in the scale of their own atomized sense of reality, manages these personal risks and effects through the only sphere of relations open to the private individual: commodification and correlative security projects. Thus, we purchase security against disease, security against disability, theft, unemployment, old age, etc. as these things crowd into our 'lives apart from society' as nothing more than personal concerns abstracted from the objective concrete relations that determine them. To the extent that human life becomes monadic and takes on the appearance of being assailed by alien forces, the more the demands for protection from these forces is expressed in purchases of private or individual security from these forces; which, in turn, only makes social life all the more atomized and 'apart'. Thus, **in the course of drawing on privacy as a means to confront economic and political domination, we are not only acclimatized to the existence of these relations but we are pacified, or at least deterred, from radical, collective forms of political action**. "Security is not just hegemonic, it is hegemony", says Rigakos (2011, 58). Attempts to reveal the tensions and points of incoherency within security projects simply seem to drive the greater refinement of these very projects. In many respects, it is the hegemony of security, its analytical inscrutability that has prompted the turn to pacification both as a concrete historical formation of rule and as an analytical concept, a means to reveal its contingencies, its overlaps, and points of formation (Rigakos, 2011, 61; Neocleous, 2010). The other problem posed by the hegemony of security, implicit to the first problem perhaps, is that in attaining hegemony it has colonized a number of social forms. This means that some relations that appear like sites of possible resistance, such as privacy, in fact form capillary points in the economy of relations behind security. With this problem in mind I have tried to tease out the historical relation of privacy to security in capitalist society, so as to demonstrate how the former was, from the outset, entangled with the latter. Security presupposes privacy, decides its scope of power and the facets of social life to which it applies. Furthermore, not only does security condition privacy but also privacy itself, as a mode of life, has the effect of pacifying us to the further penetration of security into social life. Thus, privacy will be in existence for as long as the logics of security remain in play; for, as I outlined earlier in this discussion, it is the private sphere of relations, the sanctity of homo-economicus, that the project of police has long since had as its object. We on 'the Left' would do well to consider these aspects of privacy. As suggested by Tyler Wall's paper in this collection, it is by making appeals to privacy, that drones in the United States have made the transition from battlefield technology to a component of the 'domestic' security apparatus. Following the insights from this paper, it can be argued that challenging drones through privacy will ostensibly experience moderate success. Drones perhaps will only be flown at certain times, in certain areas, and will contravene these rules only when vital security or safety concerns arise. The footage they capture will perhaps even be handled in a manner similar to the PNR data. Yet it is the security apparatus itself, not privacy, that will determine how these limits operate. These limits not only become our measure of freedom and autonomy but also structure our pacification. Thus, **in a society that approaches security through the right to privacy, the proliferation of the conduct of war abroad and at home, the organization of human potential into a dehumanizing economic mode of production, will continue apace**; insofar as these forces will continue to confront us as happenstance things, filtering in and out of each individual's private, insular existence. To live this pacified mode of life is no less the promise of privacy than it is the guarantee of security.

Privacy can't be made into a tool of resistance as long is tied to the idea of ownership and property.

Sebastian **Sevignani '12** Unified Theory of Information Research Group "The Problem of Privacy in Capitalism and the Alternative Social Networking Site Diaspora" tripleC 10(2): 600-617, 2012

As the privacy issue is a core issue in Diaspora*'s self-image, evaluating Diaspora*'s alternative potential must include not only evaluating its mode of production, but also a critical evaluation of privacy as a whole. In the following, I will interlink both issues. Christian Fuchs has outlined how we can analyse capital accumulation on SNSs in Marxian terms (Fuchs 2012, 143-146). Facebook's and others' capital accumulation strategy is mainly based on the targeted advertising business model, which means that they engage in exchange contracts with the advertising industry. The owner buys technical infrastructure, such as server parks and software components, as well as labour force, such as accountants, software developer, etc, and produces the SNS on which users can interact. While people use the site for different rea- sons, such as getting news, providing information, staying in touch with friends, making new rela- notion of privacy ("puts you in control of your information") and relates the promise of user control to property ("You retain full ownership of all your information"). Dominant privacy theories stress the individual's control over access to personal information and are deeply rooted in people's minds and their practical role as marketers. Privacy-aware users, who see commercial SNSs as associated with privacy invasive behaviour, are surely attracted by Diaspora*'s privacy statement. One consequence of privacy theories stressing the individual con- trol aspect is that they avoid objective constraints of the individual's power to control and decide. The public good finds no consideration here. Another alternative SNS in the making, TheGlob- alSquare, which is associated with the "occupy" movement (Roos 2011), also relates to the privacy discourse. It makes more substantial claims about what privacy is and what it is not: "Individuals have a right to privacy as part of the rights they brought from a state of nature [...]. Organizations and actions which affect the public are not protected by any such rights" (Marsh 2012). Here, indi- vidual control is not seen exclusively and this example proves that Diaspora* could also behave differently in its recourse to the value of privacy. As far as I can see, in its various self-descriptions, Diaspora* does not propose any qualification of privacy that can constrain exclusive individual con- trol and is therefore likely to fit into the dominant theories of privacy. Diaspora* mobilises the power of the individuals and their privacy – for which they think that they owe nothing to society – against economic surveillance. So, it challenges successfully the economic foundations underlying privacy threats, **but does not challenge privacy as a possessive individualistic concept**. On the contrary, Diaspora*'s focus on privacy is accompanied by stressing the relevance of ownership. Concepts of ownership or private property support the exclusive and individualistic no- tion of privacy. Here again, Diaspora* reacts to commercial SNSs. Facebook, for example, states in its terms of use that users grant Facebook "a non-exclusive, transferable, sub-licensable, royalty- free, worldwide license to use any IP [intellectual property] content that you post on or in connec- tion with Facebook" (Facebook 2011). In the case of Diaspora*, such a license is not possible. However, in the same passage, Facebook also states that "you own all of the content and infor- mation you post on Facebook, and you can control how it is shared through your privacy and appli- cation settings" (Facebook 2011). Is the notion of ownership then so appropriate for an alternative to capitalist SNSs? I think it is not and the relationship between privacy as commodity (the Face- book license for instance) and privacy as an aspect of self-possession (Diaspora*'s notion), which has been outlined above, gives grounds for holding a sceptical view. Diaspora*'s vision of privacy protection is, as outlined in the first section, essentially based on the individual opportunity to change pods/SNS-provider. Users need ownership of their data in order to migrate them from pod to pod: "And because your information is yours, not ours, you'll have the ultimate power — the abil- ity to move your profile and all your social data from one pod to another, without sacrificing your connection to the social web" (Diaspora 2011c; emphasis in original). Assuming that Diaspora* will never be able to outdo Facebook in terms of provided features and network effects in the view of the majority of SNSs users, users may then voluntarily decide to sell their privacy on Facebook or Google+ and they are indeed able to do this as they have exclusive control and ownership of their privacy. Exactly, these premises of the privacy commodity exchange are also propagated by Dias- pora*. The dominant theoretical privacy concept cannot provide reasons why users should not be- have like this. At this point of Diaspora*'s evaluation, it may be useful to remember Marx's "leading threat" of investigation expressed in the previously quoted passage from the preface to A Contribution to the Critique of Political Economy, where he refers to the relation between the entire economic founda- tion of society and the more or less rapidly transforming superstructures within which humans be- come conscious of conflicts and fight them out. The focus on privacy, as it is dominant in capital- ism, may result from Diaspora*'s multi-faceted embeddedness in capitalist structures. There is capital accumulation related to copyleft. On the one hand, copyleft products can be used for free in order to produce non copyleft products. For instance, machines that produce umbrellas can be operated on behalf of free and copyleft software. The producer of umbrellas does not have to pay for that kind of software although it contributes as means of production to his or her capital accumulation. In this case, an intensive exploitation of the labour that was once spent on the copyleft product takes place. The producer of umbrellas saves the money that he or she would otherwise have to pay for the machine's operating software. On the other hand, copyleft products are attractive for users as they cheap, widely cheaply accessible and have a high quality since a huge pool of co-operative labour builds them. Copyleft products are also often more flexibly adapt- able to specific purposes. This appeal can be used for capital accumulation indirectly. Commercial firms may offer services that are related to copyleft products. For instance, a producer of umbrellas pays another firm that collects and aggregates suitable copyleft components for running umbrella-tions, or organising events, they produce a wide range of data. These data, which include for in- stance socio-

demographic information and consumer preferences deduced from users' browsing behaviour, are then sold to advertisers. Whereas traditional forms of advertising are directed to broad groups of potential buyers, targeted advertising is tailored for exactly defined and differenti- ated groups, or even single consumers. This demands more detailed, exact, and differentiated knowledge of the users' needs and (buying) behaviour, which can be provided by the owner of SNSs. The SNSs' business model is based on the secondary use of user interaction for commodi- fication and valorisation purposes (Smythe 1989; Fuchs 2011a). The economic reason why profit- oriented SNSs develop massive systems of user surveillance and store "literally everything", as a Facebook employee has admitted (Wong 2010), lies therein. Users' interests in privacy can only be considered where the need for privacy does not inhibit SNSs' profit interests. In fact, commercial SNSs commodify users' privacy. They often do it without users' explicit consent, when they hide their profit-orientation behind the social value of networking. Today, SNSs are increasingly com- pelled to respect users' privacy through legal investigations, public pressure initiated by privacy movements, and alternative SNSs such as Diaspora*, but this does not mean that commercial SNSs have to abjure the targeted advertising model. Commercial and advertising funded SNSs need users who have control over their data and are able to exchange their privacy for the usage of the platform voluntarily by agreeing to the terms of use. For them, in order to maintain newer forms of exploitation, the challenge is not to fight against privacy at all; rather, they can support privacy if it is – as an analogy to labour force - related to private property, and hence alienable or exchange- able. It seems that **simply upholding privacy is not the right move in order to challenge surveillance** (Nock 1993, 1; Lyon 2005, 27; Stalder 2002). Diaspora* breaks with this advertising model based on privacy as commodity; hence, it protects its users and their personal data from exploitation: "Yet our distributed design means no big corpo- ration will ever control Diaspora. Diaspora* will never sell your social life to advertisers, and you won't have to conform to someone's arbitrary rules or look over your shoulder before you speak" (Diaspora 2011c; emphasis in original). Gary T. Marx reminds us that "privacy for whom and sur- veillance of whom and by whom and for what reasons need to be specified in any assessment" (Marx 2012, vii). Due to its distributed infrastructure and its funding model that is not based on ad- vertising, one can argue that Diaspora* practically provides an alternative concept of privacy (Fuchs 2012, 153f.). Diaspora* sees "privacy as collective right of dominated and exploited groups that need to be protected from corporate domination that aims at gathering information about work- ers and consumers for accumulating capital, disciplining workers and consumers, and for increas- ing the productivity of capitalist production and advertising" (Fuchs 2011b, 232). While I agree that Diaspora* practically avoids commodification of privacy and the exploitation of users, I nevertheless see some constraints for an alternative non-ideological notion of privacy that follows from my preceding analysis. **Not only is treating privacy as commodity a problem but it should also be taken into account that conceptualising privacy as an aspect of self-ownership is ideological and cannot be separated from exploitation in capitalism**. In fact, although Diaspora* is directed against newer forms of exploitation of users' privacy, its recourse to privacy remains bound to exploitation in general as it confirms exploitation's ideological premises – the possessive individualistic ideology. I shall provide evidence for such a claim.

Relying on the legal system integrates potentially transformative movements into the conservative legal establishment. The permutation would prevent the alternative from solving.

Peter **Gabel '84** Prof of Law, New college of california school of law "The mass psychology of the new federalism" 52 Geo. Wash. L. Rev. 263 1983-1984

And what is this new social consciousness, this new "false social- meaning system?" In intellectual terms, I would describe it as fol- lows: given the collapse of any visible progressive social movement that could offer a concrete hope of greater happiness, people are ex- periencing an intense privatization of everyday life in which the work-world has become a meaningless milieu perceived solely as a place to "get money" and in which any genuine human contact is felt only in privatized settings like the family, bars, and relatively margi- nal organizations like church groups. This intense privatization cou- pled with the lack of any visible social alternative is producing immense frustration and anger, and this frustration and anger is be- ing directed in part at previous political illusions and their false promises of a better life. The creation of a false social-meaning sys- tem to legitimize this very situation requires transforming this nega- tive into an affirmative. And this affirmative can and should be expressed bluntly: "Unions are self-serving, rehabilitating criminals is a fraud, politicians are corrupt, and the poor can help themselves. We Americans are good law-abiding people, we know what's what, and we want you phony liberals with your phony morality to leave us alone. We can make out just fine if only we can get you off our backs." Now in fact this affirmation of the value of privatism is completely false, and deep in their hearts everyone knows it's false. But the false "we" in this quasi-populist diatribe can still provide a substitute feel- ing of community that can serve as a cover for actual suffering and isolation, particularly when a leader emerges who can institute the group's unity by embodying its ethic in public space. They do not care that Reagan can

not answer questions at press conferences be- cause at last the truth is out: press conferences are a charade. And they certainly do not care that Rehnquist substitutes slogans for analysis, as Owen Fiss says disapprovingly in citing Rehnquist's re- mark that the Constitution does not guarantee prisoners "one man, one cell.""' They know that legal analysis is just like Washington press conferences and that in some way Rehnquist is giving it to them when he makes fun of the profundity of 'constitutional doctrine and interpretation. The fact is that this reaction to the liberal social-justice attitude is absolutely valid. The fact is that "our federalism<u>," our "fundamental values"</u> that were being carried to the states through the fourteenth amendment and to private parties through the commerce clause <u>were never really intended to achieve social justice by abolishing the hierarchy-system and giving power to the large masses of people. They were intended to maintain these very hierarchies while at the same time satisfying a very genuine wish within liberal conscious- ness to "help" poor people</u>, third-world people, those most oppressed by the system. In the long run this could only produce a sense of contradiction and anger among those not helped. Collective anger is not the only force at the heart of the new "We" that the Burger Court is trying to create, although this anger is of great libidinal importance in binding the energy of the New Right to- gether. There is also a positive utopian content in the new world- view. As I have said earlier, these world-views that succeed one an- other, generation after generation, are always founded upon a polit- ical illusion, an illusion that the world is the way it is because "We" want it this way and not because it is forced upon us. What is the political illusion inhering in the deregulation of subordinate power- centers, the return to states' rights, and in the view that criminals are criminals and that's all there is to it? It seems to me that this illusion is to be located in the displacement of the mass powerlessness generated by the concrete experience of socio- economic life into an imaginary political sphere such that the feelings of powerlessness associated with isolation and privatization appear to be caused by an imaginary political oppression. This <u>oppression is then relieved in an imaginary way by the wish-fulfilling fantasy of "getting the government off our backs so that we can be free again."</u> In other words, what Jeff Blum views as an instrumental deregulation of subordinate power-centers in his realist critique of Burger Court ideology must actually be understood as what one might call a "deregulation of the world" in the realm of mass- psychological fantasy. Thus, while it may appear to be against the rational self-interest of working class people to support the striking- down of legislative restraints on corporate campaign contributions as the Burger Court has done in the name of freedom of expression,12 it is in their psychic self-interest to support such an action because it allows them simultaneously to deny an intolerable contradiction of their concrete existence - the need for power and the apparent im- possibility of realizing it - and to alleviate the contradiction in the realm of fantasy. It allows people to feel that "we are free to express ourselves again," even as their actual life conditions force precisely the opposite awareness upon them every day of their concrete existence. <u>The true role of the Court in this process of displacement of contra- diction and generation of substitute gratification is both to satisfy a need brought about by popular suffering and to control this need so as to maintain the equilibrium of the status quo</u>. As state officials who are granted prestige and high salary solely on the basis of the political legitimacy of the existing system, <u>most judges are interested in keeping things the way they are</u>. <u>This requires the ideological integration of destabilizing movements from the right as well as from the left</u>, and it is actually this attempt at ideological integration that peo-ple refer to when they say the Court is "moving to the right." The Court's aim is precisely to make the rise of the New Right constitutional, and in so doing to resolve the current legitimacy-crisis by reconstituting the existing hierarchy-system within an imaginary framework that conforms to a new "intent of the framers." For in the long run it is only by transforming the recent wave of right-wing ac- tivism into a passively-accepted legal order that the new conserva- tism can become a genuinely dominant ideology in the way that democratic liberalism has been for most of our recent history. Whether this process of re-legitimation will succeed depends upon a great many factors, among the most important of which is the self- conscious, sustained efforts of groups like ourselves to refute the New Right's vision convincingly by showing that it mystifies a world that cannot actually satisfy people's real human needs. But to do this we must be more radical rather than less radical, using whatever re- sources are available to us as teachers and practitioners to expose the myths of liberal as well as conservative world-views. Speaking to law teachers in particular, since I am a law teacher myself, this means abandoning any professionalist identification with the liberal- legalism of the Warren Court and showing how the Burger Court's ideology makes sense to a mass middle-class and working-class con- stituency faced with unliveable contradictions in their everyday lives.

The public/private distinction is unstable and analytically bankrupt. Embracing a concept of privacy shuts down alternatives to liberal political orders

Karl E **Klare '82** Professor of Law, Northeastern University "THE PUBLIC/PRIVATE DISTINCTION IN LABOR LAW" 130 U. Pa. L. Rev. 1358 1981-1982

For the most part the terms "public" and "private" will be used in this Article simply as they appear in the cases and doctrinal literature. However, these terms have several distinct if related and overlapping meanings, and this Article will be primarily con- cerned with the formulation that focuses on distinguishing between the "political" and "socio-economic" domains of life.8 Part I provides an overview of some specific doctrinal examples of the public/private distinction in labor law. Part II offers

a more detailed examination of a particular problem, namely the various appearances of the public/private distinction in the theory of the collective bargaining and grievance processes. Parts I and II will attempt to establish that <u>although public/private rhetoric is perva- sive in labor doctrine, it is devoid of significant, determinate ana- lytical content</u>. Specifically, <u>the Article will demonstrate the in- coherence of the public/private distinction by showing that: (i) the distinct designations "public" and "private" are at different times, or even simultaneously, employed to characterize the same phe- nomena;</u> 9 (ii) <u>judges and other legal thinkers beginning from an identical premise about the "publicness" or "privateness" of a par- ticular phenomenon will arrive at sharply contrasting or opposed legal conclusions regarding it;</u> or, beginning from opposed premises they will arrive at identical legal conclusions; 10 and (iii) <u>most im- portant, the "borderline" dividing "public" and "private" is con- stantly being altered and redefined in the presence of new legal problems, but absent significant changes in the nature of the under- lying phenomena or social forces that the labels "public" and "private" supposedly describe</u>." Overall, the several examples contained in Part I and the ex- tended review of one issue in Part II are intended to suggest <u>that it is seriously mistaken to imagine that legal discourse or liberal political theory contains a core conception of the public/private distinction capable of being filled with determinate content or ap- plied in a determinate manner to concrete cases.</u> **There is no "public/private distinction."** <u>What does exist is a series of ways of thinking about public and private that are constantly undergoing revision, reformulation, and refinement</u>. The law contains a set of imageries and metaphors, more or less coherent, more or less prone to conscious manipulation, designed to organize judicial thinking according to recurrent, value-laden patterns. <u>The public/private distinction</u> poses as an analytical tool in labor law, but it <u>functions more as a form of political rhetoric used to justify particular results</u>. Part III explores the apologetic character of public/private discourse in labor law, discussing three particular sets of political values that are contained in and reinforced by contemporary public/private rhetoric about the workplace. It argues that the use of such rhetoric obscures rather than illuminates, and that **the social function of the public/private distinction is to repress aspirations for alternative political arrangements by predisposing us to regard comprehensive alternatives to the established order as absurd**.

AT: Law Good

Law = Violence

The law is not defined by objective reason or by logical rules – it functions only because of foundational and continuous violence

Robert **Cover '86** Professor law at Yale, "Violence and the Word" 95 Yale L.J. 1601 1985-1986

Legal interpretation' takes place in a field of pain and death. This is true in several senses. Legal interpretive acts signal and occasion the imposition of violence upon others: **A** judge articulates her understanding of a text, and as a result, somebody loses his freedom, his property, his children, even his life. Interpretations in law also constitute justifications for violence which has already occurred or which is about to occur. When interpreters have finished their work, they frequently leave behind victims whose lives have been torn apart by these organized, social practices of violence. Neither legal interpretation nor the violence it occasions may be properly understood apart from one another. This much is obvious, though the growing literature that argues for the centrality of interpretive practices in law blithely ignores it.2 Taken **by** itself, the word "interpretation" may be misleading. "Inter- pretation" suggests a social construction of an interpersonal reality through language. But pain and death have quite other implications. In- deed, pain and death destroy the world that "interpretation" calls up. That one's ability to construct interpersonal realities is destroyed **by** death is obvious, but in this case, what is true of death is true of pain also, for pain destroys, among other things, language itself. Elaine Scarry's bril- liant analysis of pain makes this point: [F]or the person, in pain, so incontestably and unnegotiably present is it that "having pain" may come to be thought of as the most vi- brant example of what it is to "have certainty," while for the other person it is so elusive that hearing about pain may exist as the pri- mary model of what it is "to have doubt." Thus pain comes un- shareably into our midst as at once that which cannot be denied and that which cannot be confirmed. Whatever pain achieves, it achieves in part through its unshareability, and it ensures this unshareability in part through its resistance to language .. . .Prolonged pain does not simply resist language but actively destroys it, bringing about an immediate reversion to a state anterior to language, to the sounds and cries a human being makes before language is learned.3 The deliberate infliction of pain in order to destroy the victim's norma- tive world and capacity to create shared realities we call torture. The in- terrogation that is part of torture, Scarry points out, is rarely designed to elicit information. More commonly, the torturer's interrogation is designed to demonstrate the end of the normative world of the victim-the end of what the victim values, the end of the bonds that constitute the community in which the values are grounded. Scarry thus concludes that "in compel- ling confession, the torturers compel the prisoner to record and objectify the fact that intense pain is world-destroying."'4 That is why torturers almost always require betrayal-a demonstration that the victim's intangi- ble normative world has been crushed by the material reality of pain and its extension, fear.5 The torturer and victim do end up creating their own terrible "world," but this world derives its meaning from being imposed upon the ashes of another.' The logic of that world is complete domina- tion, though the objective may never be realized. Whenever the normative world of a community survives fear, pain, and death in their more extreme forms, that very survival is understood to be literally miraculous both by those who have experienced and by those who vividly imagine or recreate the suffering. Thus, of the suffering of sainted Catholic martyrs it was written: We must include also ...the deeds of the saints in which their triumph blazed forth through the many forms of torture that they underwent and *their marvelous confession of the faith.* For what Catholic can doubt that they suffered more than is possible for human beings to bear, and did not endure this by their own strength, but by the grace and help of God?' And Jews, each year on Yom Kippur, remember- Rabbi Akiba. **.** .chose to continue teaching in spite of the decree [of the Romans forbidding it]. When they led him to the executioner, it was time for reciting the Sh'ma. With iron combs they scraped away his skin as he recited *Sh'ma Yisrael,* freely accepting the yoke of God's Kingship. "Even now?" his disciples asked. He replied: "All my life I have been troubled by a verse: 'Love the Lord your God with all your heart and with all your soul,' which means even if He take your life. I often wondered if I would ever fulfill that obli- gation. And now I can." He left the world while uttering, "The Lord is One."" Martyrdom, for all its strangeness to the secular world of contemporary American Law, is a proper starting place for understanding the nature of legal interpretation. Precisely because it is so extreme a phenomenon, martyrdom helps us see what is present in lesser degree whenever interpretation is joined with the practice of violent domination. Martyrs insist in the face of overwhelming force that if there is to be continuing life, it will not be on the terms of the tyrant's law. Law is the projection of an imagined future upon reality. Martyrs require that any future they possess will be on the terms of the law to which they are committed (God's law). And the miracle of the suffering of the martyrs is their insistence on the law to which they are committed, even in the face of world-destroying pain.9 Their triumph-which may well be partly imaginary-is the imagined triumph of the normative universe-of Torah, Nomos,-over the material world of death and pain. 10 Martyrdom is an extreme form of resistance to domination. As such it reminds us that the normative world-building which constitutes "Law" is never just a mental or spiritual act. A legal world is built only to the extent that there are commitments that place bodies on the line. The torture of the martyr is an extreme and repulsive form of the organized violence of institutions. It reminds us that the interpretive commitments

<u>of officials are realized, indeed, in the flesh</u>. As long as that is so, the interpretive commitments of a community which resists official law must also be realized in the flesh, even if it be the flesh of its own adherents.

Law Naturalizes Oppression

The legal system and the courts are primarily institutions designed to legitimize and naturalize domination and oppressions

Although I believe Blum's approach is much the best of the three, it shares a basic error with the other two: the failure to recognize <u>that the Supreme Court is fundamentally a figment of the cultural imagination and that its true role is to be found not in the direct prac- tical consequences of the outcomes of its decisions</u> - with the poli- tics of these outcomes being mystified by ideology - <u>but rather in the ideology itself as a set of cultural images that are intended to give a false political legitimacy to the social order</u>. Let me develop this idea and then return to Blum's analysis in order to reinterpret it in accordance with the view of the Court that I am proposing. <u>Contemporary American society is a network of hierarchies</u> within which people feel profoundly isolated from one another. Although we long to overcome the isolation and mutual distrust that characterizes hierarchical life, we are also afraid to make the attempt because from the vantage point of our distance from one another, the fragility of our common desire seems no match for the alienation that contains it. The risk of a humiliating and even violent rejection by others al- ways seems very great. Faced with this conflict, our history takes on the quality of a double-movement. Because of our fear, <u>the hierarchies tend to reproduce themselves generation after generation in the form of class domination, racial and sexual oppression</u>, and in many other ways that need not be reduced to these conventional categories, such as the teacher-student relationship. Yet, because of our desire to overcome the inhumanity and powerlessness inherent in these hierarchical conditions, we are continually forming into groups that challenge the way things are, in movements like the labor movement, or the civil-rights movement, or the women's movement, or in very disorganized ways as was the case for the 60s counter-culture. <u>Sometimes direct force is used to suppress these challenges to the hierarchy-system, but it is much more effective for those who wish to maintain the status quo to get people to consent to it</u>. <u>To do this the conflict that is generated within the hierarchies must be continually mediated by people whose job it is to produce illusions about the justness of the existing order</u>.   One might describe such people as producers of false social mean-ing. In place of the painful absence of connectedness that is at the heart of people's actual experience of the hierarchical world, they convey false pictures of social life that attempt to provide people with a substitute and fantasy-based feeling of connection with others. <u>This</u>, it seems to me, <u>is where the Supreme Court comes in. The objective of the Supreme Court is to pacify conflict through the mediation of a false social-meaning system</u>, a set of ideas and images about the world which serve today as the secular equivalent of religious ideology in previous historical periods. Either a conflict is assimilated into an existing prevailing world-view, or the existing world- view accommodates itself somewhat to absorb the conflict.3 But in either case the objective is to maintain a relatively coherent, though false, sense of social-meaning and connection.

Judges are not instruments of order and logic, but distributors of pain, violence, and death

We begin, then, not with what the judges say, but with what they do. The judges deal pain and death. That is not all that they do. Perhaps that is not what they usually do. But they *do* deal death, and pain. From John Winthrop through Warren Burger they have sat atop a pyramid of violence, dealing **....** In this they are different from poets, from critics, from artists. It will not do to insist on the violence of strong poetry, and strong poets. Even the violence of weak judges is utterly real-a naive but immediate reality, in need of no interpretation, no critic to reveal it.20 Every prisoner displays its mark. Whether or not the violence of judges is justified is not now the point-only that it exists in fact and differs from the violence that exists in literature or in the metaphoric characterizations of literary critics and philosophers. I have written elsewhere that judges of the state are juris- pathic-that they kill the diverse legal traditions that compete with the State.2 ' Here, however, I am not writing of the jurispathic quality of the office, but of its homicidal potential. The dual emphasis on the *acts* of judges and on the violence of these acts leads to consideration of three characteristics of the interpretive di- mension of judicial behavior. Legal interpretation is (1) a practical activ- ity, (2) designed to generate credible threats and actual deeds of violence, (3) in an effective way. In order to explore the unseverable connection between legal interpretation and violence, each of these three elements must be examined in turn.

Law is not Rational/Objective

The law is not the product of common meaning nor can it be used to achieve progressive ends – it is violence, not shared meaning or common principles, that make legal systems effective

Robert **Cover '86** Professor law at Yale, "Violence and the Word" 95 Yale L.J. 1601 1985-1986

There is a worthy tradition that would have us hear the judge as a voice of reason; see her as the embodiment of principle. The current academic interest in interpretation, the attention to community of meaning and commitment, is apologetic neither in its intent or effect. The trend is, by and large, an attempt to hold a worthy ideal before what all would agree is an unredeemed reality. I would not quarrel with the impulse that leads us to this form of criticism. There is, however, danger in forgetting the limits which are intrinsic to this activity of legal interpretation; in exaggerating the extent to which any interpretation rendered as part of the act of state violence can ever constitute a common and coherent meaning. I have emphasized two rather different kinds of limits to the commonality and coherence of meaning that can be achieved. One kind of limit is a practical one which follows from the social organization of legal violence. We have seen that in order to do that violence safely and effectively, responsibility for the violence must be shared; law must operate as a system of cues and signals to many actors who would otherwise be unwilling, incapable or irresponsible in their violent acts. This social organization of violence manifests itself in the secondary rules and principles which generally ensure that no single mind and no single will can generate the violent outcomes that follow from interpretive commitments. No single individual can render any interpretation operative as law-as authority for the violent act. While a convergence of understandings on the part of all relevant legal actors is not necessarily impossible, it is, in fact, very unlikely. And, of course, we can not flee from the multiplicity of minds and voices that the social organization of law-as-violence requires to some hypothetical decision process that would aggregate the many voices into one. We know that-aside from dictatorship-there is no aggregation rule that will necessarily meet elementary conditions for rationality in the relationships among the social choices made. While our social decision rules cannot guarantee coherence and rationality of meaning, they can and do generate violent action which may well have a distinct coherent meaning for at least one of the relevant actors. We are left, then, in this actual world of the organization of law-as- violence with decisions whose meaning is not likely to be coherent if it is common, and not likely to be common if it is coherent. This practical, contingent limit upon. legal interpretation is, however, the less important and less profound of the two kinds of limits I have presented. For if we truly attend to legal interpretation as it is practiced on the field of fear, pain, and death, we find that the principal impediment to the achievement of common and coherent meaning is a necessary limit, intrinsic to the activity. Judges, officials, resisters, martyrs, wardens, convicts, may or may not share common texts; they may or may not share a common vocabulary, a common cultural store of gestures and rituals; they may or may not share a common philosophical framework. There will be in the immense human panorama a continuum of degrees of commonality in all of the above. But as long as legal interpretation is constitutive of violent behavior as well as meaning, as long as people are commit- ted to using or resisting the social organizations of violence in making their interpretations real, there will always be a tragic limit to the common meaning that can be achieved. The perpetrator and victim of organized violence will undergo achingly disparate significant experiences. For the perpetrator, the pain and fear are remote, unreal, and largely unshared. They are, therefore, almost never made a part of the interpretive artifact, such as the judicial opinion. On the other hand, for those who impose the violence the justification is important, real

and carefully cultivated. Conversely, for the victim, the justification for the violence recedes in reality and significance in proportion to the overwhelming reality of the pain and fear that is suffered. Between the idea and the reality of common meaning falls the shadow of the violence of law, itself.

Legal interpretation is never just about texts or language – legal interpretation requires a system of socially organized violence in order to be effective. The violence inherent in the law trumps any rational element.

Robert **Cover '86** Professor law at Yale, "Violence and the Word" 95 Yale L.J. 1601 1985-1986

Legal interpretation, therefore, can never be "free;" it can never be the function of an understanding of the text or word alone. Nor can it be a simple function of what the interpreter conceives to be merely a reading of the "social text," a reading of all relevant social data. Legal interpretation must be capable of transforming itself into action; it must be capable of overcoming inhibitions against violence in order to generate its requisite deeds; it must be capable of massing a sufficient degree of violence to deter reprisal and revenge. In order to maintain these critical links to effective violent behavior, legal interpretation must reflexively consider its own social organization. In so reflecting, the interpreter thereby surrenders something of his independence of mind and autonomy of judgment, since the legal meaning that some hypothetical Hercules (Hyporcules) might construct out of the sea of our legal and social texts is only one element in the institutional practice we call law. Coherent legal meaning is an element in legal interpretation. But it is an element potentially in tension with the need to generate effective action in a violent context. And neither effective action nor coherent meaning can be maintained, separately or together, without an entire structure of social cooperation. Thus, legal interpretation is a form of bonded interpretation, bound at once to practical application (to the deeds it implies) and to the ecology of jurisdictional roles (the conditions of effective domination). The bonds are reciprocal. For the deeds of social violence as we know them also require that they be rendered intelligible-that they be both subject to interpretation and to the specialized and constrained forms of behavior that are "roles." And the behavior within roles that we expect can neither exist without the interpretations which explain the otherwise meaningless patterns of strong action and inaction, nor be intelligible without understanding the deeds they are designed to effectuate. Legal interpretation may be the act of judges or citizens, legislators or presidents, draft resisters or right-to-life protesters. Each kind of interpreter speaks from a distinct institutional location. Each has a differing perspective on factual and moral implications of any given understanding of the Constitution. The understanding of each will vary as roles and moral commitments vary. But considerations of word, deed, and role will always be present in some degree. The relationships among these three considerations are created **by** the practical, violent context of the practice of legal interpretation, and therefore constitute the most significant aspect of the legal interpretive process.

The law is political – it is not rational.

Mark **Tushnet '5** Prof of Law at Harvard, formerly Georgetown. Father of Rebecca. "Critical Legal Theory" *The Philosophy of Law and Legal Theory* pp 80-90

The most general statement of critical legal theory was the slogan, ''Law is politics'' (Kairys 1982). This meant several things. First, the methods of legal reasoning were, in the end, in- distinguishable from the methods of political ar- gument: analysis would show that what legal theorists presented as distinctively legal argu- ments were reducible to

arguments commonly made in general political discourse. <u>Second, dis- putes within law were resolved in the same way that disputes within politics were resolved, by some fairly messy combination of coercion and reasoned argument, rather than by reason alone</u> (as they understood their seniors to claim). Im- portantly, the claim was not that law, like politics, was a domain of coercion pure and simple; rather, it was that both domains mixed coercion and reason. This part of the claim about law and pol- itics thus connected critical legal theory to trad- itional jurisprudential concerns about the relation between law and morality, although the connec tion was weak and never became a focus of atten- tion within the work of critical legal theorists. Third, and perhaps most obvious, <u>just as in politics we do not expect disagreement to disappear once some provisional resolution of a problem is located, so too in law we should not expect dis- agreement to disappear once an apparently authoritative decision has been rendered</u>. Critical legal theory drew from American legal realism the perception that an account of law must combine analysis of legal reasoning with social theory, loosely defined. See A M E R I C A N LEGAL REALISM. The legal realists had found themselves confronting what they, or at least their successors, described as a conceptualistic formalism, in which verbal formulations of rules were to be interpreted in ways that resolved con- crete controversies. For the legal realists, formal- ism meant that legal rules could be justified by deduction from self-evident first principles. (To the extent that those principles are moral prin- ciples, the legal realists' understanding of formal- ism is loosely related to more contemporary definitions of formalism, which assert that the legal system has an immanent moral rationality.) Critical legal theorists appreciated – and perhaps may be said to have appropriated – the legal realists' rule-skepticism as a response to formalism. <u>By examining the relation between particular rules and concrete problems, rule skeptics argued that the rules actually did not provide conclusive answers to any legal dispute</u>; the formalist prom- ise that answers could be deduced from agreed- upon premises failed, according to the legal real- ists, because alternative interpretations of agreed- upon rules, defensible by accepted methods of legal reasoning, were ordinarily available to support quite diverse outcomes. Critical legal theorists confronted versions of formalism that had arisen after the legal realists developed their rule-skepticism, notably the legal-process school and the Chicago style of law-and-economics scholarship that played a large role in the legal academy when critical legal theory began to be developed. But, the critical legal theorists believed, legal-process theory re- produced formalism. Instead of deducing substantive rules from higher-level premises, legal- process theorists argued that legal tasks should be allocated to different institutions on the basis of higher-level principles identifying each institu- tion's central characteristics. For critical legal the- orists, this simply shifted the level on which formalism occurred from substantive law to the questions of institutional design and procedure. The scientism of Chicago-style law-and-econom- ics was even more obviously formalistic; here sub- stantive legal rules were to be deduced from extremely thin assumptions about individual motivation and self-interest. Critical legal theorists also appreciated the legal realists' materialism. As the critical legal theorists read legal realism, <u>rule-skepticism implied that one could not explain the outcomes actually reached in legal disputes by referring to the rules of law alone</u>. Some social, not legal, theory would have to be invoked to explain outcomes. Again, as the critical theorists read legal realism, the rele- vant social theory for legal realists was fundamen- tally materialist in a loosely Marxist sense: <u>class interests explained why judges (and, even more obviously, legislators) reached the results they did</u>. Critical legal theory modernized rule-skepti- cism, but probably did not add strikingly new arguments to the ones the legal realists had pro- duced. The situation was different with respect to the explanatory social theory, though. Critical legal theory combined, sometimes awkwardly, a phenomenological account of social action with elements of the humanist rather than determinist Marxism that had become fashionable on the left in the 1960s and early 1970s.

Neither the law nor any system of rights are rational – they are systems of oppression that disguise their true nature under the guise of rational decision making

Peter **Gabel '84** Prof of Law, New college of california school of law "Phenomenology of Rights- Consciousness and the Pact of the Withdrawn Selves" 62 Tex. L. Rev. 1563 (1983-1984)

Yet this description of reification is perhaps itself somewhat reified to the degree that it places too little emphasis on the emotional strain required to believe that something unreal is real,30 and by reminding ourselves of the nature and source of this strain we can come to see the link between reification and indeterminacy. For reification is not a mere abstract characteristic of legal thought; it is lived as a difficult effort to keep out of awareness an underlying existential conflict be- tween the desire for connection and the felt need to deny this desire. One aspect of this effort involves repression: we keep the conflict out of awareness by treating existing reality as fixed and embracing this idea with passion. 3 1 But a second aspect involves substitute gratifica- tion: we keep the conflict out of awareness by anxiously "keeping up" our absorption in the fantasies of substitute connection provided by the utopian imagery of legal thought. The carrying out of this second as- pect requires that the cognitive or surface

meanings of legal concepts be infinitely malleable because they are created and "believed in" precisely in order to resist (or to keep out of awareness) the underlying meaning that desire has in mind for them. In other words, for substi ute gratifications to secure their substitute or unrealized character, the rights which embody them must be suspended in a permanent state of abstraction. They must be able to mean anything at the surface level in order that they not mean anything at the underlying level, where the desire for freedom and equality, for example, is embroiled in conflict. Thus the indeterminacy of what any right "really means concretely" results from our very intention that it should not mean anything con- crete (or to put this more precisely, that it should not mean what it means). This idea that substitutive fantasies involve a constant jug- gling act in which conflictual wishes are perpetually kept out of aware- ness through the use of displacing imagery is a common theme in psychoanalysis-a child will allow his dream-thoughts to wander over an infinite series of symbolic objects in order not to think of his mother's breast.32 If indeterminacy is therefore an existential constituent of existing legal thought, intentionally produced in order to secure the substitute connection of our withdrawn selves (as well as the anonymity or un- groundedness of our role-performances), then the value of a critique which demonstrates this indeterminacy must be limited to delegitimiz- ing the apparently determinate character that rights-thinking acquires through reification. Without negating the importance of this activity, I think it is nonetheless essential to recognize its paradoxical nature, be- cause the critique itself presupposes that rights-thinking does not actu- ally have to be determinate in order to convince those who intend to be convinced by it. In fact, just the opposite is the case if, as I believe, this thought is intentionally constructed to be both indeterminate and yet apparently determinate at the same time. The real question is how to make sense of this paradox-how does consciousness manage to play this trick on itself without being aware that it is doing so? To answer this question, we must recall that the feeling of substitute connection which makes legal thought partially gratifying is generated not by the rational or manifest content of rights, but by their latent content as unconscious fantasies. In other words, it is the fantasy of real freedom embedded in the idea of "freedom of contract" that accounts for our being attached to it (and "attached" through it), rather than any deep loyalty we have to the supposed set of "rational outcomes" that the right to freedom of contract "entails." If the reification of legal reason- ing, and thus its apparent determinacy, derives from this emotional at- tachment to its latent content, then we can see quite clearly how reification and indeterminacy not only can coexist but also work to- gether. Indeterminacy allows rights to possess an infinite number of surface meanings that serve (through a kind of perpetual flight into abstraction) to protect their fantastic nature from the call of desire to give them a realized meaning. Reification allows us to believe in the determinacy of any of these surface meanings through our very attach- ment to the fantasy of connection that each provides. As a conse- quence, the law does not have to be "really" rational for people to believe in it-in fact, this very "belief' is sustained by its nonrational or indeterminate quality.

Law is indeterminate

Legal propositions are indeterminate – arguments can be found to support any outcome or meaning

Mark **Tushnet '83** Prof of Law at Harvard, formerly Georgetown. Father of Rebecca. 16 QLR 339 (1996-1997) "Defending the Indeterminacy Thesis"

As I take the indeterminacy thesis, <u>a proposition of law</u> (or legal proposition) <u>is indeterminate if the materials</u> of legal analysis-the ac- cepted sources of law <u>and the accepted methods of working with those sources</u> such as deduction and analogy<u>-are insufficient to resolve the question</u>, "Is this proposition or its denial a correct statement of the law?" If a litigated case turns on an indeterminate legal proposition, a result favoring either the plaintiff or the defendant is equally well- supported by the legal materials.'0 The indeterminacy thesis is simple to state: <u>Across an analytically interesting range of "cases" or legal events, legal propositions are indeterminate."</u> This is not a claim about the degree of controversy over the right outcome, or about the difficulty of discerning that outcome. <u>The indeterminacy thesis asserts that no matter how hard one tries, or how skilled one is as a lawyer, legal propositions in the relevant range are in- determinate</u>. Most discussions of the indeterminacy thesis identify some com- mon ground between its proponents and its critics. Nearly everyone agrees that some legal propositions are indeterminate. Typical examples include highly contentious Supreme Court decisions interpreting the Constitution. Where the Court persistently divides five-to-four over some proposition, it seems fair to call the proposition indeterminate. The indeterminacy thesis holds, then, within some domain. If that do- main is small enough, though, nothing interesting about the rule of law follows. To be interesting, the indeterminacy thesis must include a "fair amount" of legal propositions. Sometimes, in unguarded moments, people will assert-then quickly withdraw the assertion-that the domain of indeterminacy does not exist at all. Controversy and division within the Supreme Court, af- ter all, might not result from the Constitution's indeterminacy. The jus- tices might not have had time to work out all the difficult problems as- sociated with the relevant legal materials, for example. But, in the fullness of time (and aided by critical commentary from legal academ- ics), we will know the right answer to any constitutional question. And if we can know the answer there, surely we can know the answers any- where in the law. This is to assert that legal materials provide one right answer for every contestable legal proposition. At one point Ronald Dworkin made that claim. 2 Dworkin's argument, however, was restricted enough that, even if accepted, it does not threaten the indeterminacy thesis. To es- 3 tablish his claim, Dworkin had to posit a judge who he called Hercules.1 The name indicated that such a judge, with all the skill over the materi- als of law one could demand, could always arrive at the right answer to any legal question.'4 Put this way, Dworkin's is a claim about the on- tology of law, asserting that all legal propositions are in some sense true or false. It says nothing about whether real judges can arrive at the right answer in any case. And, because the indeterminacy thesis is connected to claims about the democratic legitimacy of law in real societies, Dworkin's conceptual point does not impair it. And, to the extent that the indeterminacy thesis deals with informal political theory, <u>what matters is what happens in law as it is practiced</u>. More threatening to the indeterminacy thesis are examples of clearly determinate legal propositions. Standard examples are: "Litigants named Tushnet always lose"; "Under the present United States Consti- tution no person may become president who is under 35 years of age"; "Under the present United States Constitution the president may not dis- approve-veto--a single item in an appropriations bill passed by the Senate and the House of Representatives." The first (hypothetical) legal proposition is determinate because we know that, were it part of the law, I would lose any case in which I was a plaintiff or defendant. The other propositions are assertions about the meaning of the present United States Constitution. Another version of this sort of criticism of indeter- minacy claims points to the large proportion of cases decided unani- mously by appellate courts and reports by judges that they find serious legal questions in only a small proportion of the cases they have to de- cide. If the propositions offered as examples are indeed determinate, or if judicial unanimity establishes determinacy, the domain of the indeter- minacy thesis might be quite small. These examples of determinacy do not actually impair the indeterminacy thesis because they do not signifi- cantly restrict the thesis's domain, when the thesis is properly under- stood. And, defining the proper domain of the thesis and explaining why indeterminacy occurs will put in question the apparent determinacy of even these propositions. <u>The indeterminacy thesis's domain is this</u> (or some roughly equivalent variant): <u>Every legal proposition that a lawyer would find professionally respectable to assert is indeterminate</u>. 5 Identifying the domain in this way points toward why <u>the indeterminacy thesis has implications for democratic legitimacy</u>. It makes the professional judg- ment of lawyers crucial to the thesis.'6 And, in ways explored in more detail later, lawyers are a "class" or social group whose judgments need not indicate that arguments lawyers do not make are frivolous in some deep sense. The fact that the profession and the social groups with which it is associated screen out some claims from professional respect- ability does not mean that those claims lack social significance.17 The undeniable fact that no one raises claims in connection with many "legal events"-stopping at a stop sign, paying the sales tax on clothing pur- chases-therefore, does not undermine the indeterminacy thesis, unless raising claims about them could not possibly fall within the range of professionally respectable argument.

Rights Bad

Rights bad – they are used for conservative ends by conservative judges, generate opposition, and rely too heavily on individualistic assumptions

Mark **Tushnet '5** Prof of Law at Harvard, formerly Georgetown. Father of Rebecca. "Critical Legal Theory" *The Philosophy of Law and Legal Theory* pp 80-90

The indeterminacy thesis and the phenomenological arguments about the ways in which people created images of legality to reconcile themselves with their social positions combined in one of early critical legal theory's most controversial claims, described as the critique of rights (Tushnet 1984). Critical legal theory was created after the US Supreme Court had begun to repudiate its earlier interventions on behalf of liberal interests in cases involving race and social welfare. Those interventions remained important in the legal academy's understanding of the possibilities of legal, and particularly judicial, action in support of progressive visions of social justice. Among those possibilities was the use of the legal system to vindicate rights – moral, constitutional, and other – on behalf of socially subordinated groups. Brown v. Board of Education (1954), the desegre- gation decision, and Roe v. Wade (1973), the abortion decision, loomed large in the minds of progressive legal scholars. The critique of rights posed a sharp challenge to the prevailing image of legal possibility. It seemed to place Brown and Roe in question, suggesting that these triumphs of liberal legal activism were somehow inconsistent with en- during achievements for progressive law and politics. The critique of rights questioned the utility of making claims of legal right on a number of grounds. First, the indeterminacy thesis suggested to critical legal scholars **that rights-claims were a double-edged sword**. There was no reason to suppose, they argued, that courts would vindi- cate only rights-claims made by subordinated groups. Seeing hints in the late 1970s and early 1980s of possibilities that came to fruition in the 1990s, the critique of rights worried that strong defenses of courts as rights-protectors would turn against progressives when the courts started to vindicate the rights of whites in affirmative action cases, and property owners in cases involving claims that government regulation amounted to a taking of primate property. Second, the critique of rights found in the slogan, ''Law is politics,'' another danger in reli- ance on rights-claims in the judicial arena. Such claims could trigger counter-claims of right- invasion by political opponents. More important, framing political claims in legal terms naturally induced activists to seek redress in courts, dimin- ishing the attention they could devote to other arenas of political action such as legislatures and the streets. But, courts were not a reliable source of rights-protection. Even when courts took the progressive side in identifying rights-violations, actually implementing the courts' decisions required a mobilized political community whose development might have been impaired by the dominance of lawyers pursuing the rights strategy. Third, the critical legal scholars' phenomenology led them to believe that, at least in the context of the United States in the late twentieth century, claims about rights were likely to re- inforce an individualism that they believed stood in the way of developing community solidarities that could generate more substantial progressive change. The dominant concepts in constitutional law in particular were strongly individualist. The rhetoric of Brown focused on the rights of each individual African American child to attend school without regard to his or her race; Roe relied on an earlier case saying, ''If the right of privacy means anything, it is the right of the indi- vidual . . . to be free from unwarranted govern- mental intrusion'' (Eisenstadt v. Baird, 1972). Critical legal theorists believed that the individu- alism of a rights-based strategy occluded the underlying social conditions, including social mobilization, that actually induced courts to recognize rights. Related to this last point was a fourth one, deriving from the phenomenological social theory. Rights-strategies on

behalf of progressive interests took advantage of, but were also infected by, the prevailing view of people as individuals with rights that resided in themselves as em- bodied persons, a view most obviously compat- ible with the claims of women in the abortion cases. But, the critique of rights argued, rights- claims were made against the state, and led people to experience rights as something conferred on them by a fantasized ''state'' rather than as a set of lived experiences arising out of social relations of a particular sort. The critique of rights elicited a strong reaction from minority legal scholars who were part of the rough social formation – leftist, non-liberal legal theorists – that included the early critical legal scholars (Williams 1987). The minority response was that the critique of rights undervalued the contribution rights-claims had made to reducing social subordination and, perhaps more import- ant, failed to take account of the ways in which judicial recognition of rights provided minority communities with a sense of full membership in the nation even if the rights were imperfectly implemented. The latter point, if not the former, was actually compatible with the indeterminacy thesis and, indeed, with the critique of rights itself, and this aspect of the minority response to early critical legal theory became an accepted part of critical legal theory generally.

Aff Answers

Permutation

The permutation solves – we can use the plan as a way to make privacy less individualistic and more collective. Privacy as a concept can be reformed very easily

Colin J. **Bennett 11**, Professor of political science at University of Victoria, British Columbia, 2011, "In Defence of Privacy: The concept and regime," Surveillance and Society 8-4, http://library.queensu.ca/ojs/index.php/surveillance-and-society/article/view/4184/4186

The individualistic conceptions of privacy, however, hardly constitute a paradigmatic understanding of the problem, and there have been a number of attempts to realign the issue in ways that perhaps hold more contemporary relevance. Most prominently, Priscilla Regan has argued that privacy should be seen as a common value, 'in that all individuals value some degree of privacy and have some common conceptions about privacy'. It is a public value, 'in that it has value not just to the individual...but also to the democratic political system'. And it is a collective value, 'in that technology and market forces are making it hard for any one person to have privacy without all persons having a similar minimum level of privacy' (Regan 1995, 213). Her analysis suggests that privacy, framed in individualistic terms, is always on the defensive against arguments for the social benefits of surveillance. Privacy will always be in conflict with those social and collective issues, which tend to motivate mass publics and their representatives. We must, therefore, frame the question in social terms, because society is better off if individuals have greater levels of privacy.

In a similar vein, Valerie Steeves has recently attempted to reconceptualize privacy 'as a dynamic process of negotiating personal boundaries in intersubjective relations...By placing privacy in the social context of intersubjectivity, privacy can be more fully understood as a social construction that we create as we negotiate our relations with others on a daily basis' (Steeves 2008, 193). The critique also appears in analyses of particular surveillance practices. Jane Bailey and Ian Kerr, for instance, have analyzed the continuous archival and retrieval of personal experiences (CARPE) and concluded that the 'individualistic conception of privacy that predominates western thinking, is nevertheless inadequate in terms of recognizing the effect of individual uptake of these kinds of technologies on the level of privacy we are all collectively entitled to expect' (Bailey and Kerr 2007).

Moreover, recognition of the social value of privacy is increasingly observed in the legal and policy world. One of the earliest and most influential reports on privacy protection was produced in the mid-1970s in the United States. The Privacy Protection Study Commission was established under the 1974 Privacy Act, and had some influence on setting US privacy protection policy along a different track from that followed in Europe and other countries. It began, however, by pointing out that: 'A major theme of this report is that privacy, both as a societal value and as an individual interest, does not and cannot exist in a vacuum. Indeed, 'privacy' is a poor label for many of the issues the Commission addresses because, to many people, the concept connotes isolation and secrecy, whereas the relationships the Commission is concerned with are inherently social' (United States PPSC 1977, 21, my emphasis).

The perm solves best – neoliberalism is not a monolithic evil, but a series of multiple, contradictory processes. The plan be harnassed as part of the effort to restrain the bad parts of neoliberalism

Clive **Barnett**, Faculty of Social Sciences at The Open University, PUBLICS AND MARKETS What's wrong with Neoliberalism?,
http://www.open.ac.uk/socialsciences/emergentpublics/publications/barnett_publicsandmarkets.pdf

What's really wrong with neoliberalism, for critics who have constructed it as a coherent object of analysis, is the unleashing of destructive pathologies through the combined withdrawal of the state and the unfettered growth of market exchange. 'Individual freedom' is presented as a medium of uninhibited hedonism, which if given too much free reign undermines the ascetic virtues of self-denial upon which struggles for 'social justice' are supposed to depend. Underwritten by simplistic moral denunciations of 'the market', these theories cover over a series of analytic, explanatory, and normative questions. In the case of both the Marxist narrative of neoliberalization, and the Foucauldian analysis of neoliberal governmentality, it remains unclear whether either tradition can provide adequate resources for thinking about the practical problems of democracy, rights and social justice. This is not helped by the systematic denigration in both lines of thought of 'liberalism', a catch-all term used with little discrimination. There is a tendency to present neoliberalism as the natural end-point or rolling-out of a longer tradition of liberal thought – an argument only sustainable through the implicit invocation of some notion of a liberal 'episteme' covering all varieties and providing a core of meaning. One of the lessons drawn by diverse strands of radical political theory from the experience of twentieth-century history is that struggles for social justice can create new forms of domination and inequality. It is this that leads to a grudging appreciation of liberalism as a potential source for insight into the politics of pluralistic associational life. The cost of the careless disregard for 'actually existing liberalisms' is to remain blind to the diverse strands of egalitarian thought about the relationships between democracy, rights and social justice that one finds in, for example: post-Rawslian political philosophy; post-Habermasian theories of democracy, including their feminist variants; various postcolonial liberalisms; the flowering of agonistic liberalisms and theories of radical democracy; and the revival of republican theories of democracy, freedom, and justice. No doubt theorists of neoliberalism would see all this as hopelessly trapped within the 'neoliberal frame' of individualism, although if one takes this argument to its logical conclusion, even Marx's critique of capitalist exploitation, dependent as it is on an ideal of selfownership, is nothing more than a variation on Lockean individual rights.

While some tradeoff between rights and safety is inevitable in civil society however only beginning by engaging with and attempting to work with the legal system can we please both sides of the discussion

Amitai **Etzioni 99**, University Professor at the George Washington University, "The Limits of Privacy", 1999, Basic Books (e-book), Pg 22-23

 "The challenge of carefully crafting a balance between the common good and individual rights, between public health, public safety, and privacy, is particularly keen if the balance sought is to be achieved not merely within the context of some abstract theory or model, but in the context of specific historical and social conditions of a real, existing society. The question I raise in practically every lecture I deliver on the subject is: How is one to determine whether the existing relationship between privacy and the common good (or between privacy as one good and other common goods) is out of kilter, and if it is, what ought to be done to correct the imbalance? In the following pages I suggest four criteria that can help to determine whether an imbalance exists, in which direction society is tilting, the scope of corrective action called for, and the specific qualities of the correctives to be

employed. They are applied to each of the five public policies under review here. Even those who do not share the approach to privacy advanced in this book may well find these criteria of interest in the study of other matters of public policy, legal doctrine ", and civic culture. (Previous presentations and applications of these criteria have been received favorably.28) Indeed, **even if the common good could somehow overnight be well protected in all the areas under study-if there were no more pedophiles, no infants born with HIV, no criminals hiding behind false IDs, and no terrorists exchanging unbreakable encrypted messages-the following analysis would still apply**. The specific studies of public policy, aside from whatever light they cast on the measures needed to improve the ways we protect public safety and health, also seek to illustrate a mode of policy analysis that encompasses ethical, legal, and practical considerations in the quest for a better society." "**Much of the discussion reflects a pivotal fact about society: Unlike ideologies, which can be centered on one core value, society cannot but serve multiple needs and wants**. This fact has an important consequence that deserves much more attention: **Societies typically cannot make perfect choices, because often they must sacrifice some measure of one good for the sake of another. Indeed, much of what is under discussion here concerns trade-offs between privacy and the common good**. I like to observe, however, that trade-offs are not always necessary. Indeed, **the discussion of most privacy issues should start with a quest for policies or laws that could enhance both goods**. One brief example: A kit that allows individuals to determine their HIV status in " "the privacy of their own home was developed in 1985. The kit entails no visit to a doctor's office or clinic, no filling out of forms or computer entries. Users can mail in a few drops of blood and a code name and then call for the results. Aside from providing more privacy than had been previously available, the kit also advances public health by offering those reluctant to be tested in a less private place an opportunity to learn their IIIV status. One notes with some sadness that the politics of privacy are such that even this very simple kit was bottled up in the Food and Drug Administration (FDA) for seven years before it was finally approved.29"

Perm Solves Liberalism

Liberalism can be improved from within – focusing on individual emancipation is key

Alan **Hunt '86**, professor of Sociology and Law at Carleton University, "The Theory of Critical Legal Studies", Oxford Journal of Legal Studies, 1986, http://www.academia.edu/8509655/THE_THEORY_OF_CRITICAL_LEGAL_STUDIES

The critique of orthodox legal scholarship draws upon a more generalized critique of liberalism and thus constitutes one of the major points of unification of critical legal studies. The core of this critique is the contention that the claim made by liberalism to resolve the persistent and systematic conflict between individual and social interests through the mechanism of objective rules within a framework of procedural justice is inherently flawed. Mediation between conflicting interests at best offers only a pragmatic response to social conflict which can achieve nothing other than a set of results which reflects the unequal distribution of power and resources whilst claiming to act in the name of a set of universal social values. Critical legal theory thus grounds itself on the critique of₈ the historical project of the Enlightment which is perceived as offering a rationalist and consensual solution to the problem of social order." It is in this context that I suggest that we can understand the ambiguous relationship between Roberto Unger and the critical legal studies movement. Unger provides a general theoretical critique of liberalism whilst at the same time insisting upon the inadequacies of the existing alternatives, the 'secular doctrines of emancipation', of which Marxist socialism is the most important. I suggest that sense can be made of Unger's relationship with critical legal studies by recognizing that he provides a coherent critique of liberalism which is widely invoked by critical legal authors. But there is only a very limited acceptance of Unger's own prescription for transcending liberalism, His alternative is itself a 'superliberalism' which stands close to the liberal tradition and holds out the promise of realizing the prospect of individual emancipation which liberalism itself has proved incapable of delivering, Unger himself is explicit, his alternative represents a superliberalism. It pushes the liberal premises about state and society. about freedom and dependence and governance of social relations by the will, to the point at which they merge into a larger ambition: the building of a social world less alien ..,. [It] represents an effort to make social life resemble more closely what politics (narrowly and traditionally defined) are already largely like in the liberal democracies: a series of conflicts and deals among more or less transitory and fragmentary groups." It is important to emphasize that it is *liberalism* as an intellectual construct rather than as an historically grounded system of social relationships which is the subject of this critique. Unger himself recognizes that his general critique 'treats liberal doctrine as a set of interlocking conceptions whose relationship to society is disregarded. The study of the internal structure of the theory has been pursued at the cost of an awareness of theory's social significance."

Privacy Good – Human Rights

The aff's defense of a right to privacy is key to human rights—turns the K

George **Kateb 01**, William Nelson Cromwell Professor of Politics, Emeritus, at Princeton University, Spring 2001, "On Being Watched and Known," Social Research 68-1, http://www.jstor.org/stable/40971451

Now if people, by some chance, do not complain when their rights appear, in the judgment of the observer, to be violated, or if they consider the matter insignificant, or even think that they deserve to be treated as they have been treated, the spirit of the laws - if I may reify - would admonish them. It would say that when a person is treated in certain ways, even if the harm is not felt as harm or felt at all, that person has nevertheless been harmed. A person is obliged to guard his or her rights by knowing when they are violated, or suspecting that they may have been, even in the absence of a judicial declaration to that effect. Every citizen must be extremely sensitive to actual or threatened or even arguable violations. That is the heart of democratic citizenship. By guarding one's rights, one is guarding not only one's own vital interests, but by the force of example or precedent, the vital interests of everyone else. In that sense, we are each other's keepers. Every valid assertion that my right has been infringed is simultaneously the same assertion on behalf of everyone else. Basic rights are general possessions. There is a further complication.

By guarding one's rights, one is also guarding one's own personhood or human status as well as everyone else's. (Personhood and human status are rough synonyms.) I mean to say that every violation of a basic right, just by being the suppression of a vital claim or interest, is also a failure to respect the personhood of a human being. In being improperly coerced, a person is also being held in contempt. A person is being treated, say, as if he or she were a child rather than an adult, or were a mere means to an end; or has forfeited all rights because of some offense. These forms of contempt are injuries or insults to persons and should register as an additional harm. Every basic right thus has a double meaning. The spirit of the laws - that is, the spirit of the U.S. Constitution and other comparable charters - reveres personhood, reveres the human status of every individual. Indeed, the substance of specific basic rights, such as free speech and religion, or the prohibition of self-incrimination and double jeopardy as well as, of course, the various rights clustered in the idea of the right of privacy, may be said to derive from an initial idea of personhood. Or if the practice of a given right preceded the articulation of the idea of personhood, then it is this idea that provided the rationale for the right when, for example, the codification we know as the Bill of Rights was framed, and that still provides the deepest reason for it.

Privacy Good - Democracy

Protecting privacy is key to democracy

George **Kateb 01**, William Nelson Cromwell Professor of Politics, Emeritus, at Princeton University, Spring 2001, "On Being Watched and Known," Social Research 68-1, http://www.jstor.org/stable/40971451

The third consideration is the overall inequality or asymmetry that is inherent in the situation. The world is divided between those who watch and know and those who are watched and known. Even without sinister purposes, those who watch and know are able to objectify the rest. Knowing that one is being objectified, one should feel that an attempt has been made to diminish oneself. Before one tries to rise above objectification, one should see it for what it is. Each of us is treated like a lab animal, a creature that excites the curiosity and probably the desire for further techniques and projects of those immersed in the process of watching and knowing.

This last consideration is the most comprehensive: that the new and ever more numerous techniques of watching and knowing human beings - and they are, with a cruel irony, most advanced in constitutional democracies - can lead to a fundamental revision in a person's self-conception. The revision is sharply at odds with the self-conception that a democratic individual, a democratic citizen, should have, and has so far usually had. In a constitutional democracy, in which everyone is guaranteed certain basic individual rights, personal and political, a sense builds up of oneself as precious, as a whole world, as an end in oneself. I have already referred to the idea that rights aim at denying the state the power and authority to treat adults as if they were children or to reduce them to mere means, mere instruments or machines. Part of the built-up sense yields the thought and corresponding sentiment that one owns oneself, which means that one is not owned by the state or by some superior caste or by society as an abstract entity. One is enabled to freely treat oneself as autonomous, to an important extent and in many respects. Woven into that notion of self-ownership and in the cognate of autonomy is that one is inviolable. That means not only that a person should not be invaded by forces that try to use him for purposes not his own, but also that we should think of a person as having boundaries that should not be breached.

Privacy Good – Mass Incarceration

Valuing privacy is key to solving mass incarceration—protects against self-incrimination

George **Kateb 01**, William Nelson Cromwell Professor of Politics, Emeritus, at Princeton University, Spring 2001, "On Being Watched and Known," Social Research 68-1, http://www.jstor.org/stable/40971451

On the specific matter of being known in accumulated detail that is instantly retrievable, and transferable to who knows how many agencies and groups and for who knows what purposes, two other consequences are worth mentioning. The first is that accumulated detail about people has the effect of defining them and locking them in that definition. The identity of each is established by imputation, and the identity is equated with an exhaustive account. A person is thought to be known through and through, and without appeal, until perhaps that person has to mount a legal or political challenge to that assumption. The second consequence is that a detailed record follows a person through life, growing old with him or her, yet not losing memory as the person does. A person will not be able to start life over again, free of some of time's filthy load. A person cannot run away or hide, unless prepared to abandon everything familiar and find some alien refuge. There is no escape from a recorded identity, no escape from deeds done long ago that, if wrong, were paid for, or were not wrong but somehow technically incorrect or forgivably careless.

There is no doubt that the storage and dissemination by police agencies of lifetime records improve the capacity of these agencies to determine the identity of criminals with greater certainty. Not so long ago, The New York Times (March 3, 1999, p. B3) published an account of how a man who was later accused of murdering three people betrayed himself when he was arrested in an unrelated misdemeanor theft case. Detectives had the man, already suspected of murder, unknowingly provide a DNA sample just by drinking from a soda bottle or glass. He was charged with murder on the basis of DNA obtained from his saliva sample.

I am happy that a murderer was caught. But the story of his self-incrimination distresses me. Not only may the spirit of the Fifth Amendment have been violated by the police technique, but the power of other new techniques that seduce an individual into giving himself away is alarming. This is being watched and known in an extended sense. I think that the greater ease of tracking down criminals through new techniques may reach the point where the struggle against crime has tilted so far in favor of the police that the very texture of life in a supposedly free society is radically altered. I hazard to say that if criminals were always caught, especially with their own cooperation, so to speak, we would no longer be living in a free society, a society where the human status is paramount. What would become of the spirit of the Fourth and Fifth Amendments - these precious and, yes, counterintuitive amendments that mean as much to personhood as any other amendments in the Bill of Rights? Such a society is not yet a police-state, but it erects so sharp a division between the innocent and the guilty that the innocent become too grateful that they are not guilty. They become too anxious to stay that way. There must be a blurred middle ground between guilt and innocence, if innocence is not to become too proud and hence censorious, and punitive or vindictive. Democracy is antithetical to moral rigor; the concept of individual human status cannot survive it. Not that there can ever be perfect deterrence: a new thrill is added to breaking the law when policing is armed with increasingly potent devices of watching and knowing. But the perfection of the apparatus signifies the willed diminishment of human beings. We can be sure that authorities in the United States are working to achieve a world where everyone at birth is fingerprinted and made to leave a DNA deposit, not only a world in which every communication is recorded and can be retrieved. What is left of respect for the human status in all this?

Privacy Good – Innovation

Privacy is key to innovation and freedom—Turns the K because innovation and freedom are prerequisites to solve

Julie E. **Cohen 12**, Professor of Law at Georgetown University Law Center, November 5, 2012, "What Privacy is For," Harvard Law Review Vol. 126,
http://poseidon01.ssrn.com/delivery.php?ID=11406900900910311202802010208401410600404902008801209107307110211100811306701011002401811001706306204909711800610501812512500400804308802605207010411908009302605003501309608911107512100500411400008808900106712

When the predicate conditions for innovation are described in this way, the problem with characterizing privacy as anti-innovation becomes clear: it is modulation, not privacy, that poses the greater threat to innovative practice. Regimes of pervasively distributed surveillance and modulation seek to mold individual preferences and behavior in ways that reduce the serendipity and the freedom to tinker on which innovation thrives. The suggestion that innovative activity will persist unchilled under conditions of pervasively distributed surveillance is simply silly; it derives rhetorical force from the cultural construct of the liberal subject, who can separate the act of creation from the fact of surveillance. As we have seen, though, that is an unsustainable fiction. The real, socially-constructed subject responds to surveillance quite differently—which is, of course, exactly why government and commercial entities engage in it. Clearing the way for innovation requires clearing the way for innovative practice by real people, by preserving spaces within which critical self-determination and self-differentiation can occur and by opening physical spaces within which the everyday practice of tinkering can thrive.

Public/Private Divide Good

The Public-Private distinction is essential to check the power of the state and to maintain the right to privacy and freedom.

Gregory P. **Magarian 04**, professor of law at Villanova University, "The First Amendment, the Public-Private Distinction, and Nongovernmental Suppression of Wartime Political Debate", *The George Washington Law Review*, Volume 73 No. 1, November 2004, pg. 12-13

The public rights theory's emphasis on deliberative **democracy makes the concept of personal integrity essential for expressive freedom**. In order **for the First Amendment to ensure robust democratic discourse, it must respect** a zone of **individual conscience that allows people to evaluate information, formulate ideas, and participate meaningfully in democratic processes**. This conception of personal integrity embodies a functional corollary to the public rights theory's recognition of a public-private convergence. The public-private distinction should inform First Amendment analysis only to the extent the distinction serves the core First Amendment value of participatory democracy. Respecting a zone of individual conscience shields members of the political community from any conceivable First Amendment liability while also identifying them as First Amendment rights-holders. **329 The essential role of individual conscience in collective self-government is what puts the "rights**" in the public rights First Amendment. The importance of **allowing** individuals to exercise their conscientious faculties in political processes precludes any First Amendment check on their treatment of others' speech. In contrast, nongovernmental institutions are not members of the political community, nor do they possess the similar sort of individual privacy interests predicated on the Due Process Clause, that can properly fend off constitutional claims in general.330 In fact, **the economic power of many non-governmental institutions makes them significant threats to public rights of expressive freedom**, 331 a fact that justifies courts in enjoining nongovernmental interference with political debate.332 That same economic power can transform institutions' First Amendment claims into weapons against government reforms designed to enrich and broaden political debate.333 As I disuss below, **many nongovernmental institutions make** sufficiently important **contributions to democratic discourse to warrant protecting their expressive autonomy.334 Determining when to extend such protection, however, requires a nuanced functional analysis**--not merely a reflex **to slap the label "private" on any institution outside the government.**

At: Privacy Bad - Gender

A focus entirely on the negative aspects of this dichotomy on women obscures the positives. We must consider both ends of the spectrum before consider the alternative.

KAREN **ENGLE 99**, Redford Professor in Law & Director at University of Texas at Austin, "AFTER THE COLLAPSE OF THE PUBLIC/PRIVATE DISTINCTION: STRATEGIZING WOMEN'S RIGHTS", *Strategizing Women's Rights Reconceiving Reality: Women and International Law*, 1999, pg. 148

Just as there are advantages to the critiques, though, there are disadvantages. It is on the difficulties with the critiques that I concentrate, in an attempt to think about ways to strategize women's rights that take into account the multiple spaces (and spheres) in which women live. First, focusing so much on the ideology and on women's lives in what we see as the private realm has reified both the public and the private spheres. Even as the distinction has been collapsed, we still write and talk as though the categories mean something, and as though women really live in the "private" and need protection of international law there. Second (and at the risk of reifying the private), the critiques make us think of the unregulated private as something that is necessarily bad for women. We rarely look at the ways in which privacy (even if only because it seems the best available paradigm) is seen by at least some women to offer them protection. A number of examples immediately come to mind, each of which centers on women's bodies and, not surprisingly, on women's sexuality. The language of privacy, and sketching out zones of privacy, many would argue, is our best shot at legally theorizing women's sexuality. In United States legal jurisprudence, the First Amendment has been used to a similar end, as often seen in the debates about pornography.2"

The social provides a third sphere beyond the public and private that can help women

Karen V. **Hansen 87**, "Feminist Conceptions of Public and Private: A Critical Analysis", Berkeley Journal of Sociology, Vol. 32, 1987, http://www.jstor.org/stable/41035361?seq=1#page_scan_tab_contents

The public/private categories are ubiquitous in social science, and indeed fundamental to philosophies of the nineteenth and twentieth centuries. This however, insufficiently addresses the complexity of women's experience without an additional category: "the social." If we continue to ignore women's lived experience because it is "too complicated" for our conceptual categories we have failed as observers and analysts of society What is gained from examining the world through the prism of "the social" rather than the First, Arendt per- simply public/private? Deceptively characterized the modern industrial world as too complex to be captured by a simple dichotomy .In particular the, transfer of production outside the home changes the texture of family life as well as complicating the public arena. Second, these historical examples reveal "private" to be a misnomer when applied to nineteenth-century women's lives. Women did not exist in isolation nor were they concerned solely with "particular interests". Louisa Chapman was involved in a had multiple work and friend relation-community, ships, and was very concerned about her reputation. As Ryan so aptly put it, "A Sphere is nota Home." Louisa, like Martha Barrett and many others, was involved outside her home-church meetings, care for the sick, visiting , teaching Sabbath School, attending temperance lecture-in a way that could not accurately be called private. of social and alter the definitions of the other realms

structure, accordingly**". The social" is a distinct realm with its own regularities, processes and rules of behavior. "the social" allows us to reorient our and Finally, perspective, to see women's "social" activities as "work," weaving together the fabric of society, as Cott suggests**. Building on the recent work of Micaeladi Leonardo and others we can expand our of understanding the "social" work of women beyond kin networks and look at the and Women's role within "the social" neighborhood village.71 sphere consists of mediating the various forces of society-tying the church to the household, to the individual to the collectivity. The ideas raised and evidence provided in this paper challenge the and usefulness of the divide as a model accuracy public/private for social organization. Although definitive historical answers are not yet developed, it is important to ask questions about the of these and how we appropriateness sociological categories, understand what men and women do. Rather than reject categorization as Pitkin advocates, I **suggest we add a third category", the social," ascribed Arendt. Both as a reinterpret meaning by and its theoretical advance and as a concrete historical phenomenon", the social" informs our study of past and present. Since neither women nor men can be so we are bound to conduct a readily pigeonholed, careful review of lives as they were lived. The study of** these **people of 150 years ago fundamentally challenges the way we look at social structure and prompt students of contemporary social relations to re-examine our attachment to the less sophisticate dichotomy.**

Privacy supports private property

TARA J.**RADIN** and PATRICIA H**. WERBANE 07**, Doctoral Candidate and Ruffin Professor of Business Ethics at the Darden Graduate School of Business Administration at the University of Virginia, THE PUBLIC/PRIVATE DISTINCTION AND THE POLITICAL STATUS OF EMPLOYMENT", American Business Law Journal, 22/9/2007, http://onlinelibrary.wiley.com/doi/10.1111/j.1744-1714.1996.tb00699.x/full

The American economic system is based on private property, but it is often unclear where "private" property and ownership end and "public" property and ownership begin. "The process of drawing **the line between private and public is neither natural nor automatic**," asserts Alan Wolfe. "**The line is drawn differently in different times and different places, and law, including corporate** law", is one of the major mechanisms by which it is drawn. Within the workplace, ownership and control are often divided. **Corporate assets are held by an ever-changing group of individual and institutional shareholders. It is no longer always true that owners exercise any real sense of control over their property and its management. Moreover, such complex property relationships are spelled out and guaranteed by the stat**e. This has prompted at least one thinker to argue that "private property" should be defined as "certain patterns of human interaction underwritten by public power."12 **This fuzziness about the "privacy" of property is exacerbated by the way we use the term "public" in analyzing the status of businesses, and, in particular, corporations**. For example, we distinguish between privately - owned business corporations and government-owned or controlled, public institutions. **Among those companies that are not government-owned, we distinguish between regulated "public" utilities whose stock is owned by private individuals and institutions, "publicly held" corporations,** those corporations whose stock is traded publicly, who are governed by special SEC regulations and whose financial statements are public knowledge, and privately-held corporations and entrepreneurships, companies and smaller businesses that are owned by an individual or group of individuals and not available for public stock purchase.

