Politics are good

We don't have to win that the political system is good – all relationships are contingent and exclusionary – we just have to win that 'the political' is an institution worth discussing. It is. **Mouffe 13** (Chantal Mouffe, Professor of Political Theory at the University of Westminster at the Centre for the Study of Democracy, She is in the departments of Social Sciences and Humanities, Politics and International Relations, and has research in the Centre for the Study of Democracy and the Institute for Modern and Contemporary Culture; "Agonistics: Thinking the World Politically"; eISBN: 978-1-78168-235-7; published by Verso 2013; v3.1)HB

The essays collected in this volume examine the relevance of the agonistic approach I have elaborated in my previous work for a series of issues that I take to be important to the left-wing project. Each chapter deals with a different question, but in each case my aim is to address the question in a political way. As Ernesto Laclau and I argued in *Hegemony and Socialist Strategy*, to think politically requires recognizing the ontological dimension of radical negativity.¹ It is because of the existence of a form of negativity that cannot be overcome dialectically that full objectivity can never be reached and that antagonism is an ever present possibility. Society is permeated by contingency and any order is of an hegemonic nature, i.e. it is always the expression of power relations. In the field of politics, this means that the search for a consensus without exclusion and the hope for a perfectly reconciled and harmonious society have to be abandoned. As a result, the emancipatory ideal cannot be formulated in terms of a realization of any form of 'communism'.

The reflections proposed here take their bearings from the critique of rationalism and universalism that I have developed [END PAGE xi] since *The Return of the Political*, where I began to elaborate a model of democracy which I call 'agonistic pluralism'.² In inscribing the dimension of radical negativity in the political domain, I proposed in that book to distinguish between 'the political' and 'politics'. By 'the political', I refer to the ontological dimension of antagonism, and by 'politics' I mean the ensemble of practices and institutions whose aim is to organize human coexistence. These practices, however, always operate within a terrain of conflictuality informed by 'the political'.

The key thesis of 'agonistic pluralism' was later elaborated in *The Democratic Paradox*, where I argued that a central task of democratic politics is to provide the institutions which will permit conflicts to take an 'agonistic' form, where the opponents are not enemies but adversaries among whom exists a conflictual consensus.³ What I intended to show with this agonistic model was that it was possible, even when starting with the assertion of the ineradicability of antagonism, to envisage a democratic order.

Nonetheless, it is true that political theories that affirm such a thesis usually end up defending an authoritarian order as the only way to keep civil war at bay. This is why most political theorists committed to democracy believe that they have to assert the availability of a rational solution to political conflicts. My argument, however, is that the authoritarian solution is not a necessary logical consequence of such an ontological postulate, and that by distinguishing between 'antagonism' and 'agonism', it is possible to visualize a form of democracy that does not deny radical negativity.

In recent years, reflecting on worldwide political [END PAGE xii] developments, I have been led to enquire about the possible implications of my approach for international relations. What are the consequences in the international arena of the thesis that every order is an hegemonic one? Does it mean that there is no alternative to the current unipolar world, with all the negative consequences this entails? Undoubtedly, the illusion of a cosmopolitan world beyond hegemony and beyond sovereignty has to be relinquished. But this is not the only solution available, as we can also conceive of another one: a pluralization of hegemonies. In my view, by establishing more equal

relations between regional poles, a multipolar approach could be a step towards an agonistic order where conflicts, although they would not disappear, would be less likely to take an antagonistic form.

Another aspect of my reflections concerns the consequences of the hegemonic approach regarding radical projects whose aim is to establish a different social and political order. How can such a new order be brought about? What strategy to follow?

The traditional revolutionary approach has mostly been forsaken, but it is increasingly replaced by another one that, under the name of 'exodus', reproduces, albeit in a different way, many of its shortcomings. In this book **I take issue with the total rejection of representative democracy by those who, instead of aiming at a transformation of the state through an agonistic hegemonic struggle, advocate a strategy of deserting political institutions. Their belief in the availability of an 'absolute democracy' where the multitude would be able to self-organize without any need of the state or political institutions signifies a lack of understanding of what I designate as 'the political'.**

To be sure, they question the thesis of a progressive homogenization of the 'people' under the category of 'the [END PAGE xiii] proletariat', while affirming the multiplicity of 'the multitude'. But to acknowledge radical negativity implies recognizing not only that the people is multiple, but that it is also divided. Such a division cannot be overcome; it can only be institutionalized in different ways, some more egalitarian than others. According to this approach, radical politics consists in a diversity of moves in a multiplicity of institutional terrains, so as to construct a different hegemony. It is a 'war of position' whose objective is not the creation of a society beyond hegemony, but a process of radicalizing democracy - the construction of more democratic, more egalitarian institutions.

We should engage in agnostic fights about politics -

Mouffe 13 (Chantal Mouffe, Professor of Political Theory at the University of Westminster at the Centre for the Study of Democracy, She is in the departments of Social Sciences and Humanities, Politics and International Relations, and has research in the Centre for the Study of Democracy and the Institute for Modern and Contemporary Culture; "Agonistics: Thinking the World Politically"; eISBN: 978-1-78168-235-7; published by Verso 2013; v3.1)HB

In *The Return of the Political*, *the Democratic Paradox* and *on the Political* I have developed these reflections on 'the political', understood as the antagonistic dimension which is inherent to all human societies.² To that effect, I have proposed the distinction between 'the political' and 'politics'. 'The political' refers to this dimension of antagonism which can take many forms and can emerge in diverse social relations. It is a dimension that can never be eradicated. 'Politics', on the other hand, refers to the ensemble of practices, discourses and institutions that seek to establish a certain order and to organize human coexistence in conditions which are always potentially conflicting, since they are affected by the dimension of 'the political'.

As I have repeatedly emphasized in my writings, political questions are not mere technical issues to be solved by experts. Proper political questions always involve decisions that require making a choice between conflicting alternatives. This is something that cannot be grasped by the dominant tendency in liberal thought, which is characterized by a rationalist and individualist approach. This is why liberalism is unable to adequately envisage the pluralistic nature of the social world, with the conflicts that pluralism entails. These are conflicts for which no rational solution could ever exist, hence the dimension of antagonism that characterizes human societies.

The typical understanding of pluralism is as follows: we live in a world in which there are indeed many perspectives and values, but due to empirical limitations, we will never be able to adopt them all; however, when put together, they could constitute an harmonious and non-conflictual ensemble. I have shown that this type of perspective, which is dominant in liberal political theory, has to negate the political in its antagonistic dimension in order to thrive. Indeed, one of the main tenets of this kind of liberalism is the rationalist belief in the availability of a universal consensus based on reason. No wonder, therefore, that the political constitutes liberalism's blind spot. By bringing to the fore the inescapable moment of decision – in a strong sense of having to decide within an undecidable terrain – what antagonism reveals is the very limit of any rational consensus.

The denial of 'the political' in its antagonistic dimension is, I have argued, what prevents liberal theory from envisaging politics in an adequate way. The political in its antagonistic dimension cannot be made to disappear by simply denying it or wishing it away. This is the typical liberal gesture, and such negation only leads to the impotence that characterizes liberal thought when confronted with the emergence of antagonisms and forms of violence that, according to its theory, belong to a bygone age when reason had not yet managed to control the supposedly archaic passions. This is at the root of liberalism's current incapacity to grasp the nature and causes of new antagonisms that have emerged since the Cold War.

Liberal thought is also blind to the political because of its individualism, which makes it unable to understand the formation of collective identities. Yet the political is from the outset concerned with collective forms of identification, since in this field we are always dealing with the formation of 'us' as opposed to 'them'. Here the main problem with the liberal rationalism is that it deploys a logic of social based on an essentialist conception of 'being as presence', and that it conceives objectivity as being inherent to things themselves. It cannot recognize that there can only be an identity when it is constructed as difference, and that any social objectivity is constituted through acts of power. What it refuses to admit is that any form of social objectivity is ultimately political and that it must bear the traces of the acts of exclusion that govern its constitution.

Limits Good

Substantive and demarcated limits are necessary for dialogue – EVEN IF THEY EXCLUDE and probably because they exclude – refusal to make identity claims normative kills the possibility for discussion.

John **Dryzek 06**, Professor of Social and Political Theory, The Australian National University, Reconciling Pluralism and Consensus as Political Ideals, American Journal of Political Science, Vol. 50, No. 3, July 2006, Pp. 634–649

A more radical contemporary pluralism is suspicious of liberal and communitarian devices for reconciling difference. Such a critical pluralism is associated with agonists such as Connolly (1991), Honig (1993), and Mouffe (2000), and difference democrats such as Young (2000). As Honig puts it, "Difference is just another word for what used to be called pluralism" (1996, 60). Critical pluralists resemble liberals in that they begin from the variety of ways it is possible to experience the world, but stress that the experiences and perspectives of marginalized and oppressed groups are likely to be very different from dominant groups. They also have a strong suspicion of liberal theory that looks neutral but in practice supports and serves the powerful.

Difference democrats are hostile to consensus, partly because consensus decisionmaking (of the sort popular in 1970s radical groups) conceals informal oppression under the guise of concern for all by disallowing dissent (Zablocki

1980). But the real target is political theory that deploys consensus, especially deliberative and liberal theory. Young (1996, 125–26) argues that the appeals to unity and the common good that deliberative theorists under sway of the consensus ideal stress as the proper forms of political communication can often be oppressive. For deliberation so oriented all too easily equates the common good with the interests of the more powerful, thus sidelining legitimate concerns of the marginalized. Asking the underprivileged to set aside their particularistic concerns also means marginalizing their favored forms of expression, especially the telling of personal stories (Young 1996, 126).³ Speaking for an agonistic conception of democracy (to which Young also subscribes; 2000, 49–51), Mouffe states:

To negate the ineradicable character of antagonism and aim at a universal rational consensus— that is the real threat to democracy. Indeed, this can lead to violence being unrecognized and hidden behind appeals to “rationality,” as is often the case in liberal thinking. (1996, 248)

Mouffe is a radical pluralist: “By pluralism I mean the end of a substantive idea of the good life” (1996, 246). But neither Mouffe nor Young want to abolish communication in the name of pluralism and difference; much of their work advocates sustained attention to communication. Mouffe also cautions against uncritical celebration of difference, for some differences imply “subordination and should therefore be challenged by a radical democratic politics” (1996, 247). Mouffe raises the question of the terms in which engagement across difference might proceed. Participants should ideally accept that the positions of others are legitimate, though not as a result of being persuaded in argument. Instead, it is a matter of being open to conversion due to adoption of a particular kind of democratic attitude that converts antagonism into agonism, fighting into critical engagement, enemies into adversaries who are treated with respect. Respect here is not just (liberal) toleration, but positive validation of the position of others. For Young, a communicative democracy would be composed of people showing “equal respect,” under “procedural rules of fair discussion and decisionmaking” (1996, 126). Schlosberg speaks of “agonistic respect” as “a critical pluralist ethos” (1999, 70).

Mouffe and Young both want pluralism to be regulated by a particular kind of attitude, be it respectful, agonistic, or even in Young’s (2000, 16–51) case reasonable. Thus neither proposes unregulated pluralism as an alternative to (deliberative) consensus. This regulation cannot be just procedural, for that would imply “anything goes” in terms of the substance of positions. Recall that Mouffe rejects differences that imply subordination. Agonistic ideals demand judgments about what is worthy of respect and what is not. Connolly (1991, 211) worries about dogmatic assertions and denials of identity that fuel existential resentments that would have to be changed to make agonism possible. Young seeks “transformation of private, self-regarding desires into public appeals to justice” (2000, 51). Thus for Mouffe, Connolly, and Young alike, regulative principles for democratic communication are not just attitudinal or procedural; they also refer to the substance of the kinds of claims that are worthy of respect. These authors would not want to legislate substance and are suspicious of the content of any alleged consensus. But in retreating from “anything goes” relativism, they need principles to regulate the substance of what rightfully belongs in democratic debate.

Specific Affs

Surveillance

Surveillance is uniquely a political act – state involvement is possible

Fernandez and Huey 9 (Luis Fernandez [PhD in Justice Studies, Arizona State University] and Laura Huey [PhD in Sociology, University of British Columbia], 2009, “Is Resistance Futile? Some Thoughts on Resisting Surveillance,” *Surveillance & Society*, 6(3): 198-202)

Let's now turn to a quick examination of resistance. As a central theme in the surveillance literature, it is sticking that resistance, as a concept, remains under theorized. In part, this may be due to the generalized nature of the concept, which can cover vast territories of divergent human action. Thus, like surveillance, it is probably useful to start not with all-encompassing definition, but with an understanding that resistance too will be contextual, relational, and dependent on the power dynamics of a given situation. Possible actors engaged in the resistance of surveillance, then, could include individuals, groups, institutions, networks, and the state itself (e.g., states versus states). But the nature of resistance tactics, technologies, and techniques will evolve in a direct response to a power struggles. Of the work in this area that has been produced to date, what is clearly revealed is the fact that surveillance-based practices are highly contested political territory within and across contemporary society, both at the individual level and collectively. Monahan (2006), for instance, asserts that surveillance is already imbedded in a set of social practices that reproduce social stratification. If he is correct, and we believe he is, then most forms of surveillance are, from their inception, already embedded in a power dynamic that could, with some help, lead to forms of resistance. We see this as a good starting point for analyzing the potential for resisting surveillance, since it builds a dialectic relationship between those who observe and collect data, and those who are observed and from whom information is extracted. Further, we suggest that another good starting point in the study of resistance and surveillance is not surveillance mechanisms, but resistance itself. This insight comes from Hardt and Negri (2004), who in their analysis of revolt and state control argue that revolt is generally the innovator, with the state adapting and developing new forms of control to address the innovations. For example, Fernandez (2008) shows how protesters caught the Seattle Police off guard at the 1999 World Trade Organization protest, eventually resulting in significant policing innovations in the following years. This same dynamic, we believe, might exist in the resistance of surveillance and might yield important insight on how surveillance evolves. In sum, we suggest that if surveillance and resistance are best understood as dynamic, then we must examine instances of resistance first, since they are likely going to be not only a response to surveillances practices but also present the new starting ground for the next set of surveillance mechanisms. This, we think, inverts the current analysis of the relationship. We encourage scholars to pursue research projects along these lines of inquiry

Queer

Liberal politics is accessible to the queer subject – the political body is queered

--both are changeable – its about agreeing to be something

- the queer subject is veiled in obscurity, just like the appositive political subject
- restrictions don't destroy people's identities – all people have access to politics
- queer bodies are fluid – they can enter and exit spaces based on the queering of those spaces – that presumes autonomy – autonomy over your position taking is the definition of the liberal subject

Samuels '99 (Jacinth; 1999; DANGEROUS LIAISONS: QUEER SUBJECTIVITY, LIBERALISM AND RACE; [[[[CITES]]]]; www.tandfonline.com/doi/pdf/10.1080/095023899335383; 7-26-15; mbc)

Rawls attempts to redress the inequities that have historically plagued the judicial system by proposing a theory of justice whose principles are collectively determined by occupants of the 'original position', a hypothetical environment wherein inhabitants are necessarily ignorant of their achieved and ascribed characteristics. These restrictions allow the original position to be constituted as an 'initial status quo' wherein any fundamental agreements or conclusions concerning the principles of justice are inevitably fair – a phenomenon which Rawls terms 'justice as fairness' (1971: 12).

Yet it is precisely these restrictions – those which Rawls deems essential to attaining rational agreement on first principles of justice – which form the basis for comparison between the Rawlsian and the queer subject. Entry to the original position is, for example, conditional upon the participant's willingness to deliberate from behind a 'veil of ignorance', the goal being to mask and thereby neutralize the impact of any factors which would prompt people to exploit circumstances to their own advantage. Hence the Rawlsian subject, now rendered ignorant of its sex, race, class, ethnicity, gender, etc., provides an apposite model for any subject which is at least partially defined by the absence of such characteristics. In this respect the queer subject, similarly 'veiled' in its own obscurity, may be likened to the former; both subjects, united in the quest for neutrality, sustain their existence through the absence or, at the very least, mitigation of presence.

It seems odd then that a subject position which is defined largely by what it excludes could be deemed inclusive, much less accessible, but Rawls deftly circumvents this problem by emphasizing the original position's conceptual status. Any number of people may 'simulate the deliberations of this hypothetical situation, simply by reasoning in accordance with the appropriate restrictions.' Exactly when one enters the original position or even who does so is irrelevant because the veil of ignorance ensures the uniformity of all available information (Rawls, 1971: 138–9).

The original position is therefore distinguished by the sheer fluidity of its spatiality, a quality which facilitates the seemingly effortless entrance/exit of its participants. Here, once again, we discover an area consistent with queer subjectivity for which the notion of 'space'⁴ is also essential. Queer subjectivity occupies a 'new space in the domain of sexuality: a postgay, postlesbian space' (Morton, 1995: 369) which, like the original position, can be entered and/or exited at will. It is a space whose fluidity reflects an identity which refuses to name itself and which heralds the declaration that '[t]o be gay is to have a mere identity; to be queer is to enter and celebrate the ludic space of textual indeterminacy' (Morton, 1995: 373).

The ability to move freely into and out of a space/subject position, be it Rawlsian or ‘queer’, presumes the liberty of an autonomous subject – liberty and autonomy being constitutive elements of liberalism. Thus liberty, for Rawls (1971: 202), is premised upon agents who are free to act without restriction – a definition which affirms both the sovereignty of the liberal subject and the freedom to do what one desires where not prohibited by law (Brown, 1995: 154). Insofar as liberty is juxtaposed not to slavery but a will-less absence of choice (Brown, 1995: 154), the autonomous subject is characterized by ‘the absence of immediate constraints on [his] entry into and movement within civil society’ (Brown, 1995: 156). To the extent that liberalism deems race, class, gender, sexuality, etc. to be indicative of such ‘constraints’, their removal is a necessary condition for both the liberty of the Rawlsian and ‘queer’ subjects and the autonomous exercise of their respective will.

Rawls’ theory of justice is clearly indicative of a neo-Kantian theoretical heritage which defines moral subjects on the basis of autonomy, rationality and an uncompromising distinction between reason and affectivity. Given Kant’s conviction that moral legislation is contingent upon the freedom and equality of rational beings, the deliberations of those in the original position must, in turn, be the product of rational choice rather than bias, ascriptive or achieved characteristics (Rawls, 1971: 252). Subjects within this Kantian ideal are thus akin to ‘geometricians in different rooms who, reasoning alone for themselves, all arrive at the same solution to a problem’ (Benhabib, 1987: 91). Hence the Rawlsian subject, much like its Kantian predecessor, inhabits a unitary subject position which occludes subjectivity outside of itself.

In his attempt to do justice to Kant’s conception of noumenal agency, Rawls recapitulates a basic problem with the Kantian conception of the self, namely, that noumenal selves cannot be individuated. If all that belongs to them as embodied, affective, suffering creatures, their memory and history, their ties and relations to others, are to be subsumed under the phenomenal realm, then what we are left with is an empty mask that is everyone and no one. (Benhabib, 1987: 89)

Nor would it seem that the queer subject is any more suited to resolving this dilemma. On the one hand, ‘queer’ celebrates the diversity of those who experience heterosexist oppression without invoking an essentialized identity, but at the same time ‘the most appealing aspect of a queer identity is the refusal to name what that identity means’ (Slagle, 1995: 97–8). Perhaps this refusal is less the result of a principled aversion to essentialism than it is the **discomforting knowledge of what such a disclosure would occasion**. That is, once the veil of ignorance ‘relieves’ participants of all individuating characteristics, the parties are no longer similarly but rather identically situated (Sandel, 1982: 131), **thus effectively erasing the basis for any claim to diversity**. Moreover, with each subject being driven by precisely the same motivations and knowledge, the original position essentially consists of a single ‘disembodied, pre-social or transcendent self reasoning to reflective equilibrium’ (Frazer and Lacey, 1993: 46).

The interrogation of the Rawlsian subject necessarily casts doubt on assertions that the fluidity of queer subjectivity is a deliberate strategy designed to avoid both the strictures of definitional boundaries and their intrinsic essentialism (Morrison, 1992: 14). Rather than simply a means by which to ensure both poetic and political licence, the indeterminacy of ‘queer’ masks the same problem that the veil of ignorance is intended to obscure. Once the veil can no longer bear the weight of its own scrutiny, it is not people, but a solitary subject who is exposed by the accident of its drooping facade. The veil tumbles to reveal ‘no real plurality of perspectives in the Rawlsian original position, but only a definitional identity’ (Benhabib, 1987: 90). Hence, the judgements are those of the philosopher himself, the construction of the original position having served only to obscure, to neutralize, substantive assumptions which should have been spelled out and defended. Far from being the product of an abstract, transcendent process of reasoning, the theory of justice is revealed as chosen from a very specific social position, that of a white, middle-class, liberal American male. (Frazer and Lacey, 1993: 55)

These sentiments are echoed in the critique of a queer discourse **which tacitly adapts male subjects as its implicit referent** (Kader and Piontek, 1992: 9). The problem stems from those objectives, defined as either Rawlsian or ‘queer’, **which are nevertheless similarly rooted in liberal idealism**. The veil of ignorance is deemed unproblematic by Rawls because it is considered a necessary condition for the achievement of rationality and morality among subjects. Only rational, moral subjects – so designated, tautologically, by virtue of inhabiting the original position – are imbued with the unity of thought, or logic of identity, needed to achieve rational agreement on first principles of justice. Queer subjectivity, though not explicitly concerned with rational consensus, is none the less specifically designed to achieve the same inclusivity/universality and equality which are foundational to the liberal tradition. Hence the agent of ‘equality’ need not differ substantively from the agent of ‘rationality’, ‘fairness’ or ‘justice’: **they are, in fact, the same**. Moreover,

[t]o the extent that the attributes of liberal personhood and liberal justice are established by excluding certain beings and certain domains of activity from their purview, liberalism cannot fulfill its universalist vision but persistently reproduces the exclusions of humanist Man. The hollowness of liberalism's universalist promise, then, inheres . . . in its depoliticization of invidious social powers . . . [and] in its often cruel celebration of conditional sovereignty. (Brown, 1995: 164)

A revelation of this magnitude is bound to have serious consequences for the inclusivity which is similarly integral to the production of queer subjectivity. Positioned rather precariously between the postmodern critique which spawned its creation, and the liberal strategies which it actively employs in an attempt to distinguish itself from its predecessors, the queer subject is subsequently constitutive not of a genuinely autonomous, anti-essentialist subject, but rather the unwitting reproduction of the very liberal humanist subject which it was originally intended to critique.

LGBTQ

LGBTQ+ theorization is applicable to politics – passage of Gay Marriage legislation proves the normative statements of this study

Marzullo & Herdt 11 (Michelle A., Gilbert; November 8th, 2011; Marriage Rights and LGBTQ Youth: The Present and Future Impact of Sexuality Policy Changes; Michelle A. Marzullo holds a PhD in Anthropology concentrating in Race, Gender, and Social Justice from American University in Washington, DC + Gilbert H. Herdt is Professor of Human Sexuality Studies and Anthropology and a Founder of the Department of Sexuality Studies and National Sexuality Resource Center at San Francisco State University; onlinelibrary.wiley.com/doi/10.1111/j.1548-1352.2011.01204.x/full; 7-26-15; mbc)

DOMA and “Don't Ask, Don't Tell” effectively ushered in a new generation of discourses and social practices that continue to shape the political, social, and cultural milieu in the United States (Herdt and Kertzner). The issue of marriage has often been used by politicians and policy elites when votes are needed for a particular candidate (Mooney and Schuldt :212). In 2004, this strategy generated a genuine moral panic during the 2004 presidential campaign when the question of marriage equality for gays and lesbians was used as a wedge issue to help reelect President George W. Bush and many reported voting on their “moral values” (Herdt ; Tiger 2004). Confirming that “same-sex marriage” is a morality policy, Mooney and Schuldt showed that many people find decisions around the issue to be technically simple as most respondents reported their decision was made by “simply applying their basic values rather than by gathering information” (:203). “Morality policy” is distinct from information driven policy and has three main characteristics: (1) “moral values” are the basis for policy conflict; (2) these “moral values” do not lend to compromise; and, (3) such policies are technically simple, lacking complicated numerical formulas or indexes perceived as necessary for understanding by the general public (Mooney and Schuldt :200). Of those most opposed to “same-sex marriage,” 60 percent report that changing their stance would be nearly impossible or difficult (Mooney and Schuldt :209). As witnessed in Pat Buchanan's culture war rebuke, those identifying as “traditionalists” are strongly predicted to be opposed to “same-sex marriage” (Henry and Reyna). Implicit in

such culture war traditionalism is usually an underlying judgment thwarting sexual or intimate citizenship for all gay and lesbian people translating into restrictive laws and higher surveillance of this group (Herdt and Kertzner). In 2006 and continuing through the writing of this article, several other states have either rejected same-sex marriage or codified a definition of marriage as between one man and one woman only. In building opposition to these political machinations and largely as a result of consciousness raising at the grassroots level by marriage equality advocates, there has been a hard-fought yet significant positive change in U.S. attitudes surrounding homosexuality. For example, a major ABC News–Washington Post poll conducted in shows that 49 percent of Americans agree that gay and lesbian or homosexual people should be able to get legally married, while a full 66 percent of those ages 18–29 believe that “LGB” couples should be able to get married. To date, 44 states either ban or do not explicitly support marriages between gays and lesbians, although a growing number of these states do offer other limited forms of partnership recognition, such as domestic partnership or civil union (Confessore and Barbaro ; Human Rights Campaign). We turn now to examining public opinion fluctuations on the subject of marriage equality over the past 20 years to show how this national conversation and the ensuing legal contests have impacted attitudes of Americans, not the least of which are the generations of young people, LGBTQ and straight, who have grown up in this climate.

Feminism

Feminist legal change is possible – must remain a priority – it is historically inaccurate to suggest the law hasn’t improved for feminist goals

Larson 1993

(Jane Larson (1958 - 2011) was the Voss-Bascom Professor of Law at the University of Wisconsin Law School. ; INTRODUCTION: THIRD WAVE CAN FEMINISTS USE THE LAW TO EFFECT SOCIAL CHANGE IN THE 1990s? ; 1992-93 ; http://heinonline.org/HOL/Page?handle=hein.journals/illlr87&div=45&g_sent=1&collection=journals ; AWEY)

Just as notable as the increasing complexity of feminism's political vision is the depth of the philosophical critique of the existing legal regime that the Symposium essays reflect. In the past decade, feminism has come fully into its own as a philosophical and political tradition, developing distinctive theories of knowledge, human nature, justice, and the paths, purposes, and practices of power. Feminist theorists increasingly set aside conventional political traditions and analytic models as inadequate for women's purposes: the lack of de jure equality does not explain women's condition; traditional civil rights strategies will not remedy women's injuries; and neither conservative, liberal, nor radical political theories fully articulate a model for a sexually just society. Yet, paradoxically, feminism remains more committed to change from within the existing frame of society than other progressive and critical political tendencies. Women are unwilling to separate their lives, interests, and aspirations from those of other people. As a result, feminism tends to fight its battles close to home, from within the families, workplaces, and polities that feminists seek fundamentally to reorder. The Symposium participants share with much current feminist thinking a tendency to theorize about broad principles of justice and fairness from quite intimate and particular settings—sexuality, 18 abortion, 19 childbirth and child rearing, 20 and education. 21 Looking to legal feminism's past accomplishments, no Symposium participant is so skeptical as to deny that feminist lawyering and theory have won many meaningful legal battles to advance women. It is no longer acceptable to explicitly argue that laws should reflect the view that men are superior to women—more capable, energetic, reasonable, intelligent, or just, or, by virtue either of divine or biological imperative, better suited than

women to power. Linda Hirshman argues, however, that the law has found a new and more covert language for these same claims of male supremacy. The legal system, for example, freely spends its justice resources to order the political and commercial spheres critical to men's interests, yet it deprives, under a rubric of privacy and limited government, the relational and familial realms important to women. In the public sphere of politics and law, women's claims for sexual fairness often are derided as based on passion rather than logic, politics rather than reason, representing the pleading of special interests rather than the pursuit of universal principles appropriate in a democracy. Thus, the voices of women are systematically ignored, Hirshman contends, even in a legal and political system that claims to fully incorporate and represent their interests. 22 Hirshman gives special attention to the ways that the male-superior norm pervades legal education, expressed through disrespect of feminist legal scholars and their work, and in the minuscule numbers of women on law faculties.²³ Through control of the political and scholarly agenda, Professor Hirshman claims, what is accepted as true, rational, and relevant continues to be judged according to a malesuperior norm. Hirshman advises her readers to be skeptical about the possibilities for bettering women's lives through law while lawyers continue to be trained in institutions that either ignore or disrespect women and their interests.²⁴ Professor Hirshman urges feminists to "take back" the law as a tool for social justice by remaking the institutions of legal power, beginning with their intellectual foundation in the law schools. Drawing attention to the importance of the Anita Hill-Clarence Thomas hearings in persuading Congress to pass the 1991 Civil Rights Restoration Act, ²⁵ Professor Greene counsels the same kind of effort to reconstitute the legislatures, to ensure that elected representatives are able to hear and respond to calls for fundamental change on behalf of women.²⁶ For both Hirshman and Greene, it is not enough for women to have an opportunity to be heard by those in power, to be the objects of men's justice. Rather, women must be represented among those who have the power to determine what justice is.

Cyborg

Talking about cyborgs allows for meaningful political action

Sundén 2k1 (Jenny Sundén, Professor of Gender Studies at Södertörn University, She has a Ph.D. from the Department of Communication Studies from Linköping University, she is currently a reviewer of journals such as European Journal of Women's Studies, Feminist media Studies, Feminist Theory, and New Media and Society; "What Happened to Difference in Cyberspace? The (Re)turn of the She-Cyborg"; Feminist Media Studies, Vol. 1, No.2, 2001; Published online Dec. 12, 2010; <http://www.tandfonline.com/doi/pdf/10.1080/14680770120062141>)/HB

Instead of reinforcing the Cartesian split through bodily destruction, feminist readings of the cyborg take transgressions as its subject. The cyborg is viewed as an alternative figuration, as a way out of the old schemes of thought. It is a powerful political fiction that shatters the dichotomous categorizations of Enlightenment epistemology, such as mind/body.

organism/machine, public/ private, culture/nature, civilized/primitive, and centrally, man/woman, male/ female, masculine/feminine. Haraway (1991a: 149) has argued for a positive reading of the cyborg mythos in a world that has blurred distinctions between these oppositions, in a “border war” in the territories of production, reproduction and imagination. Her ambition is “to build an ironic political myth faithful to feminism, socialism and materialism”. Her “Cyborg Manifesto” proposes a grounding for meaningful political action, and questions the tendencies of feminisms that base their epistemologies on an inversion of the dichotomies they intend to criticize. It is a cyborg interpretation with no commitment to an absolute grounding for knowledge, but with an emphasis on “situated” and “partial” knowledges, uncertain and sometimes contradictory subjectivities and identities whose significations are not determined by the categorizations of human/animal/machine.

Anti-State/Foucault Affs

Resistance to surveillance shouldn't be held to only anti-state criticism – doing so limits new methods of resistance and ignores other forms of surveillance

Geesin 12 (Beverly Geesin, PhD candidate in Sociology at U. of York, March 2012, Thesis: “Resistance to Surveillance in Everyday Life,” <http://etheses.whiterose.ac.uk/2697/>, pg. 9-10)

While acknowledging the tremendous contribution that has been made towards the understanding of surveillance systems within contemporary society within surveillance studies, there are three ways in which the discipline appears to be rather stuck. One goal of this thesis is to reinvigorate discussions around surveillance in order to move beyond these three conceptual difficulties. Firstly, the field is held back by its attachment to Foucault's metaphor of the Panopticon (1977/1995). Even within attempts to move beyond Foucault's Panopticon, theorists seem to find it very difficult to let it go (see Poster, 1990; Gandy, 1993; Mathiesen, 1997; Lyon, 1994, 2006a, 2006b amongst others) and this has led to a second fixation with Deleuze's brief updating of the Panopticon with his ‘Post-script on Control Societies’ (1992). The model of the Panopticon as outlined by Foucault has become ‘reified’. This has, on the one hand, limited the development of theoretical frameworks which go beyond this model. On the other hand, with forms of surveillance which do not fit within this model, they have either been excluded from analysis or misunderstood through an inappropriate application of the Panopticon (Haggerty, 2006). This introductory chapter will explore this fascination with the Panopticon and the limitations of this particular model for understanding contemporary forms of analysis. The rest of this thesis will explore other frameworks for understanding contemporary surveillance (Chapters 2 and 3) and utilise them to analyse three ‘sites’ of surveillance (Chapters 4, 5 and 6).

Islamaphobia

Engaging the state and changing policy builds upon current government efforts to self-reform and ensures law enforcement stops racial profiling on minorities— disengaging the state is ineffective and cedes the political to further allow dehumanization of not just Muslims, but all minorities

Representative Ellison, 14 (12/11/2014, Rep. Keith Ellison (D-MN), US Official News, “Rep. Ellison Testifies in Senate Hearing on Civil and Human Rights,” Lexis, JMP)

Office of the House of Representative Keith Ellison, U.S Government has issued the following news release: Rep. Keith Ellison (D-MN) testified in front of Senate Judiciary Committee on the Constitution, Civil Rights, and Human rights today during a hearing entitled “The State of Civil and Human Rights in the United States.” The hearing was chaired by Senator Dick Durbin (D-IL) and Rep. Ellison was joined by his colleagues Senator Cory Booker (D-NJ) and Rep. Luis Gutierrez (D-IL). Rep. Ellison’s written testimony submitted for the record to the committee is below. Last week 15 year old Abdisamad Sheikh-Hussein was run over by a

man in an SUV that had a bumper sticker that said "Islam Is Worse Than Ebola" on it. **Discrimination and hate exist everywhere and we should shine a light on them. Today I’d like to focus on state-sponsored violations of our civil rights and liberties and the context in which these violations occur.** Why? Because **the government’s job is to promote the general welfare.**

Because we entrust our government with the right to protect and serve our communities, we expect more of them. Most of the time our public servants diligently uphold this social contract; but when the state fails it is all the more devastating and deserves our attention. President **Obama and Attorney General Holder have demonstrated leadership that has brought important reforms** like the Hate Crimes Prevention Act, the repeal of Don’t Ask Don’t Tell, and the Fair Sentencing Act. **We still have a long way to go. Our system of justice works for some, not all.** This

injustice takes place in a social and economic context. When Officer Wilson confronted Michael Brown on Canfield Drive in Ferguson, the interaction didn’t take place in a vacuum. Like many of our communities, Ferguson suffers from economic abandonment. Ferguson Missouri’s unemployment is 13%, over double the national average. The number of low-income people in Ferguson doubled over the last 10 years. In 2012, almost all of Ferguson’s neighborhoods had a poverty rate of over 20%, the threshold at which the negative effects of poverty emerge. Do we respond to this with policies that create jobs, improve infrastructure, and promote education? No. We build more prisons and give our police weapons designed for a war zone. Our low income and minority communities are over-policed and under-protected. We cannot continue to try to address our economic problems with criminal justice solutions. It isn’t fair to our communities. It isn’t fair to law enforcement. And it solves neither the criminal justice nor the economic justice problems. If we only buy body cameras and don’t address structural and economic inequality, we will find ourselves here again, year after year. We know we have an inequality problem when the CEO of Wal-mart makes over \$12,000 per hour and the average Wal-mart employee makes \$8.48, or when the CEO of McDonalds makes \$9,200 an hour and the cashier makes \$8.25. I’d also like to talk about another form of state sponsored discrimination – one that I have experienced myself. It isn’t a secret that I have experience with the divisive rhetoric and fear-mongering that some public officials use to gain power. Many will recall the House Committee on Homeland Security hearings to discuss the threat posed by Muslims in America. My request to broaden the hearing to include all forms of violent extremism was rejected. Now, years later, public officials around the country continue to use divisive rhetoric. A county commissioner in Coffee County, TN posted on his public Facebook page an image of a man holding a shotgun with the caption “How to Wink at a Muslim.” A state senator in Oklahoma said that American Muslims are a “cancer in our nation that needs cutting out.” And in my own state of Minnesota, a GOP County

chairman called Muslims parasites that should be fragged. To frag someone means to violently kill them. **These are not rare occurrences. These examples demonstrate that these toxic views have spread.** This type of bigotry is contrary to what we stand for as Americans,

and **when our public officials engage in it, it gives the American public a signal that it is ok to do the same.** **Public officials have an increased responsibility and when they begin to treat a**

particular group differently because of their faith, they should be called out and held accountable. Our words matter. **Beyond changing the rhetoric, we have to change our policies.** Shortly after he took office President Bush said that racial profiling is “wrong, and we will end it in America.” Over a

decade later we still have bad policies on the books. **In New York and many other US cities, Muslim communities are mapped, infiltrated, and surveilled simply because they are Muslim. The Departments of Homeland Security and Justice conduct extensive operations in Arab, Middle Eastern, Muslim, and South Asian communities under the guise of countering violent extremism.** Study after study has shown that acts of violent extremism in the United States are motivated by a variety of ideologies and that only a small percentage are committed by American Muslims. According to the FBI, only 6% of acts of terrorism on American soil between 1980 and 2005 were committed by those Muslims. Yet, nearly all programming targeted towards countering violent extremism is geared towards Muslim communities. I am not against surveillance. I am against surveillance without reasonable suspicion. We should not be singling out communities and harassing and spying on them without cause. **Intelligence gathering should never be based on religion or race. If you**

think this is just a “Muslim problem” – you’re wrong. Local law enforcement, encouraged by the federal government, raid Latino communities and workplaces. There is FBI surveillance, without suspicion, of Chinese and Russian communities in the US. And as we know, there is the routine practice of

profiling African American young men. A young black man is 21 times more likely to be shot and killed by a police officer than his white counterpart. **As the co-chair**

of the Progressive Caucus I have joined the chairs of the Congressional Black Caucus, The Congressional Hispanic Caucus, and The Asian Pacific Caucus to urge the Department of Justice to issue revised profiling guidance that will help stop law enforcement from discriminating against our citizens based on their religion, national, origin, ethnicity, and sexuality. Yesterday the Department of Justice issued the revised guidance that expands protections for some, but allows the FBI, TSA, and Border Patrol to continue mapping, monitoring, and targeting Americans based on their religion or what they look like. We should not continue to violate the civil liberties of our citizens in the name of national security. Discriminatory profiling is wrong. It doesn't help prevent crime. It creates a culture of fear and resentment within our communities. It is contrary to our core constitutional principles when federal dollars are spent perpetuating law-breaking activity like entrapment.

Topical version of the aff solve better— curtailing FBI surveillance power provide the best safeguard against abuse and only reform through the state addresses the heart of the problem

Berman, 11 --- Counsel in the Liberty and National Security Project at the Brennan Center for Justice (Emily, “DOMESTIC INTELLIGENCE: NEW POWERS, NEW RISKS,” http://brennan.3cdn.net/b80aa0bab0b425857d_jdm6b8776.pdf, JMP)

Substantive Recommendations Regardless of what additional procedural protections are implemented, some elements of the FBI's existing powers simply permit too much government intrusion into the lives of innocent Americans and therefore should be curtailed in the following ways: 1. Prohibit the FBI from using highly intrusive investigative techniques unless there is some basis in fact to suspect wrongdoing.²⁹⁰ • This would prohibit tailing someone, posing as other people in order to mine information from neighbors and acquaintances, and recruiting informants to glean more information in the absence of some factual basis for suspicion. • This prohibition, summarily overturned by the 2008 Guidelines, was enshrined in all previous iterations of the Guidelines for decades. It is the single most important safeguard against profiling and other forms of abuse, and the government has offered no persuasive justification for its sudden disappearance. 2. Require agents to use the least intrusive investigative technique that is likely to prove effective. • The “least intrusive method” requirement has been part of the Guidelines since their inception. The current, equivocal language on this requirement in the Guidelines and the DIOG should be amended to stress its importance, even in terrorism investigations. 3. Prohibit improper consideration of race, religion, ethnicity, national origin, or First-Amendment-protected activity in investigative decisions. • Addressing this issue is most urgent in the context of rules regarding use of informants to collect information about First-Amendment-protected activity, such as infiltration of a place of worship or political gathering. Such activities should require higher levels of predication and more aggressive oversight of investigative decisions than activities that do not implicate Americans' constitutional rights. Even outside the First Amendment context, however, reform is necessary. One standard to consider was recently implemented by the Office of the Director of National Intelligence (DNI). The standard for use in the DNI's Information Sharing Environment (ISE)-Suspicious Activity Reporting (SAR) system adopts a “behavior-focused approach to identifying suspicious activity” based on the standard announced in Terry v. Ohio,²⁹¹ 392 U.S. 1 (1968). It requires that “race, ethnicity, national origin, or religious affiliation should not be considered as factors that create suspicion (except if used as part of a specific suspect description).”²⁹² This type of limitation on the use of these factors to justify law enforcement activity is crucial. Conclusion The time to act is now—before the Guidelines result in widespread and unwarranted intrusions into Americans' privacy, harmful religious and ethnic profiling, and the divergence of scarce resources to ineffective and indiscriminate collection of information. The changes recommended above will go a long way to reduce the risk of excesses that the current Guidelines permit. They would reinvigorate the substantive standards on which investigative activity should be predicated and would ensure that intrusive investigative methods

are used only when necessary. And **they would impose internal and external checks to guarantee the lawful, effective use of the powers conferred on federal agents.** In short, **they would safeguard Americans' rights of privacy, free expression, association, and religion** as well as help to focus investigative activity where there are indications of threats. The result will be a safer, more just America.

Not Mutually Exclusive

Public Movements not exclusive

Public movements and legal reforms are not mutually exclusive— projects of oral dissent must be incorporated into politics in order to effectively create change within the state

Guinier 09 (Lani Guinier is an American civil rights theorist; she is the Bennett Boskey Professor of Law at Harvard Law School and the first woman of color appointed to a tenured professorship at that institution. “BEYOND LEGISLATURES: SOCIAL MOVEMENTS, SOCIAL CHANGE, AND THE POSSIBILITIES OF DEMOSPRUDENCE” 89 B.U. L. Rev. 539 2009 p. 544-547, pg. online @ www.law.harvard.edu/faculty/guinier/publications/bu-courting.pdf//DM)

In her Ledbetter dissent and subsequent remarks, Justice Ginsburg was courting the people to reverse the decision of a Supreme Court majority and thereby limit its effect. In Robert Cover’s “jurisgenerative” sense, she claimed a space for citizens to advance alternative interpretations of the law. Her oral dissent and public remarks represented a set of demosprudential practices for instantiating and reinforcing the relationship between public engagement and institutional legitimacy. In Justice Ginsburg’s oral dissent we see the possibilities of a more democratically-oriented jurisprudence, or what Gerald Torres and I term demosprudence.³⁷ Demosprudence builds on the idea that lawmaking is a collaborative enterprise between formal elites – whether judges, legislators or lawyers – and ordinary people. The foundational hypothesis of demosprudence is that the wisdom of the people should inform the lawmaking enterprise in a democracy. From a demosprudential perspective, the Court gains a new source of democratic authority when its members engage ordinary people in a productive dialogue about the potential role of “We the People” in lawmaking.³⁸ Demosprudence is a term Professor Torres and I initially coined to describe the process of making and interpreting law from an external – not just internal – perspective. That perspective emphasizes the role of informal democratic mobilizations and wide-ranging social movements that serve to make formal institutions, including those that regulate legal culture, more democratic.³⁹ Demosprudence focuses on the ways that “the demos” (especially through social movements) can contribute to the meaning of law. Justice Ginsburg acted demosprudentially when she invited a wider audience into the conversation about one of the core conflicts at the heart of our democracy.⁴⁰ She grounded her oral dissent and her public remarks in a set of demosprudential practices that linked public engagement with institutional legitimacy. Those practices are part of a larger demosprudential claim: that the Constitution belongs to the people, not just to the Supreme Court. The dissenting opinions, especially the oral dissents, of Justice Ginsburg and other members of the Court are the subject of my 2008 Supreme Court foreword, Demosprudence Through Dissent. ⁴¹ The foreword was addressed to judges, especially those speaking out in dissent, urging them to “engage dialogically with nonjudicial actors and to encourage them to act democratically.”⁴² The foreword focuses on oral dissents because of the special power of the spoken word, but Justices can issue demosprudential concurrences and even majority opinions, written as well as spoken.⁴³ Moreover, true to its origins, demosprudence is not limited to reconceptualizing the judicial role. Lawyers and nonlawyers alike can be demosprudential, a claim that I foreshadow in the foreword and which Torres and I are developing in other work on law and social movements.⁴⁴ Supreme Court Justices can play a democracy-enhancing role by expanding the audience for their opinions to include those unlearned in the law. Of the current Justices, Justice Antonin Scalia has a particular knack for attracting and holding the attention of a nonlegal audience. His dissents are “deliberate exercises in advocacy” that “chart new paths for changing the law.”⁴⁵ Just as Justice Ginsburg welcomed women’s rights activists into the public sphere in response to the Court majority’s decision in Ledbetter, Justice Scalia’s dissents are often in conversation with a conservative constituency of accountability.⁴⁶ By writing dissents like these, both Justices have acknowledged that their audience is not just their colleagues or the litigants in the cases before them. Both exemplify the potential power of demosprudential dissents when the dissenter is aligned with a social movement or constituency that “mobilizes to change the meaning of the Constitution over time.”⁴⁷ Thus, Justice Ginsburg speaks in her “clearest voice” when she addresses issues of gender equality.⁴⁸ Similarly, Justice Scalia effectively uses his originalist jurisprudence as “a language that a political movement can both understand and rally around.”⁴⁹ Both Justices Ginsburg and Scalia are at their best as demosprudential dissenters when

they encourage a “social movement to fight on.”⁵⁰ Robert Post, writing in this symposium, reads my argument exactly right: “[C]ourts do not end democratic debate about the meaning of rights and the law; they are participants within that debate.”⁵¹ As Post explains, I argue that the “meaning of constitutional principles are forged within the cauldron of political debate,” a debate in which judges are often important, though not necessarily central, actors.⁵² Law and politics are in continuous dialogue, and the goal of a demosprudential dissenter is to ensure that the views of a judicial majority do not preempt political dialogue. When Justice Ginsburg spoke in a voice more conversational than technical, she did more than declare her disagreement with the majority’s holding. By vigorously speaking out during the opinion announcement, she also appealed to citizens in terms that laypersons could understand and to Congress directly.⁵³ This is demosprudence.

State Centered Practices spur social change

Even if the state is not perfect, it has a role to play in key social and rights movements—specifically the Supreme Court can engage in acts of demosprudence to spur dissent and public conversation

Guinier 09 (Lani Guinier is an American civil rights theorist; she is the Bennett Boskey Professor of Law at Harvard Law School and the first woman of color appointed to a tenured professorship at that institution. “BEYOND LEGISLATURES: SOCIAL MOVEMENTS, SOCIAL CHANGE, AND THE POSSIBILITIES OF DEMOSPRUDENCE” 89 B.U. L. Rev. 539 2009 p. 547-551, pg. online @ www.law.harvard.edu/faculty/guinier/publications/bu-courting.pdf//DM)

Robert Post eloquently summarizes and contextualizes the argument I make about demosprudence. He also corrects the misunderstanding of the law/politics divide that beats at the heart of Gerald Rosenberg’s criticisms of that argument.⁵⁴ Post neatly restates my premise: “Law inspires and provokes the claims of politically engaged agents, as it simultaneously emerges from these claims.”⁵⁵ In his companion essay, Professor Rosenberg polices the law/politics distinction to create a false binary. Rosenberg dismisses the possibility of an ongoing and recursive conversation between law and politics that may produce changes in the law and eventually in our “constitutional culture,” meaning changes in the popular as well as elite understanding of what the law means. Constitutional culture is the fish tank in which the beliefs and actions of judicial as well as non-judicial participants swim. It is the “dynamic sociopolitical environment” in which ideas about legal meanings circulate, ferment, compete and ultimately surface in formal venues such as legal advocacy or legislative actions.⁵⁶ As political scientist Daniel HoSang explains, the goal of demosprudence is “to open up analytic and political possibility to build and sustain more dynamic and politically potent relationships between [legal elites] and aggrieved communities.”⁵⁷ Professor Rosenberg’s critique of demosprudence rests on several misunderstandings of my work and that of other legal scholars.⁵⁸ First, Professor Rosenberg wrongly assumes that my claims are descriptive rather than aspirational.⁵⁹ Second, Professor Rosenberg’s concern about my “Courtcentric” analysis overlooks the occasion for my argument;⁶⁰ that is, the traditions associated with the Supreme Court foreword published every year in the November issue of the Harvard Law Review. Third, he orients his entire critique around polling data and other social science research to trivialize the relationship of narrative to culture, to exaggerate the predictive capacity of a data-driven approach to quantify causation and to preempt other useful analytic approaches.⁶¹ First, my foreword posits that judges can play a demosprudential role and that oral dissents are one potential vehicle for allowing them to do so.⁶² While it is true that oral dissents currently face obstacles to their demosprudential efficacy, those obstacles need not be insurmountable. Moreover, Rosenberg’s critique arguably makes my point. He is saying “people don’t pay attention,”⁶³ while I am saying “yes, they can!” Indeed, they might pay more attention if Justices took the time to talk to them.⁶⁴ He characterizes the past; I aim to sketch out the contours of a different future. Rosenberg is absolutely right that one next step might be to deploy the tools of social science to explore the extent to which this claim has been realized.⁶⁵ But the foreword is suggestive, not predictive. Justices of the Supreme Court can be demosprudential when they use their opinions to engage non-legal actors in the process of making and interpreting law over time. They have democratically-based reasons to seek to inspire a mobilized constituency; it is not that they invariably will cause a social movement to emerge. Similarly, the idea that Court opinions do not invariably inspire social movements does not mean they cannot have this effect. Nor do I argue that oral dissents are the only, or even the single most important, communication tool at the Court’s disposal. When the Supreme Court announced Brown v. Board of Education⁶⁶ in 1954, there were no dissents. Moreover, the orality of the opinion announcement was not a central feature of the event. No one heard the voice of Earl Warren reading his decision on the radio. Nevertheless, the decision had a powerful effect, in part because it was

purposely drafted to speak to “the people.”⁶⁷ Justice Warren consciously intended that the Brown opinion should be short and readable by the lay public.⁶⁸ In his work, Professor Rosenberg focuses on the white backlash the Brown decision inspired.⁶⁹ But a demosprudential analysis also focuses on the front lash, the way that Brown helped inspire the civil rights movement. Brown’s accessibility and forcefulness helped inspire a social movement that in turn gave the opinion its legs.⁷⁰ In 1955, Rosa Parks refused to give up her seat on a bus in Montgomery. She was arrested. Four days later, when she was formally arraigned and convicted, a one-day bus boycott by the black citizens of Montgomery was unexpectedly, amazingly, successful.⁷¹ Dr. Martin Luther King, Jr. delivered a sermon that evening before a mass meeting of 5000 people gathered at and around Holt Street Baptist Church.⁷² He prepared his audience to take the bold step of continuing the boycott indefinitely. He did so by brilliantly fusing two great texts: the Supreme Court’s pronouncement a year earlier in Brown and the Bible.⁷³ Dr. King roused the crowd at that first mass meeting in Montgomery with a spirited refrain: “If we are wrong – the Supreme Court of this nation is wrong. If we are wrong God Almighty was wrong.”⁷⁴ In the foreword, I argue that Dr. King was a classic example of a “roleliterate participant.”⁷⁵ His theological and strategic acumen enabled him to invoke Brown as “authorization” and “legitimation” to sustain the actions that 50,000 blacks in Montgomery, Alabama would take for over thirteen months when they refused to ride the city’s buses.⁷⁶ But as Robert Post rightly points out, the word “authorize” meant something more like embolden or encourage.⁷⁷ My point is that Brown shows judicial actors can inspire or provoke “mass conversation.” It is when the legal constitution is narrated through the experience of ordinary people in conversation with each other that legal interpretation becomes sustainable as a culture shift.⁷⁸ And if a majority opinion can rouse, so too can a dissenting one. Thus, demosprudence through dissent emphasizes the use of narrative techniques and a clear appeal to shared values that make the legal claims transparent and accessible. Although demosprudence through dissent is prescriptive rather than descriptive, it was never my intent to suggest that the Court should be central to any social movement. Like Justice Ginsburg, I am not a proponent of juridification (the substitution of law for politics).⁷⁹ In Justice Ginsburg’s words, “[t]he Constitution does not belong to the Supreme Court.”⁸⁰ At the same time, I recognize that the Court has been deeply influential, albeit unintentionally at times, in some very important social movements. Studying the 1960s student movement in Atlanta, Tomiko Brown-Nagin argues that the lunch counter sit-ins were, in fact, a reaction to the Supreme Court’s decision – not because of what the Supreme Court said, but because of what it did not say.⁸¹ The Court initially raised, then dashed expectations. It was the disappointment with “all deliberate speed” – the legal system’s failure to live up to the promise of the Court’s initial ruling – that inspired students to take to the streets and initiate some of the bold protest demonstrations at lunch counters and in streets in the 1960s.⁸² Brown-Nagin emphasizes the multiple ways in which courts, lawyers and social movement actors are engaged in a dialogic and recursive discourse.⁸³

Cultural Change

Using the law creates a “cultural shift” which can change people’s mindset

Loewy 2000

(Karen L. Loewy is a Senior Staff Attorney for Lambda Legal, the oldest and largest national legal organization committed to achieving full recognition of the civil rights of lesbians, gay men, bisexuals, transgender people and those with HIV. Ms. Loewy is involved in all aspects of Lambda Legal’s impact litigation, policy advocacy and public education, with particular emphasis on issues affecting LGBT and HIV-positive seniors. ; LAWYERING FOR SOCIAL CHANGE; 1999-2000; http://heinonline.org/HOL/Page?handle=hein.journals/frdurb27&div=61&g_sent=1&collection=journals ; AWEY)

Three ways of approaching the achievement of social change are the notions of “cultural shift,” “negotiation of strategy” and “dimensional lawyering.” These views are not mutually exclusive, but they are informed by different underlying ideologies. a. Cultural Shift The creation of a cultural shift is one view of the way to make true social change. ³⁹ Professor Thomas Stoddard

suggests that social change and legal change are not always coexistent, that one does not always prompt the other.⁴¹ Furthermore, attempts at law reform may only succeed on a formal level and may not have any real impact on the larger cultural context into which they fit.⁴¹ The law's traditional mechanisms can be adapted, however, to improve society in extra-legal ways. This use of the law is what Stoddard calls the law's culture-shifting capacity.⁴² A cultural shift may take place when far-reaching or significant change occurs, public awareness of that change is widespread, the public generally perceives that change as legitimate or valid, and there is continuous, overall enforcement of the change. ⁴³ One theory perhaps underlying the notion of cultural shift and its belief that all of these components must occur contemporaneously is that lawyers may not be able to divert the direction of a rule of law very far off course from the beliefs of elected officials." Without the support of the general public and the enforcement of the change, change cannot really occur. To make major changes in critical social relationships, one must change the way people think about the issue.⁴⁵ A new law that affects a large number of people in fundamental ways creates the potential for culture shifting. ⁶ For the shift to have cultural resonance, however, the general public must also perceive the shift. It must be "generally discerned and then absorbed by the society as a whole."⁴⁷ This common awareness must also be accompanied by some sense of public acceptance grounded in a sense of legitimacy or validity, as awareness is never enough to assure compliance.⁴⁸ Finally, unless the rules are enforced, the public will disregard them. Unless a new law promotes public awareness and adherence to the rules, as well as provides appropriate sanction for their disregard, culture-shifting cannot occur.⁴⁹ Professor Nan Hunter suggests an additional requirement for a true cultural shift.⁵⁰ She posits that in addition to the four requirements listed above, some type of public engagement in the effort to change the law must occur.⁵¹ When a change stems from a mobilized public demand, whether through litigation or legislation on state or federal levels, the resulting change has an immediate culture-shifting impact.⁵² She thus places great emphasis on mobilization and empowerment of those seeking legal assistance, and strengthening the represented constituency or community organization.⁵³ This empowerment is valuable because the constituent community will work toward larger, more fundamental change, viewing the law as a tool to accomplish this change as opposed to viewing the reform of the law as the end goal in and of itself.⁵⁴ Consequently, these communities will not be constrained by the limits of the law and will better serve as repeat players in the scheme of social change.⁵⁵ Professor Chai Feldblum suggests that in order for the public to believe in the legitimacy of a change, whether enacted by the legislature or decided by a court, there must be an engagement with the morality underlying the issue.⁵⁶ She maintains that the moral discourse surrounding the debate of social issues must not be discounted.⁵⁷ While legal commentators have long documented the impact of judicial reasoning on the moral rhetoric surrounding a controversial issue, the legislators' discourse has lacked similar recognition.⁵⁸ Because the surrounding rhetoric is so powerful, it must involve a real engagement with the underlying moral issues, as this grappling will have an impact on the type of culture-shift that occurs.⁵⁹ Because the issues around which social change occur are those that are grounded, at their core, in morality, the more the moral aspects of the issues are emphasized, the greater the impact of the cultural shift. ⁶⁰

Blocks

A2 Law Sucks/Excludes Us

Engaging Paradoxically with the law has value – if the law is BAD then the only way it will change is buying getting into the trenches

Hirsch 12 (Dr. Alexander Keller Hirsch is Assistant Professor in the Department of Political Science at the University of Alaska, Fairbanks. His primary field is political theory, and his research and teaching interests focus on the entanglements, impasses, and dreamworlds faced by people who inhabit the aftermath of catastrophe, 2012, "The promise of the unforgiven: Violence, power and paradox in Arendt," pgs. 9-11, online @ psc.sagepub.com/content/early/2012/12/13/0191453712467319.full.pdf+html//DM)

My approach to the paradox differs from both Young-Bruehl's and Bar On's in that I am less interested in smoothing over, correcting, or otherwise neutralizing Arendt's aporia. Rather than view it as something to be explained or solved, I contend that the irresolvability of the paradox is precisely its source of generativity. In this sense I follow in line with a number of scholars who have recently argued that paradox, far from an endgame, represents a condition of possibility for a renewed vision of democratic politics as an inherently tragic venture. Perhaps Bonnie Honig has been most effective in this regard. In her marvelous recent collection of essays, *Emergency Politics*, Honig invokes Rousseau's well-known paradox of politics. For Rousseau, famously, political founding requires virtuous citizens to set it in motion, and yet such a citizenry cannot exist until that founding has conditioned a people capable of founding in the first place. As Honig parses Rousseau, 'In order for there to be a people well-formed enough for good lawmaking, there must be good law, for how else will the people be well formed?'⁴⁴ Where most deliberative theorists, such as Seyla Benhabib or Jürgen Habermas, work to find normative or prescriptive principles and procedures for solving Rousseau's paradox, Honig urges us to bracket the inclination to settle, sublimate, or otherwise resolve it at all. Rather she sees the paradox of politics as fecund with possibility. On this point, it is well worth quoting Honig at length: It might seem that acknowledging the vicious circularity of the paradox of politics must be costly to a democracy, or demoralizing: If the people do not exist as a prior – or even as a post hoc – unifying force, then what will authorize or legitimate their exercises of power? But there is ... also promise in such an acknowledgment. Besides, denial is costly too, for we can deny or disguise the paradox of politics only by suppressing or naturalizing the exclusion of those (elements of the) people whose residual, remaindered, minoritized existence might call the pure general will into question. From the perspective of the paradox of politics, unchosen, unarticulated, or minoritized alternatives – different forms of life, identities, solidarities, sexes or genders, alternative categories of justice, unfamiliar tempos – represent themselves to us daily, in one form or another, sometimes inchoate. The paradox of politics provides a lens through which to re-enliven those alternatives. It helps us to see the lengths to which we go or are driven to insulate ourselves from the remainders of our settled paths. It keeps alive both the centripetal force whereby a people is formed or maintained as a unity and the centrifugal force whereby its other, the multitude, asserts itself.⁴⁵ Here, Honig highlights those forms of exclusion that get erased when the paradox of politics is resolved or forgotten. Taking the irreparability of that paradox seriously means that new angles of vision get opened up. Specifically, the paradox helps us to see the extent of our attempts to conceal the violence committed in the act of founding a people. What is further revealed is the extent to which the work of democratic politics entails 'not just rupture but maintenance, not just new beginnings but preparation, receptivity, and orientation'.⁴⁶ This is the tragic condition of the political paradox Honig redeems for democratic thinking. In qualifying what constitutes a tragic condition Honig turns to the moral philosophy of Bernard Williams. For Williams, Honig recalls, tragic situations are 'situations where there is no right thing to do but something must be done. Here every

action is inaction.⁴⁷ Tragic situations are paradoxical ones. No matter what choice we make we are stuck. In this sense, tragedy questions the view that the subject is the sovereign master of its destiny. Tragedy raises doubts about the Platonist vision of the hyper-rational ideal and the Kantian belief in the sufficiency and autonomy of the self.⁴⁸ Instead, tragedy affirms the notion that the subject and its actions are vulnerable to forces and power not entirely within rational control. Moreover, for Williams, as for Honig, ‘the question posed to the moral agent by the tragic situation is not simply what should we do in a tragic situation but what does the tragic situation do to us and how can we survive it with our moral integrity intact?’⁴⁹ The goal of moral theory is not to guide action or prescribe the normative ‘right thing’ to do, but rather to help the agent to survive the situation. **‘The goal’**, Honig writes, **‘is to salvage from the wreckage of the situation enough narrative unity for the self to go on.’**⁵⁰ Arendt’s paradox is certainly tragic in this sense. If forgiveness is both violent, in its suddenness, and yet redeeming, in its capacity to release us from what we have violently done, we are left wedged between an impossible choice and a no less compelling imperative to act. If promising is what we do to subdue the unexpected and beckoning chaos of the future, then we must promise not to forgive, not to begin, not to do the violence required of us if we are to enter the world of appearances together and generate the conditions for power’s emergence. This tragic situation calls for a theory of survivability and survival, for a salvaging on behalf of the self. Importantly though, I think there is more than a moral dimension to the tragedy at play in the paradox of Arendt’s treatment of violence, power, forgiveness and promising. There is a political face too. A tragic view sacralizes the restlessly ongoing and irresolvable quality of conflict endemic to human experience. It also induces a critical responsiveness to ambivalence, what Richard Seaford calls the ‘prevalence of duality over unity’.⁵¹ Politics, seen as a tragic condition of human life, is conceived less as a means of foreclosing the conflicts that arise out of difference and disagreement than as a channel through which they might be quickened, elaborated and honed. In this sense, tragedy is attuned to an immensely complex field of powers, pressured encounters and civic possibilities. When conceived politically, which is to say tragically, democracy fosters robust and active modes of citizenship engaged in projects of public and counter-public building. These projects are aware both of the omnipresent and ineliminable quality of conflict and that the dynamism of this conflict is the source of political agency in the perpetually disputed and contingent character of the world held in common. This is a world shimmering with plurality, so long as the tragedy of democratic experience is upheld.