Neoliberalism Good – Democracy

Neoliberalism promotes a democracy where a marketplace of ideas will ensure reforms in the future

Mike **Doyle 11**, Master's in Development Studies from the University of Cambridge, 4/12/11, "In Defense of Neoliberalism: Part III,"
https://cambridgedevelopmentstudies.wordpress.com/2011/04/12/in-defense-of-neoliberalism-part-iii/

We have had many discussions about one of the central tenet s of liberalism: democracy. We have debated whether it causes or is the cause of development. We talked about how efficient it is and whether it adequately addresses the needs of the very poor. However, I think we have glossed over one of the chief strengths of democracy: its ability to create a marketplace of ideas. In a democracy, new ideas have the ability to come into being, propagate, and put into practice. Just as evolution works to select the best traits to suit a given environment, so does the market place of ideas allow the best ideas to come to the fore. To be sure, this is a slow process full of trial and error, but it does allow societies to adapt effectively to an ever-changing environment. At the beginning of the paper, I talked about the dangers of an ossifying ideology. This danger takes on new heights in an intellectual environment where criticisms and views cannot be freely expressed. I believe the USSR collapsed precisely because there was not a fair exchange of ideas, it was not able to adapt until it was far to late. The following vignette is an example of what can happen when there is no marketplace for ideas:

After the reality of the devastation brought about by the Great Leap Forward came to Chairman Mao's attention, he issued a very interesting statement. To paraphrase, he said that the great Chinese famine would have never occurred in a democracy because the devastation caused by the agricultural reform would have been brought to attention much earlier. Because there was no free press and tolerance of criticism was low, Chinese bureaucrats were able to keep publishing inflated numbers about rice production even though production had been falling. The Chinese government continued to believe these inflated projections until the truth could no longer be ignored. Unfortunately, 20 million people died before this happened. What is more unfortunate is that Mao did not continue his brief flirtation with democracy.

Markets Good – Freedom

Free markets are prerequisites to political freedom

Milton **Friedman 82**, Economist at the University of Chicago, Winner of the 1976 Nobel Memorial Prize in Economic Sciences, 1982, "Capitalism and Freedom," pp. 15-17, http://www.pdf-archive.com/2011/12/28/friedman-milton-capitalism-and-freedom/friedman-milton-capitalism-and-freedom.pdf

Economic arrangements play a dual role in the promotion of a free society. On the one hand, freedom in economic arrangements is itself a component of freedom broadly understood, so economic freedom is an end in itself. In the second place, economic freedom is also an indispensable means toward the achievement of political freedom.

The first of these roles of economic freedom needs special emphasis because intellectuals in particular have a strong bias against regarding this aspect of freedom as important. They tend to express contempt for what they regard as material aspects of life, and to regard their own pursuit of allegedly higher values as on a different plane of significance and as deserving of special attention. For most citizens of the country, however, if not for the intellectual, the direct importance of economic freedom is at least comparable in significance to the indirect importance of economic freedom as a means to political freedom.

The citizen of Great Britain, who after World War II was not permitted to spend his vacation in the United States because of exchange control, was being deprived of an essential freedom no less than the citizen of the United States, who was denied the opportunity to spend his vacation in Russia because of his political views. The one was ostensibly an economic limitation on freedom and the other a political limitation, yet there is no essential difference between the two.

The citizen of the United States who is compelled by law to devote something like 10 per cent of his income to the purchase of a particular kind of retirement contract, administered by the government, is being deprived of a corresponding part of his personal freedom. How strongly this deprivation may be felt and its closeness to the deprivation of religious freedom, which all would regard as "civil" or "political" rather than "economic", were dramatized by an episode involving a group of farmers of the Amish sect. On grounds of principle, this group regarded compulsory federal old age programs as an infringement of their personal individual freedom and refused to pay taxes or accept benefits. As a result, some of their livestock were sold by auction in order to satisfy claims for social security levies. True, the number of citizens who regard compulsory old age insurance as a deprivation of freedom may be few, but the believer in freedom has never counted noses.

A citizen of the United States who under the laws of various states is not free to follow the occupation of his own choosing unless he can get a license for it, is likewise being deprived of an essential part of his freedom. So is the man who would like to exchange some of his goods with, say, a Swiss for a watch but is prevented from doing so by a quota. So also is the Californian who was thrown into jail for selling Alka Seltzer at a price below that set by the manufacturer under so-called "fair trade" laws. So also is the farmer who cannot grow the amount of wheat he wants. And so on. Clearly, economic freedom, in and of itself, is an extremely important part of total freedom.

Viewed as a means to the end of political freedom, economic arrangements are important because of their effect on the concentration or dispersion of power. The kind of economic organization that provides economic freedom directly, namely, competitive capitalism, also promotes political freedom because it separates economic power from political power and in this way enables the one to offset the other.

Historical evidence speaks with a single voice on the relation between political freedom and a free market. I know of no example in time or place of a society that has been marked by a large measure of political freedom, and that has not also used something comparable to a free market to organize the bulk of economic activity.

Because we live in a largely free society, we tend to forget how limited is the span of time and the part of the globe for which there has ever been anything like political freedom: the typical state of mankind is

tyranny, servitude, and misery. The nineteenth century and early twentieth century in the Western world stand out as striking exceptions to the general trend of historical development. Political freedom in this instance clearly came along with the free market and the development of capitalist institutions. So also did political freedom in the golden age of Greece and in the early days of the Roman era.

Queer K

ATs

AT: Capitalism

Class analysis can't do anything for us – Marxism oppresses those who are not heterosexual workers

Mary Nardini gang 2009 (criminal queers from Milwaukee, Wisconsin "toward the queerest insurrection" 2009)

When we speak of social war, we do so because∂ purist class analysis is not enough for∂ us. What does a marxist economic worldview∂ mean to a survivor of bashing? To a sex worker?∂ To a homeless, teenage runaway? How∂ can class analysis, alone as paradigm for a∂ revolution, promise liberation to those of us∂ journeying beyond our assigned genders and∂ sexualities? The Proletariat as revolutionary∂ subject marginalizes all whose lives don't fit∂ in the model of heterosexual-worker. ∂ Lenin and Marx have never fucked the ways∂ we have.∂ We need something a bit more thorough∂ - something equipped to come with teethgnashing∂ to all the intricacies of our misery.∂ Simply put, we want to make ruins of domination∂ in all of its varied and interlacing forms.∂ This struggle inhabiting every social relationship∂ is what we know as social war. It is both∂ the process and the condition of a conflict with∂ this totality.

AT: Cede the political

Read: alt solvency card – it's a political strategy and does not cede the political

The political is also already ceded for queers – we are precluded from discussions about politics because we are not "normal"

AT: Cooption

Read: queers are the only ones able to access failure as a political strategy [in 2NC topshelf]

AT: Kills collective Politics

1. Alt → queer solidarity – a method for queers to envision a different future from the status quo

2. Best method for queers to have political agency – it is difficult for us to access politics normally, but the alternative allows for queers to have access to the political realm.

Realism

Realism's ethic of consequentialism checks unwise action.

Williams '05 (Michael Williams, Senior Lecturer, Department of International Politics, University of Wales, THE REALIST TRADITION AND THE LIMITS OF INTERNATIONAL RELATIONS, 2005, 169)

Over the course of the preceding chapters, I have attempted to show that ==questions of the construction of action, and its ethical and political evaluation, lie at the core of the willful Realist tradition.== This final chapter seeks to demonstrate how this is expressed in two key and continuingly controversial Realist concepts: the ethic of responsibility and the national interest. The relationship between these two concepts is at the heart of many understandings of Realist ethics. In its most straightforward form, ==the national interest is seen to provide the value to be pursued and defended, while a foreign policy limited to and by the pursuit of that national interest and a prudent consequentialism provides a responsible limit on state action.== While this certainly captures important aspects of the Realist position, I will suggest that it fails to capture either the complexity or the continuing significance of willful Realism's engagement with the question of responsibility and its ethic of national interest.

Realism is empirically proven to be successful and is the best way to avert war

Guzzini '98 Stefano Guzzini, Senior Researcher, research units on Danish and European foreign policy and on Defence and security, 1998, Realism in International Relations and International Political Economy: The Continuing Story of A Death Foretold, 30-31

==The historical context of Munich and appeasement gave realism, as opposed to the idealist approaches prevailing in the inter-war period, an enormous appeal.== Carr and Morgenthau contributed to undermining the basic principles of what was dubbed idealism (Carr's Utopianism). Morgenthau was crucial in securing the ascendancy of realism in the newly founded academic specialization of International Relations. Carr used realist scepticism to criticize a great power of his day, his native Britain. He debunked the apparently universal harmony of interests as a status quo power ideology. Yet Carr's scepticism produces a restless circle of criticism which is, as he acknowledged, self-contradicting. Moreover, Carr's scepticism is neither able to define his exact mix of realism and idealism, nor to positively propose a coherent policy. Morgenthau, in his attempt to teach the diplomatic lessons of the past, was torn between his earlier criticism (1946) of idealists who confounded politics with science, and his own attempt to replace idealism by a claim to the scientific superiority of realism (1948, 1960). The result is a theory which must find conceptual bridges starting from the eternal laws of human nature, via the state as a unitary actor, to a necessary balance of power theory. It is much more complex and contradictory than usually acknowledged. To take just one example, Kenneth Waltz (1959) proposed a famous distinction between three images for understanding the causes of war. The first image is based on human nature, the second on the nature of the political regime, and the third on the specific characteristics of the international realm (anarchy). Waltz plainly placed Morgenthau within the first category. Yet, although Morgenthau derived power, and hence the essential characteristics of all politics including war, from human nature, he could also qualify for the other two images. He argued that the typical war of the gruesome twentieth century was a result of the democratization, and hence nationalization of international politics. This was how he called the shift to mass societies whose rulers have to respond to large constituencies. This is a form of a second image explanation. And finally, although it is true that politics is about the struggle for power based on human nature, the specificity of the international realm, what he called multiplicity, explains why the warlike struggle for power, while tamed at the domestic level, is endemic to the international level. How can Carr and Morgenthau, so different in style and content, and whose approaches are filled with so many internal tensions, become major reference points for one school of thought? Obviously they were perceived mainly through what they had in common, the critique of idealism and the priority given to power and politics. Hence, this chapter should also serve as a warning: as much as idealism was often idealized to allow a realist critique, realism has often been demonized by its adversaries and misused by reactionary friends. The binary opposition of realism and idealism more often serves to provide observers and practitioners with an identity than it does to provide analytical clarity**.** The ==realist world-view wants to be pragmatic, not cynical. Its main purpose is the avoidance of great war through the management and limitation of conflicts by a working balance of power supplemented by normative arrangements.== Nevertheless, for realists, the struggle for power will always arise. Conflicts cannot be abolished. For realists, foreign policy often brings choices that nobody wants to make. Diplomats might at

times have to gamble, but not because they like doing it. On the stage of world politics where brute forces can clash unfettered, diplomats enter a theatre of tragedy. This is the fate of the statesman, who, in the writings of Morgenthau, but also Kennan and Kissinger, appears as a romanticized heroic figure. Often misunderstood also by self-proclaimed realists, realist policy is not the external projection of a military or even reactionary ideology; it is the constant adjustment to a bitter reality. For realists, Realpolitik is not a choice that can be avoided, it is a necessity which responsible actors have to moderate.

Racism-Alternative Casualties

The common default of suspicion that surrounds the black body causes racism

Higgins 15 [Eoin Higgins, Master's Degree in History from Fordham University "Just Another Instance of White Terrorism" 6/23/2015 http://www.huffingtonpost.com/eoin-higgins/just-another-instance-of-_b_7618822.html Accessed 6/30/2015]

Blacks are criminalized in the news media, treated as less desirable than whites in the popular culture, and presented overwhelmingly as threatening criminal elements in film and television. Americans of all colors are inculcated to see blacks as threatening, alien, dangerous. This is terrorism. Black Americans are killed for eating skittles. Playing with toy guns as children. Listening to loud music. Selling cigarettes on the street. Running away from police officers. Hanging out at a pool party. Attending prayer meetings. There doesn't seem to be a way for black Americans to just be that doesn't involve the threat of death or violence at the hands of whites. This is terrorism. White Americans can drive without fear of being pulled over for the color of their skin and walk down the street without fear of being stopped and frisked. Black Americans cannot. White Americans can walk up to a police officer looking for help or directions. Black Americans face the chance of death if they do the same. This is terrorism. Terrorism is political and social violence and coercion that has the effect of changing the standard operating procedure of the societies it affects and striking fear into the communities it assaults. Blacks in America have no static standard operating procedure. Their behavior has to change constantly to reflect the threats and intimidation. For the black community in America, even the church is a place where one cannot feel safe. Not in 1963, not in the '90s, not in 2015.

The affirmative can solve for all alternative causes of racism

Watson 15 [Elwood Watson, Professor of History and African-American Studies at East Tennessee State University, "It Will Take More Than a Cup of Coffee to Address the Thorny Issue of Race in America" 3/27/2015 http://www.huffingtonpost.com/elwood-d-watson/it-will-take-more-than-a-cup-of-coffee_b_6944958.html Accessed 6/30/2015]

For many people, race is, indeed, often the 800-pound rambunctious elephant in the room. It is permeating our current state of affairs. The supposedly post-racial society we supposedly entered several years ago. For the record, I (and probably many other people of color) never believed such a fallacy. There is no person who is attuned to the climate of the current environment who can convincingly argue otherwise and Schultz is to be commended for attempting to tackle this thorny issue. That being said, the fact is that for far too often any effort to address the issue of race in America has been a largely packaged affair; ceremonial, co-opted and controlled by well-meaning yet often alarmingly out-of-touch legislators and celebrities. To put it bluntly, far too many efforts to address the issue of racism in our contemporary culture is often misguided, distressingly adrift, naive and tone deaf to the concerns and harsh realities that many people who suffer its (racism) pernicious effects have to deal with on a daily basis. Politicians of all races, entertainers and the occasional athlete or public intellectual locking arms and singing freedom songs from the civil rights movement more than half a century ago does little if anything to confront the searing issues that are plaguing many communities of color in the 21st century. Unarmed Black men

(and some women) being routinely shot by police officers. Students of color and non-White faculty and administrators, college students and faculty routinely enduring relentless forms of microaggressions from fellow students and colleagues on their campuses. Our current African American president, since the day he was inaugurated as president, consistently being subjected to disgraceful acts of obstruction, personal slights and blatant disrespect. Black college graduates are more than likely as their White cohorts to be unemployed. Applicants with Black-sounding names are considerably less likely to be contacted by employers than applicants with more White-sounding names. Black customers being disproportionately more likely to be followed by staff and, in some cases, detained by police officers in stores for suspicion of shoplifting -- "Shopping While Black".

Lack of communication between whites and blacks perpetuates racism

Blake 14 [John Blake, honoree of the Society of Professional Journalist, journalist for CNN "The New Threat: 'Racism without Racists'" 11/27/2014 http://www.cnn.com/2014/11/26/us/ferguson-racism-or-racial-bias/ Accessed 6/30/2015]

In a classic study on race, psychologists staged an experiment with two photographs that produced a surprising result. They showed people a photograph of two white men fighting, one unarmed and another holding a knife. Then they showed another photograph, this one of a white man with a knife fighting an unarmed African-American man. When they asked people to identify the man who was armed in the first picture, most people picked the right one. Yet when they were asked the same question about the second photo, most people -- black and white -- incorrectly said the black man had the knife. Even before it was announced that a grand jury had decided not to indict a white police officer in the shooting death of an unarmed black teen in Ferguson, Missouri, leaders were calling once again for a "national conversation on race." But here's why such conversations rarely go anywhere: Whites and racial minorities speak a different language when they talk about racism, scholars and psychologists say. The knife fight experiment hints at the language gap. Some whites confine racism to intentional displays of racial hostility. It's the Ku Klux Klan, racial slurs in public, something "bad" that people do. But for many racial minorities, that type of racism doesn't matter as much anymore, some scholars say. They talk more about the racism uncovered in the knife fight photos -- it doesn't wear a hood, but it causes unsuspecting people to see the world through a racially biased lens. It's what one Duke University sociologist calls "racism without racists." Eduardo Bonilla-Silva, who's written a book by that title, says it's a new way of maintaining white domination in places like Ferguson. "The main problem nowadays is not the folks with the hoods, but the folks dressed in suits," says Bonilla-Silva. "The more we assume that the problem of racism is limited to the Klan, the birthers, the tea party or to the Republican Party, the less we understand that racial domination is a collective process and we are all in this game."

Economic racism prevents discrimination from being resolved

Blake 14 [John Blake, honoree of the Society of Professional Journalist, journalist for CNN "The New Threat: 'Racism without Racists'" 11/27/2014 http://www.cnn.com/2014/11/26/us/ferguson-racism-or-racial-bias/ Accessed 6/30/2015]

One study conducted by a Brigham Young University economics professor showed that white NBA referees call more fouls on black players, and black referees call more fouls on white players. Another study that was published in the American Journal of Sociology showed that newly released white felons experience better job hunting success than young black men with no criminal record, Ross says. "Human beings are consistently, routinely and profoundly biased," Ross says. The knife fight experiment reveals that even racial minorities are not immune to racial bias, Ross says. "The overwhelming number of people will actually experience the black man as having the knife because we're more open to the notion of the black man having a knife than a white man, " Ross says. "This is one of the most insidious things about bias. People may absorb these things without knowing them." Another famous experiment shows how racial bias can shape a person's economic prospects. Professors at the University of Chicago and MIT sent 5,000 fictitious resumes in response to 1,300 help wanted ads. Each resume listed identical qualifications except for one variation -- some applicants had Anglo-sounding names such as "Brendan," while others had black-sounding names such as "Jamal." Applicants with Anglo-sounding names were 50% more likely to get calls for interviews than their black-sounding counterparts. Most of the people

who didn't call "Jamal" were probably unaware that their decision was motivated by racial bias, says Daniel L. Ames, a UCLA researcher who has studied and written about bias. "If you ask someone on the hiring committee, none of them are going to say they're racially biased," Ames says. "They're not lying. They're just wrong." Ames says such biases are dangerous because they're often unseen. "Racial biases can in some ways be more destructive than overt racism because they're harder to spot, and therefore harder to combat," he says.

Economic inequality perpetuates racism

Blake 14 [John Blake, honoree of the Society of Professional Journalist, journalist for CNN "The New Threat: 'Racism without Racists'" 11/27/2014 http://www.cnn.com/2014/11/26/us/ferguson-racism-or-racial-bias/ Accessed 6/30/2015]

Many whites -- including many millennials -- believe discrimination against whites is more prevalent than discrimination against blacks." But as Nicholas Kristof recently pointed out in The New York Times, the U.S. has a greater wealth gap between whites and blacks than South Africa had during apartheid. Such racial inequities might seem invisible partly because segregated housing patterns mean that many middle- and upper-class whites live far from poor blacks. It's also no longer culturally acceptable to be openly racist in the United States, says Bonilla-Silva, author of "Racism Without Racists."

An unwillingness to admit to racism prevents the deconstruction of racist policies and ideologies

Blake 14 [John Blake, honoree of the Society of Professional Journalist, journalist for CNN "The New Threat: 'Racism without Racists'" 11/27/2014 http://www.cnn.com/2014/11/26/us/ferguson-racism-or-racial-bias/ Accessed 6/30/2015]

When protests erupted in Ferguson after the shooting this summer, various white and black residents tried to talk about race, but such discussions didn't bear fruit because of another reason: People refuse to admit their biases, research has consistently shown. Ross, author of "Everyday Bias," cited a Dartmouth College survey where misinformed voters were presented with factual information that contradicted their political biases. There were voters, for example, who were disappointed with President Obama's economic record and believed he hadn't added any jobs during his presidency. They were shown a graph of nonfarm employment over the prior year that included a rising line indicating about a million jobs had been added. "They were asked whether the number of people with jobs had gone up, down, or stayed about the same," Ross wrote. "Many, looking straight at the graph, said down." Ross says it's even more difficult to get smart people to admit bias. "The smarter we are, the more self-confident we are, and the more successful we are, the less likely we're going to question our own thinking," Ross says. Some of the nation's smartest legal minds aren't big believers in racial bias either, and that could complicate efforts in Ferguson to reduce racial tensions. Some say they could be eased by hiring more officers of color in Ferguson's police force. But the conservative majority on the U.S. Supreme Court, led by Chief Justice John Roberts, has been suspicious of efforts to achieve diversity in workforces, believing that they amount to reverse racism or racial preferences, legal observers say. Some fear the court is about to get rid of one of the most effective legal tools for addressing racial bias. The court recently took up a fair housing case in Texas where the conservative majority could very well rule against the concept of "disparate impact," a legal approach that doesn't try to plumb the racist intentions of individuals or businesses but looks at the racial impact of their decisions. Disparate impact

is built on the belief that most people aren't stupid enough to openly announce they're racists but instead cloak their racism in seemingly race-neutral language. It also recognizes that some ostensibly race-neutral policies could reflect unintentional bias. <u>A disparate impact lawsuit</u>, for instance, wouldn't have to prove that a police department's white leaders are racist -- it <u>would only have to show the impact of having all white officers in an almost all-black town</u>. Roberts distilled his approach to race in one of the court's most controversial cases in 2007. The court ruled 5-4 along ideological lines that a public school district in Seattle couldn't consider race when assigning students to schools, even for the purposes of integration. "The way to stop discrimination on the basis of race is to stop discriminating on the basis of race," Roberts said in what is arguably his most famous quote. Roberts has equated affirmative action programs with Jim Crow laws, says Erwin Chemerinsky, author of "The Case Against the Supreme Court." <u>"Chief Justice Roberts has expressly said that the Constitution and the government should be colorblind,</u>" Chemerinsky says. "He sees no difference between government action that discriminates against minorities and one that benefits minorities." <u>What that means for Ferguson is that any aggressive attempt to integrate the police force could be struck down in court</u>, says Mark D. Naison, an African-American Studies professor at Fordham University in New York City. <u>Unless a lawyer can find smoking-gun evidence of some police department official saying he won't hire blacks, people won't have much legal leverage</u> to make the police department diverse, he says.

There are too many alternative causes to racism—surveillance isn't the brink
Bazian 14 [Hatem Bazian, lecturer in the Departments of Near Eastern and Ethnic Studies at University of California- Berkley "Michael Brown, racism and America's open casket" 11/24/2014 http://www.aljazeera.com/indepth/opinion/2014/11/michael-brown-racism-america-o-2014112552418399369.html Accessed 6/30/2015]

<u>America's</u> open casket to the world is its <u>racism</u> that <u>has been institutionalised and commodified into every part of the society from the police force, political order, court system, corporate structure, media and global relations</u>. Some are quick to point to gains made by African Americans since the civil rights movement; and, indeed we can point to these noticeable advancements including the first black president in the White House. However, <u>statistical data provides a</u> different <u>picture of a nation that is separate and profoundly unequal. African American unemployment</u> and underemployment <u>is almost twice as that of whites</u>. Further, data shows that "<u>by age 17, the average black student is four years behind the average white student; black 12th graders score lower than white 8th graders</u> in reading, math, US history and geography". What is most disturbing is that <u>incarceration rates for black American men stands at</u> 4,347 per 100,000 which is <u>almost 6.5 times the national average</u> of 707 per 100,000. Often US politicians and media talking heads spend countless hours speaking on prison-related human rights abuses abroad while under their noses a prison industrial complex is humming efficiently and their 401K might be invested in parts of it and providing a healthy return. More critically, <u>African American household net worth stands at $4,995 compared to $97,000 for whites, which is slightly ahead of an adult living under occupation in Palestine, and a poverty rate of 27.4 percent twice the national average</u>. In The National Center for Victims of Crime study, a troubling picture for African American young males and crime emerges concluding that "<u>black youth are three times more likely to be victims of reported child abuse or neglect, three times more likely to be victims of robbery, and five times more likely to be</u>

victims of homicide. In fact, <u>homicide is the leading cause of death among African American youth</u> ages 15 to 24". While the data shows blacks are victims of crime nevertheless, the approach by the government to their community adds insult to injury by treating them collectively as a criminal class by deploying police force to control rather than to serve and provide protection for the trans-historically abused community. Racism is America's open casket to the world and the murder of Michael Brown is the latest episode in a too familiar story dating back to the founding of the country. Emmett Till's casket remains open today for the underlying causes that murdered him are still around and unchanged. Michael Brown's cause of death is America's racism, the police officer was the weapon and the grand jury is the clean up crew. <u>Justice for African Americans remains an illusion since America fails to account for racism, the scars and the real bullets it leaves behind.</u>

Racial discrimination is still an issue in schools
Case, 2002

(Rebecca, Fall 2002, Not Separate but Not Equal: How Should the United States Address Its International Obligations to Eradicate Racial Discrimination in the Public Education System?,
http://racism.org/index.php?option=com_content&view=article&id=1167:education02-3&catid=49&Itemid=172

2. Academic Tracking **Many districts have created academic tracking programs.** These programs allow teachers and school administrators to determine a student's abilities and potential and then place that student in an academic track reflective of teacher's or administrator's personal perception<u>. The academic tracks range from remedial and special education programs to accelerated and gifted programs.</u> **Studies show that African American and Latino students are over-represented in the lower tracks and under-represented in the higher tracks.** <u>The tracking can begin very early in a child's academic career and can be extremely detrimental to the child's future. If a child is placed in a lower track because of a perceived inability to do mainstream work, it is often very difficult for the child to break into the higher track due to the very nature of the tracking system.</u> The method of determining how to put a student in a particular track is laden with racially discriminatory factors. **To determine which track to place a child in, three factors are considered: standardized test scores, teacher recommendations, and parental intervention.** <u>First, the standardized tests have frequently been criticized for being racially biased. Second, teacher recommendations are strictly subjective and can be based solely upon general impressions. Third, if parents are unaware of the system due to language barriers or because of general ignorance, the parents are unlikely to intervene on behalf of their child and push for a higher track placement.</u> 3. "Zero-Tolerance" Discipline Policies **Another area of racial disparity that leads to unequal treatment in the schools is the area of discipline. Studies show that students of color are more likely to be suspended and/or expelled from school than similarly situated white students.** This statistic has become more pronounced now that schools that receive federal funding (all public schools) must implement "zero- tolerance" policies for weapons offenses. **The policy may appear race neutral on its face, but the implementation of the policy has lead to findings of racial discrimination.** Since the consequences of bringing a weapon to school can be harsh, and can include suspension or expulsion, schools are permitted to evaluate incidents on a case-by-case basis and may deliver a less severe punishment if mitigating circumstances permit. <u>There is evidence to suggest that if a student appears to have a positive and</u>

promising future, schools will overlook relatively minor violations such as weapon possession, and will not expel the student. Instead the schools will deliver a lesser punishment in the hopes of rehabilitation, but there are inequalities in the application of this school discretion. Often, the minority students do not receive the benefit of this second chance and tend to suffer more devastating consequences. Racial discrimination affects more than disparate test scores and overall unequal treatment in the schools. One effect is addressed indirectly in CAT; however, because of the United States' limited definition of "torture," the CAT's implications are severely limited. According to the United States, the government need only deal with mental suffering caused by torturous acts in very few circumstances. These situations do not deal with any intentional racial discrimination that takes place in the schools but rather they address situations when the victim is in the custody of an official in the criminal setting or in a mental institution. The United States appears to ignore the times when children are under the control of the state during schools hours. Children are under the school's control during much of the day, for five days a week. Yet this time of responsibility is not considered time during which the United States accepts a responsibility to ensure that the children are not experiencing torture in the form of mental suffering. **When a child endures racial discrimination in the school system, the child will experience severe mental suffering that will affect him/her throughout the child's life. Students can easily feel frustrated as they are disregarded and classified in lower academic brackets, punished more harshly, and not given the financial means to succeed in school.** As the discrimination continues throughout school, the long-term effects will cause severe mental pain as the students begin to believe they are inferior to their white peers. The United States has not acknowledged the possibility that the suffering of the students under the government's control may fall squarely under its own limited definition of torture. **According to all three treaties, the unequal treatment between minority students and Caucasian students runs counter to the United States' international obligations.** In the United States' report to CERD, **the government characterizes racial discrimination problems as mainly private acts of discrimination. However, the disparities in schools are not just a result of intentional or private acts. Discrimination in school is a form of institutional racism and must be addressed by the United States.** The United States has an obligation under CERD to protect everyone from acts of racial discrimination and laws that either discriminate or have the effects of discrimination. Under CAT, the United States must prevent torture of all forms, including mental torture. Under ICCPR, the United States must protect every child, regardless of his/her race, as a minor in the society. These requirements are not currently being met.

Racial discrimination still affects minority wages
Fryer, Pager, Spenkuch, 2014

(Roland Fryer, Devah Pager, JÖrg Spenkuch, 8 January 2014, Spenkuch is an Assistant Professor of Managerial Economics and Decision Sciences, Fryer, Roland G., Devah Pager, and Jörg L. Spenkuch. 2013. "Racial Disparities in Job Finding and Offered Wages."Journal of Law and Economics, 56(3), 633–689. "Statistics That Hurt: Racial discrimination still affects minority wages" http://insight.kellogg.northwestern.edu/article/statistics_that_hurt

Recent research coauthored with Roland G. Fryer, Jr. of Harvard University and Devah Pager of Princeton University sets out to challenge the conventional wisdom that racial bias has a negligible effect on wage gaps between blacks and whites. Spenkuch says that his own anecdotal observations inspired the research. "I'm originally from Germany, and there, racial discrimination is essentially a nonissue because almost everyone is white," he says. "But when I came to the **United States, it just jumped into my face. It's very striking, and not just in job markets—there are racial differences in health, in life expectancy, in education. No matter where you look, race is a really important predictor of how well people do in life."** Indeed, Spenkuch and his coauthors find that black job seekers are offered—and accept—less compensation than white job seekers. In fact, **racial discrimination among employers could account for at least a third of the raw wage gap between black and white workers.** A New Lens on Racial Bias The researchers began by considering the limitations of previous economic approaches

to explaining—or explaining away—racial wage disparities. The so-called "Mincerian approach," Spenkuch explains, uses statistical regression methods to assign an impact to various observed variables affecting wages, including race. "This approach crucially relies on high-quality data in which there is no variable you could possibly think of that is correlated with race and also affects wages—which is of course never true," he says. Another approach uses structural models of the labor market, which can generate results that are highly dependent on initial assumptions used to construct the model—and if those assumptions are implausible, the results are suspect. Spenkuch and his coauthors attempted to combine the strengths of these two approaches while avoiding their shortcomings. "The strength of the structural approach is that there's a model of how people make decisions," he says, "and the strength of the first approach is that we can control simultaneously for a lot of different variables." The researchers also obtained access to a novel and uniquely rich set of data which observed the job-seeking activity of approximately 5200 recently unemployed black and white workers in New Jersey over twelve weeks in 2009—"basically 'yesterday' in economic terms," Spenkuch says. Crucially, this data also included wage offers—and not just the offers that applicants accepted, but also ones that they rejected. Spenkuch's "empirical test" became a matter of finding pairs of job-seekers—identical in every aspect except race, including the wages they received at their last job—and comparing the set of offers they each received while searching for a new job. (The researchers' model also included two initial assumptions: that whites and blacks draw job offers from a similar set of possible openings, and that blacks are not "systematically overpaid" in their previous positions compared to whites—in other words, that strong affirmative-action policies do not artificially prop up black workers' wages in spite of lower productivity.) Seeing Is Believing The findings were striking. **First, black job seekers were offered significantly less compensation than whites by potential new employers. Second, blacks were much more likely to accept these lower offers than their white counterparts.** "This is exactly what you would expect if blacks know that they're being racially discriminated against," Spenkuch adds. Finally, and surprisingly, the researchers found that wage gaps narrow over time as black workers stay at the same job. "As an employer I may discriminate against you by offering a lower wage when I first hire you," Spenkuch explains, "but over time as you work for me, I come to know how good you really are as an individual, and I adjust your wage accordingly." By taking these variables into effect alongside race, the researchers found that the "raw" wage gap between black and white workers—"which we observe at around 30 to 35 percent, if we don't adjust for anything," Spenkuch explains—narrows to between ten and twelve percent. This means that **racial discrimination must account for at least a third of the factors that contribute to black workers receiving lower wages than whites.** "It follows intuitively from the two assumptions in our model," Spenkuch says. "Those assumptions are not necessarily innocuous, but we feel confident that they are plausible." Bias by the Numbers The kind of racial bias that drives this effect, says Spenkuch, is called "statistical discrimination"— "which has nothing to do with any emotional distaste for working with minorities," he adds. "In our model, employers are purely profit-seeking. The employer says, 'I don't care why blacks are less productive on average; I know that they are, because of the lower SAT scores and other data that are observable. Therefore, if I don't know anything else about the candidate, I have to treat him as I would the average candidate in that racial group—that is, less favorably. Of course, by law employers are not allowed to do that. But the data show that it's happening." Spenkuch is quick to assert that "we haven't necessarily overturned the last twenty years of research on discrimination in the labor market with one study." After all, if a third of the wage gap between black and white workers is due to racial discrimination, that means that the majority of the gap is still being driven by other factors, such as disparities in education quality and other so-called "pre-market skill differentials." "Those factors clearly matter," Spenkuch says. "What we want to argue is that it's wrong not to pay any attention to discrimination, too. These results suggest that it's still going on—and enforcing existing legislation would substantially reduce the wage gaps we observe in the labor market. It wouldn't eliminate them. But it would narrow them.

Racial Discrimination still prevalent in law enforcement.
McKay, 2014

(John, 18 August 2014, Tom is a staff writer at Mic who covers national politics, media, policing and the war on drugs. He has previously written for The Daily Banter, Wonkette and MTV News, "One Troubling Statistic Shows Just How Racist America's Police Brutality Problem Is" http://mic.com/articles/96452/one-troubling-statistic-shows-just-how-racist-america-s-police-brutality-problem-is**)**

The statistics: **White officers kill black suspects twice a week in the United States, or an average of 96 times a year.** Those are the findings of a USA Today analysis of seven years of FBI data, which claims around a quarter of the 400 annual deaths reported to federal authorities by local police departments were white-on-black shootings. What's more, the analysis indicates that **18% of the black suspects were under the age of 21 when killed by the police, as opposed to just 8.7% of white suspects.** Throughout much if not all of America, black people are disproportionately more likely to be killed by the police. The background: Statistics like these may help explain why Pew polls have demonstrated continued low confidence among non-whites in the police and justice systems. Police in general,

and white cops in particular, have a pattern of disproportionately directing force against black people. **All too often, cases of abuse and excessive force are simply swept under the rug.** University of Nebraska criminologist Samuel Walker told USA Today that the lack of a comprehensive national repository on use of force has been a "major failure" for oversight, while USC colleague Geoff Alpert pointed out that around 98.9% of excessive force allegations are ultimately ruled as justified. In just one of many examples, NYPD almost exclusively shoots black or Hispanic suspects. <u>Protests involving black people are also more likely to attract police attention and use of force to disperse them. The ACLU has intensely documented an immensely troubling pattern of police militarization and found SWAT teams and other heavy-handed tactics are much more likely to be used against minority suspects than white ones</u>: In Ferguson, where community members are currently protesting deeply entrenched, racially discriminatory policing, **92% of all people arrested in 2013 were black.** The community as a whole, however, is 65% black. It's not just the police, either — the Urban Institute estimates that **white-on-black homicides in states with Stand Your Ground laws are 354% more likely to be ruled justifiable than white-on-white ones.** The State's Warren Boltondescribes how black men in America "endure a lifetime of suspicion," both from the authorities and people of other races. The statistics are clear. **Being the disproportionate target of violence by the police and white people in general is a systemic problem for black people across America.** Why you should care: The statistic on white-cop-on-black-suspect shootings is alarming in and of itself. But while race plays a critical role, the number of white cops shooting black people is just part of a larger problem. **Black people across the United States are more likely to face discrimination in the criminal justice system and be harassed, arrested and shot by police. Sadly, even the most extreme cases of police excess often end in little punishment.**

Racial Discrimination shows in the poverty groups of America
Vara, 2013

(Vauhini, 27 August 2013, Vauhini Vara, the former business editor of newyorker.com, lives in San Francisco and is a business and technology correspondent for the site. "Race and Poverty, Fifty Years After the March, http://www.newyorker.com/business/currency/race-and-poverty-fifty-years-after-the-march)

When we talk about the historic civil-rights gathering whose fifty-year anniversary will be celebrated on Wednesday, we usually call it the March on Washington. In fact, the full name of the event was the March on Washington for Jobs and Freedom; early in his speech, <u>Martin Luther King, Jr., lamented that black Americans lived "on a lonely island of poverty in the midst of a vast ocean of material prosperity." The marchers had ten demands for Congress, at least four of which were aimed at improving black people's financial circumstances and narrowing the gulf between black and white Americans' economic opportunities. Fifty years later, that gulf hasn't changed much. By some measures it has widened.</u> **In 2011, the median income for black households was about fifty-nine per cent of the median income for white households,** up slightly from fifty-five per cent in 1967, according to Census data analyzed by the Pew Research Center. But when you consider *wealth*—that is, everything a family owns, including a home and retirement savings—the difference seems to have grown. Pew found that **the median black household had about seven per cent of the wealth of its white counterpart in 2011,** down from nine per cent in 1984, when a Census survey first began tracking this sort of data. The trend is unsettling—hard to believe, even—particularly given the progress black Americans have seen on some fronts. In a 1961 poll, forty-one per cent of respondents said they wouldn't vote for a "generally well-qualified man" from their party if he happened to be black; five years ago, Americans elected a black President. In 1964, white students graduated high school at almost double the rate of their black peers; today, graduation rates for blacks are only a couple of percentage points lower than for whites. Yet black Americans have moved ahead little—and by some measures have fallen behind—with regard to the one standard that matters most to Americans: making money. How did this happen? How do we fix it? Back in 1963, the Washington marchers made these four economic demands: a higher federal minimum wage, a law barring discrimination by employers, a massive job-training program, and an increase in the areas of employment covered by the Fair Labor Standards Act of 1938—the law that established standards such as overtime pay. The policy changes brought about by the

protesters' demands, and the civil-rights movement at large, were significant, if not as numerous as King and his allies sought. In January of 1964, President Lyndon B. Johnson launched the policies that became known as the War on Poverty; that July, Congress enacted the Civil Rights Act of 1964. Through the sixties and into the seventies, the government started job-training programs and deliberately hired more black people into government jobs, among other measures. African-Americans increasingly found white-collar and skilled blue-collar work that provided decent wages—not only in northern cities like Baltimore and Detroit, which had drawn black workers earlier in the century, but also in the South. Black Americans seemed to be getting a foothold in the economy; by 1978, the black median income rose to fifty-eight per cent of the white median income, according to Pew. Then came the early nineteen-eighties, when corporations began going abroad for lower-cost labor and cutting domestic manufacturing jobs. That coincided, roughly, with a Reagan-era backlash against public spending that led to cuts in many of the earlier government programs. The gap between black and white incomes widened again. (The black-to-white income ratio would not surpass its 1978 high until the nineties.) "The people who went to Baltimore, who went to Detroit, were the go-getters of the African-American community," Dedrick Muhammad, the senior director of the economic department of the N.A.A.C.P., told me. "They were willing to work hard. These people, who have become demonized as the permanent underclass, *became* the permanent underclass when the jobs died." Because of the dearth of pre-1984 wealth information, researchers have had a hard time studying the racial wealth gap in the years immediately after the civil-rights movement. They have, however, come to better understand what has happened over the past twenty-five years. When researchers compare today's situation with that of 1984, they find that a greater share of blacks than whites have ended up in low-paying service positions—for instance, assisting in nursing homes—that don't offer benefits that help compound people's wealth, such as retirement plans. Black families are less likely to receive inheritances; black students both graduate college at lower rates and are more likely to be saddled with college debt; and blacks are incarcerated at disproportionate rates, reducing their ability to earn good wages even when those who are imprisoned become free. But the wealth gap mostly comes down to home ownership. Researchers at Brandeis University recently tracked the same group of black and white families from 1984 to 2009. During that period, a smaller proportion of black families bought homes, and those who did bought them later in life than their white peers—and that meant they benefited less as home values rose, according to Thomas Shapiro, a professor at Brandeis University. When one compares white families whose wealth grew over the years to black families whose wealth grew, Shapiro said, **twenty-seven per cent of the disparity between the two groups is related to home ownership.** Which brings us back to the March on Washington. **The marchers of 1963 sought policies that would help poor people generate wealth; back then, the government did that by helping people find good work and make decent wages, along with introducing anti-poverty programs that helped people pay for food and other essentials. Today, now that the wealth gap mostly has to do with investments— especially in housing—it would seem that the best policy solution would be to help people buy homes that they can afford and acquire other wealth-generating assets. Instead, the government's policies for poor people have emphasized consumption without also focussing on savings and investments**, as the Urban Institute, a research organization, pointed out in an April report. For instance, the government helps people pay for food with the Supplemental Nutrition Assistance Program. Families can even lose certain benefits if they save too much. **The United States does have policies aimed at building wealth—but those policies happen to disproportionately help people who are already pretty rich.** For instance, homeowners claim the mortgage-interest tax deduction only if they itemize their deductions, which higher-income taxpayers are likelier to do, and the deduction gets bigger when you have a larger mortgage or are in a higher tax bracket. There are solutions. The government could, for instance, turn the deduction for homeowners into a flat amount—and one, Shapiro said, that could apply only to a first home and wouldn't require taxpayers to fill out an extra form. EARN, a San Francisco nonprofit, offers savings accounts in which the nonprofit adds two dollars or more for every dollar a person deposits. The government could emulate that approach to encourage people to save. Four years after the March on Washington, King became frustrated with the government's focus on the Vietnam War at the expense of the War on Poverty. He organized a kind of sequel to the 1963 march—this time called the Poor People's Campaign. "We ought to come in mule carts, in old trucks, any kind of transportation people can get their hands on," he said. "People ought to come to Washington, sit down if necessary in the middle of the street and say, 'We are here; we are poor; we don't have any money; you have made us this way … and we've come to stay until you do something about it.' " In April of 1968, King was assassinated. Given his concerns about the stagnation of the civil-rights movement soon after the March on Washington, it's hard to imagine that King would have been satisfied, had he lived, to discover that on the fiftieth anniversary of his speech, black Americans are still calling out from an island of poverty and going unheard.

Global democracy is resilient – the US isn't key – our evidence assumes current trends

Larry **Diamond**, January **2014**, [prof. at Stanford], Journal of Current History, vol. 99, "The Next Democratic Century," http://cddrl.fsi.stanford.edu/sites/default/files/LD_Current_History_Jan_14.pdf, mm

This is an odd moment to predict a bright future for democracy. Despite the unprecedented expansion of political freedom during the three decades from 1974, democratic regimes are in trouble worldwide today. The past decade has witnessed democratic breakdowns at a growing pace, and levels of freedom have receded in many places. Autocrats are cooperating and innovating to preempt movements for democratic change. The world's oldest and most esteemed democracies, beginning with the United States, have lost their luster and (it seems) their capacity to function effectively to address their most important public policy challenges. Still, no other broadly legitimate form of government exists today, and authoritarian regimes face profound challenges and contradictions that they cannot resolve without ultimately moving toward democracy. During the past century, democracy went from being a unique feature of the West (and a few Western-leaning Latin American countries) to a system incorporated by a growing number of nonWestern countries, most of them former British colonies that reached independence during the first two decades after World War II. But the rise of communism and fascism and the shock of the Great Depression during the interwar period had occasioned what the political scientist Samuel Huntington called a "reverse wave" of democratic breakdowns. From the late 1950s to the mid- 1970s, the world wrestled with a second reverse wave, during which military coups swallowed fragile and often deeply polarized democracies in Latin America, Greece, Turkey, and parts of Asia, while elsewhere in Asia and Africa one-party or personal authoritarian regimes came to dominate. A number of factors fed the authoritarian zeitgeist: the spectacular failures of some democracies to govern effectively or maintain order, the successes of East Asian developmental dictatorships, the popularity in poor countries of authoritarian socialist models and ideologies, and the US-Soviet Cold War rivalry that saw each superpower back any dictator who would offer geopolitical support. By the mid-1970s, democracy seemed to many a quaint relic of a liberal past—a model of where the world had been, not where it was headed. Then came Portugal's Revolution of the Carnations in April 1974, overturning nearly half a century of quasi-fascist dictatorship, and a new wave of democratization began. Even with the rise of democracy in Portugal, Spain, and Greece in the subsequent few years, and then the transitions from military to democratic rule in Latin America in the late 1970s and early 1980s, few imagined that a truly global process of transformation was under way. Even the popular protests that toppled Ferdinand Marcos in the Philippines, or the student demonstrations that compelled the military to hand over power in South Korea, did not suggest a global trend. The fall of the Berlin Wall, however, changed everything. Not only did it spark democratic transitions in Central and Eastern Europe; the end of the Cold War unfroze the African landscape and encouraged democratic openings throughout the continent. By the mid- 1990s, democracy had become a global phenomenon, accounting for about three of every five states in the world.

Global democratization is consolidating now – the US isn't key

Larry **Diamond**, January **2014**, [prof. at Stanford], Journal of Current History, vol. 99, "The Next Democratic Century," http://cddrl.fsi.stanford.edu/sites/default/files/LD_Current_History_Jan_14.pdf, mm

Even so, a surprising number of other emerging democracies have met a litmus test of reasonably "liberal" democracy (garnering one of the two best scores on the seven-point Freedom House scales of both political rights and civil liberties). Forty percent of the world's states and about twothirds of the world's democracies (or 79 nations in all) now meet this test. And while the number and proportion of liberal democracies have hardly changed in the last seven years, **at least they have not declined**. Moreover, a number of other emerging market countries have

consolidated a decent level of¶ democracy—in the sense that it is very difficult¶ to imagine another reversal of democracy in these¶ countries. To the extent that they find democratic¶ "consolidation" a useful concept, most scholars¶ of Brazil would put it in this category. The same¶ is true for Mexico, where democracy has survived¶ in the face of widespread violence related to drug¶ trafficking. For all its disturbing levels of corruption,¶ clientelism, paralysis, and dysfunction, it¶ is similarly difficult to imagine democracy being¶ replaced by another type of regime in India. If,¶ after a disappointing second term for President¶ Susilo Bambang Yudhoyono, Indonesia elects a¶ reformist president in 2014 (such as the energetic,¶ progressive governor of Jakarta, Joko Widodo,¶ who is now leading in the polls), Indonesian¶ democracy might also turn in a more liberal and¶ stable direction.¶ South Korea, Brazil, Mexico, India, and¶ Indonesia are among the emerging market members¶ of the Group of 20 industrialized nations Three other members of that club—Turkey,¶ Argentina, and South Africa—fall into the category¶ of more troubled or embattled democracies,¶ with ruling executives and parties that appear to¶ harbor hegemonic ambitions. Each of the three¶ will hold national elections in 2014 or 2015, during¶ which each could move either in the direction¶ of further democratic decay or toward a more liberal¶ and rooted democracy.¶ Having decimated the old power establishment¶ in suspiciously wide-ranging trials of alleged¶ coup plotters, while also continuing to intimidate¶ and constrain the press, Prime Minister Recep¶ Tayyip Erdogan and his Justice and Development¶ Party (AKP) remain the dominant political force¶ in Turkey. After serving more than a decade as¶ prime minister, Erdogan (whose party's rules¶ bar him from seeking another term in that post) is trying to change the constitution to create a¶ muscular, French-style semi-presidential system,¶ which would enable him to remain in power for¶ a long time. Turkey will hold its first direct presidential¶ election in August 2014, but it is not at all¶ clear that Erdogan will succeed in amending the¶ constitution to give that post the strong executive¶ powers he seeks. Widespread youth protests in¶ recent months signal the beginning of a societal¶ pushback against the AKP's autocratic governing style.¶ In Argentina, President Cristina Fernández de¶ Kirchner's bid to aggrandize her power has already¶ failed. In midterm elections in late October 2013,¶ her party fell far short of the two-thirds majority¶ it would need to amend the constitution to allow¶ her a third term. Political momentum is now shifting¶ from her party due to corruption and economic¶ mismanagement, and Argentines are beginning¶ to look beyond what will be a dozen years of rule¶ by Fernández de Kirchner and her late husband,¶ Néstor Kirchner.¶ In South Africa, while there is little doubt¶ that President Jacob Zuma's African National¶ Congress will win the 2014 national elections, a¶ viable multiracial opposition is slowly beginning¶ to rise in the form of the Democratic Alliance,¶ the country's only party to have steadily and¶ significantly increased its share of the vote in¶ each of the four post-apartheid national elections.¶ Led by a savvy and effective institution¶ builder, Western Cape Premier Helen Zille, the¶ Democratic Alliance is gradually expanding from¶ its roots in South Africa's racial minorities to¶ appeal to black voters dissatisfied with corruption,¶ high unemployment, and poor service¶ delivery—long-standing problems that have only¶ grown worse under Zuma.¶ The fate of democracy outside the West will¶ be shaped disproportionately by what happens in¶ these weighty G-20 countries that could move in¶ either direction—Indonesia, Argentina, Turkey,¶ and South Africa—and by whether Brazil and¶ India can demonstrate the ability of large democracies¶ to generate vigorous, sustainable, and reasonably¶ equitable economic growth. If these countries¶ move even incrementally to entrench democracy¶ and deliver development, the G-20 will have¶ become a strong "club of democracies," with only¶ Russia, China, and Saudi Arabia holding out.

Global democracy is increasing – liberal values and civil society are trending upwards

Larry **Diamond**, January **2014**, [prof. at Stanford], Journal of Current History, vol. 99, "The Next Democratic Century," http://cddrl.fsi.stanford.edu/sites/default/files/LD_Current_History_Jan_14.pdf, mm

There are other reasons for optimism about the¶ future of democracy. Particularly in Asia, economic¶ development in a number of countries is having¶ the predictable effects it had in South Korea and¶ Taiwan, and before that in Spain and Portugal.¶ With rising levels of education and incomes and¶ growing access to information, values are changing.¶ People are becoming more tolerant of diversity,¶ more politically demanding and assertive, and¶ more willing to protest. As Ronald Inglehart of the¶ University of Michigan and Christian Welzel of¶ Leuphana University put it, people's value priorities¶ are shifting from material gain to "emancipation¶ from authority." Closely intertwined with this¶ psychological shift is the rise of civil society—of¶ independent organizations and flows of information,¶ opinion, and ideas.¶ These psychological and social changes undermine¶ the legitimacy of authoritarian rule and¶ generate favorable conditions for democratization¶ in Asia—not only in Malaysia and Singapore,¶ where it will probably happen within a decade,¶ but in China itself, where both the decay of communist¶ rule and the rise of a middle-class society¶ are much more advanced than has generally been¶ appreciated. Without major political reforms, it is¶ unlikely that communist rule can survive in China¶ beyond Xi Jinping's expected two five-year terms¶ as president. And in terms of the pressure for¶ political change, Vietnam is not all that far behind¶ China (particularly given South Vietnam's earlier¶ experience with more pluralistic politics and more¶ capitalist economics).¶ Factor in as well the incremental progress¶ toward reviving democracy in¶ Thailand, the efforts of reformist¶ President Benigno Aquino¶ to rein in corruption in the¶ Philippines, and a political¶ opening in Myanmar (though it¶ is still far from democracy), and¶ it becomes possible to imagine¶ that one of the most powerful emerging-market¶ trading blocs could be predominantly democratic¶ within a decade.

Aff – AT Growth Unsustainable

Growth is sustainable – innovation constantly increases our carrying capacity

Tsvi **Bisk**, **2012**, World Future Society, "No Limits to Growth,"
https://www.wfs.org/Upload/PDFWFR/WFR_Spring2012_Bisk.pdf, mm

When one factors in the growth of the proportion of GDP of services, the picture becomes even less foreboding. Services have become the major drivers of global economic growth. They constitute over 63% of global GDP and well over 70% of GDP in the developed world,6 and the proportion is increasing. While services such as translation, consulting, planning, accounting, massage therapy, legal advice, etc., also consume some natural resources, the quantity is infinitesimal in relation to the economic value produced. If I manufacture a car for $10,000 I have consumed a huge amount of natural resources and energy. But if I translate a 100,000-word book for $10,000 I have consumed merely the electricity necessary to run my computer, and the electricity used to send the translation as an email attachment, and little else that is even measurable. Consumers and the consumer society are not the problem. The problem lies in the production methods presently used by manufacturing, mining, and agriculture. And the solution lies in the revolutions that are also presently taking place in material science, water engineering, energy harvesting, and food production. We might speculate that the world economy can continue to grow **indefinitely** at 4%-5% a year while our negative footprint on the planet simultaneously declines. By the end of this century the planet will be able to carry a population of 12 billion people with an American standard of living and **one-tenth** the present negative environmental impact.

Growth is sustainable – innovation will usher in a "no limit to growth" era by 2020

Tsvi **Bisk**, **2012**, World Future Society, "No Limits to Growth,"
https://www.wfs.org/Upload/PDFWFR/WFR_Spring2012_Bisk.pdf, mm

But it is superlight materials that have the greatest potential to transform civilization and, in conjunction with the above, to usher in the "no limits to growth" era. I refer, in particular, to car- bon nanotubes—alternatively referred to as Buckyballs or Buckypaper (in honor of Buckminster Fuller). Carbon nanotubes are between 1/10,000th and 1/50,000th the width of a human hair, more flexible than rubber and 100-500 times stronger than steel per unit of weight. Imagine the energy savings if planes, cars, trucks, trains, elevators—everything that needs energy to move—were made of this material and weighed 1/100th what they weigh now. Imagine the types of alternative energy that would become practical. Imagine the positive impact on the environment: replacing many industrial processes and mining, and thus lessening air and groundwater pollution. Present costs and production methods make this impractical but that infinite resource—the human mind—has confronted and solved many problems like this before. Let us take the example of aluminum. A hundred fifty years ago, aluminum was more expensive than gold or platinum.37 When Napoleon III held a banquet, he provided his most honored guests with aluminum plates. Less-distinguished guests had to make do with gold! When the Washington Monument was completed in 1884, it was fitted with an aluminum cap—the most expensive metal in the world at the time—as a sign of respect to George Washington. It weighed 2.85 kilograms, or 2,850 grams. Aluminum at the time cost $1 a gram (or $1,000 a kilogram). A typical day laborer working on the monument was paid $1 a day for 10-12 hours a day. In other words, today's common soft-drink can, which weighs 14 grams, could have bought 14 ten-hour days of labor in 1884.38 Today's U.S. minimum wage is $7.50 an hour. Using labor as the measure of value, a soft drink can would cost $1,125 today (or $80,000 a kilogram), were it not for a new method of processing aluminum ore. The Hall-Héroult process turned aluminum into one of the cheapest commodities on earth only two years after the Wash ington Monument was capped with aluminum. Today aluminum costs $3 a kilogram, or $3000 a metric ton. The soft drink can that would have cost $1,125 today without the process now costs $0.04. Today the average cost of industrial grade carbon nanotubes is about $50-$60 a kilogram. This is already far cheaper in real cost than aluminum was in 1884. Yet revolutionary methods of production are now being developed that will drive costs down even more radically. At Cambridge University they are working on a new electrochemical production method that could produce 600 kilograms of carbon nanotubes per day at a projected cost of around $10 a kilogram, or $10,000 a metric ton.39 This will do for carbon nanotubes what the Hall-Héroult process did for aluminum. Nanotubes will become the universal raw material of choice, displacing steel, aluminum, copper and other metals and materials. Steel presently costs about $750 per metric ton. Nanotubes of equivalent strength to a metric ton of steel would cost $100 if this Cambridge process (or others being pursued in research labs around the world) proves successful. Ben Wang, director of Florida State's

HighPerformance¶ Materials Institute claims that: "If¶ you take just one gram of nanotubes, and you unfold¶ every tube into a graphite sheet, you can cover¶ about two-thirds of a football field".40 Since other¶ research has indicated that carbon nanotubes¶ would be more suitable than silicon for producing¶ photovoltaic energy, consider the implications.¶ Several grams of this material could be the¶ energy-producing skin for new generations of superlight¶ dirigibles—making these airships energy¶ autonomous. They could replace airplanes as the¶ primary means to transport air freight.¶ <u>Modern American history has shown that¶ anything human beings decide they want done¶ can be done in 20 years</u> if it does not violate the¶ laws of nature. The atom bomb was developed in four years; putting a man on the moon took eight¶ years. <u>It is a reasonable conjecture that by 2020 or¶ earlier, an industrial process for the inexpensive¶ production of carbon nanotubes will be developed,¶ **and that this would be the key to solving¶ our energy, raw materials, and environmental¶ problems all at once**</u>.

Innovation proves there are no limits to growth – advancements are being made now that will quickly reduce our impact on the environment

Tsvi **Bisk**, **2012**, World Future Society, "No Limits to Growth," https://www.wfs.org/Upload/PDFWFR/WFR_Spring2012_Bisk.pdf, mm

<u>The</u> embryonic <u>revolution in material science¶ now taking place is the key to "no limits to¶ growth</u>." I refer to "smart" and superlight materials.¶ Smart materials "are materials that have one¶ or more properties that can be significantly¶ changed in a controlled fashion by external stimuli."32¶ They can produce energy by exploiting differences¶ in temperature (thermoelectric materials)¶ or by being stressed (piezoelectric materials).¶ Other smart materials save energy in the manufacturing¶ process by changing shape or repairing¶ themselves as a consequence of various external¶ stimuli. <u>These materials have all passed the "proof¶ of concept" phase</u> (i.e., are scientifically sound)¶ and many are in the prototype phase<u>. Some are¶ already commercialized and penetrating the market</u>. For example, the Israeli company Innowattech¶ has underlain a one-kilometer stretch of local¶ highway with piezoelectric material to "harvest"¶ the wasted stress energy of vehicles passing¶ over and convert it to electricity.33 They reckon¶ that Israel has stretches of road that can efficiently¶ produce 250 megawatts. If this is verified, consider¶ the tremendous electricity potential of the¶ New Jersey Turnpike or the thruways of Los Angeles¶ and elsewhere. Consider the potential of railway¶ and subway tracks. We are talking about tens¶ of thousands of potential megawatts produced¶ without any fossil fuels.¶ Additional energy is derivable from thermoelectric¶ materials, which can transform wasted¶ heat into electricity. As Christopher Steiner notes,¶ capturing waste heat from manufacturing alone¶ in the United States would provide an additional¶ 65,000 megawatts: "enough for 50 million¶ homes."34 Smart glass is already commercialized¶ and can save significant energy in heating, airconditioning and lighting—up to 50% saving in¶ energy has been achieved in retrofitted legacy¶ buildings (such as the former Sears Tower in Chicago).¶ New buildings, designed to take maximum¶ advantage of this and other technologies could¶ save even more. Buildings consume 39% of America's¶ energy and 68% of its electricity. They emit¶ 38% of the carbon dioxide, 49% of the sulfur dioxide,¶ and 25% of the nitrogen oxides found in¶ the air.35 Even greater savings in electricity could¶ be realized by replacing incandescent and fluorescent¶ light bulbs with LEDS which use 1/10th¶ the electricity of incandescent and half the electricity¶ of fluorescents.¶ These three steps: transforming waste heat¶ into electricity, retrofitting buildings with smart¶ glass, and LED lighting, could cut America's electricity¶ consumption and its CO2¶ emissions by 50%¶ within 10 years. They would also generate hundreds¶ of thousands of jobs in construction and¶ home improvements. <u>Coal driven electricity generation would become a thing of the past</u>. The¶ coal released could be liquefied or gasified (by¶ new environmentally friendly technologies) into¶ the energy equivalent of 3.5 million barrels of oil¶ a day. This is equivalent to the amount of oil the¶ United States imports from the Persian Gulf and¶ Venezuela together.36¶ Conservation of energy and parasitic energy¶ harvesting, as well as urban agriculture would cut¶ the planet's energy consumption and air and water¶ pollution significantly. <u>Waste-to-energy technologies¶ could begin to replace fossil fuels</u>. Garbage,¶ sewage, organic trash, and agricultural and¶ food processing waste are essentially hydrocarbon¶ resources that can be transformed into ethanol,¶ methanol, and biobutanol or biodiesel.¶ These can be used for transportation, electricity¶ generation or as feedstock for plastics and other¶ materials. <u>Waste-to-energy is essentially a recycling¶ of CO2¶ from the environment instead of introducing¶ new CO2¶ into the environmen</u>t.¶ Waste-to-energy also prevents the production,¶ and release from rotting organic waste, of¶ methane—a greenhouse gas 25 times more powerful¶ than CO2¶ . Methane accounts for 18% of the¶ manmade greenhouse effect. Not as much as CO2¶ ,¶ which constitutes 72%, but still considerable¶ (landfills emit as much greenhouse gas effect, in¶ the form of methane, as the CO2¶ from all the vehicles¶ in the world). Numerous prototypes of a¶ variety of waste-to-energy technologies are already¶ in place. <u>When their declining costs meet¶ the rising costs of fossil fuels, they will become¶ commercialized and</u>, if history is any judge, <u>will¶ replace fossil fuels **very quickly**</u>—just as coal replaced¶ wood in a matter of decades and petroleum¶ replaced whale oil in a matter of years.

Momentum is building in the squo to prevent environmental destruction and warming through democratic channels – there is no need to turn to eco-fascism

Micah **White**, 9/16/**2010**, The Guardian, "an alternative to the new wave of ecofascism," http://www.theguardian.com/commentisfree/cif-green/2010/sep/16/authoritarianism-ecofascism-alternative, mm

Humanity can avert climate catastrophe without accepting ecological tyranny. However, this will take an immediate, drastic reduction of our consumption. This requires the trust that the majority of people would voluntarily reduce their standard of living once the forces that induce consumerism are overcome.¶ **The future of environmentalism is in liberating humanity from the compulsion to consume**. Rampant, earth-destroying consumption is the norm in the west largely because our imaginations are pillaged by any corporation with an advertising budget. From birth, we are assaulted by thousands of commercial messages each day whose single mantra is "buy". Silencing this refrain is the revolutionary alternative to ecological fascism. **It is a revolution which is already buddin**g and is **marked by** three synergetic campaigns: **the criminalisation of advertising, the revocation of corporate power and the downshifting of the global economy**.¶ **In São Paulo**, the seventh largest city in the world, **outdoor advertising has been banned**. Meanwhile, **artists in New York City and Toronto are launching blitzkrieg attacks on billboards**, replacing commercials with art. Their efforts have put one visual polluter out of business. Grassroots organisers in the US are pushing for an amendment to the constitution that will end corporate personhood while others are fighting to revive the possibility of death penalties for corporations. **The second international conference on degrowth** economics **met** recently **in Barcelona.** In Ithaca, New York a local, time-based currency is thriving. Buy Nothing Day campaign is celebrated in dozens of nations and now Adbusters is upping the ante with a call for seven days of carnivalesque rebellion against consumerism this November. And, most important of all, **across the world everyday people are silently, unceremoniously and intentionally spending less and living more**.¶ **Authoritarian environmentalists** fail to imagine a world without advertising, so they **dream of putting democracy "on hold**". In Linkola's dystopian vision, the resources of the state are mobilised to clamp down on individual liberty. But **there is no need to suspend democracy if it is returned to the people. Democratic, anti-fascist environmentalism means marshalling the strength of humanity to suppress corporations**. **Only by silencing the consumerist forces will both climate catastrophe and ecological tyranny be averted.** Yes, **western consumption will be substantially reduced.** But it will be done **voluntarily and joyously**.

Aff - AT Growth Unsustainable – Population

Overpopulation is overblown – global growth will peak at 10 billion and decline to 7 billion by the end of the century

Tsvi **Bisk**, **2012**, World Future Society, "No Limits to Growth,"
https://www.wfs.org/Upload/PDFWFR/WFR_Spring2012_Bisk.pdf, mm

One constant refrain of anti-growth advocates is that we are heading towards 12 billion people by the end of the century, that this is unsustainable, and thus that we must proactively reduce the human population to 3 billion-4 billion in order to "save the planet" and human civilization from catastrophe. But recent data indicates that a **demographic winter will engulf humanity by the middle of this century**. More than 60 countries (containing over half the world's population) already do not have replacement birth rates of 2.1 children per woman. This includes the entire EU, China, Russia, and half a dozen Muslim countries, including Turkey, Algeria, and Iran. If present trends continue, India, Mexico and Indonesia will join this group before 2030. The human population will peak at 9-10 billion by 2060, after which, for the first time since the Black Death, it will begin to shrink. By the end of the century, the human population might be as low as 6 billion-7 billion. The real danger is not a population explosion; but the consequences of the impending population implosion.47 This demographic process is not being driven by famine or disease as has been the case in all previous history. Instead, it is being driven by the greatest Cultural Revolution in the history of the human race: the liberation and empowerment of women. The fact is that even with present technology, we would still be able to sustain a global population of 12 billion by the end of the century if needed. The evidence for this is cited above.

Aff - AT Growth Unsustainable – Warming

Innovation will solve warming in the status quo

Tsvi **Bisk**, **2012**, World Future Society, "No Limits to Growth," https://www.wfs.org/Upload/PDFWFR/WFR_Spring2012_Bisk.pdf, mm

The goal of mitigating global warming/climate change without changing our lifestyles is not naïve. Using proven Israeli expertise, planting forests on just 12% of the world's semi-arid areas would offset the annual CO_2 output of one thousand 500-megawatt coal plants (a gigaton a year).45 A global program of foresting 60% of the world's semi-arid areas would offset five thousand 500-megawatt coal plants (five gigatons a year). Since mitigation goals for global warming include reducing our CO_2 emissions by eight gigatons by 2050, this project alone would have a tremendous ameliorating effect. Given that large swaths of semi-arid land areas contain or border on some of the poorest populations on the planet, we could put millions of the world's poorest citizens to work in forestation, thus accomplishing two positives (fighting poverty and environmental degradation) with one project. Moving agriculture from its current fieldbased paradigm to vertical urban agriculture would eliminate two gigatons of CO_2. The subsequent re-wilding of vast areas of the earth's surface could help sequester up to 50 gigatons of CO_2 a year, **completely reversing the trend**. The revolution underway in material science will help us to become "self-sufficient" in energy. It will also enable us to create superlight vehicles and structures that will produce their own energy. Over time, carbon nanotubes will replace steel, copper and aluminum in a myriad of functions. Converting waste to energy will eliminate most of the methane gas humanity releases into the atmosphere. Meanwhile, artificial photosynthesis will suck CO_2 out of the air at 1,000 times the rate of natural photosynthesis.46 This trapped CO_2 could then be combined with hydrogen to create much of the petroleum we will continue to need. As hemp and other fast-growing plants replace wood for making paper, the logging industry will largely cease to exist. Self-contained fish farms will provide a major share of our protein needs with far less environmental damage to the oceans.

Aff – AT Alt – Worse for Environment

A robust body of research proves that liberal, democratic regimes are better at managing environmental problems than authoritarian regimes

Dan **Shahar**, **2015**, Environmental Values, 24(3), "Rejecting eco-authoritarianism, again, 345-366, mm

As Eco-Authoritarianism has re-emerged into contemporary environmental discourse,¶ <u>a number of scholars have begun to pay closer attention to the environmental and political¶ performance of actual authoritarian societies</u>, primarily including but not limited to China.¶ <u>This scrutiny has revealed a largely-mixed track record</u> including some important successes¶ alongside significant shortfalls. Critics of China in particular have questioned the ability of¶ the Communist Party to successfully implement and enforce its high-minded directives,42¶ noting that sometimes "<u>being aggressive has no bearing on being effective</u>."43 Reservations¶ about the actual effectiveness of authoritarian environmental policies have been echoed in¶ discussions of other regimes in countries like Egypt,44 Iran,45 and Thailand.46 ¶ Bolstering these concerns, a recent study by Hanna Bäck and Axel Hadenius has¶ suggested the existence of a more general "J-shaped" relationship between democratization¶ and administrative efficiency across various countries and time periods. According to Bäck¶ and Hadenius, "<u>administrative quality is higher in strongly authoritarian states than in states¶ that are partially democratize</u>d; **it is highest of all**, however, <u>in states of a pronouncedly¶ democratic character</u>."47 They suggest <u>that this may be because highly democratic states can¶ rely on a well-developed civil society</u> for help in making sure that policies are well-calibrated¶ to particular contexts and for constructive feedback on policies once they are implemented.48¶ The authors note that authoritarian governments can sometimes perform better than partially democratized¶ societies with poorly-developed civil societies, but that they have thus far been¶ hard-pressed to find an effective substitute for the genuine citizen participation that enables¶ successful democracies to formulate and implement their policies successfully.49 Thus¶ <u>although authoritarian governments may be free from certain policy-making constraints faced¶ by governments in liberal regimes, administrators in even the most successful authoritarian¶ countries have historically failed to match the levels of state capacity enjoyed by citizens of¶ prosperous democratic countries</u> like Finland, New Zealand, and the Netherlands.50¶ <u>The dubious performance of</u> actually <u>existing authoritarian governments may</u> be¶ thought to <u>cast</u> some <u>doubt on the viability of Eco-Authoritarianism as a response to the¶ ecological crisis</u>. Thus Anthony Giddens has recently defended democracy against Shearman¶ and Smith by observing that "<u>Totalitarian states have generally had poor or disastrous¶ environmental records.</u> So also have most of those that have undergone processes of¶ 'authoritarian modernization,' such as China, Russia or South Korea."51 What Giddens fails¶ to appreciate, however, is the extent to which contemporary Eco-Authoritarians accept his¶ observations. Shearman and Smith, for example, begin The Climate Change Challenge and¶ the Failure of Democracy by announcing, "We agree that existing authoritarian societies,¶ largely based upon Marxist doctrines, have had an appalling environmental record. We accept¶ that there is no example of an existing authoritarian government that does not have a record¶ of environmental abuse."52

The alt would be far worse for the environment – history shows that democratic societies have better track records at protecting the environment

Jonathon **Adler**, Prof. Law and Dir. Center for Business Law and Regulation – Case Western Reserve U., New Atlantis, "Green Bridge to Nowhere", Fall, **2008**, http://www.thenewatlantis.com/publications/green-bridge-to-nowhere, mm

The first item on his agenda is the replacement of modern capitalism with some undefined "non-socialist" alternative. "The planet cannot sustain capitalism as we know it," he warns, calling for a fundamental transformation. But he does not understand the system he wants to reform, let alone what he would substitute in its place. According to Speth, "most environmental deterioration is a result of systemic failures of capitalism." This is an odd claim, as <u>the least capitalist nations of the world also</u> **have the worst environmental**

records. The ecological costs of economic statism are far worse than those of economic liberty. The environmental record of the various Soviet regimes amply bears this out: The West's ecological nightmares were the Soviet bloc's environmental realities. This is not due to any anomaly of the Soviet system. Nations with greater commitment to capitalist institutions experience greater environmental performance. While Speth occasionally acknowledges pockets of environmental progress, he hardly stops to consider the reasons why some environmental resources have been conserved more effectively than others. Fisheries are certainly declining throughout much of the world—some 75 percent of fisheries are fully or over-exploited—but not everywhere. It is worth asking why. Tropical forests in less-developed nations are declining even as most temperate forests in industrialized nations are rebounding. Recognizing these different trends and identifying the key variables is essential to diagnosing the real causes of environmental deterioration and prescribing a treatment that will work. Speth acknowledges that much of the world is undergoing "dematerialization," such that economic growth far outpaces increases in resource demand, but seems not to appreciate how the capitalist system he decries creates the incentives that drive this trend. Were it not for market-driven advances in technological capability and ecological efficiency, **humanity's footprint on the Earth would be far greater**. While modern civilization has developed the means to effect massive ecological transformations, it has also found ways to produce wealth while leaving more of the natural world intact. Market competition generates substantial incentives to do more with less—thus in market economies we see long and continuing improvements in productive efficiency. This can be seen everywhere from the replacement of copper with fiber optics (made from silica, the chief component in sand) and the light-weighting of packaging to the explosion of agricultural productivity and improvements in energy efficiency. Less material is used and disposed of, reducing overall environmental impacts from productive activity. The key to such improvements is the same set of institutional arrangements that Speth so decries: property rights and voluntary exchange protected by the rule of law—that is, capitalism. As research by Wheaton College economist Seth Norton and many others has shown, societies in which property rights and economic freedoms are protected experience superior economic and environmental performance than those societies subject to greater government control. Indeed, such institutions have a greater effect on environmental performance than the other factors, such as population growth, that occupy the attention of Speth and so many other environmental thinkers. Speth complains that capitalism is fundamentally biased against the future; but the marketplace does a far better job of pricing and accounting for future interests than the political alternative. "Future generations cannot participate in capitalism's markets [today]," says Speth. Fair enough, but they cannot vote or engage in the regulatory process either. Thus the relevant policy question is what set of institutions does the best—or least bad—job of accounting for such concerns, and here there is no contest. However present-oriented the marketplace may be, it is better able to look past the next election cycle than any plausibly democratic alternative.

China and Russia prove that eco-authoritarianism fails

Dan **Shahar, 2015,** Environmental Values, 24(3), "Rejecting eco-authoritarianism, again, 345-366, mm

In its own way, the early Eco-Authoritarian position made a certain amount of sense:¶ if it were true that an ecological crisis was being caused by excessive autonomy, that¶ democratic market liberal societies would systematically fail to generate the constraints¶ necessary to avoid the crisis, and that authoritarian governments would be able to keep¶ societies away from catastrophe through enlightened central planning, then the relative appeal¶ of authoritarianism would be clear.21 The problem with this position, however, was its crucial assumption that authoritarian governments would actually be able to generate better¶ outcomes through central planning.¶ This premise was quickly challenged in the academic literature by critics who argued¶ that authoritarian governments would be hard-pressed to cope successfully with their vastly increased¶ size and complexity while also navigating difficult ecological challenges.22 But the¶ biggest blows to early Eco-Authoritarianism came from the failure of real-world experiments¶ with centralized authoritarianism around the world. With the disintegration of the Soviet¶ Union and thoroughgoing economic reform of the People's Republic of China, it became¶ increasingly untenable in any area of discourse to advocate centralized authoritarianism as a¶ solution to any problem, never mind one requiring highly complex, efficient, and coordinated¶ actions by public agents.

The eco-authoritarian model can't solve – the USSR proves

Matthew **Humphrey**, **2007**, Ecological Politics and Democratic Theory: The challenge to the deliberative ideal, p. 140, mm

For all that the problems with which eco-authoritarians struggled were and¶ remain real, the faith they placed in an authoritarian state to resolve these¶ problems was surely misguided. Whilst the inferior ecological record of nondemocratic¶ states in itself proves nothing (how many of these states actually¶ prioritised environmental goals?), the ability of a state to impose its 'green will'¶ on an unwilling and resentful public who see their taken-for-granted freedoms¶ being curtailed is questionable, in the absence of a monstrous architecture of¶ green totalitarianism. Authoritarian states have often not been good at achieving¶ those policy goals that they have prioritised, as the forlorn ambition of the Soviet¶ Union to outstrip the productive capacity of the capitalist West testifies. There is¶ no obvious reason to expect an authoritarian green state to be better than the¶ Soviet Union at overcoming the internal divisions, inefficiencies, corruption, and¶ perverse incentives that plague such states.

Aff – AT Alt – AT Benevolent Leaders

Eco-authoritarianism inevitably collapses into tyrannical despotism – that makes solving the environment impossible

Dan **Shahar**, **2015**, Environmental Values, 24(3), "Rejecting eco-authoritarianism, again, 345-366, mm

Traditionally, critics of authoritarianism have worried that unrestrained power granted to government officials could fall into the wrong hands, resulting in a serious potential for tyrannical despotism.53 Despotism is obviously problematic due to the harms it typically generates for citizens living under its rule, but in the current context we may also worry that a despotic regime would end up neglecting to prioritize environmental protection, thereby failing to ameliorate the crisis that would have motivated the shift toward authoritarianism in the first place. In order to avoid this problem, Eco-Authoritarians would need to provide reason to think that following their prescriptions would mean putting our collective futures not into the hands of injurious despots but rather into those of administrators who possess both the capacity to address an impending environmental crisis effectively and the motivation to do so. This challenge has two interrelated aspects: first, it must be shown that a capable and benevolent "eco-elite" could be generated in the first place to rule over our society; and second, it must be shown that a system of rule by "eco-elites" could be effectively perpetuated over a long period of time. To my knowledge, the only contemporary Eco-Authoritarians who have taken up this challenge are also the most extreme proponents of the view: David Shearman and Joseph Wayne Smith. In The Climate Change Challenge and the Failure of Democracy, Shearman and Smith contend that successful Eco-Authoritarianism would require leaders of a caliber far higher than we find in contemporary society, and that producing such leaders would require a radically different system of education. This new system would be built around superior "real universities" that would purportedly "train holistic thinkers in all of the arts and sciences necessary for tough decision making that the environmental crisis confronts us with."54 The products would be "true public intellectuals with knowledge well grounded in ecology,"55 who would be charged with preserving "remnants of our civilization when the great collapse comes" as "the new priesthood of the new dark age."56 Perhaps unsurprisingly, the authors give only sketchy details on exactly how "real universities" would achieve these felicitous results. Their main proposals in The Climate Change Challenge and the Failure of Democracy seem limited to focusing scholarly research on problems that are important to human well-being,57 expanding the role of information sharing among the intellectual community,58 and accelerating the development of programs in environmental studies.59 Although many of these proposals seem reasonable and even attractive, they hardly seem like the sorts of revolutionary changes that would equip graduating students with the capacities and motivations needed to effectively rule over complex modern societies. Even if a capable and benevolent eco-elite could be produced, a further hurdle for Eco-Authoritarianism would involve demonstrating that the quality of elite rule could be maintained over time. Shearman and Smith do not take up this aspect of the issue in a substantive way, and to my knowledge neither does any other contemporary EcoAuthoritarian. But the challenge of sustaining a capable and benevolent ruling class over time is a notoriously difficult one for an authoritarian regime to overcome. As the eco-anarchist philosopher Alan Carter has quite reasonably worried: Even if a particular leader does turn out to be genuinely benevolent, even if he or she is not corrupted by the exercise of power or the need to retain power, how can it be guaranteed that those who inherit his or her position will be equally benevolent? Hierarchical structures, by their very nature, make it easy for the most competitive, most ruthless and least caring to attain power. Moreover, the centralized exercise of authoritarian rule is an ever-attractive goal for would-be usurpers, whose vision is usually less pure than those whom they usurp, as the history of many coups attests to.60 At the very least, it seems that Eco-Authoritarians owe us some account of how their proposed regimes could predictably avoid corruption over time.

Aff – Perm Solvency

The perm solves best – democracy is reflexive and can resolve environmental problems. The alt alone fails because the public will never get on board.

Bruce **Jennings**, May **2013**, [Jennings is the Director of Bioethics and Editor of Minding Nature at the Center for Humans and Nature], Center for Humans & Nature, "Governance in a Post-Growth Society: An Inquiry into the Democratic Prospect," http://www.humansandnature.org/governance-in-a-post-growth-society--an-inquiry-into-the-democratic-prospect-article-136.php, mm

<u>Ecological authoritarians are exceedingly pessimistic</u> about the current state of ordinary moral sensibility and political judgment in Western society. <u>They rest their assessment</u> and theory of governance <u>on a belief in the</u> widespread <u>cultural dominance of excessive individualism and materialism</u>, and seem to think that consumerism has thoroughly triumphed over every competing cultural or ethical value system. As an account of the logical tendencies at work in a particular form of economic system and society, <u>this argument has validity</u>, **but not as a complete empirical description** of currently existing culture and politics. <u>It underestimates the remaining moral capital in a growth-oriented society that can be channeled in future degrowth directions,</u> <u>thereby making a different form of democracy compatible with ecological requirements.</u> Many still quite powerfully held values compete with individualism and materialism in the attitudes and motivations of contemporary citizens. Furthermore, <u>it is far from clear that massive numbers of people will withdraw their allegiance from democratic governments</u> even if they fail to produce high levels of economic prosperity. Indeed, it is not at all clear that a democratic system would not be able to survive even a period of considerable austerity, if the need for such measures were clear and if the burdens and hardships were shared in a truly just and equitable way. These are large ifs. The relationship between economics and political legitimation is complex.¶ <u>As a matter of intellectual history, this equating of all forms of democracy with materialism</u> and a narrowly self-interested individualism **is overly selective**. Even in the modern period, democratic governance has rested on more than simply the ideology of growth and expansive capitalism. While <u>possessive individualism</u> has certainly been one important strand within Western democratic societies, it <u>has not been the only strand, and it has not gone unchallenged from within democratic thought itself.</u>[20] Thus it is misleading to argue that democratic governance cannot honestly appeal to any sense of public purpose larger than throwaway consumption. Believing that democratic governments could neither call for nor obtain popular support except on the basis of a promise of more economic growth, <u>ecological authoritarianism turns to non-democratic governance out of a sense of despair</u>. But, so far at least, <u>neither the sociological nor their historical arguments of this theory are sufficient to warrant that conclusion</u>.

Aff – Democratic Peace Theory

DEMOCRATIC PEACE THEORY IS EMPIRICAL FACT

McFaul, prof of political science @ Stanford and special assistant to Obama, **2010**

(Michael, Advancing democracy abroad: why we should and how we can)

==The== second ==concern about democracies being more prone war is also exaggerated. Democracies do not go to war with each other==. More precisely, **Bruce ==Russett, one of the closest observers of this phenomenon, writes==**, First, ==democratically organized political systems in general operate under restraints that make them more peaceful in their relations with other democracies==. . . . Second, in the modern international system, democracies are less likely to use lethal violence toward other democracies than toward autocratically governed states or than autocratically governed states are toward each other. Furthermore, there are no clearcut cases of sovereign stable democracies waging war with each other in the modern international system. ==Reflecting on a vast academic literature on the causes of war, Jack Levy concluded that the democratic peace theory is "the closest thing we have to empirical law in the study of international relations==."107 Democracies are not pacifist regimes when dealing with autocracies. But democracies are peaceful when interacting with other democracies.!

The best empirical data proves that democratic peace theory is a statistical law

Robert **Delahunty**, law professor, St. Thomas, John Yoo, law professor, Cal Berkeley, Winter **2010**, Chicago Journal of International Law, p. 463

> **Democracies settle disputes** through peaceful dispute settlement processes **more often than others**. Democracies are more likely to initiate wars against non-democracies than vice-versa. **Democracies fight shorter wars** with lower costs when they begin the wars. Transitional democracies are more likely to fight, and larger democracies are less likely to go to war than smaller ones. **Critics have questioned whether the findings are statistically robust, or have argued that omitted variables such as the stability of the Cold War are the true explanations. Yet it appears that the democratic peace is as close to a statistical law as anything will be in international politics**.

Rigorous statistical analysis supports democratic peace theory

Robert **Delahunty**, law professor, St. Thomas, John Yoo, law professor, Cal Berkeley, Winter **2010**, Chicago Journal of International Law, p. 461-2

> But before we reach any conclusion on whether American foreign policy ought to promote democracy--even to the point of using force to achieve regime change--**we need to understand the roots of** the **democratic peace.** If the peace is only a statistical regularity explained by factors other than domestic political systems, then spreading democracy will not advance American national security and could well be counter-productive. Defining democracy in a narrow way in order to fit the data might make the lessons for real world security more tenuous and even impractical. We need to understand the causal mechanism that makes democracies less warlike with each other before we can link the national security policy of individual states to Kant's larger goal of a league of democratic republics. **The "empirical regularity" of the democratic peace thesis is critical to our argument. Rigorous statistical analysis shows that democracies do not wage war with other democracies.**

Aff – Nuclear War o/w Environment

Environmental collapse can't cause extinction---nuke war outweighs---magnitude and probability

David **Schweickart 10** is Professor at Loyola University Chicago. He holds a Ph.D. in Mathematics (University of Virginia), and a Ph.D. in Philosophy (Ohio State University). "Is Sustainable Capitalism Possible?" Procedia Social and Behavioral Sciences 41 (2010) 6739–6752

It is not true either that the various ecological crises we are facing will bring about "the end of the world." Consider the projections of the Stern Review, the recently released report commissioned by the British Government. If nothing is done, we risk "major disruption to economic and social activity, later in this century and the next, on a scale similar to those associated with the great wars and economic depression of the first half of the 20th century." This is serious. Some sixty million people died in World War Two. The Stern Review estimates as many as 200 million people could be permanently displaced by rising sea level and drought. But this is not "the end of the world." Even if the effects are far worse, resulting in billions of deaths-- a highly unlikely scenario --there would still be lots of us left. If three-quarters of the present population perished, that would still leave us with 1.6 billion people--the population of the planet in 1900. I say this not to minimize the potentially horrific impact of relentless environmental destruction, but to caution against exaggeration. We are not talking about thermonuclear war--which could have extinguished us as a species. (It still might.) And we shouldn't lose sight of the fact that millions of people on the planet right now, caught up in savage civil wars or terrorized by U.S. bombers (which dropped some 100,000 lbs. of explosives on a Baghdad neighborhood during one ten-day period in January 2008--the amount the fascists used to level the Basque town of Guernica during the Spanish Civil War), are faced with conditions more terrible than anyone here is likely to face in his or her lifetime due to environmental degradation.

Aff – Environment Impact Defense

No impact to the environment

Easterbrook '95 (Gregg, Distinguished Fellow @ The Fullbright Foundation and Reuters Columnist, "A Moment on Earth," p. 25, 1995)

In the aftermath of events such as Love Canal or the Exxon Valdez oil spill, every reference to the environment is prefaced with the adjective "fragile." "Fragile environment" has become a welded phrase of the modern lexicon, like "aging hippie" or "fugitive financier." But <u>the notion of a fragile environment is profoundly wrong</u>. Individual animals, plants, and people are distressingly fragile. <u>The environment</u> that contains them **is close to indestructible**. <u>The</u> living <u>environment</u> of Earth <u>has survived ice ages</u>; bombardments of <u>cosmic radiation</u> more deadly than atomic fallout; <u>solar radiation</u> more powerful than the worst-case projection for ozone depletion; thousand-year periods of <u>intense volcanism</u> releasing global air pollution far worse than that made by any factory; <u>reversals of the</u> planet's <u>magnetic poles</u>; the rearrangement of continents; transformation of plains into mountain ranges and of seas into plains; fluctuations of ocean currents and the jet stream; 300-foot vacillations in sea levels; shortening and lengthening of the seasons caused by shifts in the planetary axis; collisions of <u>asteroids and comets</u> bearing far more force than man's nuclear arsenals; and the years without summer that followed these impacts. <u>Yet hearts beat on, and petals unfold still</u>. Were the environment fragile it would have expired many eons before the advent of the industrial affronts of the dreaming ape. <u>Human assaults on the environment</u>, though mischievous, <u>are pinpricks compared to forces of the magnitude nature is accustomed to resisting</u>.

Aff – AT Biodiversity Impact

No impact to biodiversity loss

<u>Although</u> one may agree with ecologists such as Ehrlich and Raven that the <u>earth stands on</u> **the brink of** an episode of massive **extinction**, **it may not follow** from this grim fact **that human** being**s will suffer** as a result. On the contrary, skeptics such as science writer Colin Tudge have challenged biologists to explain why we need more than a tenth of the 10 to 100 million species that grace the earth. Noting that "cultivated systems often out-produce wild systems by 100-fold or more," <u>Tudge declared</u> that "the argument that humans need the variety of other species is, when you think about it, a theological one." n343 Tudge observed that "the **elimination of all but a** tiny **minority** of our fellow creatures **does not affect** the material well-being of **humans** one iota." n344 This skeptic challenged ecologists to list more than 10,000 species (other than unthreatened microbes) that are essential to ecosystem productivity or functioning. n345 "The **human** species **could survive** just as well **if 99.9%** of our fellow creatures **went extinct,** provided only that we retained the appropriate 0.1% that we need." n346 [*906]   The monumental Global Biodiversity Assessment ("the Assessment") identified two positions with respect to redundancy of species. "At one extreme is the idea that each species is unique and important, such that its removal or loss will have demonstrable consequences to the functioning of the community or ecosystem." n347 The authors of the Assessment, a panel of eminent ecologists, endorsed this position, saying it is "unlikely that there is much, if any, ecological redundancy in communities over time scales of decades to centuries, the time period over which environmental policy should operate." n348 These eminent ecologists rejected the opposing view, "the notion that species overlap in function to a sufficient degree that removal or loss of a species will be compensated by others, with negligible overall consequences to the community or ecosystem." n349 Other biologists believe, however, that <u>species are so</u> fabulously <u>redundant</u> in the ecological functions they perform that the life-support systems and processes of the planet and ecological <u>processes</u> in general will <u>function</u> perfectly <u>well with fewer</u> of them, certainly fewer than the millions and millions we can expect to remain **even if every threatened organism becomes extinct**. n350 Even the kind of sparse and miserable world depicted in the movie Blade Runner could provide a "sustainable" context for the human economy as long as people forgot their aesthetic and moral commitment to the glory and beauty of the natural world. n351 The Assessment makes this point. "Although any ecosystem contains hundreds to thousands of species interacting among themselves and their physical environment, the emerging consensus is that the system is driven by a small number of . . . biotic variables on whose interactions the balance of species are, in a sense, carried along." n352 [*907]   To make up your mind on the question of the functional redundancy of species, consider an endangered species of bird, plant, or insect and ask how the ecosystem would fare in its absence. The fact that the creature is endangered suggests an answer: it is already in limbo as far as ecosystem processes are concerned. What crucial ecological services does the black-capped vireo, for example, serve? Are any of the species threatened with extinction necessary to the provision of any ecosystem service on which humans depend? If so, which ones are they? Ecosystems and the species that compose them have changed, dramatically, continually, and totally in virtually every part of the United States. There is little ecological similarity, for example, between New England today and the land where the Pilgrims died. n353 In view of the constant reconfiguration of the biota, one may wonder why Americans have not suffered more as a result of ecological catastrophes. The cast of species in nearly every environment changes constantly-local extinction is commonplace in nature-but the crops still grow. Somehow, it seems, property values keep going up on Martha's Vineyard in spite of the tragic disappearance of the heath hen. One might argue that <u>the</u> sheer <u>number and variety</u> of creatures available to any ecosystem <u>buffers that system against stress</u>. Accordingly, we should be concerned if the "library" of creatures ready, willing, and able to colonize ecosystems gets too small. (Advances in genetic engineering may well permit us to write a large number of additions to that "library.") In the United States as in many other parts of the world, however, **the number of species has been increasing** dramatically, not decreasing, as a result of human activity. This is because the hordes of exotic species coming into ecosystems in the United States far exceed the number of species that are becoming extinct. Indeed, introductions may outnumber extinctions by more than ten to one, so that the United States is becoming more and more species-rich all the time largely as a result of human action. n354 [*908] Peter Vitousek and colleagues estimate that over 1000 non-native plants grow in California alone; in Hawaii there are 861; in Florida, 1210. n355 In Florida more than 1000 non-native insects, 23 species of mammals, and about 11 exotic birds have established themselves. n356 Anyone who waters a lawn or hoes a garden knows how many weeds desire to grow there, how many birds and bugs visit the yard, and how many fungi, creepy-crawlies, and other odd life forms show forth when it rains. All belong to nature, from wherever they might hail, but not many homeowners would claim that there are too few of them. Now, not all exotic species provide ecosystem services; indeed, some may be disruptive or have no instrumental value. n357 This also may be true, of course, of native species as well, especially because all exotics are native somewhere. Certain exotic species, however, such as Kentucky blue grass, establish an area's sense of identity and place; others, such as the green crabs showing up around Martha's Vineyard, are nuisances. n358 Consider an analogy [*909] with human migration. Everyone knows that after a generation or two, immigrants to this country are hard to distinguish from everyone else. The vast majority of Americans did not evolve here, as it were, from hominids; most of us "came over" at one time or another. This is true of many of our fellow species as well, and they may fit in here just as well as we do. It is possible to distinguish exotic species from native ones for a period of time, just as we can distinguish immigrants from native-born Americans, but as the centuries roll by, species, like people, fit into the

landscape or the society, changing and often enriching it. Shall we have a rule that a species had to come over on the Mayflower, as so many did, to count as "truly" American? Plainly not. When, then, is the cutoff date? Insofar as we are concerned with the absolute numbers of "rivets" holding ecosystems together, extinction seems not to pose a general problem because a far greater number of kinds of mammals, insects, fish, plants, and other creatures thrive on land and in water in America today than in prelapsarian times. n359 The Ecological Society of America has urged managers to maintain biological diversity as a critical component in strengthening ecosystems against disturbance. n360 Yet as Simon <u>Levin observed</u>, "much of the detail about species composition will be irrelevant in terms of influences on ecosystem properties." n361 [*910] He added: "For net primary productivity, as is likely to be the case for any system property, biodiversity matters only up to a point; above a certain level, <u>increasing biodiversity is likely to make **little difference**</u>." n362 What about the use of plants and animals in agriculture? There is no scarcity foreseeable. "Of an estimated 80,000 types of plants [we] know to be edible," a U.S. Department of the Interior document says, "only about 150 are extensively cultivated." n363 About twenty species, not one of which is endangered, provide ninety percent of the food the world takes from plants. n364 Any new food has to take "shelf space" or "market share" from one that is now produced. Corporations also find it difficult to create demand for a new product; for example, people are not inclined to eat paw-paws, even though they are delicious. It is hard enough to get people to eat their broccoli and lima beans. It is harder still to develop consumer demand for new foods. This may be the reason the Kraft Corporation does not prospect in remote places for rare and unusual plants and animals to add to the world's diet. Of the roughly 235,000 flowering plants and 325,000 nonflowering plants (including mosses, lichens, and seaweeds) available, farmers ignore virtually all of them in favor of a very few that are profitable. n365 To be sure, any of the more than 600,000 species of plants could have an application in agriculture, but would they be preferable to the species that are now dominant? Has anyone found any consumer demand for any of these half-million or more plants to replace rice or wheat in the human diet? There are reasons that farmers cultivate rice, wheat, and corn rather than, say, Furbish's lousewort. There are many kinds of louseworts, so named because these weeds were thought to cause lice in sheep. How many does agriculture really require? [*911] The species on which agriculture relies are domesticated, not naturally occurring; they are developed by artificial not natural selection; they might not be able to survive in the wild. n366 This argument is not intended to deny the religious, aesthetic, cultural, and moral reasons that command us to respect and protect the natural world. These spiritual and ethical values should evoke action, of course, but we should also recognize that they are spiritual and ethical values. We should recognize that ecosystems and all that dwell therein compel our moral respect, our aesthetic appreciation, and our spiritual veneration; we should clearly seek to achieve the goals of the ESA. There is no reason to assume, however, that these goals have anything to do with human well-being or welfare as economists understand that term. These are ethical goals, in other words, not economic ones. Protecting the marsh may be the right thing to do for moral, cultural, and spiritual reasons. We should do it-but someone will have to pay the costs. In the narrow sense of promoting human welfare, protecting nature often represents a net "cost," not a net "benefit." It is largely for moral, not economic, reasons-ethical, not prudential, reasons- that we care about all our fellow creatures. They are valuable as objects of love not as objects of use. What is good for [*912] the marsh may be good in itself even if it is not, in the economic sense, good for mankind. The most valuable things are quite useless.

Biodiversity loss won't cause extinction

Lomberg 1 (Bjorn Lomborg, associate professor of statistics in the Department of Political Science at the University of Aarhus, Denmark, August 9, 2001, "Environmentalists tend to believe that, ecologically speaking, things are getting worse and worse."

We are all familiar with the litany of our ever-deteriorating environment. It is the doomsday message endlessly repeated by the media, as when Time magazine tells us that "everyone knows the planet is in bad shape", and when the New Scientist calls its environmental overview "self-destruct". <u>We are defiling our Earth, we are told. Our resources are running out. The population is ever-growing, leaving less and less to eat. Our air and water is more and more polluted. The planet's species are becoming extinct in vast numbers - we kill off more than 40,000 each year. Forests are disappearing, fish stocks are collapsing, the coral reefs are dying. The fertile topsoil is vanishing. We are paving over nature, destroying the wilderness, decimating the biosphere, and will end up killing ourselves in the process. The world's ecosystem is breaking down.</u> We are fast approaching the absolute limit of viability. Global warming is probably taking place, <u>though **future projections are overly pessimistic** and the traditional cure of radical fossil-fuel cutbacks is far more damaging than the original affliction. Moreover, its total impact will not pose a devastating problem to our future. Nor will we lose 25-50% of all species in our lifetime - in fact, we are losing probably 0.7%. Acid rain does not kill the forests, and the air and water around us are becoming less and less polluted. In fact, in terms of practically every measurable indicator, mankind's lot has improved.</u> This does not, however, mean that everything is good enough. We can still do even better. Take, for example, starvation and the population explosion. In 1968, one of the leading environmentalists, Dr Paul R Erlich, predicted in his bestselling book, The Population Bomb, that "the battle to feed humanity is over. In the course of the 1970s, the world will experience starvation of tragic proportions - hundreds of millions of people will starve to death." This did not happen. Instead, according to the UN, agricultural production in the developing world has increased by 52% per person. The daily food intake in developing countries has increased from 1,932 calories in 1961 - barely enough for survival - to 2,650 calories in 1998, and is expected to rise to 3,020 by 2030. Likewise, the proportion of people going hungry in these countries has dropped from 45% in 1949 to 18% today, and is expected to fall even further, to 12% in 2010 and 6% in 2030. Food, in other words, is becoming not scarcer but ever more abundant. This is reflected in its price. Since 1800, food prices have decreased by more than 90%, and in 2000, according to the World Bank, prices were lower than ever before. Erlich's prediction echoed that made 170 years earlier by Thomas Malthus. Malthus claimed that, unchecked, human population would expand exponentially, while food production.

Aff – AT Warming Impact

Warming will be slow and the impact will be small

Ridley 6/19/14, (Matt Ridley is the author of The Rational Optimist, a columnist for the Times (London) and a member of the House of Lords. He spoke at Ideacity in Toronto on June 18., "PCC commissioned models to see if global warming would reach dangerous levels this century. Consensus is 'no'" , [http://tinyurl.com/mgyn8ln] , //hss-RJ)

The debate over climate change is horribly polarized. From the way it is conducted, you would think that only two positions are possible: that the whole thing is a hoax or that catastrophe is inevitable. In fact there is room for lots of intermediate positions, including the view I hold, which is that man-made climate change is real but not likely to do much harm, let alone prove to be the greatest crisis facing humankind this century. After more than 25 years reporting and commenting on this topic for various media organizations, and having started out alarmed, that's where I have ended up. But it is not just I that hold this view. I share it with a very large international organization, sponsored by the United Nations and supported by virtually all the world's governments: the Intergovernmental Panel on Climate Change (IPCC) itself. The IPCC commissioned four different models of what might happen to the world economy, society and technology in the 21st century and what each would mean for the climate, given a certain assumption about the atmosphere's "sensitivity" to carbon dioxide. Three of the models show a moderate, slow and mild warming, the hottest of which leaves the planet just 2 degrees Centigrade warmer than today in 2081-2100. The coolest comes out just 0.8 degrees warmer. Now two degrees is the threshold at which warming starts to turn dangerous, according to the scientific consensus. That is to say, in three of the four scenarios considered by the IPCC, by the time my children's children are elderly, the earth will still not have experienced any harmful warming, let alone catastrophe. But what about the fourth scenario? This is known as RCP8.5, and it produces 3.5 degrees of warming in 2081-2100. Curious to know what assumptions lay behind this model, I decided to look up the original papers describing the creation of this scenario. Frankly, I was gobsmacked. It is a world that is very, very implausible. For a start, this is a world of "continuously increasing global population" so that there are 12 billion on the planet. This is more than a billion more than the United Nations expects, and flies in the face of the fact that the world population growth rate has been falling for 50 years and is on course to reach zero – i.e., stable population – in around 2070. More people mean more emissions. Second, the world is assumed in the RCP8.5 scenario to be burning an astonishing 10 times as much coal as today, producing 50% of its primary energy from coal, compared with about 30% today. Indeed, because oil is assumed to have become scarce, a lot of liquid fuel would then be derived from coal. Nuclear and renewable technologies contribute little, because of a "slow pace of innovation" and hence "fossil fuel technologies continue to dominate the primary energy portfolio over the entire time horizon of the RCP8.5 scenario." Energy efficiency has improved very little. These are highly unlikely assumptions. With abundant natural gas displacing coal on a huge scale in the United States today, with the price of solar power plummeting, with nuclear power experiencing a revival, with gigantic methane-hydrate gas resources being discovered on the seabed, with energy efficiency rocketing upwards, and with population growth rates continuing to fall fast in virtually every country in the world, the one thing we can say about RCP8.5 is that it is very, very implausible. Notice, however, that even so, it is not a world of catastrophic pain. The per capita income of the average human being in 2100 is three times what it is now. Poverty would be history. So it's hardly Armageddon. But there's an even more startling fact. We now have many different studies

of climate sensitivity based on observational data and they all converge on the conclusion that it is much lower than assumed by the IPCC in these models. It has to be, otherwise global temperatures would have risen much faster than they have over the past 50 years. As Ross McKitrick noted on this page earlier this week, temperatures have not risen at all now for more than 17 years. With these much more realistic estimates of sensitivity (known as "transient climate response"), even RCP8.5 cannot produce dangerous warming. It manages just 2.1C of warming by 2081-2100. That is to say, even if you pile crazy assumption upon crazy assumption till you have an edifice of vanishingly small probability, you cannot even manage to make climate change cause minor damage in the time of our grandchildren, let alone catastrophe. That's not me saying this – it's the IPCC itself. But what strikes me as truly fascinating about these scenarios is that they tell us that globalization, innovation and economic growth are unambiguously good for the environment. At the other end of the scale from RCP8.5 is a much more cheerful scenario called RCP2.6. In this happy world, climate change is not a problem at all in 2100, because carbon dioxide emissions have plummeted thanks to the rapid development of cheap nuclear and solar, plus a surge in energy efficiency. The RCP2.6 world is much, much richer. The average person has an income about 15 times today's in real terms, so that most people are far richer than Americans are today. And it achieves this by free trade, massive globalization, and lots of investment in new technology. All the things the green movement keeps saying it opposes

because they will wreck the planet. The answer to climate change is, and always has been, innovation. To <u>worry now in 2014 about a very small, highly implausible set of circumstances in 2100 that just might, if climate sensitivity is much higher than the evidence suggests, produce a marginal damage to the world economy, makes no sense</u>. Think of all the innovation that happened between 1914 and 2000. Do we really think there will be less in this century? As for how to deal with that small risk, well there are several possible options. You could encourage innovation and trade. You could put a modest but growing tax on carbon to nudge innovators in the right direction. You could offer prizes for low-carbon technologies. All of these might make a little sense. But the one thing you should not do is pour public subsidy into supporting old-fashioned existing technologies that produce more carbon dioxide per unit of energy even than coal (bio-energy), or into ones that produce expensive energy (existing solar), or that have very low energy density and so require huge areas of land (wind). The IPCC produced two reports last year. One said that the cost of climate change is likely to be less than 2% of GDP by the end of this century. The other said that the cost of decarbonizing the world economy with renewable energy is likely to be 4% of GDP. Why do something that you know will do more harm than good?

Warming is slow – no risk of an impact

Michaels and Knappenberger 11/19/13, (*Chip Knappenberger is the assistant director of the Center for the Study of Science at the Cato Institute, and coordinates the scientific and outreach activities for the Center. He has over 20 years of experience in climate research and public outreach, including 10 years with the Virginia State Climatology Office and 15 years as the Research Coordinator for New Hope Environmental Services, Inc, **Patrick J. Michaels is the director of the Center for the Study of Science at the Cato Institute. Michaels is a past president of the American Association of State Climatologists and was program chair for the Committee on Applied Climatology of the American Meteorological Society. He was a research professor of Environmental Sciences at University of Virginia for thirty years. Michaels was a contributing author and is a reviewer of the United Nations Intergovernmental Panel on Climate Chanage, which was awarded the Nobel Peace Prize in 2007, "With or Without a "Pause" Climate Models Still Project Too Much Warming", [http://www.cato.org/blog/or-without-pause-climate-models-still-project-too-much-warming] //hss-RJ)

A new paper just hit the scientific literature that argues that the apparent pause in the rise in global average surface temperatures during the past 16 years was really just a slowdown. As you may imagine, this paper, by Kevin Cowtan and Robert Way is being hotly discussed in the global warming blogs, with reaction ranging from a warm embrace by the global-warming-is-going-to-be-bad-for-us crowd to revulsion from the human-activities-

have-no-effect-on-the-climate claque. The lukewarmers (a school we take some credit for establishing) seem to be taking the results in stride. <u>After all, the "pause" as curious as it is/was, is not central to the primary argument that, yes, human activities are pressuring the planet to warm, but that t</u><mark>he rate of warming is going to be much slower than is being projected by the collection of global climate models</mark> (upon which mainstream projections of future climate change—and the resulting climate alarm (i.e., calls for emission regulations, etc.)—are based). Under the adjustments to the observed global temperature history put together by Cowtan and Way, the models fare a bit better than they do with the unadjusted temperature record. That is, the observed temperature trend over the past 34 years (the period of record analyzed by Cowtan and Way) is a tiny bit closer to the average trend from the collection of climate models used in the new report from the U.N.'s Intergovernmental Panel on Climate Change (IPCC) than is the old temperature record. Specifically, while the trend in observed global temperatures from 1979-2012 as calculated by Cowtan and Way is 0.17°C/decade, it is 0.16°C/decade in the temperature record compiled by the U.K. Hadley Center (the record that Cowtan and Way adjusted). Because of the sampling errors associated with trend estimation, these values are not significantly different from one another. Whether the 0.17°C/decade is significantly different from the climate model average simulated trend during that period of 0.23°C/decade is discussed extensively below. But, suffice it to say that an insignificant difference of <u>0.01°C/decade in the global trend measured over more than 30 years is pretty small</u>

beer and doesn't give model apologists very much to get happy over. Instead, the attention is being deflected to "The Pause"—the leveling off of global surface temperatures during the past 16 years (give or take). Here, the new results from Cowtan and Way show that during the period 1997-2012, instead of a statistically insignificant rise at a rate of 0.05°C/decade as is contained in the "old" temperature record, the rise becomes a statistically significant 0.12°C/decade. "The Pause" is transformed into "The Slowdown" and alarmists rejoice because global warming hasn't stopped after all. (If the logic sounds backwards, it does to us as well, if you were worried about catastrophic global warming, wouldn't you rejoice at findings that indicate that future climate change was going to be only modest, more so than results to the contrary?) The science behind the new Cowtan and Way research is still being digested by the community of climate scientists and other interested parties alike. The main idea is that the existing compilations of the global average temperature are very data-sparse in the high latitudes. And since the Arctic (more so than the Antarctic) is warming faster than the global average, the lack of data there may mean that the global average temperature trend may be underestimated. Cowtan and Way developed a methodology which relied on other limited sources of temperature information from the Arctic (such as floating buoys and satellite observations) to try to make an estimate of how the surface temperature was behaving in regions lacking more traditional temperature observations (the authors released an informative video explaining their research which may better help you understand what they did). They found that the warming in the data-sparse regions was progressing faster than the global average (especially during the past couple of years) and that when they included the data that they derived for these regions in the computation of the global average temperature, they found the global trend was higher than previously reported—just how much higher depended on the period over which the trend was calculated. As we showed, the trend more than doubled over the period from 1997-2012, but barely increased at all over the longer period 1979-2012. Figure 1 shows the impact on the global average temperature trend for all trend lengths between 10 and 35 years (incorporating our educated guess as to what the 2013 temperature anomaly will be), and compares that to the distribution of climate model simulations of the same period. Statistically speaking, instead of there being a clear inconsistency (i.e., the observed trend value falls outside of the range which encompasses 95% of all modeled trends) between the observations and the climate mode simulations for lengths ranging generally from 11 to 28 years and a marginal inconsistency (i.e., the observed trend value falls outside of the range which encompasses 90% of all modeled trends) for most of the other lengths, now the observations track closely the marginal inconsistency line, although trends of length 17, 19, 20, 21 remain clearly inconsistent with the collection of modeled trends. Still, throughout the entirely of the 35-yr period (ending in 2013), the observed trend lies far below the model average simulated trend (additional information on the impact of the new Cowtan and Way adjustments on modeled/observed temperature comparison can be found here). The Cowtan and Way analysis is an attempt at using additional types of temperature information, or extracting "information" from records that have already told their stories, to fill in the missing data in the Arctic. There are concerns about the appropriateness of both the data sources and the methodologies applied to them. A major one is in the applicability of satellite data at such high latitudes. The nature of the satellite's orbit forces it to look "sideways" in order to sample polar regions. In fact, the orbit is such that the highest latitude areas cannot be seen at all. This is compounded by the fact that cold regions can develop substantial "inversions" of near-ground temperature, in which temperature actually rises with height such that there is not a straightforward relationship between the surface temperature and the temperature of the lower atmosphere where the satellites measure the temperature. If the nature of this complex relationship is not constant in time, an error is introduced into the Cowtan and Way analysis. Another unresolved problem comes up when extrapolating land-based weather station data far into the Arctic Ocean. While land temperatures can bounce around a lot, the fact that much of the ocean is partially ice-covered for many months. Under "well-mixed" conditions, this forces the near-surface temperature to be constrained to values near the freezing point of salt water, whether or not the associated land station is much warmer or colder. You can run this experiment yourself by filling a glass with a mix of ice and water and then making sure it is well mixed. The water surface temperature must hover around 33°F until all the ice melts. Given that the near-surface temperature is close to the water temperature, the limitations of land data become obvious. Considering all of the above, we advise caution with regard to Cowtan and Way's findings. While adding high arctic data should increase the

observed trend, the nature of the data means that the amount of additional rise is subject to further revision. As they themselves note, there's quite a bit more work to be done this area. In the meantime, their results have tentatively breathed a small hint of life back into the climate models, basically buying them a bit more time—time for either the observed temperatures to start rising rapidly as current models expect, or, time for the modelers to try to fix/improve cloud processes, oceanic processes, and other process of variability (both natural and anthropogenic) that lie behind what would be the clearly overheated projections. We've also taken a look at how "sensitive" the results are to the length of the ongoing pause/slowdown. Our educated guess is that the "bit" of time that the Cowtan and Way findings bought the models is only a few years long, and it is a fact, not a guess, that each additional year at the current rate of lukewarming increases the disconnection between the models and reality.

Crisis Rhetoric

1NC Crisis Rhetoric

The aff's use of crisis rhetoric relies on taken-for-granted assumptions about social organization while mobilizing threat of catastrophe to depoliticize them, reproducing inequality
Roitman 14

(Janet Roitman, Associate Prof. in Anthropology @ Graduate Program for International Affairs at the New School for Social Research, *Anti-Crisis*, pgs. 10-14)

To do so, we embark on a trek over the anxious terrain of crisis narration. This trek is one of observation: **we observe how** academic and nonacademic **observers themselves observe economic and financial actors**, both human and technical, which they locate, define, and interpret **as having produced crisis**. We observe, then, the blind spot of second-order observation. Moreover, through this survey of the practice of crisis in contemporary narrations of "the 2007–9 financial crisis," we see how **accession to crisis engenders certain narrations and** note how the term enables and **forecloses various** kinds of **questions**. Through this review of a host of recent narratives of financial crisis, I am not seeking to establish the relative veracity of these accounts; I am not interested in whether or not certain purported ex- planations of "the crisis" are more or less tenable. Although I do explore questions relating to the production of value and risk, and the status of subprime and houses, I do so only insofar as these terms constitute the grammar of financial crisis narratives. **The point** of this grand tour of crisis narratives **is not to determine the best way to decipher the crisis** or to establish who "got it right" in recent analyses. **The point is to demonstrate how the term "crisis" establishes the conditions of possible histories and** to indicate how it **is a ~~blind~~ spot in social science narrative constructions**.¶ We thus take a journey through a wide-ranging array of interpretations, each of which claims a particular tradition: liberal economy, neo-Keynesian, neo-Marxist, cultural studies, and cultural economy. All proceed from the question, what went wrong? All search for origins, sources, roots, causes, reasons . . . none waver in their faith in crisis, a term that is posited without question or doubt. **All seek to demonstrate deviations from the proper course of history and distortions in human knowledge** and practice—**the discrepancy between the world and human knowledge of the world. Crisis signifies a purportedly observable chasm between "the real,"** on the one hand, **and what is** variously **portrayed** in the accounts reviewed below **as fictitious**, erroneous, **or** an **illogical departure** from the real, on the other. The chasm signifies a supposed dissonance between empirical his- tory and a philosophy of history—between truly grounded material value, on the one hand, and hypothetical judgments and evaluations, on the other.13 What is at issue is our alienation from history and the potential for revelation of true value and the true significance of events—of redemption, emancipation, deliverance. I ask: how can we claim to represent that chasm? What is the basis of a claim to know the locus of our alienation from underlying value, from material value, from real value, from truth value?¶ To conclude this expedition over the terrain of crisis narration, I put a set of particularly pragmatic questions to the narratives that I review herein: When does a credit (asset) become a debt (toxic asset)? How do we distinguish the former from the latter? At what point do houses figured as equity become figured as a debt? At what point do subprime mortgage bonds transform from an asset to a liability? And the ultimate question: When does the judgment of crisis obtain? We see, by putting these questions to contemporary crisis narratives, how crisis, in itself, cannot be located or observed as an object of first- order knowledge. The observation "money" is a first-order observation based on a distinction (money/not money); the statements "I lost money" or "Lost money is a crisis" are second-order observations. A first-order observation (money) does not indicate how the distinction (money/not money) was made; and the distinction (how the observation was made) is necessarily the object of a second-order observation.14 But taking note of crisis as a distinction, or as a second-order operation, does not amount to denying crisis. **The point is to take note of the effects of the claim to crisis**, to be attentive to the effects of our very accession to that judgment. **Crisis engenders certain forms of critique, which politicize interest groups. This is a politics of crisis. Would not crisis**, if it effectively obtained, **engender** not merely critique of existing relations and practices, but rather occasion **the reorganization** and transformation **of the very boundary between "the economic" and "the political," and**, more significant, **the transformation of the very intelligibility of constitutive terms, such as "debt," "liquidity," and "risk"**? **In assuming crisis as a point of departure, we remain closed off in a politics of crisis**. We can ask, echoing the Occupy Wall Street movement, who should bear the burden of fading prosperity? But **other constitutive questions**, related to the production of effective practice, **remain unarticulated, such as, how did debt come to be figured as an asset class in the first place**?¶ To answer this latter question, I turn to the few studies of the production of value through market devices and financial infrastructures that help us to account for the efficacy of economic and financial practices, which sustain the production of value—figured as debt. Here, **instead of financial crisis due to irrational speculation**, corrupt culture, erroneous policy, faulty regulation, defective models, **missed forecasting, or systemic failure** and underlying contradictions, **we have an accounting of specific practices and the production of positive**—or, better, practical—**knowledge, such that the claim to crisis becomes a particular** (political) **solution to what is declared a problem for certain domains of life**. These rare observations of the production of economic and financial value without positing crisis help us to grasp how **"crisis" is** less a claim about error in valuation than **a judgment about value**. But noncrisis accounts cannot be taken as distinct "alternative" narrations insofar as they do not provide evidence against "X account of crisis" so as to prove or affirm "Y account of crisis." In that sense, my turn to these accounts is a thought experiment: this exercise explores the grounds of narrative without crisis, but these are not alternative explanations because crisis is not their object. Doubtless, this thought experiment risks

reproducing the "problem of meaning"— or the belief that there is a discrepancy between history and representations of history—insofar as it raises the possibility of narrating history otherwise.15 But here I want to underscore that **critique and crisis are cognates, and so want to bring to our attention the forms of critique engendered by crisis narratives**. We see that **these forms of critique rest on assumptions about how categories** like "the market" or "finance" **should function and therefore generate conjecture about how deviations** from "true" market or financial value **were produced; they do not account for the ways that such value is produced in the first place**. In other words, **when crisis is posited as an a priori, it obviates accounts of positive, pragmatic spaces** of calculative possibility. I therefore raise the possibility of noncrisis narratives and explore how possible, alternative narratives about houses and their worth might be generated without recourse to a "sociology of error" (Bloor 1991, 12), without constructing a post hoc narrative of denunciation or post hoc judgments of deviation and failure.16¶ Ultimately, **I invite the reader to put less faith in crisis, which means asking what is at stake with crisis in-and-of-itself**. **"Crisis" is a term that is bound up in the predicament of signifying human history**, often **serving as a transcendental placeholder in ostensible solutions** to that problem. In that sense, **the term "crisis" serves as a primary enabling ~~blind~~ spot for the production of knowledge**. That is, **crisis is a point of view**, or an observation, **which itself is not viewed or observed**. I apprehend the concept of crisis through the metaphor of a blind spot so as to apprehend crisis as an observation that, like all observations or cognitions, does not account for the very conditions of its observation.17 Consequentially, **making that ~~blind~~ spot visible means asking questions about how we produce significance for ourselves**. At least, it means asking about how we produce "history." At most, **it means asking how we might construct accounts without discerning historical significance in terms of ethical failure**. Thus we might ask: what kind of narrative could be produced where meaning is not everywhere a problem?18 **An answer to that question**, no matter how improbable, as we will see below, **requires, as a first**, inaugural **step, consideration of the ways** in which **crisis, as an enabling ~~blind~~ spot for the production of knowledge, entails unremitting and** often **implicit judgment about latencies, or errors and failings that must be eradicated and, evidently hopefully, overcome**.

Cyber Security

1NC Cyber Security

The AFF employs a <u>militarized discourse</u> of cybersecurity --- that <u>inflates threats</u> and ignores <u>dangerous vulnerabilities</u>

Myriam Dunn **Cavelty 12**, lecturer for security studies and a senior researcher in the field of risk and resilience at the Center for Security Studies, "The militarisation of cyber security as a source of global tension," STRATEGIC TRENDS 2012: Key Developments in Global Affaris ed. by Daniel Möckli, Center for Security Studies, p. 114-21, fwang

<u>The militarisation of cyber security is first and foremost based on the belief in a massive threat of a large-scale cyber attack</u>. There are two aspects to this perception: In the first subsection, it is shown how and why the past and current level of the threat is overrated. The second subsection places the future likelihood of cyber war into perspective. It shows that now and in the future, the probability of a large-scale attack is very low. The third subsection looks at an additional reason for how widespread the fear of cyber war has become: Most countries simply follow the threat perception and reasoning of the US, even though the strategic context and disparity in power positions warrant a different threat assessment. The fourth subsection finally criticises the widespread use of vocabulary that is full of military analogies. **Such vocabulary insinuates a reality governed by the traditional logic of offense and defence – a reality that does not exist. Even worse, it is decoupled from the reality of the threat and the possibility for meaningful countermeasures and is complicit in solidifying the militarisation of cyber security**.

An overrated threat

<u>There is no denying that different political, economic, and military conflicts have had cyber(ed) components for a number of years now</u>. Furthermore, criminal and espionage activities involving the use of computers happen every day. It is a fact that **cyber incidents are continually causing minor and only occasionally major inconveniences**: These may be in the form of **lost intellectual property or other proprietary data, maintenance and repair, lost revenue, and increased security costs**. Beyond the direct impact, badly handled cyber attacks have also damaged corporate (and government) reputations and have, theoretically at least, the potential to reduce public confidence in the security of Internet transactions and e-commerce if they become more frequent.

However, in the entire history of computer networks, **there are no examples of cyber attacks that resulted in actual physical violence against persons** (nobody has ever died from a cyber incident), and only **very few had a substantial effect on property** (Stuxnet being the most prominent). So far, **cyber attacks have not caused serious long-term disruptions. They are risks that can be dealt with by individual entities using standard information security measures, and their overall costs remain low in comparison to other risk categories such as financial risk**s.

These facts tend to be almost completely disregarded in policy circles. There are several reasons why **the threat is overrated**. First, as combating cyber threats has become a highly politicised issue, **official statements about the level of threat must also be seen in the context of competition for resources and influence between various bureaucratic entities**. This is usually done **by stating an urgent need for action and describing the overall threat as big and rising**.

Second, **psychological research has shown that risk perception, including the perception of experts, is highly dependent on intuition and emotions**. **Cyber risks**, especially in their more extreme form, **fit the risk profile of so-called 'dread risks', which are perceived as catastrophic, fatal, unknown, and basically uncontrollable**. **There is a propensity to be disproportionally afraid of these risks despite their low probability**, **which translates into pressure for** regulatory **action of all sorts** and the willingness to bear high costs of uncertain benefit.

Third, **the media distorts the threat perception even further**. **There is no hard data for the assumption that the level of cyber risks is actually rising – beyond the perception of impact and fear**. Some IT security **companies have recently warned against overemphasising sophisticated attacks just because we hear more about them**. In 2010, **only about 3 per cent of all incidents were considered so sophisticated that**

they were impossible to stop. The vast majority of attackers go after low-hanging fruit, which are small to medium sized enterprises with bad defences. These types of incidents tend to remain under the radar of the media and even law enforcement.

Cyber war remains unlikely

Since the potentially devastating effects of cyber attacks are so scary, the temptation is very high not only to think about worst-case scenarios, but also to give them a lot of (often too much) weight despite their very low probability. However, most experts agree that **strategic cyber war remains highly unlikely in the foreseeable future**, mainly **due to the uncertain results such a war would bring**, **the lack of motivation on the part of the possible combatants**, and their **shared inability to defend against counterattacks**. Indeed, **it is hard to see how cyber attacks could ever become truly effective for military purposes: It is exceptionally difficult to take down multiple, specific targets and keep them down over time. The key difficulty is proper reconnaissance and targeting, as well as the need to deal with a variety of diverse systems and be ready for countermoves from your adversary**.

Furthermore, nobody can be truly interested in allowing the unfettered proliferation and use of cyber war tools, least of all the countries with the offensive lead in this domain. Quite to the contrary, strong arguments can be made that **the world's big powers have an overall strategic interest in developing and accepting internationally agreed norms on cyber war, and in creating agreements that might pertain to the development, distribution, and deployment of cyber weapons or to their use** (though the effectiveness of such norms must remain doubtful). The most obvious reason is that the **countries that are currently openly discussing the use of cyber war tools are precisely the ones that are the most vulnerable to cyber warfare attacks due to their high dependency on information infrastructure. The features of the emerging information environment make it extremely unlikely that any but the most limited and tactically oriented instances of computer attacks could be contained**. More likely, **computer attacks could 'blow back' through the interdependencies that are such an essential feature of the environment**. Even relatively harmless viruses and worms would cause considerable random disruption to businesses, governments, and consumers. **This risk would most likely weigh much heavier than the uncertain benefits to be gained from cyber war activities**.

Certainly, thinking about (and planning for) worst-case scenarios is a legitimate task of the national security apparatus. Also, it seems almost inevitable that until cyber war is proven to be ineffective or forbidden, states and non-state actors who have the ability to develop cyber weapons will try to do so, because they appear cost-effective, more stealthy, and less risky than other forms of armed conflict. However, **cyber war should not receive too much attention at the expense of more plausible and possible cyber problems**. Using too many resources for highimpact, low-probability events – and therefore having less resources for the low to middle impact and high probability events – does not make sense, neither politically, nor strategically and certainly not when applying a cost-benefit logic.

Europe is not the US

The cyber security discourse is American in origin and American in the making: At all times, **the US government shaped both the threat perception and the envisaged countermeasures**. Interestingly enough, there are almost no variations to be found in other countries' cyber threat discussions – even though the strategic contexts differ fundamentally. **Many of the assumptions at the heart of the cyber security debate are shaped by the fears of a military and political superpower. The US eyes the cyber capabilities of its traditional rivals, the rising power of China and the declining power of Russia, with particular suspicion**. This follows a conventional strategic logic: The main question is **whether the cyber dimension could suddenly tip the scales of power against the US or have a negative effect on its ability to project power anywhere and anytime**. In addition, **due to its exposure in world politics and its military engagements, the US is a prime target for asymmetric attack**.

The surely correct assumption that modern societies and their armed forces depend on the smooth functioning of information and communication technology does not automatically mean that this dependence will be exploited – **particularly not for the majority of states in Europe. The existence of**

the cyber realm seems to lead people to assume that because they have vulnerabilities, they will be exploited. But in security and defence matters, careful threat assessments need to be made. Such assessments require that the following question be carefully deliberated: 'Who has an interest in attacking us and the capability to do so, and why would they?' For many democratic states, particularly in Europe, the risk of outright war has moved far to the background and the tasks of their armies have been adapted to this. Fears of asymmetric attacks also rank low. The same logic applies to the cyber domain. The risk of a warlike cyber attack of severe proportions is minimal; there is no plausible scenario for it. Cyber crime and cyber espionage, both political and economic, are a different story: They are here now and will remain the biggest cyber risks in the future.

The limits of analogies

Even if the cyber threat were to be considered very high, the current trend conjures up wrong images. Analogies are very useful for relating non-familiar concepts or complex ideas with more simple and familiar ones. But when taken too far, or even taken for real, they begin to have detrimental effects. Military terms like 'cyber weapons', 'cyber capabilities', 'cyber offence', 'cyber defence', and 'cyber deterrence' suggest that cyberspace can and should be handled as an operational domain of warfare like land, sea, air, and outer space (cyberspace has in fact been officially recognised as a new domain in US military doctrine). Again, this assumption clashes with the reality of the threat and the possibilities for countermeasures.

First, calling offensive measures cyber weapons does not change the fact that hacker tools are not really like physical weapons. They are opportunistic and aimed at outsmarting the technical defences. As a result, their effect is usually not controllable in a military sense – they might deliver something useful or they might not. Also, even though code can be copied, the knowledge and preparation behind it cannot be easily proliferated. Each new weapon needs to be tailored to the system it is supposed to attack. Cyber weapons cannot be kept in a 'silo' for a long time, because at any time, the vulnerability in the system that it is targeted at could be patched and the weapon would be rendered useless.

Second, thinking in terms of attacks and defence creates a wrong image of immediacy of cause and effect. However, high-level cyber attacks against infrastructure targets will likely be the culmination of long-term, subtle, systematic intrusions. The preparatory phase could take place over several years. When – or rather if – an intrusion is detected, it is often impossible to determine whether it was an act of vandalism, computer crime, terrorism, foreign intelligence activity, or some form of strategic military attack. The only way to determine the source, nature, and scope of the incident is to investigate it. This again might take years, with highly uncertain results. The military notion of striking back is therefore useless in most cases.

Third, deterrence works if one party is able to successfully convey to another that it is both capable and willing to use a set of available (often military) instruments against the other side if the latter steps over the line. This requires an opponent that is clearly identifiable as an attacker and has to fear retaliation – which is not the case in cyber security because of the attribution problem. Attribution of blame on the basis of the cui bono logic is not sufficient proof for political action. Therefore, deterrence and retribution do not work in cyberspace and will not, unless its rules are changed in substantial ways, with highly uncertain benefits. Much of what is said in China and in the US about their own and the other's cyber capabilities is (old) deterrence rhetoric – and must be understood as such. The White House's new International Strategy for Cyberspace of 2011 states that the US reserves the right to retaliate to hostile acts in cyberspace with military force. This 'hack us and we might bomb you' statement is an old-fashioned declaratory policy that preserves the option of asymmetrical response as a means of deterrence, even though both sides actually know that following up on it is next to impossible.

Fourth, **cyberspace is only in parts controlled or controllable by state actors**. At least in the case of democracies, **power in this domain is in the hands of private actors**, especially the business sector. **Much of the expertise and many of the resources required for taking better protective measures are located outside governments. The military** – or any other state entity for that matter – **does not own critical (information) infrastructures and has no direct access to them. Protecting them as a military mandate is impossible, and conceiving of cyberspace as an occupation zone is an illusion**. Militaries cannot defend the **cyberspace** of their country – it **is not a space where troops and tanks can be deployed**, because **the logic of national boundaries does not apply**.

2NC Cyber Security

It's a question of sequencing – their discourse produces fear-based responses that ensure error replication – consider the link prior to evaluating the risk of their advantages

Watkin and Brito 11 – [Tate – Research Associate @ Mercatus Center @ George Mason University. Jerry –

Senior Research Fellow @ Mercatus Center @ George Mason University] [LOVING THE CYBER BOMB? THE DANGERS OF THREAT INFLATION IN CYBERSECURITY POLICY] (http://tinyurl.com/pnmhhru) (accessed 7-17-15) //MC

CONCLUSION

Cybersecurity is an important policy issue, but the **alarmist rhetoric** coming **out of Washington that focuses on worst-case scenarios is unhelpful and dangerous**. Aspects of **current cyber policy discourse parallel the run-up to the Iraq War** and pose the same dangers. Pre-war threat inflation and **conflation of threats led us into war on shaky evidence**. By **focusing on doomsday scenarios and conflating cyber threats**, government **officials threaten to legislate**, regulate, or spend in the name of **cybersecurity based largely on fear**, misplaced rhetoric, conflated threats, and credulous reporting. The public should have access to classified evidence of cyber threats, and further **examination of the risks posed by those threats**, **before sound policies can be proposed, let alone enacted**.

Furthermore, **we cannot ignore parallels between the military-industrial complex and the burgeoning cybersecurity industry**. As President Eisenhower noted, we must have checks and balances on the close relationships between parties in government, defense, and industry. **Relationships between these parties and their potential conflicts of interest must be considered when weighing cybersecurity policy** recommendations and proposals.

--Total War

Cybersecurity creates an omnipresent environment of threat that ensures total war – security measures _constitute_ the dangers they attempt to resolve
Väliaho 14

Pasi Väliaho, Senior Lecturer in Film and Screen Studies at Goldsmiths, University of London, *Biopolitical Screens: Image, Power, and the Neoliberal Brain*, MIT Press, p. 86-7, fwang

Here the correspondence between the immunitary logic of self-preserva-tion and the therapeutic logic of the virtualization of war, on the one hand, and the political and economic logic of contemporary wars, on the other, becomes apparent. Just as, in the epistemo-politics of PTSD, **virtual reality therapies** such as Virtual Iraq **see the psyche as a war zone, where defense against threats to it becomes priority number one**, and where **images are evoked for the sake of self-preservation**, **to fight against pathogenic memories and to make patients operative and flexible again**, so **Western societies see the globe as a war zone**, **where they fight to defend and expand the neoliberal way of life against threats to it, incorporating the outside under their rule**. Thus **virtual reality images**, on one level, **and current wars**, on another, **both positively promote the neoliberal way of life and its impulse to adapt and expand by incorporating the outside to the point where inside and outside become indistinguishable**. Thus, too, **"self-defense" in the age of the preemptive "war on terror" comes to mean expansion through destruction of all threats to the collective organism**.

At the same time, however, posttraumatic stress disorder reveals an inherent and fundamental paradox in this notion of life's emergence and self-protection. That **contemporary wars, in attempting to protect and pro-mote life by administering death, produce as their effective outcome the traumatic body of PTSD in constant crisis runs directly counter to immunitary logic, turning self-preservation into self-destruction**. In the traumatic body, **certain memories integral to the organism are identified as foreign to it, as something the organism can get rid of only by destroying itself: seeing itself as a foreign body**, **the species-being attacks itself**. **This persistent state of emergency**, according to Esposito, **embodies the autoimmunitary crisis of wars waged after 9/11, a crisis within the immunity system of the collective organism**, whereby **the imperative of protecting and promoting life is pursued so aggressively that it turns against itself**:

War is no longer the always possible inverse of global coexistence, but the only effective reality, where **what matters** isn't only the specular reality that **is determined between** adversaries … but … **the exponential multiplication of the same risks that would like to be avoided**, or at least reduced, **through instruments that are instead destined to reproduce them more intensely**.

Thus **the immunitary paradigm of protecting life from what threatens it is inverted**, and **the preservation of life becomes its destruction**, a suicidal project. In contemporary wars, as the problematic of PTSD demonstrates, **the promotion of the neoliberal way of life with advanced military techno-logical power produces traumatic events and endogenous simulations destructive of this very way of life**. In this respect, **the self-destructive tendencies of PTSD**, as currently understood and treated, **closely correspond to the self-destructive tendencies that emerge in the excessive pursuit of the biopolitical imperative to protect and promote life**.

The forces that define life in our current world are the very ones that seek to erase it, whence the impossibility of making clear distinctions between the active and the passive, or between the promotion of life and its destruction, that characterizes the traumatic body in particular and neoliberal subjectivity in general. Posttraumatic stress disorder and biopsychiattic efforts to treat it crystallize the logic of

contemporary biopolitics, according to which "it is no longer only death that lies in wait for life, but life itself that constitutes the most lethal instrument of death." Thus **Virtual Iraq can be seen to implement the suicidal logic of biopolitics**, **repeatedly reproducing the trauma of PTSD patients and accelerating the fears that animate it**, which is to say, **turning the organism further against itself by presenting it with constant flight-or-fight situations**, **colored by ever-growing fear that finds no relief because fear is seen as essential to the very life of the organism**.

It may well be that, in attempting to immunize the psyche by turning the world into the brain's endogenous apparition, **the images circulating on military, virtual reality, and video game screens end up triggering the psyche's potential for self-destruction**, **producing**, instead of salvation from trauma, **the world as a never-ending nightmare**.

--Turns Case

Cybersecurity is a <u>particular manifestation</u> of securitization that is <u>enhanced</u> by technical discourse --- their framing translates into <u>further surveillance measures</u>
Jin et al 14

Further cementing the influence of hegemonic power structures are cybersecurity's focus on "hypothetical futures" or estimations of risk and threat (Buzan et al., 1998), **and the reliance in security and technical fields on "experts" who are not always held accountable**. Bigo remarked on the "**lack of precision required for threats identified by the professionals who know some secrets**. Amateurs always need to prove their claims, whereas **professionals**, whether international, national, or local, corporate or public, **can evoke without demonstrating**" (2002, p. 74). Indeed, Hansen and Nissenbaum (2009, p. 1168) argue that although **cybersecurity** is not uniquely reliant on technical, expert discourse, it **is the field where "[technifications] have been able to take on a more privileged position** than in any other security sector," as **computer security often requires knowledge that is unavailable to the general public**. This is important because **the effect of "technifications," as speech acts similar to securitization, is that "they construct an issue as reliant upon technical, expert knowledge, but they also simultaneously presuppose a politically and normatively neutral agenda, that technology serves"** (ibid., p. 1167). **The simultaneous use of both securitization and technification in cybersecurity discourse is therefore significant because they "work to prevent it from being politicized in that it is precisely through rational, technical discourse that securitization may 'hide' its own political roots**" (ibid., p. 1168).

Increasingly, **security agencies and law enforcement advance the securitizing argument**. **Resultant attempts to control the development of networked computing reflect a desire to know and to secure that is central to both the security of the state and society's normalization and productive functioning**. Foucault discussed this as governmentality, a method of governance that protects, controls, and fosters economic expansion, and as such is inextricable from economic liberalism (2007). **Surveillance in response to insecurity is a way of knowing a population, rendering it calculable and thereby manageable**. It not only informs state action but also influences the way subjects think about themselves. This is evident in Foucault's illustration of the panopticon: surveillance (or the assumption of surveillance) induces in the subject "a state of conscious and permanent visibility that assures the automatic functioning of power" (1995, p. 201). Theoretically, this produces a disciplined, ordered, productive society without the need to enforce, punish, or necessarily carry out the surveillance in the first place. Similarly, **Neocleous addressed police as a form of governmental power for the administration of society and active fabrication of social order** (2000, p. 14).

Nye 10

(David Nye, Professor of American History at the University of Southern Denmark, *When the Lights Went Out: A History of Blackouts in America*, pgs. 180-184)

The sociologist Lee Clarke noted how institutions often issue such reassurances and create detailed crisis instructions, although these preparations are largely **"fantasy documents."**20 Many civil defense plans to deal with nuclear attacks are implausible, Clarke noted, including one for commandeering commercial aircraft to evacuate the entire population of New York City in three days—a comforting but impossible scenario. Many **plans narrowly focus on the point of failure and lose sight of the complexity of the problem**. If "the critical infrastructure is made up of those systems required to maintain life,"21 then it extends considerably beyond police, fire departments, and repairmen. In the influenza outbreak of 1918, hospitals, morticians, and graveyards were overwhelmed with dead bodies. As corpses literally piled up, the population became demoralized, normal life ceased, and in some communities public services collapsed. People fled, seeking to escape the disease, often leaving their dead to rot. Clarke argues that those who try to plan for "worst cases" tend to **define preparations in narrow, technical terms** and to focus on imagined "first responders" (e.g., police and firemen). Disaster plans typically **overemphasize technical repairs and maintaining public order** but overlook the centrality of actual first responders, many of whom work for schools, taxi companies, bus companies, churches, mortuaries, hospitals, and cities, but some of whom may be random passers- by. Plans seldom integrate a wide range of institutions into contingency plans or recognize that in practice the first to respond are people accidentally on the scene, who must improvise. In Clarke's view, **"social networks rather than formal organizations" are "far more likely" to save a life or evacuate an area** in time.22¶ The collapse and blackout of New Orleans after Hurricane Katrina (2005) shows how the definition of critical infrastructure extends beyond the technical system to include a wide range of people and institutions. After Katrina hit Louisiana and Mississippi, 1.8 million people were without power. Major hospitals and homes for the elderly had to be evacuated. The Superdome, a football stadium designated as a safe haven for those who could not escape the city, also lacked electricity. About 20,000 people sweltered there in a fetid atmosphere, many suffering from heat exhaustion. And as in the London Blitz or the 1977 New York blackout, some people took advantage of the evacuation to loot, seeking not only survival necessities but also luxuries. Even hospitals were attacked. Without electricity to light the streets, sound alarms, or run pumps and other equipment, the disaster worsened each day. The National Guard went in to restore order, but much of the city remained unlivable.¶ As with Hurricane Katrina, the official response to disaster is often slow, disorganized, and inadequate. "Worst case disasters are too unexpected and overwhelming for organizations to fold into their standard operating procedures."23 When the levees broke and the flood came, the Federal Emergency Management Agency failed to respond to the human needs of those trapped in the city. While FEMA dithered, volunteers saved thousands.24 Six months after the hurricane, some New Orleans neighbor- hoods were still without electricity and uninhabitable.¶ Without electricity, present-day life loses most of its critical infrastructure. Yet the US electrical system is hard to protect because of its sheer extent. A hurricane strikes the grid randomly, but the saboteur strikes a vulnerable point where severe damage can be done, transforming social spaces that sustain life into anti-landscapes that do not. Though American grids have not been attacked, it is not because they are impregnable. Perhaps Alfred Hitchcock's 1936 film Sabotage suggests why transmission systems are not yet a target of choice. The film begins with a blackout that darkens a whole district of central London. A saboteur has thrown sand into some powerhouse equipment, and it takes an hour to clean and restart the system. The public response to this unexpected darkness, however, is not fear but nonchalance and even considerable laughter. Like the crowds in the 1965 New York blackout three decades later, Hitchcock's Londoners take it with aplomb. Frustrated at this result, the saboteurs then decide to bomb a crowded public place. This seems more likely than a blackout to cause panic. Even in 1936 it was clear that short-lived power outages cause few or no deaths and little destruction, whereas a bomb causes both and is terrifying. A blackout, far from being demoralizing, **may strengthen the bonds of community**. Accounts of the 2003 New York black- out suggest that this is what happened. A sociologist who happened to be in Brooklyn when the blackout began spent hours walking the streets, where he found people extremely helpful and far less reserved toward strangers than usual.25¶ After the rolling blackouts of the 1990s, and especially after the terrorist attacks of September 11,

2001, the public was not likely to take blackouts lightly. Rather, **they improvised moments of solidarity**, based on the implicit belief that the power would soon come on again. Yet the public knows that prolonged system failure will not merely paralyze a city but will also threaten them with food shortages, dehydration, and the failure of essential services, while rendering office buildings and apartments uninhabitable. Nevertheless, New Yorkers' behavior during the 2003 power failure often recalled that of 1965. Once initial fears of a possible terrorist attack were dispelled, people flocked into the streets, which took on a holiday air. **The blackout became a carnival, not an apocalypse**. The Russian critic Bakhtin once wrote that during a carnival "people who in life are separated by impenetrable hierarchical barriers enter into free and familiar contact."26

Something similar occurred in New York in 2003. Even after a decade with many small power failures, a blackout could still become a moment of sociability and friendliness. As in 1965, few people could work without electricity, and all had to negotiate a city without most of its amenities. At Muldoon's Irish Pub on Third Avenue, "the loss of power meant a license to party."27 Patrons ordered extra beer, and many ambled outside, glasses in hand. As was recalled in a blog titled "The Gothamist," at first the event "made New Yorkers wonder if there was another terrorist attack" but "then they just settled in for some street parties after finally making it home." Many brought out battery-powered audio players, sat on their front stoops, and partied into the night. Afterward, The New Yorker published a cartoon that suggested both the solidarity that developed among those trapped in the city that day and also how quickly that unity dissolved again. A homeless man in ragged clothing chases after a businessman, calling out "Don't you remember me? During the blackout we slept on the same sidewalk." According to one interpreter, the "August 14 event was a bit like the medieval Feast of Fools, the Yuletide holiday when in towns around Europe class distinctions were suspended, if only for a day, and masters and servants switched places, church observances were mocked, and revelry overruled solemnity."28¶ For anyone moving about, **the city was "re-materialized."** A visiting Brazilian architect later wrote: "Forget Virilio and Baudrillard and the virtual realities, there is no compression of time and space anymore. You are left alone with the disvirtual reality of space."29 Suddenly it was not possible to mediate one's relation to the built environment, which had to be measured by the body and its ability to climb, to walk, and to adjust. "Without neon lights and electronics, space becomes what it has always been," and one "cannot hide behind a wireless phone nor dive yourself into the Internet."30 When electrified space is decompressed, the world suddenly seems populated by unavoidable others. "Others on the stairway, Others down the street, Others on the way home. It's dark, and as a result, you start to see more and more Other people."31 The sheer physicality of the world and its inhabitants had become bewilderingly near.

Blackout discourse overstates the scale of crisis – best evidence concludes the population will respond with solidarity and community solutions

(Antti Silvast, PhD, University of Helsinki Department of Social Research, ANTICIPATING INTERRUPTIONS: SECURITY AND RISK IN A LIBERALIZED ELECTRICITY INFRASTRUCTURE, Academic Dissertation, https://helda.helsinki.fi/handle/10138/40138, pgs. 25-26)

If electricity is understood as a societal infrastructure vital for people's well-being, then the ways in which lay persons cope with its failures is an important research topic. The premise of my third case study is that **blackouts** – albeit their many potentially disastrous impacts for the national state and industries – **are also events of everyday life**. It analyses the systemic effects of blackouts for energy users by asking the following research question: how do lay people reconstruct blackouts and their effects as risks in households? When choosing this question, however, it is not just at issue that experts might not be interested in everyday folk. On the contrary, numerous expert measures exist that try to determine the quality "expectations" of energy consumers and their willingness to accept power cuts, cope with their effects, and possibly pay for higher-quality electricity (see, e.g., Forstén 2002; CEER 2005, 2010, 2011; Kauppa- ja teollisuusminis- teriö 2006), or purchase prepayment energy and opt-out when they cannot pay (Graham & Marvin 2001, 208-209). Indeed, these experts often assume **a particular rationality** for lay people: that of **a prepared individual who constantly reflects on financial harms and compensations** for a power cut. Such a starting point **pays virtually no attention** to more habitual forms of thinking or to whether people are interested and able, or even willing, to do such calculations in everyday life (Silvast & Virtanen, forthcoming). The habitual forms of thinking are in turn in my interest in the third case study.¶ A partiality of a different sort also figures in some disaster mitigation activities according to researchers. Anthropologists Julien Langumier and Sandrine Revet (2010; Revet 2013) have both drawn on the long tradition of sociological and anthropological disaster research (see Dynes & Drabek 1994; Perry 2007) to approach catastrophes ethnographically. One thing they and their colleagues (Langumier & Revet

2010, 6; Revet 2013, 47; 50) note is that several sources like the media, disaster relief, and simulated crisis exercises often portray people merely as **passive "victims" of a disaster**. Suggested by the Finnish Boxing Day blackout media stories, this "victimization" happens in Finland too. For instance, it is emphasized how anxious people are during a long blackout and how they simply want to go back to their normal life (see HS 31 December 2011, 1 January 2012, 2 January 2012). **This gives little consideration for how people have learned from past risks and remember them**, thus shaping what can be considered "normal" life to begin with (Langumier & Revet 2010, 6; Revet 2013, 40).¶ To address such everyday reasoning about risk, the term lay people, though also used here for brevity's sake, is indeed somewhat inappropriate. The term indicates some lay sphere of a population or victims that is completely separate from the sphere of experts. Yet, as Revet (2013, 43) points out, local people tend to be intrinsically involved with disasters and many experts know this: a natural disaster, for example, creates novel interactions among rescue workers and residents. New studies about major or recurrent infrastructure failures in Sweden (Höst et al 2010) and Russia (Alapuro 2011) suggest that such encounters in a catastrophe even have a political potential: **experiencing a failure, people may start to act collectively to communicate the harm they suffered** to expert decision makers, **or purchase community power generators**, for example. Whether they will in fact take these kinds of actions is an empirical problem. With this issue in mind, I want to pay attention to some ways in which Finnish people reconstruct blackout events and try to resume their habitual actions when the power fails (Kilpinen 2000). I shall also talk about the interactions that blackouts motivate – or could motivate – between homes, electricity experts, and authorities. The material in the third case study consists of interviews and a questionnaire on Finnish homes.

----Turns Case

"Blackout" rhetoric uses particular "risk technique" patterns that determine the plan's implementation – this structures the relationship between the public, electricity infrastructure, and government institutions and turns the case because of serial policy failure
Silvast 13

(Antti Silvast, PhD, University of Helsinki Department of Social Research, ANTICIPATING INTERRUPTIONS: SECURITY AND RISK IN A LIBERALIZED ELECTRICITY INFRASTRUCTURE, Academic Dissertation, https://helda.helsinki.fi/handle/10138/40138, pgs. 15-17)

Recently, many scholars have taken a different approach to the topic of risk than outlined above. In new studies about risk governance, its rationalities, and its concrete technologies (O'Malley 2004; Helén 2004; Collier, Lakoff & Rabinow 2004; Jauho 2007; Collier 2008; Collier & Lakoff 2008; Lehtonen & Liukko 2010, 2012; Liukko 2013), the concern is not primarily with broad and global societal transformations, with the multiple societal effects of new hazards, or with the cultural perceptions of risks. Certainly these issues remain relevant, but the research objective is different. This objective is to study those rationales and technologies which are applied when enacting hazards as objects for thought and action.¶ A key object of this tradition is called **risk techniques**, where technique has many meanings and uses. It highlights those tools – like **statistical calculations**, contracts, social and private insurance, **simulated scenarios**, **policy programmes**, **and wider political processes** – that operationalize risk government aspirations, which are hence not exclusively "mental" phenomena to begin with (O'Malley 2004, 12-13). This line of reasoning comes close to social scientific Science and Technology Studies (STS): the "technical" features of any given technology are rarely easy to separate from its "social" or "cultural" features (Pollock & Williams 2009a, 57-58). Technique also means a particular way of doing something: risk, specifically, enacts threats in a particular way by uncovering their probability and impact and signifying them as harms to be acted upon (Helén 2004, 32-33). Such techniques can be further drawn upon to found policy programmes about risk mitigation, responsible conduct, and government (Ewald 1993, 61-62; O'Malley 2004, 13). The technique of insurance in the welfare state offers a typical example (Ewald 1993; Liukko 2013).¶ A risk technique, once rationalized and used systematically by actors, can also be understood as **a style of reasoning regarding the maximization of security**. The concept, popularized by the philosopher Ian Hacking (2002, 178-199), focuses on how people explore, classify, and name the objects that they inquire. To these ends, both abstract concepts and measuring equipment are deployed by a style of reasoning to propose regularities, possibilities, explanations, and proofs – or "truths" and "falsities" – that can then, subsequently, be applied locally and also debated publicly (Lehtonen 2003, 5-8). Examples of styles of reasoning include statistical analysis, postulation, empirical experimentation, and the construction of hypotheses and models (Hacking 2002, 181-182). However, while the concept of a style often exemplifies "sweeping" and "generous" phenomena (Hacking 2002, 178-180) and emphasizes a small number of broad scientific traditions, my use of the concept is more situated corresponding with other works (Collier 2008, 2011). For instance, anthropologist Stephen Collier (2008, 230) has stressed that there are multiple styles of reasoning about risk with their own "systemicity, specificity, and rigour" and provision of "frameworks (...) for choice".¶ Styles of reasoning, like risk techniques, have **a close connection with practical deployment**. As researchers argue, "articulations of ideas and techniques (of risk government) are always practical" (O'Malley 2004, 12), while styles of reasoning are never separate from the instances where they are manifested (Lehtonen 2003, 6). What does the term "practical" mean here and what are the said instances of manifestation like? Let me suggest a final conceptual extension, which, I believe, adds colour to discussions about those situations in which people manage risks in practice.¶ By definition, risk outlines a problematic situation like a surprise, a crisis, or a disaster. Risk management then suggests ex-ante anticipatory actions, prudence, and foresight about this situation. That is, if the combination of the problematic situation's probability and harm is high, then it is rational to mitigate the problem through performative actions (Luhmann 1993). At the same time, pragmatist sociologists and philosophers would say that people generally try to solve problematic situations by drawing on their habits: their common sense about those actions that have already worked before on several occasions (Joas 1992, 190-195; Kilpinen 1998; Kilpinen 2000, 57-60; see also Rabinow 2008, 6- 11). My proposal here is that

risk techniques are placed in a similar context. From this premise, then, <u>risk techniques are deployed</u> first of all <u>in problematic situations and when people sense that the techniques work</u>. <u>If they do not work</u>, however, <u>the result can be doubt about the technique and restructuring of its practices of use</u>. Collier (2008, 239) has shown this in the disaster mitigation context in the US: unlike a strong "risk society" thesis foresees, anomalic observations and doubt are seldom a reason for abandoning technical expert reasoning more than for redeploying such thinking little by little.¶ When I say habit, I do not mean routines, mannerisms, or action that is repeated mechanically (see Kilpinen 2000, 57). Rather, like pragmatists, <u>my concern with habits is in continuous and general phenomena, or **"rules of action"**</u> (ibid, 59), <u>which people can deploy as a resource when making sense of</u> those <u>varying problematic conditions that the theme of risk suggests</u>. To me, habit is a relatively flexible concept that can refer to engineering habits and skills (Suchman 2000), to everyday habits of energy use (Shove 2003, 2010) or to acquired knowledge that is often named as tradition (Giddens 1994, 190; Hänninen & Laurila 2008). However, **all such habitual phenomena**, as I claim and illustrate later, **provide new insight into the risks of electricity infrastructures**, especially compared to the more popular assumptions in some risk-based debates: namely, that risk transforms the society and its activities as a whole or that a priori mental perceptions determine all forms of risk management (Joas 1992, 232; Kilpinen 1998).