A2 Cant Engage the Surveillance Culture

Forum exists in the FISA Court to challenge the NSA – public advocates prove

Nolan et al. 13 (Andrew Nolan, Richard M. Thompson II, and Vivian S. Chu, Legislative Attorneys of the Congressional Research Service, 10/23/2013, “Introducing a Public Advocate into the Foreign Intelligence Surveillance Act’s Courts: Select Legal Issues,”

<https://www.justsecurity.org/wp-content/uploads/2013/10/CRS-Report-FISC-Public-Advocate-Oct.-25-2013.pdf>)

It is a basic principle of American constitutional law that with one exception⁴⁶ the Constitution only applies to the federal government and, via the Fourteenth Amendment and certain other clauses, to the governments of the states.⁴⁷ Accordingly, before evaluating the constitutional implications of including a public advocate in FISA proceedings a threshold issue is to assess what the exact role of the FISA advocate is as a legal matter and, more specifically, whether the advocate is a sovereign entity that can be subject to the constraints of the Constitution.⁴⁸ At first blush, one can argue that an opposition advocate in a FISA proceeding cannot be considered a government actor, as a public advocate represents the privacy interests of either the general public or those being targeted. Indeed, as one scholar noted in another context regarding the concept of a public advocate, the institution itself, in actively

opposing the position of a government agent, is “so different from the traditional three branches of government” that the advocate “would be like a fourth branch of government, totally different from anything contemplated by the framers at the time of the ratification of the Constitution,” and, therefore, free of the constraints of the Constitution.⁴⁹ Moreover, if one assumes a public advocate is a direct analogue to that of a public defender in a federal criminal case, the adversarial relationship of the FISA advocate with the government arguably prevents consideration of the opposition advocate as an instrument of the federal government.⁵⁰ Specifically, a public advocate, being bound by the canons of professional responsibility, must exercise independent judgment on behalf of his client – the public – and cannot be considered a “servant of an administrative superior” – i.e., the government.⁵¹ Put another way, an opponent of the government’s position cannot be converted into its “virtual agent.”⁵² In this light, some proposals for including an advocate have described the advocate’s client as not being the government, but the “people of the United States” in “preserving privacy and civil liberties.”⁵³

1nc Frontline

Alt causes- HUMINT issues generate from deployment of spies and complete penetration of organizations is impossible

O'Brien, 05- President and CEO of Artemis Global Logistics & Solutions, Former Graduate Research Assistant at the Jebson Center for Counter Terrorism Research, Former International Trade Specialist for the Department of Commerce (James, "Trojan Horses: Using Current U.S. Intelligence Resources To Successfully Infiltrate Islamic Terror Groups", International Affairs Review Vol. 14 No.2 Fall 2005)/KTC

Nevertheless, it is easier to recognize HUMINT deficiencies than to fix them. This is especially true when reconstituting sectors spread over several agencies that have been allowed to corrode. There is no quick fix in resolving this deficiency. This reality is recognized by both policy advisors and policy-makers, who propose long-term investments in intelligence reform. A 2002 Congressional Research Service report exemplifies this mindset: While U.S. policymakers are emphasizing the need for rapid intelligence overhaul to close the HUMINT deficit, the United States is fighting a War on Terror with other countries' unreliable eyes. 142 · International Affairs Review First is a renewed emphasis on human agents. Signals intelligence and imagery satellites have their uses in the counterterrorism mission, but intelligence to counter terrorism depends more on human intelligence (HUMINT) such as spies and informers. Any renewed emphasis on human intelligence necessarily will involve a willingness to accept risks of complicated and dangerous missions, and likely ties to disreputable individuals who may be in positions to provide valuable information. Time and patience will be needed to train analysts in difficult skills and languages.^h Unfortunately, the "time and patience" necessary to develop these operatives is not a luxury the United States can afford. The 9/11 Commission Report describes the rapid nature and lack of warning that defines the current security environment: National security used to be considered by studying foreign frontiers, weighing opposing groups of states, and measuring industrial might.... Threats emerged slowly, often visibly, as weapons were forged, armies conscripted, and units trained and moved into place.... Now threats can emerge quickly. An organization like al Qaeda, headquartered in a country on the other side of the earth, in a region so poor that electricity or telephones were scarce, could nonetheless scheme to wield weapons of unprecedented destructive power in the largest cities of the United States.ⁱ Furthermore, even if the United States succeeds in developing the types of intelligence operatives with the skill sets desired for an effective war against Islamic extremists, the capacity to penetrate these groups will likely never be fully achieved. The problem is that Islamic terrorist groups are highly insulated from outside intrusion because of their family-based and/or clan-based recruitment policies: "Ethnically based terrorist groups recruit new members personally known to them, people whose backgrounds are known and who often have family ties to the organization. Intelligence penetration of organizations recruited this way is extremely difficult."^j Even those organizations that do not recruit exclusively through family ties, such as al Qaeda, still employ a severe level of vetting that places an operative's survival in jeopardy. Regional dialects, local cultural sensitivities and "six-degrees-of-separation" within small populations all work against an operative attempting to secure a terrorist leader's trust. Recognizing these difficulties, Rich Trojan Horses · 143 and Betts summarizes this operational reality: "More and better spies will help, but no one should expect breakthroughs if we get them. It is close to impossible to penetrate small, disciplined, alien organizations like Osama bin Laden's al Qaeda, and especially hard to find reliable U.S. citizens who have even a remote chance of trying."^k Nevertheless, the intelligence community should pursue HUMINT reform that will develop operatives with penetration potential, but accessing the inner circles of terror groups may take years to materialize, or may even be impossible. For example, if the operative is accepted by a terror group, he may be isolated or removed from the organization's hierarchy, leaving the operative uninformed as to what other groups within the same organization are planning, including the cell within which he may be operating.^l Therefore, recognizing the U.S. HUMINT deficiency, the lengthy process of comprehensive reform, the unpredictable nature of

terrorism as a constant imminent threat, and the insulated structure of terrorist groups, the United States will need to employ creative methods to collect information without jeopardizing long-term intelligence reform. Bruce Hoffman suggests “some new, ‘out-of-the-box’ thinking that would go beyond simple bureaucratic fixes.” One possibility is taking a backdoor approach to penetrating various fundamentalist terrorist organizations. SOLUTION PROPOSED: WORK WITH THE TOOLS WE HAVE The Backdoor One backdoor ripe for exploitation is the dependence of Islamic extremists on illicit activities and services to fund, train, and/or facilitate their operations. The “Achilles heel” of terror groups is their dependence on criminal or other interconnected terrorist groups to provide certain services to them, specifically weapons and drug smuggling. The United States should exploit this dependence and has the capacity to do The “Achilles heel” of terror groups is their dependence on criminal or other interconnected terrorist groups to provide certain services to them, specifically weapons and drug smuggling. 144 · International Affairs Review so. This backdoor should be envisioned just as the name connotes: an alternative entrance that is easier to sneak into than the front door. In the world of computer programming, a backdoor is “an undocumented way of gaining access to a program, online service or an entire computer system. The backdoor is written by the programmer who creates the code for the program. It is often only known by the programmer. A backdoor is a potential security risk.” when hackers discover backdoors in software programs, they exploit them. The U.S. intelligence community should adopt the hackers’ approach; infiltration agents should be looking for similar types of alternative access routes.

No NSA overload – Accumulo tech solves.

Harris ‘13

(Not Scott Harris, because large data sets do sometimes overwhelm him... But Derrick Harris. Derrick in a senior writer at Gigaom and has been a technology journalist since 2003. He has been covering cloud computing, big data and other emerging IT trends for Gigaom since 2009. Derrick also holds a law degree from the University of Nevada, Las Vegas. This evidence is also internally quoting Adam Fuchs – a former NSA employee that was involved in software design. “Under the covers of the NSA’s big data effort” – Gigaom - Jun. 7, 2013 - <https://gigaom.com/2013/06/07/under-the-covers-of-the-nsas-big-data-effort/>)

The NSA’s data collection practices have much of America — and certainly the tech community — on edge, but sources familiar with the agency’s technology are saying the situation isn’t as bad as it seems. Yes, the agency has a lot of data and can do some powerful analysis, but the argument goes, there are strict limits in place around how the agency can use it and who has access. Whether that’s good enough is still an open debate, but here’s what we know about the technology that’s underpinning all that data. The technological linchpin to everything the NSA is doing from a data-analysis perspective is Accumulo — an open-source database the agency built in order to store and analyze huge amounts of data. Adam Fuchs knows Accumulo well because he helped build it during a nine-year stint with the NSA; he’s now co-founder and CTO of a company called Sqrl that sells a commercial version of the database system. I spoke with him earlier this week, days before news broke of the NSA collecting data from Verizon and the country’s largest web companies. The NSA began building Accumulo in late 2007, Fuchs said, because they were trying to do automated analysis for tracking and discovering new terrorism suspects. “We had a set of applications that we wanted to develop and we were looking for the right infrastructure to build them on,” he said. The problem was those technologies weren’t available. He liked what projects like HBase were doing by using Hadoop to mimic Google’s famous BigTable data store, but it still wasn’t up to the NSA requirements around scalability, reliability or security. So, they began work on a project called CloudBase, which eventually was renamed Accumulo. Now, Fuchs said, “It’s operating at thousands-of-nodes scale” within the NSA’s data centers. There are multiple instances each storing tens of petabytes (1 petabyte equals 1,000 terabytes or 1 million gigabytes) of data and it’s the backend of the agency’s most widely used analytical capabilities. Accumulo’s ability to handle data in a variety of formats (a characteristic called “schemaless” in database jargon) means the NSA can store data from numerous sources all within the database and add new analytic capabilities in days or even hours. “It’s quite critical,” he added. What the NSA can and can’t do with all this data As I explained on Thursday, Accumulo is especially adept at analyzing trillions of data points in order to build massive graphs that can detect the connections between them and the strength of the connections. Fuchs didn’t talk about the size of the NSA’s graph, but he did say the database is designed to handle months or years worth of information and let analysts move from query to query very fast. When you’re talking about analyzing call records, it’s easy to see where this type

of analysis would be valuable in determining how far a suspected terrorist's network might spread
and who might be involved.

Accumulo solves without violating privacy.

Henschen '13

Doug Henschen is Executive Editor of InformationWeek, where he covers the intersection of enterprise applications with information management, business intelligence, big data and analytics. He previously served as editor in chief of Intelligent Enterprise, editor in chief of Transform Magazine, and Executive Editor at DM News. He has covered IT and data-driven marketing for more than 15 years. "Defending NSA Prism's Big Data Tools"- Information Week - Commentary - 6/11/2013 - <http://www.informationweek.com/big-data/big-data-analytics/defending-nsa-prisms-big-data-tools/d/d-id/1110318?>

The more you know about NSA's Accumulo system and graph analysis, the less likely you are to suspect

Prism is a privacy-invading fishing expedition. It's understandable that democracy-loving citizens everywhere are outraged by the idea that the U.S. Government has back-door access to digital details surrounding email messages, phone conversations, video chats, social networks and more on the servers of mainstream service providers including Microsoft, Google, Yahoo, Facebook, YouTube, Skype and Apple. But the more you know about the technologies being used by the National Security Agency (NSA), the agency behind the controversial Prism program revealed last week by whistleblower Edward Snowden, the less likely you are to view the project as a ham-fisted effort that's "trading a cherished American value for an unproven theory," as one opinion piece contrasted personal privacy with big data analysis. The centerpiece of the NSA's data-processing capability is Accumulo, a highly distributed, massively parallel processing key/value store capable of analyzing structured and unstructured data. Accumulo is based on Google's BigTable data model, but NSA came up with a cell-level security feature that makes it possible to set access controls on individual bits of data. Without that capability, valuable information might remain out of reach to intelligence analysts who would otherwise have to wait for sanitized data sets scrubbed of personally identifiable information. Sponsor video, mouseover for sound [Want more on the Prism controversy? Read NSA Prism: Inside The Modern Surveillance State.] As InformationWeek reported last September, the NSA has shared Accumulo with the Apache Foundation, and the technology has since been commercialized by Sqrl, a startup launched by six former NSA employees joined with former White House cybersecurity strategy director (and now Sqrl CEO) Ely Khan. "The reason NSA built Accumulo and didn't go with another open source project, like HBase or Cassandra, is that they needed a platform where they could tag every single piece of data with a security label that dictates how people can access that data and who can access that data," said Khan in an interview with InformationWeek. Having left government employment in 2010, Kahn says he has no knowledge of the Prism program and what information the NSA might be collecting, but he notes that Accumulo makes it possible to interrogate certain details while blocking access to personally identifiable information. This capability is likely among the things James R. Clapper, the U.S. director of National Intelligence, was referring to in a statement on the Prism disclosure that mentioned "numerous safeguards that protect privacy and civil liberties." Are They Catching Bad Guys? So the NSA can investigate data with limits, but what good is partial information? One of Accumulo's strengths is finding connections among seemingly unrelated information. "By bringing data sets together, [Accumulo] allowed us to see things in the data that we didn't necessarily see from looking at the data from one point or another," Dave Hurry, head of NSA's computer science research section, told InformationWeek last fall. Accumulo gives NSA the ability "to take data and to stretch it in new ways so that you can find out how to associate it with another piece of data and find those threats."

Aff exaggerates – NSA budget's too small for untargeted mass data collection

Harris '13

(Not Scott Harris, because large data sets do sometimes overwhelm him... But Derrick Harris. Derrick in a senior writer at Gigaom and has been a technology journalist since 2003. He has been covering cloud computing, big data and other emerging IT trends for Gigaom since 2009. Derrick also holds a law degree from the University of Nevada, Las Vegas. This evidence is also internally quoting Adam Fuchs – a former NSA employee that was involved in software design. "Under the covers of the NSA's big data effort" – Gigaom - Jun. 7, 2013 - <https://gigaom.com/2013/06/07/under-the-covers-of-the-nsas-big-data-effort/>)

We're not quite sure how much data the two programs that came to light this week are actually collecting, but the evidence suggests it's not that much — at least from a volume perspective. Take the PRISM program that's gathering data from web properties including Google, Facebook, Microsoft, Apple, Yahoo and AOL. It seems the NSA would

have to be selective in what it grabs. Assuming it includes every cost associated with running the program, **the \$20 million per year allocated to PRISM**, according to the slides published by the Washington Post, **wouldn't be nearly enough to store all the raw data—much less new datasets created from analyses— from such large web properties. Yahoo alone**, I'm told, **was spending over \$100 million a year to operate its** approximately 42,000-node Hadoop environment, consisting of hundreds of **petabytes**, a few years ago. **Facebook users are generating more than 500 terabytes of new data every day. Using** about **the least-expensive option** around **for mass storage**— cloud storage provider Backblaze's open source storage pod designs — just storing 500 terabytes of Facebook data a day **would cost more than \$10 million in hardware alone over the course of a year.** Using higher-performance hard drives or other premium gear — things Backblaze eschews because it's concerned primarily about cost and scalability rather than performance — would cost even more. Even at the Backblaze price point, though, which is pocket change for **the NSA**, the agency **would easily run over \$20 million trying to store too many emails, chats, Skype calls, photos, videos and other types data** from the other companies it's working with.

Big Data can handle it.

Pontius '14

Brandon H. Pontius. The author holds a B.S. from Louisiana State University and an M.B.A., Louisiana State University. The author wrote this piece in partial fulfillment of a MASTER OF SCIENCE IN COMPUTER SCIENCE from the NAVAL POSTGRADUATE SCHOOL. The thesis advisor that reviewed this piece is Mark Gondree, PhD. Gondree is a security researcher associated with the Computer Science Dept at the Naval Postgraduate School – “INFORMATION SECURITY CONSIDERATIONS FOR APPLICATIONS USING APACHE ACCUMULO” - September 2014 - http://calhoun.nps.edu/bitstream/handle/10945/43980/14Sep_Pontius_Brandon.pdf?sequence=1

Generation of actionable intelligence from large data sets requires efficient analysis. Manual analysis of large data sets to develop these insights is unsustainably resource intensive. In January 2014, the deputy director of the Defense Intelligence Agency noted, “We’re looking for needles within haystacks while trying to define what the needle is, in an era of declining resources and increasing threats” [7]. **Big data platforms have the storage and analytical capabilities necessary to handle large data sets. These solutions can relieve the processing burden on human analysts and allow them to spend more time generating real intelligence** [5]. **Big data analytics make information more usable, improve decision making, and lead to more focused missions** and services. For instance, geographically separated teams can access a real-time common operating picture, **diagnostic data mining can support proactive maintenance programs that prevent battlefield failures**, and data can be transformed into a common structure that allows custom queries by a distributed force composed of many communities [4], [6].

1nc Frontline Resource Wars

() *No resource wars – too expensive and market checks*

Victor '8

David G,- Adjunct Senior Fellow for Science and Technology, Council on Foreign Relations; Director, Program on Energy and Sustainable Development @ Stanford “Smoke and Mirror” <http://www.nationalinterest.org/PrinterFriendly.aspx?id=16530>

MY ARGUMENT is that classic **resource wars**—hot conflicts driven by a struggle to grab resources—**are increasingly rare. Even where resources play a role, they are rarely the root cause of bloodshed.** Rather, the root cause usually lies in various failures of governance. That argument—in both its classic form and in its more nuanced incarnation—is hardly a straw man, as Thomas Homer-Dixon asserts. Setting aside hyperbole, the punditry increasingly points to resources as a cause of war. And so do social scientists and policy analysts, even with their more nuanced views. I’ve triggered this debate because conventional wisdom puts too much emphasis on resources as a cause of conflict. Getting the story right has big implications for social scientists trying to unravel cause-and-effect and often even larger implications for public policy. Michael Klare is right to underscore Saddam Hussein’s invasion of Kuwait, the only classic resource conflict in recent memory. That episode

highlights two of the reasons why classic resource wars are becoming rare—**they're expensive and rarely work.** (And even in Kuwait's case, many other forces also spurred the invasion. Notably, Iraq felt insecure with its only access to the sea a narrow strip of land sandwiched between Kuwait on one side and its archenemy Iran on the other.) In the end, **Saddam lost resources on the order of \$100 billion** (plus his country and then his head) **in his quest for Kuwait's 1.5 million barrels** per day of combined oil and gas output. By contrast, Exxon paid \$80 billion to get Mobil's 1.7 million barrels per day of oil and gas production—a merger that has held and flourished. **As the bulging sovereign wealth funds are discovering, it is easier to get resources through the stock exchange than the gun barrel.**

() *Chinese Resource War claims are false*

Victor '7

(David G.- Adjunct Senior Fellow for Science and Technology, Council on Foreign Relations; Director, Program on Energy and Sustainable Development @ Stanford "What Resource Wars?" 11/12 <http://www.nationalinterest.org/Article.aspx?id=16020>)

RISING **ENERGY prices and** mounting **concerns about environmental depletion have animated fears that the world may be headed for a spate of "resource wars"**—hot conflicts triggered by a struggle to grab valuable resources. Such fears come in many stripes, but **the threat industry has sounded the alarm bells especially loudly in** three areas. First is the rise of **China, which is poorly endowed with many of the resources it needs**—such as oil, gas, timber and most minerals—and has already “gone out” to the world with the goal of securing what it wants. Violent conflicts may follow as the country shunts others aside. A second potential path down the road to resource wars starts with all the money now flowing into **poorly governed** but resource-rich **countries.** Money can fund civil wars and other hostilities, even leaking into the hands of terrorists. And third is global **climate change,** which could multiply stresses on natural resources and trigger water wars, catalyze the spread of disease or bring about mass migrations. **Most of this is bunk,** and nearly all of it has focused on the wrong lessons for policy. **Classic resource wars are good material for Hollywood screenwriters. They rarely occur in the real world.** To be sure, resource money can magnify and prolong some conflicts, but **the root causes of those hostilities usually lie elsewhere.** Fixing them requires focusing on the underlying institutions that govern how resources are used and largely determine whether stress explodes into violence. When conflicts do arise, the weak link isn't a dearth in resources but a dearth in governance.

Ext. No Resource Wars

() *Resource wars are empirically false and won't escalate*

Homer-Dixon '8

(Thomas,- Chair of Peace and Conflict Studies at the Trudeau Centre for Peace and Conflict Studies at the University. of Toronto. "Oil, Oil, Toil and Trouble."– The National Interest – January /February, edition)

Rather, we argue that **resource stress always interacts in complex conjunction with a host of other factors**--ecological, institutional, economic and political--**to cause mass violence**. Also, **causation is almost always indirect**. People, groups and **countries rarely fight over natural resources directly**; instead, resource stress causes various forms of social dislocation--including widening gaps between rich and poor, increased rent-seeking by elites, weakening of states and deeper ethnic cleavages--that, in turn, make violence more likely. And, finally, **this violence is almost always sub-national**; it takes the form of insurgency, rebellion, gangsterism and urban criminality, **not** overt interstate war. **The claim that resource stress is sufficient by itself to cause violence is easily refuted. One simply has to identify cases where resource stress was present but violence didn't occur.** Likewise, the claim that resource stress is a necessary cause of violence is easily refuted by finding cases of violence not preceded by resource stress. At various points in his article, Victor uses exactly these strategies to debunk the link between resources and war.

() *Best studies prove resources have very small effect on warfare.*

Goldstone '2K

(Jack,- professor of public policy, George Mason, Population and Security: How Demographic Change Can Lead to Violent Conflict., JOURNAL OF INTERNATIONAL AFFAIRS, Fall2002, Vol. 56, p. 123)

For example, Wenche Hauge and Tanja Ellingsen, in **the most comprehensive** global **test of the** environmental-**scarcity-leads-to-violence hypothesis** with recent data (1980-92), **found that while deforestation, land degradation and low freshwater** availability **were** positively **correlated with** the incidence of civil war and armed **conflict, the magnitude of their effects was tiny**. By themselves, **these factors raised the probability of civil war by** 0.5 to under **1.5 percent**. These factors did have a slightly higher impact on the probability of lesser kinds of armed conflict (causing increases in the chances of such conflict by from 4 percent to 8 percent); **but their influence paled compared to the impact of such traditional risk factors as poverty, regime type and current and prior political instability.**

Ext. HUMINT fails

HUMINT fails- intelligence officers can't adapt

Sano 1/28 (John, 2015, Former Deputy Director, National Clandestine Service, CIA, "Guide to the Study of Intelligence: The Changing Shape of HUMINT," Draft of paper, <http://www.afio.com/publications/SANO%20Changing%20Shape%20of%20HUMINT%20DRAFT%202015Jan28.pdf//RTF>)

Managing this younger, more technically astute, workforce can be problematic for a number of reasons – not the least of which is the dramatic generational difference when it comes to learning. Today's workforce thinks and processes information significantly differently from its predecessors. As Dr. Bruce Perry of Baylor College of Medicine has stated, "Different kinds of experiences lead to different brain structures."² As such today's workforce receives information much faster than their predecessors. And while reception does not always equal comprehension, it does present an issue for managers as well as for IC instructors. Education within the world of HUMINT is in large measure "anecdotally based," with instruction incorporating legacy-based scenarios, or "tribal memories" to emphasize key points. While useful, it is often a technique that many younger practitioners of espionage find unfamiliar,

even ineffective. Growing up on a regular diet of technology driven information today's clandestine officer is better connected and more adept at multitasking and networking than previous generations. Adjusting to this significant divide is often difficult, for most instructors view education in much the same way as they themselves were taught – via lectures, step-by-step logic and “tell-test” instruction. Today's officers are more comfortable with procedures that they grew up with – TV, Internet, video cams, cell phones and all the other accretions associated with the digital age. What does this mean? Aside from the way today's officers want to learn, it also impacts expectations. Today's clandestine service officer expects to access any information, anytime, anywhere, and on any device. Aside from the obvious security aspects, there is also the problem of managing these expectations – attempting to inculcate the proper balance of security vs. expediency, not to mention patience within an increasingly impatient workforce is no easy task, but nonetheless critical aspect of any clandestine activity.

HUMINT is a bad form of intelligence gathering – 7 reasons

Turner ,05 -Dr. Michael A. Turner teaches at both San Diego State University and the University of San Diego. He is also a consultant to the United States Government on national security matters. Until 2006, Dr. Turner was the Director of International Relations Program at Alliant International University in San Diego, CA. Before joining Alliant, Dr. Turner was a senior CIA officer, attached both to the analytical directorate as well as to elements supporting the Director of Central Intelligence. At varying times, Dr. Turner has taught strategic affairs at the University of Maryland, the University of Virginia, Johns Hopkins University, the University of Southern California, and the Air War College. Dr. Turner's research interests include intelligence and national security, American foreign policy, Middle East as well as Central and South Asian Politics, and counterterrorism policy. Dr. Turner teaches both graduate and undergraduate international relations courses. (Michael A., “Why Secret Intelligence Fails”, pg 92, accessed 6-30-15)//KTC

On the other hand, HUMINT's disadvantages probably outweigh its advantages. One, American case officers may not have sufficient training and know-how to perform their jobs well. According to the one analyst, CIA operatives are not particularly well prepared; they seldom speak foreign languages well and almost never know a line of business or a technical field.¹³ Two, the process of recruiting spies is time consuming and lengthy, which often brings into question the benefits of such an activity in relation to its cost. Three, HUMINT information is highly perishable and therefore has a low threshold of utility. Four, HUMINT is often vulnerable to deception and double- agent operations. Five, spying is illegal everywhere, and case officers who have been caught in the process of recruitment have embarrassed the U.S. government and damaged relations with both unfriendly and friendly governments. Six, espionage is risky to the lives of the intelligence agents and their assets. Seven, because HUMINT assets are often employed in covert actions, espionage operations sometimes become corner shed in political controversies at home. Eight, many people believe that spying is ethically wrong, an activity that diminishes the moral standing of the United States around the globe.

Ext. Accumulo checks overload

() *Data overload wrong – Accumulo tech solves*

Gallagher '13

Sean Gallagher is the IT editor at Ars Technica. Sean is a University of Wisconsin grad, a former systems integrator, a former director of IT strategy at Ziff Davis Enterprise. He wrote his first program in high school – “What the NSA can do with “big data”” - Ars Technica - Jun 11, 2013 - <http://arstechnica.com/information-technology/2013/06/what-the-nsa-can-do-with-big-data/2/>

Ironically, about the same time these two programs were being exposed, Internet companies such as **Google and Yahoo were solving the big data storage and analysis problem**. In November of 2006, Google published a paper on BigTable, a database with petabytes of capacity capable of indexing the Web and supporting Google Earth and other applications. And **the** work at Yahoo to catch up with Google's GFS file system—the basis for BigTable—resulted in the Hadoop. BigTable and Hadoop-based **databases offered a way to handle huge amounts of data being captured by the NSA's operations, but they lacked** something critical to intelligence operations: compartmentalized **security** (or any security at all, for that matter). **So** in 2008, **NSA set out to create a better version** of BigTable, **called Accumulo**—now an Apache Foundation project. Accumulo is a “NoSQL” database, based on key-value pairs. It's a design similar to Google's BigTable or Amazon's DynamoDB, but **Accumulo has special security features designed for the NSA, like multiple levels of security access**. The program is built on the open-source Hadoop platform and other Apache products. One of those is called Column Visibility—a capability that allows individual items within a row of data to have different classifications. That allows users and applications with different levels of authorization to access data but see more or less information based on what each column's “visibility” is. Users with lower levels of clearance wouldn't be aware that the column of data they're prohibited from viewing existed. **Accumulo also can generate near real-time reports from specific patterns in data, so, for instance, the system could** look for specific words or addressees in e-mail messages that come from a range of IP addresses; or, it could look for phone numbers that are two degrees of separation from a target's phone number. Then it can **spit** those **chosen e-mails or phone numbers into another database, where NSA workers could peruse it at their leisure. In other words, Accumulo allows the NSA to do what Google does** with your e-mails and Web searches—**only with everything that flows across the Internet**, or with every phone call you make. **It works because of a type of server process called “iterators.”** These pieces of code constantly process the information sent to them and send back reports on emerging patterns in the data. Querying a multi-petabyte database and waiting for a response would be deadly slow, especially because there is always new data being added. **The iterators are like NSA's tireless data elves.**

() *No NSA data overload - Accumulo checks.*

Kelly '12

Jeff Kelly is a Principal Research Contributor at The Wikibon Project and a Contributing Editor at SiliconANGLE. He focuses on trends in Big Data and business analytics. His research has been quoted and referenced by the Financial Times, Forbes, CIO.com, Network World, GigaOM, TechTarget and more – “Accumulo: Why The World Needs Another NoSQL Database” – Wikibon Blog – August 20th - <http://wikibon.org/blog/breaking-analysis-accumulo-why-the-world-needs-another-nosql-database/>

If you've been unable to keep up with all the competing NoSQL databases that have hit the market over the last several years, you're not alone. To name just a few, there's HBase, Cassandra, MongoDB, Riak, CouchDB, Redis, and Neo4J. To that list you can **add Accumulo, an open source database originally developed at the National Security Agency**. You may be wondering why **the world needs** yet **another database to handle** large volumes of multi-structured data. The answer is, of course, that no one of these NoSQL databases has yet checked all the feature/functionality boxes that most enterprises require before deploying a new technology. In the Big Data world, that means the ability to handle the three V's (**volume, variety and velocity**) of data, the ability to process multiple types of workloads (analytical vs. transactional), and the ability to maintain ACID (atomicity, consistency, isolation and durability) compliance at scale. With each new NoSQL entrant, hope springs eternal that this one will prove the NoSQL messiah. So what makes Accumulo different than all the rest? According to proponents, **Accumulo is capable of maintaining consistency even as it scales to thousands of nodes and**

petabytes of data; it can both read and write data in near real-time; and, most importantly, it was built from the ground up with cell-level security functionality.

Ext. Accumulo solves privacy

Accumulo tech solves overload – and does so without mass privacy violations.

Jackson ‘13

Joab Jackson covers enterprise software and general technology breaking news for the IDG News Service, and is based in New York. “NSA's Accumulo data store has strict limits on who can see the data” - PC World - Oct 31, 2013 - <http://www.pcworld.com/article/2060060/nsas-accumulo-nosql-store-offers-rolebased-data-access.html>

With its much-discussed enthusiasm for collecting large amounts of data, the NSA naturally found much interest in the idea of highly scalable NoSQL databases. But the U.S. intelligence agency needed some security of its own, so it developed a NoSQL data store called Accumulo, with built-in policy enforcement mechanisms that strictly limit who can see its data. At the O'Reilly Strata-Hadoop World conference this week in New York, one of the former National Security Agency developers behind the software, Adam Fuchs, explained how Accumulo works and how it could be used in fields other than intelligence gathering. The agency contributed the software's source code to the Apache Software Foundation in 2011. “Every single application that we built at the NSA has some concept of multi-level security,” said Fuchs, who is now the chief technology officer of Sqrl, which offers a commercial edition of the software. The NSA started building Accumulo in 2008. Much like Facebook did with its Cassandra database around the same time, the NSA used the Google Big Table architecture as a starting point. In the parlance of NoSQL databases, Accumulo is a simple key/value data store, built on a shared-nothing architecture that allows for easy expansion to thousands of nodes able to hold petabytes worth of data. It features a flexible schema that allows new columns to be quickly added, and comes with some advanced data analysis features as well. Accumulo's killer feature Accumulo's killer feature, however, is its “data-centric security.” Fuchs said. When data is entered into Accumulo, it must be accompanied with tags specifying who is allowed to see that material. Each row of data has a cell specifying the roles within an organization that can access the data, which can map back to specific organizational security policies. It adheres to the RBAC (role-based access control) model. This approach allowed the NSA to categorize data into its multiple levels of classification—confidential, secret, top secret—as well as who in an organization could access the data, based on their official role within the organization. The database is accompanied by a policy engine that decides who can see what data. This model could be used anywhere that security is an issue. For instance, if used in a health care organization, Accumulo can specify that only a patient and the patient's doctor can see the patient's data. The patient's specific doctor may change over time, but the role of the doctor, rather than the individual doctor, is specified in the database. The NSA found that the data-centric approach “greatly simplifies application development.” Fuchs said. Because data today tends to be transformed and reused for different analysis applications, it makes sense for the database itself to keep track of who is allowed to see the data, rather than repeatedly implementing these rules in each application that uses this data.

North Korea

1nc Frontline

Squo solves North Korean nuclear detection

Dahl 14 (Frederick, May 9th, Reuters, “Monitoring body 'ready to detect' any North Korea nuclear test,” <http://www.reuters.com/article/2014/05/09/us-northkorea-nuclear-ctbto-idUSBREA480FL20140509//RTF>)

The global nuclear test monitoring agency would quickly detect seismic signs of any new underground atomic explosion conducted by North Korea and inform member states, its head said on Friday. The United States said last month it was watching the Korean peninsula closely after reports that North Korea may be planning a fourth nuclear test since 2006, and it urged Pyongyang not to take any step that would threaten regional peace. The Comprehensive Test Ban Treaty

Organization (CTBTO), set up in the mid-1990s, says it now has more than 85 percent of a planned worldwide network of 337 facilities up and running to check the planet for any atomic bomb testing. The Vienna-based CTBTO's International Monitoring System consists of stations designed to pick up seismic, radionuclide, infrasound or hydroacoustic signals. "The normal (mode) of the organization is being highly on alert," Lassina Zerbo, CTBTO executive secretary, told Reuters when asked about the possibility of a North Korean nuclear test. "I can assure you that we are always ready to detect anything, anywhere, anytime," he said. "We stand ready to face any type of test or event." The first, almost immediate indication would likely be in the form of seismic shockwaves, while it could take weeks to pick up any "smoking gun" radioactive traces, if at all. When North Korea last detonated a nuclear device - in February 2013 - the CTBTO detected radioactive gases that could have come from the explosion only about two months later. Zerbo said this remained "unique" as it had not been picked up by anybody else, including the five recognized nuclear weapon states - the United States, China, Russia, Britain and France. "None of those countries were able to detect this sniff of radio-isotope 50 days or so after the test," he said. The impoverished North, which routinely threatens the United States and South Korea with destruction, warned in March it would not rule out a "new form" of atomic test after the U.N. Security Council condemned the country's launch of a mid-range ballistic missile into the sea east of the Korean peninsula. "I'm hoping that it is only rumors and that they will not cross that red line in pursuing the fourth nuclear test," Zerbo said. "They have been warned by the international community." North Korea is already subject to U.N. sanctions over its previous three atomic tests. TEST BAN NOT YET LAW Zerbo, a geophysicist from Burkina Faso who took office last year, also called on countries which have yet to ratify the test ban treaty to do so in order for it to finally become international law. There is widespread international support for the pact, which has been ratified by more than 160 states, but it cannot come into effect because some nuclear powers like the United States and China have not yet taken that step. Proponents argue U.S. ratification of the pact - which they say has helped to dramatically cut the number of tests since the Cold War with only North Korea setting off an atomic device in this century - could encourage other holdouts to sign on. But, "any of the eight remaining countries should show leadership," Zerbo said, referring to all those whose ratification is still required, also including India, Pakistan, Israel, Iran, North Korea and Egypt. He said Israel - assumed to be the Middle East's only nuclear-armed country - could become the next to ratify, saying there had been "positive" signs when he visited it in March. President Barack Obama's administration argues that the United States no longer needs to conduct nuclear tests. But the Senate needs to approve the treaty, which it rejected in 1999. Opponents argued at the time that a formal, permanent end to testing could erode the reliability of the U.S. nuclear arsenal and some also questioned whether cheaters could be detected. U.S. Under Secretary for Arms Control and International Security, Rose Gottemoeller, said last month that despite the treaty's clear merits, "we need time to educate the public and Congress to build support for U.S. ratification"

North Korea war is unlikely and won't start by accident.

Farley 13 — Robert Farley, assistant professor at the Patterson School of Diplomacy and International Commerce at the University of Kentucky, 2013 ("North Korea and the Fallacy of Accidental Wars," *The Diplomat*, April 5th, accessible online at <http://thediplomat.com/2013/04/north-korea-and-the-fallacy-of-accidental-wars/>, accessed on 6-22-15)

Few wars happen by accident. Given the situation on the Korean Peninsula, a war seems unlikely, as none of the combatants stand to benefit.

Accidental wars rarely happen. Historians have demonstrated that most wars initially deemed "accidental," (perhaps most notably the First World War), have in actuality resulted from deliberative state policy, even if the circumstances of the war were unplanned. While war seems discordant, it actually requires a great deal of cooperation and coordination. Fundamentally, two parties have to agree to conduct a war; otherwise, you have either a punitive raid or an armed surrender negotiation.

Consequently, the baseline for evaluating the chances for accidental war on the Korean Peninsula should be judged as quite low. South Korea, in all likelihood, views the prospect of decisive victory against North Korea as worse than the status quo. The United States has no interest in fighting a war against the DPRK at the moment. For example, the sinking of the Cheonan was obviously an act of war, but neither the United States nor South Korea were interested in fighting

a war on the terms offered. While we know less about the strategic calculus of North Korea, there is little reason to think that North Korea was interested in war, either; it probed South Korean capabilities and resolve, but did not press the issue in ways that could have forced Seoul's hand.

Ext. Detection Now

CTBT Verification system Solves

Wächter 2014 (Elisabeth, December 9th, Chief of Public Information for CTBTO, "LARGEST-EVER CTBT ON-SITE INSPECTION EXERCISE CONCLUDES SUCCESSFULLY," <https://www.ctbto.org/press-centre/press-releases/2014/largest-ever-ctbt-on-site-inspection-exercise-concludes-successfully/>)//RTF

The most sophisticated on-site inspection exercise conducted to date by the Comprehensive Nuclear-Test-Ban Treaty Organization (CTBTO) formally concludes this week. The Integrated Field Exercise IFE14 in Jordan started on 3 November and involved four years of preparation, 150 tonnes of specialized equipment and over 200 international experts. CTBTO Executive Secretary Lassina Zerbo said: "Through this exercise, we have shown the world that it is absolutely hopeless to try to hide a nuclear explosion from us. We've now mastered all components of the verification regime, and brought our on-site inspection capabilities to the same high level as the other two components, the 90% complete network of monitoring stations and the International Data Centre." During the five-week long exercise, the inspection team searched an inspection area of nearly 1,000 square kilometres using 15 of the 17 techniques permissible under the Comprehensive Nuclear-Test-Ban Treaty (CTBT). Some of these state-of-the-art techniques were used for the first time in an on-site inspection context, including equipment to detect traces of relevant radioactive noble gases on and beneath the ground as well as from the air. Other techniques scanned the ground in frequencies invisible to the human eye. Key pieces of equipment were provided by CTBTO Member States as voluntary and in-kind contributions.

Throughout the inspection, the team narrowed down the regions of interest to one limited area where relevant features including traces of relevant radionuclides were successfully found.

Inspection team leader Gregor Malich said: "We started off with the 1,000 square kilometres specified in the inspection request, using all available information provided. We also used satellite imagery and archive information for planning the initial inspection activities. Once in the field, the team conducted overflights, put out a seismic network and undertook wide area ground-based visual observation as well as radiation measurements. This helped us narrow down the areas of interest to more than 20 polygons which we then inspected in more detail. In the end, we detected radionuclides relevant for the on-site inspection and indicative of a nuclear explosion. At this location, the team also applied geophysical methods to find signatures (tell-tale signs) consistent with a recent underground nuclear explosion." The exercise also tested the CTBTO's elaborate logistical system, which features specially developed airfreight-compatible containers that allow for field equipment, sensors or generators to be used straight from the containers. Thanks to a strict safety and security regime, not a single health or security incident occurred throughout the exercise.

We can already detect North Korean nuclear tests

Williams 13 (Martyn, April 24th, The Guardian, "North Korea: Radioactive gases 'consistent with' nuclear test detected," <http://www.theguardian.com/world/2013/apr/24/north-korea-nuclear-radiation/>)//RTF

A nuclear monitoring station in Japan has recorded what could be the first radioactive noble gases from February's nuclear test in North Korea. The station in Takasaki, about 1,000km from North Korea's Punggye-ri nuclear test site, is operated by the Comprehensive Nuclear Test Ban Treaty Organization, which made the announcement yesterday. Radioactive isotopes of the noble gas xenon – xenon-131m and xenon-133 – were detected, something the organisation called "rather unusual." The measurements, almost two months after Pyongyang said it had carried out the underground detonation, gave no indication of whether plutonium or highly enriched uranium was used, the organisation said. The time that had passed before the so-called noble gases were picked up made it "very difficult" to distinguish between the two fissile materials, said spokeswoman Annika

Thunborg. Noble gases are one of four things the organisation looks out for in its nuclear monitoring process, because the gases can be released by either slowly seeping through rock and sediment from underground to the surface after a nuclear test or come from activity at a test site. The Comprehensive Nuclear Test Ban Treaty Organization said the ratio of the detected xenon isotopes is consistent with a nuclear fission event occurring more than 50 days before the detection, matching the timeframe for the North Korean nuclear test. Further, atmospheric modeling indicates the isotopes could be carried from Punggye-ri to Takasaki. But the organisation isn't quite ready yet to say the detection is definitely linked to the February test in North Korea. "We are in the process of eliminating other possible sources that could explain the observations; the radionuclides could have come from a nuclear reactor or other nuclear activity under certain specific conditions, but so far we do not have information on such a release," Mika Nikkinen said in a statement. The Comprehensive Nuclear Test Ban Treaty Organization's monitoring system was one of the first to indicate that North Korea had conducted its nuclear test. The organisation maintains almost 100 stations monitoring the tell-tale seismic activity that occurs with a nuclear test. On 12 February those stations recorded the event at 2:57:51 UTC (11:57:51 local time). The test was measured at magnitude 4.9 and located at latitude 41.313 degrees north and longitude 129.101 degrees east.

We can verify nuclearization now- CTBT safeguards are effective

Wolfsthal 13 (John, 4/24/13, Deputy Director, James Martin Center for Nonproliferation Studies, "Detection of North Korea Test Shows CTBT Can Be Verified," http://www.huffingtonpost.com/jon-wolfsthal/north-korea-nuclear-verification_b_3140106.html)//RTF

One of the strongest concerns expressed by those who oppose American approval of the Comprehensive Test Ban Treaty (CTBT) is that of verification. News on Tuesday that in addition to the 94 seismic sensors that detected the actual detonation on February 12 of an alleged North Korean nuclear weapon, the verification system set up by the CTBT has detected radioactive particles in the air all but put to rest the legitimacy of those concerns. If, despite significant efforts by North Korea to ensure that no tell-tale gases escaped the underground test site, the system put in place by the Treaty has registered that material, it strongly supports what the United States government has been saying about the CTBT for over 15 years -- the CTBT is effectively verifiable. Debates over the value of arms control agreement often center on the issue of verification -- can you be sure that cheating will be detected? This is the right debate to have as no one wants to put agreements in place that cannot deter or detect significant cheating. The verification system to be put in place under the CTBT, however, has been unfairly maligned by those who oppose the treaty of philosophical grounds. Can people create fantastic hypothetical cases that might reduce the confidence that the monitoring network might detect a small event? Of course they can. But in the real world, where states have to operate, it now appears that despite their best efforts to prevent the release of noble gases from the test site, North Korea -- exactly the kind of state we would want to monitor with the CTBT, has failed. By any stretch of the imagination, the seismic readings alone have been and would be enough to trigger an on-site inspection under the CTBT, were it to be in force. Detection of unique gases released from nuclear explosions would be icing on the cake and make even the most reluctant treaty member keenly aware that a possible violation has taken place. Other critical issues that will have to be addressed if and when the Treaty is brought up for consideration in the United States Senate include the ability of the United States to maintain its nuclear deterrent in the absence of nuclear testing. To be sure, a national consensus about how large a nuclear arsenal we need and what maintaining it should cost are desperately needed conversations. But the capabilities of the CTBT system, backed up by American intelligence means, are now demonstrably capable of detecting clandestine, underground nuclear tests making the treaty effectively verifiable. This position, confirmed through a National Academy of Sciences report issued in 2010, has now been validated in the real world and it would be nice if members of the Senate decided to visit there.

Ext. No War

Zero risk of a premeditated attack- deterrence checks

Kimball 14 (Daryl, October 31st, Daryl Kimball is executive director of the Arms Control Association, “Will North Korea ever use its nuclear weapons?,” <http://www.theguardian.com/world/2014/oct/31/sp-north-korea-nuclear-weapons>)//RTF

North Korea’s nuclear weapons test explosion on 12 February 2013 – its third – has been the single-most worrisome development in recent years. The blast was conducted in defiance of Pyongyang’s lone remaining ally, China. The explosion was the first under the reign of Kim Jong-un, a signal that he was doubling down on a more confrontational approach vis-à-vis the rest of the world rather than seeking a more moderate path. One more test does not fundamentally change the security threat North Korea poses. But this test, unlike the two previous ones, produced a significant yield of about six to seven kilotons. The use of highly enriched uranium is significant because North Korea’s plutonium supply is limited, perhaps enough for fewer than 10 bombs. The use of highly enriched uranium is significant because North Korea’s plutonium supply is limited, perhaps enough for fewer than 10 bombs. If its nuclear and missile programmes continue unchecked, the risk that Pyongyang sells fissile material to another country or to terrorists in exchange for much-needed hard currency could increase. Denuclearisation is still possible, but for now it should not be the precondition for resuming diplomatic efforts to halt further North Korean nuclear and missile advances. Further sanctions on the North through the UN security council are certainly justified in the wake of the latest nuclear test, but by themselves, will not produce adequate results. China must recognise that Pyongyang’s continued nuclear pursuits represent a direct threat to its long-term interests and security. Its leaders must take stronger steps to implement existing UN sanctions. North Korea’s leaders still appear to be willing to abandon portions of their nuclear weapons programme in exchange for improved relations with the US, a formal end to the Korean war, and the possibility of much-needed energy and economic support. As president Ronald Reagan once said, “a nuclear war can never be won and must never be fought”. North Korea does not have, and will not have for many years, the means to strike with nuclear weapons beyond the peninsula – that would be suicide. Combined US and South Korean forces would end the Kim dynasty and destroy much of the country. Therefore, there is a near zero chance of a premeditated North Korean nuclear attack. The serious risk of miscalculations by either side could increase over time if leaders in Seoul make the mistake of trying to develop their own independent nuclear weapons capability – which is all the more reason to renew efforts to freeze, and then later reverse, North Korea’s nuclear and missile programmes.

War is unlikely — North Korea is a rational actor, claims are just rhetoric.

Murray and Cox 13 – Robert W. Murray is an Adjunct Professor of Political Science at the University of Alberta, Canada — Dan G. Cox is an Associate Professor of Political Science at the School of Advanced Military Studies, 2013 (“Crazy, Irrational, or Under Pressure? Why War with North Korea is Unlikely,” *E-Ir*, April 21st, accessible online at <http://www.e-ir.info/2013/04/21/crazy-irrational-or-under-pressure-why-war-with-north-korea-is-unlikely/>, accessed on 6-23-15)

There is certainly cause for concern when tensions continue to increase as the tit-for-tat game between the North Korean regime and the United States goes on, but we contend war is still unlikely unless continued misperceptions persist. As a new and young leader, Kim Jong-un is working through a process of trying to appease military hardliners that may question his ability to lead and just how far he will go to stand up to the United States. The cult of personality in North Korea can only be sustained if the divine claims about the abilities of the leader persist, and so it should come as little surprise that promises of world destruction have become louder and louder. Further, the nuclear variable is a constant source of fear for states, as is the case whenever a new member of the nuclear club emerges, particularly one with a reputation of being irrational according to western political standards.

Even so, by looking closely at the situation, it is difficult to genuinely believe that war is imminent. To date, North Korea has not successfully tested a model of delivery that would see a nuclear weapon capable of reaching US territory, including Guam and/or Hawaii. A rocket test is a far cry from an armed nuclear warhead attached to the rocket. Moving beyond the technological limitations, there is no evidence to date that would suggest Kim Jong-un is ready or willing to commit an entirely irrational act of preemptive strikes against the United States or its allies. Obtaining a nuclear weapon does not automatically signal that a state will become an aggressor. In fact, quite the opposite is true, as the logic of Mutual Assured Destruction (or, in this case, assured destruction of North Korea) still applies and though we might question the sanity of a leader or state apparatus, rationality calculations are an entirely different thing. The same causal logic can be applied to Iran, or any other nuclear state. Wanting a bomb, developing a bomb, and having a bomb does not mean the use of a bomb. If it did, it is probable the world would have seen nuclear war well before now.

Even if war occurs, nuclear escalation is unlikely.

Wall 13 — Mike Wall, Freelance Journalist — Internally citing Union of Concerned Scientist reports about North Korean nuclear probability and capabilities, 2013 (“North Korea Nuclear Strike on US Unlikely,” *Space.com*, April 5th, accessible online at <http://www.space.com/20527-north-korea-nuclear-threat-united-states.html>, accessed on 6-22-15)

There's little reason to believe that North Korea can actually make good on its recent threats to turn major American cities into "seas of fire," experts say.

Angered by United Nations sanctions and joint U.S./South Korean military exercises, Pyongyang has been ramping up its bellicose rhetoric over the past few weeks, threatening to launch nuclear strikes on Washington, D.C. and other parts of the American mainland.

But the available evidence suggests that North Korea's missiles cannot deliver nuclear warheads to such distant targets, analysts say. Further, the regime likely has just a handful of nuclear weapons, which it may not want to put atop missiles of questionable reliability.

"If I were in South Korea and this were ratcheting up, if I were in Japan — you might worry about chemical weapons or something like that that they could put on the front of [a missile]." said physicist and missile-technology expert David Wright, co-director of the Union of Concerned Scientists' Global Security Program. "But once you get farther away than that, I think it's really a bluff." [Images: North Korea's Rocket Program]

Rising tensions

Tension has been escalating on the Korean peninsula since December, when North Korea launched a satellite into orbit for the first time. Many officials in the United States and allied nations viewed the launch, which used a rocket called the Unha-3, as a thinly disguised test of ballistic missile technology.

Two months later, North Korea conducted its third-ever nuclear-weapons test. Both the launch and the test violated UN Security Council resolutions, so further economic sanctions were imposed on the already isolated communist nation.

North Korean officials reacted angrily to the sanctions, and the ongoing American/South Korean military exercises have further stoked their ire. The result has been a stream of threats, with

Pyongyang announcing Wednesday (April 3) that it had authorized a potential nuclear attack against the United States.

North Korean leaders have also stated that the nation is now in a state of war with South Korea. In addition, Pyongyang has moved a missile to its east coast, South Korean officials say, and barred South Korean workers from an industrial complex run jointly by the two nations.

While such talk and activity fit into a longstanding pattern of North Korean bluster and brinkmanship, the United States is responding with some countermeasures. The Pentagon announced Wednesday (April 3), for example, that it will deploy a missile-interception system to the U.S. Pacific territory of Guam in the coming weeks, two years ahead of the original schedule.

The United States will also beef up its missile defense sites in Alaska and California over the next few years, Defense Secretary Chuck Hagel said last month.

Civilian Casualties Scenario

Civilian Casualties

1nc Frontline

Human intelligence doesn't improve effectiveness or accuracy of strikes

Ali and Abbott 13 (Shazad and Chris, October 24th, Shazad is a Journalist in Pakistan and pursuing a PhD in European Studies at the University of Karachi and Chris is founder and executive director of Open Briefing. He is an Honorary Visiting Research Fellow in the School of Social and International Studies at the University of Bradford and the former deputy director of Oxford Research Group, "US DRONE STRIKES IN PAKISTAN: INEFFECTIVE AND ILLEGITIMATE," <http://sustainablesecurity.org/2013/10/24/us-drone-strikes-in-pakistan/>)/RTF

However, even those strikes directed by intelligence are fallible. Such strikes rely on a mixture of signals intelligence and human intelligence from assets on the ground in Pakistan. The local CIA operatives are notoriously unreliable sources of intelligence. The doubts over the accuracy of US intelligence have some credence, as there are several cases in which a militant was reported killed in a drone strike only to be declared dead again following a later strike. For example, the alleged al-Qaeda leader in Pakistan, Ilyas Kashmiri, was reportedly killed in a drone strike in January 2009 and then again in September 2009, though he gave an interview to a Pakistani journalist the next month. Civilians are known to have been harmed in these unsuccessful attacks. In the January attack, 14-year-old Fahim Quershi lost an eye and suffered multiple injuries. In the September 2009 attack, 15-year-old Sadaullah Wazir lost his both legs and an eye. Three of his relatives died in the same attack. Kashmiri was again declared dead in July 2011, which is also contested. The United States has indeed managed to kill many militants in drone strikes in Pakistan, but these have been mostly low-level targets. According to a September 2012 study by Stanford Law School and New York University's School of Law, only 2% of militant casualties in drone strikes between 2004 and 2012 were high-value targets.

Targeted drone strikes necessary are necessary and civilian casualties decreasing

Baker, 10 – Writer for the New York Times (Peter, "Obama's War Over Terror", The New York Times, 1/17/10, Lexis Nexis)/KTC

SECTION: Section MM; Column 0; Magazine Desk; MAGAZINE PREVIEW; Pg. 30

The Christmas Day plot touched off a new round of questions among Obama's critics about whether the president is enough of a warrior for the fight against Islamic terrorism. But he has spent much of his time in office killing suspected extremists. With information processed at the NCTC and elsewhere, Obama has authorized the C.I.A. to greatly expand a program inherited from Bush using unmanned Predator and Reaper drones to launch missiles at suspected Al Qaeda hideouts along the border between Pakistan and Afghanistan. Critics complain that such "targeted assassinations" are morally suspect and strategically dangerous because of the reaction among Pakistanis when civilians are killed. Obama had a searching conversation during the transition with Brennan and Denis McDonough, Catholics who oppose the death penalty, about whether to keep the program. "He was wrestling with it," one adviser says. But in the end, there was no serious disagreement with the decision to continue the program. At one of his first Situation Room meetings as president, according to a participant, Obama said pointedly, "The C.I.A. gets what it needs." The C.I.A. launched more than 50 such strikes in Obama's first year in office, more than during Bush's entire presidency, according to data compiled by Peter Bergen and Katherine Tiedemann at the New America Foundation. In part, that strategy owes to increasingly precise technology that has made it easier in the last couple of years to hit a desired target with fewer civilian casualties. And in part, it underscores the ability to redirect resources away from Iraq now that the war has subsided there; when the Obama administration came into office, it learned that dozens of drones were devoted to operations in Iraq and Afghanistan but just five or six in the tribal areas of Pakistan where Al Qaeda's leadership is mainly holed up, according to officials who declined to be identified discussing a classified program. Obama has authorized doubling the number of drones in the Pakistani border area, as well as increasing the presence over Yemen and Somalia, officials said. Over the course of Obama's first year in office, his drones have taken out a number of "high-value targets," including Baitullah Mehsud, leader of the Pakistani Taliban; Saad bin Laden, a son of Osama bin Laden; and Tahir Yuldashev, leader of the Islamic Movement of Uzbekistan, a close ally

of Al Qaeda. At the same time, according to estimates by Bergen and Tiedemann, the civilian death rate of those killed by drone strikes has fallen to about 24 percent in 2009 from about 40 percent from 2006 to 2008. Government officials insist that the civilian casualty rate is even lower. "I don't hear anyone inside the government, including people like me who came from outside, who thinks the Predator program is anything but essential," a senior Obama counterterrorism official says. "There are a lot of negatives, but it is completely essential."

Yemen

Meta-Level Defense

Frontline

Not reverse causal enough — even if some signal is sent to potential recruits, the government currently controlling Yemen has “death to America” in its charter.

Saudi strikes and US intervention fail to solve — ongoing intervention still creates instability — the timeframe for solvency is decades.

The Independent 15 — The Independent UK newspaper, 2015 (“Sand storm looms: Continuing Saudi air strikes against civil-war ravaged Yemen can only further undermine the region's stability,” *The Independent*, June 18th, accessible online at <http://www.independent.co.uk/voices/editorials/sand-storm-looms-continuing-saudi-air-strikes-against-civilwar-ravaged-yemen-can-only-further-undermine-the-regions-stability-10327270.html>, accessed on 6-27-15)

The Saudis do not deserve to "win" in any meaningful sense of the term, but it would also be a disaster if the instability that is now all around them began to throw the major power in the region - and source of so much of the world's oil - into turmoil. That would do no one, rich or poor, in Saudi Arabia or the wider world, any good.

In Syria, the West learned the hard way that picking a winner in a civil war, among constantly shifting factions with uncertain loyalties and goals, can be a losing game. Much the same can be said for Libya, Somalia and the rest. There are at least eight separate civil wars raging in an arc from the Maghreb to virtually the borders of India and Pakistan.

The dilemma for the West is that doing nothing is not going to bring them to an end; intervening on the ground or from the sky, usually adds to the tensions; and sponsoring peace talks has proved a fairly futile exercise.

Yemen's agonies look set to intensify; and Saudi Arabia increasingly vulnerable.

Alt cause — the US will still use risky drone strikes to help Yemeni forces.

Goodman 14 — Ryan Goodman, Anne and Joel Ehrenkranz Professor of Law at NYU School of Law, Formerly Rita E. Austin, 2014 (“Ongoing “Drone Strikes” in Yemen Raise Four Questions,” *Just Security*, April 21st, Accessible Online at <http://justsecurity.org/9604/ongoing-drone-strikes-yemen-raise-questions/>, Accessed On 6-25-15)

4. Yemen’s internal armed conflict

Six months ago, I wrote that US operations in Yemen appear to have slid into fighting a domestic insurgency alongside the Yemeni authorities (here and here). If true, these actions would run contrary to an earlier position of President Obama and John Brennan who, according to Dan Klaidman’s book, opposed getting involved in the insurgency. And it would run counter to several public assurances by the administration. For example, in May 2012, the National Security Council spokesperson stated: “We’re pursuing a focused counter-terrorism campaign in Yemen designed to prevent and deter terrorist plots that directly threaten US interests at home and abroad ... We have not, and will not, get involved in a broader counter-insurgency effort.”

The ongoing US actions in Yemen (in addition to the actions I discussed late last year) raise questions about whether those official US statements still hold. First, according to Yemeni officials, recent actions were in response to a threat to civilian and military installations at least in Bayda province (#2 above). The statement by the state news agency also added that the militants killed in the strike were responsible for the assassination of Bayda’s deputy governor on April 15. Those sound more like fighting an insurgency rather than fighting AQAP’s direct threat to the United States. Second, the strikes were described as a joint U.S.-Yemen operation by the Yemeni official who spoke to CNN. And he explained that Yemeni troops would have faced heavy losses if they had attempted a ground assault themselves.

Finally, the Long War Journal reports that “no senior AQAP leaders or operatives are reported to have been killed in the strike” on Saturday (the LWJ is yet to report on the other strikes). The LWJ, has previously described a “trend” in which “the US has targeted not only senior AQAP operatives who pose a direct threat to the US, but also low-level fighters and local commanders who are battling the Yemeni government,” which is contrary, the LWJ notes, to the fact that “Obama administration officials have claimed, however, that the drones are targeting only those AQAP leaders and operatives who pose a direct threat to the US homeland, and not those fighting AQAP’s local insurgency against the Yemeni government.” Once again, however, we should not fall victim to hindsight bias with respect to the recent operations. Even though no senior AQAP operatives have (yet) been reported killed in any of the recent days’ operations, we have also yet to learn who exactly was the target of the attacks.

Presidential override — the President can override restrictions for civilian casualties on national security grounds.

Goodman 14 — Ryan Goodman, Anne and Joel Ehrenkranz Professor of Law at NYU School of Law, Formerly Rita E. Hauser Professor of Human Rights and Humanitarian Law and Director of the Human Rights Program at Harvard Law School, Ph.D. from Yale University, J.D. in Law from Yale Law School, B.A. in Political Science and Government from the University of Texas, Austin, 2014 (“Ongoing “Drone Strikes” in Yemen Raise Four Questions,” *Just Security*, April 21st, Accessible Online at <http://justsecurity.org/9604/ongoing-drone-strikes-yemen-raise-questions/>, Accessed On 6-25-15)

3. Presidential override

One provision of the New Rules that has escaped significant media attention is a clause that appears to allow the President to override these restrictions. After setting forth criteria for kill and capture operations, the new rules state near the end:

“Reservation of Authority. These new standards and procedures do not limit the President’s authority to take action in extraordinary circumstances when doing so is both lawful and necessary to protect the United States or its allies.”

Notice that the criteria (in #2) limit lethal actions to threats to US persons, but the “Reservation of Authority” states that the President may nevertheless take actions “to protect the United States or its allies” (my emphasis). The Reservation of Authority presumably may also lend itself to a decision by the President to authorize military operations that incur a greater risk of civilian casualties than the rules otherwise provide.

Aff can’t solve without resolving larger political issues — instability causes AQAP, not the other way around.

Goodman 14 — Ryan Goodman, Anne and Joel Ehrenkranz Professor of Law at NYU School of Law, Formerly Rita E. Hauser Professor of Human Rights and Humanitarian Law and Director of the Human Rights Program at Harvard Law School, Ph.D. from Yale University, J.D. in Law from Yale Law School, B.A. in Political Science and Government from the University of Texas, Austin — citing Adam Baron, Visiting Fellow on the Middle East and North Africa at the European Council on Foreign Relations, Ph.D. in Middle East Studies from King’s College London, 2014 (“Ongoing “Drone Strikes” in Yemen Raise Four Questions,” *Just Security*, September 25th, Accessible Online at <http://justsecurity.org/9604/ongoing-drone-strikes-yemen-raise-questions/>, Accessed On 6-25-15)

Among the world’s many trouble spots, Yemen has been experiencing political turmoil, which carries significant implications for the people of Yemen and for US national security interests. To help us think critically about this fast developing situation, I asked leading Yemen analyst Adam Baron the following set of questions:

The AP recently noted that, while Yemen has been no stranger to turmoil, it “had largely been spared Shiite-Sunni hatreds like those that tore apart Syria and Iraq” – and that this may be changing given current events. How should the community of US national security experts, inside and outside the US government, best understand the current turmoil in Yemen, viewed in light of its implications for US security interests? What would you identify as potential myths or mistakes that US decision-makers should avoid in reacting to the unfolding situation in Yemen?

Baron graciously provided the following response:

For years now, the concept of a so-called “Yemen model” has been repeated as virtual dogma in beltway circles. The frequent protestations of many of those familiar with the country—myself included—seemed subsumed into a general steamroller of a narrative casting the United States’ intervention in the country as a multifaceted success. Yemen’s internationally-brokered transition, we were told, was a model for a region in post-Arab Spring upheaval; the Obama administrations cooperation with the Yemeni government, Obama trumpeted roughly two weeks ago, had lead unparalleled progress in the battle against the Yemen-based Al Qaeda in the Arabian Peninsula (AQAP).

Both narratives have come to a head with an increasingly disparate reality as of late, as rebel fighters belonging to the Zaidi Shi'a lead Houthi movement managed to seize virtual control of Sanaa, the Yemeni capital, with little resistance from the Yemeni military, raising immediate questions regarding the utility of hundreds of millions of dollars in US military aid and a US-sponsored program of military restructuring, to say nothing of the viability of Yemen's already fraught transition.

When it comes to understanding what's just occurred in Sanaa, then, its key stress that much of mainstream consensus is flawed at best, and, key among that, is the idea that recent events in Sanaa amount to a Sunni-Shia battle.

The Houthis have their roots in the far northern province of Saada, but they've been able to transcend their origins in Zaidism, a nearly exclusively Yemeni branch of Shi'a Islam and that—rather than their sectarian identity—has proven the key to their success; their most recent demands—the reversal of a decision to remove fuel subsidies and the replacement of Yemen's prime minister and his cabinet—have wide-ranging support from all Yemenis. And, regardless of the group's alleged ties to Iran—the United States and Yemeni governments alike have claimed that the Houthis are armed and funded by the Islamic Republic—the Houthis' success is rooted in their ability to understand—and capitalize on—the local political situation and the concerns of the average Yemeni.

That being said, the rise of a group whose members emphatically shout a slogan including the phrase “death to America” and whose leaders refuse to meet with American diplomats on ideological grounds could certainly create tensions in the United States government's until now cordial relationship with the country's post Arab Spring government. It's unclear how much power close American ally Abdo Rabbu Mansour Hadi truly has at the moment: those on the ground speak of the Houthis as defacto rulers of Sanaa but, notably, the president has retained the right to name the heads of the ministries of the Interior, Defense, Finance and Foreign Affairs in the new government according to the new agreement, though it remains to be seen whether Houthi fighters—who currently maintain checkpoints throughout the city—will withdraw from Sanaa's streets any time soon.

Ultimately, **the past week only underlines the folly of a Sanaa-centric Yemen policy.** Indeed the past weekend's events only underline the key importance of events outside the capital; after all, not so long ago, the clashes between the Houthis and their rivals seemed like a distant echo. And, regardless of the ultimate fallout—which remains unclear—the fact remains that such issues as the battle against Al Qaeda in the Arabian Peninsula (AQAP) cannot be dealt with as separate issues from the larger challenge facing Yemen at the moment: the establishment of inclusive, accountable governance and the shoring up of state authority—which, at the moment, verges on nonexistent—across the country. As the US-supplied military equipment currently being paraded in the streets of Sanaa by jubilant Houthi militants demonstrates, a counter-terrorism centered policy risks missing the forests for the trees.

Extend #1 — Not Reverse Causal

The affirmative has categorically misrepresented their internal link — even if they switch the mindset of some AQAP recruits and Yemeni people, the larger civil war still forces various regional interventions and greater instability, forging a regional sectarian split and escalating simmering tensions.

At best, they can resolve one of the players in a larger destabilizing civil war, not stop the war itself. That doesn't come close to solvency.

This functions as more than an alt cause to stability — civil war actively empowers AQAP.

Rayman 15 — Noah Rayman, Middle East Editor for Time Magazine, B.A. in Social Studies and Middle Eastern Studies from Harvard University, 2015 (“Houthis’ Rise in Yemen Risks Empowering al-Qaeda,” *Time Magazine*, January 22nd, accessible online at <http://time.com/3677676/houthis-yemen-al-qaeda/>, accessed on 6-28-15)

On Wednesday, in a statement reported on by Reuters, Hadi indicated that the contentious draft constitution was open to amendments, a key rebel demand, but that he would remain in his post. Still, it’s clear who is pulling the strings now in Sana’a.

The Houthis are members of a northern minority Shi’ite sect known as the Zaidi, and they have waged a decade-long on-and-off insurgency against the government calling for greater rights for their people. But since the ouster of President Ali Abdullah Saleh in 2011 amid the wave of popular protests that swept the region, the Houthi movement has gained wider traction as self-proclaimed reformers, capitalizing on dissatisfaction with the poor economic and security situations under Hadi’s U.S.-backed government.

The movement’s surge has posed a particularly thorny problem for the U.S. as it fights al-Qaeda in the Arabian Peninsula (AQAP), the Yemen-based terrorist group that is among al-Qaeda’s most powerful affiliates. AQAP claimed responsibility for the Jan. 7 terrorist attack on the French satirical newspaper Charlie Hebdo and has been linked to three failed attempts to take down U.S.-bound airplanes.

For years, the U.S. has struck at AQAP in Yemen with drones and Special Ops, but it has also invested in the Yemeni government to help repel AQAP on the ground, pouring nearly \$1 billion of economic, military and humanitarian aid into the country since 2011. That strategy has been hailed as a success by President Barack Obama and was used as a blueprint for the fight against the Islamic State in Iraq and Greater Syria (ISIS). But as the government has focused on the Houthi rebellion, AQAP has regained a foothold in southern Yemen. U.S. officials now fear that a prolonged power vacuum in Sana’a could give AQAP free rein to grow—and to pose new threats to the West.

“Yemen was supposed to be a role model for this smarter approach of building local capacity and getting our allies to do more,” Bruce Riedel, a senior fellow at the Brookings Institution, wrote in a blog post. “It’s a sobering reality that it’s not working.”

The Houthis, though, are no friends of the Sunni al-Qaeda militants. The group, which is believed to be backed by the Shi’ite leadership of Iran, has clashed with al-Qaeda in Yemen and criticized

Hadi's failure to quash Sunni extremism. The problem for the U.S.'s counterterrorism operations is that it also has no interest in an alliance with the U.S.; it has been equally critical of Hadi's dependence on U.S. support, and its motto reads in part, "Death to Israel, Death to America."

Meanwhile, its growing influence in Sana'a threatens to marginalize Sunnis in the deeply fractured country and boost support for al-Qaeda. "The Houthis victory also ironically benefits AQAP by polarizing Yemen, the poorest country in the Arab world, between Shia and Sunni, with AQAP emerging as the protector of Sunni rights." Riedel writes.

Extend #2 — Intervention Fails

Decades of regional instability in the Middle East is inevitable — intervention can't stop it.

Haass 15 — Richard Haass, President of the Council on Foreign Relations, Sol M. Linowitz Visiting Professor of International Studies at Hamilton College, DPhil in International Relations from Oxford University, B.A. in Public Policy from Oberlin College, 2015 ("Decades of deadly conflict will spread across the Middle East," *Financial Times*, March 26th, accessible online at <http://www.ft.com/intl/cms/s/0/8ad02c70-d3d5-11e4-99bd-00144feab7de.html>, accessed on 6-28-15)

The modern Middle East is like 17th-century Europe, enmeshed in violent and costly, political and religious struggles within and across borders that could well last for three decades longer. The situation in Yemen, long characterised by poverty and internal divisions along tribal, religious, political and geographic lines, is just the latest in those conflicts. There is now a civil war involving at least three principal actors: remnants of the former Sunni-led government of Abd Rabbuh Hadi; the terrorist group al-Qaeda in the Arabian Peninsula; and the Houthis, supported by a segment of Yemen's population representing a branch of Shia Islam.

But there is also outside involvement. US intelligence services, for example, had forged a working relationship with the government against al-Qaeda and other groups seen to be regional and even global threats. Drone strikes were common. But the policy collapsed when the government fell and the security situation deteriorated.

Iran, for its part, is alleged to be providing arms, training and money to the ascendant Houthis. Now Saudi Arabia and countries apparently including the United Arab Emirates, Bahrain, Morocco and Jordan are coming to the aid of what was the government. Other Sunni governments, including Pakistan, are said to be considering joining the operation. Air strikes have already been carried out against Houthi-controlled military bases and assets.

This Saudi-led military intervention is almost sure to be too little, too late, as air strikes alone will not be able to take back territory controlled by either the Houthis or al-Qaeda. But the action does reflect recognition in Riyadh and beyond that a failed Yemen, or one dominated by a group aligned to Iran, would be a big threat to the interests of Saudi Arabia and other Sunni governments

What this means is that Yemen has become the latest locus of Iran-Saudi, Shia-Sunni conflict. Another is Bahrain: four years ago the Saudis and the UAE dispatched several thousand troops to bolster a minority Sunni government facing protests from a majority Shia population. But Bahrain has a population maybe one-20th that of Yemen; its territory less than 1 per cent. The Bahraini government never lost control and the protests were not civil war. A relatively small number of police and soldiers could restore order.

There are other reasons to predict limits to what the Saudis can do. They lack much in the way of capable ground forces, and also have to worry about the home front. It is only a matter of time before Saudi Arabia faces a direct challenge from groups such as the Islamic State of Iraq and the Levant, also known as Isis, which will see ousting the government that controls Islam's two holiest cities as essential to their ambitions.

Meanwhile, the Syrian civil and regional war continues. There is the Iran- and Russia-backed minority government of Bashar al-Assad; radical Sunni groups, including Isis; Kurds; and other Sunni groups. Sunni states have launched air attacks but have not committed ground forces to the fight. Hundreds of thousands of Syrians have lost their lives; more than 10m have lost their homes. **There is no end in sight.**

Iraq has its own dynamic. Government forces aided by Iran and Shia militia are taking on Isis in an effort to regain control of Tikrit, a Sunni-dominated city once home to Saddam Hussein. The US has held back — until recently, when its aircraft joined the attack. Left unclear is what will happen in the aftermath of pushing Isis out. Sunnis and Kurds will never accept a country dominated by Iran and Shia militias.

All of which brings us back to Europe's 30 Years War. Civil wars fuelled by outsiders with religious and political agendas tend to end for one of several reasons: order is imposed by one side or a third party, or the sides settle, usually out of exhaustion. Alas for the Middle East, no such scenario seems imminent.

Extend #3 — No Signature Strike Stop

Drone strikes are wildly popular — congress and the American people will fight hard for signature strikes.

NYT 15 — New York Times, major American newspaper — Byline: Scott Shane — Internally citing Micah Zenko, Drone Fellow at the Council on Foreign Relations, 2015 (“Drone Strikes Reveal the Uncomfortable Truth: US is Often Unsure of Who Will Die,” *New York Times*, April 23rd, accessible online at <http://www.nytimes.com/2015/04/24/world/asia/drone-strikes-reveal-uncomfortable-truth-us-is-often-unsure-about-who-will-die.html>, accessed on 6-28-15)

Despite the bad reviews overseas, drone strikes remain persistently popular with the American public, with about two-thirds expressing approval in polls. And despite the protests of a few liberal Democrats or libertarian Republicans, they have enjoyed unusual bipartisan support in Congress, where they are viewed as reducing the threat of terrorist attack and keeping American operators out of harm's way.

Mr. Zenko said that Mr. Obama and Congress should create a commission to examine the targeted killing program, its results and its flaws. But he said the combination of public and Congressional popularity probably mean that even the latest disclosures will not bring such scrutiny to the program.

"I predict that even this episode will have no effect," he said.

*The episode referred to is a drone strike in Afghanistan that killed 6 Western hostages from the U.S. and Italy.

Extend #4 — Presidential Override Circumvention

Obama will use signature strikes regardless of better intelligence — he views risky strikes as key to his overall terror strategy.

NYT 15 — New York Times, major American news source — Byline: Peter Baker and Julie Davis, 2015 (“Amid Errors, Obama Publically Wrestles with Drones’ Limits,” *New York Times*, April 24th, accessible online at <http://www.nytimes.com/2015/04/25/us/politics/hostage-deaths-show-risk-of-drone-strikes.html>, accessed on 6-28-15)

Aides say that the president views the strikes as a critical tool in confronting Al Qaeda in dangerous and remote regions such as the one where Mr. Weinstein and Mr. Lo Porto died. They argue that the practice has undermined Al Qaeda's ability to plot and execute attacks against the United States, recruit followers and operate a military organization.

At the same time, the use of unmanned aircraft seems to appeal to Mr. Obama's desire to steer clear of freewheeling military engagements in favor of technology-driven precision strikes that minimize harm to bystanders. But he is aware - and increasingly open to acknowledging in public - that the standard of "near certainty" for avoiding such collateral damage, which he laid out in a 2013 speech on drone policy, is difficult to achieve.

"Narrowly tailored counterterrorism operations are the kinds of operations that do the most to reduce the risk of civilian casualties," Mr. Earnest said. "But necessarily, these kinds of operations are contemplated in regions of the world where absolute certainty is just not possible."

Weighing the inherent risk to civilians against the potential national security benefits of such strikes is among the most difficult exercises Mr. Obama has to go through, Mr. Earnest said.

Mr. Panetta, who personally approved drone strikes, said there were no other options for hunting down terrorists in the forbidding tribal regions of Pakistan, where the central government has little authority, that would not cause far greater civilian losses.

Extend #5 — Political Instability Alt Cause

Oil Price Spikes

Frontline

Closure of the strait is extremely unlikely and wouldn't affect global commerce or prices.

Daoud 15 — Zaid Daoud, Head Economist at the National Qatar Bank, Ph.D. in International Commerce from the London School of Economics, 2015 (“Will the conflict in Yemen impact oil prices?,” *Awraq*, March 30th, accessible online at <http://ziaddaoud.blogspot.com/2015/03/will-conflict-in-yemen-impact-oil-prices.html>, accessed on 6-23-15)

This could take the form of the closure of the Bab el-Mandeb Strait. The strait is an important trade route, where 3.8m b/d of crude oil and refined products passed through in 2013, mostly going from the Gulf to the Mediterranean. But the closure of the Bab el-Mandeb Strait does not take this supply out of the market; it just means that the oil tankers have to use an alternative

route around Africa. This would add time and transit cost, but the impact on the oil market should still be contained.

In this regard, the strait of Bab el-Mandeb is far less important than that of Hormuz both in terms of oil flow (17m b/d in Hormuz versus 3.8m b/d in Bab el-Mandeb) but also in terms of the availability of alternative routes to bypass each strait (there is not enough pipeline capacity to bypass the strait of Hormuz, while alternative routes exist to bypass Bab el-Mandeb).

The closure of the Bab el-Mandeb Strait is unlikely. There is a heavy presence of international warships in nearby waters as well as an American military base in Djibouti. And if necessary, the Egyptian, Saudi or even the Israeli navy could be deployed to keep the strait open.

Oil price shocks don't harm the US economy — the US is diversified and it boosts the oil industry.

Rines 15 — Samuel Rines, Economist at Chiton Consulting, M.A. in Economics from the University of New Hampshire, B.A. in International Economics from Oxford University, B.A. in Economics from Georgetown University, 2015 (“Newsflash: The U.S. economy does not have the same relationship it once had with high oil prices,” *The National Interest*, May 5th, accessible online at <http://nationalinterest.org/feature/get-ready-america-high-oil-prices-could-be-good-thing-12803>, accessed on 6-24-15)

In the second half of 2014, oil prices plummeted, and most of the United States—and the world—cheered. Now, oil may have bottomed, possibly marking the beginnings of a comeback. The vaunted "tax break" from lower prices, and its positive economic effects, may be evaporating. But it does not appear the U.S. economy realized the majority of the benefits from lower oil. This is why if higher oil prices are on the horizon, it might actually be a good thing for the U.S. economy.

To date, lower oil prices have not been all that helpful. In the first quarter of 2015, GDP showed lackluster consumption growth. This should not be surprising. Before consumers are willing to spend the “gasoline stimulus,” they need to have confidence lower oil prices will stay low. For a decline in oil to matter, it's not enough for the price of oil to fall. It needs to remain low. Since oil has not been low enough for long enough, the economy has yet to feel the stimulus. There is some evidence households are using the savings to pay down debt, but little evidence that it's increasing economic growth. Households have yet to believe that oil will remain low. And there are reasons to believe households will be harder to convince today than in previous cycles.

The economic rhetoric has been focused on the increasing demand from developed markets, and oil prices have been exceedingly volatile over the past ten years. Because of the rhetoric and how volatile the price of oil has been lately, it may take longer for households to alter their consumption habits.

There are a few pieces of data that have seen an oil boost. Consumer sentiment indicators are elevated, and some of this is attributable to lower oil prices, but some is also due to lower unemployment and the feeling of a stable economic environment. And while the economic data underlying the reasoning is suspect, the news still positively influences consumer sentiment. It should not be a surprise, then, that lower oil prices have yet to really benefit the underlying U.S. economy. Households may require longer time periods to trust low oil prices will remain depressed.

The U.S. economy does not have the same relationship it once had with high oil prices. Not long ago, higher oil prices threatened to cut short economic expansions. To the contrary, the United States has now become a pseudo-petrostate, and oil patch job losses came swiftly as the rig count fell. Companies react far more quickly than households, and they slashed payrolls quickly. It could get worse, granted. But the U.S. economy has already felt some of the possible pain of oil's downside.

Higher oil prices allowed a number of U.S. regions to grow quickly, and those regions drove much of the growth in the U.S. economy out of the Great Recession. As oil has fallen, so have the growth rates in the regions. Texas gets much of the attention, but others have greater concentrations of oil for their growth. The reason Texas gets much of the attention is simply its size and recent rapid growth in GDP and jobs. This was particularly noticeable when Texas job growth sputtered in March, and dragged the national statistics down with it. The shale boom was a significant boost to the recovery, and its absence is already beginning to be felt.

As a consequence, the U.S. economy is waiting for the benefit, and already felt some of the pain. But this leaves the U.S. economy in an intriguing spot. Since it's already taken the pain, there is incrementally less to come if current prices persist. Households haven't spent the savings, so prices increasing would not be the typical headwind to growth. Instead, reasonably higher prices would stem the job losses in the oil sector without damaging the consumer much at all. This dynamic places the U.S. economy in a strong position to handle higher oil prices. Putting it together, a moderate rise in the price of oil may strengthen, not weaken, the U.S. economy.

We control uniqueness — prices and perception of instability are decreasing.

Gloystein 15 — Henning Gloystein, Reuters Energy Editor, M.A. in Politics and International Relations from Humboldt University of Berlin, 2015 (“Oil prices fall more than \$1 as supply threat eases,” *Live Mint*, March 27th, accessible online at <http://www.livemint.com/Money/pvqSzSaSAwsStRXhZajRnK/Oil-prices-fall-more-than-1-as-supply-threat-eases.html>, accessed on 6-24-15)

Oil prices fell more than \$1 on Friday, after sharp gains in the previous session, as worries of a disruption to crude supplies due to Saudi Arabia-led air strikes in Yemen eased.

Goldman Sachs Group Inc. said in note that the strikes in Yemen would have little effect on oil supplies as the country was only a small crude exporter and tankers could avoid passing its waters to reach their ports of destination.

Brent crude was at \$58.18 a barrel at 10:00am, down \$1. It fell to \$58.17 earlier in the session. US crude was down \$1.06 at \$50.37 a barrel, after dropping to a low of \$50.25 earlier in the day.

Oil jumped around 5% on Thursday, the biggest daily gain in a month, as air strikes in Yemen by Saudi Arabia and its Gulf Arab allies sparked fears that escalation of the Middle East battle could disrupt world crude supplies.

The rally had been driven by worries over the possible impact on the Bab el-Mandeb strait, the closure of which could affect 3.8 million barrels a day of crude and product flows.

Yemen is a small producer, with an output of around 145,000 barrels per day in 2014.

“Now the market is questioning how sustainable the (impact of the) geopolitical event is on oil prices,” said Jonathan Barratt, chief investment officer at Sydney’s Ayers Alliance.

Extend #1 — No Closure/Internal Link

The internal link chain is extremely unlikely — the waters are heavily militarized by foreign powers that would use military force to keep the strait open, and even if it was closed, the impact wouldn’t be large because of alternative routes around Africa — that’s Daoud.

Prefer our evidence — Daoud is predictive and one of the leading Middle East economists.

Other supply routes fill in — producers will find other ways to get products to the market.

FT 3/23 — Financial Times, major financial newspaper, 2015 (“Yemen attack raises spectre of oil disruption,” *Financial Times*, March 23rd, accessible online at <http://www.ft.com/intl/fastft/298943/oil-saudi-arabia>, accessed on 6-23-15)

News of Saudi Arabia-led air strikes on Sana'a, the Yemeni capital and retaliation triggered a jump in the price of crude oil on Thursday.

Brent, the international benchmark, rose \$2.27 to \$58.80 while West Texas Intermediate, the US marker, increased by \$2 to \$51.30 a barrel. Both had risen by more than \$3 a barrel in earlier trading, reports Anjali Raval, oil and gas correspondent.

The attack is not expected to cause any major disruption to supplies.

Yemen is a small oil producer of less than 130,000 barrels a day of crude last year, down from a peak of 400,000 b/d in 2001, due to natural declines and numerous supply disruptions.

Richard Mallinson, geopolitical analyst at Energy Aspects, a London-based consultancy, said **although there may be more disruption to Yemen's oil and gas output as fighting intensifies, "there is no real threat to Saudi territory or oil production".**

Even so, the narrow waters between Yemen and Djibouti are considered a "chokepoint" to global oil supplies, according to the US energy department.

Almost 7 per cent of global oil maritime trade at around 3.5m b/d passes through the Bab el-Mandeb strait.

Oil from big producers such as Saudi Arabia, the United Arab Emirates, Kuwait and Iraq has to go into the Gulf of Aden in order to pass through the Red Sea and Suez Canal to Europe.

Mr Mallinson said **although the closure of the strait would force tankers to sail around the southern tip of Africa instead, he does not believe the transit route is a target of the Houthis and other militant groups.**

They "are unlikely to be able to carry out a sustained campaign against shipping, so there is little risk to global trade."

No closure — Western militarization and alternative trade routes.

Gloystein 15 — Henning Gloystein, Reuters Energy Editor, M.A. in Politics and International Relations from Humboldt University of Berlin, 2015 (“Oil prices fall more than \$1 as supply threat eases,” *Live Mint*, March 27th, accessible online at <http://www.livemint.com/Money/pvqSzSaSAwsStRXhZajRnK/Oil-prices-fall-more-than-1-as-supply-threat-eases.html>, accessed on 6-24-15)

If the fighting becomes a regional conflict involving Islamic militants, then prices could climb, but a blockade of the Bab el-Mandeb strait—a chokepoint for shipping between the Red Sea and Gulf of Aden—seems unlikely, he said.

In case of a closure of the strait, tankers could be diverted to travel a longer route around Africa instead of passing Yemen, analysts said.

Analysts also said that the less than 40 km narrow strait between Yemen and Djibouti was heavily militarized by the West, with the United States and France both operating bases in Djibouti and NATO and other allies having a fleet presence in the Gulf of Aden to combat piracy.

Extend #2 — No Economy Impact

No harm to the US economy — the economy relies on more sectors than just oil and the oil sector would be helped by a rise in global prices — the “stimulus effect” of lower oil prices is negligible because consumers don’t spend it — that’s Rines.

Prefer our evidence — Rines is a global market strategist with years of experience and multiple degrees.

No connection between Oil shocks and economic decline — 2014 oil shock proves.

Reid et al. 14 — Jim Reid, Managing Director, Head of Global Fundamental Credit Strategy at Deutsche Bank, BA in Economics and Economic History from Warwick University — Nick Burns, Credit Consultant at IMA Financial Group, M.A. in Economics from the University of Notre Dame — Seb Barker, Associate at Deutsche Bank, BSc in Economics from the University of Warwick, B.A. in Economics from King’s School Gratham, 2014 (“Credit Outlook 2015: Plate Spinning,” *Deutsche Bank*, December 12th, accessible online at https://institutional.deutscheawm.com/content/_media/Credit_Outlook_2015.pdf, accessed on 6-25-15)

It’s also important to remember that whilst oil is an important global commodity it is rare for it alone to drive global economic outcomes. The halving of global oil prices in 2008 didn’t prevent many of the world’s oil importing economies from suffering severe recessions and as Figure 135 shows there is no easy nor automatic relationship between falling oil prices and rising US growth. The environment within which the oil price change occurs is important. Indeed if the current drop in the price of oil is being driven by expectations of falling demand driven by expectations of a slowdown in global growth it’s possible that the drop in the oil price

is at best going to partially cushion the global economy from a slowdown rather than drive it to higher growth rates.

Also importantly for investors, falling oil prices will not affect all areas of economies equally, even in those economies that should benefit at an aggregate level. As our US credit strategy team wrote recently, energy companies make up the largest single sector component of the US HY market at 16% (US HY DM Index) and so the falling oil price may prove a negative for the US HY credit market. Our US team added that if the WTI price fell to \$60/bbl this would push the whole US HY energy sector into distress, with around 1/3rd of US energy Bs/CCCs forced to restructure, implying a 15% default rate for overall US HY energy which would contribute 2.5% to the broad US HY default rate. This could be a sizeable enough shock to cause concern throughout the rest of the US HY market.

There is no doubt that the fall in the price of oil in 2014 has been a significant economic shock. Most estimates suggest that this should add to global growth, weigh on global inflation and most likely have varied but oil-specific asset price implications (EM oil producing nations and US HY weakness stand out); however it is likely that growth tailwinds from this year's fall in oil prices will not be the main story for investors in 2015.

Their studies lack basis — the empirical examples they cite are flawed.

Andrews 14 — Robert Andrews, Independent Oil consultant, BSc in Geology from Aberystwyth, MSc in Applied Physics from Binghamton University, 2014 (“Oil Shocks And The Global Economy,” *Oilprice.com*, October 22nd, accessible online at <http://oilprice.com/Energy/Oil-Prices/Oil-Shocks-And-The-Global-Economy.html>, accessed on 6-24-15)

There's also no evidence that oil price fluctuations had any more impact on consumption than they did on GDP outside recessionary periods. Neither the oil price collapse in 1985-86 nor the tripling of oil prices between 1999 and 2007 had any visible impact, although some of the recession-induced consumption decreases, particularly the one during the Great Recession, clearly had a depressing impact on price.

Figure 6 shows XY plots of the annual data from the above Figures. There is no significant relationship between annual percentage changes in oil price and real per-capita GDP nor between annual percentage changes in oil price and oil consumption. There is, however, a relationship between annual percentage changes in real per-capita GDP and annual percentage changes in oil consumption, particularly before 1986, and the relationship is positive, i.e. with consumption increasing as GDP increases. I interpret this to mean that GDP growth is driving consumption, which is the basis for my comments on earlier threads that wealth now generates oil and not the other way round:

A final word on oil and the “Great Recession”. It's generally accepted that this recession was triggered by what are now euphemistically called “structural defects” in the financial markets and had little or nothing to do with oil. Wikipedia, for example, gives a long list of potential contributors, starting with subprime lending and the housing bubble, and while it does eventually get around to mentioning oil it doesn't get there until section 14.8.

Extend #3 — Getting Better

We control uniqueness — perceptions of a cut-off or other oil production related concerns faded — there is no “perception” internal link to oil prices because countries and investors have already realized there’s very little risk of supply disruptions — that’s Gloystein.

The oil market won’t react to violence in Yemen — other source fill in, and small risk.

Forex 15 — Forex, a trading magazine run by Orbex Financial management — citing Ali Naimi, Saudi Arabia’s oil minister, 2015 (“Crude Oil market seems comfortable with small risk,” *Forex*, June 9th, accessible online at <http://www.atozforex.com/news/crude-oil-market-seems-comfortable-with-small-risk/>, accessed on 5-25-15)

*Risk premium — the return for a risky investment given to investors that braved the uncertainty.

Ali Naimi, Saudi Arabia’s Oil Minister responded to Questions about the ongoing violence in Iraq, Libya, Yemen, saying there was “very, very small” risk premium in the current oil price.

“This premium is there but fortunately the world is getting very comfortable with the risk,” said Naimi, addressing an OPEC seminar before the cartel’s output meeting on Friday.

“That is why you see that portion is really very small no matter what is happening ... in the most productive part of the Middle East. They don’t seem to be affecting production, shipping, demand, supply... The risk premium is there, but it is very, very small because of the variability of supplies.”

OPEC produces about 30 percent of the world’s oil in the Crude Oil market, and chose to keep its collective production target at 30 million barrels per day in their last meeting, even though lower oil prices slashed revenues for the cartel’s 12 members. This was in an effort to maintain OPEC’s share of the market which was flooded by a vast supply glut, attributed partly to booming US shale oil.

The oil market has stabilized on the whole — it’s following the dollar and becoming less volatile.

WSJ 6/19 — Wall Street Journal, leading American newspaper — Byline: Tim Puko and Georgi Kantchev, 2015 (“Oil Prices Fall on Firming U.S. Dollar,” *Wall Street Journal*, June 19th, accessible online at <http://www.wsj.com/articles/oil-prices-fall-on-firming-u-s-dollar-1434705270>, accessed on 6-24-15)

Oil markets Friday followed a common recent pattern of taking cues from moves of the dollar, even largely ignoring an updated count on the amount of oil drilling in the U.S., analysts said.

The Wall Street Journal Dollar Index, which tracks the dollar against a basket of other currencies, spend most of Friday’s session in positive territory. Oil is priced in dollars and becomes more expensive for holders of other currencies as the greenback appreciates. The dollar fell back to unchanged in the afternoon, and oil subsequently pared losses that had briefly pushed U.S. oil below \$59 a barrel.

New data in the afternoon did show the U.S. oil-rig count fell by four to 631 in the latest week, according to Baker Hughes Inc., marking the 28th straight week of declines. The number of

working U.S. oil rigs, a proxy for drilling and production, has fallen now about 61% since its peak in October.

The small cutback revealed Friday reaffirms a trend suggesting the most dramatic cutbacks are past, said John Saucer, vice president of research and analysis at Mobius Risk Group in Houston. But that wasn't enough to jolt prices, he added.

"It wasn't any sort of seismic shift," Mr. Saucer said. "Today was another day that crude is just following the dollar-euro cross."

Instability

Frontline

Middle East instability is inevitable — the Arab Spring has faded and terror organizations have filled the void.

Beauchamp 15 — Zach Beauchamp, Editor of TP Ideas, reporter for ThinkProgress.org, B.A.s in Philosophy and Political Science from Brown University, M.Sc in International Relations from the London School of Economics, 2015 ("Yes, Bush helped create ISIS — and set up the Middle East for a generation of chaos," *Vox News*, June 2nd, accessible online at <https://www.vox.com/2015/6/2/8703059/bush-isis-middle-east>, accessed on 6-23-15)

Today, the US is without a playbook in the Middle East. Its old system of authoritarian alliances remains (mostly) in place, but it's poorly suited to dealing with problems like ISIS and the Yemeni civil war. Bush's democracy-promotion agenda is in tatters; the Arab Spring protests having mostly given rise to failed states, civil war, and sectarian conflict. And instead of developing a brand new regional strategy, the Obama administration has essentially drifted from crisis to crisis — an approach that's been effective in some cases, like securing a tentative nuclear deal with Iran, but terribly ineffective in others.

That's particularly bad in the case of the region's destabilizing civil wars, from Iraq to Syria to Libya to Yemen. With the exception of Libya, these conflicts are playgrounds for Iran and Saudi Arabia in their struggle for regional influence. These two regional powers tend to support (respectively) Shia and Sunni factions, making the region's sectarian bloodletting much worse — and much harder to control.

Obama's attempts to ameliorate the regional crisis have, in some cases, heightened that tension by strengthening Iran. For example, US airstrikes against ISIS in Iraq have put ISIS on the defensive, but they have relied on ground support from Iranian-backed militias — thus boosting Iran's political influence in Iraq.

It's not that the failure of the freedom agenda caused all of the regional problems we see today. It's that its legacies — civil war in Iraq and the Saudi-Iranian competition — bled into the post-Arab Spring conflicts and made them much worse than they had to be.

So there still isn't really an American plan for a Middle East full of failed states and civil conflict. Its old strategies helped make the problem: its key authoritarian ally, Saudi Arabia, helped spread violent Islamic extremism. Its new strategies exacerbated it: Bush's democracy-promotion strategy collapsed Iraq, sparking an uncontrollable regional cold war. The US desperately needs a

new approach. But the scary thing is that no one seems to know what a good one would look like.

No Middle East proliferation — numerous infrastructural and political checks.

Esfandiary and Tabatabai 15 — Dina Esfandiary, McArthur Fellow in the Centre for Science and Security Studies at King’s College, London, Research Associate in the Non-Proliferation and Disarmament programme of the International Institute for Strategic Studies, Ph.D. in Security Studies from the Graduate Institute of Security Studies of Geneva, M.A. in Security Studies from King’s College, London — Ariane Tabatabai, visiting assistant professor in the Security Studies Program at the Georgetown University School of Foreign Service, Ph.D. in War Studies from King’s College, London, M.A. in International Peace and Security with Distinction from King’s College London, B.A. in Political Science and Cinema and Cultural Studies from the SUNY, Stony Brook, 2015 (“Why an Iran deal won’t lead to nuclear proliferation,” *Washington Post*, April 28th, accessible online at <http://www.washingtonpost.com/blogs/monkey-cage/wp/2015/04/28/why-an-iran-deal-wont-lead-to-nuclear-proliferation/>, accessed on 6-25-15)

But developing nuclear power is neither easy, nor cheap. There are a number of technical, legal and political hurdles regional states need to overcome.

Should they do so, then the fear is that aspects of their civilian nuclear programs will pave the way for the bomb. But that, too, is implausible.

First, the entire region, except for nuclear-armed Israel, is party to the NPT. This means that they’ve already legally given up the nuclear weapon option. Moreover, nuclear weapon states can’t legally provide them nuclear weapons either. Second, many countries have safeguards agreements and some, the additional protocol, in place. This means that their programs are under close International Atomic Energy Agency (IAEA) scrutiny.

None of these states have expressed an interest in reprocessing, which closes the plutonium path to the bomb. Some have even foregone enrichment, which blocks the uranium path to the bomb. That’s the case for the UAE. But some states, such as Saudi Arabia and Turkey, want to reserve “the right” to enrich. Riyadh went further and stated it wanted whatever Iran got out of the negotiations, including enrichment.

Saudi Arabia, Turkey, Egypt, Jordan and the UAE are all dependent on foreign suppliers and expertise for their programs. They lack the human capacity for the programs. Foreign involvement makes it difficult, though not impossible, to covertly develop a nuclear weapon. This means that suppliers also need to do their due diligence and ensure that buyers use their equipment for purely peaceful purposes.

One explanation as to why Tehran went so far in developing its indigenous nuclear technology, including enrichment, is that international suppliers weren’t as involved and reliable after the 1979 Islamic Revolution. Following the revolution, Iran’s original suppliers, the United States, France and Germany, dumped the country, which then looked East. It went to Pakistan, including the illicit nuclear procurement network led by Pakistan’s A.Q. Khan, Russia and China. But Iran’s government believed it could not rely on any of these partners. Without a strong involvement in its program by foreign suppliers committed to nonproliferation, Iran was able to pursue indigenous nuclear technology. This diminished the international community’s leverage on Tehran.

The Iranian context, however, is different from other countries in the region, which depend on the West and U.S. allies for their nuclear programs. Today's nuclear newcomers must comply with certain international requirements for their programs to be completed by these suppliers. This means that suppliers can and should try to limit the further proliferation of enrichment and reprocessing.

No "Domino Effect" — the advantage oversimplifies complex geopolitics and misrepresents fundamental state interests.

Esfandiary and Tabatabai 15 — Dina Esfandiary, McArthur Fellow in the Centre for Science and Security Studies at King's College, London, Research Associate in the Non-Proliferation and Disarmament programme of the International Institute for Strategic Studies, Ph.D. in Security Studies from the Graduate Institute of Security Studies of Geneva, M.A. in Security Studies from King's College, London — Ariane Tabatabai, visiting assistant professor in the Security Studies Program at the Georgetown University School of Foreign Service, Ph.D. in War Studies from King's College, London, M.A. in International Peace and Security with Distinction from King's College London, B.A. in Political Science and Cinema and Cultural Studies from the SUNY, Stony Brook, 2015 ("Why nuclear dominoes won't fall in the Middle East," *Bulletin of Atomic Scientists*, April 22nd, accessible online at <http://thebulletin.org/why-nuclear-dominoes-wont-fall-middle-east8236>, accessed on 6-25-15)

But technical constraints aside, there are political obstacles to the proliferation cascade theory. Countries like Turkey and Saudi Arabia are dependent on Western allies for their security. Washington can leverage this influence to stop them from going nuclear. The United States showed its willingness to do just that in 1988, when it learned that Riyadh purchased Chinese missiles and it threatened to block the sale of military equipment.

The conventional wisdom is wrong.

Conventional wisdom holds that a nuclear Iran will lead to a nuclear weapon proliferation cascade in the highly volatile Middle East, making an already rough neighborhood even more unstable and insecure. After all, a combination of fragile and failed states, terrorist organizations, and nuclear weapons could well constitute a horror story.

Nuclear history shows us that nuclear arms races are the exception rather than the rule. A final agreement between six world powers and Iran to limit the Iranian nuclear program would aim to keep Tehran from acquiring a nuclear weapon. But if an agreement is not reached or Iran cheats and acquires nuclear weapons, a nuclear weapons race is still unlikely to unfold in the Middle East. A number of political and technical challenges are likely to prevent it. No country in the region currently has the technical ability to develop a nuclear weapon by itself. Most regional candidates to become nuclear weapons states—especially ones most vocal in claiming they'll go nuclear, if Tehran does—depend heavily on the United States and other Western states for their security, providing the West with significant leverage over them.

Multiple alt causes to small arms proliferation — stopping one entrance point doesn't stop the spread.

Stohl and Hogendoorn 10 — Rachael Stohl, Senior Associate with the Managing Across Boundaries Initiative at the Stinson Center, adjunct professor in the Security Studies Program at Georgetown University, M.A. in international policy studies from the Monterey Institute of International Studies, B.A. in political science and German from the University of Wisconsin-Madison — EJ Hogendoorn, Crisis Group's Africa Deputy Program Director, Ph.D. in Security Studies from Princeton University, 2010 ("Stopping the Destructive Spread of Small Arms," *Center for American Progress*, March, accessible online at https://www.americanprogress.org/wp-content/uploads/issues/2010/03/pdf/small_arms.pdf, accessed on 6-28-15)

The abundance of small arms-based initiatives and programs since the mid-1990s has not eliminated the problems caused by uncontrolled small arms proliferation and misuse. On the contrary, small arms continue to contribute to devastation around the world. Why have these initiatives failed?

There are several reasons. Some of them are based on the dynamics of the arms trade—of political and economic pressures—while others have more to do with priorities and agendas. As we've shown, numerous treaties, agreements, and programs exist to address the excessive and destabilizing accumulations of small arms, but they do so in many different ways. Some governments may simply ignore new agreements, but it is also often difficult to ascertain the implementation of existing instruments because of ambiguous language, a lack of verification regimes, or the absence of enforcement mechanisms.

For some countries signing a treaty or agreement is all that is accomplished. The lack of implementation could be due to a lack of capacity or resources or could be linked to what plagues the small arms issue above all—a lack of political will. Governments may not have the financial or technical resources or the actual manpower or know-how to implement effective programs, policies, and actions. Still others may be uninterested in pursuing the small arms agenda—other issues may top their priority list—or they have political or economic reasons not to act as the agreement requires.

Many global small arms initiatives are undermined by the inherent limitations of the United Nations itself. First, the United Nations is a consensus-based body, so in many cases a lower denominator outcome is negotiated to gain consensus, leaving little impetus for those already in compliance with the agreement to do more. Moreover, at times the United Nations has been slow to act and is unimaginative in their efforts. The small arms issue has been pigeonholed in the disarmament community, which means issues of development or demand are often left out of the arms control, supply-sided focus of current initiatives. These approaches often have little relevance for countries affected by small arms and so little action is taken by them.

What's more, some governments have refused to develop small arms initiatives until other issues are addressed first and have demanded action on nuclear agreements before future work is done on small arms (such as some Middle Eastern countries claiming that work on small arms cannot begin until Israel's nuclear program is dealt with). Other small arms issues have been viewed as too controversial to consider both politically and economically, and thus solutions to small arms proliferation have missed many opportunities.

For example, some states, including the United States, have been loath to mention restrictions on civilian weapons ownership, the legal trade and manufacture of small arms and light weapons, or on the sale of small arms and light weapons to entities other than governments. Arms exporters want to maintain their market opportunities and not have economic or foreign policy considerations impede their trade. States also want to maintain deniability if their arms are used for unintended or illegal purposes.

Extend #1 — Instability is Inevitable

Instability is inevitable — the Arab spring created a power vacuum in the Middle East that was filled by terror groups and weak governments — the US built a house of cards, and the collapse will take decades — trying to promote stability inevitably fails — that's Beauchamp.

Regional stability is already ruined — multiple simultaneous state collapses prove.

Vox 15 — Vox.com, major online news source — Byline: Max Fisher, 2015 (“This is a terrible idea for fixing Iraq, and Washington loves it,” *Vox.com*, June 22nd, accessible online at <https://www.vox.com/2015/6/22/8824069/iraq-breakup>, accessed on 6-23-15)

And those were the success stories; elsewhere, peace by partition has been disastrous. Dividing up India and Pakistan was meant to solve sectarianism. Instead, it led to the forced migration of an estimated 12 to 14 million people, and triggered massive, violent attacks on civilians that killed thousands more. Post-partition, those tensions went from internal to interstate, with India and Pakistan fighting multiple wars and in at least one instance coming to the brink of nuclear war. Today, their proxy conflict is one of the drivers of the chaos in Afghanistan.

The idea of partitioning Iraq was rightly derided in 2006 and looks even dicier today. It offers the false hope of a solution to the problem of sectarianism among Sunni Arabs. Presumably, the idea is that the world would promise Sunni Arabs their own state in exchange for helping drive out ISIS. But there is a reason Sunni Arabs were willing to embrace ISIS and its violent sectarianism: Those ideas are popular.

Rewarding Sunnis with more sectarianism, permanently enshrined in an explicitly sectarian state, is going to worsen that problem, not solve it. For one thing, minorities in that region are already in constant peril; that peril is likely to increase if Sunni Iraq becomes an officially sectarian state. And partition will create many new minorities: The Shias left in the post-partition Sunni state and the Sunnis in the post-partition Shia state will be vulnerable to ethnic cleansing.

And perhaps more importantly, Iraq's problems do not exist in isolation. Rather, they are just one part of a Middle East divided by sectarianism, driven both at the grassroots level and by regional states such as Saudi Arabia and Iran that foment it to serve their own interests. Handing Saudi Arabia and Iran new sectarian proxy states is going to entrench that problem, not solve it.

US attempts to promote stability in the Middle East fail — foreign policy ignores the internal dynamics of the region.

Green 14 — Andrew Green, Former Ambassador to Syria, M.A. in Demography from Oxford University, 2014 (“Why Western democracy can never work in the Middle East,” *The Telegraph*, August 16th, accessible online at

<http://www.telegraph.co.uk/news/worldnews/middleeast/11037173/Why-Western-democracy-can-never-work-in-the-Middle-East.html>, accessed on 6-23-15)

The enthusiasm of yester-year for the “Arab Spring” has proved entirely misguided. It has led to chaos in Egypt and anarchy in Libya. Those determined to be “on the right side of history” now find themselves on the wrong side of the argument. Democracy is emphatically not the solution for extremely complex societies and Western meddling only makes matters immeasurably worse. The fundamental reason for our failure is that democracy, as we understand it, simply doesn’t work in Middle Eastern countries where family, tribe, sect and personal friendships trump the apparatus of the state. These are certainly not societies governed by the rule of law. On the contrary, they are better described as “favour for favour” societies. When you have a problem of any kind, you look for someone related to you by family, tribe or region to help you out and requests are most unlikely to be refused since these ties are especially powerful. In countries where there is no effective social security, your future security lies only in the often extensive family.

Behind what we might perceive as this somewhat chaotic structure lie the secret police and the armed forces. They hold the state together under the aegis of the president, king, or whoever rules the roost. That leader keeps the different elements of society in play with concessions to each group but he has an iron fist to be used when necessary, as the public well understand.

Examples can readily be found in Presidents Mubarak in Egypt, Asad in Syria and Saddam in Iraq. Nor are the kings of Jordan, Bahrain or, indeed, Saudi Arabia altogether different. There is much less cruelty in the latter countries but the iron fist is there when needed. Yet who in those countries today could survey the Middle East and believe that a republic would be a better option.

The West’s abject failure to understand the inner workings of these countries has had some disastrous effects. Iraq is the classic case. I was opposed to the invasion of that country, not because I had any love for Saddam but because I believed that the alternative would be worse. I was concerned that our invasion would destroy the stability of the Gulf which had, since the fall of the Shah in 1979, depended on a tripod comprising Iran, Iraq and Saudi Arabia (the latter supported by the West). That is exactly what happened and we now find that the Iranians are in a position to dominate the Gulf region.

Internally, the outcome was even worse. The army was disbanded (although some would say it disbanded itself). The Americans then closed down the Ba’ath party, the only political organisation in the country. Certainly, it had been an instrument of Saddam’s rule but it was not all bad. Just as anybody in a position of responsibility in the Soviet Union was obliged to be a member of the Communist party so were senior Iraqis obliged to be members of the Ba’ath party. The result was to atomise the social and political structure of the entire country. Favour for favour ground to a halt and so did the country’s governance

A while later, elections were held to loud applause from Washington. There was a huge turnout by the majority Shia’ who must have been amazed at the naivety of their occupiers. As it turned out, Nouri Malaki, the Iraqi prime minister who was finally forced to step down this week, proved to be a Shia’ version of Saddam – at least as the minority Sunnis perceived him. Indeed, it was the severe disaffection of the Sunni tribes in the North of Iraq that permitted IS to make the rapid territorial gains that have stunned both the West and the governments of the region.

We in the West have little conception of the mutual hatred and contempt between these two Islamic sects. Think of the Protestant and Catholic hatreds, thankfully of the past, and multiply them up. Then add in a regional struggle for power. We now have the leading Sunni power, Saudi Arabia, feeling threatened by the growing power of the Shia' standard bearer in Iran as their influence spreads in Syria and Lebanon – a Shi'ite arc which the Saudis are determined to oppose.

Where do our interests now lie? We have a humanitarian interest in getting effective aid to the hundreds of thousands of refugees fleeing the blood curdling violence of the Islamic fighters. Protecting them requires that the front line of Kurdish controlled Iraq be stabilised. Only the Kurds can do that and, as the US and most of Europe - EU foreign ministers met in emergency session in Brussels yesterday to discuss the issue - HAVE now recognised, they must be provided with the ammunition, equipment and intelligence that they need. It is very likely that close air support will also be necessary, at least for some months but any involvement of ground troops would be a very serious mistake. While it may be necessary to have a very small number of special forces in a position to direct air strikes, we cannot allow “mission creep” to take over. Before long the very presence of Western forces generates resentment and hostility.

Once the immediate crisis has been addressed, we must prevent the development of the Islamic state. That will require an effective government in Baghdad who must take steps to win back the acquiescence, if not the loyalty, of the Northern tribes who, of course, are Sunni and who could take on the Islamic extremists if they chose to. Beyond that we need to review our attitude to the present regimes in Tehran and in Damascus – yes, Damascus. We cannot afford to do less. An “Islamic state” poses a major threat to the stability of the whole Middle East. Furthermore, it establishes an area under the control of Islamic extremists which poses a threat to Britain itself. The Security Service have been unambiguous in pointing to the risk of “blow-back” – that is young men from Britain going out to fight and coming back fired up with hostile intent. This risk will be exacerbated by any success that IS may continue to have as it will certainly be seen by its adherents as a sign of God's favour to their cause.

To be effective in the region and to ensure our own security, we must, for once, learn from the past and ensure that our policies take account of the internal dynamics of the countries of the region. We cannot afford any more mistakes. The growing chaos in the Middle East poses a real and present danger both to our economy and the peace of our society and indeed to that of the wider world.

Extend #2 — No Middle East Proliferation

This is specifically true of Saudi Arabia — infrastructural and international barriers make it impossible.

Esfandiary and Tabatabai 15 — Dina Esfandiary, McArthur Fellow in the Centre for Science and Security Studies at King's College, London, Research Associate in the Non-Proliferation and Disarmament programme of the International Institute for Strategic Studies, Ph.D. in Security Studies from the Graduate Institute of Security Studies of Geneva, M.A. in Security Studies from King's College, London — Ariane Tabatabai, visiting assistant professor in the Security Studies Program at the Georgetown University School of Foreign Service, Ph.D. in War Studies from King's College, London, M.A. in International Peace and Security with Distinction from King's College London, B.A. in Political Science and Cinema and Cultural

Studies from the SUNY, Stony Brook, 2015 (“Why nuclear dominoes won't fall in the Middle East,” *Bulletin of Atomic Scientists*, April 22nd, accessible online at <http://thebulletin.org/why-nuclear-dominoes-wont-fall-middle-east8236>, accessed on 6-25-15)

Saudi Arabia: The human and technical impediments to a nuclear arsenal. Saudi Arabia is viewed as the Middle East's most likely nuclear proliferator. Riyadh has been the loudest voice in the region, claiming it'll "go nuclear" should Iran do so. It also wants an enrichment capability to mirror Iran's. An assessment of the nascent Saudi nuclear power program shows that for all of Riyadh's foot-stomping, it doesn't have the technical capability to build nuclear weapons. Even if this technical deficit could be overcome, its allies could influence its intentions.

Saudi Arabia has ambitious plans for its nuclear industry. It wants to build 16 nuclear reactors in the next few decades, but right now Saudi Arabia does not have any nuclear reactors, and its first won't go on line until 2022, at earliest. To date, the King Abdullah City for Atomic and Renewable Energy (KA-CARE) has scouted out foreign suppliers and developed regulatory frameworks—but gone no further down the nuclear path.

Riyadh lacks the human capacity to develop and operate its own nuclear infrastructure in the foreseeable future. But Saudi Arabia is aware of its technical shortcomings, and it's looking for other options

After contributing financially to Pakistan's nuclear weapons program and defense sector, the Saudis may want Islamabad to return the favor, some observers believe. The Saudi leadership plays along with suggestions it may acquire nuclear technology from Pakistan. In March 2015, King Salman bin Abdulaziz urgently summoned Pakistani Prime Minister Nawaz Sharif to Riyadh to discuss strategic cooperation efforts, while calling for Pakistani involvement in Saudi efforts in Yemen. This was intended to remind nuclear weapons state negotiators that Riyadh is keeping its nuclear options open.

But it is unlikely the Saudis will get a nuclear weapon from Pakistan. Pakistan—which covertly developed its nuclear arsenal outside the nuclear nonproliferation regime—aims to normalize its nuclear status, rather than becoming further alienated from the international community.

Islamabad was already singled out for the activities of the world's biggest and most successful illicit nuclear trafficking network, led by a key figure in its nuclear weapons program, A.Q. Khan. What's more, Islamabad is extremely proud of its nuclear achievements. In the words of Zulfiqar Ali Bhutto, “We will eat grass, even go hungry, but we will get one of our own [bomb].” Pakistanis didn't eat grass, but they endured a great deal of hardship to get the bomb. The program was extremely costly for the country. So, it's no surprise that many Pakistani officials and former officials take issue with assertions that their country might give nuclear weapons to Saudi Arabia.

Even if Pakistan agreed to provide the Kingdom with the bomb, the Saudis are very unlikely to go through with such an acquisition. Saudi Arabia is dependent on the United States for security guarantees. As long as Washington remains Riyadh's main security guarantor, it has the power to influence Saudi decision making on other issues, including, specifically, nuclear weapon acquisition. And the Kingdom would find it very difficult to attract another country willing to supply the security and trade guarantees that the United States now provides. It is hard to imagine any of the world's major powers agreeing to be viewed as a supporter of nuclear proliferation.

Effect #3 — No “Domino Effect”

“Domino” theories are more rhetoric than reality — no state has the capability or political will.

Varnum 15 — Jessica Varnum, NTI Project Manager and a Research Associate at the James Martin Center for Nonproliferation Studies, Adjunct Professor of Conflict and Peace Analysis at the Middlebury Institute of International Studies in Monterey, M.A. in International Policy Studies from the Monterey Institute of International Studies, B.A. in government and international studies from Colby College, 2015 (“Middle East Nuclear Race More Rhetoric Than Reality,” *World Politics Review*, May 14th, accessible online at <http://www.worldpoliticsreview.com/articles/15769/middle-east-nuclear-race-more-rhetoric-than-reality>, accessed on 6-25-15)

In the run-up to the June 30 deadline for a comprehensive nuclear agreement with Iran, **alarmists** in Washington, Tel Aviv and elsewhere **are again warning of an imminent race to nuclear weapons capabilities in the Middle East**—one that will occur in the guise of peaceful nuclear programs, as countries such as Saudi Arabia, Egypt and Turkey all rush to construct their first nuclear power plants.

But the logic of chain-reaction proliferation in the Middle East is critically flawed. Equally flawed are assumptions that the region’s nuclear power aspirants are anywhere near having operational programs. Ambitious rhetoric aside, including Saudi Arabia’s pledge to compete with Iranian enrichment levels, **few countries in the region have meaningfully increased their civil or military nuclear capabilities in recent years.** With the Gulf Cooperation Council summit at Camp David Thursday putting talk of a nuclear Middle East back into the headlines, **it’s time for a reality check on the region’s actual capacity for both nuclear energy and nuclear weapons.**

Extend #4 — Small Arms Proliferation Inevitable.

Credibility Scenario

1nc Frontline

Litany of alt causes to US human rights violations – the UN found 25

Hudson, 14- B.A. in International Relations and a minor in Middle Eastern Languages, Literatures and Cultures, focusing on the Arabic language. Studied international humanitarian law and public policy at the University of Oxford (Adam, “UN Human Rights Committee Finds US in Violation on 25 Counts”, Truth Out, 4/4/14, <http://www.truth-out.org/news/item/22887-un-human-rights-committee-finds-us-in-serious-violation>)/KTC

While President Obama told the country to “look forward, not backward” when it came to Bush’s torture program, the United Nations has taken a different route. Recently, **the UN Human Rights Committee issued a report excoriating the United States for its human rights violations. It focuses on violations of the International Covenant on Civil and Political Rights, to which the country is party. The report mentions 25 human rights issues where the United States is failing. This piece will focus on a few of those issues - Guantanamo, NSA surveillance, accountability for Bush-era human rights violations, drone strikes, racism in the prison system, racial profiling, police violence, and criminalization** of the homeless.

Status quo solves a bigger internal link to perception US image- assumes global opposition to surveillance

Pew Research Center 14 (Pew Research Center is a nonpartisan fact tank that informs the public about the issues, attitudes and trends shaping America and the world. We conduct public opinion polling, demographic research, content analysis and other data-driven social science research. “Global Opposition to U.S. Surveillance and Drones, but Limited Harm to America’s Image” 7/14/14 <http://www.pewglobal.org/2014/07/14/global-opposition-to-u-s-surveillance-and-drones-but-limited-harm-to-americas-image/> lg)

Another high-profile aspect of America’s recent national security strategy is also widely unpopular: drones. In 39 of 44 countries surveyed, majorities or pluralities oppose U.S. drone strikes targeting extremists in countries such as Pakistan, Yemen and Somalia. Moreover, opposition to drone attacks has increased in many nations since last year. Israel, Kenya and the U.S. are the only nations polled where at least half of the public supports drone strikes. Despite these misgivings about signature American policies, across 43 nations, a median of 65% express a positive opinion about the U.S. And these overall ratings for the U.S. are little changed from 2013. Moreover, President Obama is still largely popular internationally – across 44 nations, a median of 56% say they have confidence in him to do the right thing in world affairs. And, while Obama no longer has the same high levels of popularity that he enjoyed immediately after his election in 2008, there has been very little change in his appeal over the past year. The biggest declines in his ratings since last year are found in two nations where the U.S. has listened to the private phone conversations of national leaders: Germany (from 88% confident in 2013 to 71% confident now) and Brazil (69% in 2013, 52% now). Obama’s favorability is also down considerably in Russia, reflecting recent tensions over the crisis in Ukraine. Only 15% of Russians currently express confidence in the American president, down from an already low 29% in 2013. U.S. favorability has also declined dramatically – just 23% of Russians say they have a favorable opinion of the U.S., less than half of the 51% registered in last year’s survey. In spite of the unpopularity of U.S. spying and its use of drones, America also remains more popular globally than China, its principal rival in world affairs. A median of 49% of the publics surveyed hold a positive view of China. And the U.S. is still considered the world’s top economic power, although this is less true today than it was before the Great Recession. However, looking to the future, a median of 50% of those surveyed in both 2013 and 2014, up from 41% last year, see China eventually supplanting America as the dominant world superpower. But China’s rising power also generates its own anxieties, especially in its immediate neighborhood. In particular, there are strong concerns in Asia that territorial disputes between China and its neighbors will lead to military conflict. More than seven-in-ten in the Philippines, Japan, Vietnam, South Korea and India say this is a concern. And two-thirds of Americans agree, as do 62% in China itself. These are among the major findings of a new survey by the Pew Research Center, conducted in 44 countries among 48,643 respondents from March 17 to June 5, 2014. The survey also finds that in most nations, young people are more favorable than their elders toward both the U.S. and China.