----Blackouts Inevitable

System-wide complexity and competing decisionmaking incentives make blackouts inevitable – the aff's attempts at management fail and misunderstand the functioning of large-scale infrastructure systems
Silvast 13

(Antti Silvast, PhD, University of Helsinki Department of Social Research, ANTICIPATING INTERRUPTIONS: SECURITY AND RISK IN A LIBERALIZED ELECTRICITY INFRASTRUCTURE, Academic Dissertation, https://helda.helsinki.fi/handle/10138/40138, pgs. 40-42)

Over the past 15 years, empirical disaster and crisis studies have covered various major blackouts including Auckland, New Zealand in 1998 (Stern, Newlove & Svedin 2005), Canada in 1998 (Scanlon 1999), Buenos Aires, Argentina in 1999 (Ullberg 2005), and Sweden in 2005 and 2007 (Höst et al 2010). Blackouts, as these studies found, became urgent and threatening situations for various reasons: the complexity of the electricity infrastructure failure, its knock-on effects on other infrastructures, and the difficulty of coordinating among privatized utilities and public stakeholders on many different levels (Ullberg 2005; Höst et al 2010). In many cases, electricity utilities and decision-making bodies undermined worst-case scenarios and sought short-term operational goals at the expense of longer-term crisis management perspectives (Stern, Newlove & Svedin 2005; Ullberg 2005). In all of these cases, the blackout soon developed into a collective crisis of public credibility – even as electricity companies themselves suffered as "victims" of the power failures (Stern, Newlove & Svedin 2005; Ullberg 2005). In Canada (Scanlon 1999) and Sweden (Höst et al 2010), groups and organizations not directly concerned with electricity networks began to manage the disaster, including social services, road support staff, and regional water services, self-organized municipal resource groups, and a federation of farmers.¶ According to Bennett (2005) who studied the public response to the North American blackout in 2003, blackouts often incite blame: the question here is, who or what can be held responsible for the electric power failure? A useful illustration is given by official blackout reports: typically, their explanations centre on immediately operational contexts or relatively non-specific political-economic framings of a blackout (such as the role of private markets and their regulation) (e.g. CRE & AEEG 2004; UCTE 2004, 2007; see Silvast & Kaplinsky 2007). In this context, contrasting with simple mechanisms of blame, the above research provides an interesting and relevant vantage point to understand the emergence of a collective crisis. It details the rich and varied practices through which a blackout disaster or crisis was problematized by actors and then mitigated – or not, as sometimes was the case. These are relevant insights for my interest in risk as practical problem solving. But another question is, why had the electricity infrastructures failed: what was the system-level background to these crises of large infrastructures? It would seem that this issue, while important, is not central to the mentioned studies whose focal point is in the disaster or crisis and its decision making, not in whether the incident was caused by a technical failure, a natural disaster, human error, or other reasons (Ullberg 2005, 69). However, according to one relatively brief argument by crisis scholars (Stern, Newlove & Svedin 2005, 3; 108-110), rapidly cascading failures are "inherent" to large- scale systems and thus they might be impossible to avert.¶ The last consideration stems from a perspective which moves closer to the large technological systems and their actual functioning. In 1984, sociologist and organizational scholar Charles Perrow (1999) published Normal Accidents: Living With High Risk Tech- nologies, which concerns various human-built systems (e.g. nuclear power plants, air traffic, DNA recombination, space missions). It characterizes their two related traits: interactive complexity and tight coupling. The first trait refers to the degree of unexpected interactions among system components; the second to the pace in which effects propagate from one component to the other. When interactive complexity and tight coupling are both high in a system, accidents – damaging, unintended and disrupting events (Perrow 1999, 63-64) – become difficult to anticipate and, over time, almost inevitable. To highlight this inevitability, Perrow calls such specific disruptive events system accidents or normal accidents (see Silvast & Kelman 2013). Probably the best-known complex and tightly coupled technological case by Perrow is nuclear power plants, but electricity supply systems are also discussed briefly in the book. Perrow (1999, 97) sees the power grid as a tightly coupled, but relatively linear rather than complexly interactive system. Recently, however, studies have suggested that the complexity of energy systems is growing. In particular, when these systems are liberalized, the number of system components grows and unexpected interactions are highly likely especially when energy trading starts to happen increasingly real-time (Roe & Schulman 2008). This view also seems to be shared by Perrow (2008, Chapter 7) in his recent case study about the US liberalized

electricity transmission grid and has also been considered by Van Der Vleuten and Lagendijk (2010) while discussing the European blackout in 2006.

--Link – Critical Infrastructure

Economic collapse and critical infrastructure impact claims reproduce neoliberalism – even if cyber security threats are real, they prioritize market continuity and business interests, cementing neoliberal social relations

Cavelty 2014 [Myriam Dunn (Lecturer for security studies and a senior researcher in the field of risk and resilience @ Center for Security Studies), "Breaking the Cyber-Security Dilemma: Aligning Security Needs and Removing Vulnerabilities", Sci Eng Ethics (2014) 20:701–715, AX]

Cyber-security linked to critical infrastructures creates and **is implemented in a special type of security environment. Whereas the traditional logic of national security suggests unilateral government action and policy, the policies of cyber-security are inevitably blurred by liberalization, domestic considerations and other policy imperatives** (Coaffee and Murakami Wood 2006). **The management of infrastructure is** in general **not** (or no longer) **the prerogative of government; instead it is based on the logic of the market.** While it remains the essential task of a government to provide **the security of society**, it **has** simultaneously **become impossible for any government to achieve** this **by itself**. **What is at stake is not the** body of the **state** or its borders, ''**but the** conjoined body of public and **private-sector networks**'' (Der Derian and Finkelstein 2008: 102). Therefore, **the private sector becomes instrumental** in not only helping with the act of ''identification'' of critical objects, but also more directly in assuring the health of networks and the services provided by them. Whereas the methodology employed to identify critical assets is very similar in both the public and private sector, the commonalities end when it comes to the protection goals. From the public sector's perspective, criticality is linked to the loss of one or more broad national functions. That set of functions—or protection principles—has expanded over time, beginning with national defense and economic security, to include public health and safety, and then national morale (Kristensen 2008). Through definition of these national functions along the lines of general well- being of a nation and its citizens, the link between critical infrastructure protection and national security is forged. **For the state, the goal of protection is the collective well-being represented as a way of liberal life** (Anderson 2010)—but, by implication, **also the continued function of the state.** The relationship between state and infrastructure emerges as an alternative to the image of Abraham Bosse's Leviathan on the frontispiece of Hobbes famous book: Instead of being made up of its citizens, the state is regarded as consisting of the things inside its territory that make life there 'good'; assets that are not directly identified with its citizens, but material assets that give substance (and significance) to the state through being its foundation (Dunn Cavelty and Kristensen 2008). **For the private sector, the reference point varies depending on the business model**; in the abstract, however, **it is their functioning, or 'business continuity', that is the ultimate protection goal. The reference object for companies**, therefore, **is themselves. Crucial for the continued performance and effectiveness of many of today's companies that operate as traders of information/knowledge with the help of information/knowledge networks, is protection against loss of information and routine preservation of knowledge.** These techniques sever the human mind/body as '''incubator' of this knowledge'' from the knowledge itself (Der Derian and Finkelstein 2008: 102), which is given autonomous value over that which becomes replaceable as a result of these practices. In this view, **humans become reduced to nodes in the network, needed to ensure the wealth and health of the networks, but not their own health.** National Security versus Human Security in Cyberspace In cyber-security as currently understood and practised, **human beings are seen as victims**, as weakest link in the system, as direct threat—**but not** (or only very indirectly) **as beneficiaries of the type of security that states (and companies) want**. On the one hand, the neglect of the human element is a direct consequence of a focus on technical systems as targets and technology-based countermeasures in cyber-security. On the other hand, the lack of consideration for ''the human'' in this field also seems to be an effect of the issue that human security scholarship has already tackled decades ago: that too much focus on the state and national security tends to crowd out consideration for the individual citizen, with often detrimental effects for security overall (cf. Burgess and Owen 2004). I look at both aspects and their consequences for security below and then turn to the clash between this type of security and human security. Technical Systems, Political Consequences A focus on technical objects is not a bad thing per-se. In fact, the type of security that emerges directly from the wish to ensure cyber-security is one that seemingly dodges problematic issues normally associated with security, at least in the first instance. Ultimately, we are looking at the practice of protecting inanimate things; the regulation of machines and their performance. Computers, servers, and the computer-powered infrastructures are non-human objects, which are someone's legitimate property and have a certain (usually undisputed) value for societies. Cyber-security measures thus imagined have little to no bearing on citizens' lives directly. Most importantly, there are no concerns about freedom/security trade-offs,

and no civil liberty issues (Buzan et al. 1998). This security does not depend upon the invocation of a state of emergency, but is 'clean' and ultimately, 'good', since everybody seems to benefit from an interruption-free performance of vital systems. However, this view is inevitably problematized, because these **machines cannot be isolated from human life. The image of modern complex critical infrastructures is one in which it becomes futile to try and separate the human from the technological**. Technology is not simply a tool that makes life livable: rather, technologies become constitutive of novel forms of 'a complex subjectivity', which is characterized by an inseparable ensemble of material and human elements (Coward 2009: 414). Therefore, **even if technologies may appear to regulate objectively and apolitically, there is always a connection to a place, to a space, to a space of protection, to values, to life.** An even closer look at **the seemingly apolitical management of** a technical issue with **technical means reveals a deeply political nature,** because the selection of referent objects as described above always entails a larger argument **about protection**: **Endangered entities are judged to have legitimate claims to protection (while others do not).** In other words, **this type of security will only provide relief to a valued referent object—not necessarily ''the citizen'' or humans more generally. In cyber-security**, as argued above, **economic imperatives like profit maximization are decisive. It is not a given**, then, **that cyber-security is a truly public good**, understood as security for all. **Quite the opposite: the type of security that emerges mainly benefits a few and already powerful entities and has** no or even **negative effects for the rest. The** type of **referent object to be protected** and by implication, the type of life to be saved, **is represented by the uninterrupted flow of information linked to the accumulation of capital and economic growth** (Swyngedouw 2007), which in turn is linked to national security**. This is at the heart of the cyber-security dilemma, in which the dominant form of security is making large parts of the population arguably less secure.** Various security needs are not aligned; and while they do not always have to be, more awareness of the clash between them is needed.

Infrastructural development to avert catastrophe is a key securitizing move – it enables the mobilization of militarized violence

Aradau 2010 (Claudia, Senior Lecturer in International Relations & Centre for the Study of Political Community, *Security That Matters: Critical Infrastructure and Objects of Protection*, Oct. 14, Sage, *thw_*)

The securitization of critical infrastructure is pre-eminently about the protection of objects. Critical infrastructure protection is generally held to have emerged as a security issue in the mid-1990s and the terminology of 'critical infrastructure' itself to have been coined by Clinton administration in 1996. Critical infrastructure allegedly signifies a difference from earlier usages of 'infrastructure'. While infrastructure was part of military strategy to weaken the enemy, its transformation into a matter of national security has been variously located either during the Cold War (Collier and Lakoff 2007) or after 9/11 (Center for History and New Media 2009). If military strategy could also 9 involve the destruction of one's own infrastructure, the securitization of critical infrastructure assumes an understanding of infrastructure as foundational. Societies are 'grounded' in infrastructure, their functioning, continuity and survival are made possible by the protection of infrastructure. A 1997 report by the Commission on Critical Infrastructure Protection was symbolically entitled 'Critical Foundations' (Commission for Critical Infrastructure Protection 1997). Definitions of critical infrastructure list heterogeneous elements, from communications, emergency services, energy, finance, food, government, health, to transport and water sectors (Centre for the Protection of National Infrastructure (CPNI) 2009). The general argument about the necessity to protect critical infrastructure is framed along these lines (with little variation from a report to another and from an author to another): Our modern society and day to day activities are dependent on networks of critical infrastructure – both physical networks such as energy and transportation systems and virtual networks such as the Internet. If terrorists attack a piece of critical infrastructure, they will disrupt our standard of living and cause significant physical, psychological, and financial damage to our nation (Bennett 2007: 9). The UK's Centre for the Protection of National Infrastructure defines the effects of any failure in national infrastructure to lead to 'severe economic damage, grave social disruption, or even large scale loss of life' (Centre for the Protection of National Infrastructure (CPNI) 2009). Naming infrastructures as critical for the purposes of protecting them against terrorist attacks is a securitising move. Where critical infrastructure experts would look for the adequacy of representation to the reality of objects threatened – by drawing up lists of critical infrastructure as a result of risk assessment scenarios – a performative approach would consider the constitution of reality through the iterative speech acts that securitize infrastructure by naming as 'critical' and in need of protection against potential terrorist attacks and/or other hazards. The Centre for the Protection of Critical Infrastructure in the UK encapsulates this double move: The most significant threat facing the UK comes from international terrorism and its stated ambitions to mount 'high impact' attacks that combine mass casualties with substantial disruption to key services such as energy, transport and communications. This is a threat that is different in scale and intent to any that the UK has faced before (Centre for the Protection of National Infrastructure (CPNI) 2010b). Yet, for the Copenhagen School of security studies for example, objects are also relegated to the status of external conditions of speech acts. Objects that are generally held to be threatening (for example, tanks or polluted waters) play a facilitating role in the process of securitization (Buzan, Waever, and de Wilde 1998: 33). Energy blackouts, transport

<u>failures and so on could also be read as facilitating conditions of the speech act.</u> In this approach, there is ontological and epistemological ambiguity about the role of   objects: as they outside speech acts or the result of speech acts? As the next section will show, this approach cannot account for different materializations of critical infrastructure – the matter of critical infrastructure is not constant and given but varies depending on   the agential cuts created.

--Link – Data Flows/Economy

The focus on protecting data flows and developing strong information networks proves our link – the imperative on protecting information companies allows neoliberal expansion to continue unimpeded
Webster 6

[Frank Webster, Professor of Sociology @ City University London, "Theories of the Information Society Third Edition", Routledge Publishing, pg. 126-128, AX]

In the writing of Herbert Schiller there are at least four arguments that are given special emphasis. I signal them here and expand on them later in this chapter. The first draws attention to the pertinence of market criteria in informational developments. In this view **it is essential to recognise that the market pressures of buying, selling and trading in order to make profit decisively influence information and communications innovations.** To Schiller (and also to his wife of fifty years, Anita, a librarian who researches informational trends) **the centrality of market principles is a powerful impulse towards** a second major concern, **the commodification of information,** which means that it is, increasingly, **made available only on condition that it is saleable.** In this respect it is being treated likeother things in a capitalist society: '**Information today is being treated as a commodity**. It is something which, like toothpaste, breakfast cereals and auto-mobiles, is increasingly bought and sold' (Schiller and Schiller, 1982, p. 461). The third argument insists that **class inequalities are a major factor in the distribution of, access to and capacity to generate information.** Bluntly, **class shapes who gets what information and what kind of information they may get.** Thereby, **depending on one's location in the stratification hierarchy, one may be a beneficiary or a loser in the 'information revolution'.** The fourth key contention of Herbert Schiller is that **the society that is under-going such momentous changes in the information and communications areas is one of corporate capitalism.** That is, **contemporary capitalism is one dominated by corporate institutions that have particular characteristics.** Nowadays **these are highly concentrated, chiefly oligopolistic** – rarely monopolistic – **organisations that command a national and generally international reach. If one wishes to picture this**, then **one has but to imagine**, say, **the clutch of oil companies which dominate our energy supply**: Shell, BP, Exxon, Texaco and a few others are huge, centralised enterprises, though they also have enormous geographical spread, linking across continents while also reaching deep into every small town and sizeable village in the advanced nations.To the Critical Theorist, **modern-day capitalism is of this kind: wherever one cares to look corporations dominate the scene with but a few hundred commanding the heights of the economy** (Trachtenberg, 1982; Barnet and Müller,1975). For this reason, in Herbert Schiller's view, **corporate capitalism's priorities are especially telling in the informational realm. At the top of its list of priori-ties is the principle that information and ICTs will be developed for private rather than for public ends.** As such **it will bear the impress of corporate capitalism more than any other potential constituency in contemporary society**. Clearly these are established features of capitalism. **Market criteria and class inequalities have been important elements of capitalism since its early days, and even corporate capitalism has a history extending well over a century** (cf.Chandler, 1977), though many of its most distinctive forms appeared in the latetwentieth century. But to Herbert Schiller this is precisely the point: **the capitalist system's long-established features**, its structural constituents **and the imperatives on which it operates are the defining elements of the so-called 'information society'**. From this perspective those who consider that informational trends signify a break with the past are incredible since, asks Schiller, how can one expect the very forces that have generated information and ICTs to be super-seded by what they have created? Far more likely to anticipate that **the 'information revolution' does what its designers intended – consolidates and extends capitalist relations.** What we have here is a two-sided insistence: **the 'information society' reflects capitalist imperatives** – i.e. **corporate and class concerns and market priorities are the decisive influences on the new computer communications facilities – and, simultaneously, these**

informational developments sustain and support capitalism. In this way Schiller accounts for the importance of information and ICTs in ways which at once identify how the history of capitalist development has affected the informational domain and how **information has become an essential foundation of that historical development.**

--Link – Public/Private

Public-private cyber security arrangements use inflated threats as a basis for outsourcing government administration and security responsibilities to private corporations

Eriksson and Giacomello 9 [Johan (Swedish Institute of International Affairs) and Giampiero (University of Bologna), "Who Controls the Internet? Beyond the Obstinacy or Obsolescence of the State", International Studies Review (2009) 11, 205–230, JSTOR, AX]

There are some difficulties for studying information age security issue from an academic perspective, mainly because the majority of books and articles on national security aspects of the Internet published over the last 10–15 years tend to be highly specific and policy-oriented, are US-centric, and do not communicate with more general international relations theory and research (prominent examples for this kind of literature include Arquilla and Ronfeldt 1997; Alberts and Papp 1997; Henry and Peartree 1998. For a broader discussion of IR theory and information age security, see Eriksson and Giacomello 2007). A common feature of most of the literature on the information revolution is the particular belief that **in the ''information age,'' information is becoming the major resource of power.** One of the core arguments in this literature is that the **technological development enhances two trends that diminish the importance of the state**, both of **which have implications for security**: **increasing internationalization and increasing privatization.** Two central conflicts reveal the nature of an ongoing redistribution of power: first, the notion that the information revolution empowers new forms of international actors, such as NGOs and activists, thus challenging the state's status as the major player in the international system; and second, the idea that the emergence of a global electronic marketplace would inevitably imply a collapse of the state's economic pillar of power as companies increasingly become global citizens and economic boundaries no longer correspond to political ones. Both of these trends have particular implications for nation-states' room for maneuver when it comes to security. More recently, some scholars have focused on the construction of information-age security threats by using frameworks informed by constructivism, particularly securitization theory (Eriksson 2001; Bendrath 2003; Dunn Cavelty 2008). From this, valuable insights can be gained with regard to threat perceptions and policy reactions, but more research is warranted particularly with regard to comparative studies of threat constructions in countries other than the United States. Post-structuralism has influenced another body of literature, which focuses on so-called ''Postmodern War'' (Hables Gray 1997, 2005; Der Derian 2001), seen as a discourse on technical–military interaction that also focuses on the centrality of information. **Information becomes the ''new metaphysics of power''** (Dillon and Reid 2001:59), **with various implications of** such a **conceptualization for the military itself and society as a whole.** This kind of literature focuses less clearly on the loss of control by state actors, but, by their very nature, strongly on questions of power and control more generally (see also Franklin). How National Security and Cyberspace Became Interlinked **In order to understand the security debate surrounding the Internet** today, **we need to consider two interlinked** and at times mutually reinforcing **debates** that have largely shaped the current discussions and are also reflected in the literature as discussed above. **The first is the expansion of the threat spectrum after the Cold War**, especially **in terms of malicious actors and their capabilities.** During the ColdWar, threats were mainly perceived as arising from the aggressive intentions of states to achieve domination over other states. Among other things**, the end of the Cold War** also **heralded the end of unambiguous threat perceptions: following the disintegration of the Soviet Union, a variety of ''new'' threats were moved onto the security policy agendas of most countries. The main distinguishing quality of these ''new'' challenges is the element of uncertainty that surrounds them. The notion of ''threat'' as something imminent, direct, and certain no longer accurately describes these challenges**. Rather, **they can be characterized as ''risks,'' which are** by definition **indirect, unintended, uncertain, and situated in the future, since they only materialize when they occur** in reality (Rasmussen 2001). **As a result of these diffuse risks and** due to **difficulties in locating and identifying enemies**, parts of **the focus of security policies has shifted away from actors,capabilities, and motivations towards general vulnerabilities** of entire societies. The catchphrase in this debate is ''asymmetry,'' and **the US military has been a driving force behind the shaping of this threat perception** in the early 1990s(Rattray 2001). The US, as the only remaining superpower, was seen as being pre-destined to become the target of asymmetric warfare. **Specifically**, those **adversaries who were likely to fail against the American war machine might instead plan to bring the United States to its knees by striking** against **vital points** at home that are fundamental not to the military alone, but **to the essential functioning of industrialized societies** as a whole. These points are called critical infrastructures(CI). **They are deemed critical because their**

incapacitation or destruction would have a debilitating impact on the national security and the economic and social welfare of a nation (Abele-Wigert and Dunn 2006; Dunn Cavelty and Kristensen 2008). **Fear** of asymmetrical measures against such ''soft targets'' **was aggravated by** the second debate, revolving around **new kind of vulnerabilities due to modern society's dependency on** inherently **insecure information systems**. Under the heading of vital system security, **protection concepts for strategically important infrastructures and objects have been part of national defense planning for decades**, though they played a relatively minor role during the Cold War (Collierand Lakoff 2008). Around the mid-1990s, however, **the possibility of infrastructure discontinuity caused by attacks or other disruptions attracted fresh attention among security strategists**, mainly **due to the information revolution**. ''**The Internet'',** understood here **as a network of** networks linking computers to computers that share protocols for **communication, seemed to add a variety of novel aspects to the older debate about vital system security** (Eriksson 2001). Aspects of Control: The Internet as Target and Weapon Subsequently, the question of whether the Internet was becoming the new Achil-les' heel of modern societies began to be discussed in earnest. In this debate, **infor-mation infrastructures are regarded as the backbone of critical infrastructures, given that** the uninterrupted **exchange of data is essential** to the operation of infra-structures in general and the services that they provide. Centralized Supervisory,Control and Data Acquisition (SCADA) systems are widely employed to remotely monitor and control infrastructures. But SCADA-based systems are not secure:once-cloistered systems and networks are increasingly using off-the-shelf productsand IP-based networking equipment, and require interconnection via the Internet,which opens the door to attackers from the outside in addition to the inside. **The complex interdependence of liberal (risk) societies and their growing technological sophistication have transnationalized and technologized the types of security problems that they face.** We seem be witnessing scalar changes moving in opposite directions: the power to resist vulnerability moves outwards to international markets and international organizations while the power to cause vulnerability moves inwards, through classes and groups to the individual. Representations of this security threat are very broad and also very vague, both in terms of what or who is seen as the threat and of what or who is seen as being threatened. **Global information networks, so the argument goes, make it much easier to attack even the strongest powers, as such an attack no longer requires big, specialized weapons systems. In theory, attacks can be carried out in innumerable ways by anyone with a computer** connected to the Internet, and for pur-poses ranging from juvenile hacking to organized crime, political activism, or strategic warfare. The technology employed for attacks is simple to use, inexpen-sive, and widely available. The methods of attack have become increasingly auto-mated and more sophisticated, resulting in more damage from a single attack. In addition, Internet attacks in general are quick, easy, inexpensive, and may behard to detect or trace, especially since the globe-spanning networks grant a great deal of anonymity. In this debate, ''the Internet''—or rather the information infrastructure—plays three different roles: first, the Internet is used for controlling aspects of critical infrastructures (often remotely); second, the Internet is seen as an attractive tar-get; third, the Internet can be a weapon or at least a kind of ''delivery system''for attacks. **In an attempt to control what they consider to be ''malicious activity'' online and to increase security, states** (i) **aim to enhance the security of the control infrastructure** to ensure reliable functionality of services and (ii) strengthen national law-enforcement capacities and international cooperation. **There are also** sporadic **calls for arms control efforts or multilateral behavioral norms for the military use of computer exploitation** (Denning 2001a,b; Rathmell 2001).Due to the breadth of issues subsumed under the virtual threat, all three dimen-sions of Internet control mentioned in the introduction (access to the Internet, functionalityof the Internet, and activityon the Internet) are implied. Actors: Distributed Security Through Distributed Responsibility **Considering its framing as national security issue** or ''high politics,'' **forceful attempts by nation states to control undesirable effects** in this domain **could be expected**. What we do see, however, is that **governments fail to provide security by themselves so that policies are predicated on the concept of voluntarily sharing responsibility with private actors.** There is little consensus among a variety of **public and private actors** regarding both the nature of the problem and the approaches to be taken. Depending on their viewpoints, they **may see information infrastructures as tools for maintaining a competitive edge over business adversaries, as technical–operational systems, as facilitators of criminal activities, or as defense-relevant strategic assets.** This leads to tensions between different stakeholders when it comes to addressing necessary control and security measures. On the one hand, **turf battles among government actors are frequent**. As is the case **for every ''new'' threat that needs negotiation in the political process, different government agencies compete with each other by bringing their own perspective** to bear on the problem **and try to shape future**

policies accordingly (Bendrath 2001; Dunn Cavelty 2008). This also has specific implications for how the issue can be addressed theoretically (see below). On the other hand, **governments see themselves in need to engage with the technological community and the private sector as the main proprietor and operator of the critical information infrastructure**. In many countries, the provision of energy, communication, transport, financial services, and health care have all been, or are being, privatized as previously protected markets are deregulated. In a nonliberalized economy, the state assumes the responsibility as well as the costs of guaranteeing functioning systems and services. **In a liberalized global economy**, however, assigning responsibility for securing such systems and services is becoming a major issue (Andersson and Malm 2006). It comes as no surprise, therefore, that **governments seek to integrate the private owners** of critical infrastructure in CIP practices **by means of** so-called **public–private partnerships and information-sharing initiatives** (Suter 2007). This is, however, not an easy task: In many countries, discontent between the private sector and government is deeply rooted and **there are continuing struggles over the question of whether "security" means the security of the state as a whole, or** whether it only refers to **the security of individual users or technical systems**, and should therefore be handled by authorities other than national security bodies. We can thus argue, by re-quoting Salhi, **that state not only "allowed non state actors to take on crucial roles"—but that they actually need nonstate actors in order to provide** one of the core tasks of the nation state: **security** for their citizens.

Economy

1NC Economy

Economic securitization leads to protectionism and turns the case

Lipschutz 98 (Ronnie, Director – Politics PhD Program, UC Santa Cruz, 1998. "On Security" p. 11-12 *thw_*)

The ways in which the **framing of threats is influenced by a changing global economy is seen** nowhere more clearly than **in recent debates over competitiveness and "economic security."** What does it mean to be competitive? Is a national industrial policy consistent with global economic liberalization? How is the security component of this issue socially constructed? Beverly Crawford (Chapter 6: "Hawks, Doves, but no Owls: The New Security Dilemma Under International Economic Interdependence") shows how **strategic economic interdependence** --a consequence of the growing liberalization of the global economic system, the increasing availability of advanced technologies through commercial markets, **and the ever-increasing velocity of the product cycle** --**undermines the ability of states to control** those **technologies that**, it is often argued, **are critical to economic strength and military might. Not only can others acquire these technologies, they might also seek to restrict access to them. Both** contingencies **could be threatening**. (Note, however, that by and large the only such restrictions that have been imposed in recent years have all come at the behest of **the United States**, which **is most fearful of its supposed vulnerability in this respect.**) What, then, is the solution to this "new security dilemma," as Crawford has stylized it? According to Crawford, state decisionmakers can respond in three ways. First, they can try to restore state autonomy through self-reliance although, in doing so, they are likely to undermine state strength via reduced competitiveness. Second, they can try to restrict technology transfer to potential enemies, or the trading partners of potential enemies, although this begins to include pretty much everybody. It also threatens to limit the market shares of those corporations that produce the most innovative technologies. Finally, they can enter into co-production projects or encourage strategic alliances among firms. The former approach may slow down technological development; the latter places control in the hands of actors who are driven by market, and not military, forces. They are, therefore, potentially unreliable. All else being equal, **in all** three **cases, the state appears to be a net loser where its security is concerned. But this does not prevent the state from trying** to gain.

2NC Economy

Increasing economic power is an attempt for securitization

Schweller, 11 (Randall, Prof. of Poli Sci @ Ohio State University, "Rational Theory for a Bygone Era", Security Studies Vol. 20 Issue 3, 8/25/2011, http://www.tandfonline.com/doi/full/10.1080/09636412.2011.599196, RM)//*thw_*

But geography and <u>policies rooted in geopolitics have become less relevant to</u> the formation of strategy and politics than they were when raw materials and land were the major prerequisites for state power. <u>We no longer live in a world</u> governed by the logic of the mercantilist age, <u>when military conquest to control territory and achieve</u> autarky (or a <u>monopoly</u> on goods) <u>was the surest route to riches and power</u>. Today, the traditional link between territory and wealth has been largely broken. The current era of high technology, instant communication, and nuclear weapons has significantly raised the benefits of peace and the costs of war. <u>What matters most today is</u> not <u>a state's</u> ability to exert direct control over resources but its <u>capacity to purchase</u> them <u>in a free global market</u>. Accordingly, <u>the foundation of modern state power has shifted</u> away from traditional military power <u>toward an emphasis on economic production</u> and a sustained capacity to generate ideas and commercial innovations that create wealth. To be perfectly clear on this point, <u>innovation and economic growth remain key building blocks of military power</u>; I am not suggesting otherwise. Rather, I am saying that military power is no longer an essential building block of economic growth and wealth creation; <u>and this has deeply changed the nature of international politics</u> and how the game is played.

--Turns Case

Securitizing against threat of economic decline and threats to technology leads to a culture of panoptic surveillance

Tuathail 96 (Gearóid Ó Tuathail, Prof. of Govt & Int'l Affairs & Director of the Public & Int'l Affairs program @ Virginia Tech, September 1996. "AT THE END OF GEOPOLITICS?." http://www.nvc.vt.edu/toalg/Website/Publish/papers/End.htm *thw_*)

A second cluster of postmodern geopolitics is that emerging from the efforts of intellectuals and institutions of statecraft to re-map the global strategic landscape after the Cold War. While the crude Manichean world of the Cold War may be gone for now, the preoccupation of the national security establishment with "rogue states and nuclear outlaws" is indicative of a persistent territorial conceptualization of danger in international security studies. Underwriting these territorializing specifications of danger are, of course, old-fashioned essentialist identities -- totalitarian states, Islamic fundamentalists, die-hard Communists, terrorists, criminals and devils (like Saddam Hussein) -- and a longstanding strategic commitment on the part of the Western security apparatus to pro-Western states like Israel, Saudi Arabia and Kuwait. The effort of NATO to extend this zone of strategic commitment and protection in Central Europe is evidence that a state-centric territorial geopolitics does persist, but increasingly it is also non-territorial "postmodern terrorist" threats in a speeding hybrid world that preoccupy the defense planners in the Pentagon, at NATO headquarters in Brussels, and elsewhere. Threats from contraband flows and proliferations -- the spread of nuclear weapons, plutonium, terrorists, drugs, illegal migrants, infectious diseases, money laundering, sensitive high-tech assets, biological and chemical agents, etc. -- and threats to vital official flows and ports -- oil pipelines, subways, world trading centers, airports, teleports, secret data archives, fiber-optic lines, international financial networks, and global sporting spectacles -- have brought into being a postmodern geopolitics of security where the geographies are in fluid flowmations not fixed formations. Ostensibly preoccupied by a geography of territorial fixities during the Cold War, security discourse has expanded to encompass the protection of fundamental spaces of flows from material attack or the immaterial terrorism of computer hackers and software viruses. The creation of a Belfast-style "ring of steel" and CCTV system around the City of London -- a strategic space of financial flows -- and the militarization of U.S. airports in response to recent spectacular bombings disclose a geopolitics that mixes traditional forms of containment and detainment with new panoptic surveillance and scanning technologies. Again, media vectors are also implicated in the creation of these landscapes, one of their "strategic" functions being the simulation of security and the containment of media borne viruses of panic and hysteria.

US economic liberalism damages other countries sense of security – causes a self fulfilling cycle of securitization

Lipshutz 95 (Ronnie D. Lipschutz, Asst Prof. of Politics @ UCSC, 1995. On Security p. 15-16 *thw_*)

Consider, then, the consequences of the intersection of security policy and economics during and after the Cold War. In order to establish a "secure" global system, the United States advocated, and put into place, a global system of economic liberalism. It then underwrote, with dollars and other aid, the growth of this system.[43] One consequence, of this project was the globalizations of a particular mode of production and accumulation, which relied on the re-creation, throughout the world, of the domestic political and economic environment and preferences of the United States. That such a project cannot be accomplished under conditions of really-existing capitalism is not important: the idea was that economic and political liberalism would reproduce the American self around the world.[44] This would make the world safe and secure for the Untited States inasmuch as it would all be the self, so to speak. The joker in this particular deck was that efforts to reproduce some version of American society abroad, in order to make the world more secure for Americans, came to threaten the cultures and societies of the countries being transformed, making their citizens less secure. The process thereby transformed them into the very enemies we feared so greatly. In Iran, for example, the Shah's efforts to create a Westernized society engendered so much domestic resistance that not only did it bring down his empire but so, for a time, seemed to pose a mortal threat to the American Empire based on Persian Gulf oil.

Islamic "fundamentalism," now characterized by some as the enemy that will replace Communism, seems to be U.S. policymakers' worst nightmares made real,45 although without the United States to interfere in the Middle East and elsewhere, the Islamic movements might never have acquired the domestic power they now have in those countries and regions that seem so essential to American "security."

Failed States/Cartels

1NC Failed States

Discourse of failed states legitimizes US imperialism, framing the underdeveloped as inferior Others to be controlled

Abrahamsen 2005 (Rita Abrahamsen, Prof. Intl Pol @ U Whales, "Blair's Africa:

The Politics of Securitization and Fear" Alternatives: Global, Local, Political January 2005 vol. 30 no. 1 70-71 *thw_*)

Rather schematically, it could be argued that the **policies that follow from securitization are formulated to** win over, contain, or **destroy the external enemy or threat. In the case of "failed"** and "underdeveloped" **states**, a strategy of containment is on its own rendered largely ineffective by Labour's understanding of the world as increasingly interconnected and borderless. **Because the "zones of chaos" cannot successfully be sectioned off from the "zones of peace,"** strategies to win over the enemy predominate and operate alongside strategies of containment. At the same time, the possibility of destruction is never ruled out. **Conquest and conversion**, as William Connolly has remarked in a different context, **remain the two authorized responses to otherness**.60

The Blair **government's main answer to the problem** of how to deal with those who do not subscribe to the values of the "international community" **is** conversion, or **strategies of assimilation and incorporation**: the dangerous areas must be included (or won over) **in order to** be **control**led **and manage**d. Hence, for Blair, "the starving, the wretched, the dispossessed, the ignorant, those living in want and squalor from the desert of northern Africa to the slums of Gaza, to the mountain ranges of Afghanistan: they too are our cause." And the cause is "to bring those same values of democracy and freedom to people around the world."61

This fairly aggressive liberal universalism cannot be understood without reference to security and the ambivalent relationship between freedom and security in liberal societies.62 **While liberalism seeks to free the individual** from the clutches of the state, **it is also concerned to ensure that people will exercise that freedom according to appropriate standards of civility and reason**. In other words, in order to act freely, the subject must first be shaped, guided, and molded into one capable of exercising that freedom in a responsible manner. Thus, what makes it possible for the free inhabitants of modern liberal societies to be governed via state mechanisms that appear to rest on their consent is the fact that the vast majority of those people have already been trained in the dispositions and values of responsible autonomy.63 **Security**, in other words, **is best achieved through** creating and expanding the conditions where people can enjoy the right kind of rights and liberties. At the level of international relations, development assistance can be regarded as a **government practice seeking to shape and regulate the behavior and conduct of freedom** in recipient states and societies.64

Through detailed interventions to reduce poverty, increase literacy, promote free trade, create representative institutions and 70 practices, and build capacity and institutions, development aid can be seen as a technique of government whereby Africa comes to conform to the liberal values of the "international community," such as free markets and democracy. **Development interventions also create a framework within which the West can introduce itself "as an intimate, regular presence"** in African states and in the life of their populations.65 Development, in other words, serves to guide states and their populations toward the responsible conduct of their freedom, so that "we" can continue to enjoy our freedom and way of life.66

At the same time, it is important to remember that **liberalism always contains the possibility of illiberal interventions in the lives of those who do not conform** to the accepted standards of civility or possess the attributes required to join the liberal community. In John Stuart Mill's formulation, for example, **liberty applied only to human beings "in the maturity of their faculties,"** and hence he regarded authoritarian government of the colonies as perfectly consistent with liberal values.67 **Liberalism's** principled **belief in equality can** thus be seen to **function simultaneously as a dividing practice, so that those who do not make use of the opportunities available for improvement toward civility or the "maturity of their faculties" can legitimately be excluded and treated outside conventional liberal rules of engagement. Today, states that refuse to reform** according to the rules and norms of the "international community" **face at best abandonment and** the withdrawal of development assistance, **at worst illiberal interventions to enforce compliance** and ensure the survival of the international community. In Cooper's fairly blunt terminology, this means that "[a]mongst ourselves, we keep the law but when we are operating in the jungle, we must also use the laws of the jungle."68

2NC Failed States/Cartels [LA Specific]

Stories of cartel violence and failed states are used to justify unhindered US imperialism in Latin America

Carlos 14 (Alfredo, Q.A. Shaw McKean Jr. Fellow @ Rutgers U School of Management and Labor Relations and Doctoral Candidate in Political Science @ U California – Irvine, Mexico "Under Siege": Drug Cartels or U.S. Imperialism?, Latin American Perspectives, Issue 195, Vol. 41 No. 2, March 2014, p. 43-59 *thw_*)//LA ***We don't endorse gendered or ableist language.

Michel Foucault (1972–1977: 120) argues that "**discourse serves to make possible** a whole series of **interventions**, tactical **and** positive interventions of surveillance, circulation, **control** and so forth." Discourses generate knowledge and "truth," **giving those who speak this "truth" social, cultural, and even political power**. This power "produces; it produces reality; it produces domains of objects and rituals of truth" (Foucault, 1979: 194). For Foucault (1972–1977:119), "what makes power hold good, what makes it accepted, is . . . that it traverses and produces things, it induces pleasure, forms knowledge, produces discourse." In essence, **power produces discourse that justifies, legitimates, and increases it**. Similarly, Edward Said (1994: 14), speaking in reference to literary discourse, says that literature as a cultural form is not just about literature. It is not autonomous; rather, it is about history and politics. He says that literature supports, elaborates, and consolidates the practices of empire. Television, newspapers, magazines, journals, books, advertisements, and the Internet all help construct stories, creating cultures of "us" that differentiate us from "them" (Said, 1994: xiii). They all elaborate and consolidate the practices of empire in multiple overlapping discourses from which a dominant discourse emerges.

Dominant discourses are constructed and perpetuated for particular reasons. As Kevin Dunn (2003: 6) points out, **representations have very precise political consequences. They** either **legitimize or delegitimize power**, depending on what they are and about whom (Said, 1994: 16). Said asserts that **a narrative** emerges that **separates what is nonwhite, non-Western**, and non-Judeo/Christian **from the acceptable Western ethos as a justification for imperialism and** the resulting policies and practices and argues that discourse **is manipulated in the struggle for dominance** (36). Discourses are advanced in the interest of exerting power over others; **they tell a story that provides a justification for action**. For Said, there is always an intention or will to use power and therefore to perpetuate some discourses at the expense of others. It is this intentionality that makes them dangerous and powerful. As Roxanne Doty (1996: 2) suggests, **through repetition they become "regimes of truth and knowledge." They do not actually constitute truth but become accepted as such** through discursive practices, which put into circulation representations that are taken as truth. Dominant discourses, meta-narratives (master frames that are often unquestioned [see Klotz and Lynch, 2007]), and cultural representations are important because **they construct "realities" that are taken seriously and acted upon**. Cecelia Lynch (1999: 13) asserts that "dominant narratives do 'work' even when they lack sufficient empirical evidence, to the degree that their conceptual foundations call upon or validate norms that are deemed intersubjectively legitimate." They establish unquestioned "truths" and thus provide justification for those with power to act "accordingly." **They allow the production of specific relations of power**. Powerful social actors are in a prime position to construct and perpetuate discourses that legitimize the policies they seek to establish. Narrative interpretations don't arise out of thin air; **they must be constantly articulated, promoted, legitimized, reproduced, and changed** by actual people (Lynch, 1999). Social actors with this kind of power do this by what Doty (1996) calls self-definition by the "other." Said (1994: 52) suggests that the **formation of cultural identities** can only be understood contrapuntally— that an identity **cannot exist without an array of opposites**. Western1 powers, including **the United States, have maintained hegemony by establishing the "other"**: North vs. South, core vs. periphery, white vs. native, and civilized vs. uncivilized are identities **that have provided justifications for the white man's civilizing mission and have created the myth of a benevolent imperialism** (Doty, 1996: 11; Said, 1994: 51). The historical construction of this "other"' identity produces current events and policies (Dunn, 2003). Through constant repetition, a racialized identity of the non-American, barbaric "other" is constructed, along with a U.S. identity considered civilized and democratic despite its engagement in the oppression, exploitation, and brutalization of that "other." **Consequently, dominant discourses** and meta-narratives **provide a veil for "imperial encounters," turning them into missions of salvation rather than conquests** or, in Mexico's case, economic control (Doty, 1996). Dunn (2003:174) suggests that dominant discourses legitimize and authorize specific political actions, particularly economic ones.

Scholars, intellectuals, and academics also engage in the perpetuation of discourses and participate in their construction. **There is a large body of scholarly literature that describes Latin America as a "backward" region that "irrationally" resists modernization**. Seymour Martin **Lipset** (1986), drawing on Max Weber and Talcott Parsons, **portrays Latin America as having** different, "inherently" faulty and "detrimental" **value systems that lack the entrepreneurial ethic and are therefore antithetical to the systematic accumulation of capital**. A newer version of this theory is promoted by Inglehart and Welzel (2005), who focus on countries that allow "self-expression" and ones that do not. Howard **Wiarda** (1986) **suggests that the religious history** of Latin America **promotes a corporatist tradition** that is **averse to democratic and liberal values**, a sentiment more recently echoed by the political scientist Samuel Huntington (1996). Along these same lines, Jacques **Lambert** (1986) **argues that the** paternalistic latifundia (**feudal-like**) **social structure** of Latin America **provides no incentive for self-improvement** or mobility. Ultimately, **the discourse created by the modernization and development literature focuses on the "backward" values of the "other" and becomes the West's justification for the continued underdevelopment of the region. These interpretations lead to** partial, **misleading, and unsophisticated treatment of complex political and economic dynamics**, particularly in Latin America. They ignore the long history of colonization and imperialism.

--US Policies → Violence

US policies strengthen cartels and directly increase poverty

Thornton & Goodman 14 [Christy Thornton, former Executive Director of NACLA, graduate student in the Department of History at NYU, and Adam Goodman, doctoral student in history at the University of Pennsylvania, "How the Mexican Drug Trade Thrives on Free Trade," 7/15/14] http://www.thenation.com/article/180587/how-mexican-drug-trade-thrives-free-trade# *nufh_*

In some places where the state has been eviscerated, **the cartels have emerged as a kind of parastate**, delivering much-needed services and the promise of economic opportunity. Some expressed shock and disbelief when hundreds of people took to the streets in Sinaloa after the arrest of Chapo Guzmán in February. But it makes sense: **El Chapo had infused millions of dollars into the economy of a poverty-stricken state and created jobs**—in security, transport and manufacturing of drugs—**that otherwise would have been nonexistent.**

Indeed, in 2008, the drug trade was Mexico's fifth-largest employer. It's likely the marchers were thinking about what El Chapo's capture will mean for them and their ability to put food on the table, rather than its impact on the drug war.

And of course, those marching in Sinaloa weren't alone in their support of the cartel. The Mexican newspaper El Universal recently uncovered evidence that **both the Mexican government and US Drug Enforcement Agency adopted a policy of supporting key parts of the Sinaloa organization in hopes of rooting out rival cartels**—from the Tijuana, Juárez and Beltrán Leyva cartels in the north, to the Familia Michoacana and Knights Templar in central-western Mexico, to the Zetas in the east and along most of the Gulf Coast. **The backing of both states helped the Sinaloa cartel defeat rival groups and reinforce its already dominant position relative to other cartels**.

Although Peña Nieto may have celebrated **the recent captures** of El Chapo and the Zetas boss Miguel Ángel Treviño, known as Z-40, and the killing of Nazario "El Chayo" Moreno González, one of the founders of La Familia Michoacana (whom the Calderón administration claimed to have already killed in 2010), they **represent only symbolic victories**. As Mexican journalist Diego Osorno commented, "The current administration relied on the old strategy of turning off the fire alarm, even though the fire is still ablaze."

Moreover, Peña Nieto's decision to extend Calderón's "kingpin" strategy is useless: the **capture of El Chapo will not dismantle the Sinaloa cartel or solve the root problems that have allowed cartels to flourish**, just as the arrest of Jamie Dimon would not take down JP Morgan nor lead to real changes to the banking industry. It's not to say that cartel leaders shouldn't be held accountable or brought to justice; it's that the problems underlying the multinational businesses they oversee are much larger than any one individual.

In his new book Campo de guerra, Mexican writer Sergio González Rodríguez notes that rampant corruption, **a "false state of law," and a "culture of a-legality" allow the legal and illegal to co-exist in Mexico. The restructuring of the country's** licit **economy** and the simultaneous and often symbiotic growth of its illicit economy **have led to unprecedented levels of economic and political inequality and insecurity**. Indeed, even **the violence of the drug war itself has been used as a pretense for** processes of "urban renewal" in cities like Ciudad Juárez, **displacing poor and working people and benefitting multinational real estate-interests**.

The quantity of capital injected into the Mexican and global economies by the drug trade is staggering—traffickers in Mexico and Colombia together make up to $39 billion each year in profit, according to a US Department of Justice report. Mexican **banks have a decades-long history of involvement in both the laundering of drug money and the support of political candidates**. As finance becomes increasingly transnational, foreign banks have become more closely tied to the drug trade, as well. As one observer put it, "the global banks are now the financial services wing of the drug cartels."

With the recent **settlements against international banks** like HSBC and Wachovia, which **protected the banks from criminal prosecutions after they were caught laundering billions of dollars for the cartels, the US**

government has signaled that the smooth functioning of the global financial system takes precedence over rooting out the cartels. Peña Nieto's reform strategy shares these priorities.

At the same time as the state and legitimate economies come to rely on illicit funds, the **cartels have diversified into** new markets—not just extortion and kidnapping, but into **formerly legitimate sectors** as well, operating in a grey area between legality and illegality. The Zetas, for example, use their dominance in the regions that produce oil and natural gas to allegedly steal and sell it to companies such as Royal Dutch Shell. In addition, the Knights Templar have made serious inroads into the mining industry, using violence, extortion and robbery, as well as simply opening new unregulated mines themselves.

The cartels' move into extractive industries has been made not just to launder money but also to seek new profit streams. Tracing shell companies set up with cartel funds to take advantage of deregulation in the petroleum sector, for example, is difficult, and the demand for heavy metals and energy sources from countries like China mirrors the demand for illegal drugs in the States. With the promise of profits to be made, **the cartels are coming more and more to resemble diversified multinational corporations**.

This reality, however, while shaped by the structural forces of international capitalism, **is also the result of policy decisions made by the Mexican and US governments**. If Mexico is going to be "saved," as a recent Time magazine cover put it, it will not be **through doubling down on the market-driven policies** that have structured the country's dual economies over the last few decades but through sustained pressure, from below and across borders, to bring to light the contradictions of capitalism and to fight for economic and social justice. Here in Mexico, that fight has put thousands in the streets of the capital in recent months, and as John Ackerman recently reported, resistance to Peña Nieto's reforms is growing.

That the rise of the cartels and the deregulation of the Mexican economy occurred together is not a coincidence: **both have used state structures to drive a relentless upward redistribution of wealth, while visiting immense physical and economic violence on the majority** of Mexicans. Reversing this trend will require recognizing the extent to which Mexico's "good" and "bad" capital are increasingly inextricable. Elite politicians, businessmen, and cartel leaders aren't strange bedfellows in Mexico—they share the billions under the mattress.

--Orientalism

Failed states discourse portray international stability and interventionism as white man's burden

Kaplan 3 [Amy, "Violent belongings and the question of empire today presidential address to the American studies Association" American Quarterly, vol. 56, no.1, march 2004, muse, pg 5-7 jf]

This is also a narrative about race. **The images of an unruly world, of anarchy and chaos, of failed modernity, recycle stereotypes of racial inferiority from earlier colonial discourses about races who are incapable of governing themselves**, Kipling's "lesser breeds without the law," or Roosevelt's "loosening ties of civilized society," in his corollary to the Monroe Doctrine. In his much-noted article in the New York Times Magazine entitled "The American Empire," Michael Ignatieff appended the subtitle "The Burden" but insisted that "America's empire is not like empires of times past, built on colonies, conquest and the white man's burden?" **Denial and exceptionalism are apparently alive and well. In American studies we need to go beyond simply exposing the racism of empire and examine the dynamics by which Arabs and the religion of Islam are becoming racialized through the interplay of templates of U.S. racial codes and colonial Orientalism.**

These narratives of the origins of the current empire-that is, the neoconservative and the liberal interventionist-have much in common. They take American exceptionalism to new heights: its paradoxical claim to uniqueness and universality at the same time. They share a teleological narrative of inevitability, that America is the apotheosis of history, the embodiment of universal values of human rights, liberalism, and democracy, the "indispensable nation," in Madeleine Albright's words. In this logic, **the United States claims the authority to "make sovereign judgments on what is right and what is wrong"** for everyone else and "to exempt itself with an absolutely clear conscience from all the rules that it proclaims and applies to others."'-' Absolutely protective of its own sovereignty, it upholds a doctrine of limited sovereignty for others and thus **deems the entire world a potential site of intervention.** Universalism thus can be made manifest only through the threat and use of violence. If in **these narratives imperial power is deemed the solution to a broken world**, then they preempt any counter narratives that claim U.S. imperial actions, past and present, may have something to do with the world's problems. **According to this logic, resistance to empire can never be opposition to the imposition of foreign rule; rather, resistance means irrational opposition to modernity and universal human values.**

Although these narratives of empire seem ahistorical at best, they are buttressed not only by nostalgia for the British Empire but also by an effort to rewrite the history of U.S. imperialism by appropriating a progressive historiography that has exposed empire as a dynamic engine of American history. As part of the "coming-out" narrative, the message is: "Hey what's the big deal. We've always been interventionist and imperialist since the Barbary Coast and Jefferson's 'empire for liberty.' Let's just be ourselves." A shocking example can be found in the reevaluation of the brutal U.S. war against the Philippines in its struggle for independence a century ago. This is a chapter of history long ignored or at best seen as a shameful aberration, one that American studies scholars here and in the Philippines have worked hard to expose, which gained special resonance during the U.S. war in Vietnam. Yet proponents of empire from different political perspectives are now pointing to the Philippine-American War as a model for the twenty-first century. As Max Boot concludes in Savage Wars of Peace, "The Philippine War stands as a monument to the U.S. armed forces' ability to fight and win a major counterinsurgency campaign--one that was bigger and uglier than any that America is likely to confront in the future."" Historians of the United States have much work to do here, not only in disinterring the buried history of imperialism but also in debating its meaning and its lessons for the present, and in showing how U.S. interventions have worked from the perspective of comparative imperialisms, in relation to other historical changes and movements across the globe.

The struggle over history also entails a struggle over language and culture. It is not enough to expose the lies when Bush hijacks words such as freedom, democracy, and liberty. It's imperative that we draw on our knowledge of the powerful alternative meanings of these key words from both national and transnational sources. Today's reluctant imperialists are making arguments about "soft power," the global circulation of American culture to promote its universal values. As Ignatieff writes, "America fills the hearts and minds of an entire planet with its dreams and desires?" The work of scholars in popular culture is more important than ever to show that the Americanization of global culture is not a one-way street, but a process of transnational exchange, conflict, and transformation, which creates new cultural forms that express dreams and desires not dictated by empire.

In this fantasy of global desire for all things American, **those whose dreams are different are often labeled terrorists who must hate our way of life and thus hate humanity itself.** As **one of the authors of the Patriot Act wrote, "when you adopt a way of terror you've excused yourself from the community of human beings."'** Although I would not minimize the violence caused by specific terrorist acts, I do want to point out the violence of these definitions of who belongs to humanity. Often in our juridical system under the Patriot Act, the accusation of terrorism alone, without due process and proof, is enough to exclude persons from the category of humanity. As scholars of American studies, we should bring to the present crisis our knowledge from juridical, literary, and visual representations about the way **such exclusions from personhood and humanity have been made throughout history, from the treatment of Indians and slaves to the internment of Japanese Americans during World War II.**

Thus **the current discourse about the American Empire embodies fantasies of a global monolithic order extending outward from a national center.** How can we draw on our knowledge of the past to bring a sense of contingency to this idea of empire, to show that imperialism is an interconnected network of power relations, which entail engagements and encounters as well as military might and which are riddled with instability, tension, and disorder-as in Iraq today? And we must further understand how **empire doesn't just take place in faraway battlefields**, but how **it exerts its power at home**-in fact, **in the interconnections between the domestic and the foreign, words already freighted with imperial meanings**, and for which we need better vocabularies.

Hegemony

1NC Hegemony

**US militarism creates a permanent state of war against to justify its expansion
Shor 10**

[Fran Shor, History Department at Wayne State University, 2010, Journal of Critical Globalisation Studies Issue 2, "War in the Era of Declining U.S. Global Hegemony", pg 73-74 jf]

Thus, a **geopolitical strategy for global dominance becomes obsessed with any global resistance that defies imperial prerogatives.** As argued by Ira Chernus, **"changes anywhere in the world that would challenge U.S. hegemony spell chaos and constant alarm"** (2006, p. 202). According to Chernus, **part of the process of seeking global dominance results in seeing and, even, of creating monsters to slay.** Although the morphing of those monsters from communists to terrorists marks certain discursive changes, **U.S. imperial policy is remarkably consistent**, irrespective of ideological shadings. One of the last Defense Department directives to be issued by the Bush Administration found **support from President Obama with the assertion that for the "foreseeable future, winning the Long War against violent extremists will be the central objective of U.S. policy." Wedded to what can only be construed as permanent war**, U.S. imperial policy garners such consensus precisely because **empire has become an American way of life.** A variation on this theme that puts the Long War into the long trajectory of U.S. imperialism is the following formulation by Andrew Bacevich: "**the Long War genuinely qualifies as a war to** preserve the American way of life … and simultaneously as a war to **extend the American imperium** (centered on dreams of a world re-made in America's image), the former widely assumed to require the latter" (2008, pp. 11 and 79-80).

While **the Long War** builds on the deep roots of U.S. imperial militarism, it also **becomes the most recent articulation of the search for global dominance**. That global **dominance relies heavily on the forward positioning of military power** throughout the world, but especially in areas laden with oil and other precious resources essential to the perpetuation of U.S. hegemony. However, while there may be an economic connection between U.S. imperial policy and the geopolitics of the extension of U.S. military power, it is important to understand how that **imperial militarism has an inherent logic that drives its thrust for global dominance.** Certainly, if not yet recognized by the American public, others in those strategically significant parts of the world readily understand how the presence of the U.S. military, in whatever guise, embodies the search, whether illusive or not, for global dominance. According to the Indian activist and writer, Arundhati Roy, "It's become clear that the War against Terror is not really about terror, and the War on Iraq not only about oil. It's about a superpower's self-destructive impulse toward supremacy, stranglehold, global hegemony" (2004, p. 34).

--Competition

U.S. primacy is based on an epistemologically flawed view of other nations as "competitors" – ensures endless war and economic collapse
Foster, 5

(John Bellamy Foster, prof of sociology @ Oregon, *Monthly Review*, "Naked Imperialism," http://www.monthlyreview.org/0905jbf.htm)

The unprecedented dangers of this new global disorder are revealed in the twin cataclysms to which the world is heading at present: nuclear proliferation and hence increased chances of the outbreak of **nuclear war, and planetary ecological destruction**. These are symbolized by the Bush administration's refusal to sign the Comprehensive Test Ban Treaty to limit nuclear weapons development and by its failure to sign the Kyoto Protocol as a first step in controlling global warming. As former U.S. Secretary of Defense (in the Kennedy and Johnson administrations) Robert McNamara stated in an article entitled "Apocalypse Soon" in the May–June 2005 issue of Foreign Policy: "The United States has never endorsed the policy of 'no first use,' not during my seven years as secretary or since. We have been and remain prepared to initiate the use of nuclear weapons—by the decision of one person, the president—against either a nuclear or nonnuclear enemy whenever we believe it is in our interest to do so." **The nation with the greatest conventional military force and the willingness to use it unilaterally to enlarge its global power is also the nation with the greatest nuclear force and the readiness to use it whenever it sees fit**—setting the whole world on edge. **The nation that contributes more to carbon dioxide emissions leading to global warming than any other** (representing approximately a quarter of the world's total) **has become the greatest obstacle to addressing global warming and the world's growing environmental problems**—raising the possibility of the collapse of civilization itself if present trends continue. **The United States is seeking to exercise sovereign authority over the planet during a time of widening global crisis: economic stagnation, increasing polarization between the global rich and the global poor, weakening U.S. economic hegemony, growing nuclear threats, and deepening ecological decline. The result is a heightening of international instability**. Other potential forces are emerging in the world, such as the European Community and China, that could eventually challenge U.S. power, regionally and even globally. Third world revolutions, far from ceasing, are beginning to gain momentum again, symbolized by Venezuela's Bolivarian Revolution under Hugo Chávez. U.S. attempts to tighten its imperial grip on the Middle East and its oil have had to cope with a fierce, seemingly unstoppable, Iraqi resistance, generating conditions of imperial overstretch. **With the United States brandishing its nuclear arsenal and refusing to support international agreements on the control of such weapons, nuclear proliferation is continuing**. New nations, such as North Korea, are entering or can be expected soon to enter the "nuclear club." **Terrorist blowback from imperialist wars** in the third world **is now a well-recognized reality**, generating rising fear of further terrorist attacks in New York, London, and elsewhere. **Such vast and overlapping historical contradictions, rooted in the combined and uneven development of the global capitalist economy along with the U.S. drive for planetary domination, foreshadow what is potentially the most dangerous period in the history of imperialism.** The course on which U.S and world capitalism is now headed points to global barbarism—or worse. Yet it is important to remember that nothing in the development of human history is inevitable. There still remains an alternative path—the global struggle for a humane, egalitarian, democratic, and sustainable society.

--Exceptionalism

Exceptionalism and military motivations for US policy lead to imperialism and backlash
Shor 10

[Fran Shor, History Department at Wayne State University, 2010, Journal of Critical Globalisation Studies Issue 2, "War in the Era of Declining U.S. Global Hegemony", pg 65-66 jf]

Convinced that they were beyond the reproach of history and the owners of the future, postwar U.S. policymakers and their ideological advocates sought to establish U.S. pre-eminence in the world by both overt and covert means. Among the overt designs was the development of numerous international and multilateral organizations, such as the United Nations, the North Atlantic Treaty Organization (NATO), the World Bank, and the International Monetary Fund (IMF). Such institutional arrangements reinforced and expanded U.S. hegemony. The covert means, deployed when coercion needed to trump a particular ideological consensus, focused primarily on the role of the newly created Central Intelligence Agency to foster favorable political arrangements and to underwrite cultural enterprises during the Cold War. Although U.S. interventions and regime change had predated the operationalization of U.S. global hegemony, those **foreign adventures increased in the developing world during the Cold War through what critics have called "stealth imperialism**," becoming, in turn, even more frequent, open, and brazen after the fall of the Berlin Wall.2

There can be no doubt that a more emboldened **imperialism and militarism have been the hallmarks of recent U.S. geopolitical strategy**. Carl **Boggs has traced** that 'revitalized **U.S. imperialism and militarism' to** a number of factors: **"a growing mood of American exceptionalism in international affairs, the primacy of military force in U.S. policy, arrogation of the right to intervene around the world, the spread of xenophobic patriotism, [and] further consolidation of the permanent war system"** (2005, p. x).3 However, as acknowledged by Boggs and other critics of U.S. imperialism, **such imperialism and militarism not only exacerbate and/or even create local insurgencies, but constant saber-rattling by the U.S. also produces global resistance**, such as the massive world-wide mobilization of millions that occurred on the eve of the U.S. military invasion of Iraq in February 2003. In effect, **the pursuit of imperial dominance through geopolitical militarism and war contains contradictions that further undermine hegemony abroad and legitimacy at home, reinforcing, in the process, a crisis of empire.**

Yet, in reviewing the last several decades of U.S. foreign policy, especially in Latin America and the Middle East, it is clear that the ruling elite in **Washington continue to believe in their right to determine the fate of others**. In fact, the policies enacted by the decision-makers in DC have become even more harried and brutal in light of those others who have the temerity to exercise their right of self-determination. In the aftermath of the crushing defeat in Vietnam and the crisis of legitimacy confronting ruling circles in the U.S., imperial policy suffered some setbacks, including the erosion of the prerogatives of the imperial presidency with the congressional passage in 1973 of the War Powers Act. Nonetheless, neither presidents nor the Pentagon felt constrained by the congressional restrictions, even though the pursuit of geopolitical military strategies varied to a certain degree depending on the soft or hard imperialist policy adopted by particular presidents. However, in Latin America, the bipartisan tradition of intervention often obliterated those differences.

--Overstretch

Pursuit of US hegemony leads to imperial overstretch and backlash
Shor 10

[Fran Shor, History Department at Wayne State University, 2010, Journal of Critical Globalisation Studies Issue 2, "War in the Era of Declining U.S. Global Hegemony", pg 75-76 jf]

Another very real dilemma for U.S. military imperialism and their **global strategies**, particularly as a consequence of the wars on Iraq and Afghanistan, **is imperial overstretch.** Both in terms of the eventual costs, estimated in the trillions of dollars just in the case of the war on Iraq, and the continuing drain on military personnel, these wars have further underscored the inherent contradictions of U.S. military imperialism and its war strategies. Even with active troops, counting the National Guard and Reserves, numbering over 2 million, the U.S. military has so depleted its human resources that it has resorted to extending tours in ways that have lowered morale and created even more internal dissent about deployment. Attempts to offset these problems by higher pay inducements, expansion of the numbers, and use of private contractors have only exacerbated the overall contradictions endemic in maintaining the kind of global garrison embodied by U.S. military imperialism. According to world-systems scholar Giovanni Arrighi, **besides having "jeopardized the credibility of U.S. military might," the war and occupation of Iraq may be one of the key components underlying the "terminal crisis of U.S. hegemony,"** albeit **without diminishing the U.S. role as "the world's pre-eminent military power"** (2005, p. 80). Nonetheless, as pointed out by other scholars (Johnson, 2004; Mann, 2003; Wallerstein, 2003), **imperial overstretch was central to the demise of previous empires and now threatens the death of a U.S. empire also bent on fighting debilitating and self-destructive wars.**

Clearly, **the pursuit of such wars also engenders resistance abroad and potential dissent at home**, the latter, however, contingent on some fundamental understanding of the whys and wherefores of prosecuting war. Certainly, **resistance to a militarized U.S. foreign policy is evident** in various guises, from local insurgencies to global protests. Irrespective of the form such resistance may take, **including insurgencies that engage in terror**, the U.S. will encounter resistance as long as it insists on imposing its sense of order in the world. In effect, a "system of global domination resting largely on military force, or even the threat of force, cannot in the greater scheme of things consolidate its rule on a foundation of legitimating beliefs on values" (Boggs, 2005, p. 178). On the other hand, **U.S. perception of that resistance, whether by the ruling elite, corporate media, or the public at large, is filtered through an ideological smokescreen that either labels that resistance as "terrorism"** or some primitive from of know-nothing anti-Americanism. **Part of the inability to recognize the reality** of what shapes the lives of others **is the** persistence of a **self-image of U.S. benevolence** or innocence, even in the face of the realities spawned by U.S. intervention and occupation.20 Also, what remains both contentious and difficult to face is the degree to which the United States, especially in its pursuit of global dominance through **military imperialism, has become,** to quote Walter Hixson, **a "warfare state, a nation with a propensity for initiating and institutionalizing warfare"** (2008, p. 14). For Hixson the **perpetuation of that warfare state requires** reaffirming a national identity whose cultural hegemony at home can provide **ideological cover for** "nation building, succoring vicious regimes, bombing shelling, contaminating, torturing and **killing hundreds of thousands of innocents, and destroying enemy others"** (2008, p. 304).

--Link – Homeland

Homeland discourse creates militarization, violence against the other and perceived racial purity

Kaplan 3 [Amy, "Violent belongings and the question of empire today presidential address to the American studies Association" American Quarterly, vol. 56, no.1, march 2004, muse pg, 8-10 jf]

The image of the American Empire also projects a fantasy about national identity: the war on terror, some would like to believe, **has supplanted the so-called culture wars. The notion of empire recuperates a consensus vision of America as a unitary whole, threatened only by terrorists, but no longer contested and constituted by divisions of race, class, ethnicity, gender, or sexuality. We can see this through the use of the word homeland**, a recent addition to the lexicon of U.S. nationalism, which gained currency along with empire, after 9/11, in the concept of homeland security. If empire insists on a borderless world, where the United States can exercise its power without limits, the notion of the homeland tries to shore up those boundaries. In **the idea of America as the homeland we can see the violence of belonging.**

The word homeland has many connotations." **It implies** a sense of native origins, of birthplace and **birthright. It appeals to common bloodlines, ancient loyalties, and often to notions of racial and ethnic homogeneity.** Though U.S. national identity has always been linked to geography, **these connotations represent a departure from traditional images of American nationhood as boundless and mobile.** In fact the exceptionalist notion of the New World pits images of mobility against a distinctly Old World definition of homeland. A nation of immigrants, a melting pot, the western frontier, manifest destiny, a classless society-all involve metaphors of spatial mobility rather than the spatial fixedness and rootedness that homeland implies. **Homeland also conveys a different relation to history, not a nation of futurity, but a reliance on a shared mythic past engrained in the land itself.** It resonates with the notion of the heartland.

This unitary notion of the homeland (it's always used with a definite article) **underwrites the resurgent nativism and anti-immigrant sentiment and policy.** Where is there room for immigrants in this fusion of nation and nativity? How many immigrants and their descendants may identify with America as their country or home but locate their homelands elsewhere, as a spiritual, ethnic, or historical point of origin? How many U.S. citizens see themselves as members of a diasporic community with a homeland in Ireland, Africa, Israel, or Palestine--a place to which they feel spiritual or political afilliation and belonging, whether literally a place of birth or not? Does the idea of America as the homeland make such dual identifications suspect and threatening, something akin to terrorism? Are you either a member of the homeland or with the terrorists, to paraphrase Bush? And what of the terrible irony of the United States as a homeland to Native Americans?

At a time when the rights of so-called aliens and **immigrants have been abrogated** by the Patriot Act, when they can be detained and deported in the name of homeland security, **the notion of homeland itself contributes to making their lives terribly insecure. It polices the boundaries between the domestic and the foreign** not simply by stopping aliens at the borders, but **by continually redrawing those boundaries everywhere throughout the nation, between Americans who can somehow claim the United States as their native land, their birthright, and immigrants and those who look to homelands elsewhere**, who can be rendered inexorably foreign. **This distinction takes on a decidedly racialized cast through the identification of homeland with a sense of racial purity** and ethnic homogeneity **that even** naturalization and **citizenship cannot erase.**

An odd thing about the use of the term homeland for the United States is that it refers often to a nation that lacks a state and territory, one to which a people or ethnic group aspires, such as Palestine, Kurdistan, or the Sikh. Tamil, or Basque homeland. Such groups are often viewed as underdogs whose legitimate claims to territory have been usurped by another state. In this vein, **homeland also has a connection to the discourse of diaspora and exile, to a sense of loss, longing, and nostalgia**. In this meaning, homeland may evoke a sense not of stability and security, but of deracination and desire. This also seems to be an appropriation and inversion. **The idea of**

America as aspiring to a lost homeland depends on evoking terrorism as the constant threat to sever Americans from their legitimate aspirations. Thus the idea of the homeland works by generating a profound sense of insecurity, not only because of the threat of terrorism but also because the homeland is a fundamentally uncanny place, haunted by all the unfamiliar yet strangely familiar foreign specters that threaten to turn it into its opposite.

This nostalgic notion of the homeland goes hand in hand with a modem security state, for **the concept of homeland security emerged** in the 1990s **to integrate U.S. territory as one unit of command in a global map of military departments.** Indeed, recently seven offices of home-land security have opened in different countries. Advocates for home-land security argue for more government and military coordination, for the armed forces to be involved in this country as well, and for the state through surveillance and policing to intrude into all areas of civil life. Although homeland security may strive to protect the domestic nation from foreign threats, it is actually about breaking down the boundaries between inside and outside, **about seeing the home in a state of constant emergency, besieged by internal and external threats that are indistinguishable. Thus the notion of the homeland draws on comforting images of a deeply rooted past to legitimate modem forms of imperial power.**

--AT Benevolent Hegemony

Claims of benevolent hegemony make intervention seem moral

Kaplan 3 [Amy, "Violent belongings and the question of empire today presidential address to the American studies Association" American Quarterly, vol. 56, no.1, march 2004, muse, pg 4-5 jf]

Another dominant narrative about empire today, told by liberal interventionists, **is that of the "reluctant imperialist**."10 **In this version, the United States never sought an empire** and may even be constitutionally unsuited to rule one, **but it had the burden thrust upon it by** the fall of earlier empires and **the failures of modern states, which abuse the human rights of their own people and spawn terrorism. The U**nited **S**tates **is the only power in the world with the capacity and the moral authority to** act as military policeman and economic manager to **bring order to the world. Benevolence and self-interest merge in this narrative; backed by unparalleled force**, the United States can save the people of the world from their own anarchy, their descent into an uncivilized state. As Robert Kaplan writes-not reluctantly at all-in "Supremacy by Stealth: Ten Rules for Managing the World": "The purpose of power is not power itself; it is a fundamentally liberal purpose of sustaining the key characteristics of an orderly world. Those characteristics include basic political stability, the idea of liberty, pragmatically conceived; respect for property; economic freedom; and representative government, culturally understood. At this moment in time it is American power, and American power only, that can serve as an organizing principle for the worldwide expansion of liberal civil society."" This narrative does imagine limits to empire, yet primarily in **the selfish refusal of U.S. citizens to sacrifice and shoulder the burden for others, as though sacrifices have not already been imposed on them by the state. The temporal dimension of this narrative entails the aborted effort of other nations and peoples to enter modernity, and its view of the future projects the end of empire only when the world is remade in our image.**

Democracy

1NC

Democracy today is a hollow signifier that creates projections that justify war and atrocities

Ivie and Giner 04

[ROBERT L. IVIE professor emeritus of communications and culture & American studies at Indiana University, OSCAR GINER Professor in the Theater department at Arizona State University, December 2004, "Hunting the Devil: Democracy's Rhetorical Impulse to War", Presidential Studies Quarterly 37, no. 4 pg 594-595 jf]

Overall, then, the diabolical incantations of **presidential war rhetoric functioned as an inducement to evacuate the political content of democracy, leaving a largely empty signifier** in its place. Although officially promoted, a narrowly circumscribed, truncated, distorted, and otherwise substantially purged simulacrum of democracy suspended ad infinitum was the diminished extent of its troubled symbolic import. Shriveled, shrunken, and emptied of meaning, **democracy was relegated to the degraded role of a political cipher—a ready** and reliable but badly disfigured **vehicle for sublimating a heavy burden of anxious self-loathing and transferring that unwanted load to an external object of terror. Diluted democracy in the heroic guise of world liberator** and protector and under the firm control of presidential order sub**stituted for robust democratic deliberation** and a full contestation of opinions. **A failure to contain democracy implied a risk of chaos**, an outbreak of violence, a loss of civilization, a reign of terror. **Killing terrorists substituted for acknowledging and confronting the suppressed dark side of America's political identity. The primal appeal of presidential war rhetoric, its patriarchal inducement to rescue a feminized and infantilized victim from the evil savagery of faceless tyranny, was to prove the nation's virtue** and virility. This was the essence of **a rhetorical diabolism that purged democratic anxiety by channeling it into an impulse to war.**

If Americans have inherited the Christian worldview from their ancestors, they have also inherited a naïve susceptibility to believe in medieval villains, a language derived from an agonic cosmology which casts the devil as an eternal, ontological adversary, and a superstitious conviction in the power of scapegoating as a ritual means of cleansing one's sins. The length of influence of old fears and the perpetuity of mental constructs are highlighted by the fact that the nation that chased devils in **Salem** in its infancy **grows up to declare war on terror and darkness.** President Bush is not an exception or even an extreme example of war mongering. What he is, as president, is the leading voice articulating the projection of a **national shadow onto terrorist enemies**—a shadow forged by Americans and **created in the image of their fears and anxieties about democracy.** Even **the president** himself **is subject to** becoming the target of such **anxious projections**, as in the case of Newsweek's February 19, 2007, issue, which merged into a single, front-cover image the left half of Bush's face with the right half of the demonized Iranian President Mahmoud Ahmadinejad's face, noting in an accompanying story that "**the two countries are now led by men who deeply mistrust the intentions and indeed doubt the sanity of the other**" (Hirsh and Bahari 2007, 30).

As long as these projections go unrecognized, they distort the nation's vision, delude it into making mistakes, and create an imaginary landscape that serves as a hideout for America's enemies: "The effect of **projection** is to **isolate the subject from his environment**, since instead of a real relation to it there is now only an illusory one" (Jung 1951, 146). **This fanciful terrain provides camouflage for the actual threat and is even a source of mistakes in battle.** At the turn of the century, arguing for a more complex understanding of the social phenomenon of Russian anarchist terrorists, George Bernard Shaw (1952, 214) warned, "If a man cannot look evil in the face without illusion, he will not know what it really is, or combat it effectively."

The true danger to the nation that is posed by unexamined projections is twofold: first, **unexamined projections leave us weak and vulnerable**. Having cast our vital energy on others, **we are left small and terrified before imagined external dragons** (like in those dreams in which we are chased by our own monsters). Second, **by branding others as evil**—cruel and inhumane though they may be—**we position ourselves as good**, leaving our "evil spirit," in the words of Robert Johnson, free to "catch a Greyhound bus and ride" (Johnson 1990, 46). **Because we are good, we believe ourselves justified** in Abu Ghraib, in Guantanamo, **in violating** the **rights** of American citizens and disregarding the Constitution. Also— somewhat inconsistently but

nevertheless devilishly captivating—**<u>we are left free to deny that these events occur</u>**, that they are wrong (How could good people perpetrate wrongful acts?), and that we are complicitous in them. Thus the practical need, as well as the moral responsibility, to remove the "beam" from the nation's collective eyes. Perhaps, if **<u>we gain the means and the moxie first to recognize and eventually to reclaim democracy's projected shadow, we might then dare to move forward toward a less dehumanizing and more democratic future with a diminishing incentive for war.</u>**

--AT Democratic Peace Theory

Democratic peace theory leads to conflict – "liberal peace" relies on accounting errors that ignore massive structural violence and ensure self-fulfilling prophecy – solutions predicated on it cause error replication
Kiely 5

[Ray Kiely, Professor of International Politics @ University of London Queen Mary] [Empire in the Age of Globalisation US Hegemony and Neoliberal Disorder] (http://tinyurl.com/qgmv49l) (accessed 7-16-15) //MC

Liberal notions of democratic peace should therefore be seen in this light. It is true that liberal democracies in the advanced capitalist countries are less likely to go to war with each other today than in the past. But this **so-called 'liberal peace' is itself a product of a history of bloody conflict**, and **the idea that such peace can be simply imposed** on 'pre-modern states' **ignores the ways in which the advanced powers have generated bloody conflict** in those parts of the world. It also **ignores ongoing processes of state formation and territorial conflict in relatively new states**. Cooper's division of the world into post-modern, modern and pre-modern states has a simplistic appeal, but it is purely descriptive, and tells us nothing about the (violent) histories of state formation that have led to such a division. **It** also **betrays a simplistic linearity in which the virtues of the advanced can quickly be imposed upon the backward**. This is a version of modernisation theory, in which **countries are** said to be **poor simply because they are insufficiently globalised** (see Chapter 5). **Quick- fix solutions** such as the illiberal imposition of liberal democracy are thus likely to **exacerbate such problems**, **no matter how wellintentioned** they may be – and we would do well to remember that past interventions have been justified by recourse to support for freedom and democracy. Indeed, these have often been based on the idea that intervention in the past was ill-intentioned or misguided, but that we have got it right 'this time'. **These points** are not made to support a blanket anti-interventionist position, but they do **warn against easy solutions**, **liberal follies and messianic rhetoric**.