Credibility doesn’t matter and obsession with it increases the risk of conflict

Walt 1/6 (Stephen M., 2015, Robert and Renée Belfer professor of international relations at Harvard University, “The Credibility Addiction,” <http://foreignpolicy.com/2015/01/06/the-credibility-addiction-us-iraq-afghanistan-unwinnable-war/>)RTF

Does U.S. credibility matter? If so, how much? Is it more important for other states to have high confidence that the United States will fulfill its overseas commitments, even when doing so might be expensive and not necessarily in America’s best interest? Alternatively, is it better if other states have high confidence in America’s judgment, i.e., in its ability to analyze emerging international problems and devise effective responses to them? As anyone who’s studied the history of U.S. foreign relations knows, American leaders have been obsessed with credibility ever since World War II. If other states ever doubted U.S. power or resolve, so the argument ran, communists would be emboldened, deterrence would weaken, and America’s allies would be intimidated and neutralized, leaving the United States isolated and friendless in a hostile world. This concern led American leaders to constantly reiterate their pledges to defend allies all over the world, led Presidents Lyndon Johnson and Richard Nixon to fight on for years in Vietnam, and drove U.S. efforts to acquire some sort of “nuclear superiority” over the USSR. Even today, whenever something bad happens almost anywhere in the world, hawkish voices will immediately proclaim that America’s credibility will collapse if Uncle Sam does not do something now. It’s not surprising that credibility looms so large in U.S. foreign-policy thinking. Because the United States is the linchpin of a vast alliance network, it has to convince lots of other countries that its promises are really believable. A lot of these countries aren’t

especially powerful or strategically significant, however, so there are good reasons to wonder if it was really in America's interest to defend them. Moreover, some of these commitments involve nuclear guarantees of one sort or another, which means they entail at least some slight risk of nuclear war. As a result, Washington has to convince allies and adversaries that it might be willing to run big risks on behalf of other countries, even when the United States is not directly threatened and the countries it has pledged to defend aren't vital to maintaining the global balance of power or to American security more broadly. Add to these concerns the supposed "lesson" of Munich (i.e., the idea that all dictators are the equivalent of Adolf Hitler and that appeasement never, ever works), and you have a formula for viewing even trivial issues as somehow bearing on the broader question of how the United States will respond when its vital interests really are on the line. Of course, both the U.S. military and the foreign-policy elite are quick to embrace the notion that U.S. credibility was both fragile and all-important, because it provided another reason for large defense budgets and another justification for getting involved all over the world. Unfortunately, this obsession with credibility was misplaced. For one thing, a state's "reputation" for being tough or reliable didn't work the way most foreign-policy elites thought it did. American leaders kept worrying that other states would question the United States' resolve and capability if it ever abandoned an unimportant ally, or lost some minor scrap in the developing world. But as careful research by Ted Hopf, Jonathan Mercer, and Daryl Press has shown, states do not judge the credibility of commitments in one place by looking at how a country acted somewhere far away, especially when the two situations are quite different. In fact, when the United States did lose, or when it chose to cut its losses and liquidate some unpromising position, dominos barely fell and its core strategic relations remained unaffected. In other words, how the United States responds to a challenge in Southeast Asia or sub-Saharan Africa tells you nothing about how it would or should respond somewhere else, and other states understood this all along. When trying to figure out what the United States is going to do, other states do not start by asking what the United States did in some conflict on the other side of the world. Instead, they ask whether it is in America's interest to act in the situation at hand. And guess what? This implies that U.S. commitments are most credible when the American interest is obvious to all. I mean, nobody really doubts that the United States would fight like a tiger to defend its own soil, right? Exaggerated worries about U.S. credibility had a number of unfortunate consequences. They encouraged American leaders to act in places that didn't matter, in order to convince others that it would also act in places that did. Squandering resources on marginal conflicts undermined confidence in U.S. protection, however, because it consumed resources that could have been committed elsewhere and it sometimes made a war-weary American public even less interested in far-flung foreign adventures. Ironically, misguided efforts to bolster U.S. credibility may have weakened it instead. The credibility obsession also made it easier for U.S. allies to free-ride (something they were already inclined to do), because they could always get Uncle Sucker to take on more burdens by complaining that they had doubts about American resolve. I don't blame them for trying this ploy, but I do blame American officials for falling for it so often. In fact, had allies been a bit less confident that the United States was going to protect them no matter what, these states might have been willing to spend more on their own defense and been more attentive to Washington's wishes. If the goal is retaining U.S. influence and leverage, what really matters is whether other states have confidence in America's judgment. If they believe that the United States is good at weighing threats soberly and rationally, and if they are convinced that Washington can set clear priorities and stick to them, then U.S. allies can calibrate their actions with ours and will be more inclined to follow the U.S. lead. If allies and adversaries believe the United States understands what is going on in key regions and has a clear sense of its own interests, then they will know that the United States won't be buffaloeed into unwise actions by self-serving allied whining, or provoked into overreactions by enemies eager to drag us into another costly quagmire. By contrast, if American leaders panic at every sign of danger and treat minor problems as mortal threats, then other states will be less inclined to trust Washington's views on these matters and be more inclined to follow their own counsel. When Washington goes to war on the basis of cooked intelligence, worst-case assumptions, and unsurpassed hubris, then other countries will be warier the next time we try to get them to line up alongside us. If the United States

keeps throwing soldiers' lives and billions of dollars into unwinnable conflicts, confidence in our political system's ability to make rational decisions will decline even more. If foreign powers believe U.S. policy is driven more by domestic politics than by strategic imperatives, they'll view us with barely veiled contempt and meddle even more in our porous political system. If foreign leaders pay close attention to the bluster and balderdash that pass for strategic debate in official Washington, they'll have reason to wonder if the self-appointed Leader of the Free World really knows what it is doing. And of course, when they see a lengthy series of costly screw-ups (Iraq, Afghanistan, Yemen, Somalia, Libya, Ukraine, etc.), they will be more inclined to think for themselves than to trust Washington's guidance. What I'm suggesting, in short, is that successful diplomacy depends less on endlessly reaffirming our "will" or "resolve," and more on building confidence in the analytical capacity of the American foreign-policy community and the judgment of top U.S. officials. And that's not surprising, either. Diplomacy is mostly about persuasion; it is ultimately about convincing others to do what we want. They are more likely to accept our recommendations when we can tell a truly convincing story, i.e., one that has the merit of being true. And that means that credibility isn't the key to a successful foreign policy, especially when it becomes a reflexive tendency to respond to any and all challenges with threats, bluster, and the use of force. If America still wants other states to follow our lead, what really matters is judgment: analyzing issues intelligently, setting clear and sensible priorities, and being willing to rethink a course of action in response to events. New York Yankees pitcher Lefty Gomez famously said that it was better to be "lucky than good." He was probably right, but it's even better to be lucky and smart. And both matter more than being mindlessly predictable. Or, to paraphrase Walt Whitman, a "foolish credibility is the hobgoblin of small minds."

US image doing well

Pew 14 - The Pew Research Center is a nonpartisan American think tank based in Washington, D.C., that provides information on social issues, public opinion, and demographic trends shaping the United States and the world. ("Global Opposition to U.S. Surveillance and Drones, but Limited Harm to America's Image," <http://www.pewglobal.org/2014/07/14/global-opposition-to-u-s-surveillance-and-drones-but-limited-harm-to-americas-image/> 7/14/2014) STRYKER

A country's brand is a valued commodity, especially when that nation is the world's largest economic and strategic power. And, in 2014, America's image remains strong in much of the world. Despite anger with Washington over U.S. spying on both foreign leaders and foreign nationals, widespread opposition to U.S. drone strikes, disagreements about what to do in the Middle East and other recurring tensions, most surveyed publics around the world still hold a favorable view of the United States. Young people, in particular, in many nations have an especially positive opinion of America. Overall, attitudes toward the U.S. are largely unchanged from 2013. A global median of 65% voice an affirmative opinion about America. This includes a median of 74% in Africa, 66% in Western Europe, 66% in Asia, 65% in Latin America, but just 30% in the Middle East. For nearly a decade and a half the U.S. global image has been on a roller coaster ride. At the beginning of the century America was seen favorably by majorities in most of the countries where comparable public opinion data are available. Over the next few years the bottom fell out of U.S. approval numbers, amid widespread opposition to the war in Iraq and other aspects of U.S. foreign policy. America's image began to rally in some nations and to soar by the end of the decade following the election of Barack Obama, at least in Europe and parts of Asia and Latin America. After slipping a bit again in the first years of this decade, brand U.S. has stabilized and even recovered in a few nations in 2014. Currently, majorities in 30 of 43 nations express a favorable opinion of the United States. This includes majorities in five of seven European nations, where 78% of Italians, 75% of the French and 73% of Poles voice positive views of Uncle Sam. There is no evidence of a rise of anti-Americanism in most of Western Europe, home to great animosity toward Washington in the middle of the last decade. Only in Germany, where U.S. favorability is down 13 points since 2009, has the positive image of the United States slipped significantly. And, despite this slippage, roughly half of Germans (51%) still see America in a positive light. The biggest decline in ratings for the U.S. is in Russia, where 71% now hold an unfavorable opinion. About half (51%) the Russian public expressed a positive opinion of Uncle Sam in 2013. In 2014, only 23% hold that view, a drop of 28 percentage points. Russians' sentiments have been up and down in the last few years (57% positive as recently as 2010). The recent souring of the Russian mood about the United States has come at a time of growing Moscow-Washington tension over Crimea, Ukraine and U.S. economic sanctions against some Russians. A significant number of Greeks also harbor anti-American sentiment. More than six-in-ten Greeks express a negative view (63%, vs. 34% favorable). Greeks have been

quite negative the past three years at a time of growing Greek frustration over their economic situation. In Asia, majorities in eight of 11 nations express a positive opinion of the United States. This includes 92% of Filipinos, 82% of South Koreans and 76% of Bangladeshis and Vietnamese. Even half the Chinese give Uncle Sam a thumbs up. Only Pakistanis are strongly anti-American, with just 14% expressing a favorable assessment of the U.S., while 59% are unfavorable. The median positive approval of the United States in Pakistan in 13 surveys since 2002 has been a mere 15%. In eight of nine Latin American countries, majorities see the U.S. in a favorable light. Salvadorans (80%) are particularly positive in their assessment, as are Chileans (72%) and Nicaraguans (71%). Notably, despite all the tensions between Washington and Caracas, 62% of Venezuelans have a favorable opinion of the U.S. But less than four-in-ten Argentines (36%) are positively disposed toward Washington. In the seven surveys the Pew Research Center has conducted in Argentina since 2002, never more than about four-in-ten Argentines have expressed favorable sentiment toward their big neighbor to the north. Africans express particularly positive views about America. Strong majorities in all seven nations surveyed back the United States, including roughly three-quarters or more of Kenyans (80%), Ghanaians (77%), Tanzanians (75%) and Senegalese (74%). The Middle East is the sole region where anti-Americanism is both deep and widespread. Eighty-five percent of Egyptians and Jordanians and 73% of Turks voice a negative opinion of the United States. Only 10% of Egyptians, 12% of Jordanians and 19% of Turks have a favorable view. The Egyptian rating is the lowest among the 43 nations in the study. The Tunisians are divided: 42% positive, 47% negative. Israelis are the only public in the region where a majority (84%) holds a favorable opinion of America. And they are the second biggest U.S. fans among the nations surveyed, trailing only the Filipinos. While hardly embracing America, Palestinians' views of the United States improved by 14 percentage points, from 16% favorable in 2013 to 30% positive in 2014, possibly the consequence of Washington's efforts to restart the Middle East peace process, even though the attempt ultimately failed. The global public's view of the United States is largely unchanged from 2013. Among the thirty-five countries surveyed in both 2013 and 2014, the median favorable assessment in 2014 is 62%, unchanged from 2013. Young See U.S. Positively Young people are more likely than their elders to have a favorable view of the United States in many parts of the world. In 24 of 43 nations, there is a generation gap in sentiment toward America with those ages 18 to 29 far more supportive of Uncle Sam than people 50 years of age and older. This age disparity is particularly evident in parts of Asia, where young Vietnamese (89%) look more favorably on the U.S. than do older Vietnamese (64%), a 25 percentage point difference that is possibly a legacy of the Vietnam War, which the older generation would have experienced personally. There is a similar generation gap about the United States in Thailand (+22 points) and China (+21 points). Ethnic and Religious Divides about the United States In a number of nations where the population is divided among major ethnic and religious groups, views of the United States can divide along those fault lines. In Israel, 91% of Jews have a favorable opinion of America. Just 46% of Israeli Arabs voice a positive view. In Lebanon, Israel's neighbor to the north, more than half of Sunni Muslims (55%) and Christians (53%) say they are positively disposed toward the United States. But only 10% of Shia Muslims agree. Meanwhile in Malaysia, Buddhists (74%) are more supportive of the U.S. than are Muslims (40%). And in Nigeria, 80% of Christians express a favorable opinion of America, compared with 59% of Muslims. Obama Still Popular The election of Barack Obama as the 44th U.S. president in 2008 was widely approved around the world, leading to high expectations for the new American leader. His election also coincided with a dramatic jump in favorability of the United States, promising an end to the anti-Americanism that had plagued much of Washington's relations with the rest of the world for several years. Today, Obama remains largely popular in much of the world, except the Middle East. Half or more of the public in 28 of 44 countries surveyed has confidence in him to do the right thing in world affairs. And his median positive rating is 56%. In most nations the public's assessment of Obama's performance is largely unchanged since 2013. His image has dropped by double-digits in five nations – Brazil, Germany, Argentina, Russia and Japan. But it has risen appreciably in Israel and China. Western Europeans' views of Obama remain fairly positive. More than eight-in-ten French (83%) and seven-in-ten Italians (75%), British (74%) and Germans (71%) have confidence in the U.S. president doing the right thing. Revelations that Washington systematically reads both Americans' and some foreigners' emails and listens in on their telephone conversations appears to have significantly damaged Obama's approval in only one European Union (EU) country: Germany. Germans' views of Obama fell 17 percentage points since last year. Nonetheless, German confidence in the U.S. president remains relatively high. Russian (15%) faith in Obama, already quite low in 2013, is down 14 points, a likely casualty of the Ukraine confrontation. And Obama's handling of that crisis has not won the U.S. president much support in Ukraine, where only 44% give him a positive grade. Half or more of the publics in nine of 11 Asian nations surveyed have confidence in Obama to do the right thing in world affairs. Such pro-Obama sentiment is particularly strong in the Philippines (89%) and South Korea (84%). About half the Chinese (51%) now approve of his conduct internationally, up 20 points in the past year. Just 7% of Pakistanis think highly of Obama, making them his most severe critic. Notably, confidence in Obama's leadership, while still high in Japan (60%), is down 10 points since 2013. In Africa, half or more of the public in all seven nations surveyed give Obama a positive rating. He is particularly appreciated in Kenya (78%) and Tanzania (74%). Latin Americans take a more jaundiced view of the U.S. president. In just four of the nine countries in the

survey do half or more approve of his conduct of foreign affairs. And his highest rating is a relatively modest 58% in El Salvador. Meanwhile, roughly a third rate Obama highly in Venezuela (33%) and Argentina (31%). Moreover, appreciation for the U.S. president's international stewardship is down 17 points in Brazil and 13 points in Argentina in just the past year. Obama's lowest regional approval is in the Middle East. Only 13% of Palestinians, 17% of Jordanians and 19% of Egyptians have confidence in his leadership. At the same time, 71% of Israelis give Obama a thumbs up. And that approval has risen 10 points since 2013, possibly thanks to the Obama administration's renewed efforts to find some settlement for the Israeli-Palestinian problem. Whatever global publics think of the American president in 2014, there is widespread disappointment in his leadership in world affairs compared with views in 2009, his first year in office. Since 2009 Obama's ratings have declined in 19 of 21 countries for which comparable data exist. It is up significantly in only one. And the median assessment of his global stewardship is down from 62% in 2009 to 55% in 2014. This includes a drop of 30 percentage points in Argentina, a 25-point falloff in Japan, a 23-point decline in Egypt and 22-point slides in Germany and Russia. Only in Israel has the public's view of Obama improved significantly. Israeli confidence in him is up 15 points, from 56% to 71%, since he became president.

Ext. No impact to Heg

No impact to heg

Fettweis 10 (Christopher J. Professor of Political Science at Tulane, *Dangerous Times-The International Politics of Great Power Peace*, pg. 175-6)

If the only thing standing between the world and chaos is the US military presence, then an adjustment in grand strategy would be exceptionally counter-productive. But it is worth recalling that none of the other explanations for the decline of war — nuclear weapons, complex economic interdependence, international and domestic political institutions, evolution in ideas and norms — necessitate an activist America to maintain their validity. Were American to become more restrained, nuclear weapons would still affect the calculations of the would be aggressor; the process of globalization would continue, deepening the complexity of economic interdependence; the United Nations could still deploy peacekeepers where necessary; and democracy would not shrivel where it currently exists. More importantly, the idea that war is a worthwhile way to resolve conflict would have no reason to return. As was argued in chapter 2, normative evolution is typically unidirectional. Strategic restraint in such a world be virtually risk free.

No impact to hegemonic transition – the US order will be upheld

Ikenberry, 08 – Gilford John Ikenberry is a theorist of international relations and United States foreign policy, and a professor of Politics and International Affairs in the Woodrow Wilson School of Public and International Affairs at Princeton University (Gilford John, “The Rise of China and the Future of the West Can the Liberal System Survive?”, *Foreign Affairs*, January/February 2008 Issue, <https://www.foreignaffairs.org/articles/asia/2008-01-01/rise-china-and-future-west>)

Some observers believe that the American era is coming to an end, as the Western-oriented world order is replaced by one increasingly dominated by the East. The historian Niall Ferguson has written that the bloody twentieth century witnessed "the descent of the West" and "a reorientation of the world" toward the East. Realists go on to note that as China gets more powerful and the United States' position erodes, two things are likely to happen: China will try to use its growing influence to reshape the rules and institutions of the international system to better serve its interests, and other states in the system -- especially the declining hegemon -- will start to see China as a growing security threat. The result of these developments, they predict, will be tension, distrust, and conflict, the typical features of a power transition. In this view, the drama of China's rise will feature an increasingly powerful China and a declining United States locked in an epic battle over the rules and leadership of the international system. And as the world's largest country emerges not from within but outside the established post-World War II international order, it is a drama that will end with the grand ascendance of China and the onset of an Asian-centered world order. That course, however, is not inevitable. The rise of China does not have to trigger a wrenching hegemonic transition. The U.S.-Chinese power transition can be very different from those of the past because China faces an international order that is fundamentally different from those that past rising states confronted. China does not just face the United States; it faces a Western-centered system that is open, integrated, and rule-based, with wide and deep political foundations. The nuclear revolution, meanwhile, has made war among great powers unlikely -- eliminating the major tool that rising powers have used to overturn

international systems defended by declining hegemonic states. Today's Western order, in short, is hard to overturn and easy to join. This unusually durable and expansive order is itself the product of farsighted U.S. leadership. After World War II, the United States did not simply establish itself as the leading world power. It led in the creation of universal institutions that not only invited global membership but also brought democracies and market societies closer together. It built an order that facilitated the participation and integration of both established great powers and newly independent states. (It is often forgotten that this postwar order was designed in large part to reintegrate the defeated Axis states and the beleaguered Allied states into a unified international system.) Today, China can gain full access to and thrive within this system. And if it does, China will rise, but the Western order -- if managed properly -- will live on.

Ext. Heg unsustainable

US Heg is already on a decline

Goure 9/24 (Daniel, Dr. Daniel Goure, is a Vice President at the Lexington Institute, an analyst on national security and military issues - worked as an Adjunct Professor in the National Defense University's Homeland Security program, Gouré received a degree in Government and History from Pomona College, an MA in International Relations and Russian Studies from Johns Hopkins University, “Could America Lose Its Superpower Status?”, 9/24/2014, http://www.realcleardefense.com/articles/2014/09/24/on_the_road_from_superpower_to_regional_power_with_some_global_reach_107460.html) BBer

At last week's Air Force Association annual conference, I was privileged along with other defense analysts to have a series of conversations with senior Air Force leaders, many of whom are responsible for conducting a wide range of day-to-day operations in complex and at times dangerous parts of the world. They see the evolution of threats to U.S. global interests and the rapid rise of military competitors up close. Every one of these military leaders told the same story of being required to do more with less. This is before sequestration will cut nearly \$100 billion from the proposed FY 2016 defense budget. If that happens, the impact on U.S. national security will be nothing short of catastrophic. One Air Force officer said it best: If sequestration takes effect, the United States will stop being a global superpower and become “a regional power with some global reach.” Today, the United States faces rising security challenges on no fewer than four continents. Europe faces the specter of a Russia willing to use force to redraw national boundaries, something that has not occurred there for more than 60 years. Moscow has threatened the West with the specter of nuclear attack and claims a special right to protect those it deems to be Russian even if they are citizens of foreign lands. In Asia, North Korea is testing a family of ballistic missiles as it continues to build nuclear weapons. China has asserted unlawfully the right to control large swathes of the international air and sea environment between it and neighboring countries. Its fighter jets have repeatedly “buzzed” U.S. surveillance aircraft operating in international airspace. It is building a modern military that in a few short years could be sufficiently lethal so as to deter U.S. military intervention in the event of Chinese aggression against one of our allies in the region. The explosion in the terrorist/insurgent threat in North Africa and the Middle East now extends all the way from Libya, Mali and northern Nigeria to Sudan, Somalia, Yemen, the Sinai, Gaza, Syria and Iraq. This is an area larger than the continental United States with about as many people. Most recently, the Ebola virus has threatened to become a pandemic in West Africa prompting the Obama Administration to deploy more troops to that part of the world than it has proposed sending to Iraq to train and assist anti-ISIS forces. The U.S. military is being stretched to the breaking point. Because most of the military is now based in the United States, deploying overseas for ongoing contingencies and crises takes more manpower, equipment and units than if the U.S. were still forward deployed. For every unit overseas, regardless of the mission, there is one that just returned and another preparing but not yet ready to deploy. Critical capabilities such as the U-2 airborne surveillance aircraft have been

maxed out, which is ironic since the Pentagon plans to retire the entire fleet in 2016 even though there is not a replacement either in quantity or quality available. The Marine Corps has been forced to deploy a special response unit with V-22s and aerial tankers to a base in Spain because it doesn't have enough amphibious warfare ships to conduct continuous maritime patrols in the Mediterranean as it once did. **The U.S. military is being forced to shed capacity – meaning people and equipment – that is required if this nation is going to be able to respond to more than one major threat in a region at a time.** In addition, as more capacity and responsibility is shifted to the National Guard and Reserves, particularly in the Air Force and Army, the institutional capacities of those services, **their ability to train and equip, is deteriorating.** The Air Force, for example, cannot train enough pilots to fill today's billets. This means that in the near future, there will not be enough trained pilots exiting the regular Air Force to fill the needs of the Air National Guard. It can be argued that the U.S. is unlikely to face simultaneous conflicts in four regions of the world. But **it is already evident that this country's interests and friends are threatened by well-armed competitors, if not outright adversaries.** in at least three.

US heg has been on a decline

Wallerstein 13, (Immanuel, a senior research scholar in the sociology department at Yale University and director emeritus of the Fernand Braudel Center at Binghamton University. He is also a resident researcher at La Fondation Maison des Sciences de l'Homme in Paris, "The consequences of US decline", Aljazeera, 11/2/2013, <http://america.aljazeera.com/articles/2013/11/2/the-consequencesofusdecline.html>) BBer

That **U.S. decline as a hegemonic power began circa 1970, and that a slow decline became a precipitate one during the presidency of George W. Bush. I first started writing about this in 1980 or so. At that time, the reaction to this argument, from all political camps, was to reject it as absurd.** However, after the burst bubble of 2008, opinion of politicians, pundits and the general public began to change. **Today, a large percentage of people** (albeit not everyone) **accepts the reality of at least some relative decline of U.S. power, prestige and influence.** In the United States, this is accepted quite reluctantly. Politicians and pundits rival each other in recommending how this decline can still be reversed. I believe **it is irreversible.** **The real question is what the consequences of this decline are. The first is the manifest reduction of U.S. ability to control the world situation, and in particular the loss of trust by the erstwhile closest allies of the United States in its behavior.** In the last month, because of the evidence released by Edward Snowden, it has become public knowledge that the U.S. National Security Agency (NSA) has been directly spying on the top political leadership of Germany, France, Mexico and Brazil among others (as well, of course, on countless citizens of these countries). I am sure the United States engaged in similar activities in 1950. But in 1950, none of these countries would have dared to make a public scandal of their anger, and demand that the United States stop doing this. If they do it today, it is because today the United States needs them more than they need the United States. These present leaders know that the United States has no choice but to promise, as President Obama just did, to cease these practices (even if the United States doesn't mean it). And **the leaders of these four countries all know that their internal position will be strengthened, not weakened, by publically tweaking the nose of the United States.** He reminds us that one wins wars only by ground warfare, and the **U.S. president is presently under enormous pressure by both politicians and popular sentiment not to use ground forces.** The problem for everyone in a situation of geopolitical chaos is the high level of anxiety it breeds and the opportunities it offers for destructive folly to prevail. **The United States, for example, may no longer be able to win wars, but it can unleash enormous damage to itself and others by imprudent actions.** **Whatever the United States tries to do in the Middle East today, it loses.** At present none of the strong actors in the Middle East (and I do mean none) take their cues from the United States any longer. This includes Egypt, Israel, Turkey,

Syria, Saudi Arabia, Iraq, Iran and Pakistan (not to mention Russia and China). The policy dilemmas this poses for the United States has been recorded in great detail in The New York Times. The conclusion of the internal debate in the Obama administration has been a super-ambiguous compromise, in which President Obama seems vacillating rather than forceful. Finally, there are two real consequences of which we can be fairly sure in the decade to come. The first is the end of the U.S. dollar as the currency of last resort. When this happens, the United States will have lost a major protection for its national budget and for the cost of its economic operations. The second is the decline, probably a serious decline, in the relative standard of living of U.S. citizens and residents. The political consequences of this latter development are hard to predict in detail but will not be insubstantial.

Ext. Soft Power High

Soft power high now because of FIFA scandal action

Shearer 5/30 (Derek, Stuart Chevalier Professor, Diplomacy and World Affairs at Occidental College, "US soft power triumphs in probe of Sepp Blatter's corrupt casino," The Conversation, 5/30/15, <https://theconversation.com/us-soft-power-triumphs-in-probe-of-sepp-blatters-corrupt-casino-42538>)/kjz

The selection by FIFA of Putin's Russia to host the 2018 World Cup and of tiny Qatar to host in 2022 was highly suspect. Suspicions of money changing hands and undue influence on the FIFA executive committee were widespread, and led to cynicism about FIFA as an international sporting organization.

Blatter, who was re-elected for his fifth term as head of the organization, has continually shrugged off concerns about his leadership. He has worked at FIFA for 40 years, the past 17 as president. Although FIFA is mocked by TV comedians like John Oliver and criticized by citizen groups demanding great transparency, reform of the organization has seemed unlikely. Blatter maintained tight control of the organization. FIFA's insider-controlled governance structure seemed impenetrable, until the US took legal action. John Oliver riffs on FIFA. "Today, soccer wins, transparency wins. Enough of dirty deals, enough of lies," former Argentine soccer star Diego Maradona told the media after the indictment. Romário de Souza Faria, a Brazilian soccer star turned politician, praised the FBI on the floor of the Brazilian Senate. Popular British soccer blogger Roger Bennett told CBS Morning News that the US deserved the thanks of the world for moving against FIFA officials. The immediate impact of the Department of Justice action is a plus for American soft power. Although the US is late to the soccer world – baseball, football and basketball have always had more appeal – the game has greatly expanded from AYSO youth leagues to top collegiate teams to a professional soccer league. Begun in 1993, Major League Soccer (MLS) has expanded to 20 cities in the US and Canada and is now moving toward profitability. Average attendance at matches exceeds that of the NBA and the NHL.

US soft power still high despite Chinese gains

Shah 14 (Ritula, a journalist and news presenter on BBC Radio, "Is US monopoly on the use of soft power at an end?," BBC World Tonight, <http://www.bbc.com/news/world-29536648>)/kjz

Chinese strategy There is another complicating factor, the US may still be the only superpower but there are now new, competing visions of what the world should look like. null China's Confucius Institutes have proved controversial The success of China's economy provokes both fear and admiration though China would like more of the latter. The 2008 Beijing Olympics probably marked the beginning of the Chinese government's efforts to nurture a soft power message. Since then, things have stepped up. There has been an expansion of Chinese Central Television, with the broadcaster producing English language programming from Washington and Nairobi. The Education Ministry is funding more than 450 Confucius Institutes which aim to spread Chinese language and culture. Their locations include some 90 universities in North America. But this attempt at building soft power has gone awry. Earlier this year, the American Association of University Professors wrote a report criticising the presence of Confucius Institutes on US campuses. The academics argued the Institutes were an arm of the Chinese state, which worked to "advance a state agenda in the recruitment and control of academic staff, in the choice of curriculum, and in the restriction of debate". Tibet, Taiwan, and Tiananmen are said to be among the subjects that aren't open for discussion in the Institutes. And in recent weeks, two prominent US universities have suspended their affiliated Confucius Institutes, as concerns about them grow. So for now, China's state funded soft

power message, is treated with some suspicion and has nothing like the impact of the more grassroots US version. China is still feared rather than admired by most of its Asian neighbours (not least because of its military or hard power capacity) but over time, who is to say that Beijing's economic success, regardless of its political system, won't win over global admirers? So does soft power really matter? Governments seem to value it even though soft power alone won't prevent wars or silence your critics - although it may help to win support for your point of view. For now, US soft power, remains pre-eminent. America continues to succeed in selling us its culture, its ability to innovate and its way of life. But there are competing economic powers and competing ideologies, all demanding to be heard, all wanting to persuade you to see it their way. Wielding soft power effectively is set to get more complicated.

Ext. No risk decline

There is no risk of soft power decline OR tons of alternative causes

Nye 15 - Joseph Nye is university distinguished service professor and former dean of Harvard's Kennedy School of Government. He has served as assistant secretary of defense for international security affairs, chair of the National Intelligence Council, and deputy under secretary of state for security assistance, science, and technology. (*Is the American Century Over?* pp. 137-138 e-book, 2015) STRYKER
As we saw earlier, ancient Rome had an economy without productivity, a society riven by internecine warfare, and rampant corruption and decay in political institutions that made Rome incapable of defending itself. The facts above make it hard to draw a sustainable analogy between the United States and Rome. American culture has cleavages, but they remain manageable and less dangerous than at times in the past. Social problems abound, with some getting worse and some better. The society remains open to the outside world and better able than most to renew itself by immigration. The American economy is growing more slowly than in the past, but it remains innovative at using and commercializing technologies because of its entrepreneurial culture, the most mature venture capital industry, and a tradition of close relations between industry and the world's top ranking universities. It leads the world in research and development, and is at the forefront of new cyber, nano, bio, and energy technologies. Real problems exist in terms of inequality and educating the workforce of the future. The largest questions are about political institutions. Political gridlock was incorporated into the American system from the start, but it has been increasing in Washington in recent years. Even if they are not worse than in the past, the important question is whether the institutions will be able to cope with the problems of the future. At the same time, the federal system also ensures diversity and the potential for innovation in states and cities. And the lesser role of government means that much of the innovation in America occurs outside government and outside Washington. Moreover, despite the increased partisan bickering, several serious problems, ranging from deficits to energy to health care costs, have improved rather than deteriorated in recent years. America has many problems and they raise many questions, but they are not creating an absolute decline that gives us a clear answer about when the American century will end.

Ext. Soft power decline inevitable

Soft power loss inevitable—leads to failure to lead global order

Metla 6/10 (Valeriya, holds two Bachelor Degrees in regional studies and international criminal justice, "Is the United States a Superpower in Decline?," Law Street, 6/10/15, <http://lawstreetmedia.com/issues/world/united-states-superpower-decline/>)/kjz

It's commonly believed that the United States is experiencing the decline of its global power. Christopher Layne, Distinguished Professor of International Affairs and Robert M. Gates Chair in National Security at the Bush School of Government and Public Service, argues that global power is shifting from West to East, leading to an American decline in influence and loss of global dominance. Those who support the notion that America's superpower status is fading often argue the following: Due to its policies in the Middle East and Latin America, America lost its soft power influence over other countries. The war in Iraq is widely considered a failure that exhausted the U.S. military and broke the bank, increasing the country's debt and leading to even greater proliferation of terrorism in the Middle East. Starting from the period of decolonization, America portrayed itself as a protector of human rights and democratic values. Nevertheless, after 9/11, the United States widely used torture against suspected terrorists, who were confined in Guantanamo Bay and other "black

sites.” Basically, the United States condemns other countries for violating human rights but abuses those principles itself. America didn’t sign various important international treaties. For example, while the majority of countries can be prosecuted in the International Criminal Court (ICC) if their leaders commit certain international crimes, the United States cannot, suggesting double standards and tendency toward unilateral decision-making. At home, the state of permanent impasse in Congress is making it extremely difficult to make any progress in making decisions or reforming outdated and often counterproductive laws. In addition, racial inequality and poverty are on the rise, and infrastructure is deteriorating without proper investments. The U.S. economy still hasn’t fully recovered from the 2008 financial collapse, while other countries such as China, India, Brazil, and Turkey are becoming stronger in terms of their economies and militaries. Some even compare the United States with the British Empire, referring to its collapse a century ago. But, at the very least, this viewpoint suggests that America has lost the favor of many countries. Meanwhile, China has reached the status of a great power, and globalization has become omnipresent. Stephen Walt, Belfer Professor of International Affairs at Harvard’s John F. Kennedy School of Government, argues that “the real issue is whether developments at home and overseas are making it harder for the United States to exercise the kind of dominant influence that it did for much of the latter half of the 20th century.” According to this view, the United States is not declining and is still one of the most powerful countries in the world, but its capacity to lead global order has been diminished due to the array of domestic and foreign policy failures. As the Cold War ended, international relations also changed, making it more difficult for the United States to exercise its influence in the world. Further, Ian Bremmer, President of the Eurasia Group, argues in his book “Superpower: Three choices for America’s Role in the World” that the United States is still a global superpower. Watch the video below with Ian Bremmer to learn more about possible scenarios.

Ext. Soft power fails

US soft power fosters resentment

Gardels 05 (Nathan, editor of *New Perspectives Quarterly* since it began publishing in 1985. Since January 2014 he has been editor-in-chief of *THEWORLDPOST*, “The Rise and Fall of America’s Soft Power,” *New Perspectives Quarterly*, winter 2005, [//kjz](https://onlinelibrarystatic.wiley.com/store/10.1111/j.1540-5842.2005.00718.x/asset/j.1540-5842.2005.00718.x.pdf?v=1&t=ib9nb68d&s=a861662ec00cfe0815f1f12ce5848ee8cb9ca038)

DOUBLE MESSAGE | America’s soft power thus carries a double message. It is a beacon of hope for the huddled masses who risk their lives to get here across the scorching desert from Mexico, on rickety rafts from Haiti or in the holds of rusty cargo ships from China; but it is also a satellite signal that inflames the pious and mobilizes the militant. Those who want what America has but can’t get it are stuck in their hopeless lives under corrupt and repressive regimes. On the other hand, those who don’t want it can’t escape its ubiquitous presence. Either way there is combustible resentment and anger across the Muslim world that, as v. s. Naipaul sees it, “their misfortune is due to the success of another civilization

AT: Terrorism

Soft power fails at combatting terrorism—empirics

Kroenig, McAdam, and Weber 10 (Matthew, Associate Professor and International Relations Field Chair in the Department of Government and School of Foreign Service at Georgetown University and a Senior Fellow in the Brent Scowcroft Center on International Security at The Atlantic Council; Melissa, Visiting Scholar at George Washington University’s Elliott School, in the Institute for Security and Conflict Studies; Steven, Professor at the Information School, University of California, Berkeley, “Taking Soft Power Seriously,” *Comparative Strategy*, 12/13/10, [//kjz](http://www.tandfonline.com/loi/ucst20)

The United States has also sought to apply soft power to counter ideological support for terrorism. Again, despite a concerted effort by the United States, global support for terrorist ideology shows no sign of abating and, according to some measures, may be increasing. The inability of the United States to counter ideological support for terrorism can be attributed to an environment

hostile to the application of soft power. The societies and groups to which the United States has targeted its message largely lack functioning marketplaces of ideas and the U.S. message is not credible to the target audience. For these reasons, the application of soft power has been an ineffective tool for countering ideological support for terrorism, despite the importance of individual attitudes as a driver of terrorist behavior. In the 2005 National Defense Strategy, the United States presented a three-pronged strategy for winning the war on terror.⁴⁸ The first two elements of the strategy, attacking terrorist networks and defending the homeland, were definitively in the realm of hard power. The third and, according to many Pentagon officials, the most important element of the strategy was “countering ideological support for terrorism.”⁴⁹ As part of this soft power strategy, the United States declared its intent to “Support models of moderation in the Muslim world by helping change Muslim misperceptions of the United States and the West.”⁵⁰ According to the 2006 National Strategy for Combating Terrorism, “winning the War on Terror means winning the battle of ideas.”⁵¹ A special task force on “strategic communications” was set up at the Defense Science Board that argued, “the United States is engaged in a generational and global struggle about ideas.”⁵² Under the leadership of Karen Hughes as Undersecretary of State for Public Diplomacy, the State Department established regional media hubs offering U.S. spokespeople with foreign language skills to speak on America’s behalf in media outlets throughout the Middle East.⁵³ The United States government also increased the budget for the United States Agency for International Development (USAID), the U.S. agency responsible for dispensing foreign aid, by 60 percent, from 5 billion in 1998 to 8 billion in 2003.⁵⁴ The United States funded a variety of pro-American media in the Muslim world, including H1 magazine, Radio Sawa, and the Al Hurra television station.⁵⁵ Furthermore, the United States established reeducation facilities, such as the “House of Wisdom” in Iraq, to teach moderate Muslim theology to detainees captured in the war on terror.⁵⁶ Despite this widespread effort to communicate throughout the Muslim world, the United States largely failed in its effort to apply soft power to its advantage in the war on terror by the end of the Bush administration. The war on terror will probably be a “generational struggle,” but it is nevertheless troubling that after a sustained multiyear effort to counter ideological support for terrorism, the United States made real progress on very few of its stated objectives. The United States, since 9/11, avoided a major terrorist attack, and while the causes of this can be debated, it is not likely the result of a waning of terrorist ideology globally, as is evidenced by the string of attacks in other parts of the world.⁵⁷ Terrorist ideology continued to flourish globally with the help of the internet.⁵⁸ The low public opinion of the United States in the Muslim world, often thought to be one of the factors contributing to terrorism against the United States and its allies, did not improve by the end of the Bush administration. In fact, a 2006 study found that people’s “attitudes toward U.S. foreign policy actually worsened slightly since they started listening to Radio Sawa and Al Hurra.”⁵⁹ The U.S. failure to use soft power effectively in the war on terror was severely pronounced in some of the most important countries. In Egypt and Pakistan, for example, 60 percent and 41 percent of their respective publics possessed either positive or mixed views of al Qaeda in 2006.⁶⁰ According to Doug Miller, chairman of the international polling firm Globescan, “The fact that so many people in Egypt and Pakistan have mixed or even positive views of al Qaeda is yet another indicator that the US war on terror is not winning hearts and minds.”⁶¹ Why did the United States fail in its effort to use soft power to counter ideological support for terrorism? Part of the reason was that the United States was not able to compete in a functioning marketplace of ideas in most of the societies where a threat of jihadi terrorism exists. In the 2006 National Strategy for Combating Terrorism, the United States acknowledges that “terrorists recruit more effectively from populations whose information about the world is contaminated by falsehoods and corrupted by conspiracy theories. The distortions keep alive grievances and filter out facts that would challenge popular prejudices and self-serving propaganda.”⁶² In other words, many countries of the Middle East and the broader Muslim world lack a functioning marketplace of ideas. They are disproportionately authoritarian.⁶³ These governments often take measures, generally for the purposes of domestic stability, that have the effect of preventing meaningful competition in their domestic marketplaces of ideas. Foreign media content containing ideas about democracy and freedom is filtered.⁶⁴ Radical religious groups, extremist parties, and fundamentalist madrassas are supported to shore up the legitimacy of secular regimes.⁶⁵ Domestic problems are externalized and blamed on an “imperial” United States.⁶⁶ The lack of a functioning marketplace of ideas in this region contributes to the pervasiveness of conspiracy theories.⁶⁷ Due in part to these phenomena, public opinion of U.S. foreign policy in 2005 was lower in the Middle East than in any other world region.⁶⁸ The inability of the United States to communicate in this region is aptly described by Norman Patizz, an American media entrepreneur, who notes that “there is a media war going on [in the Muslim world] with incitement, hate broadcasting, disinformation, government censorship, self-censorship, and America is not in the race.”⁶⁹

AT:Proliferation

No prolif impact

111. LESSONS FROM HISTORY Concerns over "regional proliferation chains," "falling nuclear dominos" and "nuclear tipping points" are nothing new; indeed, reactive proliferation fears date back to the dawn of the nuclear age.¹⁴ Warnings of an inevitable deluge of proliferation were commonplace from the 1950s to the 1970s, resurfaced during the discussion of "rogue states" in the 1990s and became even more ominous after 9/11.¹⁵ In 2004, for example, Mitchell Reiss warned that "in ways both fast and slow, we may very soon be approaching a nuclear 'tipping point,' where many countries may decide to acquire nuclear arsenals on short notice, thereby triggering a proliferation epidemic." Given the presumed fragility of the nuclear nonproliferation regime and the ready supply of nuclear expertise, technology and material, Reiss argued, "a

single new entrant into the nuclear club could catalyze similar responses by others in the region, with the Middle East and Northeast Asia the most likely candidates."¹⁶ Nevertheless, **predictions of inevitable proliferation cascades have historically proven false** (see The Proliferation Cascade Myth text box). In the six decades since atomic weapons were

first developed, nuclear restraint has proven far more common than nuclear proliferation, and cases of reactive proliferation have been exceedingly rare. Moreover, most **countries that have started down the nuclear path have found the road more difficult than imagined**, both technologically and

bureaucratically. **Leading the majority** of nuclear-weapons aspirants **to reverse course**. Thus, despite frequent warnings of an unstoppable "nuclear express,"¹⁷

William Potter and Gaukhar Mukhatzhanova astutely note that the "train to date has been slow to pick up steam, has made fewer stops than anticipated, and usually has arrived much later than expected."¹⁸ None of this means that additional proliferation in response to Iran's nuclear ambitions is inconceivable, but the empirical record does suggest that regional chain reactions are not inevitable. Instead, only certain countries are candidates for reactive proliferation. Determining the risk that any given country in the Middle East will proliferate in response to Iranian nuclearization requires an assessment of the incentives and disincentives for acquiring a nuclear deterrent, the technical and bureaucratic constraints and the available strategic alternatives. Incentives and Disincentives to Proliferate Security considerations, status and reputational concerns and

the prospect of sanctions combine to shape the incentives and disincentives for states to pursue nuclear weapons. **Analysts predicting proliferation cascades tend to**

emphasize the incentives for reactive proliferation while ignoring or downplaying the disincentives. Yet, as it turns

out, **instances of nuclear proliferation (including reactive proliferation) have been so rare because going down this road often risks**

insecurity, reputational damage and economic costs that outweigh the potential benefits.¹⁹ Security

and regime survival are especially important motivations driving state decisions to proliferate. All else being equal, if a state's leadership believes that a nuclear deterrent is required to address an acute security challenge, proliferation is more likely.²⁰ Countries in conflict-prone neighborhoods facing an "enduring rival" – especially countries with inferior conventional military capabilities vis-à-vis their opponents or those that face an adversary that possesses or is seeking nuclear weapons – may be particularly prone to seeking a nuclear deterrent to avert aggression.²¹ A recent quantitative study by Philipp Bleek, for example, found that security threats, as measured by the frequency and intensity of conventional militarized disputes, were highly correlated with decisions to launch nuclear weapons programs and eventually acquire the bomb.²² The Proliferation Cascade Myth Despite repeated warnings since the dawn of the nuclear age of an inevitable deluge of nuclear proliferation, such fears have thus far proven largely unfounded. Historically, nuclear restraint is the rule, not the exception – and the degree of restraint has actually increased over time. In the first two decades of the nuclear age, five nuclear-weapons states emerged: the United States (1945), the Soviet Union (1949), the United Kingdom (1952), France (1960) and China (1964). However, in the nearly 50 years since China developed nuclear weapons, only four additional countries have entered (and remained in) the nuclear club: Israel (allegedly in 1967), India ("peaceful" nuclear test in 1974, acquisition in late-1980s, test in 1998), Pakistan (acquisition in late-1990s, test in 1998) and North Korea (test in 2006).²³ This significant slowdown in the pace of proliferation occurred despite the widespread dissemination of nuclear know-how and the fact that the number of states with the technical and industrial capability to pursue nuclear weapons programs has significantly increased over time.²⁴ Moreover, in the past 20 years, several states have either given up their nuclear weapons (South Africa and the Soviet successor states Belarus, Kazakhstan and Ukraine) or ended their highly developed nuclear weapons programs (e.g., Argentina, Brazil and Libya).²⁵ Indeed, by one estimate, 37 countries have pursued nuclear programs with

possible weapons-related dimensions since 1945, yet the overwhelming number chose to abandon these activities before they produced a bomb. Over time, **the number of nuclear**

reversals has grown while the number of states initiating programs with possible military dimensions **has** markedly

declined.²⁶ Furthermore – especially since the Nuclear Non-Proliferation Treaty (NPT) went into force in 1970 – reactive proliferation has been exceedingly rare. The NPT has near-universal membership

among the community of nations; only India, Israel, Pakistan and North Korea currently stand outside the treaty. Yet the actual and suspected acquisition of nuclear weapons by these outliers has not triggered widespread reactive proliferation in their respective neighborhoods. Pakistan followed India into the nuclear club, and the two have engaged in a vigorous arms race, but Pakistani nuclearization did not spark additional South Asian states to acquire nuclear weapons. Similarly, the North Korean bomb did not lead South Korea, Japan or other regional states to follow suit.²⁷ In the Middle East, no country has successfully built a nuclear weapon in the four decades since Israel allegedly built its first nuclear weapons. Egypt took initial steps toward nuclearization in the 1950s and then expanded these efforts in the late 1960s and 1970s in response to Israel's presumed capabilities. However, Cairo then ratified the NPT in 1981 and abandoned its program.²⁸ Libya, Iraq and Iran all pursued nuclear weapons capabilities, but only Iran's program persists and none of these states initiated their efforts primarily as a defensive response to Israel's presumed arsenal.²⁹ Sometime in the 2000s, Syria also appears to have initiated nuclear activities with possible military dimensions, including construction of a covert nuclear reactor near al-Kibar, likely enabled by North Korean assistance.³⁰ (An Israeli airstrike destroyed the facility in 2007.)³¹ The motivations for Syria's activities remain murky, but the nearly 40-year lag between Israel's alleged development of the bomb and Syria's actions suggests that reactive proliferation was not the most likely cause. Finally, even countries that start on the nuclear path have found it very difficult, and exceedingly time consuming, to reach the end. Of the 10 countries that launched nuclear weapons projects after 1970, only three (Pakistan, North Korea and South Africa) succeeded; one (Iran) remains in progress, and the rest failed or were reversed.³² The successful projects have also generally needed much more time than expected to finish. According to Jacques

Hymans, **the average time required to complete a nuclear weapons program has increased from seven** years prior to

1970 **to about 17 years** after 1970, **even as the hardware, knowledge and industrial base required for**

proliferation has expanded to more and more countries.³³ Yet throughout the nuclear age, many states with potential security incentives to develop nuclear weapons have nevertheless abstained from doing so.³⁴ Moreover, contrary to common expectations, recent statistical research shows that states with an enduring rival that possesses or is pursuing nuclear weapons are not more likely than other states to launch nuclear weapons programs or go all the way to acquiring the bomb, although they do seem more likely to explore nuclear weapons options.³⁵ This suggests that a rival's acquisition of nuclear weapons does not inevitably drive proliferation decisions. One reason that reactive proliferation is not an automatic response to a rival's acquisition of nuclear arms is the fact that security calculations can cut in both

directions. Nuclear weapons might deter outside threats, but **leaders have to weigh** these **potential gains against the possibility that**

seeking nuclear weapons would make the country or regime less secure by **triggering a regional arms race or** a preventive

attack by outside powers. Countries also have to consider the possibility that **pursuing nuclear weapons will** produce **strain** in

strategic **relationships with** key **allies** and security patrons. If a state's leaders conclude that their overall security would decrease by building a bomb, they are not likely to do so.³⁶ Moreover, although security considerations are often central, they are rarely sufficient to motivate states to develop nuclear weapons. Scholars have noted the importance of other factors, most notably the perceived effects of nuclear weapons on a country's relative status and influence.³⁷ Empirically, the most highly motivated states seem to be those with leaders that simultaneously believe a nuclear deterrent is essential to counter an existential threat and view nuclear weapons as crucial for maintaining or enhancing their international status and influence. Leaders that see their country as naturally at odds with, and naturally equal or superior to, a threatening external foe appear to be especially prone to pursuing nuclear weapons.³⁸ Thus, as Jacques Hymans argues, extreme levels of fear and pride often "combine to produce a very strong tendency to reach for the bomb."³⁹ Yet here too, leaders contemplating acquiring nuclear weapons have to balance the possible increase to their prestige and influence against the normative and reputational costs associated with violating the Nuclear Non-Proliferation Treaty (NPT). If a country's leaders fully embrace the principles and norms embodied in the NPT, highly value positive diplomatic relations with Western countries and see membership

in the "community of nations" as central to their national interests and identity, they are likely to worry that developing nuclear weapons would damage (rather than bolster) their reputation and influence, and thus they will be less likely to go for the bomb.⁴⁰ In contrast, countries with regimes or ruling coalitions that embrace an ideology that rejects the Western dominated international order and prioritizes national self-reliance and autonomy from outside interference seem more inclined toward proliferation regardless of whether they are signatories to the NPT.⁴¹ Most countries appear to fall in the former category, whereas only a small number of "rogue" states fit the latter. According to one count, before the NPT went into effect, more than 40 percent of states with the economic resources to pursue nuclear programs with potential military applications did so, and very few renounced those programs. Since the inception of the nonproliferation norm in 1970, however, only 15 percent of economically capable states have started such programs, and nearly 70 percent of all states that had engaged in such activities gave them up.⁴² The prospect of being targeted with economic sanctions by powerful states is also likely to factor into the decisions of would-be proliferators. Although sanctions alone proved insufficient to dissuade Iraq, North Korea and (thus far) Iran from violating their nonproliferation obligations under the NPT, this does not necessarily indicate that sanctions are irrelevant. A potential proliferator's vulnerability to sanctions must be considered. All else being equal, the more vulnerable a state's economy is to external pressure, the less likely it is to pursue nuclear weapons. A comparison of states in East Asia and the Middle East that have pursued nuclear weapons with those that have not done so suggests that countries with economies that are highly integrated into the international economic system – especially those dominated by ruling coalitions that seek further integration – have historically been less inclined to pursue nuclear weapons than those with inward-oriented economies and ruling coalitions.⁴³ A state's vulnerability to sanctions matters, but so too does the leadership's assessment regarding the probability that outside powers would actually be willing to impose sanctions. Some would-be proliferators can be easily sanctioned because their exclusion from international economic transactions creates few downsides for sanctioning states. In other instances, however, a state may be so vital to outside powers – economically or geopolitically – that it is unlikely to be sanctioned regardless of NPT violations. Technical and Bureaucratic Constraints In addition to motivation to pursue the bomb, a state must have the technical and bureaucratic wherewithal to do so. This capability is partly a function of wealth. Richer and more industrialized states can develop nuclear weapons more easily than poorer and less industrial ones can; although as Pakistan and North Korea demonstrate, cash-strapped states can sometimes succeed in developing nuclear weapons if they are willing to make enormous sacrifices.⁴⁴ A country's technical know-how and the sophistication of its civilian nuclear program also help determine the ease and speed with which it can potentially pursue the bomb. The existence of uranium deposits and related mining activity, civilian nuclear power plants, nuclear research reactors and laboratories and a large cadre of scientists and engineers trained in relevant areas of chemistry and nuclear physics may give a country some "latent" capability to eventually produce nuclear weapons. Mastery of the fuel-cycle – the ability to enrich uranium or produce, separate and reprocess plutonium – is particularly important because this is the essential pathway whereby states can indigenously produce the fissile material required to make a nuclear explosive device.⁴⁵ States must also possess the bureaucratic capacity and managerial culture to successfully

complete a nuclear weapons program. Hymans convincingly argues that many recent would-be proliferators have weak state institutions that permit, or even encourage, **rulers to take a**

coercive, authoritarian **management approach to their nuclear programs. This** approach, in turn, politicizes and ultimately **undermines nuclear projects by gutting the autonomy** and professionalism **of the very scientists, experts and organizations needed to** successfully **build the bomb.**⁴⁶ Alternative Sources of Nuclear Deterrence Historically, the availability of credible security

guarantees by outside nuclear powers has provided a potential alternative means for acquiring a nuclear deterrent without many of the risks and costs associated with developing an indigenous nuclear weapons capability. As Bruno Tertrais argues, nearly all the states that developed nuclear weapons since 1949 either lacked a strong guarantee from a superpower (India, Pakistan and South Africa) or did not consider the superpower's protection to be credible (China, France, Israel and North Korea). Many other countries known to have pursued nuclear weapons programs also lacked security guarantees (e.g., Argentina, Brazil,

Egypt, Indonesia, Iraq, Libya, Switzerland and Yugoslavia) or thought they were unreliable at the time they embarked on their programs (e.g., Taiwan). In contrast, several **potential proliferation**

candidates appear to **have abstained from developing the bomb** at least **partly because of** formal or informal

extended deterrence guarantees from the United States (e.g., Australia, Germany, Japan, Norway, South Korea and Sweden).⁴⁷ All told, a recent

quantitative assessment by Bleek finds that **security assurances have empirically** significantly **reduced proliferation** proclivity among recipient countries.⁴⁸ Therefore, if a country perceives that a security guarantee by the United States or another nuclear power is both available and credible, it is less likely to pursue nuclear weapons in reaction to a rival developing them. This option is likely to be particularly attractive to states that lack the indigenous capability to develop nuclear weapons, as well as states that are primarily motivated to acquire a nuclear deterrent by security factors (as opposed to status-related motivations) but are wary of the negative consequences of proliferation.

Lack of CIA torture accountability

Hudson, 14- B.A. in International Relations and a minor in Middle Eastern Languages, Literatures and Cultures, focusing on the Arabic language. Studied international humanitarian law and public policy at the University of Oxford (Adam, "UN Human Rights Committee Finds US in Violation on 25 Counts", Truth Out, 4/4/14, <http://www.truth-out.org/news/item/22887-un-human-rights-committee-finds-us-in-serious-violation>)/KTC

Accountability for Bush-Era Crimes; Torture The UN committee expressed concerned with "the limited number of investigations, prosecutions and convictions of members of the Armed Forces and other agents of the US government, including private contractors" for "unlawful killings in its international operations" and "torture" in CIA black sites during the Bush years. It welcomed the closing of the CIA black sites, but criticized the "meagre number of criminal charges brought against low-level operatives" for abuses carried out under the CIA's rendition, interrogation and detention program. The committee also found fault with the fact that many details of the CIA's torture program "remain secret, thereby creating barriers to accountability and redress for victims." In response to the 9/11 terrorist attacks, the Bush administration jettisoned the Constitution and international law and openly embraced the use of torture against suspected terrorists captured overseas. The CIA tortured people in secret prisons around the world known as "black sites." Torture was sanctioned from the top down. Then-President George W. Bush, Vice President Dick Cheney, Defense Secretary Donald Rumsfeld, National Security Advisor Condoleezza Rice, lawyers and many others in the executive branch played roles in crafting nifty ways to justify, approve and implement the use of torture. Rather than be held accountable, the top-level government officials responsible for authorizing torture and other crimes have been given comfort in the public sphere. Condoleezza Rice returned to Stanford University as a political science professor. John Yoo, who authored the torture memos, is a law professor at UC Berkeley. Jose Rodriguez, a former CIA officer in the Bush administration, vigorously defends torture in his autobiography and interviews. George W. Bush, Dick Cheney and Donald Rumsfeld are able to rest comfortably in retirement and continue to defend their records. Of the report's 25 issues, four looked at racial

disparities within the United States' criminal justice system and law enforcement practices. In the Guantanamo military commissions, evidence of torture is concealed. A "protective order" restricts what defense lawyers and the accused can say about how the defendants were treated in CIA black sites, including details of torture, because that information is classified. Defense lawyers have been fighting for declassification of those details, as they are mitigating evidence. The potential release of portions of the Senate Intelligence Committee's report on the CIA torture program could tip the scale the defense attorneys' favor. "There is every reason to believe the SSCI [Senate Select Committee on Intelligence] Report contains information about the CIA's torture of Mr. al Baluchi," said defense attorney James Connell, who represents Ammar al-Baluchi, one of the five 9/11 defendants, in a press statement. "The SSCI knows the truth of what happened, and the military commission considering whether to execute Mr. al Baluchi should know too."

US racial profiling is criticized internationally

Hudson, 14- B.A. in International Relations and a minor in Middle Eastern Languages, Literatures and Cultures, focusing on the Arabic language. Studied international humanitarian law and public policy at the University of Oxford (Adam, "UN Human Rights Committee Finds US in Violation on 25 Counts", Truth Out, 4/4/14, <http://www.truth-out.org/news/item/22887-un-human-rights-committee-finds-us-in-serious-violation>)/KTC

Racism in the Prison System; Racial Profiling; Police Brutality Of the report's 25 issues, four looked at racial disparities within the United States' criminal justice system and law enforcement practices. It denounced the "racial disparities at different stages in the criminal justice system, sentencing disparities and the overrepresentation of individuals belonging to racial and ethnic minorities in prisons and jails." The committee condemned racial profiling by police and FBI/NYPD surveillance of Muslims - but it did welcome plans to reform New York City's "stop and frisk" program. It also denounced the continuing use of the death penalty and "racial disparities in its imposition that affects disproportionately African Americans." Finally, it expressed concern at "the still high number of fatal shootings by certain police forces" and "reports of excessive use of force by certain law enforcement officers including the deadly use of tasers, which have a disparate impact on African Americans, and the use of lethal force by Customs and Border Protection (CBP) officers at the US-Mexico border." The United States contains the largest prison population in the world, holding over 2.4 million people in domestic jails and prisons, immigration detention centers, military prisons, civil commitment centers and juvenile correctional facilities. Its prison population is even larger than those of authoritarian governments like China and Russia, which, respectively, hold 1,640,000 and 681,600 prisoners, according to the International Centre for Prison Studies. More than 60 percent of the US prison population are people of color. African Americans, while 13 percent of the national population, constitute nearly 40 percent of the prison population. Moreover, one in every three black males can expect to go to prison in their lifetime, compared to one in every six Latino males, and one in every 17 white males. Thus, black men are six times more likely to be incarcerated than white men. Even though whites and blacks use drugs at roughly the same rates, African Americans are more likely to be imprisoned for drug-related offenses than whites. Every 28 hours, a black person is killed by a police officer, security guard, or self-appointed vigilante, according to a report by the Malcolm X Grassroots Movement. Recently in New York City, NYPD brutalized two teenage African-American girls at a Chinese restaurant in Brooklyn. A 16-year-old girl's face was slammed against the floor, while police threw the 15-year-old through the restaurant's window, shattering it as a result. The incident started when police ordered everyone to leave the restaurant, but one of the girls refused. While police violence against people of color has long existed, the militarization of American police exacerbates this trend. This trend began when Richard Nixon inaugurated the War on Drugs in the 1970s. Then in 1981, President Ronald Reagan signed the Military Cooperation with Civilian Law Enforcement Agencies Act, which provided civilian police agencies with military equipment, training, advice and access to military research and facilities. When 9/11 hit, police militarization kicked into overdrive with the creation of the Department of Homeland Security, which has given police still greater access military equipment like armored personnel carriers and high-powered weapons for anti-terrorism purposes. Now police look, act and think like the military, with dangerous consequences for the communities they serve. Among the report's suggestions to curb excessive police violence were better reporting of incidents, accountability for perpetrators, and "ensuring compliance with the 1990 UN Basic Principles on the Use of Force and Firearms by Law Enforcement Officers". The Basic Principles include a number of provisions, including "Law enforcement officials, in carrying out their duty, shall, as far as possible, apply non-violent means before resorting to the use of force and firearms" and "Governments shall ensure that arbitrary or abusive use of force and firearms by law enforcement officials is punished as a criminal offence under their law."