Moreover, **no US administration has** really **been committed to genuinely democratic principles** of multilateral global governance. **All post-war US governments** have **upheld** the belief in **the desirability of US hegemony**, even if some have regarded multilateral negotiation as more important than others. It could of course be argued that because the US is a liberal democracy it has a greater right than others to exercise world leadership. But **if democracy is to be valued, then it cannot be selective**: it must apply to states not only in relation to their domestic populations, but also in relation to the international system of nation-states.10 In this international system, **the US has a poor record in terms of democratic principles**, as we have seen. Singer usefully makes the point:

Advocates of democracy should see something wrong with the idea of **a nation fewer than 300 million people dominating a planet with more than six billion inhabitants**. That's **less than 5 per cent of the population ruling over the remainder** – more than 95 per cent – without their consent. (Singer 2004: 191)

It may of course be utopian to espouse the cause of global democracy, even if, as cosmopolitan democrats point out, a similar argument was used in the past to argue against democracy within nation-states. But surely **it is wishful thinking to expect the world's population to acquiesce passively to** such **a patently undemocratic international system**. This is not to romanticise much of the 'anti-imperialist' resistance to current US global domination, much of which is reactionary. Terrorism should be condemned, and indeed efforts should be made to counter terrorist attacks. But it is absurd to dismiss all resistance to the US as the actions of terrorist minorities, whose actions are completely beyond explanation. Only **the most ardent wishful thinking about 'US destiny' and** the most **dangerous amnesia about history** – such as that shared by George Bush and Tony Blair – **can reduce global politics to simplistic struggles between good and evil**.11 This is hardly surprising, as it **reflects a long tradition of liberal thought justifying illiberal measures against 'illiberal people'**. John Stuart Mill argued

that 'despotism is a legitimate mode of government in dealing with barbarians, provided the end be their improvement and the means justifi ed by actually effecting that end' (Mill 1974: 69). In the 'war on terror', **terrorism has been reduced to a totally inexplicable, polymorphous mass**. As a result, '[w]ithout defi ned shape or determinate roots, its mantle can be cast over any form of resistance to sovereign power' (Gregory 2004: 140)

Democratic peace theory contructs enemies that provoke conflict
Ivie and Giner 04

[ROBERT L. IVIE professor emeritus of communications and culture & American studies at Indiana University, OSCAR GINER Professor in the Theater department at Arizona State University, December 2004, "Hunting the Devil: Democracy's Rhetorical Impulse to War", Presidential Studies Quarterly 37, no. 4 pg 580-581 jf]

Previous to the fall of communism, scholars had warned that a rising rhetorical presidency constituted a serious and growing threat to republican governance—that a worsening condition of presidential demagoguery, or direct appeal to the masses, bypassed responsible deliberation in Congress (Tulis 1987; Ivie 1996, 157-60). In the midst of this worry over properly containing and disciplining domestic, **the nation's political leadership endorsed a theory of democratic peace** that prescribed a thin veil of democratization as the way to global peace (Doyle 1996; Russett 1993; Weart 1998; Gilbert 1999). **This assumption legitimized an aggressive post-Cold War foreign policy and a subsequent doctrine of preemptive warfare for fighting the tyranny of terrorism** (Ivie 2005a, 92-116). George H. W. Bush's **Gulf War quickly launched** a brave new world order of "moving toward democracy through the door of freedom" and "toward free markets through the door to prosperity" (quoted in Smith 1995, 313), exuding **a distinctly crusading spirit** that Amos Perlmutter (1997, 9, 161) considered "mission oriented" and aimed at world domination. Bill Clinton, nervously following in Bush's presidential footsteps, proclaimed that America, as the one essential nation, must secure "democracy's triumph around the world" (quoted in Smith 1995, 320). O**vertones of national insecurity and vulnerability resonated throughout Clinton's rhetoric of democratic world order.** Even the extension of democracy—assuming "the ennobling burdens of democracy" to foster a "global village"—in these uncertain and tenuous times was a risky affair, it seemed, when the world's "oldest democracy" continued its "most daring experiment in forging different races, religions and cultures into a single people" (quoted in Ivie 2005a, 113-14; see 111-16). Democracy was risky business at home and abroad.

By the logic of the prevailing metaphorical construct, se**curing the demon of democratic passion inside a rational container was the symbolic equivalent to quelling the forces of savagery that threatened civilization. The inner conflict paralleled the outer struggle, and suppressing the forces of savagery was the mythic motive for America's historic mission of spreading democracy's empire.** From the beginning, as Robert Kagan (2006, 3-5) argues, America was perceived by much of the world as a dangerous nation because of its "aggressive and seemingly insatiable desire for territory and dominant influence." This abiding desire for control, along with a craving for ideological and commercial hegemony, posed the ongoing danger of "swallow[ing] up those cultures with which it came into contact." Yet, a lack of self-awareness about these expansive tendencies, "even as the United States has risen to a position of global hegemony," has left Americans perplexed when they discover that others hate and fear their powerful reach**. Empire was America's unacknowledged vocation, its mythic calling expressed as the sacred mission** of an exceptional people **to advance civilization by overcoming the evil forces of savagery and securing a lasting democratic peace.**

After 9/11, **terrorism became the threatening face of savagery in democracy's troubled empire** (Ivie 2005b, 56). Indeed, terrorism became not just democracy's mortal antagonist but also its evil counterpart, at once **an enduring cause for unlimited warfare** and a ready pretext for unruly democracy's continuous restraint and indefinite deferral. **The demon of distempered democracy was symbolically subsumed under the war on terror.** The face of the terrorist enemy was a semblance of the face of the inner savage. **The terrorist was the** dark brother, if not **offspring, of the democratic demon. Democracy thus served ambiguously as both war's purpose and provocation**, sought after in the ideal but arrested in the present while its distempered, totalitarian shadow remained dangerously at large. Such a "disowned shadow" in troubled hero myths, as Janice Rushing and Thomas Frentz (1995, 220) have observed, is readily projected onto an Other toward whom "we then relate . . . in an unconscious, undifferentiated way, usually with automatic and dogmatic hatred or fear."

Doyle McManus (2006), a staff writer for the Los Angeles Times, captured this basic ambivalence over democracy. Under the headline, "Kissinger Says Iraq Isn't Ripe for Democracy," McManus invoked the ghost of Vietnam to answer America's post-election riddle of protracted warfare in Iraq. "Former Secretary of State Henry A. Kissinger, a frequent advisor to President Bush and Vice President Dick Cheney," the story began, "has concluded that **the United States must choose between stability and democracy in Iraq**—and that democracy, for now, is out of reach." Fighting against what President George W. Bush called the totalitarian ideology of global terrorism, like fighting world communism, amounted once again to something short of fighting for the enrichment of democracy at home and abroad. At best, democracy would have to be deferred rather than promoted. Kissinger, McManus reported, was a "long-declared" skeptic of the administration's avowed aim of democratization, especially as "the primary goal of U.S. foreign policy." Democracy, Kissinger averred, might be implemented overseas only over "longer historical periods." The "evolution of democracy" could not begin by holding elections and building democratic institutions "from the ground up" nor could it start before a strong Iraqi leader had stabilized the situation and a "nation [was] born." Neither total military victory nor complete withdrawal from the fighting was realistic by this measure. Moreover, Kissinger's view was now privately shared by "middle-ranking [Bush] administration officials."

Democracy remained, in Sheldon Wolin's astute term, a fugitive—a paradoxical marker of national identity at a time of increasing alienation between the people and their rulers. Its invocation in American political rhetoric and media was "a tribute, not to its vibrancy, but to its utility in supporting a myth that legitimates the very formations of power which have enfeebled it" by means of anti-democratic strategies such as appeals to efficiency, stability, emergency, and so on. In this way, **America's superpower "claim to democracy" was "a form of hypocrisy**," a shallow symbol without a substantive, participatory practice. Democracy's basic principle of collective self-rule was "fictitious" in the contemporary world that reduced "majorities" to "artifacts manufactured by money, organization, and the media" (Wolin 2004, 601). Whether **America's claim to a democratic identity was paradoxical, hypocritical, or fanciful, it was freighted with tension, distrust, and apprehension.**

The force of this chronic democratic unease—this hellhound of national self-doubt and even self-loathing in the most extreme cases—must be understood as a primal impulse to war that projects an odious self-image onto the persona of an evil, fearsome enemy. This projection of democracy's shadow is difficult to observe and acknowledge because, viewed directly, it appears too grotesque and raw to emanate from the core of the national temperament. **America sees itself as an enlightened and pacifically inclined agent of liberty** and human advancement in a dark landscape of diabolical spirits, **not as an imperial beast of prey let loose upon the world, because "we are on the side of Light, they on the side of Darkness"** (Huxley 1952, 175). The mythic shading of the repressed enemy within—a deformed representation of the people, a distempered image produced by an ingrained fear of democracy— is therefore expressed obliquely in presidential war rhetoric.

Democratic peace theory necessarily constructs non-democratic nations as threats Hayes 09

[Jarrod Hayes, PhD in Politics and International Relations from the University of Southern California and Assistant Professor in the Sam Nunn School of International Affairs at the Georgia Institute of Technology, 2 DEC 2009, "Identity and Securitization in the Democratic Peace: The United States and the Divergence of Response to India and Iran's Nuclear Programs", International Studies Quarterly, Volume 53, Issue 4, page 982-983 jf]

The term securitization refers to the act by state leaders of choosing what issues should be considered under the security rubric (Buzan et al. 1998). Crucially, **the act of securitizing an issue involves both a securitizing actor**(s), who makes the claim that a particular object of value (referent object) is facing an existential threat requiring the suspension of normal politics**, and an audience**, which must agree both that the referent object is a thing of value and that it is (existentially) threatened in the way that the securitizing agent claims. For example, preceding the 2003 invasion of Iraq, President George Bush argued that Iraq's weapons of mass destruction could be used directly against Americans or given to terrorists who would deploy them against Americans. Here, the securitizing actor is George Bush, the referent object is the physical safety of Americans, which was threatened by Iraq's possession of weapons of mass destruction. **The audience, the US public, agreed with the assessment and accepted the movement of the issue out of normal politics** (that is, the use of military force).

Applying securitization to the democratic peace gives us an avenue for studying the role of norms and identity in the formation of security policy in democratic states. It seats the locus of action at the domestic level, where decisions of war and peace are made. Securitization gives us

a structured way for looking at the security process and focusing on the communicative action of leaders and their audiences. It also ties norms and structure together in explanation. **To securitize successfully, leaders must use the language of security;** they must appeal to certain norms and identities in order **to communicate the idea of a threat and that the object threatened is valuable.** The nature of the audience (general public, small group of oligarchs, military officers) as well as the norms and identity language the audience responds to are linked to the political structure**. Securitizers in autocracies face a very different audience, requiring a very different language of securitization, than those in democracies.**

This paper seeks to explore the role of identity language in the securitization process. I expect that **political leaders use the language of democratic identity and norms to signal possible threats or the lack thereof to their securitizing audience.** Consider the domestic identity of a democracy. The norms that inform democratic identity are agreed to include non-violent conflict resolution, rule of law, compromise, and transparency (Maoz and Russett 1993; Russett 1993; Dixon 1994; Owen 1994). In order for such an identity to work, there has to be flexibility in the other delimiters of identity. Differences in religion, cultural practices, economic perspective, gender, and race all have to be tolerated if a democracy is to be successful. The criteria for recognition and respect in a democracy must be fairly open (Williams 2001). Were they not, the democracy would tear itself apart. A democracy can only operate if the population willingly buys into the program. If most people chose to identify with their religion at the expense of their democratic identity, the state would quickly turn into a theocracy. Democratic governance fundamentally rests on the democratic identity of its citizenry. Democracy, like any other ideology, distinguishes between members of the self and the other. 2 If a state is to be democratic, then democratic identity must be a significant factor in the imagined community that binds the society under the state together (Anderson 1991). Policies involving negotiation and reconciliation—democratic political behavior—are justified by appealing to democratic norms and identity. **Leaders emphasize that the external state warrants these approaches as a trustworthy member of the democratic community**, that these behaviors are expected in return, and that the situation can be approached without significant concerns over violence. Weart notes that ''**group boundaries are typically set in ways connected with political circumstances**. In particular, **democrats…normally define even foreign democrats…as in-**group, '**people like us,'** at least in terms of what kind of political relations they expect'' (1998:18). **Policies involving aggression** and violence—nondemocratic political behavior—**are justified by demonstrating that the target state is beyond reason or trust, that their behavior could result in violence against the home state** (an existential threat). **Political leaders achieve this aim by emphasizing the undemocratic identity** and unwillingness to reliably operate by democratic norms **of the other. The securitized state poses an existential threat because it is dissimilar from the democratic self, a self defined by the exclusion of violence from conflict resolution.**

The securitization dynamic is not unique to democracies. **What is unique to democracies is the audience**. In a democracy, the public plays a critical role in large foreign policy decisions like war. It is inherent to the nature of democratic governance: leaders are accountable to the public for their policy decisions. Consequently, it is to the dominant (democratic) identity of the public and the attendant set of norms that leaders in democracies must appeal if they wish to securitize an external state. Combining the work on the individual level with securitization produces a more complete picture of the mechanisms behind the democratic peace. **Democratic norms and identity shape the security policy of democratic political** leaders in two ways. First, **leaders have internalized the democratic norms and identity, shaping their personal perception of threat.** Second, **democratic political structures bind leaders to the democratic norms and identity of the electorate**. Leaders in autocracies face a very different identity and norms environment. Political structure, identity, and norms are far more personalistic, indicated by small electorates and hierarchical political structures (diZerega 1995). The governing identity(s) and the interests of the state are grounded in the particulars of the ruling group.

Pursuing security through democracy causes militarization and prompts new conflicts

Ivie 5 (Robert L Ivie, Prof. Emeritus, Dept of Comm & Culture @ Indiana U Bloomington. 2005 "Savagery in democracy's empire, Third World Quarterly, 26:1, 55-65 *thw_*)

Although the trope of savagery is not unique to American war rhetoric, it is¶ indigenous to it and deeply ingrained in the political culture. The USA was¶ born in a new world that European settlers had cleared tribe by tribe, nation¶ after nation, of its native savages. British rule was overthrown in the colonies¶ with a call to arms against English monsters that thirsted for American¶ blood.4 The War of 1812, considered by many to be America's second war of¶ independence, was justified in Congress and to the nation by increasingly intense cries of British diabolism and decivilising metaphors of force that conveyed the image of a people being trampled, trodden and bullied by an enemy portrayed variously as beast of prey,

common criminal, ruthless murderer, haughty pirate and crazed tyrant.5 Similarly, the expansionist war declared against Mexico in 1846 was portrayed by a partisan President Polk, with a disciplined majority party in Congress, as a reluctant act of national defence in response to an irrational and evil Mexican aggressor, a belligerent foe that was easily inflamed and as unstable as a violent storm.6 President McKinley's justification of commercial imperialism five decades later, as the USA was about to enter the 20th century, was that America, by God's grace, would 'uplift and civilize and Christianize' those who 'were unfit for selfgovernment'. These savages of the Philippines would be the beneficiaries of America's 'noble generosity' and 'Christian sympathy and charity'.7

The savagery of war itself, as well as the rationalisation of slaughter, was marked particularly in the modern age by the trope of the machine. War became 'the mechanical human beast', adding yet another metaphor to the heritage of 'discursive support for military conflict' and to the language of 'common sense' that legitimised its destructive reality. A 'delirium of technology' transformed the machine into a deranged and destructive monster. The national character of the evil enemy was contained in this image of mechanised madness, with expansionist Germany representing the perfectly oiled war machine, its individual citizens reduced to uniform mechanical cogs. The beast became a rampaging automaton, an anarchic machine, an abdication of individuality and human responsibility, an uncontrolled threat to democracy that transformed the savage lust of the masses into the modern menace of civilisation. Indeed, the 'broad distinction between ''civilisation'' and ''barbarism''' that was so central to the language of World War I rested heavily on the pejorative characterisation of Germany as a perversion of progress, a degeneracy of 'over-rapid development', a mechanical mentality that elevated atrocity to 'a science and a technology'. The modern primitive had become a 'murdering machine', stripping its victims of their humanity, reducing them to raw material—its mechanical ethos making war into an inevitability, into 'the Frankenstein's monster of the twentieth century'.8 Thus Woodrow Wilson called for a war against Germany to make the world safe for democracy, with 'civilization itself seeming to be in the balance' because the menace of 'autocratic governments backed by organized force' had taken control 'of the will of their people'.9

The very militarisation of America led next, under this technological shadow of war, into a second world conflagration. Franklin Roosevelt, as Michael Sherry observes, 'did not merely perceive the importance of technology in modern warfare, he seized on it as fitting the nation's strengths and he deepened the American impulse to achieve global power through technological supremacy'. Such was his 'ideological construction' of national security. Europe's war-mad barbarians were the product of a technological determinism that assaulted 'the foundations of civilization' and required the USA to adopt 'strategies of annihilation as the measure of its own security against the danger of new technologies and ideologies.10 Thus FDR called on America, as the world's arsenal of democracy, to lead a crusade against the evil Axis of fascist power, a diabolical enemy that feigned peaceful intentions even as it ravaged the world in the most shocking, brutal, and criminal acts of treachery. The Japanese aggression at Pearl Harbor on Sunday, 7 December 1941 was a cause for indignation, an affront to a God-fearing nation, and it provided an exigency for defending civilisation by vanquishing rampant evil. Roosevelt's war rhetoric condensed belligerency to its pure form for a technological age and enemy.11

War itself became, even for Americans who prided themselves on their individualism, a 'mindless, anonymous' expression of 'machine-age dehumanization and cosmic purposelessness'. The bombing of cities was portrayed 'as a process of surgical destruction administered by cool-headed Americans'. This was an image of war rendered benign and a sense of power inflated into a technological arrogance that culminated in the atomic extermination of Japanese treachery and savagery.12 The mindset of Hiroshima among the US public was 'a collective form of psychic numbing' that carried forward into a regime of cold-war nuclearism. The atomic bomb, President Truman announced in triumph, was repayment for Pearl Harbor many fold, 'a new and revolutionary increase in destruction', a 'harnessing of the basic power of the universe', which Americans were rightly 'grateful to Providence' that decent people possessed, and with which they had righteously vanquished an evil enemy.13

Democracy creates fear of authoritarianism sparking conflict
Ivie and Giner 04
[ROBERT L. IVIE professor emeritus of communications and culture & American studies at Indiana University, OSCAR GINER Professor in the Theater department at Arizona State University, December 2004, "Hunting the Devil: Democracy's Rhetorical Impulse to War", Presidential Studies Quarterly 37, no. 4 pg 580-581 jf]

America's chronic impulse to war is provoked by democracy's shadow, which lurks at the far reaches of the nation's political soul. **Democracy casts** a dark veil of **anxiety over the public disposition**-so much so that **it constitutes a national phobia.** This deep distrust of the people, or "demophobia," confounds the identity and bewilders the political will of a self-proclaimed exceptional nation (Ivie 2005a, 14, 34, 43-44, 90-91). **It produces** nothing short of **a cultural tension that is resolved in presidential rhetoric as a commanding motive for war.**

There are several continuous phases in democracy's impulse to war. **We-the people-fear the enemy within**: an impassioned ogre of mob violence, a deformed Mr. Hyde who reflects the common fear and shared anxiety about democracy. This in the crucible of collective weaknesses, misshapen by national ambivalence toward the political system **Americans claim to honor-is readily projected onto external sources which are then conjured as** evil and defined as **the public enemy. A discourse of diabolism swiftly follows to paint a threatening picture of the enemy's evil savagery and goad the nation to defend its holy democratic soul** against civilization's wicked foes. The projection of a troubled identity, the displacement of the nation's own seeming vileness onto others-"in order to wipe it out with their blood" (Miller 1987, 357)-is a recurring goad to fight.

This demonic impulse to war assumes many guises in U.S. presidential rhetoric. The devil, as an essential antagonist in the nation's cosmology, has had a long and notable history in national dramas playing the part of the enemy. To **kill the foreign devil-enemy is to reaffirm the nation's special virtue** as a chosen people destined to overcome malevolence so that civilization may prevail. This heroic mask is the stuff of political myth. In the secular rituals of presidential rhetoric, **the mask pretends worldly realism in order to summon the god of war,** which is a necessary posture in a world of presumed enlightenment and a compensatory gesture in a fragmented postmodern political culture of hyper-symbolic transactions. Even as the nation dances to the drums of war, **it justifies aggression in the prosaic presidential idiom of the real**, the rational, and the practical. Herein lay the riddle of war's apparent complexity but basic simplicity; thus the extraordinary appeal of the contemporary call to arms.

Interested observers of this powerful mythos, upon detecting its presence in presidential rhetoric, need also to consider its implications for democratic culture. Recognition of the mythic forces that inform American politics is crucial to an understanding of governance in an age of imperial warfare. Can democracy, emptied of its incentive to humanize aliens by the diabolical incantations of presidential rhetoric, function as an inclusive politics of contestation? Or must it succumb, as did the first French republic (Schama 1989, 858-59), to a culture of war? To answer this question, it is important to acknowledge that George W. Bush's **presidential rhetoric is not an aberration of American political culture; it is rather a manifestation of unresolved issues of national identity being played out in a mythic ritual of redemptive violence.**

Iran

Democratic Peace Theory makes Iran seem like a threat – a securitized approach can never solve

Hayes 09 [Jarrod Hayes, PhD in Politics and International Relations from the University of Southern California and Assistant Professor in the Sam Nunn School of International Affairs at the Georgia Institute of Technology, 2 DEC 2009, "Identity and Securitization in the Democratic Peace: The United States and the Divergence of Response to India and Iran's Nuclear Programs", International Studies Quarterly, Volume 53, Issue 4, page 979 jf]

Consistently, **the political character of Iran is the central referent point in the threat discussion. The undemocratic characteristics of Iranian governance were tied to**, and juxtaposed against, **the threat to all "free" countries.** This argument only makes sense if there is an implicit appeal to the public to accept the securitization on the basis that the nature of Iran's regime is fundamentally threatening to democracy. The argument is not a strategic one (for example, Iran having a nuclear weapon is bad for US oil supply security), it is an argument based on democratic identity. This assessment is reinforced by the call for Iran's government to change in order to eliminate the threat to the democracies of the world. If **democratic identity did not matter to the public in terms of securitizing threats, there would be no need to call for democratization as a means to resolve the threat facing it.**

Within the US Congress, **some senators and representatives contested the securitization of Iran**. Bush's 2002 "axis of evil" State of the Union speech provides a useful focal point for looking at securitization rhetoric within the Congress. Two months after the State of the Union speech, Senators Joseph Biden (D-DE) and Charles Hagel (R-NE) made an argument for keeping relations with Iran within the realm of normal politics and out of the security framework. Hagel, in introducing a speech by Biden to the American-Iranian Council into the Congressional Record, argued that differences between the US and Iran should not "close off opportunities to influence Iranian behavior and work together constructively when we may share common interests" (Senator Hagel [NE] March 21, 2002).

Biden's speech pays particular attention to the democratic aspects of Iran's unusual divided governance, noting the reformist message of Iranian elections. For Biden, the democratic aspects of Iran moderate the potential threat from the country. The reformist will of the public, according to Biden, has created a "divided government… [a]n elected branch consisting of the parliament and the presidency" aligned against an unelected "hardcore clique" from which all the policies threatening to US interests arise: "they direct the policies that pose a threat to our interests." Biden's recognition of the democratic aspects of Iranian governance forms the basis and justification for his desecuritized approach. It precedes his assessment of the threat Iran poses to US interests (not to the United States itself) as well as his policy prescriptions. When Biden discusses threatening Iranian policies, he categorically condemns all but Iran's nuclear and missile programs, which enjoy significant levels of popular support within Iran. On these points, Biden concludes, "we cannot simply dismiss Iran's security concerns." His policy prescriptions reflect Biden's unaggressive, **desecuritizing approach: permit American NGOs to support civil society organizations within Iran, cooperate with Iran on issues of mutual interest, accept Iran's bid to initiate WTO accession talks, indirectly assist Iran on issues of refugees and narcotics, and continue citizen exchanges. In his discussion of Iran, Biden, and by extension Hagel, clearly attempt to position Iran and its relationship with the US within the realm of normal politics and outside a security framework** (Senator Hagel [NE] March 21, 2002).

A counter narrative, more in line with the securitizing approach of President Bush, vied with that of Hagel and Biden. A "sense of the Senate" resolution contested Biden's partial democratization of Iran. According to the sponsoring senators, while Iran's "people aspire to democracy, civil, political, and religious rights, and the rule of law," the "ideological dictatorship presided over by an unelected Supreme Leader…an unelected Expediency Council and Council of Guardians" represses the people's will. **The senators dismiss the democratic elements of Iran's government**, pointing to "increasingly frequent anti-Khatami demonstrations" and claiming that Khatami "clearly lacks the ability and inclina- tion to change the behavior of the State of Iran…political repression, newspaper censorship, corruption, vigilante intimidation, arbitrary imprisonment of students, and public executions have increased since President Khatami's inauguration" (Senator Brownback [KS], Senator Wyden [OR], Senator Collins [ME], Senator Dorgan [ND], Senator Grassley [IO], Senator Conrad [ND], Senator Smith [NH], and Senator Boxer [CA] July 25, 2002).

As in Bush's rhetoric, the **antidemocratic characterization of Iran's government precedes, and hence is the source of, Iran's threat to the United States.** The sponsoring senators **first argue that Iran is wholly undemocratic and then outline the activities that threaten the United States. 6 While the resolution and its sponsors argue that the US should focus its efforts on "the people, and their hopes for a free**

and democratic nation'' rather than use military force, the authors are clearly constructing Iran as a security threat in the context of Iran's undemocratic governance (Senator Wyden [OR] July 25, 2002).

China/Iran

Democratic peace theory constructs nations like China and Iran as threats

Hayes 09 [Jarrod Hayes, PhD in Politics and International Relations from the University of Southern California and Assistant Professor in the Sam Nunn School of International Affairs at the Georgia Institute of Technology, 2 DEC 2009, "Identity and Securitization in the Democratic Peace: The United States and the Divergence of Response to India and Iran's Nuclear Programs", International Studies Quarterly, Volume 53, Issue 4, page 979 jf]

What is remarkable about this quote is Specter's assessment of threat. **China poses a potential threat to the United States not because it has nuclear weapons or the largest military in the world. Instead, the Chinese threat arises from its authoritarian government. Conversely, India serves as a counterbalance against the Chinese threat simply because it is a democracy.** The implicit argument is that India's democratic governance naturally allies it with the democratic United States. Tellingly, after Specter links threat assessment (or lack thereof) to Indian democracy he goes on to discuss his change of heart on the US-India nuclear deal. **While Specter claims to have been swayed by India**'s argument that the NPT is discriminatory, **it is unlikely that he would have found these arguments compelling were they coming from nondemocratic Iran.**

It is difficult to measure public acceptance of the desecuritized construction of India and its nuclear program presented by policymakers. To a certain extent, the focus on the policymaker in securitization accepts the assumption that, as politicians, these actors are intimately aware of what policies and justifications they can, or cannot, 'sell' to the public. Public opinion polling should offer some insight on the issue, but as will become clear shortly, polling data requires at least as much interpretation as political speech and is critically dependent on both the content and the manner in which questions are asked (Moore 2004).

The Gallup organization has a long-running series of polls examining Americans' perceptions of other states. While not directly commenting on the perception of threat to the United States posed (or not) by India, Gallup did run a poll in the immediate aftermath of the May 1998 nuclear tests. In it, 61% of the public felt the development of nuclear weapons in general was a ''bad thing.'' Of these respondents, however, only 47% indicated that India's development of a nuclear weapon would be a threat to world peace. This contrasts sharply against the 66% of respondents who felt Pakistan's possession of nuclear weapons posed a serious threat to world peace, and the more than 80% of respon- dents who felt that nuclear weapons development by Iran and Iraq posed a serious threat to world peace (Moore 1998). The Gallup data gives no indication as to why the threat perception of India is so far below the threat perception of Pakistan, Iraq, Iran, and nuclear weapons in general, and without other polling data on the perception of India at the time, these conclusions mean little. These caveats aside, **the significantly lower level of perceived threat with respect to India seems to support the argument presented in this paper that India's democratic governance inhibits threat perception in the public.**

Long-term trends in general perception of India also seem to support this argument. Clearly, India enjoys a generally favorable perception in the public. In 2000, 76% of Americans viewed India in a positive light–15% felt India was a US ally, while 61% saw India as a friendly non-ally (Saad 2000). Differences in the question do produce significant variation in the numbers. A short year after the 2000 poll with no international incidents of note, India's 'favorability' in the eyes of the public stood at only 58% (Moore 2001). By 2005, 75% of respondents saw India favorably, possibly reflecting the consequences of the December 2004 tsunami (Moore 2005). A year later India's favorability rating had fallen back to 66%, roughly consistent with its rating of 69% as of March 2008 (Jones 2006; Saad 2008a). Despite the variation in poll ratings, India clearly maintains a broadly favorable position in the eyes of the public; the country consistently ranks among the top ten nations in terms of favorability. It is not clear what factors drive positive public perception of India, but it is telling that **democracies dominate the top of the favorability rankings. If democracy does play an important role in structuring public threat assessment, India's high rankings are consistent with what we would expect of public opinion.**

Prerequisite

Analyzation of securitization threats in relation to democracy is a prerequisite for effective policy

Hayes 09 [Jarrod Hayes, PhD in Politics and International Relations from the University of Southern California and Assistant Professor in the Sam Nunn School of International Affairs at the Georgia Institute of Technology, 2 DEC 2009, "Identity and Securitization in the Democratic Peace: The United States and the Divergence of Response to India and Iran's Nuclear Programs", International Studies Quarterly, Volume 53, Issue 4, page 979 jf]

The securitization framework has the potential to provide significant insight into the mechanisms of the democratic peace—a considerable weakness in the literature. Muller and Wolff (2004) argue that the dominant mechanisms in the literature—political structure and political norms—are monadic mechanisms attempting to explain a dyadic phenomenon. The mechanistic ambiguity of the democratic peace leaves the theory open to legitimate counterarguments based on critiques of correlation (Gartzke 2000; Green, Kim, and Yoon 2001; Ward, Siverson, and Cao 2007) or reverse causality (Midlarsky 1995; Thompson 1996; James, Solberg, and Wolfson 1999). The lack of clear mechanistic understanding also makes it difficult for scholars and policymakers to integrate the democratic peace into a coherent foreign policy to enable democracies to take advantage of the phenomenon.

Securitization also serves to reintegrate the democratic peace back into security studies more broadly. **The democratic peace represents a regularity in how security threats are constructed,** not an exception. **Using securitization to trace that regularity and how it operates will improve our understanding of how democracies in general construct their threat environment. Securitization also reasserts the importance of politics in security policy.** While the institutions and balance of power play a role in international security, **understanding how threats and policy responses are identified and constructed by leaders both inside their heads and in public is critical for understanding international security dynamics.** Constructivist work on the democratic peace primarily focuses on the individual level of this duality. Securitization gives us a theoretical basis for examining the second—public—aspect.

Turns Case

Attempts to save democracy through securitization prevent actualizing freedom
Ivie and Giner 04

[ROBERT L. IVIE professor emeritus of communications and culture & American studies at Indiana University, OSCAR GINER Professor in the Theater department at Arizona State University, December 2004, "Hunting the Devil: Democracy's Rhetorical Impulse to War", Presidential Studies Quarterly 37, no. 4 pg 592-593 jf]

Hints of a more robust democratic culture and practice, when they occasionally surfaced in presidential war rhetoric, were directed to the future rather than the present, thus deferring indefinitely a fuller realization of democracy while avoiding direct acknowledgement of a deep and abiding anxiety over actually empowering the demos. Thus, **Iraq was "making inspiring progress toward building a lasting democracy," and Afghanistan was "on the road to democracy"** (Bush 2005c, 2004b, 2004a). Likewise, **America was "advancing the rights of mankind" and standing up for "the advance of democracy" by helping countries "lay the foundations of democracy"** and showing them "the way toward democracy," which was an ongoing process, the president reminded Americans, that would test their patience because "finding the full promise of representative government takes time" and "we are now in the early hours of this struggle between tyranny and freedom" (Bush 2004c, 2005a, 2006f). This was the overall, well-removed future context in which the president occasionally gestured (and even then jokingly) to debate as the "essence of democracy" (Bush 2005c) and made passing reference to "a pluralistic, self governing society" (Bush 2004a). In the meantime, **the "difficult road ahead" required** "the determined efforts of a unified **country" that "must put aside our differences** and work together to meet the test that history has given us" in our common quest for "a shining age of human liberty" (Bush 2006f).

The reason for continuously deferring the fulfillment of democracy's larger promise was that tyranny, like the devil who tempted Jesus, is irrepressible and only "departs for a season" (Luke 4:13). The present fight was a "current expression of an ancient struggle—between those who put their faith in dictators, and those who put their faith in the people"; America faced an enemy that was "never tired, never sated, never content with yesterday's brutality" (Bush 2005c). Tyran**ny always returns, restored to its full savagery, at the first sign of civilization's weakness**. It never stays dead or remains permanently defeated. It continues "violently opposed to democracy" (Bush 2005a), forever challenging America to "back down" (Bush 2005e) and constantly requiring the nation to "fight back" in order to disprove tyranny's unshakable belief that "democracies are weak" (Bush 2005b, 2004b).

When freedom was defined foremost in opposition to totalitarianism—as a continuous fight with the dark ideological forces of tyranny spanning centuries, not just years and decades—**it lost its focus as a positive exercise** of constitutionally privileged **and protected civil rights and its immediate relationship to democratic practice.** Thus, **fighting for freedom substituted for putting freedom and democracy into practice and hindered thinking about what a robust practice of liberal democracy might actually entail.** It insinuated instead strong presidential leadership as the appropriate mode of governance—indeed, the stronger the better, given the immediacy of totalitarianism's unending threat.

War on terror impact

Attempt to protect the world for democracy created the war on terror
Ivie and Giner 04

[ROBERT L. IVIE professor emeritus of communications and culture & American studies at Indiana University, OSCAR GINER Professor in the Theater department at Arizona State University, December 2004, "Hunting the Devil: Democracy's Rhetorical Impulse to War", Presidential Studies Quarterly 37, no. 4 pg 586-588

It was foundational in the sense of a base coat, or the gesso applied to a canvas before receiving the artist's painting. **The defacement of America's terrorist enemies by the president's rhetoric set the stage for a classic psychological projection.** The phenomenon of projection is defined by Carl Jung as "an unintentional transfer of a part of the psyche which belongs to the subject onto an outer object" (von Franz 1991, 14, emphasis in original). Alluding to a Christian metaphor, Marie-Louis von Franz reminds us that projections traffic in the "well-known business of the beam in our eye which we do not see" (von Franz 1991, 14).1 **Projections are "emotionally-toned**," and characteristically "the cause of the emotion appears to lie, beyond all possibility of doubt, in the other person" (Jung 1951, 146, emphasis in original). Th**e rhetorical manufacture of a blank slate allowed for the externalization of a** vague, disturbing, **shadowy persona**. "Terrorists try to operate in the shadows. They try to hide," Bush observed, but America would "rout out terrorism" no matter how long it might take. "No corner of the world will be dark enough to hide in" (Bush 2001f, 2001b). **Cast in a sinister undertone, the president's portrait of terror** depicted **America struggling in the dark to conquer its nemesis**. This was "a time of testing," a "time of adversity" that would reveal "the true character of the American people" (Bush 2001g, 2001l). It would be a difficult struggle, but the president assured Americans that "we can overcome evil. We're good" (Bush 2001k). Americans **were fighting to prove that** evildoers could not "break our spirit" or "diminish our soul" (Bush 2001c, 2001b). **America would not succumb in the darkness to its evil counterpart** and alter ego.

Jung reminds us that "**projections change the world into a replica of our unknown face**" (Jung 1951, 146**). Behind the mask of terrorist evil, the face of the distempered demon of democracy could be observed.** An observer tracking **the language of terror** through the president's public statements soon **encounters visible markers of the enemy's crazed brutality.** On the side of "chaotic violence" were the "barbaric acts" of "bands of murderers, supported by outlaw regimes" and driven by "mad intent"; these "shadowy, entrenched enemies" were the "authors of mass murder" (Bush 2001e, 2001q). **Their "mad ambitions"** and "fanaticism" constituted an "axis of evil" that **threatened "the civilized world" with "mass destruction"** (Bush 2002b). The "dim vision" of these "backwards," "barbaric," "cold-blooded killers," and "parasites" that "don't have hearts" was to "brutalize" their victims with "torture" and "beheadings" contrary to "all civilized norms" (Bush 2004a, 2004c, 2004d). The "fanatical," "murderous ideology" (Bush 2005c) and sheer "savagery" of these terrorists (**Bush** 2006a) **marked them** not only "as brutal an enemy as we've ever faced" (Bush 2005d) but especially **as "violently opposed to democracy"** (Bush 2005a) and against "the idea of progress itself" (Bush 2005c). Ultimately**, America's war on terrorism amounted to a "struggle between tyranny and freedom," a quest to "leave the desert of despotism for the fertile gardens of liberty"** (Bush 2006f).

Particularly difficult-to-acknowledge **apprehensions about democracy were expressed** by indirection and thereby attributed **to an old adversary** frequently revisited in presidential rhetoric. "The murderous

ideology of the Islamic radicals" was "like the ideology of communism," the president allowed, in that it "is elitist.... teaches that innocent individuals can be sacrificed to serve a political vision.... pursues totalitarian aims . . . [with] endless ambitions of imperial domination. . . . is dismissive of free peoples.... [and] contains inherent contradictions that doom it to failure" (Bush 2005c). This **projection of fear and distrust onto a totalitarian antagonist** (in abnegation of democracy) **was** purportedly **a display of what democratic America** precisely **was not** (elitist, authoritarian, imperialistic, aggressive, belligerent, murderous, and doomed to defeat). Yet **the dark image of this totalitarian**, Islamic, Communist-like **enemy corresponded**, perhaps too closely for comfort, **to the nation's ready compliance with presidential rule and its involvement in a wooly regimen of continuous global warfare.**

AT Pinker

Pinker's analysis is incomplete – solely framing peace as between great powers ignores mass deaths at the hands of those powers
Herman & Peterson 12

(David, independent writer & researcher based in Chicago, and Edward, prof. @ Wharton School UPenn "Reality Denial : Apologetics for Western-Imperial Violence" http://www.globalresearch.ca/reality-denial-apologetics-for-western-imperial-violence/32066 *thw_*)

Pinker's standard for an interruption of the "Long Peace" would be a war between the "great powers," and it is true that the major Axis and Allied powers that fought each other during World War II have not made war among themselves since 1945. But Pinker carries this line of thought even further: He contends not only that the "democracies avoid disputes with each other," but that they "tend to stay out of disputes across the board," (283) an idea he refers to as the "Democratic Peace."[12] (278-284) This will surely come as a surprise to the many victims of U.S. assassinations, sanctions, subversions, bombings and invasions since 1945.[13] For Pinker, no attack on a lesser power by one or more of the great democracies counts as a real war or confutes the "Democratic Peace," no matter how many people die.

"Among respectable countries," Pinker writes, "conquest is no longer a thinkable option. A politician in a democracy today who suggested conquering another country would be met not with counterarguments but with puzzlement, embarrassment, or laughter." (260) This is an extremely silly assertion. Presumably, when George Bush and Tony Blair sent U.S. and British forces to attack Iraq in 2003, ousted its government, and replaced it with one operating under laws drafted by the Coalition Provisional Authority, this did not count as "conquest," as these leaders never stated that they launched the war to "conquer" Iraq, but rather "to disarm Iraq, to free its people and to defend the world from grave danger."[14] What conqueror has ever pronounced as his goal something other than self-defense and the protection of life and limb? It is on the basis of devices such as this that Pinker's "Long Peace," "New Peace," and "Democratic Peace" rest. (See "Massaging the Numbers," below.)

And it is in this kind of context Pinker throws-in his "gentle commerce" theme by advancing the so-called "Golden Arches Peace" idea—that "no two countries with a McDonald's have ever fought in a war." The "only unambiguous" exception that he can name occurred in 1999, "when NATO briefly bombed Yugoslavia." (285) In an endnote he mentions that an "earlier marginal exception was the U.S. attack on Panama in 1989," but he dismisses this U.S. war as too insignificant to make the grade—"its death count falls short of the minimum required for a war according to the standard definition,"[15] though according to the UN Charter and customary international law, there was nothing sub-standard about this unambiguous U.S. aggression against a sovereign country. Here as in many other places, Pinker selects the estimated death toll that minimizes the U.S.-inflicted casualties and fits his political agenda.[16]

Pinker mentions in passing that the post-World War II peace among the giants was possibly a result of the immense cost of wars that might involve a nuclear exchange—and it did extend to the Soviet Union during its post-World War II life—but his explanation focuses mainly on the cultural evolution and biological adaptations of the Civilized,[17] in contrast with the Uncivilized of the Third World. Why this new peaceableness of the Civilized does not stop their violent interventions abroad he fails to explain. The exclusion of wars against the Uncivilized from his definition of a "Long Peace" reflects gross political bias.

Pinker attributes the sense of increased violence to multiple "illusions," one of which he believes is caused by the development of media and other advanced forms of communication that allow a rushing to the spot of bloody events, and recording them and transmitting them to the world. As he explained in a guest appearance on CBS TV's The Early Show in mid-December 2011: "Not only can we send a helicopter with a film crew to any troubled spot in the world but now anyone with a cell phone is an instant reporter. They can broadcast color footage of bloodshed wherever it occurs and so we're very aware of it."[18] Apparently Pinker believes that the

media cover the world on a non-discriminatory basis, reporting on Guatemalan peasants slaughtered by their army, civilian victims of U.S. drone warfare in Afghanistan, Honduran protesters shot dead by their own military, and dead and injured U.S. soldiers as aggressively as they report on civilian protesters shot dead on the streets of Tehran, or the victims of the Syrian government or of the late Muammar Gaddafi in 2011.[19] The naiveté here is staggering.

Pinker's "Long Peace" and "New Peace" and their alleged declines of violence not only coincide with the numerous and ongoing attacks by the giants on the midgets, the huge expansion in arms, and the new "burgeoning" of torture,[20] but runs parallel with the increasing structural violence of a global class war that has resulted in growing inequality within and between countries, systematic dispossession of vast numbers, a widespread seizure of the commons, major migrations, growing cities of slums, increased ethnic tensions and anti-Islamic fervor, deliberately stoked in a troubled, receptive environment, mass incarceration of minority populations, and more vocal oppositional forces both here and abroad.[21] These do not constitute "violence" in Pinker's accounting system.

Privacy

1NC Privacy

Creating zones of privacy against state intrusion reinforces rather than challenges the security state

Henry 13 (PhD candidate at Carleton University reading Sociology and Political Economy)
(Aaron, Socialist Studies / Études socialistes 9 (2) Winter 2013, THE PERPETUAL OBJECT OF REGULATION: PRIVACY AS PACIFICATION)

There is a conviction today that privacy is in a state of irretrievable crisis. In addition to the collection and sale of day-to-day personal activity by telecommunications services and social networking sites, programmes of surveillance and registration have allegedly eroded what were previously understood as the firm borders between public and private spheres of relations. That this has happened or is in the process of materializing has taken on the weight and opacity of a social fact. Yet, while privacy is said to be in a state of crisis, the 'right to privacy' is often trumpeted by liberals as the counterweight to balance the intrusion of state projects into the lives of individuals. Indeed, this appears to be the general sentiment that rests behind initiatives like the 'Orwell Award' given to companies that have violated privacy, or the American Civil Liberties Union recent mobilization against Drones as a privacy concern. Thus, privacy is presented as means to make intrusions into the life of the individual proportional to the objectives of security projects, and in some instances security projects are legitimized for the forms of privacy they safeguard (Cavoukian, 1999, 13). To this end, privacy is subject to a rather peculiar positioning as both a relation threatened by security and as a regulative principle capable of ensuring the 'acceptable' limits of security projects.

What I want to demonstrate in this paper is that the relation of privacy to security as both an object threatened by security and as a means of regulating security projects is the product of a longstanding relation between privacy, security and capital. This relation is expressed in two ways. First, while privacy has been invoked as a means to resist projects of security, I argue that privacy is in fact deployed as a means to structure the fields of relations through which security interventions are made.2 In this sense, when the power of state or capital intervenes upon the individual, privacy emerges as a concept. Privacy, a retroactive concept, exists as a means to assuage individuals that the duration and scope of security projects will be 'reasonable or proportional'; thus, security presupposes and delimits privacy. Second, in the course of defending the individual's freedom and autonomy over their inner world, privacy reinforces private property and private life, the very relations projects of security safeguard. Thus, privacy acclimatizes us to a mode of existence where we are alienated from our collective social power, and so we confront relations of domination and exploitation as private individuals. This commodification of our selves is, I suggest, part of the condition of pacification.

First, I attempt to theorize how security and its relation to capital render it not only generative of privacy but structure its perimeters. I demonstrate the formation of this relationship between security and privacy through a critical reading of Thomas Hobbes' Leviathan. Second, I offer a contemporary example of this relation between privacy and security through an analysis of the Passenger Name Record (PNR) agreement between the United States and the EU. Finally, I conclude by reviewing how privacy as desirable form of existence constitutes a form of pacification insofar as it not only fails to challenge capital but has further entrenched the logics of security into social life.

Proliferation

1NC Proliferation

Fears of proliferation are based in racism and colonialism
Lutz 9

[Catherine Lutz, professor of anthropology at Brown University and the Watson Institute for International Studies, 2009, *The Bases of Empire* p. 29]

The reasons given for stationing U.S. forces overseas, though, cannot simply be called wrong. While the weight of evidence just briefly reviewed suggests that they are, **the pursuit of** the immense project of **circling the globe with soldiers** and equipment **is fueled as much by mythic structures as by reason** and rationality. **It then becomes difficult to distinguish** one from the other. While such myths may be invalidated by rational argumentation, their explanatory power often remains powerfully intact. **Support for foreign military bases hinges** first **on the idea that war is** often necessary and **ultimately inevitable. It is widely believed that humans are naturally violent and that war can be** a **glorious** and good venture. **Racism adds the notion that** the modern and not coincidentally **white nations have the responsibility, intelligence, religious ethic, and right to control more primitive** (and more chaotically violent) **others through violence if necessary. These racial ideas made it possible for people in the United States and Europe to support colonial exterminationist wars** in the nineteenth century, **but to find wars between industrialized or civilized states increasingly unthinkable** during the late nineteenth century (despite what went on to happen in the twentieth). **They also underpin the assumption that Gusterson (1999) has labeled "nuclear orientalism," which holds that only the United States and European powers can truly be trusted with nuclear weapons.** Such beliefs provide important foundation stones for support of the U.S. basing system.16

2NC Proliferation Discourse

Proliferation discourse constructs nations as out of control to justify American imperialism. This orientalist framing ends in absolute domination of the Other.
Gusterson 99 (Hugh Gusterson, Prof. Anthropology & Science & Tech Studies @ MIT, 1999, "Nuclear Weapons and the Other in the Western Imagination," *thw_*)

According to the literature on risk in anthropology, shared fears often reveal as much about the identities and solidarities of the fearful as about the actual dangers that are feared (Douglas and Wildavsky 1982; Lindenbaum 1974). The immoderate **reactions in the West to the nuclear tests** conducted by India and Pakistan, and to Iraq's nuclear weapons program earlier, **are examples of an entrenched discourse on nuclear proliferation that has played an important role in structuring the Third World, and our relation to it**, in the Western imagination. This discourse, **dividing the world into nations that can be trusted with nuclear weapons and those that cannot, dates back**, at least, **to the Non-Proliferation Treaty** of 1970. The Non-Proliferation Treaty embodied a bargain between the five countries that had nuclear weapons in 1970 and those countries that did not. According to the bargain**, the five official nuclear states** (the United States, the Soviet Union, the United Kingdom, France, and China)3 **promised to assist other signatories** to the treaty in acquiring nuclear energy technology **as long as they did not** use that technology to **produce nuclear weapons**, submitting to international inspections when necessary to prove their compliance. Further, in Article 6 of the treaty, **the five nuclear powers agreed to "pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race at an early date and to nuclear disarmament"** (Blacker and Duffy 1976:395). One hundred eighty-seven countries have signed the treaty, but Israel, India, and Pakistan have refused, saying it enshrines a system of global "nuclear apartheid." Although the Non-Proliferation Treaty divided the countries of the world into nuclear and nonnuclear by means of a purely temporal metric–designating only those who had tested nuclear weapons by 1970 as nuclear powers-**the treaty has become the legal anchor for a global nuclear regime that is increasingly legitimated in Western public discourse in racialized terms**. In view of recent developments in global politics-the collapse of the Soviet threat and the recent war against Iraq, a nuclear-threshold nation in the Third World-the importance of **this discourse** in organizing Western geopolitical understandings is only growing. It **has become an increasingly important way of legitimating U.S. military programs** in the post-Cold War world **since** the early 1990s, when U.S. military **leaders introduced the term rogue states into the American lexicon of fear, identifying a new source of danger** just as the Soviet threat was declining (Klare 1995). Thus in Western discourse **nuclear weapons are represented so that "theirs" are a problem whereas "ours" are not**. During the Cold War the Western **discourse on the dangers of "nuclear proliferation"** defined the term in such a way as to sever the two senses of the word proliferation. This usage **split off the "vertical" proliferation of the superpower arsenals** (the development of new and improved weapons designs and the numerical expansion of the stockpiles) **from the "horizontal" proliferation of nuclear weapons to other countries, presenting only the latter as the "proliferation problem."** Following the end of the Cold War, the American and Russian arsenals are being cut to a few thousand weapons on each side.5 However, **the United States and Russia have turned back appeals** from various nonaligned nations, especially India, for the nuclear powers **to open discussions on** a global convention **abolishing nuclear weapons**. Article 6 of the Non-Proliferation Treaty notwithstanding, the Clinton administration has declared that nuclear weapons will play a role in the defense of the United States for the indefinite future. Meanwhile, in a controversial move, the Clinton administration has broken with the policy of previous administrations in basically formalizing a policy of using nuclear weapons against nonnuclear states to deter chemical and biological weapons (Panofsky 1998; Sloyan 1998). **The dominant discourse that stabilizes this system** of nuclear apartheid in Western ideology **is a specialized variant within a broader system of colonial** and postcolonial **discourse that takes as its essentialist premise a profound Otherness separating Third World from Western countries**.6 **This inscription** of Third World (especially Asian and Middle Eastern) nations **as ineradicably different from our own** has, in a different context, been labeled "Orientalism" by Edward Said (1978). Said argues

that orientalist discourse **constructs the world in terms of a series of binary oppositions** that produce the Orient as the mirror image of the West: **where "we" are rational and disciplined, "they" are impulsive and emotional; where "we" are modern and flexible, "they" are slaves to ancient passions and routines; where "we" are honest and compassionate, "they" are treacherous and uncultivated**. While the blatantly racist orientalism of the high colonial period has softened, **more subtle orientalist ideologies endure in contemporary politics**. They can be found, as Akhil Gupta (1998) has argued, in discourses of economic development that represent Third World nations as child nations lagging behind Western nations in a uniform cycle of development or, as Lutz and Collins (1993) suggest, in the imagery of popular magazines, such as National Geographic. I want to suggest here that another variant of contemporary orientalist ideology is also to be found in **U.S. national security** discourse. Following Anthony Giddens (1979), I define **ideology** as a way of constructing political ideas, institutions, and behavior which (1) **makes the political structures and institutions** created by dominant social groups, classes, and nations **appear to be naturally given and inescapable** rather than socially constructed; (2) presents the interests of elites as if they were universally shared; (3) **obscures the connections between different social and political antagonisms so as to inhibit massive, binary confrontations** (i.e., revolutionary situations); and (4) legitimates domination.

The Western discourse on nuclear proliferation is ideological in all four of these senses: (1) it **makes the simultaneous ownership of nuclear weapons by the major powers and the absence of nuclear weapons in Third World countries seem natural** and reasonable while problematizing attempts by such countries as India, Pakistan, and Iraq to acquire these weapons; (2) it presents the security needs of the established nuclear powers as if they were everybody's; (3) **it effaces the continuity between Third World countries' nuclear deprivation and other systematic patterns of deprivation** in the underdeveloped world in order to inhibit a massive north-south confrontation; and (4) it legitimates the nuclear monopoly of the recognized nuclear powers. In the following pages I examine four popular arguments against horizontal nuclear proliferation and suggest that all four are ideological and orientalist. The arguments are that (1) Third World countries are too poor to afford nuclear weapons; (2) deterrence will be unstable in the Third World; (3) Third World regimes lack the technical maturity to be trusted with nuclear weapons; and (4) Third World regimes lack the political maturity to be trusted with nuclear weapons. Each of these four arguments could as easily be turned backwards and used to delegitimate Western nuclear weapons, as I show in the following commentary. Sometimes, in the specialized literature of defense experts, one finds frank discussion of near accidents, weaknesses, and anomalies in deterrence as it has been practiced by the established nuclear powers, but these admissions tend to be quarantined in specialized discursive spaces where the general public has little access to them and where it is hard to connect them to the broader public discourse on nuclear proliferation.7 In this article I retrieve some of these discussions of flaws in deterrence from their quarantined spaces and juxtapose them with the dominant discourse on the dangers of proliferation in order to destabilize its foundational assumption of a secure binary distinction between "the West" and "the Third World." It is my argument that, **in the production of this binary distinction, possible fears and ambivalences about Western nuclear weapons are purged and recast as intolerable aspects of the Other. This** purging and recasting **occurs in a discourse characterized by gaps and silences in its representation of our own nuclear weapons and exaggerations in its representation of the Other's. Our discourse** on proliferation is a piece of ideological machinery that **transforms anxiety-provoking ambiguities into secure dichotomies**. I should clarify two points here. First, I am not arguing that there are, finally, no differences between countries in terms of their reliability as custodians of nuclear weapons. I am arguing that those differences are complex, ambiguous, and crosscutting in ways that are not captured by a simple binary division between, on the one hand, a few countries that have nuclear weapons and insist they are safe and, on the other hand, those countries that do not have nuclear weapons and are told they cannot safely acquire them. It is my goal here to demonstrate the ways in which **this simple binary distinction works as an ideological mechanism to impede a more nuanced and realistic assessment of the polymorphous dangers posed by nuclear weapons in all countries and to obscure recognition of the ways in which our own policies in the West have often exacerbated dangers in the Third World that**, far from being simply the problems of the Other, **are problems produced by a world system dominated by First World institutions and states**.

--Anti-nuclearism

WMD policy justifies war in the name of preservation. Coercive tactics maintain US dominance and justify nuke war

BondGraham & Parrish 2009 (Darwin BondGraham, sociologist and investigative journalist, and Will Parrish, anti-imperialist scholar. 2006 "Anti-nuclear Nuclearism", http://fpif.org/anti-nuclear_nuclearism/ *thw_*)

The Obama administration is likely to continue a policy that we call "anti-nuclear nuclearism." **Anti-nuclear nuclearism** is a foreign and military policy that **relies upon overwhelming U.S. power**, including the nuclear arsenal, **but makes rhetorical and even some substantive commitments to disarmament**, however vaguely defined. Anti-nuclear nuclearism thrives as a school of thought in several think tanks that have long influenced foreign policy choices related to global nuclear forces. Even the national nuclear weapons development labs in New Mexico and California have been avid supporters and crafters of it. As a policy, **anti-nuclear nuclearism is designed to ensure U.S. nuclear and military dominance by rhetorically calling for what has long been derided as a naïve ideal: global nuclear disarmament**. Unlike past forms of nuclearism, **it de-emphasizes the offensive nature of the U.S. arsenal**. Instead of promoting the U.S. stockpile as a strategic deterrence or umbrella for U.S. and allied forces, it prioritizes an aggressive diplomatic and military campaign of nonproliferation. **Nonproliferation efforts are aimed entirely at other states, especially non-nuclear nations with suspected weapons programs**, or states that can be coerced and attacked under the pretense that they possess nuclear weapons or a development program (e.g. Iraq in 2003). Effectively pursuing this kind of belligerent nonproliferation regime requires half-steps toward cutting the U.S. arsenal further, and at least rhetorically recommitting the United States to international treaties such as the Nuclear Non-Proliferation Treaty (NPT). **It requires** a fig leaf **that the United States isn't developing new nuclear weapons**, and that it is slowly disarming and de-emphasizing its nuclear arsenal. By these means the United States has tried to avoid the charge of hypocrisy**, even though it has designed and built newly modified weapons with qualitatively new capacities over the last decade and a half**. Meanwhile, U.S. leaders have allowed for and even promoted a mass proliferation of nuclear energy and material, albeit under the firm control of the nuclear weapons states, with the United States at the top of this pile. Many disarmament proponents were elated last year when four extremely prominent cold warriors — George P. Shultz, William Perry, Henry Kissinger, and Sam Nunn — announced in a series of op-eds their commitment to "a world free of nuclear weapons." Strange bedfellows indeed for the cause. Yet the fine print of their plan, published by the Hoover Institute and others since then, represents the anti-nuclear nuclearist platform to a tee. It's a conspicuous yet merely rhetorical commitment to a world without nuclear weapons. These four elder statesmen have said what many U.S. elites have rarely uttered: that abolition is both possible and desirable. However, **the anti-nuclear posture in their policy proposal comes to bear only on preventing non-nuclear states from going nuclear**, or else preventing international criminal conspiracies from proliferating weapons technologies and nuclear materials for use as instruments of non-state terror. In other words, it's about other people's nuclear weapons, not the 99% of materials and arms possessed by the United States and other established nuclear powers. **This position emphasizes an anti-nuclear politics entirely for what it means for the rest of the world — securing nuclear materials and preventing other states from going nuclear** or further developing their existing arsenals. U.S. responsibility to disarm remains in the distant future, unaddressed as a present imperative. Exclusive Route around the CTBT **Concerns about the nuclear programs of other states** — mostly Islamic, East and South Asian nations (**i.e., Iran**, North Korea, etc.) — **conveniently work to reinforce existing power relations embodied in U.S. military supremacy and neocolonial relationships** of technological inequality and dependence. By invoking their commitment to a "world free of nuclear weapons," **the ideologues** behind the anti-nuclear nuclearist platform **justify invasions, military strikes, economic sanctions, and** perhaps **even the use of nuclear weapons** themselves against the "rogue states" and "terrorists" whose possession of weapons technologies vastly less advanced than those perpetually stockpiled by the United States is deemed by the anti-nuclear nuclearists the first and foremost problem of the nuclear age.

Orientalism → War

This causes war, genocide, and racism based off of orientalist fears of potential threats Batur 7

[Pinar Batur, PhD @ UT-Austin – Prof. of Sociology @ Vassar, 2007, "The Heart of Violence: Global Racism, War, and Genocide," in *Handbook of the The Soiology of Racial and Ethnic Relations*, eds. Vera and Feagin, p. 446-7]

At the turn of the 20th century, the "Terrible Turk" was the image that summarized the enemy of Europe and the antagonism toward the hegemony of the Ottoman Empire, stretching from Europe to the Middle East, and across North Africa. Perpetuation of this imagery in **American foreign policy exhibited how capitalism met with orientalist constructs in the white racial frame of the western mind** (Vander Lippe 1999). **Orientalism is based on the conceptualization of the "Oriental" other**—Eastern, Islamic societies as static, irrational, savage, fanatical, and **inferior** to the peaceful, rational, scientific "Occidental" Europe and the West (Said 1978). This is as an elastic construct, proving useful to describe whatever is considered as the latest threat to Western economic expansion, political and cultural hegemony, and global domination for exploitation and absorption.

Post-Enlightenment Europe and **later America used this iconography to define basic racist assumptions regarding their uncontestable right to impose political and economic dominance globally. When the Soviet Union existed as an opposing power, the orientalist vision** of **the 20th century shifted from the image of the "Terrible Turk" to** that of the **"Barbaric Russian Bear**," In this context, **orientalist thought** then, as now, **set the terms of exclusion. It racialized exclusion to define the terms of racial privilege and superiority.** By focusing on ideology, **orientalism recreated the superior race**, even though there was no "race." **It equated the hegemony of Western civilization with the "right ideological and cultural framework." It segued into war and annihilation and genocide and continued** to foster and aid the recreation of **racial hatred of others** with the collapse of the Soviet "other." **Orientalism's global racist ideology reformed in the 1990s with Muslims** and Islamic culture **as to the "inferior other**." Seeing Muslims as opponents of Christian civilization is not new, going back to the Crusades, but the elasticity and reframing of this exclusion is evident in recent debates regarding Islam in the West, one raised by the Pope and the other by the President of the United States.

Against the background of the latest Iraq war, attacks in the name of Islam, racist attacks on Muslims in Europe and in the United States, and detention of Muslims without trial in secret prisons, Pope Benedict XVI gave a speech in September 2006 at Regensburg University in Germany. He quoted a 14th-century Byzantine emperor who said, "show me just what Muhammad brought that was new, and there you will find things only evil and inhuman, such as his command to spread by the sword the faith he preached." In addition, the Pope discussed the concept of Jihad, which he defined as Islamic "holy war," and said, "violence in the name of religion was contrary to God's nature and to reason." He also called for dialogue between cultures and religions (Fisher 2006b). While some Muslims found the Pope's speech "regrettable," it also caused a spark of angry protests against the Pope's "ill informed and bigoted" comments, and voices raised to demand an apology (Fisher 2006a). Some argue that the Pope was ordering a new crusade, for Christian civilization to conquer terrible and savage Islam. When Benedict apologized, organizations and parliaments demanded a retraction and apology from the Pope and the Vatican (Lee 2006). Yet, when the Pope apologized, it came as a second insult, because in his apology he said, "I'm deeply sorry for the reaction in some countries to a few passages of my address at the University of Regensburg, which were considered offensive to the sensibilities of Muslims" (Reuters 2006). In other words, he is sorry that Muslims are intolerant to the point of fanaticism. In the racialized world, the Pope's apology came as an effort to show justification for his speech—he was not apologizing for being insulting, but rather saying that he was sorry that "Muslim" violence had proved his point.

Through orientalist and the white racial frame, those who are subject to racial hatred and exclusion themselves become agents of racist legitimization. Like Huntington, Bernard Lewis was looking for Armageddon in his Wall Street Journal article warning that August 22, 2006, was the 27th day of the month of Rajab in the Islamic calendar and is considered a holy day, when Muhammad was taken to heaven and returned. For Muslims this day is a day of rejoicing and celebration. But for Lewis, Professor Emeritus at Princeton, "this might well be deemed an appropriate date for the apocalyptic ending of Israel and, if necessary, of the world" (Lewis 2006). He cautions that "it is far from certain that [the President of Iran] Mr. Ahmadinejad plans any such cataclysmic events for August 22, but it would be wise to bear the possibility in mind." Lewis argues that Muslims, unlike others, seek self-destruction in order to reach heaven faster. For Lewis, Muslims in this mindset don't see the idea of Mutually Assured Destruction as a constraint but rather as "an inducement" (Lewis 2006). In 1993, Huntington pleaded that "in a world of different civilizations, each . . . will have to learn to coexist with the others" (Huntington 1993:49).

Lewis, like Pope Benedict, **views Islam as the apocalyptic destroyer of civilization** and claims that reactions against orientalist, racist visions such as his actually prove the validity of his position. Lewis's assertions run parallel with George Bush's claims. In response to the alleged plot to blow up British airliners, **Bush claimed, "This nation is at war with Islamic fascists who will use any means to destroy those of us who love freedom, to hurt our nation"** (TurkishPress.com. 2006; Beck 2006). Bush argued that "the fight against terrorism is the ideological struggle of the 21st century" and he compared it to the 20th century's fight against fascism, Nazism, and communism. Even though "Islamo-fascist" has for some time been a buzzword for Bill O'Reilly, Rush Limbaugh, and Sean Hannity on the talk-show circuit, for the president of the United States it drew reactions worldwide. M**uslim Americans found this phrase "contributing to the rising level of hostility to Islam** and the American Muslim community" (Raum 2006). Considering that since 2001, Bush has had a tendency to equate "war on terrorism" with "crusade," this new rhetoric equates ideology with religion and reinforces the worldview of a war of civilizations. As Bush said, " . . .we still aren't completely safe, because there are people that still plot and people who want to harm us for what we believe in" (CNN 2006).

Exclusion in physical space is only matched by exclusion in the imagination, and racialized exclusion has an internal logic leading to the annihilation of the excluded. Annihilation, in this sense, **is not only designed to maintain the terms of racial inequality**, both ideologically and physically, **but is institutionalized with the vocabulary of self-protection.** Even though the terms of exclusion are never complete**, genocide is the definitive point in the exclusionary racial ideology, and such is the logic of the outcome of the exclusionary process, that it can conclude only in ultimate domination. War and**

genocide take place with compliant efficiency to serve the global racist ideology with dizzying frequency. The 21st century opened up with genocide, in Darfur.

Relations

1NC Relations (Mexico cartels)

Cartels are a product of US policies in Mexico, the affirmative only increases the widespread corruption and violence

Thornton & Goodman 14 [Christy Thornton, former Executive Director of NACLA, graduate student in the Department of History at NYU, and Adam Goodman, doctoral student in history at the University of Pennsylvania, "How the Mexican Drug Trade Thrives on Free Trade," 7/15/14] http://www.thenation.com/article/180587/how-mexican-drug-trade-thrives-free-trade# *nufh_*

Since 2006, more than 100,000 people have been disappeared or killed in Mexico, a country where more than 90 percent of crimes go unpunished. While running for president in 2012, Enrique Peña Nieto promised a new security strategy for the country, and an end to the highly militarized campaign waged by his predecessor, Felipe Calderón. Since taking office, however, Peña **Nieto's strategy has focused** not on the safety of its people but **on the confidence of its international investors. To make Mexico more attractive to overseas capital, he has pursued a market-based reform agenda** that includes a technocratic overhaul of education, a move to shake up the telecommunications sector and the opening of the energy sector to foreign private investment. New narratives about the "Aztec Tiger" won't make the kidnappings, beheadings and mass graves disappear, but Peña Nieto is doing everything he can to make foreign investors forget about them.

The irony of touting market-based reforms as a means of sweeping the drug trade under the rug is that the **cartels themselves have become** some of the most ruthlessly **effective multinational capitalist enterprises** in Mexico. The **cartels are beginning to diversify, making money** not just from drugs and other criminal activities like kidnapping and human trafficking but increasingly **from control over industries like mining, logging and shipping.**

Meanwhile, **finance and real estate sectors in Mexico and the United States are awash with cartel profits**, with one United Nations analyst arguing that **drug money was the "only liquid investment capital" that kept the international economy from completely imploding in 2008.** Over the last few decades Mexican capitalism has become a tangled web of legal and illegal activity, and the distinctions between licit and illicit economies have become increasingly blurred. **The policies of the Mexican and US governments are only accelerating this trend.**

There are two separate but deeply connected histories that have created the situation in Mexico today: first, the neoliberal restructuring of the economy that began in the 1980s; and second, the rise of the drug trade and the cartels that control it. Squarely at the center of both stories has been **the Mexican state**, whose corruption, incompetence and often contradictory policy choices (in tandem with those of the United States) h**ave served to create vast sums of wealth for a few, while heightening insecurity for Mexico's working people.** When we talk about the drug trade, we are talking about a deeply entrenched part of contemporary capitalism in Mexico, not its undoing.

The restructuring of the Mexican economy in the 1980s occurred as the policy of inward-looking, state-led industrial development pursued by Mexico from the 1940s through the 1970s came to a spectacular end with the 1982 debt crisis. **A structural adjustment agreement negotiated with the I**nternational **M**onetary **F**und **required Mexico to devalue the peso, slash government subsidies, cut funding for social programs and privatize hundreds of state-owned enterprises** in return for the refinancing of Mexico's debt.¶ Then, Carlos Salinas de Gortari, who came to power in a 1988 election widely regarded as fraudulent, moved Mexico from a policy of temporary austerity to one of permanent state restructuring. He amended the constitution to allow for the private sale of communal lands known as ejidos, deregulated the telecom sector, denationalized the banks and, most importantly, reoriented Mexican industry toward the export sector, negotiating of the North American Free Trade Agreement (NAFTA) with the United States and Canada.¶ **Salinas promised that NAFTA would lift Mexicans out of poverty** by creating new manufacturing jobs and famously argued that the agreement would create a Mexico that exported goods rather than people. Mexico would become part of the first world, Salinas proclaimed, and to prove it, he oversaw the country's entry into the OECD, the club for the world's leading industrial nations.

Twenty years after the implementation of NAFTA, however, it's now clear that most of Salinas's promises have gone unfulfilled. **Mexican economic growth during the period was among the lowest in Latin America, and poverty and**

inequality levels remain at pre-NAFTA levels. A study from the Center for Economic and Policy Research points out that while the poverty rate remained stagnant over the last two decades (at around 52 percent), population growth has actually meant that **14.3 million more Mexicans were living in poverty in 2012 than in 1994. Unemployment also increased in Mexico during the period, and some 4.9 million jobs were lost in the family farm sector due to post-NAFTA declines in commodity prices and reductions in state protections.**

And while the exports of goods from Mexico did increase, as Salinas had promised, NAFTA didn't stem the flow of people across the border. Instead, **the flow of undocumented workers across the border increased**: according to a Pew Research report, the number of Mexicans that immigrated to the United States rose from 430,000 in 1994 to 770,000 in 2000, before tailing off because of increased border enforcement measures and the recent economic recession. (One additional result of NAFTA is an increased exposure of the Mexican economy to downturns in its northern neighbor.) This spike in migration resulted in the growth of the Mexican population in the United States from 4.5 million in 1990 to just under 12 million today.

Of course, while NAFTA forced people to migrate, concurrent policies of border militarization made that migration increasingly difficult and dangerous. **Instead of integrating** the North American labor market or adjusting the number of work visas to match demand, **the United States militarized** its border with Mexico to previously unimaginable levels.

Since 1994 the number of Border Patrol officers has increased from just over 4,200 to more than 21,000; the number of hours agents spent patrolling the border has gone from 3 million to more than 20 million; and **the Border Patrol's annual budget has increased from $400 million to more than $3.4 billion.**

At the same time, **sectors** that were privatized during structural adjustment but protected from competition under NAFTA—telephone, television and transportation among them—**are now monopolized by some of Mexico's richest men**. Mexico's new billionaires include the owners of the two largest television networks; the distributors of Coca-Cola; and Carlos Slim, who controls more than three-quarters of all telephone service. (**Recent reforms may begin to break up these monopolies, but many believe they will actually benefit** Televisa, **the media giant with close ties to the ruling party**, the Institutional Revolutionary Party, known as the PRI). **The top 10 percent in Mexico now control more than 40 percent of its national wealth.**

The policies of the last twenty years may have made a small group of Mexicans part of the global ultra-rich elite, but they **left the vast majority** and the country as a whole no better, and in some cases **much worse**, **than before**.

It was in this same period that the **drug trade intensified and cartel power expanded**. As the historian Froylán Enciso has shown, this was anything but inevitable. Instead, **the cartels' rise can be attributed to** a combination of domestic and international factors, including **US policy and involvement in Mexico**, Mexican government policy, widespread corruption and impunity, and the $100 billion-a-year market created by demand for drugs north of the border. **These factors together have fostered conditions under which the drug trade has boomed**, creating a spectacularly violent twin for Mexico's export-oriented "legitimate" economy.

--Link – EU/China/Russia

US relations with EU, Russia, and China are part of a drive to organize Empire into "spheres of influence" – reproduces the central axis of imperialism

Negri '2, (Antonio, former Prof. of Poli Sci @ U of Padua, "The Order of War", http://www.generation-online.org/t/negriwar.htm)

Preventative war is not only a military doctrine; it is **a constituent strategy of Empire**. The American administration's September 20th document explicitly states so: preventative war is a just and necessary means to defend liberty, justice, democracy and economic growth against terrorists and tyrants. It adds that **preventative war should be considered immediately relevant concerning** three "rogue states": **Iraq, Iran and North Korea**. To certain sectors of public opinion as well as to diplomats of some countries **it seemed as though** the statement about **the "Axis of Evil",** along with a succession of angry unilateralist declarations on the part of White House representatives and their watchdogs **indicated the suspension** or definitive interruption **of the nexus between military doctrine and** the **constituent strategy of Empire**. In reality such was not the case. On the contrary, **these statements represented items on the agenda** [ordine del giorno] **around which constituent discussions between the global powers emerged**. No sensible person could have ever really thought that Iraq, Iran and North Korea posed substantial problems for a power like the USA, which could claim inordinate military power after its victory against international communism. Now American military power, which is absolutely asymmetric, must also become intransitive; it must remain an absolute superpower not so much with respect to the three 'powers of Evil' but rather in respect to the other world powers: **the Axis of evil is a metaphor for the great problems the monarchic power of the U**nited **S**tates of America **faces in three strategic areas** at the end of the cold war. **Europe, Russia and China represent the problematic poles of the new global order**. Now, **Iraq is a further indication of the European problem** (and subordinately, of the Japanese one) **presented under the guise of energy supplies**: without securing them the European economy cannot exist and whoever controls energy supplies has his hands on the whole range of biopolitical functions of power in the old continent. On the other hand, **Iran** (the area around the Caspian sea) **represents the soft underbelly of Russian development**. **North Korea is in the middle of the China Sea**. **How is Empire organized in these three fundamental zones**? What is its material constitution to become, today, in the presence of an American military superpower? How is the military supremacy of the monarchic power over the new imperial order to be preventatively secured? It is well known that **in Empire the sole exercise of military power** -or rather, of the monarchical function- **is far from being sufficient to secure** centrality and **stability** for the exercise of global power. Moreover, 911 has shown (and with what dreadful evidence!) that **the U**nited **S**tates **is in no respects an island**. **The ensuing economic crisis** –not only at the level of production but also and especially at the financial and monetary level- **has demonstrated that in Empire monarchy cannot survive unless it is in agreement with the global aristocracy**. Therefore, **the war that's brewing contains** within its core **a discussion on the imperial constitution**, and particularly, as far as Europe is concerned, the dimensions and roles of the European aristocracies in it. Chirac and Schroder are neither pacifists nor warmongers: they are debating with Bush on the place of European capitalism in the imperial constitution. **The major decisions are not being made on the war on terrorism or on the conventional war against tyrants, but rather on the forms of hegemony and the relative degrees of power that** American and/or European **capitalist elites will have in the organization of the new world order**. **Preventative decisions are not simply to do with war but more with market predominance in the sub regions of the imperial organization**.

Religious Freedom

1NC Religious Freedom

Attempts to allow religious freedom perpetrate colonialism
Rao 12

[Ramesh Rao, Professor at Columbus State University and an expert in Indian politics, August 5, 2012, "Imperialist Goals Masked in the Garb of Religious Freedom" http://www.patheos.com/Hindu/Imperialist-Goals-Ramesh-Rao-08-06-2012?offset=2&max=1]

The U.S. State Department and the U.S. Commission on International Religious Freedom **submit annual reports** evaluating conditions in the nations of the world **regarding the citizens of those countries and their ability** to profess **and practice their faiths.** Then there are myriad non-governmental organizations and activist groups, including the Hindu American Foundation, of which I am an executive council member, publishing their own reports. **Such a massive effort of looking into others' internal matters is not undertaken by any other country. The U.S. is in many ways, the world's self-proclaimed policeman, seeking to keep world order.** Whether it is right or wrong is not the focus of this essay, but instead we can argue that based on what the State Department's latest report says about religious freedom in India, the report and the exercise is flawed, myopic, and blinkered.

These exercises **minding others' businesses should be carefully evaluated and critiqued** so that we can understand why we wish to pry into others' lives and to claim for ourselves the ability and the right to do so. **A colonial, imperialist hangover, one might say, as well as the Christian's wish to be his/her brother's/sister's keeper. The White Man's Burden may indeed be heavy and self-imposed**, but how that burden is carried and is disposed of is no longer just the white man's concern but my concern too, and the concern of many like me --not Christian, not white, and not burdened with minding others' businesses.

Scholars and academics of the West have spent enormous effort at "understanding" and "describing" the other. Some have been sympathetic, some have embraced the other, but **most have been very critical.** As Rajiv Malhotra says in his recent article about Oprah Winfrey's visit to India and what she said about India, "**the history of the West is replete with assertions of supremacy over the non-West on account of religious, racial, cultural and economic factors." Those assertions and evaluations have led to the reshaping of the world to imitate and mimic the West, at tremendous cost.** Just to take the example of the ongoing Olympic games, one wonders why the rest of the world should play the sports invented and organized by Western countries, building expensive stadia, training athletes at enormous cost, and sending them to compete with others in a nationalistic rivalry replete with jingoistic slogans, and supremacist attitudes!

2NC Religious Freedom

Pursuit of religious freedom is used as a high horse to justify state violence
Hurd 10

[Elizabeth Shakman Hurd, associate professor of political science at Northwestern University, March 23rd, 2010, "The global securitization of religion", http://blogs.ssrc.org/tif/2010/03/23/global-securitization/ jf]

My first thought upon reading the Chicago Council's report "Engaging Religious Communities Abroad: A New Imperative for U.S. Foreign Policy" is that the title is misleading. This report is not about engaging religious communities abroad—one hears little if at all from such communities—nor does it say anything particularly new. There is, however, an imperative. This report is an attempt to create a particular kind of world, one defined by the projection of American power—a certain kind of religious power. The report, as Winni Sullivan observes in her companion piece, endorses an establishmentarian position in American foreign policy, meaning that **American policy could discriminate among religions, and fund and promote religious activities that meet with U.S. government approval.** This is a different kind of religious power than what Sullivan describes as the "periodic and not altogether successful efforts" at disestablishment that we have undertaken at home. Assuming that we agree with Sullivan, as I do, that "established religion is by definition not accepting of 'pluralism, freedom, and democracy,'" it becomes clear that this **report is not about engaging religious communities to promote either religious freedom or democracy. It is about the projection of American power through the securitization of religion.** Perhaps a more apt title, borrowing in part from the language of the report itself, would have been "'Savvy, selective, strategic, and targeted': the projection of American religious power and the global securitization of religion."

I want to point to a few moments at which the report works especially hard to achieve these objectives. The first is in its definition of "religious freedom," understood as the right to, "advance values publicly in civil society and political life." Religious freedom is to be articulated "in a way not viewed as imperialism, but as a means to support religious agency to undermine religion-based terrorism and promote stable democracy." Yet **one of the great challenges of our time is to engage with and listen to those who enact religious agency and live religious freedom in ways that may not conform to these protestant-secular understandings of religion and religious freedom.** In focusing exclusively on "values and beliefs," the report not only fails to engage with, or allow spaces for, religious practice, habits, and ways of being in the world that cannot be reduced to values and beliefs, but actively closes down such "religious agencies," save those that are deemed to be "undermining religion-based terrorism" in the eyes of the National Security Council (NSC). In tacitly sanctioning a protestant understanding of religion as the (only) legitimate way to be religious and modern, it forecloses upon a range of understandings of religion and arrogates to the NSC the authority to decide who is "civil" enough to be allowed into the public sphere, and who isn't. As Saba Mahmood has observed of the International Religious Freedom Act (IRFA) itself, the report illustrates, "how **the exercise of sovereign power tends to subsume the secular principle of religious freedom** ."

This rather astonishing exercise of sovereign theopolitical authority brings me to a second point involving the government regulation of religion. The report states: "We know that government regulation of religion can lead to increased persecution and religious violence, forces that increasingly escape confinement within national borders." This is a striking statement. What is the Task Force calling for, if not increased government regulation through the securitization of religion? In recommending that the NSC direct, not only governmental, but also nongovernmental engagement with religious actors and communities overseas, it vests in the government the authority and institutional capacity to regulate religion both directly and through nongovernmental proxies, calling explicitly for "practical religious literacy" on the part of governmental and nongovernmental offices and institutions. Will this lead to increased persecution and religious violence?

It won't, **according to the logic of the report, because the secular state in general, and the United States in particular, is ontologically incapable of particular kinds of violence, "religious" violence, in particular. Violence undertaken by the American state is by definition** not **religious. So, religious violence is something undertaken by others,** while secular violence disappears from the picture altogether, or is quietly subsumed and c Yet, is it not the case that, like the errant "religious actors" described in the report, the United States also, at some times and in some places, "inspire(s) or legitimate(s) violent conflict by framing it as an act of justice"? How is it that the United States manages to exempt itself from the critical scrutiny that it so avidly prescribes for its (religious) others? Could it be the case that American exceptionalism and a particular notion of American religious freedom and American power are sacralized in this report, such that they are, in the words of the report, lending "a sacred aura and intensity to disputes and campaigns that also have significant secular dimensions"? As **religion is increasingly nationalized through this heady cocktail of religious freedom and American exceptionalism, should we now brace ourselves for "calls to defend that which is held sacred […] increasingly employed as a conflict escalator"? Should we not at least consider the possibility that the United States, in its new role as self-appointed theologian, might "invoke the sacred to sow violence and confusion"? It is in closing down the possibility of this kind of self-scrutiny that the report moves in dangerous directions.**

In another example of the inherent goodness of American power, failed states, in the eyes of the Task Force, are responsible for terrorism, and never the international actions of the United States (such as in the invasion of Iraq) or other actors. The United States floats above and outside the world, guided expertly by the NSC through the rocky shoals of political theology and toward safer shores, in a carefully navigated approach, "tailored so as not to overstep the bounds by intervening unwisely in theological disputes or, worse still, seeking to manipulate religion."

Link – Islamophobia

Construction of terror threats and US supremacy leads to militaristic intervention

Kumar 13 (Deepa Kumar, associate professor of media studies and Middle Eastern studies at Rutgers University and the author of the book Islamophobia and the Politics of Empire, "Twelve Years Post 9/11, Islamophobia Still Runs High", www.truth-out.org/video/item/18759-twelve-years-post-9-11-islamophobia-still-runs-high#, 9/11/2013, sr)

KUMAR: **Islamophobia is basically the term, the name given to anti-Muslim racism. It is a form of prejudice. And it involves making generalizations about an entire group based on the actions of a few through this mythical understanding of what Islam is supposed to be.** DESVARIEUX: Okay. And we should mention that there was a poll that was conducted by the Arab American Institute that found that American attitudes towards Arab and Muslims, specifically for Republicans and Romney voters in this last presidential election, were rated to be strongly negative. Does this mean that Islamophobia is only a problem of right-wingers or conservative voters? KUMAR: Absolutely not. **I think it is true that larger numbers of conservative voters are racist. They are racist not just in terms of their attitude towards Arabs and South Asians, but also to a whole host of other groups. So it's true that this idea sort of concentrated within those ranks. But in fact Islamophobia is far more systemic than that. That is to say, the idea of a Muslim enemy, the idea of a terrorist enemy is one that actually goes back a couple of decades but was brought to light after 9/11 by the political elite, by our political leaders. So in fact it is built into the system of U.S. foreign policy in this country. And to simply look at the far right and to ignore the fact that it has larger implications in terms of justifying U.S. foreign policy would be really to have only an incomplete picture of what is at work in this form of racism.** DESVARIEUX: Okay. Let's talk about the mass media and how they depict Islam since 9/11. Can you describe for us how the mass media has depicted Islam? KUMAR: **Well, basically, the trauma of 9/11, the fact that, you know, 3,000 Americans died meant that it enabled the U.S. media to actually draw on stereotypes that have been, you know, propped up by Hollywood, by the news media, and so on for a few decades before that. And that was the idea that these are crazy, irrational people. They are all apparently driven by Islam to violence. And so we should lock them up, we should be suspicious of them, we should detain them at airports, and so on and so forth. And so that's what you saw in the immediate aftermath of 9/11. And this show called 24, which your viewers may know, is--it's about a lot of things [incompr.] that it's about justifying the building of a national security state and justifying practices like torture and so on and so forth.**
DESVARIEUX: Okay. And also the story of the day, of course, is Syria, and everyone's attention is drawn to Syria. Can you describe for us just how does Islamophobia play a role in any of the arguments for intervention in Syria, really? KUMAR: Okay. It doesn't play a direct role in that. It is--the idea of humanitarianism has a long history in the United States. **The idea that there are victims all over the world, that the U.S. government has then got to make war in order to, you know, somehow defend them, this goes back all the way to the Spanish-American war of 1898, which was supposed to be about rescuing Cubans. And similarly, you see these sorts of justifications given. You know, Vietnamese need to be defended. In Iraq, it was babies, apparently, who were being bayoneted in Kuwait, and therefore the U.S. needed to intervene and defeat Iraq in 1991. So this idea of humanitarianism has a long history within the foreign policy establishment. But what makes it particularly potent in this case is that after 9/11 what you see is the Bush administration projecting this idea of clash of civilizations, which is basically the notion that we in the West are democratic, we are rational, we are civilized, we are, you know, all things wonderful, and they in the East are barbaric, they're misogynistic, and so on and so forth, and therefore we have an obligation, what used to be called the white man's burden, to go off and rescue them. And so you see some of that language, which is the idea that Arabs cannot bring democracy by themselves, they cannot make change, and so we need to intervene. So it's a**

combination both of the victim narrative, which has a long history, combined with this language of clash of civilizations. DESVARIEUX: Okay. And how does this fit into domestic policy? How do they work Islamophobia into domestic policy? KUMAR: Right. I mean, **the comparison I make in the book and that I'm actually working on in the next book is that ==the U.S. government==, and U.S. imperialism in particular, ==always needs an enemy. That is,== when there is no humanitarian cause, ==an enemy is an extremely useful way to justify wars abroad==, as well as the policing of dissent at home. So, for instance, during the Cold War we had been menacing enemy of the Soviet Union, against whom both a hot and a Cold War had to be waged. And, of course, this justified, then, McCarthyism, because there's always a reflection of the external enemy inside, and these people have to be rounded up, blacklisted, and so on and so fort**h. So that's the logic back then, and, of course, it was entirely about a politics of fear. Today we have the same sort of thing. ==**After 9/11, the war on terror comes into being precisely about fighting endless wars**==**. Remember, back in 9/11 the Bush administration was going to start with Afghanistan, go to Iraq, and then Iran, Syria, and so on and so forth. It didn't work out that way. But ==the idea was to drum up this fear of this menacing terrorist enemy==, which justified wars all over the world in order to gain the U.S.'s interest in [incompr.] ==particularly in the oil-rich region in the Middle East==. You asked me about domestic politics. Always there was a reflection of the domestic in terms of the international threat. And so what you've seen is innocent Muslims--and often actually not even Muslims, people from the Middle East, North Africa and South Asia, some of them Sikhs, some some of them Hindus, some of them Christians, and so on, being racially profiled because that is the logic that comes out of this. I have a whole chapter in the book about how the legal system has been reworked so as to justify things like indefinite detention, things like torture, things like deportation**. And, frankly, the infiltration of agents into our schools, into my school, into colleges, and so forth. So, you know, ==**it's truly horrific the extent to which Muslim Americans and people who look Muslim have been demonized since 9/11**==. DESVARIEUX: How do you sort of categorize or interpret these votes by different states to ban sharia law? What's your take on that? KUMAR: Yes. This is actually the work of a far right wing Islamophobic network. These people have been active for the last two decades, and they get, you know, funding to the tune of $45-$50 billion over the last seven, eight years. These people hold the view that there are no moderate Muslims, all Muslims are somehow connected to Islamist organizations--Hamas or the Muslim brotherhood and so on. And even though they pretend to be moderate, right--this is the language some of these people use--in fact they are involved in a conspiracy to take over the United States and to replace the Constitution with sharia law. Of course, this is nonsense, this is complete conspiracy theory. But these are the people**. They are lawyers, they are academics, they are people in the military, they are people in the security establishment. They are responsible for this campaign where, you know, about half a dozen to a dozen states across the U.S. have adopted these laws. ==It's a process of fearmongering, and it enables the right wing to actually grow in their ranks and promote this kind of hate==**

This causes war, genocide, and racism based off of orientalist fears of potential threats Batur 7

[Pinar Batur, PhD @ UT-Austin – Prof. of Sociology @ Vassar, 2007, "The Heart of Violence: Global Racism, War, and Genocide," in *Handbook of the The Soiology of Racial and Ethnic Relations*, eds. Vera and Feagin, p. 446-7]

At the turn of the 20th century, the "Terrible Turk" was the image that summarized the enemy of Europe and the antagonism toward the hegemony of the Ottoman Empire, stretching from Europe to the Middle East, and across North Africa. Perpetuation of this imagery in **American foreign policy exhibited how capitalism met with orientalist constructs in the white racial frame of the western mind** (Vander Lippe 1999). ==**Orientalism is based on the conceptualization of the "Oriental" other**==**—Eastern, Islamic societies as static, irrational, savage, fanatical, and inferior** to the peaceful, rational, scientific "Occidental" Europe and the West (Said 1978). This is as an elastic construct, proving useful to describe whatever is considered as the latest threat to Western economic expansion, political and cultural hegemony, and global domination for exploitation and absorption.
Post-Enlightenment Europe and **later ==America used this iconography to define basic racist assumptions regarding their==**

uncontestable right to impose political and economic dominance globally. When the Soviet Union existed as an opposing power, the orientalist vision of the 20th century shifted from the image of the "Terrible Turk" to that of the "Barbaric Russian Bear." In this context, orientalist thought then, as now, set the terms of exclusion. It racialized exclusion to define the terms of racial privilege and superiority. By focusing on ideology, orientalism recreated the superior race, even though there was no "race." It equated the hegemony of Western civilization with the "right ideological and cultural framework." It segued into war and annihilation and genocide and continued to foster and aid the recreation of racial hatred of others with the collapse of the Soviet "other." Orientalism's global racist ideology reformed in the 1990s with Muslims and Islamic culture as to the "inferior other." Seeing Muslims as opponents of Christian civilization is not new, going back to the Crusades, but the elasticity and reframing of this exclusion is evident in recent debates regarding Islam in the West, one raised by the Pope and the other by the President of the United States.

Against the background of the latest Iraq war, attacks in the name of Islam, racist attacks on Muslims in Europe and in the United States, and detention of Muslims without trial in secret prisons, Pope Benedict XVI gave a speech in September 2006 at Regensburg University in Germany. He quoted a 14th-century Byzantine emperor who said, "show me just what Muhammad brought that was new, and there you will find things only evil and inhuman, such as his command to spread by the sword the faith he preached." In addition, the Pope discussed the concept of Jihad, which he defined as Islamic "holy war," and said, "violence in the name of religion was contrary to God's nature and to reason." He also called for dialogue between cultures and religions (Fisher 2006b). While some Muslims found the Pope's speech "regrettable," it also caused a spark of angry protests against the Pope's "ill informed and bigoted" comments, and voices raised to demand an apology (Fisher 2006a). Some argue that the Pope was ordering a new crusade, for Christian civilization to conquer terrible and savage Islam. When Benedict apologized, organizations and parliaments demanded a retraction and apology from the Pope and the Vatican (Lee 2006). Yet, when the Pope apologized, it came as a second insult, because in his apology he said, "I'm deeply sorry for the reaction in some countries to a few passages of my address at the University of Regensburg, which were considered offensive to the sensibilities of Muslims" (Reuters 2006). In other words, he is sorry that Muslims are intolerant to the point of fanaticism. In the racialized world, the Pope's apology came as an effort to show justification for his speech—he was not apologizing for being insulting, but rather saying that he was sorry that "Muslim" violence had proved his point.

Through orientalist and the white racial frame, those who are subject to racial hatred and exclusion themselves become agents of racist legitimization. Like Huntington, Bernard Lewis was looking for Armageddon in his Wall Street Journal article warning that August 22, 2006, was the 27th day of the month of Rajab in the Islamic calendar and is considered a holy day, when Muhammad was taken to heaven and returned. For Muslims this day is a day of rejoicing and celebration. But for Lewis, Professor Emeritus at Princeton, "this might well be deemed an appropriate date for the apocalyptic ending of Israel and, if necessary, of the world" (Lewis 2006). He cautions that "it is far from certain that [the President of Iran] Mr. Ahmadinejad plans any such cataclysmic events for August 22, but it would be wise to bear the possibility in mind." Lewis argues that Muslims, unlike others, seek self-destruction in order to reach heaven faster. For Lewis, Muslims in this mindset don't see the idea of Mutually Assured Destruction as a constraint but rather as "an inducement" (Lewis 2006). In 1993, Huntington pleaded that "in a world of different civilizations, each . . . will have to learn to coexist with the others" (Huntington 1993:49).

Lewis, like Pope Benedict, views Islam as the apocalyptic destroyer of civilization and claims that reactions against orientalist, racist visions such as his actually prove the validity of his position. Lewis's assertions run parallel with George Bush's claims. In response to the alleged plot to blow up British airliners, Bush claimed, "This nation is at war with Islamic fascists who will use any means to destroy those of us who love freedom, to hurt our nation" (TurkishPress.com. 2006; Beck 2006). Bush argued that "the fight against terrorism is the ideological struggle of the 21st century" and he compared it to the 20th century's fight against fascism, Nazism, and communism. Even though "Islamo-fascist" has for some time been a buzzword for Bill O'Reilly, Rush Limbaugh, and Sean Hannity on the talk-show circuit, for the president of the United States it drew reactions worldwide. Muslim Americans found this phrase "contributing to the rising level of hostility to Islam and the American Muslim community" (Raum 2006). Considering that since 2001, Bush has had a tendency to equate "war on terrorism" with "crusade," this new rhetoric equates ideology with religion and reinforces the worldview of a war of civilizations. As Bush said, " . . .we still aren't completely safe, because there are people that still plot and people who want to harm us for what we believe in" (CNN 2006).

Exclusion in physical space is only matched by exclusion in the imagination, and racialized exclusion has an internal logic leading to the annihilation of the excluded. Annihilation, in this sense, is not only designed to maintain the terms of racial inequality, both ideologically and physically, but is institutionalized with the vocabulary of self-protection. Even though the terms of exclusion are never complete, genocide is the definitive point in the exclusionary racial ideology, and such is the logic of the outcome of the exclusionary process, that it can conclude only in ultimate domination. War and genocide take place with compliant efficiency to serve the global racist ideology with dizzying frequency. The 21st century opened up with genocide, in Darfur.

Link – Lone Wolf

The perception of lone wolf attacks is used solely to justify the surveillance state

Lennard 2014 [Natasha Lennard, 10-27-2014, "'Lone Wolf' Terrorist Acts Will Be Used to Justify the Surveillance State," VICE News, https://news.vice.com/article/lone-wolf-terrorist-acts-will-be-used-to-justify-the-surveillance-state jf]

California Senator Dianne Feinstein, speaking on CNN's State of the Union on Sunday, suggested that "the Internet, as well as certain specific Muslim extremists, are really firing up this lone-wolf phenomenon." Whether intentionally or not, the Senate Intelligence Committee chair performed a lot of political work with that one comment. **Crystallizing "lone wolves" as a key threat domestically helps legitimize the US's current military operation against the Islamic State in Iraq and Syria.** With or without established connections, the Islamic State's far-reaching tentacles of online influence encouraging individuals worldwide cement the group as a threat to the homeland — **which is always useful for politicians struggling to legally justify another protracted war. In this way, attributing attacks to homegrown "lone wolves" is more useful for current US political interests than attributing them to madness alone.**

The assumption that terror acts were always borne of connected networks problematically buoyed domestic counter-terror efforts that saw entire communities profiled as potential threats.

Which is not to say that "lone wolf terrorist" is a flawed designation for attacks by ideologically motivated individuals. In many ways it seems apt, and any challenge is welcome to the all too basic distinction that imbues group terror with motive while dismissing individual acts as madness. **The "lone wolf" straddles the ill-conceived gap between madman and terrorist node.** It's an intersection all too complicated for the inexpert punditry of Fox News: "They are terrorist acts, to be sure," Megyn Kelly said about Canadian gunman Michael Zehaf-Bibeau, adding "but this guy was also a nutcase."

Furthermore, the assumption that terror acts were always borne of connected networks problematically buoyed domestic counter-terror efforts that saw entire communities profiled as potential threats. **Under the premise that terror networks ran like arteries through US Muslim communities enabled** an era of profile-driven **preemptive policing that has been** nothing short of racist. Entire mosques in New York were designated terrorist organizations to enable police surveillance. The NSA's meta-data collections claim justifiability on the premise that terror was locatable by tracing networks of communication.

The "lone wolf" phenomenon should at least **prompt the questioning of** the sort of **profile-based counter-terror efforts that assumed terror lurked in any network of Muslims, and that the mass hoarding of communications data was vital to national security.** However, the **rhetoric surrounding this type of domestic threat** already **bodes ill for civil liberties.** If **the hunt for terrorist networks has been plagued by ethnic profiling and overreaching spycraft, an established threat of "lone wolf" attacks gives a defensive imprimatur for unbounded NSA-style surveillance — anyone can wield a hatchet with ideological ire.**

As Chairman of the House Homeland Security Committee Michael McCaul said on This Week, finding such lone actors in advance of attacks is like "finding a needle in a haystack." And as Feinstein said the same day, "You have to be able to watch it, and you have to be able to disrupt them."

As such, **the era of the "lone wolf" terrorist does not only spell the end of the bunk distinction between motivated group and deranged individual. It ushers in the dawn of a new era of justification for our totalized state of surveillance and national security paranoia.**

Link – Neoliberalism

The war on terror and fear of Islam are rhetorical strategies to preclude critique of neoliberalism – their representations shut down movements while ensuring error replication
Fasenfest 11

(David Fasenfest, American sociologist and an Associate Professor at Wayne State University, "Terrorism, Neo-Liberalism and Political Rhetoric," *Critical Sociology* 37 (4) 2011)

The second observation is over the ambivalence shown by Western governments and political parties in the USA. **Democracy is good**, the mantra goes, **but we also desire stability and** so we **are concerned about succession** and chaos that may accompany the deposition of Mubarak in Egypt. **Conservatives, long the champions of 'freedom' and 'democracy'** around the world (but perhaps not in Florida!), **find themselves critical of Obama's stance calling for change and respect for the wishes of 'the people' of Egypt**. Even these calls for change by the Administration are tempered by concerns over the transition. **After all, Mubarak was a valued ally** (translate: a willing instrument of our foreign policy) and Egypt a recipient of our foreign aid (translate: we fund their military) – they should not be abandoned so quickly. Other absolute rulers in the region are watching us to see how we respond to this 'democratic' threat. Similar themes emerge: what is this movement for change and who will assume the mantle of leadership. After all, we cannot just legitimize the aspirations of the dispossessed and the claims against tyrants we have put into place and propped up for many years, even decades – that would describe so many countries around the world and potentially herald a Jacobin moment in each. **We only wish to demonize and overthrow our enemies, not our allies**. **How best to do that if not to invoke images of** Taliban-like governments in waiting eager to seize control, thereby worrying about **the rising role of** what we call **Islamists** in the region. Images of another Iran are offered us to caution for calm and patience regarding Egypt. Nationalist forces and national liberation movements during the period from the end of World War II through the Vietnam War era and beyond were either supported by the USA if that movement called for deposing a government unfriendly to US interests – for example, funding the Contra war against Sandinista Nicaragua, or were vilified as 'communist' or worse if they opposed dictators friendly towards the USA – fostering rebellion in the Congo and the overthrow and assassination of Lumumba, and the overthrow of Mosaddeq in Iran followed by the installation of Mohammad Reza Shah come to mind (see Berberoglu, 2000 on the politics of national liberation struggles).¶ The case of the successful coup in Iran in 1953, which served as a blueprint for a successful coup in Guatemala in 1954 and the failed Bay of Pigs intervention in Cuba in 1961, is instructive in the current situation for two reasons. First, the harsh rule of the USA-supported Shah left an animosity among the Iranian people that culminated in an Islamic revolution in 1979 steeped in the hatred of the USA. So long as we were pre-occupied by our Cold War against the Soviet Union and the Warsaw Pact countries, and so long as Iran was kept in check by our ally Saddam Hussein in Iraq, that country was not a primary concern of the USA. Second, our memory of the Iranian situation and hostage taking after the overthrow of the Shah informs our political response and assessment of any post-Mubarak Egypt. Our government fails to see how this popular anti- American rhetoric is born out of an association with a hated regime propped up by American guns and money. The image of a group like the Moslem Brotherhood taking part in discussions of a post-Mubarak Egypt and visions of the Ayatollah led revolution in Iran and the unenlightened rule of the Taliban in Afghanistan (Langman, 2005) fuel our fears.¶ **Since** the events of **9/11 the West in general and the USA in particular have used the specter of Islam as our excuse and justification for our foreign (and domestic) policies**. **That cataclysmic event vaulted a neo-conservative world view front and center**, which lead to a willingness to use military power unilaterally and without regard to international norms in order to rectify and restore American and European interests as the US Government has defined them. Our official understanding of anti-western terrorism is that it is a direct result of Islam's rejection of western liberalism and a rejection of the freedom and conspicuous consumption of non-Islamic nations. **By framing the response as a 'war on terrorism' the US Government obscures the anti-communal nature of its position**. By anti-communal, I mean that **neo-liberalism rejects the rights of those who embody difference even as it purports to defend a system of democracy rooted in difference**. Clearly, there is no uniform definition of Arab (David, 2007) but it is clear that **there has been an attempt to both create a singular Muslim identity and then strip it of its symbols** (Byng, 2010) **in the creation and embodiment of this external threat**. Only by raising the specter of an Islamic regime, with all its implied hostility to the West, can our current political leaders rationalize a measured and hesitant response to the opposition movement in Egypt, and in so doing urge that the transition from Mubarak does not leave a power vacuum.¶ Once again we fail

to recognize or choose to ignore the fact that legitimate grievances against despotic regimes will lead, in turn, to legitimate grievances against states and governments that support and maintain those regimes in power. The anger of the Iranian people amid the memory of US involvement in installing and supporting the Shah is ignored, and in its place we identify the Islamic nature of the revolution as the root cause of the animosity against this country. **We now seem to ignore the poverty and repression sustained by US aid for a leader whose main value was to be a powerful instrument of our foreign policy** and a proxy in an important region (not to mention a willing partner through rendition and the application of torture illegal in the USA). **The signals are clear. The overthrow of the government in Tunisia, the responses to popular protest in Jordan and Yemen, and current events in Egypt all point to a growing willingness by citizens to challenge the existing order that ensures widespread poverty**, aggregates wealth and power among a very few, and in this way to resist the forces of social control in demonstrating and demanding real change. **By labeling this opposition as 'Islamist' and demonizing its goals western governments can ignore legitimate claims and dismiss popular protest.**¶ And so we return to the situation in the USA. We face persistent unemployment that promises to be devastating for a generation of workers too old to retrain and too young to partake of years of retirement – especially as the conservatives in Congress mean to strip bear the underpinning of the social supports making that retirement possible. On some level **the willingness and eagerness of** these same **conservative forces to advocate for the continuation of the Mubarak regime reveals the true nature of their domestic social political agenda**. **There are no appeals to poverty alleviation, no sense that there is a social responsibility of society to all citizens**, and no compassion for those dealt a harsh blow by the policies of its government and the working of its economy. **This is true in their response to events in Egypt, and apparently true as these politicians contemplate policies and budget cuts to social spending in the USA.**

Impacts

Democracy

Security depoliticizes issues – preventing democratic debate and deliberation

Jayasuriya 1 (Senior Research Fellow, Southeast Asia Research Centre, City University of Hong Kong) (Kanishka, 9/11 and the New 'Anti-politics' of 'Security', Social Science Research Council, http://essays.ssrc.org/sept11/essays/jayasuriya.htm)

The dramatic events of September 11, 2001 have ramifications for the nature of global governance as well as the institutions of liberal democracy. The most serious danger these events pose is their potential to usher in, under the appealing cloak of 'security', a debilitating a form of 'anti politics' that marginalises the constructive conflicts - the debate and discussion - that animate the public sphere in liberal polities. Some of these effects are already apparent in the US, where self-censorship in the media has made discussion of the politics of terrorism all but impossible. Perhaps more seriously, the language of security serves to frame facets of transnational governance in terms of 'risk', thereby occluding important issues of conflict and power. Take, for example, the pressure on the Canadian government by the United States to impose 'perimeter continental security', with the objective of establishing common entry and exit policies for visitors, immigrants, and refugees. Posing the movement of people as primarily a security risk submerges the significant questions of power and distribution raised by the proposed policy of continental integration, and constrains serious discussion of the proposal. It could well be argued that these developments presage the emergence of a new security state. Indeed, an analogy for the present crisis can be found in the anti-Communist and cold war rhetoric that dominated US domestic and international politics in the decades after 1945. The obvious parallels are to be found in the increasing importance attached to issues of 'security' in both domestic and international politics. The decisive shift in the political climate initiated by Truman, and consolidated by Eisenhower, lay not in the increasing salience of security to public policy and political language, but in how the US state apparatus came to be dominated by cold war imperatives. The pursuit of these imperatives was often at the expense of broader civil liberties, as exemplified by the infectious spread of McCarthyism. Like the cold war, the present crisis has also exposed the precarious position of civil liberty as this 'new war' gathers steam. The US Attorney General has proposed far reaching changes - including the preventive detention of immigrants on suspicion of terrorism - which would severely curtail civil liberties. Further, the US President has signed an order for special military tribunals to try those charged with terrorism. These tribunals have lower standards of proof and admissibility of evidence than ordinary judicial processes. Yet other actions such as increasing surveillance and wire-tapping powers pose serious problems for those concerned with basic rights. Similarly the British Home Secretary has proposed tough anti-terrorist legislation that includes extending the already substantial powers to detain suspected terrorists, and the extensive use of surveillance powers. In Australia, the ruling Liberal and National Coalition, with the support of the opposition Labor Party, has enacted draconian laws on border security that effectively curtail judicial review for asylum seekers and give wide discretionary powers to Ministers. In surprisingly short order, a broad set of emergency powers based on the concept of 'exceptions' has emerged to offer political leaders and other public officials a legislative framework for acting outside normal constitutional and representative institutions. Carl Schmitt, the deeply conservative jurist who was a critic of the Weimar Republic, is perhaps the most pre-eminent theorist of the exception: 'exception' is the capacity of the sovereign to make decisions in terms of its political will rather than be constrained by normative 'law'. Schmitt suggests the exception as something that is '... codified in the existing legal order, can at best be characterised as a state of peril, a danger to the existence of the state, or the like. But it cannot be circumscribed factually and made to conform to preformed law' (1985: 6). In this context, the emergence of certain aspects of a 'state of exception' (to use a phrase of the outstanding Weimar jurist Franz Neumann) should be a cause for concern for those interested in the protection of fundamental political rights. One of Neumann's (1986) central arguments is that the development of capitalism leads to the development of non-formal instruments of law. The last century has seen a gradual acceleration of legal fragmentation and dissolution. Legal deformalization Neumann argued is rooted in a fundamental transformation of capitalist economies over the greater part of the twentieth century. It could be argued that the new language of security reflects the fact that globalisation has changed the internal architecture of the state and this is markedly apparent in the increasing emphasis placed on aspects of 'risk' and 'security' across social life. It leads both at the international and domestic level to the kind of legal deformalisation so astutely analyzed by Neumann. This process has been accelerated by the events of September 11. At this point the analogy with the cold war 'national security state' is misleading because it obscures how globalisation has transformed the very notion of security in recent years, so that it is increasingly understood in terms broader than merely as a matter of 'guns and bombs'. The language of security now permeates every sphere of life - ranging from finance to the environment. International relations boffins like to talk about 'securitisation' to describe this expansive notion of security. For example, one of the most striking elements of the policy response to this crisis is that many ethnic and minority groups are now deemed to pose a threat to national security. Many cold war warriors in the United States have given extraordinarily generous airplay to Sam Huntington's thesis of a clash of civilisation. Unlike during the cold war, these threats to national security are framed in terms of 'ethnicity' rather than 'ideology', but the outcome poses the same challenge to basic rights. Further, this shift towards a 'security state' is not confined to the US and Britain, but is evident in a number of European countries as well as Australia where members of the ruling Coalition government have implied that Afghan refugees and Muslim immigrants were 'terrorists'. But this language of security is not just confined to mainstream security agencies. It has also become an intrinsic rationale of the program of development agencies like the United Nations Development Program (UNDP). For these international agencies and many other non-governmental organisations, the vacuous notion of 'human security' now includes such areas as poverty and the environment; it is the transnational analogue of 'community policing'. This new perspective embodies the more expansive understanding of security employed by establishment security agencies. The expansive definition of security - whether used by the UNDP or the Pentagon - has disturbing consequences. Security in this conception takes over the idea of risk management from penology and other related disciplines. Indeed, this is what is most striking about the new security debate: the extension of the US 'law and order state' to the transnational arena. In this respect, one of the most interesting and worrying developments is likely to be the internationalisation of the 'state of exception'. New forms of risk management apply risk profiles to a set of relationships, institutions, and even geographic sites, rather than endeavouring to manage or transform the behaviour of individuals. This emphasis on the management of risk at the level of population rather than individuals is critical. It is reflected in the high priority given to issues of border control and the use of identity documents. This approach to risk control and management strips away the social and legal context of individual behaviour as governments and other organisations

seek to manage the 'sites' of criminal activity such as terrorism, international drug trafficking, or the current panic over so-called 'people smuggling'. The effect is depoliticisation of complex problems and issues, as transnational problems are disembedded from the politics of power and interests and situated within the anti-political framework of security and risk. Within the framework of the new security language - whether it is the 'hard' security of Bush's National Security Council or the 'soft' security of some international development agencies - the conflict and debate that are raw material of politics get submerged in the search for policies of risk management. This 'politics of anti-politics' is deeply inimical to the institutions and values that sustain and animate politics in liberal democracies.

Fear

Security fears create debilitating fear

Masco 6 (Associate Professor of Anthropology, University of Chicago)
(Joseph, The Nuclear Borderlands: The Manhattan Project in Post-Cold War New Mexico, pg. 229)

A core project for many activists is thus to register the psychosocial and cultural effects of the bomb on their lives, replacing a discourse of national security with a quotidian experience of nuclear terror. One laboratory critic, for example, declared herself to be the "potential mother of a mutant child. n She narrated to DOE officials what it was like to be six months pregnant living beside a nuclear facility and worrying if her unborn fetus was mutating inside her. Imagining a future life caring for a deformed child, she decried the DOE for allowing "nuclear projects," "toxic dumps," and "bomb tests" to be performed in northern New Mexico, concluding that "maybe a country who planned to bomb and destroy whole countries deserves to bear monsters, a karma fitting to so monstrous a mentality. Maybe I deserve to have a mutant because once I was so casually uncaring about what these bombs were made for." As her womb is made foreign and dangerous to her, she is colonized by the psychosocial consequences of the nuclear security state. This activist articulates the proliferating anxiety felt by some in Santa Fe at the end of the Cold War, as news of environmental damage around the nuclear complex changed not only how they viewed Los Alamos but also their own lived spaces. **The inability here** to **escape nuclear terror-in either the form of radioactive contamination or nuclear war---destabilizes a self that can no longer locate the boundaries between body and bomb.** When pursued through a discourse of citizenship this process also illustrates one of the core effects of radioactive nation-building, a toxic public sphere where official statements are by definition suspect and discounted as conspiracy.

Neoliberalism → Inequality & Oppression

Security discourse reproduces neoliberalism – its cover for consolidating access to resources in periphery countries – reproduces inequality and oppression
Girdner 5

[Eddie J. Girdner PhD in PoliSci from University of California, taught PoliSci for 25+ years in Cyprus, Turkey, Mississippi, and Alabama] [THE GREATER MİDDLE EAST INITIATIVE: REGİME CHANGE, NEOLIBERALISM AND US GLOBAL HEGEMONY*] (http://tinyurl.com/qcj46n7) (accessed 7-16-15) //MC

Consequently, under this rubric, **the US carried out the cold war**, **conducted counterinsurgency against potential social democratic governments**, **supported authoritarian governments** in Latin American and elsewhere, or supported more democratic states as well, **depending upon whether this was deemed to serve its interests**. **National interests** were **calculated primarily in terms of the needs and benefits to the corporate class in the pursuit of global capitalist accumulation**.3

Within this framework, the US approach to the Middle East was relatively simple and straight forward, having been essentially settled at the end of the Second World War. **Democracy was not considered to be on the charts**, under the rubric of Middle Eastern exceptionalism, **and the Unites States would support the autocratic and dictatorial regimes which were in place as long as the oil flowed through the US corporate structure**. The US would be the regional hegemon with ostensibly independent states. This arrangement was referred to as **the** "**Arab façade**." **The US would sponsor local** "co**ps on the beat**," **Israel and Turkey, to help keep order in the region**. This was part of the deal which was struck at the end of World War II. "**Security**" **referred to the preservation of the system of capitalist accumulation in the interests of the ruling classes** of the US. This "security" arrangement would be enforced by regional arrangements with Iran, Iraq, Pakistan, and so on. **This** often **precluded democracy**, **as with the overthro w of Mohamad Mossadegh in Iran**, **and put the US at odds with more democratic states**, such as India.

Consequently, while lip service was often paid to "democratization," in actual practice, **democratic regimes were supported only in cases in which it was clear that it would protect capital and serve the US corporate class**. In practice, **US foreign policy was** generally one of "**deterring democracy**," in which **scores of regimes were overthrown by the CIA**, which held the promise of the emergence of local democratic autonomy, which was **deemed to militate against the needs of the US corporate ruling class**.4

The history of US foreign policy since World War II **has been fairly consistent and significant shifts in the policy of support for authoritarian regimes**, such as in Latin America in the 1970s, have been **consistent with the bottom line of a rational calculus about what served the domestic ruling class, rather than any abstract ideals about freedom and democracy**. **There is no reason why one should expect any radical shift in this historical approach in the near future trajectory** of US foreign policy.

Prior to the US invasion and occupation of Iraq in March 2003, and following the destruction of the Twin Towers in New Yor, some of the neo-conservatives in the Bush Administration declared that the US policy of appeasement of authoritarian regimes in the Middle East had failed and that the US must move quickly to remove these regimes and establish democracy across the region.5 Regime change emerged as a new buzz word.

Nevertheless, the Iraq war was not launched upon the rationale of establishment of democracy, but rather upon the rationale that Iraq possessed weapons of mass destruction and that Saddam Hussein had established links with al-Qaeda. When the Iraq War began to go badly and encounter stiff resistance from indigenous forces, in the fail of 2003, it became clear that the US was in for a long hard slog. The Bush Administration fell back upon the position of presenting "democratization" as the center plank in the "War on Terrorism." George W. Bush

made his famous November 6, 2003 speech at the American Enterprise Institute (AEI), where the National Endowment for Democracy (NED) is located, announcing a US "forward strategy of freedom." Bush called for $40 million for the NED budget to be targeted for the Middle East alone.6

The idea of Greater Middle East Initiative (**GMEI)**, developed by the US State Department **was** to be **another tool of imperialist control** which could be **used to secure the resources, labor and markets of the region to beef up US global hegemony and secure corporate profits in the region**, while theoretically, ending any incentives for terrorism. It is not clear if the neo-conservative ideologues took this argument seriously, but **the rational of** "**democratization**" **went forward under the same rubric as the invasion of Iraq**, that of **the** "**War on Terrorism**." In fact, as will be argued below, **both enterprises were of a piece with pushing forward the logic of serving the US ruling class in consolidation the global rule of neoliberalism and increasing global power and corporate profits**. Under sleight of hand, the same mechanisms developed and used in Latin American would be brought in, opening the channels and floodgates for a massive flow of new CIA money into the region on behalf of US capital.

Value to Life

Security destroys the value to life

Der Derian 93

(James, "The value of security: Hobbes, Marx, Nietzsche, and Baudrillard," in The Political Subject of Violence, pp. 102-105)

The desire for **security is** manifested as **a collective resentment of** difference **that which is not** us, not certain, not **predictable**. Complicit with a negative will to power is the fear-driven desire for protection from the unknown. Unlike the positive will to power which produces an aesthetic affirmation of difference, **the search for truth produces a truncated life which conforms to the rationally knowable**, to the causally sustainable. In The Gay Science Nietzsche asks of the reader: Look, isn't our need for knowledge precisely this need for the familiar, the will to uncover everything strange, unusual, and questionable, something that no longer disturbs us? Is it not the instinct of fear that bids us to know? And is the jubilation of those who obtain knowledge not the jubilation over the restoration of a sense of security?" **The fear of the unknown and** the **desire for certainty** combine to **produce a domesticated life, in which causality and rationality become the** highest sign of a sovereign self, the **surest protection** against contingent forces. The fear of fate assures a belief that everything reasonable is true, and everything true reasonable. In short, the security imperative produces and is sustained by the strategies of knowledge which seek to explain it. Nietzsche elucidates the nature of this generative relationship in The Twilight of the Idols: A safe life requires safe truths. The strange and the alien remain unexamined, **the unknown becomes** identified as **evil**, and evil provokes hostility - **recycling the desire for security**. The 'influence of timidity,' as Nietzsche puts it, **creates** a **people** who are **willing to subordinate** affirmative **values to the 'necessities' of security**: 'they fear change, transitoriness: this expresses a straitened soul, full of mistrust and evil experiences'." The point of Nietzsche's critical genealogy is to show the perilous conditions which created the security imperative - and the western metaphysics which perpetuate it - have diminished if not disappeared; yet the fear of life persists: 'Our century denies this perilousness, and does so with a good conscience: and yet it continues to drag along with it the old habits of Christian security, Christian enjoyment, recreation and evaluation." Nietzsche's worry is that the collective reaction against older, more primal fears has created an even worse danger: the tyranny of the herd, the lowering of man, the apathy of the last man which controls through conformity and rules through passivity. The **security** of the sovereign, rational self and state **comes at the cost of ambiguity, uncertainty, paradox - all that makes life worthwhile**. Nietzsche's lament for this lost life is captured at the end of Daybreak in a series of rhetorical questions:

War

Security politics makes escalation of war inevitable

Burke 7 (Prof on Int'l Relations, University of New South Wales)
(Anthony, Ontologies of War: Violence, Existence and Reason, Theory and Event, 10:2, MUSE)

This closed circle of existential and strategic reason generates a number of dangers. Firstly, the emergence of conflict can generate military action almost automatically simply because the world is conceived in terms of the distinction between friend and enemy; because the **very existence of the other** constitutes an unacceptable threat, rather than a chain of actions, judgements and decisions. (As the Israelis insisted of Hezbollah, they 'deny our right to exist'.) This effaces agency, causality and responsibility from policy and political discourse: our actions can be conceived as independent of the conflict or quarantined from critical enquiry, as necessities that achieve an instrumental purpose but do not contribute to a new and unpredictable causal chain. Similarly the Clausewitzian idea of force -- which, by transporting a Newtonian category from the natural into the social sciences, assumes the very effect it seeks -- further encourages the resort to military violence. We ignore the complex history of a conflict, and thus the alternative paths to its resolution that such historical analysis might provide, by portraying conflict as fundamental and existential in nature; as possibly containable or exploitable, but always irresolvable. Dominant portrayals of the war on terror, and the Israeli-Arab conflict, are arguably examples of such ontologies in action.

This relation to the world creates war and violence as a natural and mechanistic part of all life

Burke 7 (Prof on Int'l Relations, University of New South Wales)
(Anthony, Ontologies of War: Violence, Existence and Reason, Theory and Event, 10:2, MUSE)

By itself, such an account of the nationalist ontology of war and security provides only a general insight into the perseverance of military violence as a core element of politics. It does not explain why so many policymakers think military violence works. As I argued earlier, such an ontology is married to a more rationalistic form of strategic thought that claims to link violent means to political ends predictably and controllably, and which, by doing so, combines military action and national purposes into a common -- and thoroughly modern -- horizon of certainty. Given Hegel's desire to decisively distil and control the dynamic potentials of modernity in thought, it is helpful to focus on the modernity of this ontology -- one that is modern in its adherence to modern scientific models of truth, reality and technological progress, and in its insistence on imposing images of scientific truth from the physical sciences (such as mathematics and physics) onto human behaviour, politics and society. For example, the military theorist and historian Martin van Creveld has argued that one of the reasons Clausewitz was so influential was that his 'ideas seemed to have chimed in with the rationalistic, scientific, and technological outlook associated with the industrial revolution'.54 Set into this epistemological matrix, modern politics and government engages in a sweeping project of mastery and control in which all of the world's resources -- mineral, animal, physical, human -- are made part of a machinic process of which war and violence are viewed as normal features.

War/Structural Violence

Their mode of security politics makes both escalation and <u>global structural violence</u> inevitable

Anthony **Burke**, Senior Lecturer @ School of Politics & IR @ Univ. of New South Wales, **'7** [*Beyond Security, Ethics and Violence*, p. 231-2]

Yet the first act <mark>in America's 'forward strategy</mark> of freedom' was to invade and attempt to subjugate Iraq, suggesting that, <u>if 'peace' is its object, i**ts means is war**</u>: the engine of history is violence, on an enormous and tragic scale, and violence is ultimately its only meaning. This we can glimpse in 'Toward a Pacific Union', a deeply disingenuous chapter of Fukuyama's The End of History and the Last Man. This text divides the earth between a 'post-historical' world of affluent developed democracies where 'the old rules of power-politics have decreasing relevance', and a world still 'stuck in history' and 'riven with a variety of religious, national and ideological conflicts'. The two worlds will maintain 'parallel but separate existences' and interact only along axes of threat, disturbance and crucial strategic interest: oil, immigration, terrorism and the proliferation of weapons of mass destruction. Because 'the relationship between democracies and nondemocracies will still be characterised by mutual distrust and fear', writes Fukuyama, the 'post-historical half must still make use of realist methods when dealing with the part still in history ... <u>force</u> will still be the ultima ratio in their relations'. For all the book's Kantian pretensions, Fukuyama **naturalises war and coercion as the dominant mode of dealing with billions of people** defined only through their lack of 'development' and 'freedom'. Furthermore, in his advocacy of the 'traditional moralism of American foreign policy' and his dismissal of the United Nations in favour of a NATO-style 'league of truly free states ... capable of much more forceful action to protect its collective security against threats arising from the non-democratic part of the world' we can see an early premonition of the historicist unilateralism of the Bush administration. 72 In this light, <u>we can see</u> the invasion of Iraq as continuing <mark>a long process of 'world-**historical' violence** that stretches</mark> back <u>to</u> Columbus' discovery of the Americas, and <u>the</u> subsequent politics of <mark>genocide, warfare and dispossession through which the modem U</mark>nited <u>S</u>tates <mark>was created and then expanded -</mark> initially with the colonisation of the Philippines and coercive trade relationships with China and Japan, and eventually <u>to the</u> self-declared role Luce had argued so forcefully for<u>: guarantor of global</u> economic and **strategic order** after 1945. <u>This role involved the</u> <mark>hideous destruction of Vietnam and Cambodia, 'interventions'</mark> <u>in Chile, El Salvador, Panama, Nicaragua and Afghanistan</u> (or an ever more destructive 'strategic' involvement in the Persian Gulf that saw the United States first building up Iraq as a formidable regional military power, and then punishing its people with a 14-year sanctions regime that caused the deaths of at least 200,000 people), all of <u>which we are meant to accept as proof of America's benign intentions</u>, of America putting its '<u>power at the service of princip</u>le'. They are merely history working itself out, the 'design of nature' writing its bliss on the world.73 <mark>The bliss 'freedom' offers</mark> us, however, is **the bliss of the graveyard**, <u>stretching endlessly into a world marked not by historical perfection</u> or democratic peace**, but by the eternal recurrence of tragedy**, <u>as ends</u> <u>endlessly disappear in the</u> <mark>**means of permanent war and permanent terror**</mark>. This is how we must understand both the prolonged trauma visited on the people of Iraq since 1990, and the inflammatory impact the US invasion will have on the new phenomenon of global antiWestern terrorism. American exceptionalism has deluded US policymakers into believing that they are the only actors who write history, who know where it is heading, and how it will play out, and that in its service it is they (and no-one else) who assume an unlimited freedom to act. As a senior adviser to Bush told a journalist in 2002: 'We're an empire now, and when we act, we create our own reality . . We're history's

actors."

WSDI Security K

Permutation Do Both

1. Permutation Do Both

2. Some surveillance is necessary

Macnish '10 (Kevin, Professor at the University of Leeds, Internet Encyclopedia of Philosophy, A Peer-Reviewed Academic Resource, "Surveillance Ethics: Necessity", http://www.iep.utm.edu/surv-eth/#H7, AO)

Necessity is often cited as an important condition for justified surveillance. Article 8 of the European Union Convention on Human Rights, for example, states that "there shall be no interference by a public authority with the exercise of this right [to privacy] except such as is in accordance with the law and is necessary in a democratic society in the interests of national security, public safety or the economic well-being of the country, for the prevention of disorder or crime, for the protection of health or morals, or for the protection of the rights and freedoms of others" (Council of Europe 1950). We shall discuss proportionality and discrimination below. Here we shall focus on what is meant by necessity in the context of surveillance. When is surveillance necessary, though? Should surveillance, like war, be a matter of last resort? If so, when is that moment of last resort reached? The concept of necessity can limit surveillance from being undertaken arbitrarily or prematurely. An authority may not monitor anyone at any time. Surveillance must rather be required by the circumstances of the case. However, this is simply to replace "necessary" with "required" and so does not help. We are still left with the question as to when surveillance is required by the circumstances of the case. John Lango (Lango 2006) has suggested two criteria for necessity: The feasibility standard and the awfulness standard. The first occurs when there is sufficient evidence to suggest that there is no feasible alternative, the second when the alternatives are worse than the proposed course of action. When one of these criteria is met the action may be deemed necessary. Given the harms of surveillance, it should therefore be avoided if there are less harmful alternatives. However, surveillance becomes necessary when either there is no alternative, or when the alternatives such as physical intrusion or arrest are more harmful than the surveillance itself.

Net Benefits-Police Drones

Drones good for police—Laundry list

Alderton 4/30 (Matt, Writer specializing in business, design, and technology, "To the Rescue! Why Drones in Police Work Are the Future of Crime Fighting", http://lineshapespace.com/drones-in-police-work-future-crime-fighting/, AO)

Here are just a few of the areas in which drones likely will be leveraged for law enforcement when that future arrives. **Hostage Negotiation**. During the Dykes drama, the FBI's drone kept constant eyes on Dykes' bunker. In the future, however, a drone the size of an insect could keep watch inside the bunker, as well. "What we're seeing right now are 'quadcopters,' which consist of four [rotor] blades on top of a tiny robot. But in the future we're going to see biomimetic designs that mimic nature—based on a dragonfly, maybe, or a hummingbird," Scott explains. "These drones will be able to fly into a space and produce a 3D scan so that if you're dealing with a hostage situation, you can see exactly what's going on inside the building without risking lives." Drones equipped with telepresence technology will enhance hostage negotiations even further. "Instead of risking lives by sending a negotiator into the space, you could send in a drone with a screen attached to it and still have a face-to-face conversation with the hostage or hostage-taker," Scott says. **Bomb Investigation.** The same drones that provide situational awareness during a hostage crisis could do so in the event of a bomb threat. In fact, the San Jose Police Department (SJPD) in San Jose, Calif., recently acquired a drone for exactly this purpose. "SJPD intends to use the [drone] primarily to access potential explosive devices and avoid exposing police bomb squad personnel to possible hazards," the department reported in August 2014. "The [drone] can be flown over a device to obtain images that would assist the bomb technicians." **Missing Persons.** Imagine a child missing at a crowded amusement park, a hiker lost in the wilderness, an Alzheimer's patient wandering from home, or a runaway teen hitchhiking her way out of town. Drones equipped with cameras, license-plate readers, and facial-recognition software could one day soon increase the probability of locating them—not to mention the speed at which they're found. "It's 50 times quicker than you could put people on horseback, motorcycles, bikes, or on foot," John Noland, a lieutenant with the Santa Rosa Police Department in Santa Rosa, Calif., told the North Bay Business Journal in fall 2014. "It gives you real-time intelligence." **Criminal Surveillance and Pursuit**. Missing persons aren't the only ones police could find in a crowd. Criminals also could be identified. One company—Persistent Surveillance Systems of Dayton, Ohio—already is using manned aircraft to this effect, working with local law enforcement to fly manned surveillance aircrafts over cities for up to 200 hours a month. In Ciudad Juaréz, Mexico, aerial images it collected in 2009 captured 34 murders as they occurred, including a cartel killing, video analysis of which led police to the hitman, his getaway vehicle, and several accomplices. "What we essentially do is a live version of Google Earth, only with a full TiVo capability," Persistent Surveillance Systems President and CEO Ross McNutt said of his company's technology during a 2014 interview with the Center for Investigative Reporting. "It allows us to rewind time and go back and see events that we didn't know occurred at the time they occurred." It's only a matter of time before unmanned vehicles can produce similar results. **Drug Interdiction**. In February, Dutch police shut down an illegal marijuana grow house when they noticed that the home's roof was snow-free—the only one in the winter-kissed neighborhood. As it turns out, the heat lamps used inside such grow houses make them warmer than surrounding properties, making them easy to identify in wintertime. In the future, drones surveilling cities from above could make spotting such homes easier. If such drones were outfitted with special spectroscopic sensors, they might even be able to detect meth labs and drug storage sites. **Crime Scene Analysis**. Future iterations of CSI: Crime Scene Investigation might very well feature drones as prominent characters, as UAVs are poised to play a starring role at future crime scenes. "Let's say you have a case where maybe there's dust on the floor, or blood, and you don't want people tracking through," Scott says. "If you want to see the scene exactly as it was left—without any sort of footprints or fingerprints from people contaminating that space—maybe your first task will be sending a drone in to photograph and scan the crime scene without disturbing it." Drones likewise could help police **locate discarded murder weapons**, or create maps that assist with solving and prosecuting crimes. "If someone ran down our local Main Street and started shooting at people, we could fly a

drone through and map it electronically," Noland told the North Bay Business Journal. "You can get the exact curve of the street, exactly where round casings dropped."

Police drone use good, efficient

Alderton 4/30 (Matt, Writer specializing in business, design, and technology, "To the Rescue! Why Drones in Police Work Are the Future of Crime Fighting", http://lineshapespace.com/drones-in-police-work-future-crime-fighting/, AO)

For nearly a week, hostage negotiators communicated with Dykes through a narrow PVC pipe connecting the bunker with the world above. A tiny spy camera inserted into the pipe helped authorities monitor the situation inside. Outside, however, the FBI used something theretofore more characteristic of Afghanistan than Alabama: an unmanned aerial vehicle, or UAV—otherwise known as a drone. "UAVs have been used for surveillance to support missions related to kidnappings, search and rescue operations, drug interdictions, and fugitive investigations," the FBI revealed in a 2013 letter to Sen. Rand Paul (R-Kentucky), who had inquired about FBI use of drones. "Since late 2006, the FBI has conducted surveillance using UAVs in eight criminal cases [including the Dykes incident] and two national security cases." Ten times in seven years may not sound like much, but the drone revolution is just getting started, according to technology futurist Gray Scott. "We are right on the tip of the iceberg," Scott says. "Within the next five years I believe we're going to see a saturation of drones in the United States; they're going to be extremely common everywhere." In fact, drone sales this year are expected to balloon to $130 million, up 55 percent from 2014, and will easily exceed $1 billion within five years, according to recent research from the Consumer Electronics Association (CEA). "Unmanned vehicles have the potential to create new businesses and new jobs and give consumers unprecedented remote access to our skies. They also will improve and protect lives," CEA President and CEO Gary Shapiro said at the 2015 International Consumer Electronics Show (CES) in Las Vegas. "Drones already are helping emergency and disaster management programs, national weather service tracking and traffic management programs, among others . . . In short, drones are not just for fun, they are an economic game-changer—one that will transform the way we do business." **And drones in police work will also change the way police officers do their jobs.** "It's like having 20 officers on patrol or more," Tijuana police chief Alejandro Lares, who uses drones to patrol residential neighborhoods in the Mexican border town, told USA Today in 2014. "Even the bad guys . . . they're going to know now there's something in the air that might be watching them . . . It may be a small step in community policing, but it's huge for our future."

A2: Complexity

Frontline

Scenario planning is key to decision making—it's a reliable method for creating policies that anticipate future events

Han, Institute of Foreign Affairs and National Security research fellow, 11

(Dong-ho, PhD in political science from University of Nebraska, June 2011, "Scenario Construction and Its Implications for International Relations," Research Korean Journal of International Studies, Vol. 9.1, da 7-20-15, http://www.kaisnet.or.kr/resource/down/9_1_02.pdf, mee)

How do we assess future possibilities with existing data and information? Do we have a systematic approach to analyze the future events of world politics? If the problem of uncertainty in future world politics is increasing and future international relations are hard to predict, then it is necessary to devise a useful tool to effectively deal with upcoming events so that policy makers can reduce the risks of future uncertainties. In this paper, I argue that the scenario methodology is one of the most effective methods to connect theory to practice, thereby leading to a better understanding of future world events. The purpose of this paper is to introduce the scenario methodology to the field of IR in a more acceptable fashion and to explore its implications for a real policy world. To achieve this goal, I will explain the scenario methodology and why it is adequate to provide a better understanding of future world events. More specifically, I will clarify what the scenario method is and what its core components are and explain the importance and implications of the scenario method in IR by analyzing existing IR literature with an emphasis on security studies that primarily provide the prospect of future security issues. 1. Introduction How do we assess future possibilities with existing data and information? Do we have a systematic approach to analyze the future events of world politics? Given various theoretical ideas for predicting and analyzing future events in the field of international relations (IR), to understand these events properly it is important both to cast out all plausible outcomes and to think through a relevant theory, or a combination of each major theory, in connection with those outcomes. This paper aims to explain the scenario methodology and why it is adequate to provide a better understanding of future world events. After clarifying the scenario methodology, its core components, and its processes and purposes, I will explore other field's use of this methodology. Then I will explain the importance and implications of the scenario method in the field of IR. I will conclude with summarizing the advantage of the scenario method in a real world of policy making. 2. What is the Scenario Methodology? This section begins with one major question – what is the scenario methodology? To answer this, some history regarding the development of this method should be mentioned.1 Herman Kahn, a pioneer of the scenario method, in his famous 1962 book Thinking about the Unthinkable, argued that the decision makers in the United States should think of and prepare for all possible sequences of events with regard to nuclear war with the Soviet Union.2 Using scenarios and connecting them with various war games, Kahn showed the importance of thinking ahead in time and using the scenario method based upon imagination for the future.3 According to Kahn and his colleagues, scenarios are "attempts to describe in some detail a hypothetical sequence of events that could lead plausibly to the situation envisaged."4 Similarly, Peter Schwartz defines scenarios as "stories about the way the world might turn out tomorrow, stories that can help us recognize and adapt to changing aspects of our present environment."5 Given a variety of definitions of scenarios,6 for the purpose of this research, I refer to the scenario-building methodology as a means by which people can articulate different futures with trends, uncertainties, and rules over a certain amount of time. Showing all plausible future stories and clarifying important trends, scenario thinking enables decision makers to make an important decision at the present time. Key Terms in the Scenario Methodology The core of the scenario method lies in enabling policy makers to reach a critical decision at the present time based on thinking about all plausible future possibilities. Key concepts in the scenario method include: driving forces, predetermined elements, critical uncertainties, wild cards and scenario plot lines.7 Driving forces are defined as "the causal elements that surround a problem, event or decision," which could be many factors, including those "that can be the basis, in different combinations, for diverse chains of connections and outcomes."8 Schwartz defines driving forces as "the elements that move the plot of a scenario, that determine the story's outcome."9 In a word, driving forces constitute the basic structure of each scenario plot line in the scenario-making process. Predetermined elements refer to "events that have already occurred or that almost certainly will occur but whose

consequences have not yet unfolded."10 Predetermined elements are "givens" which could be safely assumed and understood in the scenario-building process. Although predetermined elements impact outcomes, they do not have a direct causal impact on a given outcome. Critical uncertainties "describe important determinants of events whose character, magnitude or consequences are unknown."11 Exploring critical uncertainties lies at the heart of scenario construction in the sense that the most important task of scenario analysts is to discover the elements that are most uncertain and most important to a specific decision or event.12 Wild cards are "conceivable, if low probability, events or actions that might undermine or modify radically the chains of logic or narrative plot lines."13 In John Peterson's terms, wild cards are "not simple trends, nor are they byproducts of anything else. They are events on their own. They are characterized by their scope, and a speed of change that challenges the outermost capabilities of today's human capabilities."14 Wild cards might be extremely important in that in the process of scenario planning their emergence could change the entire direction of each scenario plot line. A scenario plot line is "a compelling story about how things happen" and it describes "how driving forces might plausibly behave as they interact with predetermined elements and different combinations of critical uncertainties."15 Narratives and/or stories are an essential part of the scenario method due to the identical structure of analytical narratives and scenarios: "both are sequential descriptions of a situation with the passage of time and explain the process of events from the base situation into the situation questioned."16 Process and Purpose of Scenario Analysis Scenario analysis begins with the exploration of driving forces including some uncertainties. However, scenario building is more than just organizing future uncertainties; rather, it is a thorough understanding of uncertainties, thereby distinguishing between something clear and unclear in the process of decision making.17 As Pierre Wack has pointed out, "By carefully studying some uncertainties, we gained a deeper understanding of their interplay, which, paradoxically, led us to learn what was certain and inevitable and what was not." In other words, a careful investigation of raw uncertainties helps people figure out more "critical uncertainties" by showing that "what may appear in some cases to be uncertain might actually be predetermined – that many outcomes were simply not possible."18 Exploring future uncertainties thoroughly is one of the most important factors in scenario analysis. Kees van der Heijden argues that in the process of separating "knowns" from "unknowns" analysts could clarify driving forces because the process of separation between "predetermineds" and uncertainties demands a fair amount of knowledge of causal relationships surrounding the issue at stake.19 Thus, in scenario analysis a thorough understanding of critical uncertainties leads to a well-established knowledge of driving forces and causal relations.20 Robert Lempert succinctly summarized the scenario-construction process as follows: "scenario practice begins with the challenge facing the decision-makers, ranks the most significant driving forces according to their level of uncertainty and their impact on trends seemingly relevant to that decision, and then creates a handful of scenarios that explore different manifestations of those driving forces."21

A2: Predictions Fail

We can use past events to predict future outcomes

Dekker et. al, Griffith University, 11

(Sidney Dekker, Key Centre for Ethics, Law, Justice and Governance at Griffith University, Paul Cilliers, Centre for Studies in Complexity, Departments of Philosophy and Biochemistry at the University of Stellenbosch, and Jan-Hendrik Hofmeyr, Centre for Studies in Complexity, Departments of Philosophy and Biochemistry at the University of Stellenbosch, 02-21-11, "The complexity of failure: Implications of complexity theory for safety investigations," Safety Science, Vol. 49, accessed Science Direct 07-20-15, mee)

In the Newtonian vision of the world, everything that happens has a definitive, identifiable cause and a definitive effect. There is symmetry between cause and effect (they are equal but opposite). The determination of the ''cause'' or ''causes'' is of course seen as the most important function of accident investigation, but assumes that physical effects can be traced back to physical causes (or a chain of causes-effects) (Leveson, 2002). The assumption that effects cannot occur without specific causes influences legal reasoning in the wake of accidents too. For example, to raise a question of negligence in an accident, harm must be caused by the negligent action (GAIN, 2004). Assumptions about cause-effect symmetry can be seen in what is known as the outcome bias (Fischhoff, 1975). The worse the consequences, the more any preceding acts are seen as blameworthy (Hugh and Dekker, 2009). Newtonian ontology is materialistic: all phenomena, whether physical, psychological or social, can be reduced to (or understood in terms of) matter, that is, the movement of physical components inside three-dimensional Euclidean space. The only property that distinguishes particles is where they are in that space. Change, evolution, and indeed accidents, can be reduced to the geometrical arrangement (or misalignment) of fundamentally equivalent pieces of matter, whose interactive movements are governed exhaustively by linear laws of motion, of cause and effect. The Newtonian model may have become so pervasive and coincident with ''scientific'' thinking that, if analytic reduction to determinate cause-effect relationships cannot be achieved, then the accident analysis method or agency isn't entirely worthy. The Chairman of the NTSB at the time, Jim Hall, raised the specter of his agency not being able to find the Eureka part in TWA 200, which would challenge its entire reputation (p. 119): ''What you're dealing with here is much more than an aviation accident... What you have at stake here is the credibility of this agency and the credibility of the government to run an investigation'' (Dekker, 2011). 2.3. The foreseeability of harm According to Newton's image of the universe, the future of any part of it can be predicted with absolute certainty if its state at any time was known in all details. With enough knowledge of the initial conditions of the particles and the laws that govern their motion, all subsequent events can be foreseen. In other words, if somebody can be shown to have known (or should have known) the initial positions and momentum of the components constituting a system, as well as the forces acting on those components (which are not only external forces but also those determined by the positions of these and other particles), then this person could, in principle, have predicted the further evolution of the system with complete certainty and accuracy. If such knowledge is in principle attainable, then harmful outcomes are foreseeable too. Where people have a duty of care to apply such knowledge in the prediction of the effects of their interventions, it is consistent with the Newtonian model to ask how they failed to foresee the effects. Did they not know the laws governing their part of the universe (i.e. were they incompetent, unknowledgeable)? Did they fail to plot out the possible effects of their actions? Indeed, legal rationality in the determination of negligence follows this feature of the Newtonian model (p. 6): ''Where there is a duty to exercise care, reasonable care must be taken to avoid acts or omissions which can reasonably be foreseen to be likely to cause harm. If, as a result of a failure to act in this reasonably skillful way, harm is caused, the person whose action caused the harm, is negligent'' (GAIN, 2004). In other words, people can be construed as negligent if the person did not avoid actions that could be foreseen to lead to effects— effects that would have been predictable and thereby avoidable if the person had sunk more effort into understanding the starting conditions and the laws governing the subsequent motions of the elements in that Newtonian sub-universe. Most road traffic legislation is based on this Newtonian commitment to foreseeability too. For example, a road traffic law in a typical Western country might specify how a motorist should adjust speed so as to be able stop the vehicle before colliding with some obstacle, at the same time remaining aware of the circumstances that could influence such selection of speed. Both the foreseeability of all possible hindrances and the awareness of circumstances (initial conditions) critical for determining speed are steeped in Newtonian epistemology. Both are also heavily subject to outcome bias: if an accident suggests that an obstacle or

particular circumstance was not foreseen, then speed was surely too high. The system's user, as a consequence, is always wrong (Tingvall and Lie, 2010). The trajectory of a Newtonian system is not only determined towards the future, but also towards the past. Given its present state, we can in principle reverse the evolution to reconstruct any earlier state that it has gone through. Such assumptions give accident investigators the confidence that an event sequence can be reconstructed by starting with the outcome and then tracing its causal chain back into time. The notion of reconstruction reaffirms and instantiates Newtonian physics: knowledge about past events is not original, but merely the result of uncovering a pre-existing order. The only thing between an investigator and a good reconstruction are the limits on the accuracy of the representation of what happened. It follows that accuracy can be improved by ''better'' methods of investigation (Shappell and Wiegmann, 2001).

Even if our scenarios are wrong, there is still necessary utility in attempting to plan policies for the future—only attempts to identify future problems allows us to solve preventable catastrophes

Garrett, Atlantic Council, 12

(Banning, director of the Asia Program and Strategic Foresight Initiative at the Atlantic Council, 01-23-12, "In Search of Sand Piles and Butterflies," da 7-20-15, http://www.atlanticcouncil.org/careers/blogs/futuresource/in-search-of-sand-piles-and-butterflies, mee)

"Disruptive change" that produces "strategic shocks" has become an increasing concern for policymakers, shaken by momentous events of the last couple of decades that were not on their radar screens – from the fall of the Berlin Wall and the 9/11 terrorist attacks to the 2008 financial crisis and the "Arab Spring." These were all shocks to the international system, predictable perhaps in retrospect but predicted by very few experts or officials on the eve of their occurrence. This "failure" to predict specific strategic shocks does not mean we should abandon efforts to foresee disruptive change or look at all possible shocks as equally plausible. Most strategic shocks do not "come out of the blue." **We can understand and project long-term global trends and foresee at least some of their potential effects, including potential shocks and disruptive change**. **We can construct alternative futures scenarios to envision potential change**, including strategic shocks. Based on trends and scenarios, we can take actions to avert possible undesirable outcomes or limit the damage should they occur. **We can** also **identify** potential opportunities or at least **more desirable futures** that we seek to seize **through policy course corrections**. We should distinguish "strategic shocks" that are developments that could happen at any time and yet may never occur. This would include such plausible possibilities as use of a nuclear device by terrorists or the emergence of an airborne human-to-human virus that could kill millions. Such possible but not inevitable developments would not necessarily be the result of worsening long-term trends. Like possible terrorist attacks, governments need to try to prepare for such possible catastrophes though they may never happen. But there are other potential disruptive changes, including those that create strategic shocks to the international system, that can result from identifiable trends that make them more likely in the future—for example, growing demand for food, water, energy and other resources with supplies failing to keep pace. We need to look for the "sand piles" that the trends are building and are subject to collapse at some point with an additional but indeterminable additional "grain of sand" and identify the potential for the sudden appearance of "butterflies" that might flap their wings and set off hurricanes. Mohamed Bouazizi, who immolated himself December 17, 2010 in Sidi Bouzid, Tunisia, was the butterfly who flapped his wings and (with the "force multiplier" of social media) set off a hurricane that is still blowing throughout the Middle East. Perhaps the metaphors are mixed, but the butterfly's delicate flapping destabilized the sand piles (of rising food prices, unemployed students, corrupt government, etc.) that had been building in Tunisia, Egypt, and much of the region. The result was a sudden collapse and disruptive change that has created a strategic shock that is still producing tremors throughout the region. But the collapse was due to cumulative effects of identifiable and converging trends. When and what form change will take may be difficult if not impossible to foresee, but the likelihood of a tipping point being reached—that linear continuation of the present into the future is increasingly unlikely—can be foreseen. Foreseeing the direction of change and the likelihood of discontinuities, both sudden and protracted, is thus not beyond our capabilities. While efforts to understand and project long-term global trends cannot provide accurate predictions, for example, of the GDPs of China, India, and the United States in 2030, looking at economic and GDP growth trends, can provide insights into a wide range of possible outcomes. For example, it is a useful to assess the implications if the GDPs of these three countries each grew at currently projected average rates – even if one understands that there are many factors that can and likely will alter their trajectories. The projected growth trends of the three countries suggest that at some point in the next few decades, perhaps between 2015 and 2030, China's GDP will surpass that of the United States. And by adding consideration of the economic impact of demographic trends (China's aging and India's youth bulge), there is a possibility that India will surpass both China and the US, perhaps by 2040 or 2050, to become the world's largest economy. These potential shifts of economic power from the United States to China then to India would likely prove strategically disruptive on a global scale.

Although slowly developing, such disruptive change would likely have an even greater strategic impact than the Arab Spring. The "rise" of China has already proved strategically disruptive, creating a potential China-United States regional rivalry in Asia two decades after Americans fretted about an emerging US conflict with a then-rising Japan challenging American economic supremacy. Despite uncertainty surrounding projections, foreseeing the possibility (some would say high likelihood) that China and then India will replace the United States as the largest global economy has near-term policy implications for the US and Europe. The potential long-term shift in economic clout and concomitant shift in political power and strategic position away from the US and the West and toward the East has implications for near-term policy choices. Policymakers could conclude, for example, that the West should make greater efforts to bring the emerging (or re-emerging) great powers into close consultation on the "rules of the game" and global governance as the West's influence in shaping institutions and behavior is likely to significantly diminish over the next few decades. The alternative to finding such a near-term accommodation could be increasing mutual suspicions and hostility rather than trust and growing cooperation between rising and established powers—especially between China and the United States—leading to a fragmented, zero-sum world in which major global challenges like climate change and resource scarcities are not addressed and conflict over dwindling resources and markets intensifies and even bleeds into the military realm among the major actors. Neither of these scenarios may play out, of course. Other global trends suggest that sometime in the next several decades, the world could encounter a "hard ceiling" on resources availability and that climate change could throw the global economy into a tailspin, harming China and India even more than the United States. In this case, perhaps India and China would falter economically leading to internal instability and crises of governance, significantly reducing their rates of economic growth and their ability to project power and play a significant international role than might otherwise have been expected. But this scenario has other implications for policymakers, including dangers posed to Western interests from "failure" of China and/or India, which could produce huge strategic shocks to the global system, including a prolonged economic downturn in the West as well as the East. Thus, **looking at relatively slowly developing trends can provide foresight for necessary course corrections now to avert catastrophic disruptive change or prepare to be more resilient if foreseeable but unavoidable shocks occur.** Policymakers and the public will press for predictions and criticize government officials and intelligence agencies when momentous events "catch us by surprise." But unfortunately, as both Yogi Berra and Neils Bohr are credited with saying, "prediction is very hard, especially about the future." One can predict with great accuracy many natural events such as sunrise and the boiling point of water at sea level. We can rely on the infallible predictability of the laws of physics to build airplanes and automobiles and iPhones. And we can calculate with great precision the destruction footprint of a given nuclear weapon. Yet even physical systems like the weather as they become more complex, become increasingly difficult and even inherently impossible to predict with precision. With human behavior, specific predictions are not just hard, but impossible as uncertainty is inherent in the human universe. As futurist Paul Saffo wrote in the Harvard Business Review in 2007, "prediction is possible only in a world in which events are preordained and no amount of actions in the present can influence the future outcome." One cannot know for certain what actions he or she will take in the future much less the actions of another person, a group of people or a nation state. This obvious point is made to dismiss any idea of trying to "predict" what will occur in the future with accuracy, especially the outcomes of the interplay of many complex factors, including the interaction of human and natural systems. More broadly, the human future is not predetermined but rather depends on human choices at every turning point, cumulatively leading to different alternative outcomes. This uncertainty about the future also means the future is amenable to human choice and leadership. **Trends analyses**—including foreseeing trends leading to disruptive change—**are** thus **essential to provide** individuals, organizations and **political leaders with the strategic foresight to take steps mitigate the dangers ahead** and seize the opportunities for shaping the human destiny. Peter Schwartz nearly a decade ago characterized the convergence of trends and disruptive change as "inevitable surprises." He wrote in Inevitable Surprises that "in the coming decades we face many more inevitable surprises: major discontinuities in the economic, political and social spheres of our world, each one changing the 'rules of the game' as its played today. If anything, there will be more, no fewer, surprises in the future, and they will all be interconnected. Together, they will lead us into a world, ten to fifteen years hence, that is fundamentally different from the one we know today. Understanding these inevitable surprises in our future is critical for the decisions we have to make today…. We may not be able to prevent catastrophe (although sometimes we can), but we can certainly increase our ability to respond, and our ability to see opportunities that we would otherwise miss."

A2: Security

Link Defense/A2: Discourse Matters

No link – intersubjectivity means there's no monolithic understanding of security and speech acts are never singular – that means dialogue solves our bad reps

Roe 12 {Paul, Associate Professor of International Relations and European Studies (Central European University), "Is Securitization a 'Negative' Concept? Revisiting the Normative Debate over Normal versus Extraordinary Politics," Security Dialogue, 43.3, SAGE#THUR}

Is securitization always about silence and speed? For the Copenhagen School, securitization represents a panic politics: we must do something now, as our very survival is at stake. In such a scenario, it is hardly surprising that Aradau and Huysmans both see the possibilities for debate and deliberation as being minimal: normal procedures must be circumvented, otherwise it might all be too late. The speed of decisionmaking and the accompanying silence on the part of those outside the relevant elite are made all the more salient by the so-called internalist (Stritzel, 2007) or philosophical (Balzacq, 2011) view of securitization, whereby the security speech act possesses its own performative power. The internalist reading is characteristic of Wæver's (1995) earlier work on securitization and accords with the notion of performativity. Performativity corresponds to John L. Austin's illocutionary act. Here, uttering security is more than just describing something: it is performing an action that creates new realities (Balzacq, 2005: 177, 2011: 20; Stritzel, 2007: 361). The security speech act thus has the power to enable emergency measures and to (re)order sociopolitical relations (friend/enemy, us/them). In other words, security is a self-referential practice. The internalist reading of securitization closely resembles the Schmittian conception of the political inasmuch as both are decisionist: the securitizing actor, like Schmitt's sovereign, defines what is exceptional. The silence that arguably marks the internalist reading therefore reflects the lack of oversight to which the securitizing actor is subject, while, with regard to speed, there is a distinct sense of automaticity in the moment when a political issue is rapidly transformed into a matter of security by virtue of its very utterance as such.