Guantanamo Bay and indefinite detention violates international law

Hudson, 14- B.A. in International Relations and a minor in Middle Eastern Languages, Literatures and Cultures, focusing on the Arabic language. Studied international humanitarian law and public policy at the University of Oxford (Adam, "UN Human Rights Committee Finds US in Violation on 25 Counts", Truth Out, 4/4/14, [//KTC](http://www.truth-out.org/news/item/22887-un-human-rights-committee-finds-us-in-serious-violation)

Guantanamo, Indefinite Detention President Obama recommitted himself to closing the prison in Guantanamo last year, but has made little progress, which the UN report noted. The committee said it "regrets that no timeline for closure of the facility has been provided." It also expressed concern that "detainees held in Guantanamo Bay and in military facilities in Afghanistan are not dealt with within the ordinary criminal justice system after a protracted period of over a decade in some cases." The report called on the United States to expedite the transfer of prisoners out of Guantanamo, close the prison, "end the system of administrative detention without charge or trial" and "ensure that any criminal cases against detainees held in Guantanamo and military facilities in Afghanistan are dealt with within the criminal justice system rather than military commissions and that those detainees are afforded fair trial guarantees." Indefinite detention violates international human rights law, but has been embraced by Obama ever since he stepped into the White House. Currently, 154 men remain held in the prison at Guantanamo Bay. Of those, 76 are cleared for release; around four dozen will remain in indefinite detention; 20 can be "realistically prosecuted," according to chief prosecutor Brig. Gen. Mark Martins' estimate; six are being tried in military commissions and two are serving sentences after being convicted in the commissions. President Obama promised to close Guantanamo right when he stepped into office. However, he has yet to fulfill that promise. Congressional obstructionism, especially from the Republican Party, has stalled his plans. For a long time, Congress blocked funding for transferring Guantanamo prisoners. Recently, though, Congress eased those restrictions, making it easier to transfer prisoners to other countries, but not to the United States. While the Obama administration is working to close the prison at Guantanamo, it maintains the policy of indefinite detention without trial, designating nearly four dozen Guantanamo prisoners for forever imprisonment. Obama's original plan to close Guantanamo was to open a prison in Illinois to hold Guantanamo detainees, many indefinitely. While soon killed, this plan would have effectively moved the system of indefinite detention from Guantanamo to US soil. Now the Obama administration is considering opening a prison in Yemen to hold the remaining Guantanamo prisoners, many of whom are Yemeni. Indefinite detention violates international human rights law, but has been embraced by Obama ever since he stepped into the White House. The 2012 National Defense Authorization Act (NDAA) that Obama signed into law contains sections that allow for the indefinite detention of US citizens on American soil.

Ext. Inevitable Bad Image

Lack of transparency and assessment of all drone strikes make backlash inevitable

Lewis, 14- Principal Research Scientist in CNA Corporation's Operations and Tactics Analysis division. Former research analyst and field representative for CNA Corporation's Operations Evaluation Group. Primary author for many of DOD's Joint Lessons Learned studies on Operation Iraqi Freedom (OIF) and Operation Enduring Freedom (OEF). He led three studies performed in support of GEN Petraeus, addressing High Value Targeting and ISR, urban operations in Iraq, and the Coalition strategy against Al Qaeda in Iraq. He serves as the U.S. National Leader for the multinational (Australia-Canada-United Kingdom-United States) analysis group TTCP Focus Area 7 (Fratricide Mitigation). Lewis received CNA Corporation's Phil E. DePoy Award for Analytical Excellence in 2003, held a NASA Summer Faculty Fellowship in 1997, was the 1994 winner of the American Physical Society/HARC Super Prize, and has held a Robert E. Welch pre-doctoral fellowship. Lewis earned a B.S. in Chemistry from the College of William and Mary and a Ph.D. in Chemistry from Rice University. (Lawrence, "Drone Strikes in Pakistan Reasons to Assess Civilian Casualties", CNA Analysis & Solutions, 4/10/14, [//KTC](https://www.cna.org/research/2014/drone-strikes-pakistan)

Civilian casualties are one consideration in the debate concerning which department or agency of the U.S. government would be best suited for continuing the drone campaign. We observe that drone strikes in Pakistan were more likely to cause civilian casualties on average than drone strikes by military forces in Afghanistan. Although there are key differences in the two campaigns, this observation warrants further examination (also reserved for a subsequent paper). Overall, it is both possible and worthwhile for the U.S. to conduct an independent assessment of civilian casualties resulting from drone strikes in Pakistan and elsewhere. This assessment could be provided to the legislative and executive branches to improve transparency and permit proper oversight of these operations. This would also help ensure that official U.S. statements reflect operational realities, helping to guard the credibility and reputation of the U.S. In addition, a process could be put into place to respond to drone-strike civilian casualties with consequence management actions—including amends—when they occur from such strikes. This practice could adapt successful U.S. measures taken in Afghanistan, and would be consistent with recent legislation governing military operations. Collectively, an assessment process for civilian harm, coupled with measures to address such harm when it is caused, would demonstrate the U.S. concern for civilians while also reducing grievances that can exacerbate threats to the U.S. in the longer term. These initiatives would help the U.S. demonstrate its stated commitment to the responsible use of force and to do all it can to minimize civilian harm in its operations.

Lack of recognition of civilian casualties tanks US perception

New York Times, 11- Cites studies done by the Bureau of Investigative Journalism (“The C.I.A. and Drone Strikes: To build credibility, the agency needs to acknowledge civilian casualties”, The New York Times, 8/14/11, Lexis Nexis)//KTC

Perfection is rare in life; in war, rarer still. Yet the Central Intelligence Agency says it has a yearlong perfect record of no civilian deaths from its campaign of drone strikes in Pakistan. We find that hard to believe. So do many Pakistanis, journalists and independent experts, including those who support the drone program. Lacking proof, the claim fuels skepticism about American intentions and harms United States-Pakistani relations. The Obama administration has vastly expanded the shadow war against terrorists, using the military and the C.I.A. to track down and kill them in a dozen countries. Pakistan -- home base to Taliban and Al Qaeda militants -- is the leading edge of robotic warfare. According to The Times's Scott Shane, the C.I.A. says that since May 2010 drones have killed more than 600 militants in Pakistan and not a single noncombatant. Since 2001, the totals are almost as striking: 2,000 militants, and 50 noncombatants. A new report by the Bureau of Investigative Journalism at City University in London tells a different story. It says that most of the 1,842 people killed in more than 230 strikes ordered by President Obama in Pakistan since 2008 were militants, but at least 218 may have been civilians. And while "civilian casualties do seem to have declined in the past year," the bureau still found "credible evidence" of at least 45 noncombatants killed. It is almost as if there were parallel realities. The C.I.A. contends that a May 6 strike on a pickup truck along the Afghan border wiped out only the intended targets: nine militants and their bomb-making materials. But British and Pakistani journalists say the missiles hit a religious school, an adjoining restaurant and a house -- killing 12 militants and six civilians. There is no question that the drone program has been successful, enabling the United States to disrupt Al Qaeda and its allies in Pakistan's lawless border region. It is true that the precision technology and American efforts have kept noncombatant deaths to a minimum. And in the remote region of North Waziristan, where most strikes occur, it is hard to find the truth. But no civilian casualties? The strikes have long been controversial in Pakistan, fueling anti-American sentiments. Washington's refusal to be more transparent about the program is counterproductive. It should provide as much public detail as possible, including civilian casualties. Pakistan's government needs to end its duplicity: privately allowing the strikes, yet publicly condemning them. Drones are becoming central to modern warfare. The United States needs to be honest about what it can do and about its failings as well. It will have little ground on which to fault other countries for strikes that cause civilian casualties if it does not own up to its own errors, compensate victims' families and keep working hard to make fewer errors in the future.

Fund HUMINT CP

Text: The USFG should substantially boost the HUMINT budget.

Solves the Aff – their only internal link to HUMINT is a resource tradeoff. We resolve that.

Koch'1

et al; Andrew R. Koch is the Senior Vice President for Defense and Homeland Security issues at Scribe. An expert on communications and the media, as well as market assessments for domestic and international defense clients, he leads Scribe's practice in providing such services as development and implementation of strategic communications planning, media outreach support, as well as evaluation of defense companies and related government programs. Scribe is a Strategic Advising firm. Article Title: "Chronic HUMINT under funding blamed for security failures" - Jane's Defence Weekly - vol. 36, no. 12, 37153, p. 4

In the aftermath of the carnage in New York and Washington DC (September 11, 2001) hundreds of questions will be asked as to how such an audacious and co-ordinated attack could have happened. This latest act of terrorism, although the most horrific to date, is not the first time that the US Government has been caught unaware. Indeed the subject of 'asymmetric warfare' - the use of terrorist methods to strike at weaknesses in the societies of western countries - has been a worry of strategic planners in the US for most of the 1990's. One possible contributing factor to this failure of the intelligence and security system could be the lack of resources the US has devoted to human intelligence (HUMINT) capabilities throughout the past decade. While national technical means continued to receive high levels of funding for surveillance satellites, signals intelligence flights and other eavesdropping technologies, human-based intelligence capabilities have withered. Areas such as analysis, linguistic skills, cultivation of agent networks, and 'tradecraft' were all of paramount importance during the Cold War, particularly before the advent of space-based intelligence assets, but have suffered a lack of resources of late. This shortfall has been exacerbated by the growing demand that increased technical intelligence has placed on people who must process the vast amounts of resulting data and prioritise it. The US intelligence community must work to close the gap between the amount of raw intelligence it can gather and the quantity it can process, analyse, and disseminate.

2nc- solvency

HUMINT requires better integration with tech and more funding – only the cp solves
Sano, 14 – Association of Former Intelligence Officer, Former Deputy Director National Clandestine Service Central Intelligence Agency. Bachelor's Degree in Political Science and a Master's in Asian Studies from St. John's University and a Master's of International Affairs from Columbia University. (John, "Guide to the Study of Intelligence The Changing Shape of HUMINT Draft", Association of Former Intelligence Officers, 11/24/14)//KTC

The Intelligence Community will continue to undergo change. Influenced as much by domestic politics as developments beyond our borders. Despite technological advances, HUMINT will continue to occupy a critical role in providing intelligence to U.S. policymakers. Discerning plans and intentions can only come from the recruitment of human sources. Even information stored digitally often requires human access; and even with data that is extracted electronically, there is still the requirement to interpret those documents and how they fit into the larger context. Human beings are essential to all processes and

operations – whether they are public or privately based. As such they are the first and last line of security. They are also the first and last entry points into the intelligence arena. As we continue to advance technologically, in essence making our world smaller, the potential threats posed by these advancements will make both protecting and exploiting real secrets exponentially more difficult. In addition, as these challenges continue to grow, those tasked with addressing them will need to adjust at a much more rapid rate. This applies both to field operatives as well as to their managers. As described above, the differences in experience and cultural expectations will continue to exacerbate the relationship, but only temporarily as the “old guard,” or “digital immigrants” gradually gives way to the “new guard,” or “digital natives.” Traditional approaches to espionage – while forming the bedrock for HUMINT, will have to be further augmented. The next generation of operatives and their managers will need to be more familiar with, if not adept at, technological augmentation. Augmentation, not replacement. While the tendency to rely increasingly on technology to make HUMINT collection more efficient is commendable, adherence to the core principals will ensure that human operations remain as secure as possible. Constrained budgets, while often cyclical in nature, will likely remain flat, if not decreased, over the next several years or longer. The Intelligence Community, for many years immune to the exigencies of financial debate within Congress – particularly during times of crises – is no longer exempt. While the old adage, “there will always be money for good operations” will remain fairly constant, what constitutes “good operations” may likely shift – dependent upon the prevailing political wind and the prioritization of competing requirements (both operational and structural/administrative). In addition, hiring and promotions within the IC are contingent to a significant degree on the availability of funds. While both will continue – hiring dependent on attrition rates and promotions on performance metrics – the availability of both will be diminished. The impact on the future generation of officers cannot be underestimated. With a workforce that can be expected to remain, on average 7 years, any limitations on advancement could have a deleterious effect on morale as well as retention. Today’s IC officers are however, exceptionally adaptive, and resilient. Though they may stay for a shorter period of time than their predecessors, their accomplishments

Terror DA Turns

Info Overload

2NC – Data Matters

The haystack matters – specific link to metadata – also turns case

Porter, 15

(R.C. Porter, Retired Intelligence Official with more than 33 years of experience in both the military and civilian affairs, M.S. Middle Eastern Studies/National Security Policy Studies, Elliott School of International Affairs, George Washington University. One year study program, National Defense University/Industrial College of the Armed Forces — National Security Resource Management, 1994. B.A., Criminal Justice, Louisiana State University, Baton Rouge Louisiana, May, 1979, “**THE DUMBING DOWN OF U.S. INTELLIGENCE; AND, WHY METADATA, AND THE ‘HAYSTACK’ MATTER — IN COMBATING TERRORISM AND PROTECTING THE U.S. HOMELAND – ‘YOU NEED A HAYSTACK...TO FIND A NEEDLE’**”, <http://fortunascorner.com/2015/05/11/the-dumbing-down-of-u-s-intelligence-and-why-metadata-and-the-haystack-matter-in-combating-terrorism-and-protecting-the-u-s-homeland-you-need-a-haystack-to-find-a-needle/>, May 11, 2015, ak.)

The above is the title of an Op-Ed by Gordon Crovitz in the May 11, 2015 edition of The Wall Street Journal. Mr. Crovitz begins by noting that “FBI Director James Comey warned last week that the American Islamists who tried to assassinate free-speech advocates at a cartoon exhibition near Dallas, Texas.....are not alone. There are “hundreds, maybe thousands” of potential terrorists in the U.S. being inspired by overseas groups.” “The haystack is the entire country.” he said. “We are looking for needles; but, increasingly the needles are unavailable to us.” “The needles will be even harder to find, if Congress weakens the Patriot Act, by reducing the intelligence available to national security,” and law enforcement agencies. “With the rise of the Islamic State and its global recruiting tools, intelligence agencies should be allowed to join the “big data” revolution.” Mr. Crovitz wrote. “Edward Snowden’s data theft raised privacy alarms; but, by now — it’s clear that no one working for the National Security Agency (NSA), leaked confidential data — other than Snowden himself,” Mr. Crovitz correctly observes. “He evaded the 300 lawyers and compliance officers who monitor how NSA staff use data.” “POTUS Obama, last year, recalled how the 9/11 hijackers escaped detection — because laws prohibited NSA from gathering and connecting the dots. He explained that the Patriot Act was passed, to “address a gap identified after 911,” by having intelligence agencies collect anonymous metadata — date, time, and duration of phone calls. But, POTUS Obama reversed himself and now wants to gut the program,” Mr. Crovitz warns. “Instead of the NSA gathering call information, phone companies would hold the data. With multiple, unconnected databases, the NSA would no longer be able to access data to mine. There wouldn’t be dots to connect to threats. As for privacy, the phone companies’ databases would be less secure than the NSA’S.” “Lawmakers will decide this month whether to extend the Patriot Act or, to water it down. Instead, they should update it to maximize both privacy, and intelligence,” Mr. Crovitz argues. “Technology now has the answer, if only politicians would get out of the way.” “Recent innovations in big data allow staggering amounts of information to be collected and mined. These data deliver correlations based on an individually anonymous basis. This work was originally done to support the chief revenue engine of the Internet — advertising. The technology generates increasingly targeted marketing messages based on an individuals’ online activities.” “The techniques have other applications. Google used them to become better than the Centers for Disease Control and Prevention, at predicting flu outbreaks by monitoring search terms like “flu medicine,” by location. Canadian researchers studied thousands of premature babies, and identified symptoms that precede fevers. Cities apply predictive policing by mining online data to assign cops where they’re needed.” “The fast shift to self-driving cars is possible, because of data transmitted among vehicles. Small drones share data that keep them from crashing into one another. A Brown University researcher discovered how banks could use metadata about people’s cell phone usage to determine their creditworthiness.” “The Patriot Act was written in 2001, before any of these advances. It lets the NSA keep anonymous data about who is calling whom for

five years; but, it isn't able to apply algorithms to find suspicious patterns. Analysts may examine call logs for suspicious links, only if there is a pre-existing "reasonable, articulable suspicion" of terrorism, or another threat to national security. There were 170 such searches last year, [2014]. "Before the Snowden leaks two years ago, Intelligence agencies had planned to ask Congress to broaden their access to anonymous data — so they could use modern tools of big data. Technology has moved far ahead, leaving intelligence -gathering stupider." Mr. Crovitz wrote. "A measure of how far behind the technology curve the intelligence agencies have become is that one of the would-be cartoon killers posted a message on Twitter beforehand, with the hashtag #TexasAttack. Law enforcement [authorities] didn't spot it until after the attack. In contrast, algorithms for delivering advertising parse signals such as hashtags to deliver relevant ads in real time... before the online page loads." "In their 2013 book, "Big Data: A Revolution That Will Transform How We Live, Work, And Think," Viktor Mayer-Schonberger and Kenneth Cukier describe the history of information: "As centuries passed, we opted for more information flows rather than less, and to guard against its excesses — not primarily through censorship; but, through rules that limited the misuse of information." In conclusion, Mr. Crovitz writes, "Congress should insist that the NSA ensure its data are used properly — no more Snowdens — but, also give the agency authority to catch up to how the private sector uses data. Politicians should update the Patriot Act by permitting the intelligence use of data to prevent terrorism." Mapping Terror Networks: Why Metadata And The 'Haystack' Matters Philip Mudd, former Deputy Director of the CIA's Counter-Terrorism Center, and Senior Intelligence Adviser to the FBI, [at the time his article was published], wrote an Op-Ed in the Dec. 30, 2014 Wall Street Journal noting that the CIA, FBI, and the entire U.S. Intelligence Community and national security establishment had devoted countless hours as to "how best can [we] clarify [and posture ourselves regarding] the blurring picture of an emerging terror conspiracy [aimed at the United States] originating overseas, or inside the United States. "How can we identify the key players (network/link analysis) and the broader network of their fundraisers [enablers], radicalizers, travel facilitators and others... quickly enough so that they can't succeed?," as well as protect civil liberties. "And," Mr. Mudd adds, "how do we ensure that we've 'mapped' the network enough to dismantle it?; or at a minimum, disrupt it?" Mr. Mudd observes, "in essence, **you need a haystack — in order to find a needle**." Last year, Federal Appeals Court Judge William H. Pauley ruled NSA metadata collection lawful; and added, "the government needs a wide net that can isolate gossamer contacts among suspected terrorists in an ocean of seemingly disconnected data; HUMINT is the more desirable method of collecting this kind of information — but, gathering critical HUMINT is often difficult and time consuming," not to mention that the Obama administration has been great at droning terrorists; but, hasn't added a single individual to Guantanamo Bay Prison. Dead men tell no tales. **You can't get critical HUMINT — if you stick your head in the sand and refuse to establish an interrogation facility** for this very purpose. Treating terrorists as criminals to be tried in a 'normal' court of law is absurd, counterproductive, and dangerous. As Mr. Mudd wrote at the time, "mapping a network of people is simple in concept; but, complex in practice: find the key operators, and then find the support group. Map a network poorly, and you may miss peripheral players who will recreate a conspiracy after the core of conspirators are arrested. The goal," Mr. Mudd said, "is to eliminate the entire spider-web of conspiracy; cutting off a piece like an arm of a starfish, is a poor second choice — the starfish's arm — regenerates." "Investigators also need an historical pool of data," Mr. Mudd argued at the time, "that they can access only when they have information that starts with a known, or suspected conspirator — in the middle of a spider-web they don't fully understand," and is missing a few corners. Who is watchers is a legitimate concern; and, a healthy skepticism about government claims for access to even more personal data... is desirable, warranted, and needed. But, the further and further we move away — in time — from the September 11, 2001 terrorist attack here on the U.S. homeland — the more we seem to lose the raison d' tere for why we passed the Patriot Act in the first place. As the Intelligence Community and Law Enforcement authorities with respect to the mass collection of phone data are allowed to atrophy and erode — our ability to ferret out and discover potential terrorist attacks against the U.S. homeland also decay. I am not sure I know the right answer as to where the balance lied — between the protection of civil liberties, versus the requirement to collect 'enough' data — that enables our intelligence and law enforcement professionals to — connect the dots. But, I think I know one thing for sure. If we do suffer a large-scale terrorist event here at home — on the scale of 9/11 or worse — and, it is determined that we likely would have been able to discover this event before hand — if we had allowed a more reasonable big data mining strata — there will be hell to pay — and, perhaps a Patriot Act on steroids. It is easy to criticize law enforcement and intelligence agencies desires for greater authority and flexibility in regards to the collection of data; but, how you see it — depends on where you sit. If you are charged with protecting the American homeland, it is a very difficult balancing act — with few clear answers.

Data mining matters and empirically works

Schmitt et al, 13

(Eric Schmit, 2 Pulitzer Prizes, Harvard University's Executive Program on National and International Security in 1991. Mr. Schmitt completed a Knight Journalism Fellowship at Stanford University, David E. Sanger, Charlie Savage, received a Pulitzer Prize for National Reporting in 2007 for his coverage of presidential signing statements for the Globe. Other awards he earned while at the Globe include the American Bar Association's Silver Gavel Award and the Gerald R. Ford Prize for Distinguished Reporting on the Presidency, "Administration Says **Mining of Data is Crucial to Fight Terror**", <http://www.nytimes.com/2013/06/08/us/mining-of-data-is-called-crucial-to-fight-terror.html>, June 8, 2013, ak.)

WASHINGTON — In early September 2009, an e-mail passed through an Internet address in Peshawar, Pakistan, that was being monitored by the vast computers controlled by American intelligence analysts. It set off alarms. The address, linked to senior Qaeda operatives, had been dormant for months. Investigators worked their way backward and traced the e-mail to an address in Aurora, Colo., outside Denver. It took them to Najibullah Zazi, a 24-year-old former coffee cart operator, who was asking a Qaeda facilitator about how to mix ingredients for a flour-based explosive, according to law enforcement officials. A later e-mail read: "The marriage is ready" — code that a major attack was planned. What followed in the next few days was a cross-country pursuit in which the police stopped Mr. Zazi on the George Washington Bridge, let him go, and after several false starts, arrested him in New York. He eventually pleaded guilty to plotting to carry out backpack bombings in the city's subway system. It is that kind of success that President Obama seemed to be referring to on Friday in California when he defended the National Security Agency's stockpiling of telephone call logs of Americans and gaining access to foreigners' e-mail and other data from Microsoft, Google, Yahoo and other companies. He argued that "modest encroachments on privacy" — including keeping records of phone numbers called and the length of calls that can be used to track terrorists, though not listening in to calls — were "worth us doing" to protect the country. The programs, he said, were authorized by Congress and regularly reviewed by federal courts. But privacy advocates questioned the portrayal of the program's intrusion on Americans' communications as modest. When Americans communicate with a targeted person overseas, the program can vacuum up and store for later searching — without a warrant — their calls and e-mails, too. Mr. Obama acknowledged that he had hesitations when he inherited the program from George W. Bush, but told reporters that he soon became convinced of its necessity. "You can't have 100 percent security and also then have 100 percent privacy and zero inconvenience," he said. "We're going to have to make some choices as a society." To defenders of the N.S.A., the Zazi case underscores how the agency's Internet surveillance system, called Prism, which was set up over the past decade to collect data from online providers of e-mail and chat services, has yielded concrete results. "We were able to glean critical information," said a senior intelligence official, who spoke on the condition of anonymity. "It was through an e-mail correspondence that we had access to only through Prism." John Miller, a former senior intelligence official who now works for CBS News, said on "CBS This Morning," "That's how a program like this is supposed to work." Veterans of the Obama intelligence agencies say the large collections of digital data are vital in the search for terrorists. "If you're looking for a needle in the haystack, you need a haystack," Jeremy Bash, chief of staff to Leon E. Panetta, the former C.I.A. director and defense secretary, said on MSNBC on Friday.

2) Hindsight and foresight – ensures terrorists don't slip through the cracks

Hines, 13

(Pierre Hines is a defense council member of the Truman National Security Project, "Here's how metadata on billions of phone calls predicts terrorist attacks", <http://qz.com/95719/heres-how-metadata-on-billions-of-phone-calls-predicts-terrorist-attacks/>, June 19, 2013, ak.)

Yesterday, when NSA Director General Keith Alexander testified before the House Committee on Intelligence, he declared that the NSA's surveillance programs have provided "critical leads to help prevent over 50

potential terrorist events.” FBI Deputy Director Sean Boyce elaborated by describing four instances when the NSA’s surveillance programs have had an impact: (1) when an intercepted email from a terrorist in Pakistan led to foiling a plan to bomb of the New York subway system; (2) when NSA’s programs helped prevent a plot to bomb the New York Stock Exchange; (3) when intelligence led to the arrest of a U.S. citizen who planned to bomb the Danish Newspaper office that published cartoon depictions of the Prophet Muhammad; and (4) when the NSA’s programs triggered reopening the 9/11 investigation. So what are the practical applications of internet and phone records gathered from two NSA programs? And how can “metadata” actually prevent terrorist attacks? Metadata does not give the NSA and intelligence community access to the content of internet and phone communications. Instead, metadata is more like the transactional information cell phone customers would normally see on their billing statements— metadata can indicate when a call, email, or online chat began and how long the communication lasted. Section 215 of the Patriot Act provides the legal authority to obtain “business records” from phone companies. Meanwhile, the NSA uses Section 702 of the Foreign Intelligence Surveillance Act to authorize its PRISM program. According the figures provided by Gen. Alexander, intelligence gathered based on Section 702 authority contributed in over 90% of the 50 cases. One of major benefits of metadata is that it provides hindsight—it gives intelligence analysts a retrospective view of a sequence of events. As Deputy Director Boyce discussed, the ability to analyze previous communications allowed the FBI to reopen the 9/11 investigation and determine who was linked to that attack. It is important to recognize that terrorist attacks are not orchestrated overnight; they take months or years to plan. Therefore, if the intelligence community only catches wind of an attack halfway into the terrorists’ planning cycle, or even after a terrorist attack has taken place, metadata might be the only source of information that captures the sequence of events leading up to an attack. Once a terrorist suspect has been identified or once an attack has taken place, intelligence analysts can use powerful software to sift through metadata to determine which numbers, IP addresses, or individuals are associated with the suspect. Moreover, phone numbers and IP addresses sometimes serve as a proxy for the general location of where the planning has taken place. This ability to narrow down the location of terrorists can help determine whether the intelligence community is dealing with a domestic or international threat. Even more useful than hindsight is a crystal ball that gives the intelligence community a look into the future. Simply knowing how many individuals are in a chat room, how many individuals have contacted a particular phone user, or how many individuals are on an email chain could serve as an indicator of how many terrorists are involved in a plot. Furthermore, knowing when a suspect communicates can help identify his patterns of behavior. For instance, metadata can help establish whether a suspect communicates sporadically or on a set pattern (e.g., making a call every Saturday at 2 p.m.). Any deviation from that pattern could indicate that the plan changed at a certain point; any phone number or email address used consistently and then not at all could indicate that a suspect has stopped communicating with an associate. Additionally, a rapid increase in communication could indicate that an attack is about to happen. Metadata can provide all of this information without ever exposing the content of a phone call or email. If the metadata reveals the suspect is engaged in terrorist activities, then obtaining a warrant would allow intelligence officials to actually monitor the content of the suspect’s communication. In Gen. Alexander’s words, “These programs have protected our country and allies . . . [t]hese programs have been approved by the administration, Congress, and the courts.”

3) Aggregated data – historical records key to efficiency and precision

Watkins et al, 3

(R. C. Watkins, K. M. Reynolds, R. F. DeMara, M. Georgiopoulos, A. J. Gonzalez, and R. Eaglin, “TRACKING DIRTY PROCEEDS: EXPLORING DATA MINING TECHNOLOGIES AS TOOLS TO INVESTIGATE MONEY LAUNDERING”, Police Practice and Research, An International Journal, <http://www.eecs.ucf.edu/georgiopoulos/sites/default/files/196.pdf>, June 1, 2003, ak.)

The most basic approach to data mining, a linear regression model, is designed by defining a dependent variable (output) and a number of independent variables (inputs). The result of a linear regression model is an equation of a line that best fits the data set, which can be used for prediction purposes. This is useful for discovering, validating, and quantifying trends from previously solved money laundering cases for use on current cases. Linear regression techniques center around the ability to predict useful quantitative probabilities. For instance, data from previously observed behaviors can be used to focus new investigative activities on the most promising locations at the most probabilistically promising day and time. Logistic regression is a very popular means of data mining because it can solve problems involving categorical variables (e.g., variables that can be described by a yes/no answer or male/female answer). This technique can be applied to rapidly evaluate all financial transaction records belonging to classes of interest to the investigator. The results can be displayed in a number of graphical formats so that commonalities among the subset of the variables selected become evident. Using logistic regression, graphic views of only the trends in the data, rather than the data itself, are displayed in multi-dimensional format using distinguishing shapes and colors without the need for the investigator to sort through the underlying data. Consequently, investigators will be presented with improved ways of viewing large masses of data in a manageable format. This makes pattern and trend identification more apparent and timely. This approach will also serve to expedite the investigation process by reducing the amount of time spent manually searching for case leads or patterns of illicit activity.

4) Statistics prove

Mayer, 13

(Jane, The New Yorker, Susan Landau is an American mathematician and engineer, and Professor of Social Science and Policy Studies at Worcester Polytechnic Institute, “What’s the Matter with Metadata?”, <http://www.newyorker.com/news/news-desk/whats-the-matter-with-metadata>, June 6, 2013, ak.)

For the law-enforcement community, particularly the parts focussed on locating terrorists, metadata has led to breakthroughs. Khalid Sheikh Mohammed, the master planner of the September 11, 2001, attacks on New York and Washington, “got picked up by his cell phone,” Landau said. Many other criminal suspects have given themselves away through their metadata trails. In fact, Landau told me, metadata and other new surveillance tools have helped cut the average amount of time it takes the U.S. Marshals to capture a fugitive from forty-two days to two.

5) RTRG proves that even the mundane can be essential

Gorman et al, 13

(SIOBHAN GORMAN, ADAM ENTOUS and ANDREW DOWELL, The Wall Street Journal, “Technology Emboldened the NSA”, <http://www.wsj.com/articles/SB10001424127887323495604578535290627442964>, June 9, 2013, ak.)

NSA stumbled in a number of its data-collection and management efforts, particularly a program called Trailblazer, but it began to gain traction with another program, which became known as Real Time Regional Gateway, or RTRG, former officials said. Initially deployed in Iraq, the program's focus moved to Afghanistan in 2010, where it assembled and analyzed all the data over a 30-day period on transactions that intelligence officials could get their hands on: phone conversations, military events, road-traffic patterns, public opinion—even the price of potatoes, former officials said. Changes in prices of commodities at markets proved to be an

indicator of potential for conflict, they said. The in-country intelligence was paired with larger computer networks capable melding cellphone data with information collected from sensors on drones and other sources, said former officials and defense contractors. Some of these drones use high-power cameras to scan large tracts of earth to look for changes that could indicate the locations of improvised explosive devices. Analysts discovered that the system's analysis improved when more information was added, so they moved to merge 90-day batches of data. The result, said a former U.S. official, was an ability to predict attacks 60% to 70% of the time. "It's the ultimate correlation tool," a former U.S. counterterrorism official said. "It is literally being able to predict the future."

Data mining more effective than individual collection – efficiency

Watkins et al, 3

(R. C. Watkins, K. M. Reynolds, R. F. DeMara, M. Georgiopoulos, A. J. Gonzalez, and R. Eaglin, University of Central Florida, "Tracking Dirty Proceeds: Exploring Data Mining Technologies As Tools To Investigate Money Laundering", http://www.cal.ucf.edu/journal/j_watkins_reynolds_jppr_03.pdf, January, 2003, ak.)

Second, it is feasible to suggest that data mining technologies could reduce problems in financial investigations that result from manpower shortages. Closely tied to the problems associated with time demands in money laundering investigations, manpower is always a major obstacle to successful lead and pattern identification. The use of data mining technologies could lessen the burden on already strained manpower resources. Because these methods have the ability to rapidly explore large financial data sets and identify case leads and money laundering patterns, it is conceivable that the inefficiencies in the current investigative processes could be reduced. Use of these technologies to rapidly and accurately identify leads and suspicious activity patterns could permit small well-trained units of domain experts to rigorously focus on analyzing outputs and leading investigations. This would be in stark contrast to the current use of under-trained and inexperienced investigators sifting through voluminous financial record sets attempting to isolate money laundering leads, patterns, and trends. A third potential benefit of using data mining technology in money laundering investigations is the identification of more case leads, potentially more accurate case leads, and certainly more timely case leads. The use of a cluster analysis technique or a neural network technique offers the ability to identify previously undiscovered case leads. Domain experts have considerable experience working with financial data. They identify patterns and case leads to focus money laundering investigations. However, due to the sheer volume of financial transactions, it is humanly impossible to identify all leads and activity patterns given the stringent time constraints under which money laundering investigations proceed. The aforementioned methodologies can rapidly process data and expeditiously generate outputs for review by financial investigators. The use of linear regression could provide financial investigators with more accurate and timely leads. This methodology is used to predict useful quantitative probabilities and delineate between strong and weak leads. For example, data from previously observed behaviors can be used to focus new investigative activities on the most promising locations at the most probabilistically promising day and time. This could remedy some of the problems in financial investigations that are associated with time and manpower shortages. In other words, if financial investigators can secure more accurate leads in a more timely fashion, they could more efficiently and effectively allocate resources.

2NC- No Overload

Computer algorithms and cross referencing prevent data overload given to analysts

Bobbitt, 13- Bobbitt is leading constitutional theorist and a Fellow of the American Academy of Arts and Sciences. He is a Life Member of the American Law Institute, and a member of the Council on Foreign Relations, the Pacific Council on International Policy, and the International Institute for Strategic Studies (London). He is a member of the Commission on the Continuity of Government. He has served as Law Clerk to the Hon. Henry J. Friendly (2 Cir.), Associate Counsel to the President, the Counselor on International Law at the State Department, Legal Counsel to the Senate Iran-Contra Committee, and Director for Intelligence, Senior Director for Critical Infrastructure and Senior Director for Strategic Planning at the National Security Council. Before coming to Columbia he was A.W. Walker Centennial Chair in Law at the University of Texas Law School. He is a former trustee of Princeton University; and a former member of the Oxford University Modern History Faculty and the War Studies Department of Kings College, London. He serves on the Editorial Board of Biosecurity and Bioterrorism. He has published eight books: *Tragic Choices* (with Calabresi) (Norton, 1978), *Constitutional Fate* (Oxford, 1982), *Democracy and Deterrence* (Macmillans, 1987), *U.S. Nuclear Strategy* (with Freedman and Treverton) (St. Martin's, 1989), *Constitutional Interpretation* (Blackwell, 1991), *The Shield of Achilles: War, Peace and the Course of History* (Knopf, 2002), *Terror and Consent* (Knopf, 2008), and most recently *The Garments of Court and Palace: Machiavelli and the World That He Made* (Atlantic, 2013) His latest essay is "The Age of Consent,," (American legal history since Grant Gilmore's 1974 Storrs Lectures, *The Ages of American Law*). 123 Yale L. J. 2334 (2014). (Philip, "NSA is upholding, not subverting, the law", *Financial Times*, 6/10/13, [//KTC](http://www.ft.com/cms/s/0/2da229bc-d1bc-11e2-9336-00144feab7de.html#axzz3eU8L1CIM)

Last week two revelations about US intelligence collection exploded in the press: a court order directing Verizon to turn over call logs from its telephone network was revealed along with details of the Prism program that gives the US intelligence community access to servers through which foreign communications are routed. How would these collection capabilities actually help prevent attacks? Would they not simply swamp analysts? First, a law enforcement agency must have some hard knowledge – a name, a photograph, a location. Computers can then use these data to draw links among all the various lines out from the initial factual starting point: what numbers were called, at what location and of what duration. Once networks emerge, computers can analyse them to determine which nodes are central to them (Mohamed Atta, the 9/11 leader, clearly emerges from such an exercise). Rather than overloading agents doing actual surveillance, this cross-hatching is done by a computer that eventually turns up the most promising leads. After the 9/11 atrocity, it was revealed that two of the terrorists were known to the FBI. Had their names been cross-referenced only with credit card accounts, frequent-flyer numbers and mobile phone numbers, US agencies might have picked up on the 17 other men linked to them flying on the same day at the same time

Handmaids DDI

Framework

Our interpretation is that an affirmative should defend curtailing federal government surveillance as the endpoint of their advocacy. This does not mandate roleplaying, immediate fiat or any particular means of impact calculus.

Surveillance can only be understood in relation to the agent doing the surveying – understanding federal government surveillance as unique is key or the topic becomes abstract and unlimited

Cetina 14

(DANIEL K. CETINA, BALANCING SECURITY AND PRIVACY IN 21ST CENTURY AMERICA: A FRAMEWORK FOR FISA COURT REFORM, 47 J. Marshall L. Rev. 1453 2013-2014, Hein)

Any legitimate attempt to discuss and critique United States surveillance tactics necessarily demands defining exactly what surveillance is and what it entails.

Although discourse surrounding governments' intelligence and law enforcement techniques transcends any specific epoch or state,¹¹ modern communication technologies "have revolutionized our daily lives [and] have also created minutely detailed recordings of those lives,"¹² thereby making governmental surveillance simple, potentially ubiquitous, and susceptible to abuse.¹³ Of course, recent surveillance programs were implemented for the noble purpose of conducting the War on Terrorism;¹⁴ but the danger is that pursuing this purpose unchecked can undermine the central principles that both provide the Republic's foundation and differentiate it from the very enemies it combats.¹⁵

While the prospect of governmental surveillance seems to implicitly suggest a quasi-Orwellian dystopia,¹⁶ fantastical science fiction mythologies,¹⁷ abstruse philosophical concepts,¹⁸ or documented repressive regimes,¹⁹ the reality is both less foreboding and more nuanced. Although American society, ostensibly, is looking increasingly akin to such fiction, theory, and totalitarianism, surveillance as applied is not so disturbing. Surveillance involves and encompasses many topics and practices, both abstract and practical,²⁰ but it primarily involves power relationships. ²¹ Specifically, surveillance is "the focused, systematic and routine attention to personal details for purposes of influence, management, protection or direction."²² Surveillance can target a modern society's numerous communications networks,²⁸ which exist to send and receive information. ²⁴ The communications include both envelope information and content information, distinct categories that draw varying degrees of interest from the surveillance authority. ²⁵

But surveillance is not strictly the province of the federal government. ²⁶ Indeed, state and local governments have their own surveillance practices, as do private corporations, which routinely use surveillance data to determine purchasing trends and calibrate advertising, especially through such social media sites as Facebook.²⁸ Surveillance, therefore, transcends the boundary between the private sector and the public sector. ²⁹

The focus here, however, is on federal governmental surveillance. It is therefore critical to understand from where the federal government derives its authority to monitor and analyze communications networks.

The Aff undermines the ability to have a limited and stable number of Affirmatives to prepare against. The link magnitude is high.

This is a reason to vote negative.

Our first standard is competition – every affirmative argument needs to be filtered through the question of “how does this function in a competitive venue of debate

where there must be a win or a loss assigned to each team. All their evidence will assume non-competitive academic environment rather than one where a forced choice will inevitably take place with every ballot.

Second is substantive side bias

Not defending the clear actor and mechanism of the resolution produces a substantive side bias.

They have the ability to recontextualize link arguments, shift focus to different proscriptional claims of the 1AC while using traditional competition standards like perms to make non-absolutist disagreements irrelevant.

The first impact to Aff sides bias is absolutism – their interp creates bad debates where negatives are forced into the absolutist positions like cap and Baudrillard to ensure links and have generic positions that can apply to everything. This is bad for education -- forcing us to the academic margins, makes us less effective scholars and less literate in current events. Trains us only for leftist infighting, rather than social change.

Second, it undermines research – Aff has an incentive to constantly break new affs at every tournament making any real attempt at engagement irrelevant and decreasing the quality of all debates. They don't spur engagement and exploration cause there are so many teams reading so many Affs, the only way to respond it with generics. The Aff is conversely incentivized to pick a body of literature with very little negative literature and a prolif of aff advocacies based on single articles or created phrases. There is no incentive to produce detailed strategies because academic disagreements in the literature are minute and easily wished away by perms or Aff changes.

And we have an external impact – Sufficient research-based preparation and debates focused on detailed points of disagreement are key to political effectiveness

Gutting 13 (professor of philosophy at the University of Notre Dame)

(Gary, Feb 19, A Great Debate, <http://opinionator.blogs.nytimes.com/2013/02/19/a-great-debate/?emc=eta1>)

This is the year of what should be a decisive debate on our country's spending and debt. But our political "debates" seldom deserve the name. For the most part representatives of the rival parties exchange one-liners: "The rich can afford to pay more" is met by "Tax increases kill jobs." Slightly more sophisticated discussions may cite historical precedents: "There were higher tax rates during the post-war boom" versus "Reagan's tax cuts increased revenues."

Such volleys still don't even amount to arguments: they don't put forward generally accepted premises that support a conclusion. Full-scale speeches by politicians are seldom much more than collections of such slogans and factoids, hung on a string of platitudes. Despite the name, candidates' pre-election debates are exercises in looking authoritative, imposing their talking points on the questions, avoiding gaffes, and embarrassing their opponents with "zingers" (the historic paradigm: "There you go again.").

There is a high level of political discussion in the editorials and op-eds of national newspapers and magazines as well as on a number of blogs, with positions often carefully formulated and supported with argument and evidence. But even here we seldom see a direct and sustained confrontation of rival positions through the dialectic of assertion, critique, response and counter-critique.

Such exchanges occur frequently in our law courts (for example, oral arguments before the

Supreme Court) and in discussions of scientific papers. But they are not a significant part of our deliberations about public policy. As a result, partisans typically remain safe in their ideological worlds, convincing themselves that they hold to obvious truths, while their opponents must be either knaves or fools — with no need to think through the strengths of their rivals’ positions or the weaknesses of their own. Is there any way to make genuine debates — sustained back-and-forth exchanges, meeting high intellectual standards but still widely accessible — part of our political culture? (I leave to historians the question of whether there are historical precedents— like the Webster-Hayne or Lincoln-Douglas debates.) Can we put our politicians in a situation where they cannot ignore challenges, where they must genuinely engage with one another in responsible discussion and not just repeat talking points?

A first condition is that the debates be focused on specific points of major disagreement. Not, “How can we improve our economy?” but “Will tax cuts for the wealthy or stimulus spending on infrastructure do more to improve our economy?” This will prevent vague statements of principle that don’t address the real issues at stake.

Another issue is the medium of the debate. Written discussions, in print or online could be easily arranged, but personal encounters are more vivid and will better engage public attention. They should not, however, be merely extemporaneous events, where too much will depend on quick-thinking and an engaging manner. We want remarks to be carefully prepared and open to considered responses.

**This guts any educational potential of the aff – failure to engage with the legal detail of surveillance policy prevents translating their argument into action.

Cohen 15 (professor of law at Georgetown University Law Center)

(Julie, 2015, Studying Law Studying Surveillance, Studying Law Studying Surveillance. Surveillance & Society 13(1): 91-101)

Relative to legal scholarship, work in Surveillance Studies is more likely to build from a solid foundation in contemporary social theory. Even so, such work often reflects both an insufficient grasp of the complexity of the legal system in action and lack of interest in the ways that legal and regulatory actors understand, conduct, and contest surveillance. By this I don’t mean to suggest that Surveillance Studies scholars need law degrees, but only to point out what ought to be obvious but often isn’t: legal processes are social processes, too, and in overlooking these processes, Surveillance Studies scholars also engage in a form of black-boxing that treats law as monolithic and surveillance and government as interchangeable. Legal actors engage in a variety of discursive and normative strategies by which institutions and resources are mobilized around surveillance, and understanding those strategies is essential to the development of an archaeology of surveillance practices. Work in Surveillance Studies also favors a type of theoretical jargon that can seem impenetrable and, more importantly, unrewarding to those in law and policy communities. As I’ve written elsewhere (Cohen 2012a: 29), “[t]oo many such works find power everywhere and hope nowhere, and seem to offer well-meaning policy makers little more than a prescription for despair.”

Acknowledgment of pervasive social shaping by networked surveillance need not preclude legal protection for socially-shaped subjects, but that project requires attention to detail.

To put the point a different way, the networked democratic society and the totalitarian state may be points on a continuum rather than binary opposites, but the fact that the continuum exists is still worth something. If so, one needs tools for assessment and differentiation that Surveillance Studies does not seem to provide.

As an example of this sort of approach within legal scholarship, consider a recent article by legal scholars Danielle Citron and David Gries (2013), which proposes that courts and legislators undertake what they term a technology-centered approach to regulating surveillance. They would have courts and legislators ask whether

particular technologies facilitate total surveillance and, if so, set to put in place comprehensive procedures for approving and overseeing their use. From a Surveillance Studies perspective, this approach lacks theoretical parity because its technology-specific focus appears to ignore the fact that total surveillance also can emerge via the fusion of data streams originating from various sources. But the proposal is pragmatic; it does not so much ignore that risk as bracket it while pursuing the narrower goal of gaining a regulatory foothold within the data streams. And because it focuses on the data streams themselves, it is administrable in a way that schemes based on loose imitations and artificial distinctions between different types of surveillance are not. One can envision both courts and legislators implementing the Canon and Grey proposal in a way that enables far better oversight of what law enforcement is doing.

Tantamount to the linked practice of commercial profiling and social media surveillance, we have already seen that work in Surveillance Studies again steps in where legal scholarship badly needs supplementation: on the question of how pervasive surveillance by private market actors shapes the production of culture and the patterns of emergent subjectivity. Such work typically does not, however, consider or explore the ways that the legal context of consent mobilizes legal and policy discourses to sanction ongoing expansions of private-sector surveillance and insulate them from regulatory oversight. Work in Surveillance Studies also has not seemed to pay particularly careful attention to the roles that rhetoric of innovation and competition play in regulatory debates about information privacy. For a discipline that seeks to develop comprehensive and rigorous accounts of surveillance as social ordering and as cultural practice, these are large omissions. As we have seen, the sense-and-choice paradigm has deep roots within liberal theory, and legal and policy discourses about notice and choice reflect legal culture in action. By the same token, understanding surveillance simply as a means to effective administration, or as a means for pursuing and performing security, misses the extent to which a narrative about the inevitable nature of innovation and knowledge production positions surveillance as a modality of technical and social progress (Cohen 2015). The "surveillance-industrial complex" does not simply parallel the military-industrial complex; it is also deeply rooted in Silicon Valley's technoculture and (often paradoxically) in the hopes of romantic individualism with which its participants self-identify. These themes have been especially salient for privacy regulation.

Engagement with legal scholarship on information privacy would inform the project of understanding surveillance as social ordering

and as culture in a number of complementary ways. First and most basically, many legal writings on information privacy are important sources that reveal the sense-and-choice paradigm and the narrative of inevitable innovation at work. But there is also a rich vein of legal scholarship interrogating the assumptions and the politics that underlie privacy and data protection regulation (e.g., Cohen 2012a, 2012c, 2013, 2015; Kent 2013; Olin 2010; Solove 2013). In addition, legal scholars have produced richly detailed and revealing investigations of regulatory and compliance cultures, for example, scholars concerned with the operation of "surveillance assemblages" and "digital enclosures" ought to read and consider the important work by Kenneth Bamberger and Deirdre Mulligan on corporate privacy compliance cultures (2011a, 2011b).

If Surveillance Studies is to inform the content of laws and the nature of regulatory practice in the domain of commercial profiling and social media, however, surveillance theorists will need to do more than simply read legal sources. Work in Surveillance Studies so far has not been particularly well-adapted to helping policymakers figure out what, if anything, to do about evolving practices of commercial surveillance. Once again, if it is to be useful to policymakers, the view from Surveillance Studies requires translation into a form that might furnish a framework for action.

Here I want to identify three important sets of questions on which Surveillance Studies scholars who want their work to make a difference might take their cues from legal scholarship.

An initial set of questions concerns how to reframe privacy and data protection in functional terms that do not presuppose the stable, liberal self, and that instead offer real benefit to the situated subjects who might claim their protection. David Lyon (2001) has argued that the organizing concepts of "privacy" and "data protection" are inadequate to comprehend surveillance as a mode of social ordering. From a sociological perspective that is unambiguously right, but privacy and data protection still might be made effective as legal constructs if articulated differently, in ways that correspond more closely to the ways that surveillance shapes experience. That project calls for the sort of theoretical canalization that makes Ph.D. committees in Real Disciplines nervous, but at which legal scholars excel. With some trepidation, I offer my own work on privacy as boundary management for the postliberal self (Cohen 2012a, 2013), as well as Valerie Steeves' (2009) work on relational subjectivity, as examples of the sort of exercise that is necessary to reframe the effects of surveillance as social ordering in ways to which legal systems can respond. For law to develop a sustainable and effective approach to regulating data protection and protecting privacy, the ways of theorizing about the subject represented by these projects must become second nature, not only for scholars but also and more importantly for legislators, regulators, and courts. That in turn requires second process of translation, from the language of academia into a vocabulary that can supply inputs into policy processes.

A second set of questions concerns how to understand what constitutes privacy harm in an era in which some surveillance is a constant. To the Surveillance Studies reader this may seem to be a variation on the first question, but it is different: in law, harm is what makes violation of an interest actionable, and the potential for harm is what creates the predicate for comprehensive regulation of particular domains of activity. Harm need not be individualized or monetizable; environmental regulation and financial market regulation address systemic and often nonmonetizable risk. But it must be reasonably definite, talk of power, power every where is plainly insufficient and it should come as no surprise that policymakers find it usable. Work on this problem is still preliminary, but here legal scholarship has a leg up because it deals in practicalities. Surveillance Studies scholars might profitably read works by Daniel C. Cronin (2007) and Paul Olin (2010) that identify and name the systemic risks associated with leaky and largely unregulated data reservoirs, and that draw on resources ranging from the history of privacy to computational processes to craft recommendations for more effective regulatory strategies.

A final set of questions concerns the design of governance mechanisms. As we have already seen, the flow of surveillance within social media create novel institutional design challenges. In the domain of commercial profiling, many activities on the business-facing side of personal information markets, emerging from consumer-facing processes that purport to create notice and choice, have eluded regulatory scrutiny entirely. Some of the classic work on privacy governance originates within the Surveillance Studies tradition; these include Priscilla Regan's (1995) study of the way privacy legislation emerges within the U.S. political system and Colin Bennett and Charles Raab's (2006) work on privacy governance and the emergence of data protection as a regulatory paradigm. But the question of governance badly needs to be revisited; in particular, Surveillance Studies scholars have not yet engaged with the "new privacy governance" now emerging as official policy in the U.S. (and as de facto policy in the European Union) as a sustained and meaningful work. Works by legal scholars on the political, epistemological, and normative dimensions of the new governance (e.g., Bamberger 2010; Cohen 2012b, 2013; Freeman 2008; Lubet 2004) offer starting points for an inquiry that moves beyond "doing Surveillance Studies" to consider the more pressing challenge of doing surveillance regulation wisely and effectively.

Conclusion: Doing Law and Surveillance Studies Differently

The prospects for fruitful interexchange and collaboration between legal scholars and Surveillance Studies scholars are likely to remain complicated by pronounced differences in underlying theoretical orientation. But since Surveillance Studies is itself an interdisciplinary (Garber 2001), and since legal scholarship has thrived

on interdisciplinary exploration, the prospects for effective communication also seem reasonably good. Bridging the gaps requires, first and foremost, efforts by emissaries from both traditions to foster a more tolerant and curious dialogue directed toward improved understanding and, ultimately, toward methodological hybridization. Within one's own academic community, it can become too easy to mistake consensus on methodological conventions for epistemological rigor, and to forget that methodological strength also derives from refusal to be hemmed in by disciplinary boundaries.

From the standpoint of theory, a more sustained dialogue between law and Surveillance Studies would count as a success if it produced a mode of inquiry about surveillance that melded the theoretical sophistication of Surveillance Studies with lawyerly attention to the details, mechanisms, and interests that constitute surveillance practices as legal practices, and to the kinds of framing that mobilize legal and policy communities. To do Surveillance Studies better, legal scholars need to challenge their own preference for putting problems in categories that fit neatly within the liberal model of human nature and behavior, and Surveillance Studies scholars can help by calling attention to the social and cultural processes within which surveillance practices are embedded. Surveillance Studies scholars need to do more to resist their own penchant for totalizing dystopian narratives, and should delve more deeply into the legal and regulatory realpolitik that surrounds the administration of surveillance systems; legal scholars can help by demystifying legal and regulatory processes.

From a legal scholar's perspective, however, theory achieves its highest value when it becomes a tool for forcing productive confrontations about how to respond to real problems. And so I think it would count as an even bigger success if dialogue between law and Surveillance Studies generated not only a hybridized theoretical discourse of law-and-Surveillance-Studies but also the beginnings of a more accessible policy discourse about surveillance and privacy, along with reform proposals designed to put the animating concepts behind such a discourse into practice. Here the goal would be a hybridization between law's ingrained pragmatism and Surveillance Studies' attentiveness to the social and cultural processes through which surveillance is experienced and assimilated. Working together, legal scholars and Surveillance Studies scholars might advance the project of formulating working definitions of privacy interests and harms, and might develop more sophisticated projections of the likely effects of different policy levers that could be brought to bear on systems of surveillance.

Next is Mechanism Education

The Aff's failure to identify an agent and mechanism makes cost-benefits analysis impossible, meaning debates take place in an academic vacuum where tradeoffs are irrelevant. It makes link comparisons vacuous and means that detailed PICs about substance are all but impossible.

And this turns the Aff – debates over mechanisms for change are crucial to solve material violence on a large scale

Capulong 9 (Assistant Professor of Law, University of Montana)

(Eduardo R.C., CLIENT ACTIVISM IN PROGRESSIVE LAWYERING THEORY, CLINICAL LAW REVIEW, 16 Clinical L. Rev. 109, Fall, 2009)

Motivating client activism under dynamic social conditions requires the development and constant assessment and reassessment of a political perspective that measures that resistance and its possibilities. That task in turn requires the development of specific activist goals within the context of such analyses, and perhaps broader, national and international strategy--what some call the political "next step." This is particularly true today, when the economic crisis plaguing capitalism, the "war on terror" and climate change undeniably have world-wide dimensions. Instances of failure, too, need to be part of that analysis, because they teach us much about why otherwise promising activist efforts do not become sustained mass movements of the sort to which we all aspire.

Thus, the theoretical need is two-fold: to construct a broader organizing perspective from a political standpoint, and to consider activism writ large. Without reading the pulse of prevailing social conditions, it is easy to miscalculate what that next step ought to be. We will not build a mass movement though sheer perseverance--a linear, idealist conception of change at odds with dynamic social conditions. By the same token, we may underestimate the potential of such mass activism if we focus simply on the local dimensions of our work.

The dialectic between a dynamic social context and political consciousness and action requires a constant organizational and political calibration and modulation often missing from theoretical scholarship.

Without such a working perspective, we are apt to be either ultra-left or overly conservative. As Jim Pope put it recently in the context of new forms of labor organizing: "If we limit our vision of the future to include only approaches that work within the prevailing legal regime and balance of forces, then we are likely to be irrelevant when and if the opportunity for a paradigm shift arises." n449 The cyclical nature of labor organizing, he argues, mirrors politics generally. American political life as a whole has likewise alternated between periods characterized by public action, idealism, and reform on the [F189] one hand, and periods of private interest, materialism, and retrenchment on the other. A prolonged private period spawns orgies of corruption and extremes of wealth and poverty that, sooner or later, ignite passionate movements for reform. n450 C. 'Activism': Towards a Broader, Deeper, Systematic Framework

In progressive lawyering theory, grassroots activism is frequently equated with "community organizing" and "movement" or "mobilization" politics. n451 Indeed, these methods have come to predominate activist lawyering in much the same way as "public interest law" has come for many to encompass all forms of progressive practice. "Activism" is, of course, broader still. Even on its own terms, the history of community organizing and social movements in the United States includes two vitally important traditions frequently given short shrift in this realm: industrial union organizing and alternative political party-building. n452 In this section, my aim is not to catalogue the myriad ways in which lawyers and clients can and do become active (methodically or institutionally)--which, given human creativity and progress, in any event may be impossible to do--but rather to problematize three assumptions: first, the tendency to define grassroots activity narrowly; second, the notion that certain groups--for example "the poor" or the "subordinated"--are the definitive agents of social change; and finally, the conviction that mass mobilization or movement-building, by itself, is key to social transformation.

1. Grassroots Activism

There are countless ways in which people become socially or politically active. Yet even the more expansive and sophisticated considerations of activism in progressive lawyering theory tend to unnecessarily circumscribe activism. For example, Cummings and Eagly argue that we need to "unpack" the term "organizing." n453 Contrasting two strategies of the welfare rights movement in the 1960s, these authors distinguish between "mobilization as short-term community action and organizing as an effort to build long-term institutional power." n454 In the same breath, however, they define organizing "as shorthand for a range of community-based practices," n455 even though at least some activism, for example union organizing or, say, [F190] fasting, might not be best characterized as "community-based."

What is required is a larger framework that takes into account the sum total of activist initiatives. Lucie White argues that we need to "map out the internal microdynamics of progressive grassroots initiatives ... observe the multiple impacts of different kinds of initiatives on wide spheres of social and political life ... and devise typologies, or models, or theories that map out a range of opportunities for collaboration." n456 This map would be inadequate--and therefore inaccurate--if we include certain activist initiatives and not others. But that is precisely what the progressive lawyering literature has done by failing to regularly consider, for example, union organizing or alternative political party-building.

2. Agents of Social Change: Identity, Class and Political Ideology As with our definition of activism, here, too, the problem is a lack of clarity, breadth or scope, which leads to misorientation. Have we defined, with theoretical precision, the social-change agents to whom we are orienting--e.g., the "people," the "poor," the "subordinated," "low-income communities" or "communities of color"? And if so, are these groupings, so defined, the primary agents of social change? By attempting to harmonize three interrelated (yet divergent) approaches to client activism--organizing on the bases of geography and identity, class and the workplace, and political ideology--modern community organizing simultaneously blurs and balkanizes the social-change agents to whom we need to orient. What, after all, is "community"? In geographic terms, local efforts alone cannot address social problems with global dimensions. n457 As Pope observed of workers' centers: "the tension between the local and particularistic focus of community unionism and the global scope of trendsetting corporations like Wal-Mart makes it highly unlikely that community unionism will displace industrial unionism as 'the' next paradigm of worker organization." n458 On the other hand, members of cross-class, identity-based "communities" may not necessarily share the same interests. In the "Asian American community," Ancheta explains: using the word "community" in its singular form is often a misnomer, because Asian Pacific Americans comprise many communities, each with its own history, culture and language: Filipino, Chinese, Japanese, Korean, Vietnamese, Thai, Cambodian, Lao, Lao-Mien, [F191] Hmong, Indian, Indonesian, Malaysian, Samoan, Tongan, Guamanian, Native Hawaiian, and more. The legal problems facing individuals from different communities defy simple categorization. The problems of a fourth-generation Japanese American victim of job discrimination, a monolingual refugee from Laos seeking shelter from domestic violence, an elderly immigrant from the Philippines trying to keep a job, and a newcomer from Western Samoa trying to reunite with relatives living abroad all present unique challenges. Add in factors such as gender, sexual orientation, age, and disability, and the problems become even more complex. n459 Angela Harris echoes this observation by pointing out how some feminist legal theory assumes "a unitary, 'essential' women's experience [that] can be isolated and described independently of race, class, sexual orientation, and other realities of experience." n460 The same might be said of the "people," which, like the "working class," may be too broad. Other categorizations--such as "low-income workers," "immigrants," and the "poor", for example--may be too narrow to have the social weight to fundamentally transform society. In practice, progressive lawyers orient to the politically advanced among these various "communities." In so doing, then, we need to acknowledge that we are organizing on the basis of political ideology, and not simply geography, identity or class. Building the strongest possible mass movement, therefore, requires an orientation not only towards certain "subordinated" communities, but to the politically advanced generally. Otherwise, we may be undermining activism writ large. This is not to denigrate autonomous community efforts. As I have mentioned, subordinated communities of course have the right to self-determination, i.e. to organize separately. But the point is not simply to organize groups of people who experience a particular oppression, but rather to identify those who have the social power to transform society. Arguing that these agents are the collective, multi-racial working class, Smith explains: The Marxist definition of the working class has little in common with those of sociologists. Neither income level nor self-definition are [sic] what determine social class. Although income levels obviously bear some relationship to class, some workers earn the same or higher salaries than some people who fall into the category of middle class. And many people who consider themselves "middle [F192] class" are in fact workers. Nor is class defined by

categories such as white and blue collar. For Marx the working class is defined by its relationship to the means of production. Broadly speaking, those who do not control the means of production and are forced to sell their labor power to capitalists are workers. n461 The practical consequence of this very well may be that we redefine who we represent as clients and consider activism or potential activism outside subordinated communities, for example union activity and alternative political-party building, as part of our work.