This is **problematized,** however, **by** the so-called externalist (Stritzel, 2007) or sociological (Balzacq, 2011) view, which emphasizes instead the intersubjectivity of the securitization process. With the externalist reading, the authority to speak and the power of the speech act itself are subject to the context in which security is uttered. Most importantly, the framing of something as a security issue is not the sole preserve of the securitizing actor but **must also be accepted by a relevant audience**. As Buzan et al. (1998: 25) make clear, presenting something as an existential threat is merely a 'securitizing move', as 'the issue is [successfully] securitized only if and when the audience accepts it as such'. Accordingly, with its emphasis on the intersubjective establishment of threat, the externalist rendering of securitization **makes problematic** Wæver's earlier assertion of security as a self-referential practice. And this conceptual tension is reflected in the specific debate over the nature of the speech act itself. For both Thierry Balzacq and Holger Stritzel, Wæver/the Copenhagen School thus present securitization as both an illocutionary act and a perlocutionary act – that is, they discuss what is done in saying security, as well as what is done by saying security. Perlocutionary acts are external to the performative aspect of the speech act and thereby correspond not to the utterance itself but to its effects: did the securitizing actor manage to convince the relevant audience. Balzacq (2005: 177–8) sums up the situation thus: either we argue that securitization is a self-referential practice, in which case we forsake perlocution with the related acquiescence of the audience … or we hold fast to the creed that using the conception of security also produces a perlocutionary effect, in which case we abandon self-referentiality. He goes on: I suspect instead that the CS [Copenhagen School] leans towards the first option…. [A]lthough the CS appeals to an audience, its framework ignores the audience, which suggests that the CS opts for an illocutionary view of security yielding a 'magical efficiency' rather than a fully-fledged model encompassing perlocution as well (Balzacq, 2005: 177–8).9 It is indeed the case that the Copenhagen School has **underconceptualized** the role of the audience.10 This is something of which Wæver (2003) himself is **well aware**. But, it is debatable whether the Copenhagen School favours an internalist reading of the securitization concept. Although Wæver is keen to stress the importance of the 'moment' of the speech act, and thus retain its illocutionary force, he nevertheless also leans towards the importance of the relationship between securitizing actor and audience. Wæver warns of viewing securitization as a 'unilateral performance' – that undertaken only by the sovereign – and thus its equivalence to a 'Schmittian anti-democratic decisionism'. Rather: We [members of the Copenhagen School] preserve the event-ness of the speech act and the performative moment, but locate it in-between the actors…. This might look like perlocution because it includes something after the speaker's first action, but if the speech act is viewed as a larger whole including audience, it is more appropriate to see securitization as what is done in the (collective) act, rather than dissolving the move into one component of a larger complex social explanation of processes (Wæver, 2007: 4). The important point here is how the security speech act moves away from a Schmittian to an Arendtian conception of politics, 'because the theory places power in-between humans … and insists on securityness being a quality not of threats but of their handling, that is, the theory places power not with "things" external to a community but internal to it' (Wæver, 2011: 468). For Wæver, securitization thus takes place in a context where there is space for open politics: actors and audiences together agree as to what constitutes security and what does not. This is not to say that agreement is necessarily reached on an equal basis, as actors often possess, and indeed employ, the resources to cajole and bully audiences into acquiescing to their depiction of events. But, it is to say that **some kind of agreement is nevertheless required**. Indeed, the potential for securitization to avoid its Schmittian connotations in this way **is also recognized** by Williams. For Williams, the **importance of the audience** relates to a 'discursive ethics' that goes against the decisionist account of securitization. The security speech act entails the **possibility of dialogue and thereby also the potential for the transformation of security** (Williams, 2003: 522–3). And although Williams (2003: 524) seems somewhat sceptical as to the extent to which securitizations are subject to such 'discursive legitimation' – also noting how security issues often 'operate in the realm of secrecy, of "national security", of decision' – he nonetheless **makes**

clear the **potential for securitizations to be 'pulled back'** into the public realm, 'particularly when the social consensus underlying the capacity for decision is challenged, either **by questioning the policies, or by disputing the threat,** or both'.

No Impact

Their K of security is overly essentialized – our form doesn't produce bad policy or scapegoating

-Liberal democracy provides checks vs bad policy

-Security spurs cooperation solving scapegoating (i.e. the emancipatory community)

Roe 12 {Paul, Associate Professor of International Relations and European Studies (Central European University), "Is Securitization a 'Negative' Concept? Revisiting the Normative Debate over Normal versus Extraordinary Politics," Security Dialogue, 43.3, SAGE#THUR}

In a 2004 article, Claudia Aradau (2004) set out the terms for a normatively defined debate over securitization/desecuritization as negative/positive conceptions. In the article, Aradau defines securitization as negative inasmuch as its mode of extraordinary politics necessarily both institutionalizes fast-track decisionmaking ('process') and produces categories of enemy others ('outcome'). Additionally, while desecuritization (i.e. maintaining issues in, or returning issues to, the realm of 'normal' politics)1 thereby offers the possibility of a more positive conception, Aradau argues that its transformatory potential is severely circumscribed, as the normal political mode is itself invariably subject to the same institutional sovereign authority and domination as securitization. For Aradau, the solution to this predicament was therefore to escape security and reconceptualize politics according to a different logic, one 'based on universal address and recognition. Such a logic disrupts the exclusionary logic of security and, at the same time, furnishes a principle upon which a new relationality with the other can be conceived' (Aradau, 2004: 401; see also Aradau, 2008). Aradau's critique of security/securitization, particularly her claim that the concept indeed corresponds to Carl Schmitt's notion of the political (decisionist/exclusionary), reflects an increasing concern with the notion of 'positive' security/securitization. While Aradau argues that securitization inevitably produces categories of 'haves' and 'have-nots' – those that belong to the political community and those that do not; as she succinctly puts it, 'we cannot all be equal sharers of security' (Aradau, 2008: 73) – other writers (e.g. McSweeney, 1999; Booth, 2005, 2007; McDonald, 2008) offer different formulations that are critical of an essentialization of security that reflects the Schmittian mode of politics. For Ken Booth (2007: 138), for instance, an exclusionary sense of 'us' and 'them' is brought into question by what he calls an 'emancipatory community': An emancipatory community recognizes that people have multiple identities, that a person's identity cannot be satisfactorily defined by any single attribution … and that people must be allowed to live simultaneously in a variety of communities expressing their multifaceted lives.2 On the one hand, the present article resides firmly within the context of this general debate inasmuch as it is concerned with particular understandings of 'negative' (and thus also 'positive') in attempts to define the meaning of security. On the other hand, however, it also has a more specific focus, in that its argument is set squarely against the Copenhagen School's notion of securitization. There are a couple of reasons for the adoption of such an approach. First, a focus on securitization illuminates some assumptions in a particular way. For example, Rita's Floyd's (2010) most recent work on the positiveness/negativeness of environmental security is predicated on an understanding of, and certain revisions to, the securitization concept with regard to 'outcome'. Second, a focus on securitization also brings with it other assumptions that are largely absent from the more general debate, assumptions related to 'process' and to the proposition that (successful) securitizations are bad for democracy. In other words, the normative critique of securitization has also generated more particular thinking over what is considered positive and negative. Accordingly, my intention is to make evident the terms of the debate that have served to inform securitization as a negative concept. In my attempt to do so, I make two main arguments. The first, which relates to to process, is that the extent to which securitization necessitates a lack of openness and deliberation has been overexaggerated: in the context of liberal democracies, legislation is invariably marked by a greater semblance of oversight than that assumed by Aradau and others. The second main argument, which relates to outcome, is that although securitization might indeed function in accordance with what Ole Wæver (1995) has called the 'logic of war', its mode of extraordinary politics belies an engagement with different constructions that also serve to reveal more non-divisive referents and cooperative practices. In the first part of the article, I set out the terms of the debate according to the concerns with process and outcome, before moving on in the second part to make clear the aforementioned arguments.

NO SPF – liberal demo provides sufficient checks, sometimes extraordinary politics are good, and their evidence assumes Cold War politics

Roe 12 {Paul, Associate Professor of International Relations and European Studies (Central European University), "Is Securitization a 'Negative' Concept? Revisiting the Normative Debate over Normal versus Extraordinary Politics," Security Dialogue, 43.3, SAGE}

Securitized issues indeed have the potential to disrupt the processes of open and accountable government: through its very nature, fast-tracking serves to limit the proper functioning of normal politics. But, extraordinary politics (in the form of the expedition of legislation) **does not mean an abandonment of legislative mechanisms**: while the legislative process is surely accelerated, a degree of **scrutiny and oversight nevertheless remains**. As a result, in the context of liberal democracies, securitization rarely resembles Schmittian decisionism. Rather, the commitment to maintaining openness and deliberation in the relationship between the executive and the legislature equates the concept far more with Wæver's own preferred Arendtian politics. Indeed (Paris School contentions aside),25 as Olav Knudsen makes clear, the speed and silence of securitization is largely characteristic of the military sector, particularly during the Cold War period. However, things 'just aren't so any more. In the post-Cold War period, **agenda-setting has been much easier to influence** than the securitization approach assumes' (Knudsen, 2001: 359). Besides which, in certain circumstances there are also dangers involved in not expediting legislation. In highlighting how securitization can give the necessary prominence to some problems, for example, Booth (2007: 168) warns against the general recourse to desecuritization (politicization): **Desecuritisation can disempower.** Having issues settled by 'ordinary' politics is a nice idea: who would not prefer it to the threat of political violence? But 'ordinary' politics **might not help in extraordinary circumstances**; indeed, treating extraordinary issues as ordinary politics is a problem, not a solution.

Security Inevitable

Security inevitable – their approach is overly reductionist

Ling '97 (et al – LL.H.M. Ling is Associate Professor on the Graduate Program in International Affairs at The New School. She graduated from Wellesley College, and from Massachusetts Institute of Technology with a Ph.D.; along with Anna M. Agathangelou and , Director of the Global Change Institute in Nicosia and Former Assistant Professor of Women's Studies and Politics at Oberlin; Studies in Political Economy, v54, Fall, p. 7-8)

Given these concerns with political transformation, post-colonialism exposes several internal ironies in dissident IR. Sankaran Krishna summarizes them accordingly:46 *A Fixation on the West Dissident IR claims to recognize all identities in the study and practice of international life but perpetuates a "remarkably self-contained and self-referential view of the West that is] oblivious to the intimate dialogue between 'Western' and 'non-Western' economies, societies, and philosophies that underwrite the disenchantment with modernity that characterizes the present epoch." 'Absence of Materiality Despite its emancipatory intentions, dissident IR tends to gloss over "a vital and phvsicalistic sense" of life's injustices (as in war) when "so preoccupied with practices of representation and signification." 'Binding Dualisms While denouncing the dualisms that shackle sovereign international relations (e.g., order vs. chaos, domestic vs. international, objectivity vs. subjectivity), dissident IR itself reproduces dichotomies such as a totalizing critique vs. a capitulationist narrative, dissidence vs. sovereignty, good vs. bad. 'Disabling Politics in its deep suspicion of a stable subjectivity and unitary agency, dissident IR undermines an enabling politics for an emancipatory future. Left unresolved, these internal ironies may lead to a "new recipe of discipline and dominance."47 Dissident IR's fixation with the West offers little analytical room for an interactive, articulating, and self-generating Other in international relations. It relegates to the Other, instead, an identity assigned by sovereign IR: i.e., as a mute, passive reflection of the West or as an Utopian projection based solely on its Otherness from the West With this construction of Self-Other relations, dissident IR tends to romanticize the dangers of its self-isolation into a totalizing critique — especially for those who must bear the brunt of its repercussions. Indeed, dissident IR's distaste for a singular, "sovereign" subjectivity further accentuates its elitism. After all, who can afford to not negotiate with sovereignty while refusing a coherent identity? As bell hooks writes. "Should we not be suspicious of postmodern critiques of the 'subject' when they surface at a historical moment when many subjugated people feel themselves coming to voice for the first time?"48 In short, these internal ironies of dissident IR continue to marginalize, silence, and exile precisely those it seeks to embrace. Worse yet, adds ROger Spegele, dissidence as offshore observation "frees us from the recognition that we have a moral obligation to do anything about it."49

A2: Mack

Psychoanalysis wrong

Robinson '5 (Andrew, Early Career Fellow in the School of Politics – University of Nottingham, "The Political Theory of Constitutive Lack: A Critique", Theory & Event, 8(1))

⬚ Lacanian analysis consists mainly of an exercise in projection. As a result, Lacanian "explanations" often look more propagandistic or pedagogical than explanatory. A particular case is dealt with only in order to, and to the extent that it can, confirm the already-formulated structural theory. Judith Butler criticizes Zizek's method on the grounds that 'theory is applied to its examples', as if 'already true, prior to its exemplification'. 'The theory is articulated on its self-sufficiency, and then shifts register only for the pedagogical purpose of illustrating an already accomplished truth'. It is therefore 'a theoretical fetish that disavows the conditions of its own emergence'52. She alleges that Lacanian psychoanalysis 'becomes a theological project' and also 'a way to avoid the rather messy psychic and social entanglement' involved in studying specific cases53. Similarly, Dominick LaCapra objects to the idea of constitutive lack because specific 'losses cannot be adequately addressed when they are enveloped in an overly generalised discourse of absence... Conversely, absence at a "foundational" level cannot simply be derived from particular historical losses'54. Attacking 'the long story of conflating absence with loss that becomes constitutive instead of historical'55, he accuses several theorists of eliding the difference between absence and loss, with 'confusing and dubious results', including a 'tendency to avoid addressing historical problems, including losses, in sufficiently specific terms', and a tendency to 'enshroud, perhaps even to etherealise, them in a generalised discourse of absence'56. Daniel Bensa'd draws out the political consequences of the projection of absolutes into politics. 'The fetishism of the absolute event involves... a suppression of historical intelligibility, necessary to its depoliticization'. The space from which politics is evacuated 'becomes... a suitable place for abstractions, delusions and hypostases'. Instead of actual social forces, there are 'shadows and spectres'57. ⬚   The operation of the logic of projection is predictable. According to Lacanians, there is a basic structure (sometimes called a 'ground' or 'matrix') from which all social phenomena arise, and this structure, which remains unchanged in all eventualities, is the reference-point from which particular cases are viewed. The "fit" between theory and evidence is constructed monologically by the reduction of the latter to the former, or by selectivity in inclusion and reading of examples. At its simplest, the Lacanian myth functions by a short-circuit between a particular instance and statements containing words such as "all", "always", "never", "necessity" and so on. A contingent example or a generic reference to "experience" is used, misleadingly, to found a claim with supposed universal validity. For instance, Stavrakakis uses the fact that existing belief-systems are based on exclusions as a basis to claim that all belief-systems are necessarily based on exclusions58, and claims that particular traumas express an 'ultimate impossibility'59. Similarly, Laclau and Mouffe use the fact that a particular antagonism can disrupt a particular fixed identity to claim that the social as such is penetrated and constituted by antagonism as such60. Phenomena are often analysed as outgrowths of something exterior to the situation in question. For instance, Zizek 's concept of the "social symptom" depends on a reduction of the acts of one particular series of people (the "socially excluded", "fundamentalists", Serbian paramilitaries, etc.) to a psychological function in the psyche of a different group (westerners). The "real" is a supposedly self-identical principle which is used to reduce any and all qualitative differences between situations to a relation of formal equivalence. This shows how mythical characteristics can be projected from the outside, although it also raises different problems: the under-conceptualization of the relationship between individual psyches and collective phenomena in Lacanian theory, and a related tendency for psychological concepts to acquire an ersatz agency similar to that of a Marxian fetish. "The Real" or "antagonism" occurs in phrases which have it doing or causing something. ⬚   As Barthes shows, myth offers the psychological benefits of empiricism without the epistemological costs. Tautology, for instance, is 'a minor ethical salvation, the satisfaction of having militated in favour of a truth... without having to assume the risks which any somewhat positive search for truth inevitably involves'61. It dispenses with the need to have ideas, while treating this release as a stern morality. Tautology is a rationality which simultaneously denies itself, in which 'the accidental failure of language is magically identified with what one decides is a natural resistance of the object'62.

⬚   This passage could almost have been written with the "Lacanian Real" in mind. The characteristic of the Real is precisely that one can invoke it without defining it (since it is "beyond symbolization"), and that the accidental failure of language, or indeed a contingent failure in social praxis, is identified with an ontological resistance to symbolization projected into Being itself. For instance, Zizek 's classification of the Nation as a Thing rests on the claim that 'the only way we can determine it is by... empty tautology', and that it is a 'semantic void'63. Similarly, he claims that 'the tautological gesture of the Master-Signifier', an empty performative which retroactively turns presuppositions into conclusions, is necessary, and also that tautology is the only way historical change can occur64. He even declares constitutive lack (in this case, termed the "death drive") to be a tautology65. Lacanian references to "the Real" or "antagonism" as the cause of a contingent failure are reminiscent of Robert Teflon's definition of God: 'an explanation which means "I have no explanation"'66. An "ethics of the Real" is a minor ethical salvation which says very little in positive terms, but which can pose in macho terms as a "hard" acceptance of terrifying realities. It authorizes truth-claims - in Laclau's language, a 'reality' which is 'before our eyes67', or in Newman's, a 'harsh reality' hidden beneath a protective veil68 - without the attendant risks. Some Lacanian theorists also show indications of a commitment based on the particular kind of "euphoric" enjoyment Barthes associates with myths. Laclau in particular emphasizes his belief in the 'exhilarating' significance of the present69, hinting that he is committed to euphoric investments generated through the repetition of the same.

Feminist IR Answers

2ac

1 – No link – we do not embrace masculinity in our affirmative – we are a break down of the way that masculinity has structured and ordered international relations discourse

2 – Permute – do the Plan – we remove the masculine regime of surveillance.

3 – Realism inevitable

4 – Perm DO both – if they say "reject the aff" we don't do that part

Deconstructing IR from within IR key to solve hegemonic masculinization.

Hooper, teacher of Gender politics and IR, lecturer at University of West England, **01**[Charlotte, Manly States: Masculinities, International Relations, and Gender Politics Columbia University Press, New York. p227

> The power of such struggles over masculine identities, as I argue, depends to some extent on their taking part in a space that has been naturalized as a masculine space. If the environment is no longer so clearly a masculine one, then some of the imagery loses its genderspecific connotations, while the rest loses the power of naturalization. Cracks in the edifice of masculinism are appearing, not only with the arrival of feminist scholarship and a number of postpositivist fellow travelers who take gender seriously, but also in that gender issues are beginning to be addressed, however crudely, by more mainstream IR contributors.

5 - Feminist international relations recreate the oppressive structures they seek to dismantle by assigning and categorizing by gender.
Stern and Zalewski 09 MARIA STERN, lecturer and researcher at the Department of Peace and Development research at Gotberg university, AND MARYSIA ZALEWSKI, Director of Centre for Gender Studies at university of Aberdeen. "Feminist fatigue(s): reflections on feminism and familiar fables of militarization" Review of International Studies (2009), 35, 611–630, Cambridge journals) DF

> In this section we clarify what we mean by the problem of sexgender and how it transpires in the context of feminist narratives within IR – which we will exemplify below with a recounting of a familiar feminist reading of militarisation. To re-iterate, the primary reason for investigating this is that we suspect part of the reason for the aura of disillusionment around feminism – especially as a critical theoretical resource – is connected to the sense that feminist stories repeat the very grammars that initially incited them as narratives in resistance. To explain; one might argue that there has been a normative feminist failure to adequately construct secure foundations for legitimate and authoritative knowledge claims upon which to garner effective and permanent gender change, particularly in regard to women. But for poststructural scholars this failure is not surprising as the emancipatory visions of feminism inevitably emerged as illusory given the attachments to foundationalist and positivistic understandings of subjects, power and agency. If, as poststructuralism has shown us, we cannot – through language – decide the meaning of woman, or of femininity, or of feminism, or produce foundational information about it or her;42 that subjects are 'effects' rather than 'origins of institutional practices and discourses';43 that power 'produces subjects in effects';44 or that authentic and authoritative agency are illusory – then the sure foundations for the knowledge that feminist scholars are conventionally required to produce – even hope to produce – are unattainable. Moreover, post-colonial

feminisms have vividly shown how representations of 'woman' or 'women' which masquerade as 'universal' are, instead, universalising and inevitably produced through hierarchical and intersecting power relations.45 In sum; the poststructural suggestion is that feminist representations of women do not correspond to some underlying truth of what woman is or can be; rather feminism produces the subject of woman which it then subsequently comes to represent.46 The implications of this familiar conundrum are far-reaching as the demands of feminism in the context of the knowledge/political project of the gender industry are exposed as implicated in the re-production of the very power from which escape is sought. In short, feminism emerges as complicit in violent reproductions of subjects and knowledges/ practices. How does this recognisable puzzle (recognisable within feminist theory) play out in relation to the issues we are investigating in this article? As noted above, the broad example we choose to focus on to explain our claims is militarisation; partly chosen as both authors have participated in pedagogic, policy and published work in this generic area, and partly because this is an area in which the demand for operationalisable gender knowledge is ever-increasing. Our suggestion is that the increasing requirement47 for knowledge for the gender industry about gender and militarisation re-animates the sexgender paradox which persistently haunts attempts to translate what we know into useful knowledge for redressing (and preventing) conflict, or simply into hopeful scenarios for our students.

6 - Alt doesn't solve – fracturing ideas of masculinity only results in more conflict
Marysia **Zalewski**, Reader in the Centre for Women's Studies, **and** Jane **Parpart**, professor of Gender Studies at University of Dalhousie, **98** [The 'Man' Question in International Relations, Westview Press, Boulder, p76]

Central though this binary conception of gender is to much of Western thought, it presents an illusory dichotomous opposition between genders that obscures important distinctions within masculinity and femininity. Interestingly enough, once the idea of fractures within Western conceptions of masculinity and femininity is accepted, the division between what is masculine and what is feminine tends to be less clear. Fractures within masculinity have played a crucial part in defining the relationships between the two orthodox paradigms in IR: namely realism and liberal internationalism. The division of orthodox IR into two different masculine camps has led to a competition between two aspiring hegemonic masculinities over which is more masculine (real and objective) and which should be regarded as inferior and feminine (subjective and normative)

7 - Post-Cold War conceptions of peace are false → the world is inevitably realist
Ikenberry 01

(G. John, reviewing John J. Mearsheimer, "The Tragedy of Great Power Politics", November/December 2001, http://www.foreignaffairs.com/articles/57267/g-john-ikenberry/the-tragedy-of-great-power-politics) SLS

Mearsheimer boldly states that great-power rivalry is not over. The major powers still fear each other, and dangerous security competition lurks. This view is built on an "offensive realist" theory of world politics: the deep insecurity generated by the anarchic (hence "tragic") international system leads great powers to act aggressively toward each other, thwarting rivals from gaining power even if such moves risk war. Moreover, great powers are rarely satisfied with the status quo and instead seek hegemony. Mearsheimer tests his theory across the last two centuries, citing the territorial conquests of Japan and Germany before 1945 and Soviet policies after 1917 as evidence. The United States and the United Kingdom do not fit as well into Mearsheimer's framework, but he argues that the "offshore balancing" strategies of these maritime states are just more sophisticated versions of calculated aggression. As a

result, Mearsheimer predicts, the post-Cold War peace among great powers will soon end: without a peer competitor in Europe or Asia, the United States will retract its security commitments there and great-power security competition will return. But he does not make clear why the United States would act in this way -- even if it is a sophisticated power maximizer.

Perm Solvency (1)

The perm solves best: IR criticism is only effective when it is combined with practical policy making.

Keohane, 98 ("Beyond Dichotomy: Conversations Between International Relations and Feminist Theory" Robert O. Keohane, Duke University. International Studies Quarterly 42, 193-198. http://www.blackwell-synergy.com/action/showPdf?submitPDF=Full+Text+PDF+%2889+KB%29&doi=10.1111%2F0020-8833.00076

The problem with Tickner's dichotomies, however, goes much deeper. The dichotomies should be replaced by continua, with the dichotomous characterizations at the poles. Each analyst of world politics has to locate herself or himself somewhere along the dimensions between critical and problem-solving theory, nomothetic and narrative epistemology, and a social or structural conception of international relations. In my view, none of the ends of these continua are the optimal places to rest one's perspective. Criticism of the world, by itself, becomes a jeremiad, often resting implicitly on a utopian view of human potential. Without analysis, furthermore, it constitutes merely the opinion of one or a number of people. On the other hand, implicit or complacent acceptance of the world as it is would rob the study of international relations of much of its meaning. How could one identify "problems" without criticism at some level? The issue is not problem-solving vs. critical theory- a convenient device for discarding work that one does not wish to accept- but how deeply the criticism should go. For example, most students of war study it because they hope to expose its evils or to control it in some way: few do so to glorify war as such. But the depth of their critique varies. Does the author reject certain acts of warfare, all warfare, all coercion, or the system of states itself? The deeper the criticism, the more wide-ranging the questions. Narrowly problem-solving work, as in much policy analysis, often ignores the most important causal factors in a situation because they are not manipulable in the short run. However, the more critical and wide-ranging an author's perspective, the more difficult it is to do comparative empirical analysis. An opponent of some types of war can compare the causes of different wars, as a way to help to eliminate those that are regarded as pernicious; but the opponent of the system of states has to imagine the counterfactual situation of a system without states.

Perm Solvency (2)

Perm – embrace realist ideologies ad question our epistemology. Maximizing the positives of politics and minimizing destruction is key to political and ethical responsibility.

Michael C. **Williams**, Senior Lecturer in the Department of International Politics at the University of Wales, 20**05**, Cambridge University Press, "The Realist Tradition and the Limits of International Relations"

This book seeks to outline this understanding of the Realist tradition, a tradition that I call 'wilful Realism'. The vision of wilful Realism as I try to present it here has three defining features. The first lies in its relationship to *scepticisim*. <u>Wilful Realism is characterised by a rational questioning of the limits of reason.</u> **It is not a denial of knowledge**, or of rationality, <u>and it insists upon the importance of empirical and historical knowledge. It is,</u> however, deeply **<u>sceptical</u>** – and often harshly critical – **of modern empiricism and rationalism as adequate bases for political knowledge**, and of the broader tendency to model knowledge after the lead of Enlightenment science. <u>These concerns</u> are not abstract: they <u>are driven by the conviction that questions of knowledge and belief are crucial elements in the construction and evaluation of action and order.</u> The sense of limits arising from this scepticism does not yield resignation or nihilism; on the contrary, it is taken as a challenge requiring the active construction of political and social order, leading wilful Realism to a continual concern with the relationship between knowledge and politics, the politics of knowledge, and a strong advocacy of the need for a politics both informed and suitably chastened by an understanding of the limits of knowledge. A second key component is *relationality*<u>. Wilful Realism does not assume that the nature of either the self or political order is fixed or given. It focuses instead on the construction of subjectivity and political order through relational processes of self and other</u>, at the level of both individuals and communities. This concern with relationality is historical and sociological, examining processes of constitution, maintenance, and transformation within and between political orders. It is also conceptual and philosophical. <u>By focusing on the importance of knowledge in the construction of action wilful Realism seeks to ensure that the inescapability of relationality – of</u>, for example, <u>the self gaining identity in relation to other</u>s<u>,</u> or of concepts gaining meaning in relation to their antitheses – <u>does not devolve into</u> dualism: into <u>understandings of identity or knowledge as defined wholly by opposition</u>. This makes the concern with relationality more than just analytic: <u>it is also part of a</u> **political and ethical sensibility** in which **the relationship between self and other has significance as a political principle**, and <u>constitutes one of the most important differences between wilful Realism and forms of rigidly oppositional power politics</u>. The third dimension can, more familiarly, be termed *power politics*. Power is central to any understanding of Realism, and wilful Realism is no exception. At the centre of wilful Realism analysis is an engagement with the multiple forms of power at work in politics, including those involved in knowledge claims, forms of subjectivity, and structures of authority and action (including those that allow the effective mobilisation and exercise of material power). Beyond these analytical issues, however, there again lies a broader set of political and ethical imperatives. Politics is in this vision identifies by its specific duality: an indeterminacy that makes it at one and the same time a realm of power and inevitable struggle, *and* a realm of openness and self-determination. As a sphere of contest over the determination of values and wills, <u>politics is an undetermined realm in which the struggle for power and domination is potentially limitless. Yet politics is also the sphere of activity uniquely concerned with the consideration, generation, and transformation of common interests and understandings: the sphere where the fundamental meanings and values of social life are contested and determined.</u> The lack of fixed understandings of the good and the true is the condition of modern politics, and the basis of its distinctiveness as a realm of freedom, creativity, and change. Wilful Realism is deeply concerned that a recognition of the centrality of power in politics does no result in the reduction of politics to pure power, and particularly to the capacity to wield violence. <u>It seeks, on the contrary, a politics of limits that recognises the destructive and productive dimensions of politics, and that **maximizes its positive possibilities while minimising its destructive potential.**</u>

Perm Solvency (3)

Turn—Their kritik creates a false dichotomy between total rejection and oppression—their "all or nothing" alternative dooms coalitions and closes off space for political activism

Krishna '93 [Sankaran, Dept. of Polit. Sci., Alternatives, 1993]

The dichotomous choice presented in this excerpt is straightforward: one either indulges in total critique, delegitimizing all sovereign truths, or one is committed to "nostalgic", essential unities that have become obsolete and have been the grounds for all our oppressions. In offering this dichotomous choice, Der Derian replicates a move made by Chaloupka in his equally dismissive critique of the more mainstream nuclear oppression, the Nuclear freeze movement of the early 1980s, that according to him, was operating along obsolete lines emphasizing "facts" and "realities" while a "postmodern" President Reagan easily outflanked them through an illusory Star Wars program. (See KN: chapter 4)Chaloupka centers this difference between his own supposedly total critique of all sovereign truths (which he describes as nuclear criticism in an echo of literary criticism) and the more partial (and issue-based) criticism of what he calls "nuclear opposition" or "antinuclearists" at the very outset of his book. (KN: xvi) Once again, the unhappy choice forced upon the reader is to join Chaloupka in his total critique of sovereign truths or be trapped in obsolete essentialisms.This leads to a disastrous politics, pitting groups that have the most in common (and need to unite on some basis to be effective) against each other. Both Chaloupka and Der Derian thus reserve their most trenchant critique for political groups that should, in any analysis, be regarded as the closest to them in terms of an oppositional politics and their desired futures. Instead of finding ways to live with these differences and to (if fleetingly) coalesce against the New Right, this fratricidal critique is politically suicidal. It obliterates the space for a political activism based on provisional and contingent coalitions, for uniting behind a common cause even as one recognizes that the coalition is comprised of groups that have very differing (and possibly unresolvable) views of reality. Moreover, it fails to consider the possibility that there may have been other, more compelling reasons for the "failure" of the Nuclear Freedom movement or anti-Gulf War movement. Like many a worthwhile cause in our times, they failed to garner sufficient support to influence state policy. The response to that need not be a totalizing critique that delegitimizes all narratives.The blackmail inherent in the choice offered by Der Derian and Chaloupka, between total critique and "ineffective" partial critique, ought to be transparent. Among other things, it effectively militates against the construction of provisional or strategic essentialisms in our attempts to create space for an activist politics. In the next section, I focus more widely on the genre of critical international theory and its impact on such an activist politics

No Link

No link– there is no one form of 'manhood' in IR that we reinforce

Marysia **Zalewski**, Reader in the Centre for Women's Studies, and Jane Parpart, professor of Gender Studies at University of Dalhousie, **98** [The 'Man' Question in International Relations, Westview Press, Boulder, p203-4]

The assertion that international politics and relations is a "man's affair" of course presupposes a single, biologically based, and largely AngloAmerican vision of masculinity. 16 Whereas most of the chapters in the book are situated within this cultural context, no single agreed standard of masculinity comes to the fore. Indeed, one is struck by the variety and richness of definitions of manhood and masculinity that emerge. Steve Niva described a series of shifts in the dominant/hegemonic conceptions of masculinity in the United States. The defeat in Vietnam undermined the longheld myth of the American frontiersman-warrior only to fuel a remasculinization of America in the Ramboized rhetoric of Reagan and Bush. Panama and the Gulf War thus played a central role in the reassertion and redefinition of American masculinity. To Cynthia Weber, the hypermasculine posturing during the Panama invasion signaled not strength but male hysteria over the loss of American hegemonic power. Perhaps these cracks in U.S. hegemony explain the shift to a new definition of (superior) manhood described by Niva. This new "tough but tender" version of hegemonic masculinity ridicules the "insensitive" hypermasculinity of Saddam Hussein and Manuel Noriega, celebrating instead the "new" American man who is morally responsive, sensitive to the needs of women and children, and yet able to kick butt when needed. The possibility that there is one, biologically based, predictable set of characteristics that define a "real man" dissolves in this complexity. Male associations with power, especially over women, youth, and subordinate males, are widespread (both historically and in the present), but definitions of masculinity(ies) obviously vary over time and place. 17 The historical context, the economic, political, and cultural/social factors at play at any given time, clearly have profound implications for the way manhood and masculinities are understood and maintained. As Spike Peterson and Jacqui True reminded us, new times require new ways of thinking about gender relations and manhood/masculinity(ies). I would argue that "old times" require (re)analysis as well, for definitions of manhood and masculinity(ies) have surely varied in the past. Indeed, colonialism and imperialism profoundly shaped the emergence of a hegemonic version of Euramerican manhood, which benefited from being compared with colonial images of soft and effeminate or warriorlike but technically "backward" colonial males

No link//IR not gender based

Gender biases in international relations don't exist and the alternative feminist perspective is fictional as well.

Alastair J.H. **Murray**, Politics Department, University of Wales Swansea, Reconstructing Realism, **1997**, p. 192

Whilst <u>Tickner's feminism</u> presents an interesting revisioning of international relations, it ultimately suffers from the problem that, in order to sustain any of its claims, most of all the notion that a distinctively *feminist* epistemology is actually necessary, it <u>must establish the existence of a gender bias in international relations theory which simply does not exist</u>, <u>and the existence of an 'alternative' feminist position on international affairs which is simply a fiction.</u> Consequently, in order to salvage her very *raison d'etre*, Tickner is forced to engage in some imaginative rewriting of international relations theory. First, <u>in order to lay the basis for the claim that an alternative perspective is actually necessary, conventional theory is stripped of its positive elements</u>, and an easily discredited caricature, centred on realism, erected in its place. Second, in order to conjure up a reason <u>for this alternative perspective to be a feminist one, the positive elements which have been removed from conventional theory are then claimed as the exclusive preserve of such perspectives.</u> Yet, however imaginative this 'revisioning' of international relations theory, <u>its inevitable result is a critique which is so riddled with contradictions that it proves unsustainable</u>, and an alternative epistemology which, based upon this flawed critique, collapses in the face of the revelation of its inadequacy

Alt Fails (1)

IR Feminist narrow the space for worldviews, creating "others".

Caprioli 2004 (Mary, PhD Assistant Professor, University of Minnesota, Duluth. "Feminist IR Theory and Quantitative Methodology: A Critical Analysis," International Studies Review, Vol. 6, No. 2, pp. 253-269) BN.

Contrary to the argument that conventional IR theory excludes feminist inquiry, <u>space exists within the field of international relations for feminist inquiry even allowing for a state-centric focus,</u> just as room exists for scholars interested in exploring the democratic peace and ethnonationalism. <u>International relations feminists make the same mistake that they accuse IR scholars of making: narrowing the space for various worldviews, thereby creating competition and a sense of exclusion among the so-called others.</u> <u>If the role of "feminist theory is to explain women's subordination, or the unjustified asymmetry between women's and men's social and economic positions, and to seek prescriptions for ending it"</u> (Tickner 2001:11), <u>then feminist IR scholarship ought to allow for an explanation of how women's subordination or inequality has an impact on state behavior, assuming a statecentric focus, while at the same time challenging the predetermination of a structural analysis.</u>

Feminism can't adequately explain international relations.

Stern and Zalewski 09 MARIA STERN, lecturer and researcher at the Department of Peace and Development research at Gotberg university, AND MARYSIA ZALEWSKI, Director of Centre for Gender Studies at university of Aberdeen. "Feminist fatigue(s): reflections on feminism and familiar fables of militarization" Review of International Studies (2009), 35, 611–630, Cambridge journals) DF

We argue that <u>one of the dominant motifs or signatures of feminism within IR is one of decline and demise particularly in relation to feminism's theoretical and methodological potential.</u>[17] <u>These apparent tired limits of feminism within IR mirror a quandary facing feminist scholarship more generally.</u>[18] Manifestations of this quandary include a certain lassitude inflecting narratives about gender weaved through feminism parsimoniously represented,[19] accompanied by a sense that <u>feminism is becoming increasingly obsolete.</u>[20] As noted above, we investigate this quandary in order to think more deeply, if tangentially through feminism, about the limitations and accompanying <u>violence</u> that <u>marks the academic production of knowledge,</u>[21] <u>as well as</u> to ponder <u>feminism's own performative function</u> in this regard.

Feminism will never be able to resolve the question of gender identity in militarization because it cannot resolve the contradiction between sex and gender.

Stern and Zalewski 09 MARIA STERN, lecturer and researcher at the Department of Peace and Development research at Gotberg university, AND MARYSIA ZALEWSKI, Director of Centre for Gender Studies at university of Aberdeen. "Feminist fatigue(s): reflections on feminism and familiar fables of militarization" Review of International Studies (2009), 35, 611–630, Cambridge journals) DF

<u>In familiar feminist fables of gender and militarization, gender conventionally materializes as if it were real (in a foundational sense) yet</u> our <u>critical feminist theorizing tells us it is a construction.</u> We 'know' that when we speak woman, we re-constitute her, we construct and delimit her through our stories about her; <u>a paradox indeed.</u> <u>If an apparent move is made toward gender</u> (usually there is an assumption that this is different from, more advanced than, or more inclusive than feminist

theorizations of woman) then gender metamorphoses into masculinity or femininity, or on the relations between the two in order to show how they act on, impact, influence or provide roles for the sexed body. 'Opening' the feminist agenda to include 'men' and 'masculinity' does not alter this dynamic. Masculinity tends also to become a (gender) 'thing' which we have learned, understood, imported, conveyed, tried to change; more inflections of paradox. 'Gender' becomes reduced to either 'women', 'men', or 'femininity', 'masculinity'; and crucially we lose sight of the productive power involved – productive of the paradox mentioned above, as well as other related paradoxes such as perpetrator victim, 54 security-insecurity,55 and even war-peace.56 We suggest that being attendant to how the 'move' from sex to gender and the 'move' from a focus on 'women' and 'men' to looking at constructions of masculinity and femininity and the hierarchical relations between the two may not be as large a step away from feminism parsimoniously defined as is usually imagined. Indeed it is perhaps not a step 'forward' at all, as we shall illustrate. This side-step invokes the specter of anxiety as it raises questions about the possibility of responsible feminist political interventions, given the paradox with which we grapple. Importantly however, we suggest the sexgender paradox or aporia can never be successfully resolved; 'an aporia is not a contradiction which can be brought into the dialectic, smoothed over and resolved into the unity of the concept, but an untotalisable problem at the heart of the concept, disrupting its trajectory, emptying out its fullness, opening out its closure.'57 As such we see the production of sexgender as irresolvable – as a perpetual conundrum. We return to this point in our conclusion. To reiterate: through the following critical reading of a familiar feminist fable of militarisation58 we illustrate the logic which produces the paradox of feminism that demands (but ultimately belies) resolution. We explore how feminist narratives are not able to fulfil their supposed transformative promise since attempts to transgress the discursive frameworks in which they are framed are haunted; thus ensuring the failure of feminist stories. Failure, in this sense, is judged in feminism's (in)ability to resolve its inherent contradiction.

Alt links back

Arguing that any IR theory overwhelms the specifics of the situation is an over simplification that re-creates the hierarchies they critique.

Caprioli, 04 "Feminist IR Theory and Quantitative Methodology: A Critical Analysis" Mary Caprioli, Dept. of Political Science, University of Tennessee. International Studies Review. Volume 42 Issue 1 Page 193-197, March 2004. http://www.blackwell-synergy.com/links/doi/10.1111/0020-8833.00076).

There is little utility in constructing a divide if none exists. As Thomas Kuhn (1962) argues, common measures do exist across paradigms that provide a shared basis for theory. It seems overly pessimistic to accept Karl Popper's ''Myth of Framework,'' which postulates that ''we are prisoners caught in the framework of our theories, our expectations, our past experiences, our language, and that as a consequence, we cannot communicate with or judge those working in terms of a different paradigm'' (Neufeld 1995:44). <u>Some feminists</u> (for example, Tickner 1996, 2001; Peterson 2002; Steans 2003) <u>appear to embrace this ''Myth of Framework'' by accentuating the differences between the perspectives of feminist and IR theorists based on their past experiences and languages and criticize IR theorists for their lack of communication with feminist IR scholars. Ironically, the ''Myth of Framework'' shares a number of assumptions with Hobbes's description of the state of nature that feminists routinely reject. The ''Myth of Framework'' assumes no middle ground scholars are presumably entrenched in their own worldviews without hope of compromise or the ability to understand others' worldviews.</u> If this is the case, scholars are doomed to discussions with likeminded individuals rather than having a productive dialogue with those outside their own worldview. <u>Scholars who accept the ''Myth of Framework'' have essentially created a Tower of Babel in which they choose not to understand each other's language. The acceptance of such a myth creates conflict and establishes a hierarchy within international relations scholarship even though conventional feminists theoretically seek to identify and eradicate conflict and hierarchy within society as a whole.</u>

Realism Inev

War is inevitable – the anarchic system of international politics ensures that States will always be vying for power, regardless of their visible intentions

Slater 09

(Hannah Louise, reviewing John J. Mearsheimer, "The Tragedy of Great Power Politics", November 25 2009, http://www.shvoong.com/law-and-politics/politics/1949577-tragedy-great-power-politics/) SLS

The Tragedy of Great Power Politics' by John Mearsheimer, outlines his theory of "Offensive Realism". It describes what motivates the international system and offers historical explanations as well as future predictions.

The book begins with the central tenet of Offensive Realist theory: <u>the international system is anarchic and this causes states to fear each other and compete for power. A state's ultimate aim is become a hegemon because this is most secure. Thus states are constantly trapped in security competition, seeking to increase their share of world power.</u> Mearsheimer argues that <u>power is based on military capabilities a state possesses and the strongest power is the state with the strongest army as only land power can win a major war alone.</u> Latent power –based upon population and wealth, which create large armies- is significant but not as important as actual power. <u>Hesitance about using nuclear weapons means land power remains the key measure of power, while this hesitance means nuclear arsenals increase stability between great powers.</u> Offensive Realism says <u>configurations of power emerge across regions, affecting fear levels between states. Fear levels determine the intensity of security competition and likelihood of war</u>. 'Bipolarity' causes least fear and is most stable, 'unbalanced multipolarity' causes most fear, thus is the least stable configuration; and 'multipolarity' sits in between. Mearsheimer posits that large bodies of water profoundly limit the power-projection capabilities of land forces, reducing fear and also explaining why there is no global hegemon. Offensive Realism says **war is inevitable** and the author argues that China and the US are "destined to be adversaries" as growing Chinese economic might translates into military might.

Mearsheimer adds Offensive Realism to a long tradition of Realist theory, bringing some of his own ideas and combining others. He agrees with Waltz's Defensive/Structural Realism that international anarchy causes states to engage in security competition. However he diverges from Waltz there saying, like Morgenthau's Human Nature/Classic Realism, <u>states will maximise their power constantly, striving ultimately for hegemony.</u> He adds ideas such as "the stopping power of water" and he has striven to ensure his is a workable theory for explaining the past and predicting the future, making his book a significant contribution to the canon of International Relations theory. 'The Tragedy of Great Power Politics' challenges the Liberal paradigm to a certain extent, but Mearsheimer does this by using abundant examples to prove his points, rather than through dissecting Liberal theory. Instead he focuses more on critiquing Defensive Realism and does this throughout the book. With regard to Liberalism, Mearsheimer says that <u>cooperation between states does exist, but only to promote a state's selfish interests, not for the sake of world peace. Security competition remains essential in today's world which, despite international institutions, remains anarchic.</u> Indeed, <u>such institutions are simply another arena for furthering national interests,</u> he argues. So while Mearsheimer's book does refute Liberal ideas, it is not a detailed critique instead concentrating on making the case for Offensive Realism. A fascinating and in-depth addition to Realist thought, The Tragedy of Great Power Politics is a good attempt to reveal what really causes war and conflict in the international system.

Security K Answers

Security K 2AC

1. Perm – do the aff an all non-competitive parts of the alt

2. Perm – do the plan and reject securitized representations – rejecting political solutions is counterproductive – realism synthesizes critical theories in order to provide for the possibility of transition
Murray 97
(Alastair J.H. Politics Department, University of Wales Swansea, *Reconstructing Realism*, p. 178-9) NS

In Wendt's constructivism, the argument appears in its most basic version, presenting an analysis of realist assumptions which associate it with a conservative account of human nature. In Linklater's critical theory it moves a stage further, presenting an analysis of realist theory which locates it within a conservative discourse of state-centrism. In Ashley's post-structuralism it reaches its highest form, presenting an analysis of realist strategy which locates it not merely within a conservative statist order, but, moreover, within an active conspiracy of silence to reproduce it. Finally, in Tickner's feminism, realism becomes all three simultaneously and more besides, a vital player in a greater, overarehing, masculine conspiracy against femininity. Realism thus appears, first, as a doctrine providing the grounds for a relentless pessimism, second, as a theory which provides an active justification for such pessimism, and, third, as a strategy which proactively seeks to enforce this pessimism, before it becomes the vital foundation underlying all such pessimism in international theory.

Yet, an examination of the arguments put forward from each of these perspectives suggests not only that the effort to locate realism within a conservative, rationalist camp is untenable, but, beyond this, that realism is able to provide reformist strategies which are superior to those that they can generate themselves. The progressive purpose which motivates the critique of realism in these perspectives ultimately generates a bias which undermines their own ability to generate effective strategies of transition. In constructivism, this bias appears in its most limited version, producing strategies so divorced from the obstacles presented by the current structure of international politics that they threaten to become counter-productive. In critical theory it moves a stage further, producing strategies so abstract that one is at a loss to determine what they actually imply in terms of the current structure of international politics. And, in post-modernism, it reaches its highest form, producing an absence of such strategies altogether, until we reach the point at which we are left with nothing but critique. Against this failure, realism contains the potential to act as the basis of a more constructive approach to international relations, incorporating many of the strengths of reflectivism and yet avoiding its weaknesses. It appears, in the final analysis, as an opening within which some synthesis of rationalism and reflectivism, of conservatism and progressivism, might be built.

3. Perm – do the plan and position yourself as a critical intellectual in order to re-think securitization – representations of security can be changed

4. Perm – do the alt – conditionality justifies
5. Our advantage is an impact turn to this criticism - ……

6. No link, impact inevitable and alt doesn't solve – treating security as a speech act means there are an infinite number of security threats, making it impossible to solve. Securitization is only when used by actors in positions to make security choices, it doesn't apply to us.

Williams 3 (Michael C., university of Whales, "Words, Images, Enemies: Securitization and International Politics", International Studies Quarterly, Vol. 47, No. 4) CC

This stance allows the Copenhagen School to argue simultaneously for both an expansion and a limitation of the security agenda and its analysis. On the one hand, treating security as a speech-act provides, in principle, for an almost indefinite expansion of the security agenda. Not only is the realm of possible threats enlarged, but the actors or objects that are threatened (what are termed the "referent objects" of security) can be extended to include actors and objects well beyond the military security of the territorial state. Accordingly, the Copenhagen School has argued that security can usefully be viewed as comprising five "sectors," each with their particular referent object and threat agenda (Buzan, Waever, and de Wilde, 1998).6 In the "military" sector, for example, the referent object is the territorial integrity of the state, and the threats are overwhelmingly defined in external, military terms. In the "political" sector, by contrast, what is at stake is the legitimacy of a governmental authority, and the relevant threats can be ideological and sub-state, leading to security situations in which state authorities are threatened by elements of their own societies, and where states can

become the primary threat to their own societies. Even further from an exclusively military-territorial focus is the concept of "societal" security, in which the identity of a group is presented as threatened by dynamics as diverse as cultural flows, economic integration, or population movements. Conversely, while treating security as a speech-act allows a remarkable broadening of analysis, securitization theory seeks also to limit the security agenda. Security, the Copenhagen School argues, is not synonymous with "harm" or with the avoidance of whatever else might be deemed malign or damaging (Buzan et al., 1998:2-5, 203-12). As a speech-act, securitization has a specific structure which in practice limits the theoretically unlimited nature of "security." These constraints operate along three lines. First, while the securitization process is in principle completely open (any "securitizing actor" can attempt to securitize any issue and referent object), in practice it is structured by the differential capacity of actors to make socially effective claims about threats, by the forms in which these claims can be made in order to be recognized and accepted as convincing by the relevant audience, and by the empirical factors or situations to which these actors can make reference. Not all claims are socially effective, and not all actors are in equally powerful positions to make them. This means, as Buzan and Waever put it, that the "Conditions for a successful speech-act fall into two categories: (1) the internal, linguistic-grammatical-to follow the rules of the act (or, as Austin argues, accepted conventional procedures must exist, and the act has to be executed according to these procedures); and (2) the external, contextual and social-to hold a position from which the act can be made ('The particular persons and circumstances in a given case must be appropriate for the invocation of the particular procedure invoked')" (Buzan et al., 1998:32). The claims that are likely to be effective, the forms in which they can be made, the objects to which they refer, and the social positions from which they can effectively be spoken are usually deeply "sedimented" (rhetorically and discursively, culturally, and institutionally) and structured in ways that make securitizations somewhat predictable and thus subject to probabilistic analysis (Waever, 2000)-and not wholly open and expandable. Finally, while empirical contexts and claims cannot in this view ultimately determine what are taken as security issues or threats, they provide crucial resources and referents upon which actors can draw in attempting to securitize a given issue.

7. Threats are real – Use your 1ac as specific proof

8. We must confront threats – key to prevent ceding the political – does not preclude the transformative potential of securitization

Franke 9

(Associate Prof of Comparative lit at Vanderbilt William Poetry and Apocalypse Page 92-93)JFS

Apocalypse prima facie refuses and makes an end of dialogue: it thunders down invincibly from above. But for this very reason the greatest test of our dialogical capacity is whether we can dialogue with the corresponding attitude or must resort to exclusionary maneuvers and force. What is called for here is a capacity on the part of dialogue not to defend itself but to let itself happen in interaction with an attitude that is apparently intolerant of dialogue. Letting this possibility be, coming into contact with it, with the threat of dialogue itself, may seem to be courting disaster for dialogue. It is indeed a letting down of defenses. Can dialogue survive such a surrendering of itself in utter vulnerability to the enemy of dialogue? Or perhaps we should ask, can it rise up again, after this self-surrender, in new power for bringing together a scattered, defeated humanity to share in an open but commonly sought and unanimously beckoned Logos of mutual comprehension and communication? May this, after all, be the true and authentic "end" of dialogue provoked by apocalypse? For what it is worth, my apocalyptic counsel is that we must attempt an openness to dialogue even in this absolute vulnerability and risk. The world is certainly not a safe place, and it will surely continue not to be such, short of something … apocalyptic. Needed, ever again, is something on the order of an apocalypse, not just a new attitude or a new anything that we can ourselves simply produce. Philosophy itself, thought through to its own end, can hardly resist concluding that "only a god can save us" (Nur noch ein Gott kann uns retten). But can not our attitude make a difference- perhaps make possible the advent of apocalypse beyond all our powers, even those of our own imaginations? I will wager an answer to this question only in the operative mood. May we bring a voice speaking up for mutual understanding onto the horizon of discourse in our time, a time marked by the terrifying sign of apocalyptic discourse. May we do this not by judging apocalyptic discourse, but by accepting that our condition as humans is as much to be judged as to judge and that all our relatively justified judgments are such to the extend that they offer themselves to be judged rather than standing on their own ground as absolute. In other words, may our discussions remain open to apocalypse, open to what we cannot represent or prescribe but can nevertheless undergo in a process of transformation that can be shared with others – and that may be genuinely dialogue.

9. Case outweights – the only impact to securitization is inaccurate constructions that they say spills over into all of their other impacts – we're winning our threats are real and that we should confront them, which means our threat of extinction should come first

10. No impact – security discourse isn't inherently bad — presenting it in debate allows the negative attributes to be avoided

Williams 3 (Michael, Professor of International Politics at the University of Wales, "Words, Images, Enemies: Securitization and International Politics," *International Studies Quarterly*, 47(4), AD: 7-10-9)

I have argued thus far that recognizing the roots of securitization theory within the legacy of a Schmittian-influenced view of politics explains a number of its key and most controversial features. Charges of an ethically and practically irresponsible form of objectivism in relation to either the act of securitization or the concept of societal security are largely misplaced. Locating the speech-act within a broader commitment to processes of discursive legitimation and practical ethics of dialogue allows the most radical and disturbing elements of securitization theory emerging from its Schmittian legacy to be offset. Seen in this light, the Copenhagen School is insulated from many of the most common criticisms leveled against it.

11. Alt doesn't solve the case – rejecting orientalist discourse doesn't prevent money laundering in Yemen, which triggers all of our impacts

12. No spillover and impact is inevitable – even if they win our threats are constructions, they're embedded in US policymaking now, which means policymakers will continue to act according to realist assumptions even if they're based on faulty representations
Williams 3

(Michael, Prof. of International Politics at the Univ. of Wales, *International Studies Quarterly*, Vol. 47, No. 4, pp. 511-531)

The first, and simplest point is that in some ways the Copenhagen School treats securitization not as a normative question, but as an objective process and possibility. Very much like Schmitt, they view securitization as a social possibility intrinsic to political life. In regard to his concept of the political, for example, Schmitt once argued,

It is irrelevant here whether one rejects, accepts, or perhaps finds it an atavistic remnant of barbaric times that nations continue to group themselves according to friend and enemy, or whether it is perhaps strong pedagogic reasoning to imagine that enemies no longer exist at all. The concern here is neither with abstractions nor normative ideals, but with inherent reality and the real possibility of making such a distinction. One may or may not share these hopes and pedagogic ideals. But, rationally speaking, it cannot be denied that nations continue to group themselves according to the friend–enemy antithesis, that the distinction still remains actual today, and that this is an ever present possibility for every people existing in the political sphere (1996 [1932]: 28).30 In certain settings, the Copenhagen School seems very close to this position. Securitization must be understood as both an existing reality and a continual possibility. Yet equally clearly there is a basic ambivalence in this position, for it raises the dilemma that securitization theory must remain at best agnostic in the face of any securitization, even, for example, a fascist speech-act (such as that Schmitt has often been associated with) that securitizes a specific ethnic or racial minority. To say that we must study the conditions under which such processes and constructions emerge and become viable is important but incomplete, for without some basis for avoiding this process and transforming it the Copenhagen School appears to risk replicating some of the worst excesses made possible by a Schmittian understanding of politics.

13. Realism is inevitable and necessary – failure to incorporate realist understandings detaches us from politics, which makes true change impossible

Guzzini 1998, Stefano (Assis. Prof @ Central European U), Realism in Int'l Relations, p. 212

Therefore, in a third step, this chapter also claims that it is impossible just to heap realism onto the dustbin of history and start anew. This is a non-option. Although realism as a strictly causal theory has been a disappointment, various realist assumptions are well alive in the minds of many practitioners and observers of international affairs. Although it does not correspond to a theory which helps us to understand a real world with objective laws, it is a world-view which suggests thoughts about it, and which permeates our daily language for making sense of it. Realism has been a rich, albeit very contestable, reservoir of lessons of the past, of metaphors and historical analogies, which, in the hands of its most gifted representatives, have been proposed, at times imposed, and reproduced as guides to a common understanding of international affairs. Realism is alive in the collective memory and self-understanding of our (i.e. Western) foreign policy elite and public whether educated or not. Hence, we cannot but deal with it. For this reason, forgetting realism is also questionable. Of course, academic observers should not bow to the whims of daily politics. But staying at distance, or being critical, does not mean that they should lose the capacity to understand the languages of those who make significant decisions not only in government, but also in firms, NGOs, and other institutions. To the contrary, this understanding, as increasingly varied as it may be, is a prerequisite for their very profession. More particularly, it is a prerequisite for opposing the more irresponsible claims made in the name although not always necessarily in the spirit, of realism. Alt fails

1ar: Alt Fails

JUST REJECTING SECURITY POLITICS REPRODUCES SOVEREIGNTY AND EXPLOITATION. ONLY POLITICAL ACTION CAN END GLOBAL OPPRESSION

Agathangelou & Ling '97   Anna M. **Agathangelou,** Dir. Global Change Inst. And Women's Studies Prof at Oberlin, and L.H.M. Ling, Institute For Social Studies at The Hague, Fall 1997, "Postcolonial Dissidence within Dissident IR: Transforming Master Narratives of Sovereignty in Greco-Turkish Cyprus," Studies in Political Economy, v. 54, pp. 7-8

Yet, ironically if not tragically, dissident IR also paralyzes itself into non-action. While it challenges the status quo, dissident IR fails to transform it. Indeed, dissident IR claims that a "coherent" paradigm or research program — even an alternative one — reproduces the stifling parochialism and hidden powermongering of sovereign scholarship. "Any agenda of global politics informed by critical social theory perspectives," writes Jim George "must forgo the simple, albeit self-gratifying, options inherent in readymade alternative Realisms and confront the dangers, closures, paradoxes, and complicities associated with them. Even references to a "real world, dissidents argue, repudiate the very meaning of dissidence given their sovereign presumption of a universalizable, testable Reality. What dissident scholarship opts for, instead, is a sense of disciplinary crisis that "resonates with the effects of marginal and dissident movements in all sorts of other localities." Despite its emancipatory intentions, this approach effectively leaves the prevailing prison of sovereignty intact. It doubly incarcerates when dissident IR highlights the layers of power that oppress without offering a heuristic, not to mention a program, for emancipatory action. Merely politicizing the supposedly non-political neither guides emancipatory action nor guards it against demagoguery. At best, dissident IR sanctions a detached criticality rooted (ironically) in Western modernity. Michael Shapiro, for instance, advises the dissident theorist to take "a critical distance" or "position offshore' from which to "see the possibility of change." But what becomes of those who know they are burning in the hells of exploitation, racism, sexism, starvation, civil war, and the like while the esoteric dissident observes "critically" from offshore? What hope do they have of overthrowing these shackles of sovereignty? In not answering these questions, dissident IR ends up reproducing despite avowals to the contrary, the sovereign outcome of discourse divorced from practice, analysis from policy, deconstruction from reconstruction, particulars from universals, and critical theory from problem-solving.

Permutation Solvency

Combining Realism and Reflectivist thinking produces the most effective form of politics

Murray 97

(Alastair, Professor in the Politics Department at the University of Wales Swansea, Reconstructing Realism)

For the realist, then, if rationalist theories prove so conservative as to make their adoption problematic, critical theories prove so progressive as to make their adoption unattractive. If the former can justifiably be criticised for seeking to make a far from ideal order work more efficiently, thus perpetuating its existence and legitimating its errors, reflectivist theory can equally be criticised for searching for a tomorrow which **may never exist**, thereby **endangering** the possibility of establishing any form of **stable order** in the **here and now**. Realism's distinctive contribution thus lies in its attempt to drive a path between the two, a path which, in the process, suggests the basis on which some form of **synthesis** between rationalism and reflectivism might be achieved. Oriented in its genesis towards addressing the shortcomings in an idealist transformatory project, it is centrally motivated by a concern to reconcile vision with practicality, to relate utopia and reality. Unifying a technical and a practical stance, it combines aspects of the positivist methodology employed by problem-solving theory with the interpretative stance adopted by critical theory, avoiding the monism of perspective which leads to the self-destructive conflict between the two. Ultimately, it can **simultaneously** acknowledge the **possibility of change** in the structure of the international system and the need to **probe the limits of the possible**, and yet also **question the proximity** of any international transformation, emphasise the **persistence of problems** after such a transformation, and serve as a **reminder** of the need to grasp whatever **semblance of order** can be obtained in the **mean time.** Indeed, it is possible to say that realism is uniquely suited to serve as such an orientation. Simultaneously to critique contemporary resolutions of the problem of political authority as unsatisfactory and yet to support them as an attainable measure of order in an unstable world involves one in a contradiction which is difficult to accept. Yet, because it grasps the **essential ambiguity** of the political, and adopts imperfectionism as its dominant motif, realism can relate these two tasks in a way which allows **neither to predominate**, achieving, if not a reconciliation, then at least a **viable synthesis.** Perhaps the most famous realist refrain is that **all politics are power politics.** It is the all that is important here. Realism lays claim to a relevance across systems, and because it relies on a conception of human nature, rather than a historically specific structure of world politics, it can make good on this claim. If its observations about human nature are even remotely accurate, the problems that it addresses will transcend contingent formulations of the problem of political order. Even in a genuine cosmopolis, conflict might become technical, but it **would not be eliminated** altogether. The primary manifestations of power might become more economic or institutional rather than (para)military, but, where disagreements occur and power exists, the employment of the one to ensure the satisfactory resolution of the other is inevitable short of a wholesale transformation of human behaviour. Power is ultimately of the essence of politics; it is not something which can be banished, only **tamed and restrained.** As a result, realism achieves a universal relevance to the problem of political action which allows it to relate the **reformist zeal** of critical theory, without which advance would be impossible, with the problem-solver's **sensible caution** that, before reform is attempted, whatever measure of **security** is possible under contemporary conditions must first be ensured.

Survaillance K Answers

Particularity Good

Particularity is essential in surveillance debates. Reject sweeping Ks.

Haggerty 6 — Kevin D. Haggerty, Director of the Criminology Program and Professor of Criminology and Sociology at the University of Alberta, Editor of the *Canadian Journal of Sociology*, Book Editor for *Surveillance & Society*, holds a Ph.D. in Sociology from the University of British Columbia, 2006 ("Tear Down The Walls: On Demolishing The Panopticon," *Theorizing Surveillance: The Panopticon and Beyond*, Edited by David Lyon, Published by Willan Publishing, ISBN 1843921929, p. 41)

The emphasis on **particular governmental projects** also restrains any desire to conceptualize surveillance **tout court** in favour of examining how **particular** systems of visibility are deployed in the context of **specific governmental ambitions**. It allows for a focused consideration of the aims, dynamics and rationalizations of **particular surveillance projects**. Such a focus can also mitigate the tendency towards forms of dystopian technological determinism that are often apparent in the surveillance studies literature. Combining a normatively ambivalent stance with a focus on **particular governmental projects** allows for the development of **a more refined normative stance** towards surveillance. Surveillance is neither good nor bad. We can only develop a **meaningful normative position** towards surveillance projects that are coordinated and calibrated in light of **particular governmental ambitions**. Such an emphasis also allows for analysis of the complexities and dynamics of contemporary surveillance politics, as citizens typically do not oppose or resist surveillance in the **abstract**, but express concerns about **concrete manifestations or imaginings** of how surveillance is or will be deployed for **very specific purposes** by **particular institutions**.

Reject totalizing Ks. Debating nitty-gritty policy details is key.

Haggerty 6 — Kevin D. Haggerty, Director of the Criminology Program and Professor of Criminology and Sociology at the University of Alberta, Editor of the *Canadian Journal of Sociology*, Book Editor for *Surveillance & Society*, holds a Ph.D. in Sociology from the University of British Columbia, 2006 ("Tear Down The Walls: On Demolishing The Panopticon," *Theorizing Surveillance: The Panopticon and Beyond*, Edited by David Lyon, Published by Willan Publishing, ISBN 1843921929, p. 41-42)

The understanding of citizens as active agents, combined with the frequent suggestion in this literature that governance has political dimensions (O'Malley 2004), suggest a clear place for the analysis of the politics of governance and attendant practices of resistance. However, to date, this line of inquiry has not been embraced, as doing so would entail breaching some of the methodological dictates established by key governmental authors. Having emerged from a Foucauldian framework, governmental studies have concentrated **almost entirely** on discourse analysis and have been reluctant to explore **the nitty-gritty politics of governance** or the experience of subjects. Indeed, almost all of these studies have followed Nikolas Rose's admonition that there is no such thing as 'the governed', but instead only 'multiple objectifications of those over whom government is to be exercised' (1999: 40). Rose also proposes that studies of governance should eschew sociological realism in order to concentrate on how authorities have conceived of what it means to govern, and how governance is made possible. Specifically, he suggests that studies of governmentality are exclusively concerned [end page 41] with 'the conditions of possibility and intelligibility for certain ways of seeking to act upon the conduct of others, or oneself, to achieve certain ends' (Rose 1999: 19). In this, governmental studies self-

consciously **exclude** a series of **important issues**, including the **actual operation of systems** of rule and the relations among political actors (Rose 1999: 19). Unfortunately, in this quest for a form of **methodological and epistemological purity**, studies of governmentality inevitably **forgo important lines of inquiry** into the **actual experience** of being subjected to different governmental regimes. Studies of surveillance therefore can and should embrace many of the insights about governance advanced within this Foucauldian approach, while also reserving space for **modestly realist projects** that analyze **the politics of surveillance** or the experiences of the subjects of surveillance.

Finally, studies of governance also allow for greater reflection on the monitoring of non-human entities. This is apparent in the types of phenomena which are recognized as being subject to governmental ambitions which include a heterodox assortment of such things as pregnancy, universities, pain, and economic life. While governmental authors are only interested in non-human entities to the extent that the governance of things also entails efforts to shape the rationality of human conduct (Dean 1999: 11), there are opportunities to explore whether there is an inevitable relationship between the monitoring of non-human phenomena such as forests, animals and microbes, and efforts to regulate human actions.

Surveillance studies can therefore benefit from embracing a modified governmental approach. It offers a path forward for exploring many of the silences and omissions of the panoptic model, but without falling into the temptation of advancing **a totalizing model of surveillance**.

Surveillance Literacy Good

Surveillance literacy is essential to make informed <u>life-or-death decisions</u>.

Donohue 13 — Laura K. Donohue, Associate Professor of Law, Director of the Center on National Security and the Law, and Director of the Center on Privacy and Technology at Georgetown University, has held fellowships at Stanford Law School's Center for Constitutional Law, Stanford University's Center for International Security and Cooperation, and Harvard University's John F. Kennedy School of Government, holds a Ph.D. in History from the University of Cambridge and a J.D. from Harvard Law School, 2013 ("National Security Law Pedagogy and the Role of Simulations," *Journal of National Security Law & Policy*, Volume 6, Available Online at http://jnslp.com/wp-content/uploads/2013/04/National-Security-Law-Pedagogy-and-the-Role-of-Simulations.pdf, Accessed 07-23-2015, p. 527-528)

5. Leadership, Integrity and Good Judgment

National security law often takes place in **a high stakes environment**. There is tremendous pressure on attorneys operating in the field – not least because of [end page 527] the coercive nature of the authorities in question. The classified environment also plays a key role: many of the decisions made will never be known publicly, nor will they be examined outside of a small group of individuals – much less in a court of law. In this context, leadership, integrity, and good judgment stand paramount.

The types of powers at issue in national security law are among **the most coercive** authorities available to **the government**. Decisions may result in the **death** of one or many human beings, the abridgment of rights, and the bypassing of protections otherwise incorporated into the law. The amount of pressure under which this situation places attorneys is of a **higher magnitude** than many other areas of the law. Added to this pressure is the **highly political nature** of national security law and the necessity of understanding **the broader Washington context**, within which individual decision-making, power relations, and institutional authorities compete. **Policy concerns** similarly **dominate the landscape**. It is not enough for national security attorneys to claim that they simply deal in legal advice. Their analyses carry consequences for those exercising power, for those who are the targets of such power, and for the public at large. The function of leadership in this context may be more about process than substantive authority. It may be a willingness to act on critical thought and to accept the impact of legal analysis. It is closely bound to integrity and professional responsibility and the ability to retain good judgment in extraordinary circumstances.

<u>Studying the details</u> is essential to surveillance literacy.

Donohue 13 — Laura K. Donohue, Associate Professor of Law, Director of the Center on National Security and the Law, and Director of the Center on Privacy and Technology at Georgetown University, has held fellowships at Stanford Law School's Center for Constitutional Law, Stanford University's Center for International Security and Cooperation, and Harvard University's John F. Kennedy School of Government, holds a Ph.D. in History from the University of Cambridge and a J.D. from Harvard Law School, 2013 ("National Security Law Pedagogy and the Role of Simulations," *Journal of National Security Law & Policy*, Volume 6, Available Online at http://jnslp.com/wp-content/uploads/2013/04/National-Security-Law-Pedagogy-and-the-Role-of-Simulations.pdf, Accessed 07-23-2015, p. 521)

2. Factual Chaos and Uncertainty

One of the most important skills for students going into national security law is the ability to deal with factual chaos. The presentation of factual chaos significantly differs from the traditional model of legal education, in which students are provided a set of facts which they must analyze. Lawyers working in national security law must figure out what information they need, integrate **enormous amounts of data** from **numerous sources**, determine which information is **reliable and relevant**, and proceed with **analysis and recommendations**. Their recommendations, moreover, must be based on contingent conditions: facts may be classified and unavailable to the legal analyst, or facts may change as new information emerges. This is as true for government lawyers as it is for those outside of governmental structures. They must be aware of what is **known**, what is **unsure**, what is **unknown**, and the possibility of **changing circumstances**, and they must advise their clients, from the beginning, how the legal analysis might shift if the factual basis alters.

Informed decision-making about national security requires consideration of policy considerations. Surveillance literacy depends on policy relevance.

Donohue 13 — Laura K. Donohue, Associate Professor of Law, Director of the Center on National Security and the Law, and Director of the Center on Privacy and Technology at Georgetown University, has held fellowships at Stanford Law School's Center for Constitutional Law, Stanford University's Center for International Security and Cooperation, and Harvard University's John F. Kennedy School of Government, holds a Ph.D. in History from the University of Cambridge and a J.D. from Harvard Law School, 2013 ("National Security Law Pedagogy and the Role of Simulations," *Journal of National Security Law & Policy*, Volume 6, Available Online at http://jnslp.com/wp-content/uploads/2013/04/National-Security-Law-Pedagogy-and-the-Role-of-Simulations.pdf, Accessed 07-23-2015, p. 523-524)

c. Creative Problem Solving. Part of dealing with factual uncertainty in a rapidly changing environment is learning how to construct new ways to address emerging issues. Admittedly, much has been made in the academy about the importance of problem-based learning as a method in developing students' critical thinking skills.134 Problem-solving, however, is not merely a method of [end page 523] teaching. It is itself a goal for the type of activities in which lawyers will be engaged. The means-ends distinction is an important one to make here. Problem-solving in a classroom environment may be merely a conduit for learning a specific area of the law or a limited set of skills. But problem-solving as an end suggests the accumulation of a broader set of tools, such as familiarity with multidisciplinary approaches, creativity and originality, sequencing, collaboration, identification of contributors' expertise, and how to **leverage each skill set**.

This goal presents itself in the context of fact-finding, but it draws equally on strong understanding of legal **authorities and practices**, **the Washington context**, and **policy considerations**. Similarly, like the factors highlighted in the first pedagogical goal, adding to the tensions inherent in factual analysis is the abbreviated timeline in which national security attorneys must operate. Time may not be a commodity in surplus. This means that national security legal education must not only develop students' **complex fact-finding skills** and their ability to provide **contingent analysis**, but it must teach them how to **swiftly and efficiently engage in these activities**.

Surveillance Debates Good — Student Participation

If <u>students like us</u> don't debate surveillance policy, *<u>no one will</u>*.

Tempera 13 — Jackie Tempera, Summer *USA Today* Collegiate Correspondent, Journalism Student at Emerson College, 2013 ("Viewpoint: Where are the college students protesting NSA surveillance?," *USA Today*, June 19th, Available Online at http://college.usatoday.com/2013/06/19/opinion-where-are-the-college-students-protesting-nsa-surveillance/, Accessed 07-24-2015)

==The college-age generation has been known as== the protesters, the action takers, ralliers and picketers. The ==**outspoken policy influencers**== and the liberals — working the First Amendment nearly since its inception.

<u>Where is that attitude now?</u> Apparently in Hong Kong, where hundreds of demonstrators stood in support of Snowden last week.

Wake up, undergrads. Channel that 1960s student fighting for civil rights or the hippie anti-war protester. ==Form an opinion, and act on it. If== we ==students don't== support whistle-blowers and ==oppose government surveillance, **who will?**==

It should make you at least a little uneasy that all this information is being cataloged. Didn't anyone else read 1984 in high school?

<u>Snowden revealing this government secret is something college students should live for. That spunky, fight-the-power attitude should run deep in the veins of students everywhere. He should be supported</u>. Not turned on or given a simple, "Meh" while you try to figure out the name of Kanye West and Kim Kardashian's new baby. (Be careful where you look, too, because the government might be recording the search.)

<u>So read an article. Talk to a friend and think about what is happening.</u> ==Be inspired and stop perpetuating the== **self-involved Generation-Y stereotype**. <u>Call a senator, hold a protest or create a hashtag</u>. For all I care, <u>vehemently argue for it</u> — ==just **do something**==.

This topic is a <u>once in a generation</u> chance for ordinary citizens to shape the surveillance debate. Neglecting it leaves our perspectives <u>unexpressed</u>.

Froomkin 13 — Dan Froomkin, Senior Washington Correspondent for the *Huffington Post*, former Columnist for *The Washington Post*, 2013 ("Politicians, press dodge crucial debate on surveillance," *Al Jazeera America*, October 9th, Available Online at http://america.aljazeera.com/articles/2013/10/9/nsa-surveillancesnowdenprivacydebate.html, Accessed 07-24-2015)

Throughout all the bombshell revelations this summer about U.S. government surveillance, President Barack <u>Obama and</u> top intelligence <u>officials have insisted they welcome a public debate</u> on the balance between security and privacy.

<u>But in reality, they could not be trying</u> much <u>harder to stifle it</u>.

Thanks to the bountiful leaks from Edward Snowden to The Guardian and other newspapers, the public is finally getting an accurate sense of the vast U.S. electronic surveillance regime that collects, connects

and retains massive amounts of information about all of us — although government officials are asking us to believe that almost none of it ever gets looked at by anyone.

Far from being forthcoming, however, when administration representatives have made themselves available for questions, their answers have been defensive — often vague or overly narrow, misleading or plainly untruthful. In oversight hearings, they have attacked the leaks and the leaker, made unsubstantiated complaints about press coverage, misrepresented the concerns of privacy advocates and employed scare tactics.

Sen. Ron Wyden, D-Ore., has been one of the few members of Congress to complain about it, raising one subterfuge in particular: "After years of stonewalling on whether the government has ever tracked or planned to track the location of law-abiding Americans through their cellphones," he said in a statement last week, "once again, the intelligence leadership has decided to leave most of the real story secret — even when the truth would not compromise national security."

The president has charged two ostensibly independent commissions to report back to him on some possible reforms, but he has indicated he thinks the most that might be needed is some tweaks. "People may want to jigger slightly sort of the balance between the information that we can get versus the incremental encroachments on privacy that if haven't already taken place, might take place in a future administration, or as technologies develop further," Obama told reporters in August.