3. From Movementism to Political Organization

Dogged as our work is in the activist realm, any effort at fundamental social transformation is doomed without effective political leadership. Such leadership, in turn, requires work not often associated with "activism," such as, for example, theoretical study. n462 "Movementism," n463 by which I mean the conviction that building a mass movement is the answer to oppression and exploitation, has its limitations. Even though activism itself is perhaps the best school for political education, we have an enormous amount to learn from our predecessors. In the final analysis, fundamental social transformation will only come about if there are political organizations clear enough, motivated enough, experienced enough, large enough, embedded enough and agile enough to respond to the twists and turns endemic in any struggle for power. "The problem," as Bellow astutely observed, "is not our analytic weaknesses, but the opportunistic, strategic, and political character of our subject." n464 Such opportunities typically occur when there is a confluence of three factors: a social crisis; a socio-economic elite that finds itself divided over how

to overcome it; and a powerful mass movement from below. As I understand the nature of social change, successful social transformations occur when there is a fourth element: political organization.

Conclusion

Client activism is not a monolithic, mechanical object. Most of the time, it is neither the gathering mass movement many of us wish for, nor the inert, atomized few in need of external, professional motivation. Rather, activism is a phenomenon in constant ebb and flow, a [*193] mercurial, fluid complex shaped by an unremitting diversity of factors. The key through the maze of lawyering advice and precaution is therefore to take a hard, sober look at the overarching state of activism. Are our clients in fact active or are they not? How many are and who are they? What is the nature of this period? Economically? Politically? What are the defining issues? What political and organizing trends can be discerned? With which organizations are our clients active, if any? What demands are they articulating, and how are they articulating them?

This is a complex evaluation, one requiring the formulation, development and constant assessment and reassessment of an overarching political perspective. My aim

in this Article is to begin to theorize the various approaches to this evaluation. In essence, I am arguing for the elaboration of a systematic macropolitical analysis in progressive lawyering theory. Here, my purpose is not to present a comprehensive set of political considerations, but rather to develop a framework for, and to investigate the limitations of, present considerations in three areas: strategic aims; prevailing social conditions; and methods of activism. Consciously or not, admittedly or not, informed and systematic or not, progressive lawyers undertake their work with certain assumptions, perspectives and biases. Progressive lawyering theory would be a much more effective and concrete guide to action--to defining the lawyer's role in fostering activism--if it would elaborate on these considerations and transform implicit and perhaps delimited assumptions and approaches into explicit and hopefully broader choices.

Over the past four decades, there has been remarkable continuity and consistency in progressive lawyers' use of litigation, legislation, direct services, education and organizing to stimulate and support client activism. The theoretical "breaks" to which Buchanan has referred n465 have not been so much about the practice of lawyering itself, but rather about unarticulated shifts in ultimate goals, societal analyses, and activist priorities, each necessitated by changes in the social, economic, and political context. That simply is another way of stating the obvious: that progressive lawyers change their practices to adapt to changing circumstances. The recurrent problem in progressive lawyering theory is that many commentators have tended to generalize these practice changes to apply across social circumstances. In so doing, they displace and often replace more fundamental differences over strategic goals, interpretation of social contexts, and organizing priorities with debates over the mechanics of lawyering practice.

The argument is turned on its head: we often assume or tend to [*194] assume agreement over the meanings and underlying conceptual frameworks relating to "fundamental social change," current political analysis, and "community organizing," and debate lawyering strategy and tactics; but instead we should be elaborating and clarifying these threshold political considerations as a prerequisite to using what we ultimately agree to be a broad and flexible set of lawyering tools. In effect, the various approaches to lawyering have become the currency by which scholars have debated politics and activism. The irony is that our disagreements are less about lawyering approaches per se, I believe, than they are about our ultimate political objectives, our analyses of contemporary opportunities, and our views of the optimal paths from the latter to the former. The myriad lawyering descriptions and prescriptions progressive lawyering theory offers are of limited use unless they are anchored in these primary considerations. How do we decide if we should subscribe to "rebellious" and not traditional "public interest" lawyering, for example, or "collaborative" over "critical" lawyering, if we do not interrogate these questions and instead rush too quickly into practical questions? The differences among these approaches matter precisely because they have different political goals, are based on different political analyses, and employ different political activist strategies.

Activist lawyers already engage in these analyses--necessarily so. To foster client activism, they must read prevailing social conditions and strategize with their clients about the political next step, often with an eye toward a long-term goal. But I don't think we necessarily engage in these analyses as consciously, or with as full a picture of the history and dynamics involved or options available, as we could. Often this is because there simply isn't time to engage these questions. Or perhaps not wanting to dominate our clients, we squelch our own political analysis and agenda to allow for organic, indigenous leadership from below. But if we are truly collaborative--and when we feel strongly enough about certain political issues--we engage on issues and argue them out. In either event, we undertake an unsystematic engagement of these fundamental issues at our peril.

If we adhere to the belief that only organized, politicized masses of people can alter or replace exploitative and oppressive institutions and bring about lasting fundamental social change, then, as progressive lawyers, we need to be clear about which legal tactics can bring about such a sustained effort in each historical moment. Without concrete and comprehensive diagnoses of ultimate political goals, social and economic contexts, and organizing priorities, progressive legal practice will fail to live up to its potential.

Now the State debate

We do not need to win that the state is good, rather just that the value of the state is something that should be debated about. This is the screen you should adopt for the Aff's ev – it can't just say that the state is bad or ineffective, their ev has to say that the state should not even be discussed. General indictments of the state can be done on the neg, while still preserving limited and effective debate and research.

First, engaging with the law is inevitable and can be effective

Capulong 9 (Assistant Professor of Law, University of Montana)

(Eduardo R.C., CLIENT ACTIVISM IN PROGRESSIVE LAWYERING THEORY, CLINICAL LAW REVIEW, 16 Clinical L. Rev. 109, Fall, 2009)

Nevertheless, in contrast to what Steve Bachmann has called the [*116] "a-legal" or "crude Marxist" approach, n19 progressive activists recognize that the legal arena remains a forum for social struggle. n20 This is so for three reasons: First, activists often do not have a choice but to work within the legal system, as when they are arrested or otherwise prevented from engaging in activism by state authorities. Second, because law is relatively autonomous from economic and political interests, n21 campaigns for legal reform can win substantial gains and are frequently the only vehicles through which more far-reaching change takes shape; struggles for reform, in other words, beget more radical possibilities and aspirations. n22 And third, law is constitutive of the social order. Law--or, more accurately, the concept of it--is not (again as some crude analysts would argue) simply a tool of one ruling class or other, but rather an essential component of a just society. n23

Commentators observe that lawyers who base their practice on these three premises are "hungry for theory," n24 for theory checks the "occupational hazards [of] reformism or cynicism." n25 The theoretical project is thus a dialectic: while law reform alone cannot "disturb the basic political and economic organization of modern American society," n26 [*117] law and lawyering are "a complex, contradictory, and open-textured setting that provides opportunities to challenge the status quo."

Second, debate about arcane legal details are crucial to the short-term survival of oppressed populations. Outside of the law being good or bad, legal education is crucial to empower even the most revolutionary of movements.

Arkles et al 10

(Gabriel Arkles, Pooja Gehi and Elana Redfield, The Role of Lawyers in Trans Liberation: Building a Transformative Movement for Social Change, Seattle Journal for Social Justice, 8 Seattle J. Soc. Just. 579, Spring / Summer, 2010, LN)

While agenda-setting by lawyers can lead to the replication of patterns of elitism and the reinforcement of systems of oppression, we do believe that legal work is a necessary and critical way to support movements for social justice. We must recognize the limitations of the legal system and learn to use that to the advantage of the oppressed. If lawyers are going to support work that dismantles oppressive structures, we must radically rethink the roles we can play in building and supporting these movements and acknowledge that our own individual interests or even livelihood may conflict with doing radical and transformative work. n162

A. Community Organizing for Social Justice When we use the term community organizing or organizing, we refer to the activities of organizations engaging in base-building and leadership development of communities directly impacted by one or more social [*612] problems and conducting direct action issue campaigns intended to make positive change related to the problem(s). In this article, we discuss community organizing in the context of progressive social change, but community-organizing strategies can also be used for conservative ends. Community organizing is a powerful means to make social change. A basic premise of organizing is that inappropriate imbalances of power in society are a central component of social injustice. In order to have social justice, power relationships must shift. In *Organizing for Social Change: Midwest Academy Manual for Activists* (hereinafter, "the Manual"), n163 the authors list three principles of community organizing: n164 (1) winning real, immediate, concrete improvements in people's lives; (2) giving people a sense of their own power; and (3) altering the relations of power. n165 Before any of these principles can be achieved it is necessary to have leadership by the people impacted by social problems. n166 As Rinku Sen points out: [E]ven allies working in solidarity with affected groups cannot rival the clarity and power of the people who have the most to gain and the least to lose . . . organizations composed of people whose lives will change when a new policy is instituted tend to set goals that are harder to reach, to compromise less, and to stick out a fight longer. n167 She also notes that, "[I]f we are to make policy proposals that are grounded in reality and would make a difference either in peoples' lives or in the debate, then we have to be in touch with the people who are at the center of such policies. n168 We believe community organizing has the potential to make fundamental social change that law reform strategies or "movements" led by lawyers cannot achieve on their own. However, community organizing is not always just and effective. Community-organizing groups are not immune to any number of problems that can impact other organizations, including internal oppressive dynamics. In fact, some strains of white, male-dominated [*613] community organizing have been widely criticized as perpetuating racism and sexism. n169 Nonetheless, models of community organizing, particularly as revised by women of color and other leaders from marginalized groups, have much greater potential to address fundamental imbalances of power than law reform strategies. They also have a remarkable record of successes. Tools from community organizers can help show where other strategies can fit into a framework for social change. The authors of the Manual, for example, describe various strategies for addressing social issues and illustrate how each of them may, at least to some extent, be effective. n170 They then plot out various forms of making social change on a continuum in terms of their positioning with regard to existing social power relationships. n171 They place direct services at the end of the spectrum that is most accepting of existing power relationships and community organizing at the end of the spectrum that most challenges existing power relationships. n172

Advocacy organizations are listed in the middle, closer to community organizing than direct services. n173 The Four Pillars of Social Justice Infrastructure model, a tool of the Miami Workers Center, is somewhat more nuanced than the Manual. n174 According to this model, four "pillars" are the key to transformative social justice. n175 They are (1) the pillar of service, which addresses community needs and stabilizes community members' lives; (2) the pillar of policy, which changes policies and institutions and achieves concrete gains with benchmarks for progress; (3) the pillar of consciousness, which alters public opinion and shifts political parameters through media advocacy and popular education; and (4) the pillar of power, which achieves autonomous community power through base-building and leadership development. n176 According to the Miami Workers Center, all of these pillars are essential in making social change, but the pillar of power is most crucial in the struggle to win true liberation for all oppressed communities. n177 [*614] In their estimation, our movements suffer when the pillar of power is forgotten and/or not supported by the other pillars, or when the pillars are seen as separate and independent, rather than as interconnected, indispensable aspects of the whole infrastructure that is necessary to build a just society. n178 Organizations with whom we work are generally dedicated solely to providing services, changing policies, or providing public education. Unfortunately, each of these endeavors exists separate from one another and perhaps most notably, separate from community organizing. In SRLP's vision of change, this separation is part of maintaining structural capitalism that seeks to maintain imbalances of power in our

society. Without incorporating the pillar of power, service provision, policy change, and public education can never move towards real social justice. n179 B. Lawyering for Empowerment In the past few decades, a number of alternative theories have emerged that help lawyers find a place in social movements that do not replicate oppression. n180 Some of the most well-known iterations of this theme are "empowerment lawyering," "rebellious lawyering," and "community lawyering." n181 These perspectives share skepticism of the efficacy of impact litigation and traditional direct services for improving the conditions faced by poor clients and communities of color, because they do not and cannot effectively address the roots of these forms of oppression. n182 Rather, these alternative visions of lawyering center on the empowerment of community members and organizations, the elimination of the potential for dependency on lawyers and the legal system, and the collaboration between lawyers and directly impacted communities in priority setting. n183 Of the many models of alternative lawyering with the goal of social justice, we will focus on the idea of "lawyering for empowerment," generally. The goal of empowerment lawyering is to enable a group of people to

gain control of the forces that affect their lives. n184 Therefore, the goal of empowerment lawyering for low-income transgender people of [*615] color is to support these communities in confronting the economic and social policies that limit their life chances.

Rather than merely representing poor people in court and increasing access to services, the role of the community or empowerment lawyer involves:

organizing, community education, media outreach, petition drives, public demonstrations, lobbying, and shaming campaigns . . . [I]ndividuals and members of community-based organizations actively work alongside organizers and lawyers in the day-to-day strategic planning of their case or campaign. Proposed solutions--litigation or non-litigation based--are informed by the clients' knowledge and experience of the issue. n185

A classic example of the complex role of empowerment within the legal agenda setting is the question of whether to take cases that have low chances of success. The traditional approach would suggest not taking the case, or settling for limited outcomes that may not meet the client's expectations. However, when our goals shift to empowerment, our strategies change as well. If we understand that the legal system is incapable of providing a truly favorable outcome for low-income transgender clients and transgender clients of color, then winning and losing cases takes on different meanings.

For example, a transgender client may choose to bring a lawsuit against prison staff who sexually assaulted her, despite limited chance of success because of the "blue wall of silence," her perceived limited credibility as a prisoner, barriers to recovery from the Prison Litigation Reform Act, and restrictions on supervisory liability in § 1983 cases. Even realizing the litigation outcome will probably be unfavorable to her, she may still develop leadership skills by rallying a broader community of people impacted by similar issues. Additionally, she may use the knowledge and energy gained through the lawsuit to change policy. If our goal is to familiarize our client with the law, to provide an opportunity for the client [*616] and/or community organizers to educate the public about the issues, to help our client assess the limitations of the legal system on their own, or to play a role in a larger organizing strategy, then taking cases with little chance of achieving a legal remedy can be a useful strategy.

Lawyering for empowerment means not relying solely on legal expertise for decisionmaking. It means recognizing the limitations of the legal system, and using our knowledge and expertise to help disenfranchised communities take leadership. If community organizing is the path to social justice and "organizing is about people taking a role in determining their own future and improving the quality of life not only for themselves but for everyone," then "the primary goal [of empowerment lawyering] is building up the community." n186

C. Sharing Information and Building Leadership

A key to meaningful participation in social justice movements is access to information. Lawyers are in an especially good position to help transfer knowledge, skills, and information to disenfranchised communities--the legal system is maintained by and predicated on arcane knowledge that lacks relevance in most contexts but takes on supreme significance in courts, politics, and regulatory agencies. It is a system intentionally obscure to the uninitiated; therefore the lawyer has the opportunity to expose the workings of the system to those who seek to destroy it, dismantle it, reconfigure it, and re-envision it.

As Quigley points out, the ignorance of the client enriches the lawyer's power position, and thus the transfer of the power from the lawyer to the client necessitates a sharing of information. n187 Rather than simply performing the tasks that laws require, a lawyer has the option to teach and to collaborate with clients so that they can bring power and voice back to their communities and perhaps fight against the system, become politicized, and take leadership. "This demands that the lawyer undo the secret wrappings of the legal system and share the essence of legal advocacy--doing so lessens the mystical power of the lawyer, and, in practice, enriches the advocate in the sharing and developing of rightful power." n188

Lawyers have many opportunities to share knowledge and skills as a form of leadership development. This sharing can be accomplished, for example, through highly collaborative legal representation, through community clinics, through skill-shares, or through policy or campaign meetings where the lawyer explains what they know about the existing structures and fills in gaps and questions raised by activists about the workings of legal systems.

D. Helping to Meet Survival Needs

SRLP sees our work as building legal services and policy change that directly supports the pillar of power. n189 Maintaining an awareness of the limitations and

pitfalls of traditional legal services, we strive to provide services in a larger context and with an approach that can help support liberatory work. n190 For this reason we provide direct legal services but also work toward leadership development in our communities and a deep level of support for our community-organizing allies. Our approach in this regard is to make sure our community members access and obtain all of the benefits to which they are entitled under the law, and to protect our community members as much as possible from the criminalization, discrimination, and harassment they face when attempting to live their lives. While we do not believe that the root causes keeping our clients in poverty and poor health can be addressed in this way, we also believe that our clients experience the most

severe impact from state policies and practices and need and that they deserve support to survive them. n191 Until our communities are truly empowered and our systems are fundamentally changed to increase life chances and health for transgender people who are low-income and people of color, our communities are going to continue to have to navigate government agencies and organizations to survive.

Monolithic rejections of the law are wrong – cooption is more likely in non-state activism and fails to compare to alternative mechanisms for change. Concrete mechanisms for success should be your metric for evaluation.

Lobel 7 (Assistant Professor of Law, University of San Diego)

(Orly, THE PARADOX OF EXTRALEGAL ACTIVISM: CRITICAL LEGAL CONSCIOUSNESS AND TRANSFORMATIVE POLITICS, 120 Harv. L. Rev. 937, February, 2007, LN)

In the following sections, I argue that the extralegal model has suffered from the same drawbacks associated with legal cooptation. I show that as an effort to avoid the risk of legal cooptation, the current wave of suggested alternatives has effects that ironically mirror those of cooptation itself. Three central types of difficulties exist with contemporary extralegal scholarship. First, in the contexts of the labor and civil rights movements, arguments about legal cooptation often developed in response to a perceived gap between the conceptual ideal toward which a social reform group struggled and its actual accomplishments. But, ironically, the contemporary message of opting out of traditional legal reform avenues may only accentuate this problem. As the rise of informalization (moving to nonlegal strategies), civil society (moving to extralegal spheres), and pluralism (the proliferation of norm-generating actors) has been effected and appropriated by supporters from a wide range of political commitments, these concepts have had unintended implications that conflict with the very social reform ideals from which they stem. Second, the idea of opting out of the legal arena becomes self-defeating as it discounts the ongoing importance of law and the possibilities of legal reform in seemingly unregulated spheres. A model encompassing exit and rigid sphere distinctions further fails to recognize a reality of increasing interpenetration and the blurring of boundaries between private and public spheres, profit and nonprofit sectors, and formal and informal institutions. It therefore loses the critical insight that law operates in the background of seemingly unregulated relationships. Again paradoxically, the extralegal view of decentralized activism and the division of society into different spheres in fact have worked to subvert rather than support the progressive agenda. Finally, since extralegal actors view their actions with romantic idealism, they fail to develop tools for evaluating their success. If the critique of legal cooptation has involved the argument that legal reform, even when viewed as a victory, is never radically transformative, we must ask: what are the criteria for assessing the achievements of the suggested alternatives? As I illustrate in the following sections, much of the current scholarship obscures the lines between the descriptive and the prescriptive in its formulation of social activism. If current suggestions present themselves as alternatives to formal legal struggles, we must question whether the new extralegal politics that are proposed and celebrated are capable of producing a constructive theory and meaningful channels for reform, rather than passive status quo politics.

A. Practical Failures: When Extralegal Alternatives Are Vehicles for Conservative Agendas

We don't want the 1950s back. What we want is to edit them. We want to keep the safe streets, the friendly grocers, and the milk and cookies, while blotting out the political bosses, the tyrannical headmasters, the inflexible rules, and the lectures on 100 percent Americanism and the sinfulness of dissent. n163

A basic structure of cooptation arguments as developed in relation to the labor and civil rights movements has been to show how, in the move from theory to practice, the ideal that was promoted by a social group takes on unintended content, and the group thus fails to realize the original vision. This risk is particularly high when ideals are framed in broad terms that are open to multiple interpretations. Moreover, the pitfalls of the potential risks presented under the umbrella of cooptation are in fact accentuated in current proposals. Paradoxically, as the extralegal movement is framed by way of opposition to formal legal reform paths, without sufficiently defining its goals, it runs the very risks it sought to avoid by working outside the legal system.

Extralegal paths are depicted mostly in negative terms and as resorting to new alternative forms of action rather than established models. Accordingly, because the ideas of social organizing, civil society, and legal pluralism are framed in open-ended contrarian terms, they do not translate into specific visions of social justice reform. The idea of civil society, which has been embraced by people from a broad array of often conflicting ideological commitments, is particularly demonstrative. Critics argue that "some ideas fail because they never make the light of day. The idea of civil society ... failed because it [*972] became too popular." n164 Such a broadly conceived ideal as civil society sows the seeds of its own destruction.

In former eras, the claims about the legal cooptation of the transformative visions of workplace justice and racial equality suggested that through legal strategies the visions became stripped of their initial depth and fragmented and framed in ways that were narrow and often merely symbolic. This observation seems accurate in the contemporary political arena; the idea of civil society revivalism evoked by progressive activists has been reduced to symbolic acts with very little substance. On the left, progressive advocates envision decentralized activism in a third, nongovernmental sphere as a way of reviving democratic participation and rebuilding the state from the bottom up. By contrast, the idea of civil society has been embraced by conservative politicians as a means for replacing government-funded programs and steering away from state intervention. As a result, recent political uses of civil society have subverted the ideals of progressive social reform and replaced them with conservative agendas that reject egalitarian views of social provision.

In particular, recent calls to strengthen civil society have been advanced by politicians interested in dismantling the modern welfare system. Conservative civil society revivalism often equates the idea of self-help through extralegal means with traditional family structures, and blames the breakdown of those structures (for example, the rise of the single parent family) for the increase in reliance and dependency on government aid. n165 This recent depiction of the third sphere of civic life works against legal reform precisely because state intervention may support newer, nontraditional social structures. For conservative thinkers, legal reform also risks increasing dependency on social services by groups who have traditionally been marginalized, including disproportionate reliance on public funds by people of color and single mothers. Indeed, the end of welfare as we knew it, n166 as well as the [*973] transformation of work as we knew it, n167 is closely related to the quest of thinkers from all sides of the political spectrum for a third space that could replace the traditional functions of work and welfare. Strikingly, a range of liberal and conservative visions have thus converged into the same agenda, such as the recent welfare-to-work reforms, which rely on myriad non-governmental institutions and activities to support them. n168

When analyzed from the perspective of the unbundled cooptation critique, it becomes evident that there are multiple limits to the contemporary extralegal current. First, there have been significant problems with resources and zero-sum energies in the recent campaigns promoting community development and welfare. For example, the initial vision of welfare-to-work supported by liberal reformers was a multifaceted, dynamic system that would reshape the roles and responsibilities of the welfare bureaucracy. The Personal Responsibility and Work Opportunity Reconciliation Act of 1996 n169 (PRWORA), supported by President Clinton, was designed to convert various welfare programs, including Aid to Families with Dependent Children, into a single block grant program. The aim was to transform passive cash assistance into a more active welfare system, in which individuals would be better assisted, by both the government and the community, to return to the labor force and find opportunities to support themselves. Yet from the broad vision to actual implementation, the program quickly became limited in focus and in resources. Indeed, PRWORA placed new limits on welfare provision by eliminating eligibility categories and by placing rigid time limits on the provision of benefits. n170

Moreover, the need to frame questions relating to work, welfare, and poverty in institutional arrangements and professional jargon and to comply with various funding block grants has made some issues, such as the statistical reduction of welfare recipients, more salient, whereas other issues, such as the quality of jobs offered, have been largely eliminated from policymakers' consideration. Despite aspects of the reform that were hailed as empowering for those groups they were designed to help, such as individual private training vouchers, serious questions have been raised about the adequacy of the particular [*974] policy design because resources and institutional support have been found lacking. n171 The reforms require individual choices and rely on the ability of private recipients to mine through a vast range of information. As in the areas of child care, health care, and educational vouchers, critics worry that the most disadvantaged workers in the new market will not be able to take advantage of the reforms. n172 Under such conditions, the goal of eliminating poverty may be eroded and replaced by other goals, such as reducing public expenses. Thus, recalling the earlier cooptation critique, once reforms are envisioned, even when they need not be framed in legalistic terms, they in some ways become reduced to a handful of issues, while fragmenting, neglecting, and ultimately neutralizing other possibilities.

At this point, the paradox of extralegal activism unfolds. While public interest thinkers increasingly embrace an axiomatic rejection of law as the primary form of progress, their preferred form of activism presents the very risks they seek to avoid. The rejected "myth of the law" is replaced by a "myth of activism" or a "myth of exit," romanticizing a distinct sphere that can better solve social conflict. Yet these myths, like other myths, come complete with their own perpetual perils. The myth of exit exemplifies the myriad concerns of cooptation. For feminist agendas, for example, the separation of the world into distinct spheres of action has been a continuous impediment to meaningful reform. Efforts to create better possibilities for women to balance work and family responsibilities, including relaxing home work rules and supporting stay-at-home parents through federal child care legislation, have been couched in terms of support for individual choice and private decisionmaking. n173 Indeed, recent initiatives in federal child care legislation to support stay-at-home parents have been clouded by preconceptions of the separation of spheres and the need to make one-or-the-other life choices. Most importantly, the emergence of a sphere-oriented discourse abandons a critical perspective that distinguishes between valuing traditional gender-based characteristics and celebrating feminine difference in a universalist and essentialist manner. n174 [*975] Not surprisingly then, some feminist writers have responded to civil society revivalism with great skepticism, arguing that efforts to align feminine values and agendas with classic republican theory of civil society activism should be understood, at least in part, as a way of legitimizing historical social structures that subordinated women.

The feminist lesson on the law/exit pendulum reveals a broader pattern. In a classic example of cooptation, activists should be concerned about the infusion (or indeed confusion) of nonlegal strategies with conservative privatization agendas. Indeed, in significant social policy contexts, legal scholarship oriented toward the exploration of extralegal paths reinforces the exact narrative that it originally resisted - that the state cannot and should not be accountable for sustaining and improving the lifeworld of individuals in the twenty-first-century economy and that we must seek alternative ways to bring about social reform. Whether using the terminology of a path-dependent process, an inevitable downward spiral, a transnational prisoner's dilemma, or a global race to the bottom, current analyses often suggest a lack of control over the forces of new economic realities. Rather than countering the story of lack of control, pointing to the ongoing role of government and showing the contradictions between that which is being kept regulated and that which is privatized, alternative extralegal scholarship accepts these developments as natural and inevitable. Similar to the arguments developed in relation to the labor movement - in which focusing on a limited right to collective bargaining demobilized workers and stripped them of their voice, participation, and decisionmaking power - contemporary extralegal agendas are limited to very narrow and patterned sets of reforms.

A striking example has been the focus on welfare reform as the single frontier of economic redistribution without a connection being made between these reforms and social services in which the middle class has a strong interest, such as Social Security and Medicare. Similarly, on the legal pluralism frontier, when activists call for more corporate social responsibility, the initial expressions are those of broad demands for sustainable development and overall industry obligations for the social and environmental consequences of their activities. n176 The discourse, however, quickly becomes coopted by a shift to a narrow focus on charitable donations and corporate philanthropy or [*976] private reporting absent an institutionalized compliance structure. n177 Moreover, because of institutional limitations and crowding out effects possible in any type of reform agenda, the focus shifts to the benefits of corporate social responsibility to businesses, as marketing, recruit-ment, public relations, and "greenwashing" strategies. n178 Critics therefore become deeply cynical about the industry's real commitments to ethical conduct.

A similar process can be described with regard to the literature on globalization. Globalization scholarship often attempts to produce a unifying narrative and an image of unitary struggle when in fact such unity does not exist. Embodied in the aforementioned irony of a "global anti-globalization" movement, social reform activism that resides under the umbrella of global movements is greatly diverse, some of it highly conservative. An "anti-globalization" movement can be a defensive nationalist movement infused with xenophobia and protective ideologies. n179 In fact, during central instances of collective action, such as those in Seattle, Quebec, Puerto Alegre, and Genoa, competing and conflicting claims were frequently encompassed in the same protest. n180 Nevertheless, there is a tendency to celebrate and idealize these protests as united and world-altering.

Similarly, at the local level, grassroots politics often lack a clear agenda and are particularly ripe for cooptation resulting in far lesser achievements than what may have been expected by the groups involved. In a critical introduction to the law and organizing model, Professor Scott Cummings and Ingrid Eagly describe the ways in which new community-based approaches to progressive lawyering privilege grassroots activism over legal reform efforts and the facilitation of community mobilization over conventional lawyering. n181 After carefully unpacking the ways in which community lawyers embrace [*977] law and organizing, Professor Cummings and Eagly rightfully warn against "exaggerating the ineffectiveness of traditional legal interventions" and "closing off potential avenues for redress."

n182 Significantly, the strategies embraced by new public interest lawyers have not been shown to produce effective change in communities, and certainly there has been no assurance that these strategies fare comparatively better than legal reform. Moreover, what are meant to be progressive projects of community action and community economic development frequently can have a hidden effect of excluding worse-off groups, such as migrant workers, because of the geographical scope and zoning restrictions of the project. n183 In the same way that the labor and corporate social responsibility movements have failed because of their embrace of a legal framework, the community economic development movement - so diverse in its ideological appeal yet so prominent since the early 1990s as a major approach to poverty relief - may bring about its own destruction by fracture and diffusion. n184

In all of these cases, it is the act of engagement, not law, that holds the risks of cooptation and the politics of compromise. It is not the particularities of lawyers as a professional group that create dependency. Rather, it is the dynamics between skilled, networked, and resourced components and those who need them that may submerge goals and create reliance. It is not the particularities of the structural limitations of the judiciary that threaten to limit the progressive vision of social movements. Rather, it is the essential difficulties of implementing theory into practice. Life is simply messier than abstract ideals. Cooptation analysis exposes the broad, general risk of assuming ownership over a rhetorical and conceptual framework of a movement for change. Subsequently, when, in practice, other factions in the political debate embrace the language and frame their projects in similar terms, groups experience a sense of loss of control or possession of "their" vision. In sum, in the contemporary context, in the absence of a more programmatic and concrete vision of what alternative models of social reform activism need to achieve, the conclusions and rhetoric of the contemporary critical legal consciousness are appropriated by advocates representing a wide range of political commitments. Understood [*978] from this perspective, cooptation is not the result of the turn to a particular reform strategy. Rather, cooptation occurs when imagined ideals are left unchecked and seemingly progressive rhetoric is reproduced by a conservative agenda. Dominant interpretations such as privatization and market competitiveness come out ahead, whereas other values, such as group empowerment and redistributive justice, receive only symbolic recognition, and in turn serve to facilitate and stabilize the process. n185

T: Its

Interpretation – Its means possession

Encarta, 9 (Encarta World English Dictionary,
<http://encarta.msn.com/encnet/features/dictionary/DictionaryResults.aspx?refid=1861622735>)

its [its]

adjective Definition: indicating possession: used to indicate that something belongs or relates to something

- The park changed its policy.

And, Government surveillance involves direct government action

Richards 8 Neil M. Richards, Professor of Law, Washington University in St. Louis.
December, 2008 Texas Law Review 87 Tex. L. Rev. 387 Article: Intellectual Privacy
lexis

What, then, should the solution to this problem be? The theory of intellectual privacy I have articulated here suggests that the interest in confidential communications also needs to be considered, and that this interest is a First Amendment one. Government surveillance - even the mere possibility of interested watching by the state - chills and warps the exercise of this interest. This effect was understood by the drafters of the Fourth Amendment, who grasped the relationship between preventing government searches of papers and protecting religious and political dissent. n271 Because government surveillance involves direct state action, it is also a rare case where constitutional doctrine could do useful work on its own. Because we are some distance removed from the freedom of thought, the confidentiality of communications need not be protected absolutely, particularly given the legitimate government interest in the prevention of international terrorism. But by the same token, this interest is not always sufficient to override the First Amendment interests in intellectual privacy. Constitutional doctrine - either First Amendment law or Fourth Amendment law taking expressive interests into account - could therefore mandate warrants for all surveillance of intellectual activity. This standard should at least be the level of the current Fourth Amendment warrant requirement, and could possibly be higher, given the particular expressive interests that could elevate scrutiny of intellectual activity beyond a search for contraband or other kinds of incriminating evidence.

Violation – their advocacy does not curtail any direct state action, and if it does, it's extra topical because it solves through curtailing an entire society's view of women.

Reasons to prefer –

Prefer our definition which reasonably defines limit for the plan – and it still allows many good affs.

Allowing their aff means any fictional story that has something to do with a group watching some other group would be topical.

Their claiming that the story is symbolic of the USFG destroys limits.

There could be millions of affs on different novels that neg could never prepare for.

Reasonable limits make debate worthwhile by promoting in depth preparation and education on the resolution

Vote neg for good discussion and education in debate

*** (Don't read) Study shows depth is more beneficial to students than breadth

Mark S. **Schwartz**, 10-10-2008, "Depth Versus Breadth: How Content Coverage in High School Science Courses Relates to Later Success in College Science Coursework" No Publication, https://www.cfa.harvard.edu/smg/ficss/research/articles/SE_Depth_versus.pdf

CONCLUSION The baseline model reveals a direct and compelling outcome: teaching for depth is associated with improvements in later performance. Of course, there is much to consider in evaluating the implications of such an analysis. There are a number of questions about this simple conclusion that naturally emerge. For example, how much depth works best? What is the optimal manner to operationalize the impact of depth-based learning? Do specific contexts (such as type of student, teacher, or school) moderate the impact of depth? The answers to these questions certainly suggest that a more nuanced view should be sought. Nonetheless, this analysis appears to indicate that a robust positive association exists between high school science teaching that provides depth in at least one topic and better performances in introductory postsecondary science courses. Our results also clearly suggest that breadth-based learning, as commonly applied in high school classrooms, does not appear to offer students any advantage when they enroll in introductory college science courses, although it may contribute to higher scores on standardized tests. However, the intuitive appeal of broadly surveying a discipline in an introductory high school course cannot be overlooked. There might be benefits to such a pedagogy that become apparent when using measures that we did not explore. The results regarding breadth were less compelling because in only one of the three disciplines were the results significant in our full model. On the other hand, we observed no positive effects at all. As it stands, our findings at least suggest that aiming for breadth in content coverage should be avoided, as we found no evidence to support such an approach.

*****K: Queer Pessimism**

The 1AC attempts to define women as having vaginas – this reinscribes gender binaries and static notions of sexuality, and ignores those who have unique reproductive organs but who don't identify as women.

Seawell 14

(Sophia Seawell, Blue Stockings Magazine, "Not Buying Into It: On Language, Capitalism and Menstruation," http://bluestockingsmag.com/2014/02/05/edit___title-menstruation/, 2/5/2014)

On July 27, 2011, I added a new post on my feminist coming-of-age blog (now inactive) This Girl on Girls, titled 'Why is Menstruation Taboo?' In it, I discussed the sexist stigmas attached to menstruation, including but not limited to the prescribed silence and shame around the process. It was certainly a well-intentioned piece, and I still believe that society (or more specifically, sexism) uses menstruation as a marker of the dirtiness or impurity of the female body and female sexuality. But what I can now recognize that I didn't at the time is the way in which **discourses about menstruation, whether they are medical or academic or everyday and whether they are sexist or feminist, are prone to falling into a ciscentric trap of framing menstruation as inherently a 'female' experience.** In my post, I wrote **things like "menstruation is completely normal and natural," and that when a woman menstruates, "her body is doing exactly what it's supposed to be doing. We should all embrace that."** I can see what I was trying to do: destigmatize menstruation and work towards accepting and potentially celebrating it. I think this is a worthwhile project but that it needs to be executed with care and intentionality and not, for starters, by emphasizing the heightened stigma in "other cultures," as I did at the time. **Talking about menstruation as if it is something only women-identified people experience erases the experience of people who may not identify as women but still have uteri, as well as of those who do identify as women but do not have uteri, like trans women. And are they not women? There are also cisgender women who, often for health-related reasons, do not menstruate. Are they not women? While on a conscious level most of us who talk about women and menstruation are not intentionally trying to exclude the experiences of trans, genderqueer or gender non-conforming people, our language can and does have that effect. This kind of essentializing language reflects our binarist conceptualization of gender, sex and the body as neatly corresponding to either male or female—that, I would argue, is the larger problem. In summary: not all women menstruate, and not all people who menstruate are women.** Another layer I'd like to add to my initial discussion of menstruation is how it relates to industry and the environment. The tropes used to convince people who menstruate to buy a particular product often involve presenting menstruation as a problem to be fixed or avoided, and this product is often a bleached tampon that puts users at risk for Toxic Shock Syndrome. It's not healthy and it's not environmentally friendly—a person who menstruates and uses tampons/pads will produce 62,415 pounds of garbage over their lifetime—but hey, you should buy it! As the video above mentions, there are other options: there are menstrual cups like the Keeper, made from latex, and the Divacup, made from silicone. Because they are non-absorbent, they don't harbor bacteria like tampons, and there's also no risk of TSS. For people who menstruate who don't want to or can't use internal products, GladRags are the reusable counterpart to more commercially available pads. Of course it's crucial to recognize that these choices still involve purchasing a product and that, though they save money and waste in the long run, these particular products are more expensive than the non-reusable options on the market. The arguments I've put forth, particularly in relation to cissexist language, are also applicable to other 'women's issues' such as reproductive justice. **And while many argue that changing the language would muddle the message, I'm not interested in a political movement that privileges progress for cisgender women at the expense of trans women or other gender-oppressed people. The project of resistance to sexism necessarily entails resistance to cissexism, and to pretend otherwise means getting nowhere, fast.**

Violence against queerness results in the annihilation of identity—this is a form of soul murder
Yep, Lovaas, and Elia 03 Professors, San Francisco University (Gust, Karen, and John, Journal of Homosexual Studies, Vol. 45, No. 2/3/4, pp. 18.)

These are the internal injuries that individuals inflict upon themselves. Very early in life children learn from interpersonal contacts and mediated messages that deviations from the heteronormative standard, such as homosexuality, are anxiety-ridden, guilt-producing, fear-inducing, shame-invoking, hate-deserving, psychologically blemishing, and physically threatening. Internalized homophobia, in the form of self-hatred and self-destructive thoughts and behavioral patterns, becomes firmly implanted in the lives and psyches of individuals in heteronormative society. Exemplifying the feelings and experiences of many people who do not fit in the heteronormative mandate, Kevin Jennings (1994) tells us his personal story: I was born in 1963. . . . [I] realized in grade school that I was gay. I felt absolutely alone. I had no one to talk to, didn't know any openly gay people, and saw few representations of gays in the media of the 1970s. I imagined gay people were a tiny, tiny minority, who had been and would always be despised for their "perversion." Not once in high school did I ever learn a single thing about homosexuality or gay people. I couldn't imagine a happy life as a gay man. So I withdrew from my peers and used alcohol and drugs to try to dull the pain of my isolation. Eventually, at age seventeen I tried to kill myself, like one out of every three gay teens. I saw nothing in my past, my present, or (it seemed) my future suggesting that things would ever get any better. (pp. 13-14) Heteronormativity is so powerful that its regulation and enforcement are carried out by the individuals themselves through socially endorsed and culturally accepted forms of soul murder. Soul murder is a term that I borrow from the child abuse and neglect literature to highlight the torment of heteronormativity (Yep, 2002). Shengold (1999) defines soul murder as the "apparently willful abuse and neglect of children by adults that are of sufficient intensity and frequency to be traumatic . . . [so that] the children's subsequent emotional development has been profoundly and predominantly negatively affected" (p. 1). Further explaining this concept, Shengold (1989) writes, "soul murder is neither a diagnosis nor a condition. It is a dramatic term for circumstances that eventuate in crime—the deliberate attempt to eradicate or compromise the separate identity of another person" (p. 2, my emphasis). Isn't the incessant policing and enforcement, either deliberately or unconsciously, by self and others, of the heteronormative mandate a widespread form of soul murder?

The alternative is to engage in queering language—queer slangs offer an opportunity to resist systems of power while still engaging within a safe space

Tzini 14 (Tzini, Anna [Anna Tzini, also known as Anna T. studied Photography, Video and New Technologies in Athens and obtained her MA in Queer Studies in Arts & culture from Birmingham City University in 2010. PhD in practice. Her work mainly deals with the relation between private / public, identities and the ways the interactions between time and space form them.]. 12/2014 "The Opacity of Queer Languages," E-flux Journal #60, accessed: 7/15/2015. <http://www.e-flux.com/journal/the-opacity-of-queer-language-2/>)/ALepow

These communication codes allowed for an easier exchange of information that to some extent shielded group members from potential aggressors: at the same time, these languages did not render group members completely invisible. It is exactly this position between visibility and invisibility—which can perhaps be described as opaqueness—that interests me in relation to the particular political stance of passivity. David Van Leer, an American scholar who researched queer cultures in the US from the 1920s to the 2000s, says that "often minorities speak most volubly between the lines, ironically reshaping dialogues the oppressor thinks he controls or even finding new topics and modes of speaking to which the oppressor himself lacks access."⁵ Language—being regulated by the state, taught in educational institutions, and used to discipline, inform, educate, or structurally violate, among other uses—is frequently subverted by minorities in an attempt to bypass authority. In this case in particular the "new topics" and "modes" Van Leer refers to are

perhaps illegal pleasures, embodied performances, irony, and disguised (or not-so-well-disguised) social critique. While trying to stay safe and communicate, individual subjects start forming a community based on a common culture. In her essay “Qwir-English Code-Mixing in Germany: Constructing a Rainbow of Identities,” Heidi Minning argues that “the resulting sociopsychological function is one of constructing group membership and a sense of the self as a participant in larger gay and lesbian local and transnational cultures.”⁶ **Lexicon** These slangs with vocabularies ranging from six hundred words (as is the case of Polari) to more than six thousand documented words (as in Kaliarda) and different lifespans (four hundred years and counting in the case of Lubunca, or thirty years in the case of IsiNgqumo), constitute mini-universes where their users freely circulate and through which they are able to connect. They do not only include terms to describe the particular practices/interests of the groups which might be dangerous to publicly describe in a noncoded way. They also include words or phrases to describe everyday household objects, professions, toponyms, and activities. They are patchworks of several other languages, including etymologically untraceable neologisms.⁷ For instance, Polari consists of English, Italian, Yiddish, and Mediterranean Lingua Franca (a composite itself),⁸ while Kaliarda is made up of Greek, English, Italian, French, Turkish, and Romani.⁹ Bajubá or Pajubá seems to have its roots in Africa and is based on several Bantu and Yoruba African languages outfitted with Portuguese syntax.¹⁰ SwardSpeak is a mixture of Tagalog, English, Spanish, and Japanese.¹¹ Lubunca consists of Turkish, Romani, French, Greek, English, Armenian, Arabic, Italian, Bulgarian, Kurmanji, Russian, and Spanish.¹² The multicultural linguistic loans seem to indicate a certain degree of mobility on the part of the speakers, who seem to have come in contact with foreigners beyond their immediate border neighbors, perhaps through working the seas, or through unsuccessful attempts to find better employment options abroad, but also due to dealing with sailors and seamen as sex-workers themselves. And as Paul Baker says, we shouldn’t throw out the possibility of the use of foreign languages as a way of coming across as more sophisticated and well-traveled.¹³ Much like the several spatiotemporal paradoxes that surround the closet, the languages that could be its product seem to predate it in certain cases. Furthermore, who speaks or spoke these languages long before the emergence of any contemporary understanding of homosexuality, the homosexual, and notions such as trans* or queer becomes an even more sensitive topic in light of queer modes of communication. **Social Queetique** As I can only fully access Kaliarda and to a certain extent Polari, one of the things I have noticed is their lack of political correctness (or any sense of self-censorship for that matter), and the pejorative terms used for both those who are socially looked down on by society (including the speakers themselves) and their oppressors alike.¹⁴ This seems to indicate a certain adoption of the mores of the general population in addition to their own, no matter how contradictory the two may be.¹⁵ For instance, the words for an effeminate homosexual or the receptive partner in penetrative sex are always pejorative, and the same cannot be said of the terms for the insertive partner. The word “Kaliarda” (καλιαρντά) itself has only negative meanings: “mean, ugly, weird,” with the verb “kaliardevó” (καλιαρντεύω) meaning to speak ill of someone.¹⁶ In addition, there are pejorative terms for other groups that seem to already be looked down on by Greek society, and for whom there already exist several offensive terms, like for the out-of-towners, the obese, the old, and the non-able-bodied. At the same time, there are

plenty of derogatory terms for legal, religious, and political authorities. This points to the counter-cultural elements of the subculture that to some extent could be the result of the constant friction with said authorities. It seems that at least by allowing for a mocking of those seen as oppressors, or by placing themselves somewhere other than the lowest position in the social hierarchy, queers can afford a moment of pleasure that derives from their deviance itself and their organizing around it. So beyond the importance of a safer space, and the practicalities of communication between precariously living subjects, another element of these languages is the proximity they produce between the speakers, and most importantly the moments of humor and joy they allow for.

For instance, small moments of pleasure among fellow deviant subjects seem to be the case with much of Kaliarda and the way it is used, which sadly remains untranslatable. I can only guess that this might well be the case for some of the other languages as well. As Elizabeth Freeman suggests, we might be able to glimpse in our archives

“historically specific forms of pleasure” that have not been institutionalized, and a deeper look at queer language can definitely provide a confirmation of that.¹⁷ Sara Ahmed states: To be happily queer might mean being happy to be the cause of unhappiness (at least in the sense that one agrees to be the cause of unhappiness, even if one is not made happy by causing unhappiness), as well as to be happy with where we get to if we go beyond the straight lines of happiness scripts.¹⁸

Kaliarda also manages to make a somewhat humorous social critique with terms like “the Vatican” (Βατικανό) to mean a gay men’s brothel; a word referring to London that translates as “faggville”/“sisterville” (αδερφοχώρι); “Moutsemeni” (Μουτσεμένη), a word referring to the Virgin Mary as having been naively tricked; and “smartasses’ gangbang” (φαεινοπαρούζα), referring to a political party; and the Acropolis being referred to as “tourist trap” (τουριστόφακα).¹⁹ Such social critique is not unique to queer slangs though; it is a phenomenon common among subcultural

languages, as the same is true for hobo slang, spiv cant, magkika and so on. Paul Baker writes that in “anti-languages’ the social values of words and phrases tend to be more emphasized than in mainstream languages,” a phenomenon termed “sociolinguistic coding orientation,”²⁰ while Nicholas Kontovas points out that the slang of marginal groups

betrays an alternative sociolinguistic market, in which the value of markers from the majority market is neither intrinsically positive nor negative, but reassessed based on an alternative habitus which is particular to the field in which that group interacts.²¹ Both Baker and Kontovas point to the specificities of the social universes these languages produce, which much like the words themselves are borrowed, reappropriated, and creatively adjusted to reflect the ever-changing needs and positions of the speakers.

The overlapping of marginalized groups that operate with those slangs offers an interesting insight into their intersectionality. Circus performers, sailors, prostitutes, and criminals, for instance, also used Polari. Polari also incorporates elements of Thieves’ Cant from the seventeenth century and Hackney rhyming slang.²² Similarly, Kaliarda—used primarily by (trans*) sex workers and “effeminate homosexuals,” according to researcher Elias Petropoulos—is also spoken by actors. It has borrowed and loaned lemmata from magkika and rebetika, two different slang varieties used by other Greek subcultures.²³ Pajubá, apart from

being used by the LGBTQ and queer community, is used by *Candomblé* practitioners.²⁴ Although all of the above categories are in one way or another marginal, perhaps illegal, with intense minoritarian traits, and although socialization between them could explain this transcultural permeation of terms, it definitely evokes the issue of intersectionality within single subjects as the reason that terms traveled so widely within large communities of “deviants” and “outcasts.” Opacity—Some

Passivity Subjects do not become invisible when talking in these languages; they can actually attract more interest from the public. But at the same time, the content of their discussion remains somewhat sealed and opaque. It is through this practice, which is not vocal (although it is verbal) and which does not actively disrupt the status quo (and yet builds an alternative social space), that passivity is generated as a political action. I am referring to passivity not as a synonym for inactivity, but rather as a variety of tactics that manage to subvert norms in ways that are not initially intended. While such cultural productions (language, music, dance, performativities, etc.) are not created with the intent to take over or substitute normative or mainstream culture, as other “active” modes of questioning would, they are forms of resistance. They refuse to be assimilated and “normalized,” choosing instead to produce an alternative that provides a safer space of expression and which—by the way—also has the potential to mock and subvert the norm. As

Jonathan D. Katz says in reference to John Cage’s silences: “Closeted people seek to ape dominant discursive forms, to participate as seamlessly as possible in hegemonic constructions. They do not, in my experience, draw attention to themselves.”²⁵ Thus, finding opaque ways of resisting seems to be a somewhat efficient option. The mannerisms and vocabulary of these slangs are flexible and made to be customizable so they can better serve the speaker. Creation and use of queer slangs is not a forceful destabilization of the status quo and the official/mainstream languages, but at the same time, using them is a refusal of complete silence. Silence here refers both to not speaking and to not speaking audibly against the regime. Queer slangs remain in a rather liminal space between inactivity and straightforward revolutionary action. It is a form of creative resistance, a way of producing a parallel social space of expression whose existence might in some ways indirectly affect the mainstream as well, without that being the primary concern or objective behind them. These languages, when used in the vicinity of outsiders, are indeed audible but not transparent; they remain opaque, allowing the nonspeakers to identify the speakers as belonging to a certain group, but not being able to pinpoint what group that is. This creates a rift in the homogenous social fabric. Katz addresses a similar paradox when he speaks of the irony in the work

of John Cage, a composer who made the loudness of silence his hallmark: Irony’s distinction between what is said and what is

meant opened up a space of otherness that was not understood as specifically oppositional. As a “readerly” relation, irony is recognized, not written, understood not declared. And irony would prove to be a means through which resistance could figure in a culture of coercion.²⁷ Cage used silence as a means to not be silent/silenced, and in a very similar manner queer subjects opt out of mainstream modes of communication and produce a separate sonic space with with a specific membership. While art is made in order to be public and communicated (at least in most cases)—and Cage’s art was very much so—these languages are supposed to be communicated within certain limits, those of the social space they help to produce. I think the way they operate in producing rifts in wider society is by the casual, perhaps accidental moments they engender. They don’t need to be translated, and one does not need to be fully aware of the speakers’ subjectivities, but the sheer fact that certain nonconforming individuals are speaking an unfamiliar dialect might be all it takes to create the impression that there is a very much present, active, and creative community producing its own subculture, and that might already be enough. These queer languages do not produce new, politically informed revolutionary terminology. But they are very much present, occupying a terrain between explicit action-oriented politics and compliance. They operate under cover of opacity and empower the marginalized, giving them space for existence, expression, and safety. Queer languages are anti-authoritative and as such, according to Katz says, “they reveal the power of the individual to construct meaning unauthorized by dominant culture—and all the while, under its very nose.”²⁸ It’s not by accident that during the Greek military dictatorship of the late 1960s and early ‘70s, popular satirical theater used Kaliaarda as a way to avoid censorship. For “precarious” words, they substituted Kaliaarda words, introducing these words to a general audience and letting this audience figure them out for themselves. In the UK a few years earlier, between 1965 and 1968, a BBC radio show that aired on Sunday afternoons and addressed the “entire family” featured two out-of-work camp actors who used Polari at a time when homosexuality was still illegal in the UK. Kaliaarda is nontransparent not only because of its neologisms and semantically altered Greek words, but also because it is spoken very fast. The words acquire meaning and specificity thanks to the contextualization offered by performative gestures and body language. Kaliaarda is seen as the quintessence of camp performance, which itself is often referred to as a method of resistance that, according to David Halperin, resists the power of the system from within.²⁹ As Nicholas De Villiers writes: In an insistence of “Camp” as a *queer* strategy of political resistance Moe Meyer clarifies his use of the term in the following way: “What ‘queer’ signals is an ontological challenge that displaces bourgeois notions of the Self as unique, abiding, and continuous while substituting instead a concept of the Self as performative, improvisational, discontinuous and processually constituted by repetitive and stylized acts.”³⁰ I think queer languages could be one of the answers to De Villiers’s questions in the preface of his book: “What if we were to look at speech as nonrevelatory, outside the parameters of confession and truth, the humanist desire for reflection, and the ideal of transparency? What if we were to attend to its opacity? What would such an opacity look or sound like, and what would be its function?”³¹

K: Baudrillard

The visibility of the affirmative recreates virulence through the hyper-signification of the 1ac. The medium has become the message. The 1ac's politics of transparency internalizes control through the panopticon, where individuals become transparent to themselves. Reality only exists through hyper-expression and over-representation; the modern "subject" no longer exists, rather an empty screen projecting a fake sociality.

Baudrillard 02 — A dead French dude "The violence of the image", <http://www.egs.edu/faculty/jean-baudrillard/articles/the-violence-of-the-image/>

This is the typical **violence of information**, of media, of images, of the spectacular. **Connected to a total visibility**, a total **elimination of secrecy**. Be it of a psychological or mental, or of a neurological, biological or genetic order - soon we shall discover the gene of revolt, the center of violence in the brain, perhaps even the gene of resistance against genetic manipulation - biological brainwashing, brainstorming, brainlifting, with nothing left but recycled, whitewashed lobotomized people as in Clockwork Orange. At this point we should not speak of violence anymore, but rather of virulence. Inasmuch that it does not work frontally, mechanically, but by contiguity, by contamination, along chain reactions, breaking our secret immunities. And operating not just by a negative effect like the classical violence, but on the contrary by an excess of the positive, just as a cancerous cell proliferates by metastasis, by restless reproduction and an excess of vitality.

That is the point in the controversy about the **violence on the screens** and the **impact of images on people's mind**. The fact is that **the medium itself has a neutralizing power**, counterbalancing the direct effect of the **violence on the imagination**. I would say : the violence of the third type annihilates the violence of the first and second type - but at the price of a more virulent intrusion in the deep cells of our mental world. The same as for anti-biotics : they eradicate the agents of disease by reducing the general level of vitality.

When the medium becomes the message (MACLUHAN), then **violence as a medium becomes its own message**, a messenger of itself. So the violence of the message cannot be compared with the violence of the medium as such, with the **violence emanating from the confusion between medium and message**. It is the same with viruses the virus also is information, but of a very special kind - it is medium, and message, agent and action at the same time. That the very origine of its "virulence", of its uncontrollable proliferation. In fact, in all actual biological, social or mental processes, **virulence has substituted violence**. **The traditional violence of alienation, power and oppression has been superated by** something more violent than violence itself : **the virality**, the virulence. And while it was an historical or individual subject of violence, **there is no subject**, no personal agent of virulence (of contamination, of chain reaction), and then no possibility to confront it efficiently. The classical violence was still haunted by the specter of the Evil, it was still visible. **Virulence only transappears**, it is **of the order of transparency** and its logic is that of the transparency of the Evil.

The image (and more generally the sphere of information) **is violent** because what happens there is the murder of the Real, the vanishing point of Reality. **Everything must be seen, must be visible**, and the **image is the site par excellence of this visibility**. But at the same time it is the site of its disappearance. And that something in it has disappeared, has returned to nowhere, makes the very fascination of the image.

Particularly in the case of all professional of **press-images which testify of the real events**. **In making reality**, even the most violent, **emerge to the visible, it makes the real substance disappear**. It is like the Myth of Eurydice : when Orpheus turns around to look at her, she vanishes and returns to hell. That is why, **the more exponential the marketing of images is growing the more fantastically grows the indifference towards the real world**. Finally, **the real world becomes a useless function, a collection of phantom shapes and ghost events**. We are not far from the silhouettes on the walls of the cave of Plato.

A wonderful model of this **forced visibility** is Big Brother and all similar programs, reality shows, docusoaps etc. **Just there; where everything is given to be seen there is nothing left to be seen**. It is **the mirror of platitude**, of banality, of the zero degree of everyday life. There is the place of **a fake sociality**, a virtual sociality where the Other is desperately out of reach - this very fact illuminating perhaps the fundamental truth that **the human being is not a social being**. Move over in all these scenarii the televisual public is mobilized as spectator and judged as become itself Big Brother. **The power of control and transvisuality has shifted to the silent majorities themselves**.

We are far beyond the panoptikon, where **there was still a source of power and visibility** it was so to say a panoptikon - **things were made visible to an external eye**, whereas **here they are made transparent to themselves - a panendoptikon** - thus erasing the **traces of control and making the operator himself transparent**. **The power of control is internalized**, and **people** are no more Lt victims of the image : **they transform themselves into images - they only exist as screens**, ;or in a superficial dimension.

All that is **visualized there**, in the operation Big Brother, is **pure virtual reality**, a synthetic image of the banality, produced : as in a computer. **The equivalent of a ready-made - a given transcripion of everyday life - which is itself already recycled by all current patterns**.

Is there any sexual voyeurism ? Not at all. Almost no sexual scenery. But **people dont want that**, what they secretly want to see is the **spectacle of the banality**, which is from now our real pornography, own true obscenity - **that of the nullity, of insignificance and platitude** (i.e. the extreme reverse of the "There of the Cruelty"). But maybe in that scene lies a certain form of cruelty, at least of a virtual one. At the time when media and television are more and more unable to give an image of the events of the world, then they discover the everyday life, the existential banality as the most criminal event, as the most violent (in)actua-lity, as the very place of the Perfect Crime. And that it is, really. And **people are fascinated, terrified and fascinated by this indifference of the Nothing-to-see, of the Nothing-to-say, by the indifference of their own life, as of the zero degree of living**. The banality and the consumption of banality have now become an olympic discipline of our time - the last form of the experiences of the limits.

In fact, this deals with the naive impulsion to be nothing, and to comfort oneself in this nothingness - sanctioned by the right to be nothing and to be considered and respected as such. Something like a struggle for Nothing and for Virtual death - the perfect opposite to the basic anthropological postulat of the struggle for life. At least it seems that we are all about to change our basic humanistic goals.

There are two ways of disappearing, of being nothing, (in the Integral Reality, everything must logically want to disappear - automatic abreaction to the overdose of reality). **Either to be hidden**, and to insist on the right not-to-be-seen (the actual defense of private life). Or one shifts to a delirious exhibitionism of his own platitude and insignificance - ultimate protection against the

servitude of being, and of being himself. Hence the **absolute obligation to be seen**, to make oneself visible at any price. Everyone deals on both levels at the same time. Then **we are in the double bind - not to be seen, and to be continuously visible**. No ethics, no legislation can solve this dilemma, and the whole current polemic about the right to information, all this polemic is useless. **Maximal information, maximal visibility** are now part of the human rights (and of human duties all the same) and **the destiny of the image is trapped between the unconditional right to see and that, unconditional as well, not to be seen**.

This means that **people are decipherable at every moment**. **Overexposed to the light of information**, and addicted to their own image. Driven to express themselves at any time - self-expression as the ultimate form of confession, as Faucauld said. To become an image, one has to give a visual object of his whole everyday life, of his possibilities, of his feelings and desires. He has to keep no secrets and to interact permanently. Just here is the deepest violence, a violence done to the deepest core, to the hard core of the individual. And at the same-time to the language, because it also loses its symbolic originality - being nothing more than the operator of visibility. It loses its ironic dimension, its conceptual distance, its autonomous dimension - where language is more important than what it signifies. **The image too is more important than what it sneaks of**. That we forget usually, again and again and that is a source of the violence done to the image.

Today everything takes the look of the image - then all pretend that the real has disappeared under the pressure and the profusion of images.. What is totally neglected is that **the image also disappears under the blow and the impact of reality**. The image is usually spoiled of its own existence as image, devoted to a shameful complicity with the real. The violence exercised by the image is largely balanced by the violence done to the image - its exploitation as a pure vector of documentation, of testimony, of message (including the message of misery and violence), its allegiance to morale, **to pedagogy, to politics, to publicity**. Then the magic of the image, both as fatal and as vital illusion, is fading away. The Byzantine Iconoclasts wanted to destroy images in order to abolish meaning and the representation of God. Today we are still iconoclasts, but in an opposite way : **we kill the images by an overdose of meaning**.

Borgès' fable on " The People of the Mirror " : he gives the hypothesis that **behind each figure of resemblance and representation there is a vanquished enemy**, a defeated singularity, a dead object. And the Iconoclasts clearly understood how icons were the best way of letting God disappear. (but perhaps God himself had chosen to disappear behind the images ? Nobody knows). Anyway, today is no more the matter of God : **We disappear behind our images**. No chance anymore that our images are stolen from us, that we must give up our secrets - because we no longer have any. That is at the same time the sign of our ultimate morality and of our total obscenity.