What the nation needs, however, is not reassurance from politicians about a few secret changes to covert programs. We need an accessible public discussion of what privacy means in this new era.

Americans have historically had a reasonable expectation that the government was not watching their every move. But the kind of ubiquitous surveillance that once required a massive application of manpower is now cheap, and will soon be effortless.

Thanks to the Snowden revelations, we now know that the government already sweeps up vast amounts of information about Americans, including "metadata" showing whom they talk to, and email, public and commercial information including bank codes, insurance information, Facebook profiles, transportation manifests and GPS-location data.

When you add all that up — even if the government stops short of actually listening in on your phone calls and reading your emails — there is basically no privacy left.

So the central questions posed by the Snowden revelations are these: Is there still a right to privacy in the modern age? And if so, how far does it extend?

And because congressional leaders appear disinclined to call attention to their own historical submissiveness to the executive branch in this area — even though they control the funding and oversight of the intelligence agencies — the following questions will need to be addressed in public by the media, through probing journalism, on-the-record interviews, public-records requests, and town halls and other public forums that encourage citizen involvement:

Do American citizens have a right to private electronic communication? Does anyone else, here or abroad? Does that right protect just the content of their communications, or the metadata about those communications as well? Or does the government's duty to protect Americans justify the collection, storage, analysis and monitoring of every electronic communication between persons?

Although most people travel openly in public and do not take precautions about being seen, they do not thereby consent to being tracked. Nor do they expect their phones to be used as tracking devices. So should there be limits to the government's use of location data gathered from cell phones, mobile apps and public video cameras?

What is permissible for other governments to do to Americans? Is the U.S. government protecting Americans from surveillance by foreign governments, or is it sharing our secrets with them? Does the U.S. intelligence community recognize any privacy rights at all for citizens of other countries?

What about attorney-client privilege? Doctor-patient confidentiality? Journalist-source secrecy? Should those be shielded from the scrutiny of U.S. intelligence, either at home or abroad? Should U.S. legislators and judges be subject to the same surveillance as everyone else?

Is the very act of collecting massive amounts of information about Americans and putting it into a giant database a violation of privacy? Or does it matter only when and if that information is accessed and used by officials?

Secure encryption protects Internet commerce, provides security and authenticates identity. Should Americans grant the government the power to undermine it? If so, under what circumstances?

And why should we trust what government officials say about surveillance programs? If nothing else, the Snowden leaks have made it painfully obvious that officials have misled the public for a very long time.

Despite such dishonesty, Americans are being asked to trust that the government will access its massive databases only for legitimate investigative purposes. We are being asked to trust the intelligence community to police itself.

How can the public be confident that any of the rules meant to protect its privacy are really being enforced? How can we be confident that the government can even keep track of what it is doing?

Finally, how much of the surveillance regime itself really needs to be secret? Al-Qaeda operatives are surely aware that the government is watching them in countless ways. What could more disclosure about the general nature of the programs tell them that they do not already surmise? How can Americans assert their rights against encroachment from such programs if they remain ignorant about them?

The Snowden revelations have been so numerous that they are still being processed, and more are to come. Predicting the public's reaction is difficult: More shocks could bring numbness and paralysis — or they could stimulate the public's desire for a coming-to-terms.

The public and the press have perhaps been cowed from demanding a more open and frank discussion of these issues in deference to national security concerns. But the Snowden revelations demand more of us.

The nature of privacy is **too important** to be determined by a small group of experts **behind closed doors**. This is the kind of debate that comes around only **once in a generation**, and is possibly even **unique to this moment in history** as our analog world transitions to a digital one.

The future of this debate depends on how the national press responds. It could allow the story to fade into just so much more background noise. Or the press could embrace its rightful role as the champion of the public interest, and make sure **regular** American citizens are a party to important decisions about what is private and what is not in the digital age.

Surveillance Debates Good — Internet Freedom

This topic presents a <u>once-in-a-lifetime</u> opportunity to educate policymakers about Internet technology. This is vital to <u>Internet freedom.</u>

Meinrath and Ammori 12 — Sascha Meinrath, Vice President and Founder and Director of the Open Technology Institute at the New America Foundation, holds a Ph.D. in Communications and Media from the Institute of Communications Research at the University of Illinois, and Marvin Ammori, Bernard L. Scwartz Fellow at the New America Foundation, Principal of the Ammori Group—a law firm, holds a J.D. from Harvard Law School, 2012 ("Internet Freedom and the Role of an Informed Citizenry at the Dawn of the Information Age," *Emory International Law Review* (26 Emory Int'l L. Rev. 921), Available Online to Subscribing Institutions via Lexis-Nexis)

More than sixty years ago, civil rights activists realized that the most effective route to bettering our country was through mass social movements, civil disobedience, and judicial review. Those whom we hold up today as champions from this era - from Rosa Parks and Thurgood Marshall to Malcolm X and Martin Luther King, Jr. - were part of **sophisticated, nationwide, legal interventions** to stand up for what they believed. To be **an informed citizen** and **an active member of civil society** during this epoch was to be **aware of these battles** and even **participate in them** — taking sides on the street, at the lunch counters, in the pages of the nation's newspapers, and through broadcast radio and television. In law school, reading Brown v. Board of Education n1 and Cooper v. Aaron, n2 you might get the mistaken impression that the judicial branch was the focus of the debate, or the most important agent of change. But this litigation was a purposeful and well-thought-out facet of a far broader social movement and organizing strategy. n3 This social movement focused on a key normative question for civil society: Who can participate in our democracy as a full citizen - with an equal vote, equal treatment under the law, equal access to education, and all the other social resources necessary to enjoy true liberty - and have a meaningful say in our government? n4

Today we are at a similar **critical juncture**, asking similar questions about participation in modern civil society. n5 We have made progress in making our [*922] democracy more racially inclusive, although controversies remain over de facto segregation and voter discrimination. n6 But while the foundation of our democracy includes the right to vote, it also requires the right to access information and disseminate information to others. n7 The Constitution terms it the right to freedom of speech and press, while the Universal Declaration of Human Rights calls it the right to opinion and expression. n8 Today the most powerful tools to amplify our thoughts and ideas are often not newspapers and broadcast stations, controlled by the few and the powerful.

The most powerful tool for a large and growing global constituency is an open Internet and the applications we use every day - from Facebook and Twitter to YouTube and Tumblr. The Internet has become the core infrastructure of modern free expression and speech. By connecting us, the free and open Internet is the foundation for twenty-first century civil society. The enemies of a robust, democratic civil society know this. It is why Internet freedom is under sustained attack.

The battle over Internet freedom will have a profound impact on the future of civil society and democracy. These attacks sometimes take the form of legislation in cybersecurity or copyright. For example, Senator Lieberman pushed to introduce legislation granting the President authority to shut down the Internet by creating a central "kill switch" - legislation that was only buried when Egypt's

President Mubarak used a similar system to take that country offline during its own democratic protests. n9 Congress also nearly passed the hugely controversial Stop Online Piracy Act n10 ("SOPA"), which is often derisively called the Stop Online Privacy Act, and Protect Intellectual Property Act n11 ("PIPA") - bills that resulted in a Wikipedia blackout on January 18, 2012. n12

 [*923] Decisions being made **right now in** Washington, D.C., will affect **the very trajectory of democracy**. Too often, proposed decisions are at odds not only with freedom, but also with technological reality. D.C. is, first and foremost, a city of lawyers. Unfortunately, these lawyers think themselves to be technologists and are running rampant, drafting remarkably bad laws - usually not through malfeasance, but through **ignorance**. Thus, there is **a crucial opportunity to change the course of history** simply by ensuring that key decision-makers **actually understand technology**, its limits, and what it makes possible. To analogize to an earlier era, the decision in Brown v. Board of Education turned on psychological evidence concerning children in segregated schools. n13 Imagine if lawyers based their case on their **"gut feeling"** rather than relying on **social psychological experts** and **research based upon empirical data**.

Sascha directs the Open Technology Institute at the New America Foundation ("OTI"). n14 The New America Foundation is a public interest think tank in Washington, D.C., whose programs span everything from foreign policy analysis to educational reform, and from asset building amongst the poor to how to remake our medical system to be both more affordable and more responsive. The Open Technology Institute is the technology and telecom arm of the New America Foundation's work - a group of technologists working to counter the misinformation campaigns currently running rampant in D.C.

Marvin is one of the few lawyers welcomed to hang out at the Open Technology Institute. He is a veteran of the open Internet battles and the SOPA battle, a First Amendment scholar, and once served as the head lawyer of Free Press. Most importantly, he tries to wield technical know-how to bolster his legal acumen.

Simply put, to defend Internet freedom at this critical juncture, we need not only legal expertise but also **technological expertise**. Interested parties - both corporations and entrenched bureaucracies - take advantage of the woeful technological naivete of most politicians, regulators, and key administration officials. Sowing "Fear, Uncertainty, and Doubt" ("FUD") is often their modus operandi. And this FUD has, for far too long, driven a national debate over [*924] cybersecurity, copyright, surveillance, and open Internet policies. This FUD is **directly undermining our ability, as a democratic society**, to protect human rights online.

Much of the work that OTI does focuses on educating key decision makers - at the Federal Communications Commission, Federal Trade Commission, State Department, and White House; in the Senate and House of Representatives; and at leading advocacy organizations - about technological reality. But the forces of FUD are powerful, and OTI has a modest team of some fifty tech-savvy staff. What is needed today is **a far more widespread intervention** - with help from technologists across the country and from **average Americans**, who often **know far more about technology** than the average policymaker in D.C.

But why would you want to help? For the same reason you would want to take part in the great debates over civil rights and civil society in the 1950s and 1960s. What stories do we want to be able to tell our children and our grandchildren? We have **a once-in-a-lifetime, perhaps a once-in-a-century**,

opportunity. As we transition into the Information Age, we must ask ourselves: How do we support a twenty-first century civil society that is **inclusive**, **decentralized**, and **free** - the kind of society where participatory democracy thrives?

The future of the Internet depends on the outcome of surveillance debates. Teaching students to win these debates is important.

Meinrath and Ammori 12 — Sascha Meinrath, Vice President and Founder and Director of the Open Technology Institute at the New America Foundation, holds a Ph.D. in Communications and Media from the Institute of Communications Research at the University of Illinois, and Marvin Ammori, Bernard L. Scwartz Fellow at the New America Foundation, Principal of the Ammori Group—a law firm, holds a J.D. from Harvard Law School, 2012 ("Internet Freedom and the Role of an Informed Citizenry at the Dawn of the Information Age," *Emory International Law Review* (26 Emory Int'l L. Rev. 921), Available Online to Subscribing Institutions via Lexis-Nexis)

The Internet has always been, from its genesis, a tool for swapping information amongst participants. And as the power of this tool has grown exponentially, far beyond what anyone could have possibly imagined, so too has **our responsibility** to act as defenders and champions of its openness and fundamentally participatory nature.

Even more importantly, we have **a responsibility to teach future generations** to improve upon what we have created and ensure that the Internet's next [*932] iterations are more inclusive, less discriminatory, and increasingly supportive of our fundamental, inalienable human rights.

The best way we can do this is to ensure that our **pedagogical practices** not only empower students with the digital literacy skills they need to navigate online resources, but also that they have the critical thinking and organizing skills necessary to **actively defend themselves against** online threats of censorship, **surveillance**, and discrimination.

Permutation vs. "Starting Point"/"Method" Alt

Both the aff _and_ the critique support the same policy conclusion. "Starting point" and "method" links overvalue <u>purity</u> at the expense of <u>effective politics</u>. <u>Perm</u> best.

Burris 13 — Greg Burris, Doctoral Candidate in the Department of Film and Media Studies at the University of California-Santa Barbara, holds degrees in Middle Eastern Studies and Central Eurasian Studies from the University of Texas-Austin and Indiana University-Bloomington, 2013 ("What the Chomsky-Žižek debate tells us about Snowden's NSA revelations," *The Guardian*, August 11th, Available Online at http://www.theguardian.com/commentisfree/2013/aug/11/chomsky-zizek-debate-snowden-nsa, Accessed 07-06-2015)

In order to demonstrate how Chomsky and Žižek, despite their squabbling, can be made to **complement each other, I** now turn to a developing story with which we should all already be concerned: the ongoing saga of whistleblower Edward Snowden and his revelations about NSA surveillance practices. Snowden's leaks have already changed the entire framework of the discussion. Their impact has thus been seismic. Here, we are talking about facts, about the importance of **new empirical data** for our assessment of the contemporary moment. The introduction of these facts into the public arena has put the government on the defense. One need only recall how Snowden's disclosures immediately revealed that Director of National Intelligence James Clapper had outright lied to Congress. Glenn Greenwald and his editors at the Guardian have thus been wise in choosing to publish Snowden's revelations gradually, thereby preventing them from so easily becoming yesterday's news.

But look how quickly the discourse shifts. After an initial shock, power can rapidly appropriate new data for its own ends. As Herbert Marcuse put it in One-Dimensional Man, that which initially appears subversive can be "quickly digested by the status quo as part of its healthy diet". Thus, government representatives are, for the most part, no longer disputing the positive content of Snowden's claims. Rather, they are justifying them in the name of fighting terror. In this way, the site of struggle slips from one dimension to another, **from the realm of contested facts to the realm of contested interpretations**.

In light of the recent NSA surveillance scandal, Chomsky and Žižek offer us very different approaches, **both of which are helpful for leftist critique**. For Chomsky, the path ahead is clear. Faced with new revelations about the surveillance state, Chomsky might engage in data mining, juxtaposing our politicians' lofty statements about freedom against their secretive actions, thereby revealing their utter hypocrisy. Indeed, Chomsky is a master at this form of argumentation, and he does it beautifully in Hegemony or Survival when he contrasts the democratic statements of Bush regime officials against their anti-democratic actions. He might also demonstrate how NSA surveillance is not a strange historical aberration but a continuation of past policies, including, most infamously, the FBI's counter intelligence programme in the 1950s, 60s, and early 70s.

Žižek, on the other hand, might proceed in a number of ways. He might look at the ideology of cynicism, as he did so famously in the opening chapter of The Sublime Object of Ideology, in order to demonstrate how expressions of outrage regarding NSA surveillance practices can actually serve as a form of inaction, as a substitute for meaningful political struggle. We know very well what we are doing, but still we are doing it; we know very well that our government is spying on us, but still we continue to support it (through voting, etc). Žižek might also look at how surveillance practices ultimately fail as a method of subjectivisation, how the very existence of whistleblowers like Thomas Drake, Bradley Manning, Edward

Snowden, and the others who are sure to follow in their footsteps demonstrates that technologies of surveillance and their accompanying ideologies of security can never guarantee the full participation of the people they are meant to control. As Žižek emphasises again and again, subjectivisation fails.

Importantly, neither of these approaches is wrongheaded. Both provide **productive and fruitful avenues** for further reflection and consideration. Indeed, political struggles **never** take place solely within one isolated site or at one level of abstraction. Rather, they take place seemingly everywhere and in multiple dimensions simultaneously. Thus, to deny ourselves access to the important contributions of either Chomsky or Žižek would be to engage in an exercise of **self-mutilation**, an instance of **cutting off one's nose to spite one's face**. Existing structures of power do not limit their operations to only one level of abstraction and **neither should we**. To meet these structures head-on, then, we must **diversify our strategies**. As a result, Chomsky's astute political analyses and Žižek's creative inquiries into the functioning of ideology can **both be helpful**. The debate between these two figures is thus a **non-debate**, and the choice between them is a **false** one. **Why choose only one when we can just as easily have both?**

Reject demands for methodological purity. The plan and alt are _on the same side_. Perm best.

Weiland 13 — Jeremy Weiland, Activist who has worked with Occupy Richmond and Richmond Industrial Workers of the World, Contributing Writer at the Center for a Stateless Society and Attack The System, Software Developer who has worked for CustomInk, Jobaio, 6th Density LLC, INM United, and ALTERthought, former Systems Analyst for the Computer Sciences Corporation, holds a B.S. in German and Computer Science from the University of Mary Washington, 2013 ("An anarchist critique of the reporting on the Snowden leaks," _Social Memory Complex_—an anarchist blog, December 31st, Available Online at http://www.socialmemorycomplex.net/2013/12/31/an-anarchist-critique-of-the-reporting-on-the-snowden-leaks/, Accessed 07-07-2015)

As the year rolls to an end, I'd like to compile a few thoughts on the handling of the NSA secrets leaked by Edward Snowden to Glenn Greenwald, Laura Poitras, Ryan Gallagher, and others. This debate has occurred on ephemeral media like twitter, and these matters deserve a more extended treatment. There have been many developments since my last post on the subject; one of the most interesting has been the journalistic issues surrounding this episode.

Throughout this post, keep in mind that I approach this as a radical, anti-institutionalist anarchist. My values place very little weight on compromising secret government plots for any reason. I disagree fundamentally with Snowden's desire for selective leaking, though it shouldn't surprise anybody that an ex-NSA employee would maintain very different priorities than an anarchist. **Nothing could be more useless** or moronic than to expect relatively establishmentarian, statist folks like Snowden, Greenwald, or Poitras to act **exactly like I might** were I in their shoes.

However, I have a basic respect for Snowden's sacrifice and Greenwald's work that **transcends my political preferences** (I'm not familiar with Poitras's work prior to this episode, though she has my respect as well). I will not sully that respect by dragging any of these people through the mud, **even if** their chosen acts don't quite conform to my personal standards. Indeed, I wish to advance a critique of

their conduct that can **actually contribute to the debate** without **drowning everything in** the noise of acrimony **and belligerence**.

Unlike many on the radical left, I believe tone is important, both for **maintaining crucial solidarity within the larger resistance** and for disciplining our own thinking against irrational laziness. Snowden, Greenwald, Poitras, and others are **fundamentally on my side of this issue**, regardless of our differences in values and ideology. People on the same side can disagree and debate without devolving into **crude infighting**. I regard it as **shameful, juvenile, and counter-productive** to elevate **any kind of political or methodological purity** over those **broad interests that unite us**.

Permutation vs. "State Bad" Alt

Responding to NSA surveillance by demanding abolition of the state is counterproductive. Our call for <u>negative state action</u> is a more effective challenge. "Reformism bad" <u>oversimplifies</u>. <u>Perm</u> best.

Weiland 13 — Jeremy Weiland, Activist who has worked with Occupy Richmond and Richmond Industrial Workers of the World, Contributing Writer at the Center for a Stateless Society and Attack The System, Software Developer who has worked for CustomInk, Jobaio, 6th Density LLC, INM United, and ALTERthought, former Systems Analyst for the Computer Sciences Corporation, holds a B.S. in German and Computer Science from the University of Mary Washington, 2013 ("An anarchist critique of the reporting on the Snowden leaks," *Social Memory Complex*—an anarchist blog, December 31st, Available Online at http://www.socialmemorycomplex.net/2013/12/31/an-anarchist-critique-of-the-reporting-on-the-snowden-leaks/, Accessed 07-07-2015)

There is only a political solution

I mentioned earlier that it is the scale at which the NSA operates that makes it dangerous. Only with such concentrated resources and authority can the NSA compromise the entire communications network infrastructure at every layer. Any defense strategy or reform that doesn't squarely address the issues surrounding this unprecedented concentration of power is **worse than useless**. Clever hacking **will not save us from concentrated power**; crypto is a workaround and not a sufficient response to the fundamental challenge here. New oversight practices, such as a "privacy advocate" position in the FISA court, will fail as surely as old ones. Organizations like the NSA specialize in telling themselves and others precisely the narratives that justify their abusive, disingenuous conduct in the dark.

Knowing this, statists of all varieties must wrestle with how to check and balance the government in this era. The sheer level of secrecy and abuse here can't help but give the lie to their minarchist approach of legal reform and institutional counterbalancing. Clearly any government abiding an organization like the NSA is no mere accomplice but rotten to the core. Any reform that does not squarely face this reality is **insufficient and counterproductive** on its face.

While anarchists understand that even this latest outrage **will not bring about the revolution**, I do think we are uniquely positioned to advocate for **extreme measures** that others currently find unthinkable. There literally is no alternative, because who could ever trust anything the government does in secret again? The NSA's power and operation in the dark must be **scaled far, far back** if we are to have **a real solution** to this crisis. Indeed, the state must be made to understand that its very legitimacy is at stake, and this is a core anarchist goal in the first place.

Dissolution of the state and the NSA may not be **politically feasible**, but a sharp and crippling cut to the budget—especially the abolition of the secret black budget—may be **one concession we can extract from the establishment**. After abolition, containing the budget is **the next best insurance** against power becoming too concentrated in an organization. Granted, this is a long shot, but it both has the virtue of being **measureable** and also marking **a grave reappraisal of the government's legitimacy**.

I'm sure each and every person responsible for bringing the NSA cache of secrets to light has a different vision of what reforms are best. However, we are at a unique juncture in history—one we indeed owe to Snowden, Greenwald, Poitras, and others, but nevertheless one which belongs to all of us. Never before

have the people faced such **pervasive and subtle totalitarianism** so undermining to society as we know it. If folks finally consider radical solutions, **it will not be because anarchists berated them into it**. The **right arguments** could ensure the separation of the head from the snake this time, if anarchists can model **a new attitude towards power** that seeks **not to alienate opponents** but **build a qualitatively different consensus**.

Our defense of <u>negative state action</u> avoids the link. <u>Perm</u> best.

Izquieta 14 — Stephanie Izquieta, Board Member and Director of Congress at the Student Net Alliance—a student-run digital rights organization, Senior in the Philosophy, Politics & Law program at Binghamton University, 2014 ("Binghamton University Students and Faculty Against Mass Surveillance," Open Letter by Faculty and Students at Binghamton University, May, Available Online at http://studentsagainstsurveillance.com/Binghamton/, Accessed 07-23-2015)

A free flow of ideas is the cornerstone of a strong and vibrant society. An informed citizenry is one of the most important guarantors of the integrity and security of a nation. As a community of teachers and scholars at Binghamton University, we sign this letter in support of digital rights and free speech on campus, and in objection to government surveillance. An important idea in the definition of a university is the notion of academic freedom. Academic freedom is the belief that the freedom of inquiry by faculty members is essential to the mission of the academy as well as the principles of academia, and that scholars should have freedom to teach or communicate ideas or facts (including those that are inconvenient to external political groups or to authorities) **without being targeted for repression**, job loss, or imprisonment. Thanks to whistleblower Edward Snowden, we now know that there exists **a tangible threat to academic freedom** and that our rights as cybercitizens are being violated. In an environment of mass surveillance, speech and academic freedom are **chilled**. We, as students and faculty of the global academic community, **protest**. Together, we are taking a stand against mass surveillance on our campus.

While the bulk of the revelations on mass government surveillance are relatively new, studies show a marked shift in people's online behavior [1]. Government surveillance negatively affects free speech and digital rights by:

* Undermining our ability to communicate and collaborate with our peers abroad by directly targeting non-US citizens, immigrants, and those connected to others outside of the United States, with programs like CO-TRAVELR [2], MYSTIC [3], and the Foreign Intelligence Surveillance Act (FISA) Court's interpretation of Section 702 of the FISA Amendments Act [4].

* Targeting our Muslim and Arab peers by spying on religious student organizations and university prayer rooms [5]. This represses free speech among students and creates an atmosphere of fear.

* Mapping and monitoring social networks [6], chilling our ability to organize and engage in political discourse.

Accordingly, we stand collectively for a university environment that decries digital surveillance and embodies principles of free speech and online privacy. As such, we are calling on the Binghamton University administration to develop policies that actively minimize on-campus surveillance and to foster a culture of digital freedom that is consonant with the commitments to academic freedom and freedom

of speech that are at the heart of any institution of higher education. As members of the global academic community, we sign this letter in protest. We **protest the U.S. surveillance state** and **the chilling effects it has** on our campus life. We **call on the** U.S. **government** to bring the NSA **back within the bounds of the constitution**.

Permutation vs. "Individual Action" Alt

No tradeoff between _individual_ and _collective_ approaches. <u>Perm</u> best.

Lee 14 — Ashlin Lee, Ph.D. Candidate and Associate Lecturer in Sociology at the School of Social Sciences at the University of Tasmania, Member of The Australian Sociological Association, The Surveillance Studies Network, and the Asia-Pacific Science Technology Studies Network, 2014 ("A Question of Momentum: Critical Reflections on Individual Options for Surveillance Resistance," _Revista Teknokultura_—Journal of Digital Culture and Social Movements, Volume 11, Issue 2, Available Online at http://dialnet.unirioja.es/descarga/articulo/4820459.pdf, Accessed 07-12-2015, p. 434-436)

Concluding Remarks and Future Directions

Is resistance to global surveillance then **pointless** for an individual? Perhaps in some current iterations, but that **does not mean** abandoning resistance is helpful. Global surveillance presents **a pressing** moral, **legal, and social issue for all** members of contemporary society. Ignoring surveillance, and allowing global surveillance regimes to go unchallenged and unopposed perpetuates a growing asymmetry between those conducting surveillance and the subject(s) of surveillance. It is therefore important that surveillance and its subsequent asymmetries do not go unquestioned or unopposed, whether this be through resistance or alternative means. But any suggested opposition to surveillance, especially for individuals, needs to recognise the current context of surveillance, including issues of technological momentum and surveillance's role in everyday life, which **complicates opposition**.

Because of these points, future discussion on resistance, especially for individuals, may benefit from looking beyond confrontational resistance towards ideas more attuned to dealing with the context. One possible angle for this might be considering ideas around how surveillance can be **controlled or engaged with**, to facilitate a positive outcome for individuals. It is unlikely global surveillance systems will be reversed or halted given the momentum developed so far and the gains these systems have had for those in power. Additionally, this momentum is set to continue to build as a new generation of technologies such as drones (Wall & Monahan, 2011), wearable devices (Whitson, 2013), and algorithmic and intelligent surveillance (Introna & Wood, 2004), are developed and deployed. An individual can never hope to resist, avoid, or destroy **all** these measures of surveillance. **However** if Marx's (2013) assertion that surveillance holds no inherent moral character and is contextually determined holds true, then [end page 434] considering how individuals can engage with surveillance and **determine its course** could be **a good next step**. Such an approach would sidestep the idea of confrontation as the basis for resistance, avoiding problems of technological momentum, while acknowledging the role of surveillance in everyday life. Positive change would occur through **participation**, **engagement**, and **control**, instead of **fighting**, **destroying**, or **hiding** from surveillance. This is not an entirely new idea, with Mann (2013) suggesting that all individuals should adopt veillance (or watching) technologies to address the current asymmetries of a surveillance society (where watching occurs only from above). He suggests harnessing the technological momentum of surveillance to allow all individuals to watch each other and the authorities. Individual thus do not have to resist surveillance when they are able to conduct their own veillance, demonstrating how participating and engaging might be positive for individuals. Through this Mann believes that society "will tend to be more balanced, just, prosperous and 'livable'" (Mann, 2013, p. 11), in comparison to where there is surveillance only. However any such notion of engagement or control would still need to overcome significant hurdles. While new generations of devices, such as Google Glass, may offer a feasible platform for this, there is

no guarantee that uptake will be high enough to create a veillance society. All individuals need equal access and opportunity to engage for a veillance society to work. As a social measure, it would also require **a supportive legislative and political environment**, a difficult proposition given that governments and corporations benefit from the current asymmetries. It also begs the question of how individuals would be able to generate enough momentum, whether this be technological, social, political, or economic, to create and maintain such a radical social arrangement.

Consequently, this would mean **a shift in focus** from **individual** to **group** forms of participation and resistance. An obvious counterpoint to much of the above discussion is that it has not engaged with these kinds of group forms of resistance. As Martin, van Brakel, and Burnhard (2009) state resistance to surveillance is best understood as occurring in relation to multiple actors and groups. It has been well demonstrated that it is possible for individual's to **come together in collectives** or communities to resist or challenge surveillance in these contexts (see Monahan, 2006a). These facts and the necessity to consider groups in the analysis of resistance is not in question, and indeed may offer individuals a way of engaging in resistance. But this should not obscure the fact that surveillance occurs in a world that is increasingly individualised and fragmented (Bauman, 2000) especially for those living in the developed West, and individual options for resistance should still be explored. This article has sought to directly engage with this notion and critique it without at all devaluing or detracting from group options for resistance. Surveillance must be considered as a part of the political economic [end page 435] patterns of society (Lyon, 2007), with individualisation existing as an important factor in these patterns. With traditional forms of sociality and community evolving towards an individually directed project (Bauman, 2000), and surveillance being increasingly ubiquitous to these projects (Lyon, 2001), it is left in the individual's hands how this risk is negotiated. Therefore a consideration of the individual and their capacity to act is important and necessary, as it compliments existing understandings of group resistance.

The importance of having options for enacting positive change upon surveillance is **enormous**, whether these options come from **individuals** or **groups**. But any such notion must be **pragmatic** and **open for development**. It is hoped this article will encourage further discussion in this vein, for the good of all the subjects under surveillance.

"Global-local" and *"focus tradeoff"* arguments are wrong. <u>Perm</u> best.

Snowden Commons 14 — Snowden Commons, a project created at the Berliner Gazette Conference that seeks to publicly share the Snowden document archive in public libraries throughout the world, 2014 ("From the Snowden Files to the Snowden Commons: The Library as a Civic Hub," *Libreas*—an academic library journal, Number 26, Available Online at http://libreas.eu/ausgabe26/08anonym/#from-the-snowden-files-to-the-snowden-commons-the-library-as-a-civic, Accessed 06-28-2015)

From the right to privacy to participatory autonomy

So far, citizens have been **trapped between two strategies** for defending themselves from the forms of surveillance implied in the Snowden files, both of which tend to be **difficult for common citizens to participate in** because they require specialized technical or policy knowledge. On the one hand,

individuals have been encouraged to use new digital privacy tools and techniques to create a wall between themselves and the watchers (but is this a solution for everyone?).

On the other, some activists, organizations and human rights advocates have sought to compel governments to better protect citizens' rights through lobbying, legal action and constitutional challenges (but what to do when the government is the watcher?). But there is **a third option**, one that **complements and supports the other two** while creating **something new**. We must **re-create public spaces** where citizens can **learn about the threat they face** and **come up with common, workable solutions**: a place to deliberate **not only about how we are affected as individuals**, but also **as a society** and **as communities**, different communities being affected **in different ways**, and what **multiple perspectives** different people and different communities take on surveillance. In this way we can build **a solid and sustained public dialogue** about security, surveillance, privacy and autonomy.

We envision the public library as a space where social movements are structured through sharing interests, information, strategies, tactics and tools. We call upon librarians to facilitate the publics' reclaimation of the information that impacts all of us.

Why? Because the right to privacy is **not simply a personal matter** of the individual; it is **a societal challenge** which requires **society-level solutions**. Further, human rights are not only something granted under constitutional and international law; they must be continuously demanded, negotiated, and constantly rebuilt from society's grassroots. For instance, while article 5 of the German Constitution guarantees the right of each person to freely express and disseminate their opinions in speech, writing, and pictures and to inform themselves without hindrance from generally accessible sources, such a right must be activated by citizens to be meaningful, effective and transformative.

To confront the new powers of surveillance we need to think broadly about building **zones of autonomy**: autonomy of the individual, autonomy for communities, autonomy for society. The principle of autonomy translates the ideal of privacy into **concrete goals** grounded in human rights.

Privacy and autonomy are **essential components** of a functional and vibrant democracy; **without them critical citizenship is not possible**. A library could be an autonomous zone proper, librarians its caretakers. We need to **create and re-imagine public institutions** to serve this purpose in the digital age, to make information **widely accessible**, truly **common** and **operative**.

Permutation vs. "Critical Theory" Alt

Critical theory divorced from <u>policy proposals</u> fails *in the context of surveillance*. <u>Perm best.</u>

Cohen 15 — Julie E. Cohen, Mark Claster Mamolen Professor of Law and Technology at the Georgetown University Law Center, Member of the Advisory Board of the Electronic Privacy Information Center, holds a J.D. from Harvard University, 2015 ("Studying Law Studying Surveillance," *Surveillance & Society*, Volume 13, Issue 1, Available Online at http://library.queensu.ca/ojs/index.php/surveillance-and-society/article/viewFile/law/lawsurv, Accessed 07-21-2015, p. 96-97)

Surveillance Studies and Law

<u>Relative to legal scholarship, work in</u> ==Surveillance Studies== <u>is more likely to build from a</u> solid <u>foundation in</u> contemporary social <u>theory.</u> Even so, <u>such</u> ==work often reflects== both an ==**insufficient grasp of the complexity**== of the legal system in action ==and lack of interest in== the ==ways== that ==legal== and regulatory ==actors understand, conduct, and contest surveillance==. By this I don't mean to suggest that Surveillance Studies scholars need law degrees, but only to point out what ought to be obvious but often isn't: legal processes are social processes, too, and <u>in overlooking these processes, Surveillance Studies</u> ==scholars== also ==engage in== a form of ==**black-boxing**== that treats law as monolithic and surveillance and government as== ==interchangeable==. Legal actors engage in a variety of discursive and normative strategies by which institutions and resources are mobilized around surveillance, and understanding those strategies is essential to the development of an archaeology of surveillance practices. Work in ==Surveillance Studies== also ==favors== a type of ==theoretical jargon that can seem **impenetrable and**==, more importantly, ==**unrewarding** to== those in ==law and policy communities==. As I've written elsewhere (Cohen 2012a: 29), "==[t]oo many== such ==works== find power everywhere and hope nowhere, and seem to ==offer== well-meaning policy makers little more than **a prescription for despair**==." Returning to the topics already discussed, let us consider some ways in which Surveillance Studies might benefit from dialogue with law.

Let us return first to the problem of digitally-enhanced surveillance by law enforcement—the problem of the high-resolution mosaic. As discussed in the section above, <u>works by Surveillance Studies scholars</u> exploring issues of mobility and control <u>offer profound insights into the ways in which continual observation shapes spaces and subjectivities</u>—the precise questions about which, as we have already seen, [end page 96] judges and legal scholars alike are skeptical. Such works reveal the extent to which pervasive surveillance of public spaces is emerging as a new and powerful mode of ordering the public and social life of civil society. ==They offer rich food for thought—**but not for action**==. Networked surveillance is increasingly a fact of contemporary public life, and totalizing theories about its power don't take us very far toward gaining regulatory traction on it. That enterprise is, moreover, essential even if it entails an inevitable quantum of self-delusion. Acknowledgment of pervasive social shaping by networked surveillance need not preclude legal protection for socially-shaped subjects, but that project requires attention to detail. To put the point a different way, <u>the networked democratic society and the totalitarian state may be points on a continuum rather than binary opposites, but the fact that the continuum exists is still worth something.</u> If so, ==one needs tools== for assessment and differentiation that ==Surveillance Studies does not== seem to ==provide==.

<u>As an example of this</u> sort of <u>approach within legal scholarship,</u> ==consider a recent article by== legal scholars Danielle ==Citron and== David ==Gray== (2013), ==which proposes== that courts and legislators undertake what they

term <mark>a technology-centered approach</mark> to regulating surveillance. They would have courts and legislators ask whether particular technologies facilitate total surveillance and, if so, act to put in place comprehensive procedures for approving and overseeing their use. <mark>From a Surveillance Studies perspective, this</mark> approach **lacks theoretical purity** <mark>because its</mark> technology-specific <mark>focus appears to ignore</mark> the fact <mark>that</mark> total <mark>surveillance</mark> also <mark>can emerge via</mark> the <mark>fusion of data streams</mark> originating from various sources. <mark>But the proposal is</mark> **pragmatic**; it does not so much **ignore** that risk as **bracket it while pursuing the narrower goal** of gaining a regulatory foothold within the data streams. And because it focuses on the data streams themselves, it is administrable in a way that schemes based on linear timelines and artificial distinctions between different types of surveillance are not. <mark>One can envision</mark> both <mark>courts and legislatures</mark> **implementing** the Citron and Gray <mark>proposal in a way that enables far better oversight</mark> of what law enforcement is doing.

Critical surveillance theory must be implemented via <u>policy levers</u>. Abstract Ks of "reform" don't apply in this context. <u>Perm</u> best.

Cohen 15 — Julie E. Cohen, Mark Claster Mamolen Professor of Law and Technology at the Georgetown University Law Center, Member of the Advisory Board of the Electronic Privacy Information Center, holds a J.D. from Harvard University, 2015 ("Studying Law Studying Surveillance," *Surveillance & Society*, Volume 13, Issue 1, Available Online at http://library.queensu.ca/ojs/index.php/surveillance-and-society/article/viewFile/law/lawsurv, Accessed 07-21-2015, p. 99)

Conclusion: Doing Law-and-Surveillance-Studies Differently

The prospects for fruitful interchange and collaboration between legal scholars and Surveillance Studies scholars are likely to remain complicated by pronounced differences in underlying theoretical orientation. But since Surveillance Studies is itself an interdiscipline (Garber 2001), and since legal scholarship has thrived on interdisciplinary exploration, the prospects for effective communication also seem reasonably good. <mark>Bridging</mark> the <mark>gaps requires</mark>, first and foremost, efforts by emissaries from both traditions to foster a more tolerant and curious dialogue directed toward improved understanding and, ultimately, toward **methodological hybridization**. Within one's own academic community, it can become too easy to mistake consensus on methodological conventions for epistemological rigor, and to forget that <mark>methodological strength</mark> also <mark>derives from refusal to be</mark> **hemmed in** by disciplinary <mark>boundaries</mark>.

From the standpoint of theory, <mark>a more sustained</mark> <mark>dialogue between law and Surveillance Studies would count as</mark> a <mark>success if it</mark> produced a mode of inquiry about surveillance that <mark>melded</mark> the <mark>theoretical sophistication</mark> of Surveillance Studies <mark>with lawyerly attention to</mark> the **details**, **mechanisms**, and interests that constitute surveillance practices as legal practices, <mark>and to</mark> the <mark>kinds of framing that</mark> **mobilize legal and policy communities**. To do Surveillance Studies better, legal scholars need to challenge their own preference for putting problems in categories that fit neatly within the liberal model of human nature and behavior, and Surveillance Studies scholars can help by calling attention to the social and cultural processes within which surveillance practices are embedded. Surveillance Studies scholars need to do more to resist their own penchant for totalizing dystopian narratives, and should delve more deeply into the legal and regulatory realpolitik that surrounds the administration of surveillance systems; legal scholars can help by demystifying legal and regulatory processes.

From a legal scholar's perspective, however, theory achieves its highest value when it becomes a tool for forcing **productive confrontations** about how to respond to **real problems**. And so I think it would count as an even bigger success if dialogue between law and Surveillance Studies generated not only a hybridized theoretical discourse of law-and-Surveillance-Studies but also the beginnings of **a more accessible policy discourse about surveillance and privacy**, along with **reform proposals** designed to put the animating concepts behind such a discourse into practice. Here the goal would be a hybridization between law's ingrained pragmatism and Surveillance Studies' attentiveness to the social and cultural processes through which surveillance is experienced and assimilated. Working together, legal scholars and Surveillance Studies scholars might advance the project of formulating working definitions of privacy interests and harms, and might develop **more sophisticated projections** of the likely effects of **different policy levers** that could be brought to bear on systems of surveillance.

Permutation vs. "Why Try?" Alt

Even if they're right _generally_, students are <u>powerful agents</u> in the context of <u>surveillance policy</u>. <u>Perm</u> best.

Glaser 14 — April Glaser, Staff Activist at the Electronic Frontier Foundation, 2014 ("17 Student Groups Pen Open Letters on the Toxicity of Mass Surveillance to Academic Freedom," Electronic Frontier Foundation, June 9th, Available Online at https://www.eff.org/deeplinks/2014/06/students-against-surveillance-17-university-groups-pen-open-letters-toxicity-mass, Accessed 07-23-2015)

<u>Students are **rising up and fighting** to protect our Internet</u>. In response to our call to action, <u>seventeen university groups</u> from across the United States <u>have published open letters about the</u> real <u>chilling effects mass surveillance is having</u> right now <u>on academic freedom</u> and life on campus.

<u>Universities are places where</u> the free flow of <u>new ideas and</u> the <u>discussion of controversial topics should be **fostered, encouraged, and amplified**</u>. <u>But when</u> students and researchers know that the <u>government is recording</u> our communications, <u>our data</u>, and our online behavior, <u>students **can't speak freely**</u>. <u>Speech is **chilled**</u>. In response, we launched our call for students across the country to write letters about the effects of illegal, unconstitutional government spying in their campus communities last month.

<u>Students and researchers get it</u>. "<u>Mass warrantless surveillance by</u> the <u>NSA has restricted our ability to freely **think**, **act**, **research**, **innovate**, and **share ideas**</u> in a multitude of ways," reads the letter from Stanford University students penned by student Devon Kristine Zuegel.

<u>Students have been **central to the movement** to</u> put an <u>end</u> to illegal <u>mass spying</u> since Snowden's leaks hit the press</u>. As the letter from Temple University students notes, it was Temple student Ali Watkins, who broke the story last March about CIA surveillance of members of the Senate Intelligence Committee.

The campus letters also call attention to the effects of mass government surveillance on international students and global collaboration in research. These international connections are a bragging point of many academic institutions. But as the letters from Purdue University students and Queens College students note, "NSA surveillance specifically targets foreign nationals, regardless of whether they have actually done anything wrong."

Both of these institutions are highly ranked, in part for their diverse, international student communities. And student activists on both campuses point out that mass government spying that targets non-US persons is not only discriminatory, but stifles student cross-cultural collaboration, especially on politically sensitive topics.

"Certain demographics of students, such as the LGBTQ community that remain closeted, could be made public," wrote Liz Hawkins in the letter she composed from the University of Nevada in Las Vegas. "This also includes students in [search] of mental health care," the UNLV student letter continues. And she's right.

<u>Students often come to universities excited to explore their identity and find community that might not have been available back home. But when we know that the government is collecting information and</u>

storing it in a way that could be potentially used against us, we don't say what we would say otherwise. Students are less likely to associate with campus groups and less likely to engage fully in campus life.

Our call to write letters was assisted by the organizing prowess of the Student Net Alliance (SNA), a group dedicated to bringing the fight for digital rights into campus communities all over the world. The SNA amplified the call to action into a campaign called Students Against Surveillance. And we're glad they did. Students are **powerful forces for change**, and intuitively understand the potential of an open, free Internet, not hampered by intrusive government spying that undermines our basic rights, like our freedom of speech and freedom from unwarranted search and seizure.

If you're a student or a researcher and want to write an open letter to take a stand against NSA surveillance on your campus, see our letter-writing guide and get in touch with either the Student Net Alliance or with us. Writing a letter is a great way to spark debate on campus and build the foundation for future organizing. The fight against NSA spying is going to be a long one. And students will be **a critical force** in building a movement to **raise awareness, push for change**, and **put an end to mass government surveillance**.

FW: Public Debate on Surveillance Good

Public Debate Works

Public Debate is influential in enacting real change with USFG surveillance policy

Michael **Mimoso** 20**14**, is the former Editorial Director of TechTarget's Security media group and former editor of Information Security magazine. He is an award-winning journalist and former Editor of Information Security magazine, a two-time finalist for national magazine of the year. He has been writing for business-to-business IT websites and magazines for over 10 years, with a primary focus on information security, "NSA Reforms present value of Public Debate", https://threatpost.com/nsa-reforms-demonstrate-value-of-public-debate/105052

Two nights ago, the *New York Times* reported that President Obama responded to those calls and would soon reveal a new legislative proposal that would end the agency's bulk collection of phone call records. While shy on many important details, the move demonstrates that **public debate still holds some sway with policy makers**. "The only [turning point] was disclosure of the program," said Brett Max Kaufman, National Security Fellow and attorney with the American Civil Liberties Union. "Since that day, this has almost been inevitable because the claims the government made in secret to FISC [Foreign Intelligence Surveillance Court] and to Congress were never given a fair hearing from the other side. Once these programs became public and the government had to defend them in a court of law and in the court of public opinion, it was clear that these claims made in secret could not withstand arguments from civil libertarians and the public at large." While the president's proposal carries the weight of the White House, it addresses only the NSA's collection of phone metadata, and none of the other alleged surveillance activities made public by the Snowden documents. Other bills, such as the USA FREEDOM Act, extend beyond phone records to digital information collected through what's known as the PRISM program under section 702 of the Foreign Intelligence Surveillance Act (FISA) and provide for enhanced oversight over intelligence gathering.

The time is now for surveillance debates, with disclosures on government procedures debate is key to maintain public security and freedom

Gigi **Alford and** Llana **Ulman** 20**13**, Senior Program Officer and Advisor at the Freedom House, Human Rights Organization, "Private Data, Secret Surveillance, and the Need for Public Debate", https://freedomhouse.org/blog/private-data-secret-surveillance-and-need-public-debate#.VbuO2PlVikp

It is time for a serious, open, and public debate on government surveillance that goes beyond pat assurances and partial revelations. The only way for this debate to lead to transparent and effective lawmaking is for the U.S. government to officially disclose to the public the existing laws and procedures surrounding its surveillance programs. A free country does not need to become a surveillance state to maintain public safety and carry out legitimate investigations of criminals online. President Obama and Congress must take a principled stand and heed public calls for a frank and unfettered conversation about what has happened and how to move forward.

Public Surveillance Debate answers SO many questions on government policy regarding liberty, transparency, and law

David **Shipler** June 17th, 20**13**, Graduate of Dartmouth college, Former fellow at the Brookings Institute, Author of latest books are two companion volumes on civil liberties, The Rights of the People: How Our Search for Safety Invades Our Liberties and Rights at Risk: The Limits of Liberty in Modern America, winner of the Pullitzer, "It's Time for a 21st Century Debate on Privacy and Surveillance", http://www.thenation.com/article/its-time-21st-century-debate-privacy-and-surveillance/

If this sounds absurd, we can hope that today's arguments on the forfeiture of privacy in a digital age will someday sound equally ridiculous. The telephone was still a relatively new technology in 1928, as cellphones and the Internet are today, and the law had not yet adjusted to its use. It took thirty-nine years for the Supreme Court to catch up with the times and reverse Olmstead. In Katz v. United States, the Court devised a new test to determine the Fourth Amendment's jurisdiction—"first that a person have exhibited an actual (subjective) expectation of privacy and, second, that the expectation be one that society is prepared to recognize as 'reasonable,'" as Justice John Marshall Harlan wrote in a concurring opinion. Thereafter, wiretaps required warrants. So it may eventually be for the massive collection of cellphone locations, numbers called and received and e-mail addresses (including subject lines)—all of which the National Security Agency has been sweeping up in an effort to map interconnections among the suspicious and the innocent alike—just in case. This "metadata," as it's called, may actually provide a more complete picture of a person's private life than the transcripts of a few phone conversations. President Obama dismissed the collection as a minor intrusion, but it's worth recalling the words of the federal appeals court in the District of Columbia, which was upheld by the Supreme Court in ruling that police had to get a warrant before attaching a GPS device to a vehicle. "A person who knows all of another's travels," the appeals court observed, "can deduce whether he is a weekly church goer, a heavy drinker, a regular at the gym, an unfaithful husband, an outpatient receiving medical treatment, an associate of particular individuals or political groups—and not just one such fact about a person, but all such facts." Indeed, in 2011, Democratic Senator Ron Wyden of Oregon rose on the Senate floor to denounce the NSA's collection, which he could not describe because it was classified, by insisting that "when the American people find out how their government has secretly

interpreted the Patriot Act, they will be stunned and they will be angry." Judging by the polls and the debate, it seems that he overestimated the American people. The future judgment about the program—both its constitutionality and cultural acceptance—will turn on how the "expectation of privacy" is defined, for that remains the main test of where the Fourth Amendment's protection begins and ends. The boundaries of privacy have grown very blurry in an age when we practically disrobe at airports, share our inner torments on Facebook and Twitter, don't mind advertisers' following us from website to website and happily allow weather and traffic apps to know where we are at all times. So how do we draw the line between what we want known and what we don't, or whom we want to know it? Is there a difference between giving information to our bank and to the FBI? Between Verizon and the National Security Agency? And if so, what firewalls should be placed between them? What tests should government have to meet to obtain and use information that we find convenient to provide to third parties?

Surveillance Education Key

Surveillance directly affects "all of us", not just one person, debate is key to prove that curtailment is needed and to bring issues to light

Virginia **Eubanks** January 15th, 20**15**, author of Digital Dead End: Fighting for Social Justice in the Information Age and co-editor with Alethia Jones and Barbara Smith of Ain't Gonna Let Nobody Turn Me Around: Forty Years of Movement Building with Barbara Smith. She teaches in the Department of Women's, Gender and Sexuality Studies at the University at Albany, SUNY, and is a fellow at the Rockefeller Institute of Government, "Want to Predict the Future of Surveillance? Ask Poor Communities", http://prospect.org/article/want-predict-future-surveillance-ask-poor-communities

Counterintuitive as it may seem, we are targeted for digital surveillance as groups and communities, not as individuals. Big Brother is watching us, not you. The NSA looks for what they call a "pattern of life," homing in on networks of people associated with a target. But networks of association are not random, and who we know online is affected by offline forms of residential, educational, and occupational segregation. This year, for example, UC San Diego sociologist Kevin Lewis found that online dating leads to fewer interracial connections, compared to offline ways of meeting. Pepper Miller has reported that sometimes, African Americans will temporarily block white Facebook friends so that they can have "open, honest discussions" about race with black friends. Because of the persistence of segregation in our offline and online lives, algorithms and search strings that filter big data looking for patterns, that begin as neutral code, nevertheless end up producing race, class, and gender-specific results. Groups of "like" subjects are then targeted for different, and often unequal, forms of supervision, discipline and surveillance, with marginalized communities singled out for more aggressive scrutiny. Welfare recipients like Dorothy are more vulnerable to surveillance because they are members of a group that is seen as an appropriate target for intrusive programs. Persistent stereotypes of poor women, especially women of color, as inherently suspicious, fraudulent, and wasteful provide ideological support for invasive welfare programs that track their financial and social behavior. Immigrant communities are more likely to be the site of biometric data collection than native-born communities because they have less political power to resist it. As panicked as mainstream America is about the government collecting cellphone meta-data, imagine the hue and cry if police officers scanned the fingerprints of white, middle-class Americans on the street, as has happened to day laborers in Los Angeles, according to the Electronic Frontier Foundation. Marginalized people are in the dubious position of being both on the cutting edge of surveillance, and stuck in its backwaters. Some forms of surveillance, like filmed police interrogations, are undoubtedly positive for poor and working-class communities and racial minorities. But marginalized people are subject to some of the most technologically sophisticated and comprehensive forms of scrutiny and observation in law enforcement, the welfare system, and the low-wage workplace. They also endure higher levels of direct forms of surveillance, such as stop-and-frisk in New York City. The practice of surveillance is both separate and unequal. Acknowledging this reality allows us to challenge mass surveillance based on the 14th Amendment, which provides for equal protection under the law, not just on the 4th Amendment, which protects citizens against unwarranted search and seizure. Surveillance should be seen as a collective issue, a civil rights issue, not just an invasion of privacy.

Surveillance debates are key to discuss not only privacy but also human rights as a whole

Virginia **Eubanks** January 15th, 20**15**, author of Digital Dead End: Fighting for Social Justice in the Information Age and co-editor with Alethia Jones and Barbara Smith of Ain't Gonna Let Nobody Turn Me Around: Forty Years of Movement Building with Barbara Smith. She teaches in the Department of Women's, Gender and Sexuality Studies at the University at Albany, SUNY, and is a fellow at the Rockefeller Institute of Government, "Want to Predict the Future of Surveillance? Ask Poor Communities", http://prospect.org/article/want-predict-future-surveillance-ask-poor-communities

In his Christmas Day address on the U.K.'s Channel 4, Edward Snowden trotted out the hoary old clichés about George Orwell, Big Brother, and the end of privacy. But for most people, privacy is a pipedream. Living in dense urban neighborhoods, public housing, favellas, prisons, or subject to home visits by caseworkers, poor and working people might wish for more personal space, but they don't make Snowden's mistake of assuming that privacy is "what allows us to determine who we are and who we want to be." We need to move away our fixation on privacy and towards a future based on digital human rights. We can take some cues from Brazil, which is currently creating a collaborative, multi-stakeholder "Internet Constitution," the Marco Civil da Internet. The Marco connects digital communication to deeply held democratic values: internationalism, active citizenship, access to information, freedom of expression, democratic governance, civic participation, multilateralism, inclusivity and non-discrimination, plurality, cultural diversity, freedom of speech. The Marco also addresses network neutrality, personal data protection, and, yes, even privacy. But it is not the central issue. Seeing privacy as the cornerstone for democracy is a kind of naiveté we can no longer excuse nor afford. We should care when national governments engage in surveillance of any kind, not just when they spy on us. Shock and outrage are callow luxuries, and the Snowden leaks eliminated our last justification for ignorance. Software designed for authoritarian political aims spawns repressive political environments wherever it is used. Systems tested in low rights environments will, as Dorothy informed me a decade ago, eventually be used on everyone.

We must discuss curtailing surveillance, and "pay attention" to the increasing surveillance occurring now

Virginia **Eubanks** January 15th, 20**15**, author of Digital Dead End: Fighting for Social Justice in the Information Age and co-editor with Alethia Jones and Barbara Smith of Ain't Gonna Let Nobody Turn Me Around: Forty Years of Movement Building with Barbara Smith. She teaches in the Department of Women's, Gender and Sexuality Studies at the University at Albany, SUNY, and is a fellow at the Rockefeller Institute of Government, "Want to Predict the Future of Surveillance? Ask Poor Communities", http://prospect.org/article/want-predict-future-surveillance-ask-poor-communities

Since Edward Snowden started disclosing millions of classified NSA documents in June, terms like metadata, software backdoors, and cybervulnerability have appeared regularly in headlines and sound bites. Many Americans were astonished when these stories broke. In blogs, comment sections, and op-ed pages, they expressed disbelief and outrage. But I wasn't surprised. A decade ago, I sat talking to a young mother on welfare about her experiences with technology. When our conversation turned to Electronic Benefit Transfer cards (EBT), Dorothy* said, "They're great. Except [Social Services] uses them as a tracking device." I must have looked shocked, because she explained that her caseworker routinely looked at her EBT purchase records. Poor women are the test subjects for surveillance technology,

Dorothy told me ruefully, and you should pay attention to what happens to us. You're next. Poor and working-class Americans already live in the surveillance future. The revelations that are so scandalous to the middle-class data profiling, PRISM, tapped cellphones–are old news to millions of low-income Americans, immigrants, and communities of color. To be smart about surveillance in the New Year, we must learn from the experiences of marginalized people in the U.S. and in developing countries the world over. Here are four lessons we might learn if we do.

We have a unique opportunity to debate surveillance in a democratic setting which is necessary to discuss our civil liberties and privacy rights

David **Madine** March 31st, 20**15**, Writer at The Hill, The Hill, premier source for policy and political coverage, reporting on every aspect of the business of Washington and the campaign trail, "Window to debate surveillance policy is closing", http://thehill.com/blogs/congress-blog/civil-rights/237407-window-to-debate-surveillance-policy-is-closing

Third, Congress could hastily pass a bill to reform or replace Section 215. Without a robust drafting process and public debate, this sort of legislation, would likely have legal and practical implications that neither Congress nor the public would fully understand until they were too late to fix. Experience with Section 215 tells us that when Congress legislates in the dark, bad policy follows. If Congress acts now, the American people and their representatives can undertake the public debate that is necessary to craft a new and sensible law that ends the telephony metadata bulk collection program but permits the government to collect the same information – but on a case-by-case basis from the telephone companies – with far less infringement of privacy and civil liberties. It would be a shame for Congress to squander the opportunity to apply a strong dose of democracy to our country's surveillance efforts.

Debate key to Deter Surveillance

This debate round is a form of resistance calling for a decrease in oppressive government surveillance

Virginia **Eubanks** January 15th, 20**15**, author of Digital Dead End: Fighting for Social Justice in the Information Age and co-editor with Alethia Jones and Barbara Smith of Ain't Gonna Let Nobody Turn Me Around: Forty Years of Movement Building with Barbara Smith. She teaches in the Department of Women's, Gender and Sexuality Studies at the University at Albany, SUNY, and is a fellow at the Rockefeller Institute of Government, "Want to Predict the Future of Surveillance? Ask Poor Communities", http://prospect.org/article/want-predict-future-surveillance-ask-poor-communities

Resistance to surveillance is as common as surveillance itself. "There is always a cross-section of the population working to trick the system," explains John Gilliom, co-author of *SuperVision: An Introduction to the Surveillance*. "Whether it's a college kid getting a fake ID, or the middle class family hiding a little bit of cash income to lower its tax bill, or the food-stamp recipient hiding an extra roommate. We often call this fraud or cheating, but something this widespread is more than misbehavior. It is resistance."

"Data is the new oil. Beyond collecting information, it also means gathering power," argues Joana Varon Ferraz, researcher from the Center of Technology and Society at Fundação Getúlio Vargas in Rio de Janeiro, Brazil, "Every government has become dataholic." Dataholic political and commercial systems foster defiance. We don't necessarily resist because we've done something wrong. We resist because surveillance is not just about privacy; it is about power, control, self-determination and autonomy.

If people remain concerned about the impact of surveillance on their lives they may voluntarily withdraw from the digital world. Gilliom suggests we might even see "a hipster social trend where disengagement becomes a form of cache." But digital disconnection can simply be an excuse for maintaining ignorance; many people don't have the option to disengage. For example, public assistance applicants must sign a personal information disclosure statement to permit social services to share their social security number, criminal history, personal, financial, medical and family information with other public agencies and private companies. Technically, you can refuse to sign and withhold your social security number. But if you do not sign, you cannot access food stamps, transportation vouchers, cash assistance, childcare, emergency housing assistance, and other basic necessities for survival, or even talk to a caseworker about available community resources.

There are alternatives to disengagement. Brazil and Germany introduced a joint resolution to the UN condemning the member countries of what is unofficially known as the Five Eyes Alliance—the U.S., U.K., New Zealand, Canada, and Australia—for massive electronic surveillance and infringement of human rights. The EU is developing a General Data Protection Regulation that would unify data protection under a single European law. The BRICS cable, a 21,000 mile, 12.8 Terabyte per second fiber system connecting Brazil, Russia, India, China, South Africa, and Miami—is creating an alternative data pipeline to lower the cost of communication among major economies of the global south and provide non-U.S. routes for world communications.

Answers to the dilemmas we face in the surveillance society are not likely to come from Silicon Valley or Washington. This year, the Obama administration was put in the position of defending the National Security Administration's snooping while stumping for a Consumer Privacy Bill of Rights that boosts security for online shoppers. It is still unclear how President Obama will respond to his Review Group on

Intelligence and Communications Technologies' report calling to terminate the storage of bulk data collected under the Foreign Intelligence Surveillance Act.

We need Debates about Government surveillance because they are necessary to address concerns about current and future uses of surveillance technology

Doug **Mataconis**, April 20**13**, B.A. in Political Science from Rutgers University and J.D. from George Mason University School of Law, http://www.outsidethebeltway.com/a-camera-on-every-corner-the-surveillance-debate-after-boston/

Additionally, it's important to note that there are virtually no Constitutional issues raised by the use of surveillance cameras in public places, whether they are maintained by the government or by private entities (although private entities are not covered by the Bill of Rights). Courts have long held that there is no reasonable expectation of privacy in a public place, which makes sense when you think about it. If a police officer observes you committing a crime in public, they have a right to arrest you on the spot so it makes sense that video evidence of that crime captured by a surveillance camera would be accepted as evidence in court, so long as the cameras proper operation and related matters are sufficiently established in court. The concern about surveillance cameras, though, isn't so much about the fact that they exist, there's nothing we can do about that now, or the way they are used in cases such as the one now pending in Boston where they are used to crack cases, it's about how they are used or may be used in the future. For example, as the linked article notes there are about 150 cameras operated by government authorities in Boston, by contrast there are more than 3,000 such cameras in New York City, most of them in the downtown/midtown area of Manhattan where attacks are believed to be most likely. According to some reports, many of those cameras are part of a system that is so advanced that it can detect when someone in Times Square leaves a package unattended and walks away and independently notifies law enforcement of the potential threat. Admittedly, that's actually a very useful piece of technology if the reports are true. However, the question that remains unanswered is what else these cameras can do. Can they track individual people as they go about their day in public, for example? Have they ever been used for that purpose outside of the context of a specific criminal investigation? And, most importantly, how will this technology be used in the future when things like facial recognition technology become far more accurate? As I said above, there aren't any specific Constitutional issues that are raised by the presence of surveillance cameras, be they public or private. However, **the uses that** this **technology could be put to in the future should raise concern**s for all of us. There was a time when one could walk the streets of a major American city with some degree of anonymity. Those times are vanishing quickly, and I'm not sure that's a good thing.

Discussion is needed to decide whether or not the USFG's surveillance programs are intrusive or useful

Rebecca **Shabad** 20**13**, The Hill, premier source for policy and political coverage, reporting on every aspect of the business of Washington and the campaign trail, "Hillary Clinton urges a 'comprehensive discussion' about NSA surveillance", http://thehill.com/policy/technology/188130-hillary-clinton-urges-comprehensive-discussion-about-nsa

Hillary Clinton says the U.S. government needs to have a 'comprehensive discussion' about the scope of the National Security Agency's surveillance program. "Trying to go up to the line of what is appropriate surveillance and security measures, and not over the line is something we need to have a full comprehensive discussion about," the former secretary of state said at Colgate University in Upstate New York Friday evening. Her comments come at the end of a week consumed in reports claiming the NSA spied on American allies abroad. Stories largely based on documents NSA leaker Edward Snowden provided to journalists said the U.S. has monitored phone calls of French citizens and may have tapped German Chancellor Angela Merkel's cell phone. The White House, however, denied the report regarding France and said the U.S. isn't and will not monitor Merkel's communications. Officials did not say whether such activity previously happened. "I think people have a right to complain if they've gone over the line," Clinton said, while adding NSA's activities have proven useful in intelligence gathering. The public should have the right to know about those operations, she said, but she also warned the U.S. doesn't want to reveal enough that would alert its enemies. "I think everybody now says, 'We have to make sure we're not going too far,' and that's a discussion that has to happen in a calm atmosphere," she said. In addition to Clinton's Colgate lecture, she recently spoke at the University of Buffalo this week, and at Hamilton College—both of which are also based in Upstate New York.

Debates on surveillance are needed to grasp the concepts of whether or not the Federal government is correct, and to understand the meaning of privacy in our age
Washington University 20**13,** University in St. Louis, Privacy and Surveillance' roundtable discussion to address history, meaning of privacy, http://news.wustl.edu/news/Pages/26147.aspx

When former National Security Agency contractor Edward Snowden exposed classified information about widespread government surveillance programs, he launched a public debate about privacy in the digital age. Is privacy a "right"? What are we willing to sacrifice for privacy? How consistent are our beliefs about privacy and how consistently do we "practice" it. In response to these types of questions, Washington University in St. Louis **experts on privacy issues, ranging from the history of privacy to privacy law, will participate in a roundtable discussion**, titled "Privacy and Surveillance," from noon to 2 p.m. Wednesday, Nov. 20, in Anheuser-Busch Hall, Bryan Cave Moot Courtroom. The Interdisciplinary Project in the Humanities (IPH) in Arts & Sciences and Arts & Sciences are co-sponsoring the discussion, which is free and open to the public. Joe Loewenstein, PhD, director of IPH and professor of English, believes the humanities are especially suited to address the complex issues surrounding privacy and surveillance. "The humanities have a real grip on what's vivid and, well, dangerous in life around us; privacy is very much our topic," Loewenstein said. "This discussion is a good opportunity to remind the St. Louis community, our university colleagues, and, especially, our students that there's a long history of meditation on privacy, that the tradition of thinking on this topic is long, volatile and complicated." The discussion will begin with the political and theoretical beginnings of thinking about privacy and move to contemporary questions surrounding Internet surveillance. In addition to discussing the negative aspects of privacy violation, experts will offer perspectives on the potential benefits of surveillance. For example, faculty will describe literary studies suggesting that repressive situations often spur rather than inhibit creativity. Other topics to be discussed include feminist critiques of certain types of privacy and the ethics of scholarship. "I think it's important that serious intellectual communities like ours should not treat a complex concept like privacy as simple or stable. We can't assume that when I speak of privacy, what you hear is what I mean. Above all, we need to recognize that

privacy is not an unmitigated and simple good," Lowenstein said. "One of the pleasures of being at a university is that we don't have to deal in sound bites."

Surveillance Debates are needed to address the effects that government surveillance has on everyday life, public space and to be educated on that

Jason W. **Patton 2000**, Department of Science and Technology Studies, Rensselaer Polytechnic Institute, "Protecting privacy in public? Surveillance technologies and the value of public places", http://www.its.ohiou.edu/bernt/ITS351/protecting%20privacy%20in%20public%20spaces.pdf

While maintaining the importance of privacy for critical evaluations of surveillance technologies, I suggest that privacy also constrains the debate by framing analyses in terms of the individual. Public space provides a site for considering what is at stake with surveillance technologies besides privacy. After describing two accounts of privacy and one of public space, I argue that surveillance technologies simultaneously add an ambiguity and a specificity to public places that are detrimental to the social, cultural, and civic importance of these places. By making public places accessible to other places and/or times, surveillance technologies make these social contexts ambiguous by blurring their spatial and temporal bounds. At the same time, surveillance technologies valence public places in functionally specific ways that are detrimental to informal civic life. To complement defensive approaches to surveillance technologies based on individual privacy, I conclude by suggesting how sociality as a relational value or an ethics of place as a contextual value could provide a proactive line of reasoning for affirming the value of that which is between people and places.

With a changing world new debate is needed to determine how the government should honor citizens' constitutional rights, while still protecting the country

Gigi **Alford and** Llana **Ulman** 20**13**, Senior Program Officer and Advisor at the Freedom House, Human Rights Organization, "Private Data, Secret Surveillance, and the Need for Public Debate", https://freedomhouse.org/blog/private-data-secret-surveillance-and-need-public-debate#.VbuO2PlVikp

Almost as troubling as the recent revelations about the U.S. government's sweeping collection and analysis of the personal information of law-abiding internet and phone users are the inadequate "just trust us" response to the outrage and the administration's lack of decisive action to regain the faith of a tense American public and wary netizens abroad. Under the U.S. constitution, citizens are guaranteed protection from unreasonable searches and seizures by their government. Violent events, such as the Boston Marathon bombings, leave no question about the serious need for strong security measures. However, maintaining an appropriate balance between security and privacy requires constant public vigilance. Any state surveillance of personal communications is an intrusion into the private domain. While exceptional circumstances may render this intrusion necessary and justified, it is only permissible when associated with a targeted investigation, conducted according to a court-supervised and transparent process, and guided by fundamental human rights principles. Freedom House outlined its views on this subject last week in its oral statement at the UN Human Rights Council session on freedom

of expression. Unfortunately, it appears that the requirements for permissible surveillance were not met in the instances of secret U.S. court orders that have recently come to light—both the large-scale seizure of Verizon customers' metadata and the secret internet data collection operation code-named PRISM—which appear to involve incredibly broad data gathering and storage by the National Security Agency (NSA) and the Federal Bureau of Investigation (FBI). These examples raise concerns that current legal and judicial protections are no longer sufficient to prevent government spying from creeping into the private lives of law-abiding individuals. Technology has evolved significantly, with new applications and means of communication being developed on an almost daily basis, including new modalities for surveillance. These changes demand public debate and consensus on new limits and laws to prevent the abuse of novel technologies.

Strong debate is key to find the best solution in surveillance policy, and to determine the truth of government surveillance (spill the beans on the USFG policies)

Michael **Mimoso** 20**14**, is the former Editorial Director of TechTarget's Security media group and former editor of Information Security magazine. He is an award-winning journalist and former Editor of Information Security magazine, a two-time finalist for national magazine of the year. He has been writing for business-to-business IT websites and magazines for over 10 years, with a primary focus on information security, "NSA Reforms present value of Public Debate", https://threatpost.com/nsa-reforms-demonstrate-value-of-public-debate/105052

The Electronic Frontier Foundation, one of the most vocal advocacy groups opposing government surveillance of Americans, applauded the White House proposal yesterday, but endorsed the FREEDOM Act. The EFF called it "a giant step forward" and said it was a more favorable proposal than the president's or another introduced by the House Intelligence Committee yesterday. "Or better still, we urge the Administration to simply decide that it will stop misusing section 215 of the Patriot Act and section 702 of the FISA Amendments Act and Executive Order 12333 and whatever else it is secretly relying on to stop mass spying," said EFF legal director Cindy Cohn and EFF legislative analyst Mark M. Jaycox. "The executive branch does not need congressional approval to stop the spying; nothing Congress has done compels it to engage in bulk collection. It could simply issue a new Executive Order requiring the NSA to stop." The president's proposal would end the NSA's collection and storage of phone data; those records would remain with the providers and the NSA would require judicial permission under a new court order to access those records. The House bill, however, requires no prior judicial approval; a judge would rule on the request after the FBI submits it to the telecommunications company. "It's absolutely crucial to understand the details of how these things will work," the ACLU's Kaufman said in reference to the "new court order" mentioned in the New York Times report. "There is no substitute for robust Democratic debate in the court of public opinion and in the courts. The system of oversight is broke and issues like these need to be debated in public." Phone metadata and dragnet collection of digital data from Internet providers and other technology companies is supposed to be used to map connections between foreigners suspected of terrorism and threatening the national security of the U.S. The NSA's dragnet, however, also swept up communication involving Americans that is supposed to be collected and accessed only with a court order. The NSA stood by claims that the program was effective in stopping hundreds of terror plots against U.S. interests domestic and foreign. Those numbers, however, quickly were lowered as they were challenged by Congressional committees and public scrutiny. "The president said the effectiveness of this program was one of the reasons it was in place," Kaufman said. "But as soon as these claims were made public, journalists, advocates and the courts pushed back and it could not withstand the scrutiny. It's remarkable how quickly [the number of] plots turned into small numbers. The NSA was telling FISC the program was absolutely necessary to

national security, but the government would not go nearly that far in defending the program. That shows the value of public debate and an adversarial process in courts."

Debate is needed to reduce the large amount of abusive surveillance occurring in this country

Virginia **Eubanks** January 15th, 20**15**, author of Digital Dead End: Fighting for Social Justice in the Information Age and co-editor with Alethia Jones and Barbara Smith of Ain't Gonna Let Nobody Turn Me Around: Forty Years of Movement Building with Barbara Smith. She teaches in the Department of Women's, Gender and Sexuality Studies at the University at Albany, SUNY, and is a fellow at the Rockefeller Institute of Government, "Want to Predict the Future of Surveillance? Ask Poor Communities", http://prospect.org/article/want-predict-future-surveillance-ask-poor-communities

We can intuit the shape of surveillance-to-come by keeping an eye on developing countries, as well as exploring its impacts on marginalized communities here in the United States. The most sweeping digital surveillance technologies are designed and tested in what could be called "low rights environments"— poor communities, repressive social programs, dictatorial regimes, and military and intelligence operations—where there are low expectations of political accountability and transparency. Drones that deliver Hellfire missiles, Long Range Acoustic Devices (LRADs) that send pain-inducing tones over long distances, and stun cuffs that deliver 80,000 volts to detainees via remote control allow users to avoid direct responsibility for the human suffering they cause. Many of these technologies are first developed for the U.S. military to deploy in the global south, and later tested for civilian purposes on marginal communities in the United States. LRADs, for example, were developed by San Diego-based military contractor American Technology Corporation in response to the bombing of the USS Cole in Yemen in 2000, and then famously used to disburse G20 protestors in Pittsburgh in 2009. Technologies designed for the military carry expectations about the dangerousness of the public, and can be used over-aggressively in community policing and crowd control. To a technology designed for counter-terrorism, everyone looks like a bad guy. Then there is the digital side of things. "Law enforcement agencies, intelligence agencies, and militaries invest in Trojans, bad software, malicious network attacks and other things that we normally associate with heavy criminality," says Amelia Andersdotter, member of the European Parliament and the Swedish Pirate Party, which is dedicated to reforming copyright and patent laws. "No one is obliged to inform users of security flaws or to fix vulnerabilities." In fact, as the Guardian and The New York Times reported in September, the NSA spends $250 million a year to work with technology companies to make commercial software—including encryption software—more "exploitable." Insecure by design, this software is passed on to business and the public sector. A standard of design liability—already common for architects—might work to hold software producers accountable. Presently, we mandate penalties for vendors that fail to security test their software in the airline and shipping industries, but not in other crucial areas: healthcare, nuclear plants, electricity grids. Andersdotter suggests that design liability regulations could hold software companies liable for not disclosing security flaws, responsible for damages they cause, and obliged to help users fix problems. But this solution may pose more questions than it settles: Who will administer the standards if software vendors and national governments are already subverting data-security requirements? How much transparency is possible when data holdings are centralized by commercial entities like Google, or by state entities, as in Brazil's proposed national data centers?

The USFG is tracking your every movement, debate is needed to become aware of this and to deter surveillance of the future

Paul **Weldman** January 17th, 20**14**, is a weekly columnist and senior writer for The American Prospect. He also writes for the Plum Line blog at The Washington Post and The Week and is the author of Being Right is Not Enough: What Progressives Must Learn From Conservative Success, "The Surveillance State of Tomorrow", http://prospect.org/article/surveillance-state-tomorrow

By the time you read this, President Obama will probably have finished his speech outlining some changes to the NSA's global information vacuum. According to early reports, he'll propose creating an independent body to hold the phone metadata that the NSA gathers, and forcing the agency to get some kind of approval (presumably from the FISA court) before accessing it. Which is all fine and good. But the real question is whether we set up procedures and systems that constrain the NSA from doing not just what we already know about, but the things we haven't yet heard of, and even more importantly, the kinds of surveillance that will become possible in the future. Just today, we learned from the Guardian that "The National Security Agency has collected almost 200 million text messages a day from across the globe, using them to extract data including location, contact networks, and credit-card details, according to top-secret documents." I can't imagine that will be the last revelation from the documents obtained by Edward Snowden. Do you find that disturbing? If not, imagine what it's going to look like ten or twenty years from now.

Predicting the development of technology is often difficult to do accurately, but we can be almost positive that in the very near future there will dramatically more information about you being collected than there is today. Your phone metadata is nothing compared to what will be gathered. There will be reasonable justifications for every step along the way, of course, ways in which each new advancement in the technology enhances your life. For instance, eventually the idea of using a piece of metal with grooves cut into it in order to get into your house will seem like a quaint anachronism, and that will be more convenient, since you won't have to carry your keys anymore. Once you have some kind of biometric entry system, it will be linked to other systems in your home that will constantly be producing data about where you go and what you do. You think Google bought Nest because it's interested in temperature adjustment and smoke detection? Of course not. Google is interested in data, and data about what happens in your home—when you come and go, when you're awake and asleep, what kinds of energy you use—that's a growth area.

Your phone tracks your movements, and future phones will monitor much more. There's a network of surveillance technologies, including but not limited to security cameras, that grows more dense and sophisticated with each passing year. Law enforcement agencies across the country use license plate scanners that can monitor everyone who drives on certain roads. These kinds of technologies will be integrated with improved face-recognition software, all powered by increasingly capable computers with the capacity to store, sort, and analyze the huge quantities of data produced. If you want to live as a participant in the modern world—having a smartphone, using the Internet, going out in public—you are already being tracked, and tomorrow you'll be tracked more closely than you are today, your every step leaving bits of data that can be gathered together and reconstructed to learn more about you than you could possibly want corporations or the government to know. And make no mistake: the NSA wants every bit of it. There is no piece of surveillance data that couldn't at least potentially be used to catch a terrorist or stop a plot, so they'll always be able to say (with complete sincerity, by the way), that they

only want to protect national security, and the more information they have about all of us, the easier it will be. So making sure that some semblance of privacy is protected in the future will take a hell of a lot more than sectioning off cell phone metadata. That's a start. But it's only a start.