There is a deep misunderstanding of the process of meaning. Most **images** and photographs today **reflect the misery and the violence of human condition**. But all **this affects us less and less, just because it is over signified**. In order for the meaning, for the message to affect us, the image has to exist on its own, to impose its original language. In order for the real to be transferred to our imagination, or our imagination transferred to the real, it must be a counter-transference upon the image, and this countertransference has to be resolved, worked through (in terms of psychoanalysis). Today we see misery and violence becoming a leitmotiv of publicity just by the way of images. Toscani for example is reintegrating sex and Aids, war and death into fashion. And why not ? Jubilating ad-images are no less obscene than the pessimistic ones) But at one

condition to show the violence of publicity itself, the violence of fashion, the violence of the medium. What actually publishers are not able even to try to do. However, fashion and high society are themselves a kind of spectacle of death. The world's misery is quite so visible, quite so transparent in the line and the face of any top-model as on the skeletal body of an african boy. The same cruelty is to be perceived everywhere, if one only knows how to look at it.

The 1AC is nothing more than the production and assimilation of otherness. This creates a violent form of identification whereby the other becomes an object of manipulation, another commodity in the economy of symbolic exchange.

Baudrillard 02 – Still French, and still very dead /Jean, Screened Out, 51 – 56/

With modernity, we enter the age of the production of the Other. The aim is no longer to kill the Other, devour it, seduce it, vie with it, love it or hate it, but, in the first instance, to produce it. The Other is no longer an object of passion, but an object of production. Perhaps, in its radical otherness or its irreducible singularity, the Other has become dangerous or unbearable, and its seductive power has to be exorcized? Or perhaps, quite simply, otherness and the dual relation progressively disappear with the rise of individual values and the destruction of symbolic ones?

The fact remains that otherness does come to be in short supply and, if we are not to live otherness as destiny, the other has to be produced imperatively as difference. This goes for the world as much as for the body, sex and social relations. It is to escape the world as destiny, the body as destiny, sex (and the opposite sex) as destiny, that the production of the other as difference will be invented. For example, sexual difference: each sex with its anatomical and psychological characteristics, with its own desire and all the irresolvable consequences that ensue, including the ideology of sex and the Utopia of a difference based both in right and in nature. None of this has any meaning in seduction, where it is a question not of desire but of a game with desire, and where it is a question not of the equality of the sexes or the alienation of the one by the other, since game-playing involves a perfect reciprocity of partners (not difference and alienation, but otherness and complicity). Seduction is as far from hysteria as can be. Neither of the sexes projects its sexuality on to the other; the distances are given; otherness is intact - it is the very condition of that higher illusion that is play with desire.

However, with the coming of the nineteenth century and Romanticism, a masculine hysteria comes into play and with it a change in the sexual paradigm, which we must once again situate within the more general, universal framework of the change in the paradigm of otherness.

In this hysterical phase, it was, so to speak, the femininity of man which projected itself on to woman and shaped her as an ideal figure in his image. In Romantic love, the aim was not now to conquer the woman, to seduce her, but to create her from the inside, to invent her, in some cases as achieved Utopian vision, as idealized woman, in others as *jemme fatale*, as star - another hysterical, supernatural metaphor. The Romantic Eros can be credited with having invented this ideal of harmony, of loving fusion, this ideal of an almost incestuous form of twin beings — the woman as projective resurrection of the same, who assumes her supernatural form only as ideal of the same, an artefact doomed henceforth to *Vamour ox*, in other words, to a pathos of the ideal resemblance of beings and sexes - a pathetic confusion which substitutes for the dual otherness of seduction. The whole mechanics of the erotic changes meaning, for the erotic attraction which previously arose out of otherness, out of the strangeness of the Other, now finds its stimulus in sameness - in similarity and resemblance. Auto-eroticism, incest? No. Rather a hypostasis of the

Same. Of the same eyeing up the other, investing itself in the other, alienating itself in the other - but the other is only ever the ephemeral form of a difference which brings me closer to me. This indeed is why, with Romantic love and all its current spin-offs, sexuality becomes connected with death: it is because it becomes connected with incest and its destiny - even in banalized form (for we are no longer speaking of mythic, tragic incest here; with modern eroticism we are dealing with a secondary incestuous form - of the protection of the same in the image of the other - which amounts to a confusion and corruption of all images).

We have here then, in the end, the invention of a femininity which renders woman superfluous. The invention of a difference which is merely a roundabout copulation with its double. And which, at bottom, renders any encounter with otherness impossible (it would be interesting to know whether there was not any hysterical quid pro quo from the feminine in the construction of a virile, phallic mythology; feminism being one such example of the hystericization of the masculine in woman, of the hysterical projection of her masculinity in the exact image of the hysterical projection by man of his femininity into a mythical image of woman).

However, there still remains a dissymmetry in this enforced assignment to difference.

This is why I have contended, paradoxically, that man is more different from woman than woman is from man. I mean that, within the framework of sexual difference, man is merely different, whereas in woman there remains something of the radical otherness which precedes the debased status of difference.

In short, in this process of extrapolation of the Same into the production of the Other, of hysterical invention of the sexual other as twin sister or brother (if the twin theme is so prominent today, that is because it reflects this mode of libidinal cloning), the sexes become progressively assimilated to each other. This develops from difference to lesser difference through to the point of role-reversal and the virtual non-differentiation of the sexes. And it ends up making sexuality a useless function. In cloning, for example, pointlessly sexed beings are going to be reproduced, since sexuality is no longer needed for their reproduction.

If the real woman seems to disappear in this hysterical invention of the feminine (though she has other means of resisting this), in this invention of sexual difference, in which the masculine occupies the privileged pole from the outset, and in which all the feminist struggles will merely reassert that insoluble privilege or difference, we must recognize too that masculine desire also becomes entirely problematical since it is able only to project itself into another in its image and, in this way, render itself purely speculative. So all the nonsense about the phallus and male sexual privilege, etc. needs revising. There is a kind of transcendent justice which means that, in this process of sexual differentiation which culminates inexorably in non-differentiation, the two sexes each lose as much of their singularity and their otherness. This is the era of the Transsexual, in which all the conflicts connected with this sexual difference carry on long after any real sexuality, any real alterity of the sexes, has disappeared.

Each individual repeats on his or her own body this (successful?) takeover of the feminine by masculine projection hysteria. The body is identified and appropriated as a self-projection, and no longer as otherness and destiny. In the facial features, in sex, in sickness and death, identity is constantly being altered. You can do nothing about that. It is destiny. But this is precisely what has to be warded off at all costs in the identification of the body, the individual appropriation of the body, of your desire, your appearance, your image: plastic surgery on all fronts. For if the body is no longer a site of otherness, of a dual relation, if it is a site of identification, then

you have urgently to reconcile yourself with it, to repair it, perfect it, turn it into an ideal object. Everyone treats his/her body as man treats woman in the projective identification we have described: he invests it as a fetish in **a desperate attempt at self-identification. The body becomes an object of autistic worship, of an almost incestuous manipulation.** And it is the body's resemblance to its model which becomes a source of eroticism and unconsummated self-seduction, insofar as it virtually excludes the Other and is the best means of excluding any seduction from elsewhere.

Many other things relate also to this production of the Other - a hysterical, speculative production. Racism is one example, in its development throughout the modern era and its current recrudescence. Logically, it ought to have declined with progress and the spread of Enlightenment. **But the more we learn how unfounded the genetic theory of race is, the more racism intensifies.** This is because we are dealing with an artificial construction of the Other, on the basis of an erosion of the singularity of cultures (of their otherness one to another) and entry into the fetishistic system of difference. So long as there is otherness, alienness and a (possibly violent) dual relation, there is no racism properly so called. That is to say, roughly, up to the eighteenth century, as anthropological accounts attest. **Once this 'natural' relation is lost, we enter upon an exponential relation with an artificial Other. And there is nothing in our culture with which we can stamp out racism, since the entire movement of that culture is towards a fanatical differential construction of the Other,** and a perpetual extrapolation of the Same through the Other. Autistic culture posing as altruism.

We talk of alienation. But **the worst alienation is** not being dispossessed by the other, but being dispossessed of the other: **it is having to produce the other in the absence of the other, and so continually to be thrown back on oneself and one's own image.** If, today, we are condemned to our image (to cultivate our bodies, our 'looks', our identities, our desires), this is not because of alienation, but because of the end of alienation and the virtual disappearance of the other, which is a much worse fate. In fact, the definition of alienation is to take oneself as one's focus, as one's object of care, desire, suffering and communication. **This definitive short-circuiting of the other ushers in the era of transparency. Plastic surgery becomes universal. And the surgery performed on the face and the body is merely the symptom of a more radical surgery: that performed on otherness and destiny.**

What is the solution? There is no solution to this erotic trend within an entire culture; to this fascination, this whirl of denial of otherness, of all that is alien and negative; to this foreclosing of evil and this reconciliation around the Same and its multiple figures: incest, autism, twinship, cloning. **All we can do is remind ourselves that seduction lies in non-reconciliation with the other, in preserving the alien status of the Other. One must not be reconciled with oneself or with one's body. One must not be reconciled with the other, one must not be reconciled with nature, one must not be reconciled with the feminine** (that goes for women)

We present no alternative. The system demands that we maximize production of meaning – in response, we refuse communication, we refuse signification, and we refuse meaning.

Baudrillard 2K ~<http://www.egs.edu/faculty/jean-baudrillard/articles/simulacra-and-simulations-viii-the-implosion-of-meaning-in-the-media/>

What is essential today is to evaluate this double challenge – the challenge of the masses to meaning and their silence (which is not at all a passive resistance) - the challenge to meaning that comes from the media and its fascination. All the marginal, alternative efforts to revive meaning are secondary in relation to that challenge.

Evidently, there is a paradox in this inextricable conjunction of the masses and the media: do the media neutralize meaning and produce unformed [informe] or informed [informée] masses, or is it the masses who victoriously resist the media by directing or absorbing all the messages that the media produce without responding to them? Sometime ago, in "Requiem for the Media," I analyzed and condemned the media as the institution of an irreversible model of communication without a response. But today? This absence of a response can no longer be understood at all as a strategy of power, but as a counterstrategy of the masses themselves when they encounter power. What then? Are the mass media on the side of power in the manipulation of the masses, or are they on the side of the masses in the liquidation of meaning, in the violence perpetrated on meaning, and in fascination? Is it the media that induce fascination in the masses, or is it the masses who direct the media into the spectacle? Mogadishu-Stammheim: the media make themselves into the vehicle of the moral condemnation of terrorism and of the exploitation of fear for political ends, but simultaneously, in the most complete ambiguity, they propagate the brutal charm of the terrorist act, they are themselves terrorists, insofar as they themselves march to the tune of seduction (cf. Umberto Eco on this eternal moral dilemma: how can one not speak of terrorism, how can one find a good use of the media - there is none). The media carry meaning and countermeaning, they manipulate in all directions at once, nothing can control this process, they are the vehicle for the simulation internal to the system and the simulation that destroys the system, according to an absolutely Mobian and circular logic - and it is exactly like this. There is no alternative to this, no logical resolution. Only a logical exacerbation and a catastrophic resolution.

With one caution. We are face to face with this system in a double situation and insoluble double bind - exactly like children faced with the demands of the adult world. Children are simultaneously required to constitute themselves as autonomous subjects, responsible, free and conscious, and to constitute themselves as submissive, inert, obedient, conforming objects. The child resists on all levels, and to a contradictory demand he responds with a double strategy. To the demand of being an object, he opposes all the practices of disobedience, of revolt, of emancipation; in short, a total claim to subjecthood. To the demand of being a subject he opposes, just as obstinately and efficaciously, an object's resistance, that is to say, exactly the opposite: childishness, hyperconformism, total dependence, passivity, idiocy. Neither strategy has more objective value than the other. The subject-resistance is today unilaterally valorized and viewed as positive - just as in the political sphere only the practices of freedom, emancipation, expression, and the constitution of a political subject are seen as valuable and subversive. But this is to ignore the equal, and without a doubt superior, impact of all the object practices, of the renunciation of the subject position and of meaning - precisely the practices of the masses - that we bury under the derisory terms of alienation and passivity. The liberating practices respond to one of the aspects of the system, to the constant ultimatum we are given to constitute ourselves as pure objects, but they do not respond at all to the other demand, that of constituting ourselves as subjects, of liberating ourselves, expressing ourselves at whatever cost, of voting, producing, deciding, speaking, participating, playing the game - a form of blackmail and ultimatum just as serious as the other, even more serious today. To a system whose argument is oppression and repression, the strategic resistance is the liberating claim of subjecthood. But this

strategy is more reflective of the earlier phase of the system, and even if we are still confronted with it, it is no longer the strategic terrain: **the current argument of the system is to maximize speech, the maximum production of meaning.** Thus the strategic resistance is that of the **refusal of meaning** and of the spoken word - or of the hyperconformist simulation of the very mechanisms of the system, which is a form of refusal and of non-reception. It is the strategy of the masses: it is equivalent to **returning to the system its own logic by doubling it,** to **reflecting meaning**, like a mirror, **without absorbing it.** This strategy (if one can still speak of strategy) prevails today, because it was ushered in by that phase of the system which prevails.

To choose the wrong strategy is a serious matter. All the movements that only play on **liberation, emancipation, on the resurrection of a subject** of history, of the group, of the word based on "**consciousness raising,**" indeed a "**raising of the unconscious**" of subjects and of the masses, do not see that **they are going in the direction of the system,** **whose imperative today is precisely the overproduction and regeneration of meaning and of speech.**

Case

First person narratives bad – kills reality of the person itself

Beth Hill, 9-20-2012, "What's Wrong With a First-person Narrator," The Editor's Blog, <http://theeditorsblog.net/2012/09/20/the-curse-of-first-person-narration/>

Did you know that stories with first-person narration face a curse? It's not that every story told in the first person falls under the curse, but a great many manuscripts, especially those of first-time novelists, flirt with it. What kind of curse, you may be asking. Many of the first-person manuscripts I see start off as tales and remain as tales rather than turn into novels. Once upon a time, I was a . . . fill in the blank. I was an explorer setting off to pursue my dream. I was a boy without a dream. I was a man in search of questions. I lived in a small village. A teeming city. At the dawn of a new century. And these kinds of things happened to me . . . I wanted to do great exploits, but my family, my village, my circumstances held me back. My mentor always told me to seek the grail, seek redemption, seek my roots. Someone else told me to find myself. Such stories go on for paragraphs, maybe for pages, maybe for chapters, simply telling us about the lead character's life. We don't see that life unfold in action. We don't hear dialogue voiced—it's always something such as The wise woman warned me again and again not to step outside the village at night and never when the moon was full or My dad told me I'd never make it as history teacher. Our narrator speaks, or rather thinks, but just as a disembodied voice. We often have no idea where he is when he's relating these stories of his past. We have no setting, no sense of time or place. We have no picture of the narrator doing anything that he describes in his tales. Nor do we have a picture of where he is as he tells them. We don't see the wise woman at a specific moment in time. We can't hear her voice, how it crackles or how she mangles her words or how her speech sounds like warm honey. We don't see the dad coming home from his second job—tired and discouraged and out of sorts—explaining why his son's plans won't work. And what of the narrator? Not only does he not tell us where he is as he's spinning his tale, he doesn't tell us what he's doing. What's going on with him as he regales us with his summers at the lake with his psychotic cousins? Is he sitting back in a rocking chair at a grand old age, sipping a glass of tea? A glass of merlot? A bourbon? Is he talking of a past 60 years earlier or one 20 years earlier or one merely 6 months earlier? We don't know because he simply begins to report Once upon a time, I . . . He might not actually say once upon a time. But that is what he means. He's simply updated the traditional wording. When I was a kid . . . My mother always told me . . . We always spent summers at the lake . . . These are the kinds of openings of stories under the curse. Rather than putting characters and readers in an identifiable place and time—a specific setting—the writer introduces readers to the general moments from a character's life. Rather than scene, we get exposition. Exposition is necessary in long fiction, so I'm not telling you to not use it (and I'm not saying you couldn't open an engrossing novel using lines similar to what I've pointed out here). But exposition shouldn't take over the story and it especially shouldn't run on for three or four chapters before the first event or first dialogue shows up. And exposition should not be the primary mode of storytelling in a novel. A comparison? Consider the differences between a movie review and the movie itself. A story that's told via exposition is merely a review. A review is flat words on the page. A movie is event and dialogue and emotion and setting. So exposition sits flat on a page while scenes are event and dialogue and emotion and an active setting. Let's return to our narrator . . .

Telling stories about an individual's suffering obscures their identity and makes it impossible for them to make change

Abbas 2010 [Asma, Professor and Division Head in Social Studies, Political Science, Philosophy at the Liebowitz Center for International Studies at Bard College at Simon's Rock, Liberalism and Human Suffering: Materialist Reflections on Politics, Ethics, and Aesthetics, London: Palgrave Macmillan, pg. Pg. 133- 136]

There is a fundamental reciprocity between how sufferers represent themselves, or are represented, and the way in which their subjectivities and those of the injurers are theorized in various political programs. Together, they determine the form of agency that is granted to the victim within any paradigm. In many theoretical attempts at redeeming victims, the work of the wounded remains attached to an imputed aspiration for agency modeled on the "health" of the agent qua perpetrator, bystander, and rescuer. Seeing the wounded as agency-impaired affirms the definition of victim as inadequate subject. There can be no justice done to the experience of suffering in its particularity if the only choice is to define it in relation to—even when only as the antithesis of—normalized healthy sovereign

action. Critiques of liberalism that build on responses to orientalism and other colonial discourses are suspicious of the mechanics of the identification of victims. For them, the victim status precludes any status beyond that of the object of an action, necessitates powerlessness, and imposes slave morality.²⁰ An inevitable result is the object's own resignation to its "assigned" lack of subjectivity.²¹ In these criticisms, the question of naming becomes inextricable from representation. It follows that the need and validity of representing the victims, the oppressed, the third world, is doubted and, finally, rejected. However, these challenges still remain attached to a relation to health as agency and to agency as health. An example is the call that victims and agents are not mutually exclusive—something to the effect that victims can be agents, too. Mohanty, for one, tells us of cottage-industry working women in Narsapur who "are not mere victims of the production process, because they resist, challenge, and subvert the process at various junctures."²² What is implicit in the "not mere victim" reaction? It brings to mind Martha Nussbaum's claim that victimization does not preclude "agency."²³ Clearly at work in Mohanty's account is a defensiveness that ends up condoning and affirming the dominant notion of agency it opposes. Occupying very different locations on the philosophical spectrum, Mohanty and Nussbaum seem closer in their gut reaction than their avowals would suggest. **Why is a victim merely a victim? What does it tell us regarding how we understand victimization? These reactions betray an inability to factor in the mode of practice that is suffering,** which may spurn the redemption of the victim on the terms of health and agency, liberal style. These thinkers highlight how voice and representation are so frequently framed in terms of agency, where agency itself becomes linked to representation: the victims or nonagents need representation, and they are redeemed by obviating representation and granting a voice all in one fell swoop. In my view, this link between agency and the authenticity of voice is a dubious one. It is on this suspect convergence that Spivak makes an important intervention. In "Can the Subaltern Speak?" she concludes that the subaltern cannot speak, an answer that, in dismissing Western intellectuals who "make space" for the subaltern to speak, reinstates a project of rethinking representation and the victim's experience. Spivak's analysis is more nuanced than Mohanty's, which rejects the very need and validity of this representation. Spivak takes issue with Foucault's wish to let the subaltern speak "in their own voice," which does not take seriously the notion that they have no voice as yet, and that this speechlessness is what defines the subaltern. She saves the notion of representation by arguing that, in the absence of a language of their own, there is no alternative but to represent the subaltern in a way that is sensitive to their silence.²⁴ As I argued in Chapters 2 and 3, the fetish of voice itself must be subject to a suspicion, since it serves those who thrive on its consolations more than those who are bid speak and must do so in order to write themselves in. This is not to say that the "victim"—its discursive and material reality—does not need redressal in a liberatory politics. Far from that, one can see it as a representation—a Darstellung and a Vorstellung—that has to itself be a subject of any social theoretical endeavor that is materialist in its imperative to make conditions (for the possibility of change) out of necessities. Liberal fictions and power structures need victims; unwittingly or not, they sustain them as they are themselves nourished by the latter's surplus suffering. Interestingly, the same Nietzsche who inspires a suspicion of the agent is also someone who forces a consideration of the material history, weight, and imperatives of agency, and of the terms and labor of its overcoming. It is more than a coincidence that Nietzsche's transition from the slave revolt in the first essay of *On the Genealogy of Morals* to the story of guilt, resentment, and punishment in the second essay, involves the myth of the doer behind the deed.²⁵ This transition is about suffering. Nietzsche's views on subjects and subjection suggest not merely that there is no doer but that the core of human existence is the suffering of that doing—that the subject is, in any case, subject to itself and its deeds. (As far as the fictive nature of the subject is concerned, Nietzsche drives home the very brutally material nature of fictions— are fictions ever merely fictions?) The centrality of the agent in liberalism's focus on suffering is manifest in the necessity of an agent as the cause or remedy of suffering. This raises the question of which fiction is more enduring in the liberal framework: the agent who causes the injury or the victim who is injured with that agency? In both cases, liberalism's attention is clear. In its keenness to see as good for liberal justice only the suffering that can be traced to a sanctioned agent, it makes victims into objects of the action. While neither of these options exhausts the possibilities in reality, they do necessitate each other. **This is why the agent looms so large, even in the imaginations of critics of liberalism, that it holds the promise, in its potential idealist-linguistic overcoming, of the undoing of the stigmatizing victim identity it spawns. However, the sufferer subjected to the fictions of agency and of the production of injury suffers these fictions** through her labors of sustaining and unwriting them.

*****The 1AC's "first-world feminism" fails to include a discussion of <insert specific demographic group(s) here>. A critical interrogation of how the notion of privacy uniquely affects each of these groups is essential in order to produce real social change.**

Miller 1 (Teresa A. Miller, Associate Professor of Law, University at Buffalo School of Law, 1-20-2001, "Keeping The Government's Hands Off Our Bodies: Mapping A Feminist Legal Theory Approach To Privacy In Cross-Gender Prison Searches," *Buffalo Criminal Law Review*,

<http://www.jstor.org/stable/10.1525/nclr.2001.4.2.861?Search=yes&resultItemClick=true&searchText=strip&searchText=searches&searchText=prison&searchUri=%2Faction%2FdoBasicSearch%3FQuery%3Dstrip%2Bsearches%2Bprison%26amp%3Bacc%3Don%26amp%3Bwc%3Don%26amp%3Bfc%3Doff%26amp%3Bgroup%3Dnone>) AC

Secondly, the feminist critique of privacy has drawn attention to the legitimating function of privacy that perpetuates the status quo by conceptualizing privacy as a negative right of protection against improper state interference, but with no correlative, affirmative governmental obligation to guarantee reproductive freedom.⁴⁵ In this respect, asserts feminist legal scholar Laura Stein, privacy is “decidedly non-transformative.”⁴⁶ Subsequent critiques of privacy doctrine by other feminist legal theorists followed and solidified what has been called the anti-privacy position of feminist legal theory.⁴⁷

More recently, a counter-critique emerged. Conceived by feminists of color, this racial critique of the feminist critique of privacy criticizes the rejection of privacy doctrine by feminist legal theorists for (1) narrowly defining women’s reproductive freedom in terms of abortion rights rather than examining the range of forces limiting the reproductive liberty of poor women of color;⁴⁸ (2) failing to take into account the more complex, racialized significance of the private sphere “as the site of solace and resistance against racial oppression” for women of color;⁴⁹ and (3) **identifying gender as the sole locus of women’s oppression and therefore ignoring racial and economic subordination.** Through counter-critique, these legal scholars seek to reclaim the right of privacy for women of color. ⁵⁰

Whereas MacKinnon’s feminist critique of privacy emphasizes the shortcomings of privacy-based protections of women’s reproductive choices, Roberts’ racial critique of the feminist critique of reproductive privacy advances our understanding of how privacy—properly contextualized—can be reconstructed to make the doctrine more effective. MacKinnon faults the doctrine of procreative privacy for its liberal presumption that individuals act autonomously, freely, and equally in spite of huge disparities in power between men and women. MacKinnon further criticizes the doctrinal formulation of privacy for preserving the status quo by failing to destabilize the power disparities between men and women. **Privacy is formulated as a negative right that entitles women merely to governmental non-intervention.** MacKinnon contends that by failing to require social changes that would eliminate women’s inequality to men, privacy doctrine perpetuates the sexual oppression that requires women to seek abortions in the first place (i.e., male control over sexuality).⁵¹ In contrast, Roberts resurrects the doctrine of privacy condemned by MacKinnon and reclaims it on behalf of women of color. Their historical experiences of being denied rights and being socially devalued as mothers underscore the significance of formulating protection of their procreative choices as a legal right—one that stresses the value of personhood and protects against totalitarian abuse of governmental power.⁵² Roberts criticizes the feminist critique of privacy for neglecting the concerns of poor women of color who simultaneously experience various forms of oppression “as a complex interaction of race, gender and class.”⁵³ She argues for a new jurisprudence of reproductive privacy that, inter alia, shifts the focus from state non-intervention to an affirmative guarantee of personhood. Roberts demonstrates that examining the experiences of women in the context of racial discrimination and economic disadvantage and formulating a privacy right that protects them leads to a doctrine of privacy that advances social justice and more fully protects everyone.⁵⁴ For example, among women claiming procreative privacy, poverty, subordination, and racial oppression influence the nature of the privacy claim. In *Killing the Black Body: Race, Reproduction and the Meaning of Liberty*, Roberts explains that racial oppression and economic disadvantage shape the meaning of black women’s claims to procreative privacy.⁵⁵ She suggests that understanding the context in which their privacy claims arise—in other words by “addressing the particular concerns of Black women”⁵⁶—a fuller vision of reproductive freedom is realized: [Black women’s’] reproductive freedom, for example, is limited not only by the denial of access to safe abortions, but also by the lack of resources necessary for a healthy pregnancy and parenting relationship. Their choices are limited not only by direct government interference in their decisions, but also by government’s failure to facilitate them Addressing the particular concerns of Black women helps to expand our vision of reproductive freedom to include the full scope of what it means to have control over one’s reproductive life.

Brainstorming

<http://www.theguardian.com/books/2014/sep/01/ya-dystopias-children-free-market-hunger-games-the-giver-divergent> this article talks about how dystopian societies frame the left wings and its ideals as dangerous; however, it focuses mainly on modern YA dystopia

K link about not discussing other races/ factors of oppression – write into a K

The Baudrillard K? Have to make sure it doesn't clash w fw. Link in dropbox folder- trying to put meaning into media and turn it into reality = bad

T its – extra T – they claim eye is stares you get when walking down the street – clearly not T, and if they claim its actually just USFG claim solvency bc they themselves stated that it symbolizes the collective gaze of everyone. Issue with this is the case isn't final, they may change the plan text and all

Case

Cultural Appropriation/Not intersectional

Atwood's tale is cultural appropriation; it describes a future for white women, which appropriates the life and the history of women of color. This supposed dystopian future is only a future for white women, it is the present and past for women of color.

Chris **Gavaler** 15, 1-4-2015, English professor at the Washington and Lee university, "The Handmaid's Tale and Bad Slavery Comparisons « The Hooded Utilitarian," No Publication, <http://www.hoodedutilitarian.com/2015/01/the-handmaids-tale-and-bad-slavery-comparisons/> - See more at: <http://www.hoodedutilitarian.com/2015/01/the-handmaids-tale-and-bad-slavery-comparisons/#sthash.0cBpx1Rm.dpuf>, jono yo)

The Handmaid's Tale clearly owes a debt to other totalitarian dystopias, most notably 1984. But it also borrows liberally from the experiences of non-white women. In fact, the novel's horror is basically a nightmare vision in which white, college-educated women like Atwood are forced to undergo the experiences of women of color.¶ This transposition is not especially subtle, nor meant to be. Handmaids wear red, full-body coverings and veils which reference the burqa. In case the parallel isn't sufficiently obvious, Atwood has her narrator directly compare the Handmaids waiting to perform their procreative duties to "paintings of harems, fat women lolling on divans, turbans on their heads, or velvet caps, being fanned with peacock tails, a eunuch in the background standing guard." The narrator has been teleported into an Orientalist fever dream, the irony only emphasized early in the novel by a group of modern, Japanese tourists, who stare at the debased Occidental women just as Westerners stereotypically stare at the debased women of the Orient. The stigma against Islam is leveraged along with, and blurs into, the stigma against prostitutes; the horror here is that middle-class, college-educated white women will be forced into the position of sex workers.¶ Slave experiences are appropriated with similar bluntness. The network that secretly ferrets Handmaid refugees over the border to Canada in the novel is called, with painful obliviousness, the Underground Femaleroad. We learn, in an aside, that the regime hates the song "Amazing Grace" — originally an anti-slavery song. It's reference to "freedom" has been repurposed here to apply to Gilead's gender inequities. The specific oppressions the Handmaids face also seem lifted from slave experience — they have their children taken from them; they are not allowed to read; they need passes to go out; if they violate any of innumerable rules, they are publicly hanged. The tension between white mistresses and black women on slave plantations is even reproduced; the narrator's Commander wants to see her outside of the proscribed procreation ceremony. She of course can't refuse — even when she finds out it provokes the commander's wife to dangerous sexual jealousy. This is a familiar dynamic from any number of slave narratives (12 Years a Slave is a high-profile recent example) with the one difference that here, not just the oppressor, but the oppressed, is white.¶ Atwood is hardly the first science-fiction author to create a white future from elements of past non-white oppression. As I've written before, this kind of reversal is central to the genre; H.G. Wells, explicitly compares the invasion of the Martians in The War of the Worlds to European colonization of Tasmania. Wells explicitly presents this parallel as a moral lesson; he asks Europeans to imagine themselves in the position of the colonized, and to think about how that would feel. You could argue, perhaps, that Atwood is doing something similar — that she's trying to get white people, and particularly white women, to imagine themselves in the position of non-white women, and to be more appreciative of and sympathetic to their struggles. You could see The Handmaid's Tale as analogous to Orange Is The New Black, where a white woman is a convenient point of entry to focus on and think about the lives of non-white women.¶ Orange Is the New Black actually includes Black and Latina women as characters, though. The Handmaid's Tale emphatically does not. The book does say that the Gilead regime is very racist, but the one direct mention of black people in the book is an assertion of their erasure. The narrator sees a news report which declares that "Resettlement of the Children of Ham is continuing on schedule." Here Atwood and Gilead seem almost to be in cahoots, resettling black people somewhere else, so that we can focus, untroubled by competing trauma, on the oppression of white people.¶ Atwood and Gilead are in cahoots in some sense; Atwood created Gilead. You

can hear an echo of the writer's thoughts, perhaps, in Moira, the narrator's radical lesbian friend, who is not shocked by the Gilead takeover. Instead, the narrator says, "In some strange way [Moira] was gleeful, as if this was what she'd been expecting for some time and now she'd been proven right." The Handmaid's Tale presents a world in which white middle-class women are violently oppressed by Christian religious fanatics. As such, it is not just a dystopia, but a kind of utopia, the function of which, as Moira says, is to prove a certain kind of feminist vision right.¶ That vision is one in which women — and effectively white women — contain all oppressions within themselves. The Handmaid's Tale is a dream of vaunting, guiltless suffering. Maybe that's why Stop Patriarchy finds the slavery metaphor so appealing as well. Using slavery as a comparison is not just an intensifier, but a way to erase a complicated, uncomfortable history in which the oppressed can also sometimes be oppressors.¶

Atwood = critique of feminism

(Don't read w/ queer k – Callaway talks about how Atwood criticizes second-wave feminism)

They should have read Atwood better, it's a critique of modern feminism. The Eye was not the meaning of the book, it's analysis on how fem has reproduced systems of control

Allana **Callaway**, may 2008, professor at san jose state university, Women disunited : Margaret Atwood's The Handmaid's Tale as a critique of feminism", san jose state university scholar work, http://scholarworks.sjsu.edu/cgi/viewcontent.cgi?article=4501&context=etd_theses, jono yo)

All of these critical foci are important; however, they miss the crucial point that Gilead's power structure is an expression of the disunity of women. While Gilead's caste system represses men and women, it is the women in positions of power, rather than the men, who make this system unpleasant and dangerous for women. This is the focus of my thesis. First, the influence of feminism on The Handmaid's Tale is discussed. In tracing the development of feminism, a sustained discussion of Second-Wave Feminism is offered. Atwood's evolving feminist sympathies are also examined, mainly through published interviews of Atwood conducted between 1972 and 2005. Second, the development of the Utopian tradition is traced through texts such as Mary Shelley's The Last Man and Charlotte Perkins Gilman's Herland. The dystopic tradition is also outlined through the following texts: Yevgeny Zamyatin's We, Aldous Huxley's Brave New World, and George Orwell's 1984. These texts were chosen because they seem to have influenced Atwood's creation of the Republic of Gilead and because they are primarily concerned with sexual power politics. Finally, it is posited that within The Handmaid's Tale the real threat in Gilead comes not from male but from female control. The ultimate result of the micro-stratification in Gilead is the evolution of a new form of misogyny, not as we usually think of it, as men's hatred of women, but as women's hatred of women. Atwood depicts one viable backlash from our current feminist momentum: gynocentric misogyny and "traditional" misogyny combined in one militaristic social and religious order—the Republic of Gilead. In other words, the male-dominated power structure relies on women to regulate one another and enforce social standards. The philosophy informing the social structure is not unique to Gilead: "no empire imposed by force or otherwise has ever been without this feature: control of the indigenous by members of their own group" (The Handmaid's Tale 308). Grounding the social hierarchy in biblical and historical precedents, the matriarchy attempts to disguise the reality of this universally degrading women's culture. For example, the new family structure relies on "the monthly rape 'Ceremony' [which] follows the scriptural 'and she shall bear upon my knees/ and grotesquely requires the presence of Wife, Handmaid, and Commander. It synthesizes the institutionalized humiliation, objectification, and ownership of women in Gilead" (Cavalcanti 166). My interpretation takes this a step further. Because of the nature of household politics, and the uniquely matriarchal content informing them, it is no longer the men, but the women who should be feared. Placing The Handmaid's Tale within the contexts of feminism and dystopian literature enables me to return to the text and reinterpret Atwood's creation of this reactionary society as a critique of Second-Wave Feminism and a prophetic call to action.

The world of Gilead criticizes modern takes on feminism

Allana **Callaway**, may 2008, professor at san jose state university, Women disunited : Margaret Atwood's The Handmaid's Tale as a critique of feminism", san jose state university scholar work, http://scholarworks.sjsu.edu/cgi/viewcontent.cgi?article=4501&context=etd_theses, jono yo)

While there is plenty of traditional feminist critique of male power structures in Atwood's works, and particularly in The Handmaid's Tale, this thesis argues that the power structure of Gilead (the biblically-inflected nation Atwood imagines) also critiques the feminine roles that support and enable the repression of other women. Placing the novel in the contexts of Atwood's career, feminism, and dystopian literature, provides a fuller understanding of how the novel functions as an expression of the disunity of women. Thus, this thesis turns the focus of The Handmaid's Tale from the consequences of patriarchal control and "traditional" misogyny, to the matriarchal network, and a new form of misogyny: women's hatred of women. Read thusly, The Handmaid's Tale becomes a prophetic call to action.

Notes

Winning strat against this aff is probably going to be Antiblackness, with maybe some of the pain commodification cards on case. Some of the indicts of the book (like the Berlatsky cards) are pretty great links to Antiblackness.

Strats that CANNOT be read together—

Countergaze+Ocularcentrism, or Countergaze+the Snow 89 card from case, Micropolitics bad+Antiblackness, or Antiblackness+Tuck and Yang, or Dystopias Bad+Antiblackness (arguably)

A lot of the cards from the kritik shells can be read on case, and a lot of the case cards can be read as links to some of the K.

Don't ignore the case cards. They're pretty "hype".

Tuck and Yang

INC

Research is used to commodify pain narratives and damage representations to reproduce oppression with the justification of the academy

Tuck and Yang 14 [Eve, & K.W., 2014, “R-Words: Refusing Research.” In n D. Paris & M. T. Winn (Eds.) Humanizing research: Decolonizing qualitative inquiry with youth and communities https://faculty.newpaltz.edu/evetuck/files/2013/12/Tuck-and-Yang-R-Words_Refusing-Research.pdf]

Urban communities, and other disenfranchised communities, Damage-centered researchers may operate, even benevolently, within a theory of change in which harm must be recorded or proven in order to convince an outside adjudicator that reparations are deserved. These reparations presumably take the form of additional resources, settlements, affirmative actions, and other material, political, and sovereign adjustments. Eve has described this theory of change as both colonial and flawed, because it relies upon Western notions of power as scarce and concentrated, and because it requires disenfranchised communities to position themselves as both singularly defective and powerless to make change (2010). Finally, Eve has observed that “won” reparations rarely become reality, and that in many cases, communities are left with a narrative that tells them that they are broken. Similarly, at the center of the analysis in this chapter is a concern with the fixation social science research has exhibited in eliciting pain stories from communities that are not White, not wealthy, and not straight. Academe’s demon-strated fascination with telling and retelling narratives of pain is troubling, both for its voyeurism and for its consumptive implacability. Imagining “itself to be a voice, and in some disciplinary iterations, the voice of the colonised” (Simpson, 2007, p. 67, emphasis in the original) is not just a rare historical occurrence in anthropology and related fields. We observe that much of the work of the academy is to reproduce stories of oppression in its own voice. At first, this may read as an intolerant condemnation of the academy, one that refuses to forgive past blunders and see how things have changed in recent decades. However, it is our view that while many individual scholars have chosen to pursue other lines of inquiry than the pain narratives typical of their disciplines, novice researchers emerge from doctoral programs eager to launch pain-based inquiry projects because they believe that such approaches embody what it means to do social science. The collection of pain narratives and the theories of change that champion the value of such narratives are so prevalent in the social sciences that one might surmise that they are indeed what the academy is about. In her examination of the symbolic violence of the academy, bell hooks (1990) portrays the core message from the academy to those on the margins as thus: No need to hear your voice when I can talk about you better than you can speak about yourself. No need to hear your voice. Only tell me about your pain. I want to know your story. And then I will tell it back to you in a new way. Tell it back to you in such a way that it has become mine, my own. Re-writing you I write myself anew. I am still author, authority. I am still colonizer the speaking subject and you are now at the center of my talk. (p. 343) Hooks’s words resonate with our observation of how much of social science research is concerned with providing recognition to the presumed voiceless, a recognition that is enamored with knowing through pain. Further, this passage describes the ways in which the researcher’s voice is constituted by, legitimated by, animated by the voices on the margins. The researcher-self is made anew by telling back the story of the marginalized/subaltern subject. Hooks works to untangle the almost imperceptible differences between forces that silence and forces that seemingly liberate by inviting those on the margins to speak, to tell their stories. Yet the forces that invite those on the margins to speak also say, “Do not speak in a voice of resistance. Only speak from that space in the margin that is a sign of deprivation, a wound, an unfulfilled longing. Only speak your pain” (hooks, 1990, p. 343).

Focusing on resistance and difference forecloses politics

Dean 05 [Jodi Dean, Prof. Poli Sci @ Hobart & William Smith, 2005, “Communicative Capitalism: Circulation and the Foreclosure of Politics,” *Cultural Politics* Vol 1 Issue 1, p. 53]

The post-political world, then, is marked by emphases on multiple sources of value, on the plurality of beliefs and the importance of tolerating these beliefs through the cultivation of an attunement to the contingencies already pervading one's own values. Divisions between friends and enemies

are replaced by emphases on all of us. Likewise, politics is understood as not confined to specific institutional fields but as a characteristic of all of life. There is an attunement, in other words, to a micropolitics of the everyday. But this very attunement forecloses the conflict and opposition necessary for politics. Finally, Hardt and Negri's description of the current techno-globalcapitalist formation coincides with Agamben's account of communication without communicability and with Žižek's portrayal of a global formation characterized by contingency, multiplicity and singularity. For example, they agree that "communication is the form of capitalist production in which capital has succeeded in submitting society entirely and globally to its regime, suppressing all alternative paths" (Hardt and Negri 2000: 347; cf. Dean 2002b: 272-5). Emphasizing that there is no outside to the new order of empire, Hardt and Negri see the whole of empire as an "open site of conflict" wherein the incommunicability of struggles, rather than a problem, is an asset insofar as it releases opposition from the pressure of organization and prevents co-optation. As I argue elsewhere, this position, while inspiring, not only embraces the elision between the political and the economic but also in so doing cedes primacy to the economic, taking hope from the intensity and immediacy of the crises within empire. The view I advocate is less optimistic insofar as it rejects the notion that anything is immediately political, and instead prioritizes politicization as the difficult challenge of representing specific claims or acts as universal (cf. Laclau 1996: 56-64). Specific or singular acts of resistance, statements of opinion or instances of transgression are not political in and of themselves; rather, they have to be politicized, that is articulated together with other struggles, resistances and ideals in the course or context of opposition to a shared enemy or opponent (cf. Laclau and Mouffe 1986:188). Crucial to this task, then, is understanding how confimunicative capitalism, especially insofar as it relies on networked communications, prevents politicization. To this end, I turn now to the fantasies animating communicative capitalism.

Instead of fetishizing breaking silence we should embrace silence as a means of resisting regulation and depoliticization

Brown 1996 [Wendy Brown, Prof. Political Science, Prof. Rhetoric, Prof. Critical Theory @ UC-Berkeley, 96, "In the 'folds of our own discourse': The Pleasures and Freedoms of Silence," 3 U. Chi. L. Sch. Roundtable, 186]

But if the silences in discourses of domination are a site for insurrectionary noise, if they are the corridors we must fill with explosive counter-tales, it is also possible to make a fetish of breaking silence. Even more than a fetish, it is possible that this ostensible tool of emancipation carries its own techniques of subjugation-that it converges with non-emancipatory tendencies in contemporary culture (for example, the ubiquity of confessional discourse and rampant personalization of political life), that it establishes regulatory norms, coincides with the disciplinary power of confession, in short, feeds the powers we meant to starve. While attempting to avoid a simple reversal of feminist valorizations of breaking silence, it is this dimension of silence and its putative opposite with which this Article is concerned. In the course of this work, I want to make the case for silence not simply as an aesthetic but a political value, a means of preserving certain practices and dimensions of existence from regulatory power, from normative violence, as well as from the scorching rays of public exposure. I also want to suggest a link between, on the one hand, a certain contemporary tendency concerning the lives of public figures-the confession or extraction of every detail of private and personal life (sexual, familial, therapeutic, financial) and, on the other, a certain practice in feminist culture: the compulsive putting into public discourse of heretofore hidden or private experiences-from catalogues of sexual pleasures to litanies of sexual abuses, from chronicles of eating disorders to diaries of homebirths, lesbian mothering, and Gloria Steinam's inner revolution. In linking these two phenomena-the privatization of public life via the mechanism of public exposure of private life on the one hand, and the compulsive/compulsory cataloguing of the details of women's lives on the other-I want to highlight a modality of regulation and depoliticization specific to our age that is not simply confessional but empties private life

into the public domain, and thereby also usurps public space with the relatively trivial, rendering the political personal in a fashion that leaves injurious social, political and economic powers unremarked and untouched. In short, while intended as a practice of freedom (premised on the modernist conceit that the truth shall make us free), these productions of truth not only bear the capacity to chain us to our injurious histories as well as the stations of our small lives but also to instigate the further regulation of those lives, all the while depoliticizing their conditions. My concern with what might be called compulsory feminist discursivity and the presumed evil of silences has yet another source. Notwithstanding American academic feminism's romance with Foucault, there is an oddly non or pre-Foucauldian quality to much feminist concern with censorship and silencing. In these formulations, expression is cast either as that which makes us free, tells our truth, puts our truth into circulation, or as that which oppresses us by putting "their" truth into circulation in the form of pornography, hate speech, harassment or simply the representation of the world from "the male point of view." If one side in the debate argues for more expression on our part—for example, by making our own pornography or telling our own stories—and the other argues for less on "their" part, both sides nonetheless subscribe to an expressive and repressive notion of speech, its capacity to express the truth of an individual's desire or condition, or to repress that truth. Both equate freedom with voice and visibility. Both assume recognition to be unproblematic when we tell our own story, and assume that such recognition is the material of power and pleasure. Neither, in short, confronts the regulatory potential of speaking ourselves. I think the whole contemporary debate over censorship—whether focused on porn or rap music—is necessarily bound to an expressive-repressive model of power and freedom, which may explain why those who feel passionately about both freedom and dignity have trouble finding their way in this debate. If the choice is cast either as the free circulation of music and pictures venerating rape, racism, and misogyny, or state repression of the same, how does one choose? To inaugurate a different kind of analysis of the relationship between silence, speech, and freedom, I want to turn to two passages in Foucault's work, the first from *The History of Sexuality: Discourses are not once and for all subservient to power or raised up against it, any more than silences are . . . Discourse transmits and produces power; it reinforces it, but also undermines and exposes it, renders it fragile and makes it possible to thwart it. In like manner, silence and secrecy are a shelter for power, anchoring its prohibitions; but they also loosen its hold and provide for relatively obscure areas of tolerance. Foucault here marks the ambiguity of silence in relationship to power, insisting that silence functions not only as a "shelter for power" but also as a shelter from it. (Foucault's example is the putative freedom of homosexual practice in a historical age when there is no discourse for or about it).⁸ This paradoxical capacity of silence to engage opposites with regard to power is rarely associated with Foucault's thinking due to his emphasis on discourse as power. Yet I do not think he is here renegeing on this emphasis nor, in speaking of silence as a shelter from power, suggesting a pre-discursive existence to things. Critical here is the difference between what Foucault calls unitary discourses, which regulate and colonize, and those which do not perform these functions with same social pervasiveness, even as they do not escape the tendency of all discourse to establish norms by which it regulates and excludes. It is through this distinction that one can make sense of Foucault's otherwise inexplicable reference to sex in the eighteenth century as being "driven out of hiding and constrained to lead a discursive existence,"⁹ or his troubling example of the village simpleton whose "inconsequential" habit of molesting young girls in exchange for pennies was suddenly subjected to medical, judicial, and popular scrutiny and condemnation. ° Neither in these cases nor in others where Foucault seems to imply a "freer" because pre-discursive existence to certain practices would he appear to mean that they really occurred "outside" discourse, but rather that they had not yet been brought into the pervasive regulatory discourses of the age—science, psychiatry, medicine, law, pedagogy, and so forth." Silence, as Foucault affirms it, then, is identical neither with secrecy nor with not speaking. Rather, it signifies a relation to regulatory discourses, as well as a possible niche for the practice of freedom within those discourses. If, as Foucault insists, freedom is a practice (as opposed to an achievement, condition, or institution), then the possibility of practicing freedom inside a regulatory discourse occurs in the empty spaces of that discourse as well as in resistance to the discourse. Moreover, silence can function as speech in both ways at once, as in the following autobiographical example offered by Foucault: Maybe another feature of this appreciation of silence is related to the obligation of speaking. I lived as a child in a petit bourgeois, provincial milieu in France and the obligation of speaking, of making conversation with visitors, was for me something both very strange and very boring. I often wondered why people had to speak. 2*

Deliberate Feminist Countergaze

1NC

We advocate a strategy of deliberate feminist countergaze as a method of challenging the Eye.

The strategy of the counter-gaze actively challenges and defies the male gaze

Matthews 91 (Patricia Matthews, "Returning the Gaze: Diverse Representations of the Nude in the Art of Suzanne Valadon", *The Art Bulletin*, Vol. 73 No. 3, September 1991)

In each of these allegorical paintings, most of the subjects are self-possessed, or otherwise occupied within the space of the painting. and there is little acknowledgment of the viewer. The viewer therefore must take up a position of covert surveillance more often than titillating voyeurism. Valadon's compositions of nudes in ...: 1920s and thirties employ similar strategies, although they are generally less dependent on traditional allegories- Redirtug Nude, 1928 (Fig. 8), for example, is also structured through contradictory narratives, but here they derive from only one theme, the male gaze. the woman lies on a divan too short comfortably to contain her large body; her legs are crossed, covering her genitals, one arm crosses her breasts, and her hand grasps a white drapery. The space of the picture is cramped and shallow, so that the figure confronts the viewer, who cannot escape her body. Although Valadon's style is much more realistic, such confrontational presentation is typical of much early twentieth-century avant-garde art. Such as Kirchner's: Girl under a Japanese Umbrella (Fig. 1), who contorts her body merely to reveal it. But unlike such representations by male artists, Valadon's nude closes her body to the viewer. The nude's expression and the tension of her tightly clenched body suggest that she resists our intrusive gaze upon her, or perhaps even disdains it. The dominating power of the male gaze is now read through the self-conscious, anxious, or negative reaction to it from the woman. Her self is very present to us, through her body language and gaze. Hers is a gaze returned, neither seductive nor passive, a gaze all awareness, response, and recoil, through which we are made to feel like self-conscious intruders rather than welcome guests. In this painting, a male gaze is constructed, but defied.

2NC Extensions

The counter-advocacy solves better than the 1AC—merely reading the narrative is defensive and still allows the Eye to choose when it can perform the gaze, while the act of counter-gazing directly challenges and fully stops the male gaze

Looking back solves—allows for a challenge to the gaze

Linstead 95 (Stephen Linstead, "Averting the Gaze: Gender and Power on the Perfumed Ticket Line", October 1995,

http://www.researchgate.net/profile/Stephen_Linstead/publication/229978974_Averting_the_Gaze_Gender_and_Power_on_the_Perfumed_Picket_Line/links/54e5e3f90cf277664ff1b14f.pdf?disableCoverPage=true)

The gendering of the flight attendant's occupation thus implies a model of 'normal' sexuality which needs to be constructed and maintained, both symbolically and practically, in everyday life. The divisionalizing practices which define what is normal or deviant, legitimate or illegitimate in thought or deed are not self-sustaining. As Foucault (1977) insists, they have to be policed. The historical passage from pre-modernism to post-modernism can be understood in terms of a move from direct, physical control (e.g. torture, flogging, corporal punishment) through rules-based, rational-legal control (e.g. industrial bureaucracy) where control is internal, to means of control where individuals, aided by powerful socialization processes, internalize beliefs which generate action that can be seen to be 'in-accordance-with-a-rule'. This occurs without the need of specific orders or instructions, advance specifications or direct supervision. The technology which epitomizes this shift Foucault identifies in the well-known example of Bentham's Panopticon.

The significant element in site disciplinary 'gaze' is that those to discipline believe in the possibility of being watched (not even its actuality). Imagining this ocular intrusion into their world, they behave in response to it. Discipline may not be externally imposed but the source of

discipline is imagined to be ex-ternal However, as de Certeau (1984) notes, the response to the 'gaze' is the 'look', the management of impressions by the dis-ciplined so that they appear to be controlled. Behind the look, myriad resistances, art alternate microphysics of power, come into being and provide the ground for subversion.

The act of looking back challenges the spectator and reclaims subjectivity

Jones 05 (Amelia Jones, "Performing the Body/Performing the Text", accessed using Google Books, August 12th, 2005)

At this juncture, the Girls are experimenting with the first and the most rudimentary layer of nakedness, shameless and without history. The naked bodies placed in performance are the artists, the paintings, and the canvases. As paintings, the artists mock the reductiveness of racial designations with the complexity of their hues. If their flesh and hair of mixed-tints be the truth that claims visual attention, then the prime-color categories of Homo Sapiens must be a myth. As canvases, the artists invite the gazing spectators to fantasize about their bodies - with wonder, with lust, with awe, or with surreptitious conscience. But these canvases are equipped with eyes that don't hesitate: to gaze back at the gazes. These are canvases that hold paintings well-crafted with revenge schemes: 'An eye for an eye,' decrees the Hebrew Bible. Judging from De Lauretis's formulation, I contend that the Naked Girls have managed to present a feminist spectacle of transgression which derides the 'phallic scenario.' They withhold the colonizing force of male spectatorial desire by making the relationships among themselves their foremost performance condition. They both act and interact as eroticized female subjects. They have chosen to utilize their naked flesh as their respective and collaborative art object/substance, basking in its sensorial gratification without the shadow of social taboos. They have turned their theatre into a moving museum, which curates their female bodies as exhibits of corporeal diversity. Since these Naked Girls do not hesitate to view one another as potential companions or sex partners, their performance boldly solicits the interests of female spectators, heterosexual, bisexual, and lesbian alike, who are no longer excluded from the implications of voyeuristic desire. While the performers stare straight into their spectators, they entice, challenge, and interrogate the actions of both men and women who stare at them. Voyeurism is a game tested by such revenge schemes, recalling one of the dangers of visibility identified by Phelan. Linda Williams in *Hard Core* defines voyeurism as 'unauthorized spying, the ability to be everywhere and to see all that is forbidden, hidden?' The Girls, however, not only authorize but expose the spying. They allow no illusionistic screen to stand between the naked spectacles and their implicated watchers. As much as the Naked Girls invite fantasies with unveiled bodies, they also make the fantasizers self-conscious about their own acts of fantasy-genie spying. Between the gazers and the performers being gazed upon and gazing back, there is a double-lane optical highway, rather than the (stereotypical) cul-de-sac which captivates the voyeuristic object. The gazers are made to earn their vicarious pleasure or guilt in their watching by witnessing not only the women's own pleasures, but their erasure of historical traces from their naked - hence untitled - flesh. Moreover, they are obligated to receive the women's counter-gaze. In this state of mutual surveillance, the spectators' voyeuristic license is suspended, if not revoked. In Alice Doesn't, Teresa De Lauretis suggests that concepts such as voyeurism and fetishism 'are directly implicated in a discourse which circumscribes woman in the sexual, binds her (in) sexuality, makes her the absolute representation, the phallic scenario.' Under such a patriarchal lens, 'woman' is perceived by the presumed male-identified spectator as a sign, 'as scene, rather than subject, of sexuality.'" She is a lustworthy object in 'a drama of vision, a memory spectacle, an image of woman as beauty — desired and untouchable, desired as remembered?' According to the above analysis, 'woman' as voyeuristic and fetishistic target is characterized by her lack of subjectivity, lack of self-willed desire, and lack of material presence. A passive receptacle of the proprietary gaze, she is destined to be a sexual and beautiful spectacle, rather than an aggressive spectacle-maker.

2NC v perm

The act of the countergaze requires the subject to combat the male gaze—the 1AC removes that which means we can't perform a countergaze

FW/T/whatever-you-call-its

Notes for T (from Strange)

Focus on “its”, less focus on “resolved”

Violations—not USFG, not “its” surveillance (surveillance means others), put this on one sheet of paper

Specifically bad—fiction is almost completely unpredictable. Steinberg/Freely makes a bit more sense (need point of controversy). Plan should be grounded in reality

INC

Our interpretation is that an affirmative should defend curtailing federal government surveillance as the endpoint of their advocacy. This does not mandate roleplaying, immediate fiat or any particular means of impact calculus.

Surveillance can only be understood in relation to the agent doing the surveying – understanding federal government surveillance as unique is key or the topic becomes abstract and unlimited

Cetina 14

(DANIEL K. CETINA, BALANCING SECURITY AND PRIVACY IN 21ST CENTURY AMERICA: A FRAMEWORK FOR FISA COURT REFORM, 47 J. Marshall L. Rev. 1453 2013-2014, Hein)

Any legitimate attempt to discuss and critique United States surveillance tactics necessarily demands defining exactly what surveillance is and what it entails.

Although discourse surrounding governments' intelligence and law enforcement techniques transcends any specific epoch or state,¹¹ modern communication technologies "have revolutionized our daily lives [and] have also created minutely detailed recordings of those lives,"¹² thereby making governmental surveillance simple, potentially ubiquitous, and susceptible to abuse.¹³ Of course, recent surveillance programs were implemented for the noble purpose of conducting the War on Terrorism;¹⁴ but the danger is that pursuing this purpose unchecked can undermine the central principles that both provide the Republic's foundation and differentiate it from the very enemies it combats.¹⁵ While the prospect of governmental surveillance seems to implicitly suggest a quasi-Orwellian dystopia,¹⁶ fantastical science fiction mythologies,¹⁷ abstruse philosophical concepts,¹⁸ or documented repressive regimes,¹⁹ the reality is both less foreboding and more nuanced. Although American society, ostensibly, is looking increasingly akin to such fiction, theory, and totalitarianism, surveillance as applied is not so disturbing. Surveillance involves and encompasses many topics and practices, both abstract and practical,²⁰ but it primarily involves power relationships. ²¹ Specifically, surveillance is "the focused, systematic and routine attention to personal details for purposes of influence, management, protection or direction."²² Surveillance can target a modern society's numerous communications networks,²³ which exist to send and receive information. ²⁴ The communications include both envelope information and content information, distinct categories that draw varying degrees of interest from the surveillance authority. ²⁵ But surveillance is not strictly the province of the federal government. ²⁶ Indeed, state and local governments have their own surveillance practices, as do private corporations, which routinely use surveillance data to determine purchasing trends and calibrate advertising, especially through such social media sites as Facebook.²⁸ Surveillance, therefore, transcends the boundary between the private sector and the public sector. ²⁹ The focus here, however, is on

federal governmental surveillance. It is therefore critical to understand from where the federal government derives its authority to monitor and analyze communications networks.

The Aff undermines the ability to have a limited and stable number of Affirmatives to prepare against. The link magnitude is high. Their affirmative prevents arguments about ____.

This is a reason to vote negative.

Our first standard is competition – every affirmative argument needs to be filtered through the question of “how does this function in a competitive venue of debate where there must be a win or a loss assigned to each team. All their evidence will assume non-competitive academic environment rather than one where a forced choice will inevitably take place with every ballot.

Second is substantive side bias

Not defending the clear actor and mechanism of the resolution produces a substantive side bias.

They have the ability to recontextualize link arguments, shift focus to different proscriptive claims of the 1AC while using traditional competition standards like perms to make non-absolutist disagreements irrelevant.

The first impact to Aff sides bias is absolutism – their interp creates bad debates where negatives are forced into the absolutist positions like cap and Baudrillard to ensure links and have generic positions that can apply to everything. This is bad for education -- forcing us to the academic margins, makes us less effective scholars and less literate in current events. Trains us only for leftist infighting, rather than social change.

Second, it undermines research – Aff has an incentive to constantly break new affs at every tournament making any real attempt at engagement irrelevant and decreasing the quality of all debates. They don't spur engagement and exploration cause there are so many teams reading so many Affs, the only way to respond it with generics. The Aff is conversely incentivized to pick a body of literature with very little negative literature and a prolif of aff advocacies based on single articles or created phrases. There is no incentive to produce detailed strategies because academic disagreements in the literature are minute and easily wished away by perms or Aff changes.

And we have an external impact – Sufficient research-based preparation and debates focused on detailed points of disagreement are key to political effectiveness

Gutting 13 (professor of philosophy at the University of Notre Dame)

(Gary, Feb 19, A Great Debate, <http://opinionator.blogs.nytimes.com/2013/02/19/a-great-debate/?emc=eta1>)

This is the year of what should be a decisive debate on our country's spending and debt. But our political “debates” seldom deserve the name. For the most part representatives of the rival parties exchange one-liners: “The rich can afford to pay more” is met by “Tax increases kill jobs.” Slightly more sophisticated discussions may cite historical precedents: “There were higher tax rates during the post-war boom” versus “Reagan's tax cuts increased revenues.”¶ Such volleys still don't even amount to arguments: they don't put forward generally accepted premises that

support a conclusion. Full-scale speeches by politicians are seldom much more than collections of such slogans and factoids, hung on a string of platitudes. Despite the name, candidates' pre-election debates are exercises in looking authoritative, imposing their talking points on the questions, avoiding gaffes, and embarrassing their opponents with "zingers" (the historic paradigm: "There you go again.")¶ There is a high level of political discussion in the editorials and op-eds of national newspapers and magazines as well as on a number of blogs, with positions often carefully formulated and supported with argument and evidence. But even here we seldom see a direct and sustained confrontation of rival positions through the dialectic of assertion, critique, response and counter-critique. Such exchanges occur frequently in our law courts (for example, oral arguments before the Supreme Court) and in discussions of scientific papers. But they are not a significant part of our deliberations about public policy. As a result, partisans typically remain safe in their ideological worlds, convincing themselves that they hold to obvious truths, while their opponents must be either knaves or fools — with no need to think through the strengths of their rivals' positions or the weaknesses of their own.¶ Is there any way to make genuine debates — sustained back-and-forth exchanges, meeting high intellectual standards but still widely accessible — part of our political culture? (I leave to historians the question of whether there are historical precedents— like the Webster-Hayne or Lincoln-Douglas debates.) Can we put our politicians in a situation where they cannot ignore challenges, where they must genuinely engage with one another in responsible discussion and not just repeat talking points?¶ A first condition is that the debates be focused on specific points of major disagreement. Not, "How can we improve our economy?" but "Will tax cuts for the wealthy or stimulus spending on infrastructure do more to improve our economy?" This will prevent vague statements of principle that don't address the real issues at stake.¶ Another issue is the medium of the debate. Written discussions, in print or online could be easily arranged, but personal encounters are more vivid and will better engage public attention. They should not, however, be merely extemporaneous events, where too much will depend on quick-thinking and an engaging manner. We want remarks to be carefully prepared and open to considered responses.

**This guts any educational potential of the aff – failure to engage with the legal detail of surveillance policy prevents translating their argument into action.

Cohen 15 (professor of law at Georgetown University Law Center)

(Julie, 2015, Studying Law Studying Surveillance, Studying Law Studying Surveillance. Surveillance & Society 13(1): 91-101)

Relative to legal scholarship, work in Surveillance Studies is more likely to build from a solid foundation in contemporary social theory. Even so, such work often reflects both an insufficient grasp of the complexity of the legal system in action and lack of interest in the ways that legal and regulatory actors understand, conduct, and contest surveillance. By this I don't mean to suggest that Surveillance Studies scholars need law degrees, but only to point out what ought to be obvious but often isn't: legal processes are social processes, too, and in overlooking these processes, Surveillance Studies scholars also engage in a form of black-boxing that treats law as monolithic and surveillance and government as interchangeable. Legal actors engage in a variety of discursive and normative strategies by which institutions and resources are mobilized around surveillance, and understanding those strategies is essential to the development of an archaeology of surveillance practices. Work in Surveillance Studies also favors a type of theoretical jargon that can seem impenetrable and, more importantly, unrewarding to those in law and policy communities. As I've written elsewhere (Cohen 2012a: 29), "[t]oo many such works find power everywhere and hope nowhere, and seem to offer well-meaning policy makers little more than a prescription for despair." Returning to the topics already discussed, let us consider some ways in which Surveillance Studies might benefit from dialogue with law.¶ Let us return first to the problem of digitally-enhanced surveillance by law enforcement—the problem of the high-resolution mosaic. As discussed in the section above, works by Surveillance Studies scholars exploring issues of mobility and control offer profound insights into the ways in which continual observation shapes spaces and subjectivities—the precise questions about which, as we have

already seen, judges and legal scholars alike are skeptical. Such works reveal the extent to which pervasive surveillance of public spaces is emerging as a new and powerful mode of ordering the public and social life of civil society. They offer rich food for thought—but not for action. Networked surveillance is increasingly a fact of contemporary public life, and totalizing theories about its power don't take us very far toward gaining regulatory traction on it. That enterprise is, moreover, essential even if it entails an inevitable quantum of self-delusion. **Acknowledgment of pervasive social shaping by networked surveillance need not preclude legal protection for socially-shaped subjects, but that project requires attention to detail.** To put the point a different way, the networked democratic society and the totalitarian state may be points on a continuum rather than binary opposites, but the fact that the continuum exists is still worth something. If so, one needs tools for assessment and differentiation that Surveillance Studies does not seem to provide.¶ As an example of this sort of approach within legal scholarship, consider a recent article by legal scholars Danielle Citron and David Gray (2013), which proposes that courts and legislators undertake what they term a technology-centered approach to regulating surveillance. They would have courts and legislators ask whether particular technologies facilitate total surveillance and, if so, act to put in place comprehensive procedures for approving and overseeing their use. From a Surveillance Studies perspective, this approach lacks theoretical purity because its technology-specific focus appears to ignore the fact that total surveillance also can emerge via the fusion of data streams originating from various sources. But the proposal is pragmatic; it does not so much ignore that risk as bracket it while pursuing the narrower goal of gaining a regulatory foothold within the data streams. And because it focuses on the data streams themselves, it is administrable in a way that schemes based on linear timelines and artificial distinctions between different types of surveillance are not. One can envision both courts and legislatures implementing the Citron and Gray proposal in a way that enables far better oversight of what law enforcement is doing.¶ Turning next to the linked practices of commercial profiling and social media surveillance, we have already seen that work in Surveillance Studies again steps in where legal scholarship badly needs supplementation: on the question of how pervasive surveillance by private market actors shapes the production of culture and the patterns of emergent subjectivity. Such work typically does not, however, consider or explore the ways that the legal construct of consent mobilizes legal and policy discourses to sanction ongoing expansions of private-sector surveillance and insulate them from regulatory oversight. Work in Surveillance Studies also has not seemed to pay particularly careful attention to the roles that rhetorics of innovation and competition play in regulatory debates about information privacy. For a discipline that seeks to develop comprehensive and rigorous accounts of surveillance as social ordering and as cultural practice, these are large omissions. As we have seen, the notice-and-choice paradigm has deep roots within liberal theory, and legal and policy discourses about notice and choice reflect legal culture in action. By the same token, understanding surveillance simply as a means to effective administration, or as a means for pursuing and performing security, misses the extent to which a narrative about the inevitable nature of innovation and knowledge production positions surveillance as a modality of technical and social progress (Cohen 2015). The “surveillance-industrial complex” does not simply parallel the military-industrial complex; it is also deeply rooted in Silicon Valley’s technoculture and (albeit paradoxically) in the tropes of romantic individualism and cultural iconoclasm with which its participants self-identify. These themes have been especially salient for privacy regulators.¶ **Engagement with legal scholarship on information privacy would inform the project of understanding surveillance as social ordering** and as culture in a number of complementary ways. First and most basically, many legal writings on information privacy are important as primary sources that reveal the notice-and-choice paradigm and the narrative of inevitable innovation at work. But there is also a rich vein of legal scholarship interrogating the assumptions and the politics that underlie privacy and data protection regulation (e.g., Cohen 2012a, 2012c, 2013, 2015; Kerr 2013; Ohm 2010; Solove 2013). In addition, legal scholars have produced richly detailed and revealing investigations of regulatory and compliance processes; for example, scholars concerned with the operation of “surveillant assemblages” and “digital enclosures” ought to read and consider the important work by Kenneth Bamberger and Deirdre Mulligan on corporate privacy compliance cultures (2011a, 2011b).¶ If Surveillance Studies is to inform the content of laws and the nature of regulatory practice in the domain of commercial profiling and social media, however, **surveillance theorists will need to do more than simply read legal sources.** Work in Surveillance Studies so far has not been particularly well-adapted to helping policymakers figure out what, if anything, to do about evolving practices of commercial surveillance. Once again, **if it is to be useful to policymakers, the view from Surveillance Studies requires translation into a form that might furnish a framework for action.** Here I want to identify three important sets of questions on which Surveillance Studies scholars who want their work to make a difference might take their cues from legal scholarship.¶ An initial set of questions concerns how to redefine privacy and data protection in functional terms that do not presuppose the stable, liberal self, and that instead offer real benefit to the situated subjects who might claim their protection. David Lyon (2001) has argued that the organizing concepts of “privacy” and “data protection” are inadequate to comprehend surveillance as a mode of social ordering. From a sociological perspective that is undoubtedly right, but privacy and data protection still might be made effective as legal constructs if articulated differently, in ways that correspond more closely to the ways that surveillance shapes experience. That project calls for the sort of theoretical cannibalization that makes Ph.D. committees in Real Disciplines nervous, but at which legal scholars excel. With some trepidation, I offer my own work on privacy as boundary management for the postliberal self (Cohen 2012a, 2013), as well as Valerie Steeves’ (2009) work on relational subjectivity, as examples of the sort of exercise that is necessary to reframe the effects of surveillance as social ordering in ways to which legal systems can respond. For law to develop a sustainable and effective approach to regulating data protection and protecting privacy, the ways of theorizing about the subject represented by these projects must become second nature, not only for scholars but also and more importantly for legislatures, regulators, and courts. That in turn requires second process of translation, from the language of academia into a vernacular that can supply inputs into policy processes.¶ A second set of questions concerns how to

understand what constitutes privacy harm in an era in which some surveillance is a constant. To the Surveillance Studies reader this may seem to be a variation on the first question, but it is different: in law, harm is what makes violation of an interest actionable, and the potential for harm is what creates the predicate for comprehensive regulation of particular domains of activity. Harm need not be individualized or monetizable; environmental regulations and financial market regulations address systemic and often nonmonetizable risk. But it must be reasonably definite; talk of power, power everywhere is plainly insufficient and it should come as no surprise that policymakers find it risible. Work on this problem is still preliminary, but here legal scholarship has a leg up because it deals in practicalities. Surveillance Studies scholars might profitably read works by Danielle Citron (2007) and Paul Ohm (2010) that identify and name the systemic risks associated with leaky and largely unregulated data reservoirs, and that draw on resources ranging from the history of tort law to computational science to craft recommendations for more effective regulatory strategies.¶ A final set of questions concerns the design of governance mechanisms. As we have already seen, the flows of surveillance within social media create novel institutional design challenges. In the domain of commercial profiling, many activities on the business-facing side of personal information markets, removed from consumer-facing processes that purport to ensure notice and choice, have eluded regulatory scrutiny entirely. Some of the classic works on privacy governance originate within the Surveillance Studies tradition; these include Priscilla Regan's (1995) study of the way privacy legislation emerges within the U.S. political system and Colin Bennett and Charles Raab's (2006) work on privacy governance and the emergence of data protection as a regulatory paradigm. But the question of governance badly needs to be revisited; in particular, Surveillance Studies scholars have not yet engaged with the "new privacy governance" now emerging as official policy in the U.S. (and as de facto policy in the European Union) in a sustained and meaningful way. Works by legal scholars on the political, epistemological, and normative dimensions of the new governance (e.g., Bamberger 2010; Cohen 2012b, 2013; Freeman 2000; Lobel 2004) offer starting points for an inquiry that moves beyond "doing Surveillance Studies" to consider the more pressing challenge of doing surveillance regulation wisely and effectively.¶ Conclusion: Doing Law-and-Surveillance-Studies Differently¶ The prospects for fruitful interchange and collaboration between legal scholars and Surveillance Studies scholars are likely to remain complicated by pronounced differences in underlying theoretical orientation. But since Surveillance Studies is itself an interdisciplinary (Garber 2001), and since legal scholarship has thrived on interdisciplinary exploration, the prospects for effective communication also seem reasonably good. **Bridging the gaps requires**, first and foremost, efforts by emissaries from both traditions to foster a more tolerant and curious dialogue directed toward improved understanding and, ultimately, toward **methodological hybridization**. **Within one's own academic community, it can become too easy to mistake consensus** on methodological conventions **for epistemological rigor**, and to forget that methodological strength also derives from refusal to be hemmed in by disciplinary boundaries.¶ From the standpoint of theory, a more sustained dialogue between **law and Surveillance Studies would count as a success if it** produced a mode of inquiry about surveillance that **melded** the theoretical sophistication of Surveillance Studies **with lawyerly attention to the details, mechanisms, and interests that constitute surveillance practices as legal practices, and to the kinds of framing that mobilize legal and policy communities**. To do Surveillance Studies better, legal scholars need to challenge their own preference for putting problems in categories that fit neatly within the liberal model of human nature and behavior, and Surveillance Studies scholars can help by calling attention to the social and cultural processes within which surveillance practices are embedded. **Surveillance Studies scholars need to do more to resist their own penchant for totalizing dystopian narratives, and should delve more deeply into the legal and regulatory realpolitik that surrounds the administration of surveillance systems; legal scholars can help by demystifying legal and regulatory processes.**¶ From a legal scholar's perspective, however, theory achieves its highest value when it becomes a tool for forcing productive confrontations about how to respond to real problems. And so I think it would count as an even bigger success if dialogue between law and Surveillance Studies generated not only a hybridized theoretical discourse of law-and-Surveillance-Studies but also **the beginnings of a more accessible policy discourse about surveillance and privacy, along with reform proposals designed to put the animating concepts behind such a discourse into practice**. Here the goal would be a hybridization between law's ingrained pragmatism and Surveillance Studies' attentiveness to the social and cultural processes through which surveillance is experienced and assimilated. Working together, **legal scholars and Surveillance Studies scholars might advance** the project of formulating working definitions of privacy interests and harms, and might develop more sophisticated projections of the likely effects of different **policy levers that could be brought to bear on systems of surveillance**.

Next is Mechanism Education

The Aff's failure to identify an agent and mechanism makes cost-benefits analysis impossible, meaning debates take place in an academic vacuum where tradeoffs are irrelevant. It makes link comparisons vacuous and means that detailed PICs about substance are all but impossible.

And this turns the Aff – debates over mechanisms for change are crucial to solve material violence on a large scale

Capulong 9 (Assistant Professor of Law, University of Montana)

(Eduardo R.C., CLIENT ACTIVISM IN PROGRESSIVE LAWYERING THEORY, CLINICAL LAW REVIEW, 16 Clinical L. Rev. 109, Fall, 2009)

Motivating client activism under dynamic social conditions requires the development and constant assessment and reassessment of a political perspective that measures that resistance and its possibilities. That task in turn requires the development of specific activist goals within the context of such analyses, and perhaps broader, national and international strategy--what some call the political "next step." This is particularly true today, when the economic crisis plaguing capitalism, the "war on terror" and climate change undeniably have world-wide dimensions. Instances of failure, too, need to be part of that analysis, because they teach us much about why otherwise promising activist efforts do not become sustained mass movements of the sort to which we all aspire.¶ Thus, the theoretical need is two-fold: to construct a broader organizing perspective from a political standpoint, and to consider activism writ large. Without reading the pulse of prevailing social conditions, it is easy to miscalculate what that next step ought to be. We will not build a mass movement though sheer perseverance--a linear, idealist conception of change at odds with dynamic social conditions. By the same token, we may underestimate the potential of such mass activism if we focus simply on the local dimensions of our work.¶ The dialectic between a dynamic social context and political consciousness and action requires a constant organizational and political calibration and modulation often missing from theoretical scholarship.

Without such a working perspective, we are apt to be either ultra-left or overly conservative. As Jim Pope put it recently in the context of new forms of labor organizing: "If we limit our vision of the future to include only approaches that work within the prevailing legal regime and balance of forces, then we are likely to be irrelevant when and if the opportunity for a paradigm shift arises." n449 The cyclical nature of labor organizing, he argues, mirrors politics generally:¶ American political life as a whole has likewise alternated between periods characterized by public action, idealism, and reform on the [189] one hand, and periods of private interest, materialism, and retrenchment on the other. A prolonged private period spawns orgies of corruption and extremes of wealth and poverty that, sooner or later, ignite passionate movements for reform. n450¶ C. "Activism": Towards a Broader, Deeper, Systematic Framework¶ In progressive lawyering theory, grassroots activism is frequently equated with "community organizing" and "movement" or "mobilization" politics. n451 Indeed, these methods have come to predominate activist lawyering in much the same way as "public interest law" has come for many to encompass all forms of progressive practice. "Activism" is, of course, broader still. Even on its own terms, the history of community organizing and social movements in the United States includes two vitally important traditions frequently given short shrift in this realm: industrial union organizing and alternative political party-building. n452 In this section, my aim is not to catalogue the myriad ways in which lawyers and clients can and do become active (methodically or institutionally)--which, given human creativity and progress, in any event may be impossible to do--but rather to problematize three assumptions: first, the tendency to define grassroots activity narrowly; second, the notion that certain groups--for example "the poor" or the "subordinated"--are the definitive agents of social change; and finally, the conviction that mass mobilization or movement-building, by itself, is key to social transformation.¶ 1. Grassroots Activism¶ There are countless ways in which people become socially or politically active. Yet even the more expansive and sophisticated considerations of activism in progressive lawyering theory tend to unnecessarily circumscribe activism. For example, Cummings and Eagly argue that we need to "unpack" the term "organizing." n453 Contrasting two strategies of the welfare rights movement in the 1960s, these authors distinguish between "mobilization as short-term community action and organizing as an effort to build long-term institutional power." n454 In the same breath, however, they define organizing "as shorthand for a range of community-based practices." n455 even though at least some activism, for example union organizing or, say, [190] fasting, might not be best characterized as "community-based."¶ What is required is a larger framework that takes into account the sum total of activist initiatives. Lucie White argues that we need to "map out the internal microdynamics of progressive grassroots initiatives ... observe the multiple impacts of different kinds of initiatives on wide spheres of social and political life ... and devise typologies, or models, or theories that map out a range of opportunities for collaboration." n456 This map would be inadequate--and therefore inaccurate--if we include certain activist initiatives and not others. But that is precisely what the progressive lawyering literature has done by failing to regularly consider, for example, union organizing or alternative political party-building.¶ 2. Agents of Social Change: Identity, Class and Political Ideology As with our definition of activism, here, too, the problem is a lack of clarity, breadth or scope, which leads to misorientation. Have we defined, with theoretical precision, the social-change agents to whom we are orienting--e.g., the "people," the "poor," the "subordinated," "low-income communities" or "communities of color?" And if so, are these groupings, so defined, the primary agents of social change? By attempting to harmonize three interrelated (yet divergent) approaches to client activism--organizing on the bases of geography and identity, class and the workplace, and political ideology--modern community organizing simultaneously blurs and balkanizes the social-change agents to whom we need to orient. What, after all, is "community?" In geographic terms, local efforts alone cannot address social problems with global dimensions. n457 As Pope observed of workers' centers: "the tension between the local and particularistic focus of community unionism and the global scope of trendsetting corporations like Wal-Mart makes it highly unlikely that community unionism will displace industrial unionism as 'the' next paradigm of worker organization." n458 On the other hand, members of cross-class, identity-based "communities" may not necessarily share the same interests. In the "Asian American community," Anchetta explains: using the word "community" in its singular form is often a misnomer, because Asian Pacific Americans comprise many communities, each with its own history, culture and language: Filipino, Chinese, Japanese, Korean, Vietnamese, Thai, Cambodian, Lao, Lao-Mien, [191] Hmong, Indian, Indonesian, Malaysian, Samoan, Tongan, Guamanian, Native Hawaiian, and more. The legal problems facing individuals from different communities defy simple categorization. The problems of a fourth-generation Japanese American victim of job discrimination, a monolingual refugee from Laos seeking shelter from domestic violence, an elderly immigrant from the Philippines trying to keep a job, and a newcomer from Western Samoa trying to reunite with relatives living abroad all present unique challenges. Add in factors such as gender, sexual orientation, age, and disability, and the problems become even more complex. n45 Angela Harris echoes this observation by pointing out how some feminist legal theory assumes "a unitary, 'essential' women's experience [that] can be isolated and described independently of race, class, sexual orientation, and other realities of experience." n460 The same might be said of the "people," which, like the "working class," may be too broad. Other categorizations--such as "low-income workers," "immigrants", and the "poor", for example--may be too narrow to have the social weight to fundamentally transform society. In practice, progressive lawyers orient to the politically advanced among these various "communities." In so doing, then, we need to acknowledge that we are organizing on the basis of political ideology, and not simply geography, identity or class. Building the strongest possible mass movement, therefore, requires an orientation not only towards certain "subordinated" communities, but to the politically advanced generally. Otherwise, we may be undermining activism writ large. This is not to denigrate autonomous community efforts. As I have mentioned, subordinated communities of course have the right to self-determination, i.e. to organize separately. But the point is not simply to organize groups of people who experience a particular oppression, but rather to identify those who have the social power to transform society. Arguing that these agents are the collective, multi-racial working class, Smith explains: The Marxist definition of the working class has little in common with those of sociologists. Neither income level nor self-definition are [sic] what determine social class. Although income levels obviously bear some relationship to class, some workers earn the same or higher salaries than some people who fall into the category of middle class. And many people who consider themselves "middle [192] class" are in fact workers. Nor is class defined by categories such as white and blue collar. For Marx the working class is defined by its relationship to the means of production. Broadly speaking,

those who do not control the means of production and are forced to sell their labor power to capitalists are workers. n461 The practical consequence of this very well may be that we redefine who we represent as clients and consider activism or potential activism outside subordinated communities, for example union activity and alternative political-party building, as part of our work.¶ 3.

From Movementism to Political Organization¶ Dogged as our work is in the activist realm, any effort at fundamental social transformation is doomed without effective political leadership. Such leadership, in turn, requires work not often associated with "activism," such as, for example, theoretical study. n462 "Movementism," n463 by which I mean the conviction that building a mass movement is the answer to oppression and exploitation, has its limitations. Even though activism itself is perhaps the best school for political education, we have an enormous amount to learn from our predecessors.

In the final analysis, fundamental social transformation will only come about if there are political organizations clear enough, motivated enough, experienced enough, large enough, embedded enough and agile enough to respond to the twists and turns endemic in any struggle for power. "The problem," as Bellow astutely observed, "is not our analytic weaknesses, but the opportunistic, strategic, and political character of our subject." n464 Such opportunities typically occur when there is a confluence of three factors: a social crisis; a socio-economic elite that finds

itself divided over how to overcome it; and a powerful mass movement from below. As I understand the nature of social change, successful social transformations occur when there is a fourth element: political organization.¶ Conclusion¶ Client activism is not a monolithic, mechanical object. Most of the time, it is neither the gathering mass movement many of us wish for, nor the inert, atomized few in need of external, professional motivation. Rather, activism is a phenomenon in constant ebb and flow, a [1933] mercurial, fluid complex shaped by an unremitting diversity of factors. The key through the maze of lawyering advice and precaution is therefore to take a hard, sober look at the overarching state of activism. Are our clients in fact active or are they not? How many are and who are they? What is the nature of this period? Economically? Politically? Culturally? What are the defining issues? What political and organizing trends can be discerned? With which organizations are our clients active, if any?

What demands are they articulating, and how are they articulating them?¶ This is a complex evaluation, one requiring the formulation, development and constant assessment and reassessment of an overarching political perspective. My aim in this Article is to begin to theorize the various approaches to this evaluation. In essence, I am arguing for the elaboration of a systematic macropolitical analysis in progressive lawyering theory. Here, my purpose is not to present a comprehensive set of political considerations, but rather to develop a framework for, and to investigate the limitations of, present considerations in three areas: strategic aims; prevailing social conditions; and methods of activism. Consciously or not, admittedly or not, informed and systematic or not, progressive lawyers undertake their work with certain assumptions, perspectives and biases. Progressive lawyering theory would be a much more effective and concrete guide to action—to defining the lawyer's role in fostering activism—if it would elaborate on these considerations and transform implicit and perhaps delimited assumptions and approaches into explicit and hopefully broader choices.¶

Over the past four decades, there has been remarkable continuity and consistency in progressive lawyers' use of litigation, legislation, direct services, education and organizing to stimulate and support client activism. The theoretical "breaks" to which Buchanan has referred n465 have not been so much about the practice of lawyering itself, but rather about unarticulated shifts in ultimate goals, societal analyses, and activist priorities, each necessitated by changes in the social, economic, and political context. That simply is another way of stating the obvious: that progressive lawyers change their practices to adapt to changing circumstances. The recurrent problem in progressive lawyering theory is that many commentators have tended to generalize these practice changes to apply across social circumstances. In so doing, they displace and often replace more fundamental differences over strategic goals, interpretation of social contexts, and organizing priorities with debates over the mechanics of lawyering practice.¶ The argument is turned on its head: we often assume or tend to [194] assume agreement over the meanings and underlying conceptual frameworks relating to "fundamental social change," current political analysis, and "community organizing," and debate lawyering strategy and tactics; but instead we should be elaborating and clarifying these threshold political considerations as a prerequisite to using what we ultimately agree to be a broad and flexible set of lawyering tools. In effect, the various approaches to lawyering have become the currency by which scholars have debated politics and activism. The irony is that our disagreements are less about lawyering approaches per se, I believe, than they are about our ultimate political objectives, our analyses of contemporary opportunities, and our views of the optimal paths from the latter to the former. The myriad lawyering descriptions and prescriptions progressive lawyering theory offers are of limited use unless they are anchored in these primary considerations. How do we decide if we should subscribe to "rebellious" and not traditional "public interest" lawyering, for example, or "collaborative" over "critical" lawyering, if we do not interrogate these questions and instead rush too quickly into practical questions? The differences among these approaches matter precisely because they have different political goals, are based on different political analyses, and employ different political activist strategies.¶ Activist lawyers already engage in these analyses—necessarily so. To foster client activism, they must read prevailing social conditions and strategize with their clients about the political next step, often with an eye toward a long-term goal. But I don't think we necessarily engage in these analyses as consciously, or with as full a picture of the history and dynamics involved or options available, as we could. Often this is because there simply isn't time to engage these questions. Or perhaps not wanting to dominate our clients, we squelch our own political analysis and agenda to allow for organic, indigenous leadership from below. But if we are truly collaborative—and when we feel strongly enough about certain political issues—we engage on issues and argue them out. In either event, we undertake an unsystematic engagement of these fundamental issues at our peril.¶

If we adhere to the belief that only organized, politicized masses of people can alter or replace exploitative and oppressive institutions and bring about lasting fundamental social change, then, as progressive lawyers, we need to be clear about which legal tactics can bring about such a sustained effort in each historical moment. Without concrete and comprehensive diagnoses of ultimate political goals, social and economic contexts, and organizing priorities, progressive legal practice will fail to live up to its potential.

Now the State debate

We do not need to win that the state is good, rather just that the value of the state is something that should be debated about. This is the screen you should adopt for the Aff's ev – it can't just say that the state is bad or ineffective, their ev has to say that the state should not even be discussed. General indictments of the state can be done on the neg, while still preserving limited and effective debate and research.

First, engaging with the law is inevitable and can be effective

Capulong 9 (Assistant Professor of Law, University of Montana)

(Eduardo R.C., CLIENT ACTIVISM IN PROGRESSIVE LAWYERING THEORY, CLINICAL LAW REVIEW, 16 Clinical L. Rev. 109, Fall, 2009)

Nevertheless, in contrast to what Steve Bachmann has called the [*116] "a-legal" or "crude Marxist" approach, n19 progressive activists recognize that the legal arena remains a forum for social struggle. n20 This is so for three reasons: First, activists often do not have a choice but to work within the legal system, as when they are arrested or otherwise prevented from engaging in activism by state authorities. Second, because law is relatively autonomous from economic and political interests, n21 campaigns for legal reform can win substantial gains and are frequently the only vehicles through which more far-reaching change takes shape; struggles for reform, in other words, beget more radical possibilities and aspirations. n22 And third, law is constitutive of the social order. Law--or, more accurately, the concept of it--is not (again as some crude analysts would argue) simply a tool of one ruling class or other, but rather an essential component of a just society. n23 Commentators observe that lawyers who base their practice on these three premises are "hungry for theory," n24 for theory checks the "occupational hazards [of] reformism or cynicism." n25 The theoretical project is thus a dialectic: while law reform alone cannot "disturb the basic political and economic organization of modern American society," n26 [*117] law and lawyering are "a complex, contradictory, and open-textured setting that provides opportunities to challenge the status quo."

Second, debate about arcane legal details are crucial to the short-term survival of oppressed populations. Outside of the law being good or bad, legal education is crucial to empower even the most revolutionary of movements.

Arkles et al 10

(Gabriel Arkles, Pooja Gehi and Elana Redfield, The Role of Lawyers in Trans Liberation: Building a Transformative Movement for Social Change, Seattle Journal for Social Justice, 8 Seattle J. Soc. Just. 579, Spring / Summer, 2010, LN)

While agenda-setting by lawyers can lead to the replication of patterns of elitism and the reinforcement of systems of oppression, we do believe that legal work is a necessary and critical way to support movements for social justice. We must recognize the limitations of the legal system and learn to use that to the advantage of the oppressed. If lawyers are going to support work that dismantles oppressive structures, we must radically rethink the roles we can play in building and supporting these movements and acknowledge that our own individual interests or even livelihood may conflict with doing radical and transformative work. n162 A. Community Organizing for Social Justice When we use the term community organizing or organizing, we refer to the activities of organizations engaging in base-building and leadership development of communities directly impacted by one or more social [*612] problems and conducting direct action issue campaigns intended to make positive change related to the problem(s). In this article, we discuss community organizing in the context of progressive social change, but community-organizing strategies can also be used for conservative ends. Community organizing is a powerful means to make social change. A basic premise of organizing is that inappropriate imbalances of power in society are a central component of social injustice. In order to have social justice, power relationships must shift. In Organizing for Social Change: Midwest Academy Manual for Activists (hereinafter, "the Manual"), n163 the authors list three principles of community organizing: n164 (1) winning real, immediate, concrete improvements in people's lives; (2) giving people a sense of their own power; and (3) altering the relations of power. n165 Before any of these principles can be achieved it is necessary to have leadership by the people impacted by social problems. n166 As Rinku Sen points out: [E]ven allies working in solidarity with affected groups cannot rival the clarity and power of the people who have the most to gain and the least to lose . . . organizations composed of people whose lives will change when a new policy is instituted tend to set goals that are harder to reach, to compromise less, and to stick out a fight longer. n167 She also notes that, "[I]f we are to make policy proposals that are grounded in reality and would make a difference either in peoples' lives or in the debate, then we have to be in touch with the people who are at the center of such policies. n168 We believe community organizing has the potential to make fundamental social change that law reform strategies or "movements" led by lawyers cannot achieve on their own. However, community organizing is not always just and effective. Community-organizing groups are not immune to any number of problems that can impact other organizations, including internal oppressive dynamics. In fact, some strains of white, male-dominated [*613] community organizing have been widely criticized as perpetuating racism and sexism. n169 Nonetheless, models of community organizing, particularly as revised by women of color and other leaders from marginalized groups, have much greater potential to address fundamental imbalances of power than law reform strategies. They also have a remarkable record of successes. Tools from community organizers can help show where other strategies can fit into a framework for social change. The authors of the Manual, for example, describe various strategies for addressing social issues and illustrate how each of them may, at least to some extent, be effective. n170 They then plot out various forms of making social change on a continuum in terms of their positioning with regard to existing social power relationships. n171 They place direct services at the end of the spectrum that is most accepting of existing power relationships and community organizing at the end of the spectrum that most challenges existing power relationships. n172 Advocacy organizations are listed in the middle, closer to community organizing than direct services. n173 The Four Pillars of Social Justice Infrastructure model, a tool of the Miami Workers Center, is somewhat more nuanced than the Manual. n174 According to this model, four "pillars" are the key to transformative social justice. n175 They are (1) the pillar of service, which addresses community needs and stabilizes community members' lives; (2) the pillar of policy, which changes policies and institutions and achieves concrete gains with benchmarks for progress; (3) the pillar of consciousness, which alters public opinion and shifts political parameters through media advocacy and popular education; and (4) the pillar of power, which achieves autonomous community power through base-building and leadership development. n176 According to the Miami Workers Center, all of these pillars are essential in making social change, but the pillar of power is most crucial in the struggle to win true liberation for all oppressed communities. n177 [*614] In their estimation, our movements suffer when the pillar of power is forgotten and/or not supported by the other pillars, or when the pillars are seen as separate and independent, rather than as interconnected, indispensable aspects of the whole infrastructure that is necessary to build a just society. n178 Organizations with whom we work are generally dedicated solely to providing services, changing policies, or providing public education. Unfortunately, each of these endeavors exists separate from one another and perhaps most notably, separate from community organizing. In SRLP's vision of change, this separation is part of maintaining structural capitalism that seeks to maintain imbalances of power in our

society. Without incorporating the pillar of power, service provision, policy change, and public education can never move towards real social justice. n179 B. Lawyering for Empowerment In the past few decades, a number of alternative theories have emerged that help lawyers find a place in social movements that do not replicate oppression. n180 Some of the most well-known iterations of this theme are "empowerment lawyering," "rebellious lawyering," and "community lawyering." n181 These perspectives share skepticism of the efficacy of impact litigation and traditional direct services for improving the conditions faced by poor clients and communities of color, because they do not and cannot effectively address the roots of these forms of oppression. n182 Rather, these alternative visions of lawyering center on the empowerment of community members and organizations, the elimination of the potential for dependency on lawyers and the legal system, and the collaboration between lawyers and directly impacted communities in priority setting. n183 Of the many models of alternative lawyering with the goal of social justice, we will focus on the idea of "lawyering for empowerment," generally. The goal of empowerment lawyering is to enable a group of people to

gain control of the forces that affect their lives. n184 Therefore, the goal of empowerment lawyering for low-income transgender people of [*615] color is to support these communities in confronting the economic and social policies that limit their life chances.¶ Rather than merely representing poor people in court and increasing access to services, the role of the community or empowerment lawyer involves:¶ organizing, community education, media outreach, petition drives, public demonstrations, lobbying, and shaming campaigns . . . [I]ndividuals and members of community-based organizations actively work alongside organizers and lawyers in the day-to-day strategic planning of their case or campaign. Proposed solutions--litigation or non-litigation based--are informed by the clients' knowledge and experience of the issue. n185¶ A classic example of the complex role of empowerment within the legal agenda setting is the question of whether to take cases that have low chances of success. The traditional approach would suggest not taking the case, or settling for limited outcomes that may not meet the client's expectations. However, when our goals shift to empowerment, our strategies change as well. If we understand that the legal system is incapable of providing a truly favorable outcome for low-income transgender clients and transgender clients of color, then winning and losing cases takes on different meanings.¶ For example, a transgender client may choose to bring a lawsuit against prison staff who sexually assaulted her, despite limited chance of success because of the "blue wall of silence," her perceived limited credibility as a prisoner, barriers to recovery from the Prison Litigation Reform Act, and restrictions on supervisory liability in § 1983 cases. Even realizing the litigation outcome will probably be unfavorable to her, she may still develop leadership skills by rallying a broader community of people impacted by similar issues. Additionally, she may use the knowledge and energy gained through the lawsuit to change policy. If our goal is to familiarize our client with the law, to provide an opportunity for the client [*616] and/or community organizers to educate the public about the issues, to help our client assess the limitations of the legal system on their own, or to play a role in a larger organizing strategy, then taking cases with little chance of achieving a legal remedy can be a useful strategy.¶

Lawyering for empowerment means not relying solely on legal expertise for decisionmaking. It means recognizing the limitations of the legal system, and using our knowledge and expertise to help disenfranchised communities take leadership. If community organizing is the path to social justice and "organizing is about people taking a role in determining their own future and improving the quality of life not only for themselves but for everyone," then "the primary goal [of empowerment lawyering] is building up the community." n186¶ C. Sharing Information and Building Leadership¶ A key to meaningful participation in social justice movements is access to information. Lawyers are in an especially good position to help transfer knowledge, skills, and information to disenfranchised communities--the legal system is maintained by and predicated on arcane knowledge that lacks relevance in most contexts but takes on supreme significance in courts, politics, and regulatory agencies. It is a system intentionally obscure to the uninitiated; therefore the lawyer has the opportunity to expose the workings of the system to those who seek to destroy it, dismantle it, reconfigure it, and re-envision it.¶ As Quigley points out, the ignorance of the client enriches the lawyer's power position, and thus the transfer of the power from the lawyer to the client necessitates a sharing of information. n187 Rather than simply performing the tasks that laws require, a lawyer has the option to teach and to collaborate with clients so that they can bring power and voice back to their communities and perhaps fight against the system, become politicized, and take leadership. "This demands that the lawyer undo the secret wrappings of the legal system and share the essence of legal advocacy--doing so lessens the mystical power of the lawyer, and, in practice, enriches the advocate in the sharing and developing of rightful power." n188¶

Lawyers have many opportunities to share knowledge and skills as a form of leadership development. This sharing can be accomplished, for example, through highly collaborative legal representation, through community clinics, through skill-shares, or through policy or campaign meetings where the lawyer explains what they know about the existing structures and fills in gaps and questions raised by activists about the workings of legal systems.¶ D. Helping to Meet Survival Needs¶ SRLP sees our work as building legal services and policy change that directly supports the pillar of power. n189 Maintaining an awareness of the limitations and pitfalls of traditional legal services, we strive to provide services in a larger context and with an approach that can help support liberatory work. n190 For this reason we provide direct legal services but also work toward leadership development in our communities and a deep level of support for our community-organizing allies.¶ Our approach in this regard is to make sure our community members access and obtain all of the benefits to which they are entitled under the law, and to protect our community members as much as possible from the criminalization, discrimination, and harassment they face when attempting to live their lives. While we do not believe that the root causes keeping our clients in poverty and poor health can be addressed in this way, we also believe that our

clients experience the most severe impact from state policies and practices and need and that they deserve support to survive them. n191 Until our

communities are truly empowered and our systems are fundamentally changed to increase life chances and health for transgender people who are low-income and people of color, our communities are going to continue to have to navigate government agencies and organizations to survive.

Monolithic rejections of the law are wrong – cooption is more likely in non-state activism and fails to compare to alternative mechanisms for change. Concrete mechanisms for success should be your metric for evaluation.

Lobel 7 (Assistant Professor of Law, University of San Diego)

(Orly, THE PARADOX OF EXTRALEGAL ACTIVISM: CRITICAL LEGAL CONSCIOUSNESS AND TRANSFORMATIVE POLITICS, 120 Harv. L. Rev. 937, February, 2007, LN)

In the following sections, I argue that the extralegal model has suffered from the same drawbacks associated with legal cooptation. I show that as an effort to avoid the risk of legal cooptation, the current wave of suggested alternatives has effects that ironically mirror those of cooptation itself. Three central types of difficulties exist with contemporary extralegal scholarship. First, in the contexts of the labor and civil rights movements, arguments about legal cooptation often developed in response to a perceived gap between the conceptual ideal toward which a social reform group struggled and its actual accomplishments. But, ironically, the contemporary message of opting out of traditional legal reform avenues may only accentuate this problem. As the rise of informalization (moving to nonlegal strategies), civil society (moving to extralegal spheres), and pluralism (the proliferation of norm-generating actors) has been effected and appropriated by supporters from a wide range of political commitments, these concepts have had unintended implications that conflict with the very social reform ideals from which they stem. Second, the idea of opting out of the legal arena becomes self-defeating as it discounts the ongoing importance of law and the possibilities of legal reform in seemingly unregulated spheres. A model encompassing exit and rigid sphere distinctions further fails to recognize a reality of increasing interpenetration and the blurring of boundaries between private and public spheres, profit and nonprofit sectors, and formal and informal institutions. It therefore loses the critical insight that law operates in the background of seemingly unregulated relationships. Again paradoxically, the extralegal view of decentralized activism and the division of society into different spheres in fact have worked to subvert rather than support the progressive agenda. Finally, since extralegal actors view their actions with romantic idealism, they fail to develop tools for evaluating their success. If the critique of legal cooptation has involved the argument that legal reform, even when viewed as a victory, is never radically transformative, we must ask: what are the criteria for assessing the achievements of the suggested alternatives? As I illustrate in the following sections, much of the current scholarship obscures the lines between the descriptive and the prescriptive in its formulation of social activism. If current suggestions present themselves as alternatives to formal legal struggles, we must question whether the new extralegal politics that are proposed and celebrated are capable of producing a constructive theory and meaningful channels for reform, rather than passive status quo politics.¶ A. Practical Failures: When Extralegal Alternatives Are Vehicles for Conservative Agendas¶ We don't want the 1950s back. What we want is to edit them. We want to keep the safe streets, the friendly grocers, and the milk and cookies, while blotting out the political bosses, the tyrannical headmasters, the inflexible rules, and the lectures on 100 percent Americanism and the sinfulness of dissent. n163¶ A basic structure of cooptation arguments as developed in relation to the labor and civil rights movements has been to show how, in the move from theory to practice, the ideal that was promoted by a social group takes on unintended content, and the group thus fails to realize the original vision. This risk is particularly high when ideals are framed in broad terms that are open to multiple interpretations. Moreover, the pitfalls of the potential risks presented under the umbrella of cooptation are in fact accentuated in current proposals. Paradoxically, as the extralegal movement is framed by way of opposition to formal legal reform paths, without sufficiently defining its goals, it runs the very risks it sought to avoid by working outside the legal system.¶ Extralegal paths are depicted mostly in negative terms and as resorting to new alternative forms of action rather than established models. Accordingly, because the ideas of social organizing, civil society, and legal pluralism are framed in open-ended contrarian terms, they do not translate into specific visions of social justice reform. The idea of civil society, which has been embraced by people from a broad array of often conflicting ideological commitments, is particularly demonstrative. Critics argue

that "some ideas fail because they never make the light of day. The idea of civil society ... failed because it [*972] became too popular." n164 Such a broadly conceived ideal as civil society sows the seeds of its own destruction.¶ In former eras, the claims about the legal cooptation of the transformative visions of workplace justice and racial equality suggested that through legal strategies the visions became stripped of their initial depth and fragmented and framed in ways that were narrow and often merely symbolic. This observation seems accurate in the contemporary political arena; the idea of civil society revivalism evoked by progressive activists has been reduced to symbolic acts with very little substance. On the left, progressive advocates envision decentralized activism in a third, nongovernmental sphere as a way of reviving democratic participation and rebuilding the state from the bottom up. By contrast, the idea of civil society has been embraced by conservative politicians as a means for replacing government-funded programs and steering away from state intervention. As a result, recent political uses of civil society have subverted the ideals of progressive social reform and replaced them with conservative agendas that reject egalitarian views of social provision.¶ In particular, recent calls to strengthen civil society have been advanced by politicians interested in dismantling the modern welfare system. Conservative civil society revivalism often equates the idea of self-help through extralegal means with traditional family structures, and blames the breakdown of those structures (for example, the rise of the single parent family) for the increase in reliance and dependency on government aid. n165 This recent depiction of the third sphere of civic life works against legal reform precisely because state intervention may support newer, nontraditional social structures. For conservative thinkers, legal reform also risks increasing dependency on social services by groups who have traditionally been marginalized, including disproportionate reliance on public funds by people of color and single mothers. Indeed, the end of welfare as we knew it, n166 as well as the [*973] transformation of work as we knew it, n167 is closely related to the quest of thinkers from all sides of the political spectrum for a third space that could replace the traditional functions of work and welfare. Strikingly, a range of liberal and conservative visions have thus converged into the same agenda, such as the recent welfare-to-work reforms, which rely on myriad non-governmental institutions and activities to support them. n168¶ When analyzed from the perspective of the unbundled cooptation critique, it becomes evident that there are multiple limits to the contemporary extralegal current. First, there have been significant problems with resources and zero-sum energies in the recent campaigns promoting community development and welfare. For example, the initial vision of welfare-to-work supported by liberal reformers was a multifaceted, dynamic system that would reshape the roles and responsibilities of the welfare bureaucracy. The Personal Responsibility and Work Opportunity Reconciliation Act of 1996 n169 (PRWORA), supported by President Clinton, was designed to convert various welfare programs, including Aid to Families with Dependent Children, into a single block grant program. The aim was to transform passive cash assistance into a more active welfare system, in which individuals would be better assisted, by both the government and the community, to return to the labor force and find opportunities to support themselves. Yet from the broad vision to actual implementation, the program quickly became limited in focus and in resources. Indeed, PRWORA placed new limits on welfare provision by eliminating eligibility categories and by placing rigid time limits on the provision of benefits. n170¶ Moreover, the need to frame questions relating to work, welfare, and poverty in institutional arrangements and professional jargon and to comply with various funding block grants has made some issues, such as the statistical reduction of welfare recipients, more salient, whereas other issues, such as the quality of jobs offered, have been largely eliminated from policymakers' consideration. Despite aspects of the reform that were hailed as empowering for those groups they were designed to help, such as individual private training vouchers, serious questions have been raised about the adequacy of the particular [*974] policy design because resources and institutional support have been found lacking. n171 The reforms require individual choices and rely on the ability of private recipients to mine through a vast range of information. As in the areas of child care, health care, and educational vouchers, critics worry that the most disadvantaged workers in the new market will not be able to take advantage of the reforms. n172 Under such conditions, the goal of eliminating poverty may be eroded and replaced by other goals, such as reducing public expenses. Thus, recalling the earlier cooptation critique, once reforms are envisioned, even when they need not be framed in legalistic terms, they in some ways become reduced to a handful of issues, while fragmenting, neglecting, and ultimately neutralizing other possibilities.¶ At this point, the paradox of extralegal activism unfolds. While public interest thinkers increasingly embrace an axiomatic rejection of law as the primary form of progress, their preferred form of activism presents the very risks they seek to avoid. The rejected "myth of the law" is replaced by a "myth of activism" or a "myth of exit," romanticizing a distinct sphere that can better solve social conflict. Yet these myths, like other myths, come complete with their own perpetual perils. The myth of exit exemplifies the myriad concerns of cooptation. For feminist agendas, for example, the separation of the world into distinct spheres of action has been a continuous impediment to meaningful reform. Efforts to create better possibilities for women to balance work and family responsibilities, including relaxing home work rules and supporting stay-at-home parents through federal child care legislation, have been couched in terms of support for individual choice and private decisionmaking. n173 Indeed, recent initiatives in federal child care legislation to support stay-at-home parents have been clouded by preconceptions of the separation of spheres and the need to make one-or-the-other life choices. Most importantly, the emergence of a sphere-oriented discourse abandons a critical perspective that distinguishes between valuing traditional gender-based characteristics and celebrating feminine difference in a universalist and essentialist manner. n174 [*975] Not surprisingly then, some feminist writers have responded to civil society revivalism with great skepticism, arguing that efforts to align feminine values and agendas with classic republican theory of civil society activism should be understood, at least in part, as a way of legitimizing historical social structures that subordinated women.¶ The feminist lesson on the law/exit pendulum reveals a broader pattern. In a classic example of cooptation, activists should be concerned about the infusion (or indeed confusion) of nonlegal strategies with conservative privatization agendas. Indeed, in significant social policy contexts, legal scholarship oriented toward the exploration of extralegal paths reinforces the exact narrative that it originally resisted - that the state cannot and should not be accountable for sustaining and improving the lifeworld of individuals in the twenty-first-century economy and that we must seek alternative ways to bring about social reform. Whether using the terminology of a path-dependent process, an inevitable downward spiral, a transnational prisoner's dilemma, or a global race to the bottom, current analyses often suggest a lack of control over the forces of new economic

realities. Rather than countering the story of lack of control, pointing to the ongoing role of government and showing the contradictions between that which is being kept regulated and that which is privatized, alternative extralegal scholarship accepts these developments as natural and inevitable. Similar to the arguments developed in relation to the labor movement - in which focusing on a limited right to collective bargaining demobilized workers and stripped them of their voice, participation, and decisionmaking power - contemporary extralegal agendas are limited to very narrow and patterned sets of reforms.¶ A striking example has been the focus on welfare reform as the single frontier of economic redistribution without a connection being made between these reforms and social services in which the middle class has a strong interest, such as Social Security and Medicare. Similarly, on the legal pluralism frontier, when activists call for more corporate social responsibility, the initial expressions are those of broad demands for sustainable development and overall industry obligations for the social and environmental consequences of their activities. n176 The discourse, however, quickly becomes coopted by a shift to a narrow focus on charitable donations and corporate philanthropy or [*976] private reporting absent an institutionalized compliance structure. n177 Moreover, because of institutional limitations and crowding out effects possible in any type of reform agenda, the focus shifts to the benefits of corporate social responsibility to businesses, as marketing, recruitment, public relations, and "greenwashing" strategies. n178 Critics therefore become deeply cynical about the industry's real commitments to ethical conduct.¶ A similar process can be described with regard to the literature on globalization. Globalization scholarship often attempts to produce a unifying narrative and an image of unitary struggle when in fact such unity does not exist. Embodied in the aforementioned irony of a "global anti-globalization" movement, social reform activism that resides under the umbrella of global movements is greatly diverse, some of it highly conservative. An "anti-globalization" movement can be a defensive nationalist movement infused with xenophobia and protective ideologies. n179 In fact, during central instances of collective action, such as those in Seattle, Quebec, Puerto Alegre, and Genoa, competing and conflicting claims were frequently encompassed in the same protest. n180 Nevertheless, there is a tendency to celebrate and idealize these protests as united and world-altering.¶ Similarly, at the local level, grassroots politics often lack a clear agenda and are particularly ripe for cooptation resulting in far lesser achievements than what may have been expected by the groups involved. In a critical introduction to the law and organizing model, Professor Scott Cummings and Ingrid Eagly describe the ways in which new community-based approaches to progressive lawyering privilege grassroots activism over legal reform efforts and the facilitation of community mobilization over conventional lawyering. n181 After carefully unpacking the ways in which community lawyers embrace [*977] law and organizing, Professor Cummings and Eagly rightfully warn against "exaggerating the ineffectiveness of traditional legal interventions" and "closing off potential avenues for redress." n182 Significantly, the strategies embraced by new public interest lawyers have not been shown to produce effective change in communities, and certainly there has been no assurance that these strategies fare comparatively better than legal reform. Moreover, what are meant to be progressive projects of community action and community economic development frequently can have a hidden effect of excluding worse-off groups, such as migrant workers, because of the geographical scope and zoning restrictions of the project. n183 In the same way that the labor and corporate social responsibility movements have failed because of their embrace of a legal framework, the community economic development movement - so diverse in its ideological appeal yet so prominent since the early 1990s as a major approach to poverty relief - may bring about its own destruction by fracture and diffusion. n184¶ In all of these cases, it is the act of engagement, not law, that holds the risks of cooptation and the politics of compromise. It is not the particularities of lawyers as a professional group that create dependency. Rather, it is the dynamics between skilled, networked, and resourced components and those who need them that may submerge goals and create reliance. It is not the particularities of the structural limitations of the judiciary that threaten to limit the progressive vision of social movements. Rather, it is the essential difficulties of implementing theory into practice. Life is simply messier than abstract ideals. Cooptation analysis exposes the broad, general risk of assuming ownership over a rhetorical and conceptual framework of a movement for change. Subsequently, when, in practice, other factions in the political debate embrace the language and frame their projects in similar terms, groups experience a sense of loss of control or possession of "their" vision. In sum, in the contemporary context, in the absence of a more programmatic and concrete vision of what alternative models of social reform activism need to achieve, the conclusions and rhetoric of the contemporary critical legal consciousness are appropriated by advocates representing a wide range of political commitments. Understood [*978] from this perspective, cooptation is not the result of the turn to a particular reform strategy. Rather, cooptation occurs when imagined ideals are left unchecked and seemingly progressive rhetoric is reproduced by a conservative agenda. Dominant interpretations such as privatization and market competitiveness come out ahead, whereas other values, such as group empowerment and redistributive justice, receive only symbolic recognition, and in turn serve to facilitate and stabilize the process. n185

Materialist Feminism K

INC

Focus on micropolitics trades off with large-scale reform—the aff makes materialist feminism impossible which precludes the possibility of change

Ebert 93 (Teresa Ebert, "Ludic Feminism, the Body, Performance, and Labor: Bringing "Materialism" Back into Feminist Cultural Studies", <http://www.jstor.org/stable/1354189>, winter 1992-1993)

Contemporary feminism has, for the most part, retreated from "materialist" politics into a form of "discursive" or what I call "ludic" politics. Broadly, materialist feminism is a political practice aimed at social transformation of dominant institutions that, as a totality, distribute economic resources and cultural power asymmetrically according to gender. But this project has been put in question by postmodern theories that announce the end of transformative politics (indeed, the end of history itself) and substitute a ludic cultural politics in its place. In this essay, I will argue for the possibility of a postmodern feminist cultural studies devoted to materialist politics-transformative social change-and indicate why I find ludic or discursive politics ineffective for feminism. I will thus use a materialist frame to engage both levels of politics: cultural politics (intervening in and changing cultural representations, specifically those concerning gender, sexuality, and race) as well as transformative politics (radical social interventions in the historical economic, political, and labor relations underlying cultural representations). My discussion, however, will focus on a critique of and engagement with cultural politics, first, because cultural politics, in its ludic mode, has become the primary form of dominant feminism and, second, because a materialist critique of cultural representations is an effective inaugural move in opening up a space for transformative politics. Whether postmodernism is seen as what Fredric Jameson calls "the cultural logic of late capitalism" or is associated with the writings of Jean-Francois Lyotard and Jean Baudrillard, with Derridean poststructuralists or Lacanian psychoanalysts, it has intimated the end of transformative politics. In short, the dominant postmodern theories-what I have called "ludic" postmodernism-2-have problematized the notion of politics and rearticulated it as solely a cultural politics: that is, as a language-effect, a mode of rhetoric aimed at changing cultural representations, rather than as a collective practice through which existing social institutions are changed so that (economic) resources and cultural power can be distributed without regard to gender, race, class, sexuality. This prevailing ludic postmodernism has so displaced and discredited politics as emancipation as to make it nearly impossible. After Lyotard, Jacques Derrida, Michel Foucault, and such ludic feminists as Luce Irigaray, Alice Jardine, Susan Suleiman, and Donna Haraway, emancipation-the collective social struggle to end exploitation-becomes simply a metaphysical project: a meta-narrative. The appropriate critical and political stance is thus, in Lyotard's words, an "incredulity toward metanarratives" (The PostmodernConditionxxiv): an incredulity, in short, toward emancipation as the necessary social struggle against "real" systems of exploitation, like patriarchy or capitalism.3 Such social systems (totalities) are, for ludic postmodernists, merely discredited meta-narratives rather than social "realities" to be contested. As a leading ludic social critic, Ernesto Laclau, claims, even "society, as a founding totality . . . is an impossible object" ("Transformations" 40). Moreover, power, as Foucault argues, is now seen as a "multiplicity of force relations" engendering "local and unstable" states of power that are "everywhere" (92-93). Power, then, is diffuse, asystematic, and "aleatory" (that is, marked by chance and arbitrariness) rather than historically determined. It produces its own immanent "plurality of resistances": for as Foucault says, "where there is power, there is resistance" (95), rather like the natural resistance to a physical force. The ludic notion of power, in short, substitutes a logic of contingency for the logic of social necessity. In doing so, it preempts any need for collective, organized social transformation-any need, in other words, for emancipation, and more important, it dispenses with the necessity for organized social and political revolution to overthrow dominant power relations. All we need to do, according to ludic postmodernists, is recognize and validate the multiplicity of local points of resistance power itself already generates. As a result, it is increasingly common to call our

age "postpolitical." The new postmodern culture studies taking hold in the United States, Britain, and a number of Commonwealth countries, notably Canada and Australia, subscribes, in large part, to these ludic assumptions and in the name of the political it becomes, in effect, "postpolitical." Increasingly it substitutes validation for critique and affirmation for opposition. John Fiske, for instance, argues for a "cultural theory that can both account for and validate popular social difference."⁴ In other words, the affirmation of already existing differences (rather than explaining why and how these have become differences) is largely seen as in itself an effective mode of social resistance to the hegemonic. Obviously this position has widespread appeal for many feminist critics—especially for those who regard the affirmation of women's experience, in and of itself, as the political basis for feminism—but we need to ask difficult and by now quite unpopular questions: What is the effect of such validation? Does it affirm "what is" rather than critique how these differences have been produced out of regimes of exploitation—and perhaps support these regimes and even be "necessary" to their continued existence and domination? Can we afford to dispense with critique if we are to transform these regimes and the differences they produce? Is critique necessary to social struggle and to a transformative cultural studies?

Critiquing for critique's sake is useless—the endgoal of all critique is to transform existing institutions

Ebert 93 (Teresa Ebert, "Ludic Feminism, the Body, Performance, and Labor: Bringing "Materialism" Back into Feminist Cultural Studies", <http://www.jstor.org/stable/1354189>, winter 1992-1993)

Perhaps I need to clarify here what I mean by critique. First, I do not regard "critique" as an end in itself. Critique is a practice through which the subject develops historical knowledge of the social totality: she or he acquires, in other words, an understanding of how the existing social institutions ("motherhood," "child care," "love," "paternity," "taxation," "family," etc.) have in fact come about and how they can be changed. Critique, in other words, is that knowledge-practice that historically situates the conditions of possibility of what empirically exists under patriarchal-capitalist labor relations and, more importantly, points to what is suppressed by the empirically existing: what could be (instead of what actually is). Critique indicates, in other words, that what "is" is not necessarily the real/true but rather only the existing actuality which is transformable. The role of critique in resistance postmodern feminism is exactly this: the production of historical knowledges that mark the transformability of existing social arrangements and the possibility of a different social organization—an organization free from exploitation. Quite simply then, critique is a mode of knowing that inquires into what is not said, into the silences and the suppressed or missing, in order to uncover the concealed operations of power and underlying socioeconomic relations connecting the myriad details and seemingly disparate events and representations of our lives. It shows how seemingly disconnected zones of culture are in fact linked through the highly differentiated and dispersed operation of a systematic logic of exploitation informing all practices of society. In sum, critique disrupts that which represents itself as what is, as natural, as inevitable, as the way things are and exposes the way "what is" is historically and socially produced out of social contradictions and how it supports inequality. Critique enables us to explain how gender, race, sexual, and class oppression operate so we can change it. A number of contemporary feminists, from Haraway and Penley to Jane Gallop and Judith Butler, have embraced the ludic mode of postmodern cultural studies and argued for its liberatory potential. But I believe if feminists are to engage in postmodern cultural studies without jeopardizing feminism's political effectiveness, we need to rigorously critique postmodernism's fundamental presuppositions and, above all, to write a materialist politics back into postmodernism. My essay is a contribution to this effort. Thus it insists on a transformative emancipatory politics in postmodernism and on the necessity of critique for an oppositional culture studies. In other words, I contend that the ludic postmodern erasure of the political in the name of discursive difference is only one way of

constructing postmodern difference. In contrast, I want to argue for feminism to radically retheorize post-modern difference itself and to articulate what I call a resistance postmodernism that will be the basis for postmodern materialist feminist culture critique.

Instead, we advocate a demand for material, political change—feminism should aim to transform current systems

Ebert 93 (Teresa Ebert, "Ludic Feminism, the Body, Performance, and Labor: Bringing "Materialism" Back into Feminist Cultural Studies", <http://www.jstor.org/stable/1354189>, winter 1992-1993)

Feminist theory, I believe, must be a politically transformative practice: one that not only disrupts the specific conditions and features of a racist, patriarchal, and capitalist oppression but also transforms the systematic relations of exploitation and moves toward producing nonexploitative social arrangements. At the same time, feminist theory needs to be especially self-reflexive and adept at critiquing its own historical situation and limits; at resisting the patriarchal appropriation and usurpation of its oppositional logic; and at insuring that its alternative practices and modes of knowing circulate and are used on behalf of an emancipatory agenda. While many may agree with this principle, its realization is the most difficult and hotly contested issue in feminist theory today.

2NC Extensions

[You can insert "theorizing bad" and macropolitics cards from case section here]

Reject their high theory—reunderstanding feminism as a material movement solves the exclusive of disadvantaged women who are unable to participate in knowledge construction

Ebert 93 (Teresa Ebert, "Ludic Feminism, the Body, Performance, and Labor: Bringing "Materialism" Back into Feminist Cultural Studies", <http://www.jstor.org/stable/1354189>, winter 1992-1993)

It is, therefore, politically more productive to move beyond the upper-middle-class antirationalism of ludic critics in order to focus on a materialist feminist reunderstanding of concepts. I believe it is necessary for feminism not to fetishize an identitarian Hegelian notion of concept as a moment of rational plenitude, in which the signifier and the signified correspond without "difference." Instead, we need to reunderstand concepts as "struggle concepts": as historical, material practices through which the subject engages the social contradictions, the exploitative effects of patriarchy. Concepts, in other words, are historical matrices of intelligibility that display the relations among apparently disconnected entities and thus enable us to grasp the logic of domination that underlies the seemingly disparate and isolated experiences of individuals in culture. Concepts allow us to perceive the way experience is produced and thus empower us to change the social relations and produce new nonexploitative experiences and collective subjectivities. The aim of such conceptual knowledge, then, is not cognitive delight—the joys of knowing—but explanatory critique: a critique that explains the conditions of the possibility of patriarchal practices and thus points to ways that they can be transformed. Concepts, contrary to the bodyism of Gallop, are not philosophical, epistemological, and cognitive but, in fact, the very materiality through which social struggles in the realm of cultural politics take place. These struggles have meant that women, people of color, and oppressed classes historically have been restricted in their ability to produce theories and concepts as well as "silenced" by the dominant regime that excludes and discredits the knowledges they do construct. In large part they have been denied access to those cultural and institutional subject positions and practices, such as education (including literacy), "philosophy," and "theory"—itself-through which individuals are enabled to produce new concepts and to legitimize those concepts they do generate (in short, to be "heard"). patriarchy has used the practices of theory and institutions of knowledge to try to keep women and others from entering into the struggle over theory and producing new modes of intelligibility that would radically reconceptualize and organize reality in nonexploitative ways. One of the most recent (and pernicious) forms of this de-educating of women has been antitheoretical theory itself. In a politically damaging move, theory is used to argue against theory, to delegitimize concepts productive for social struggle and to dissuade women from "theorizing," from offering explanatory critiques. As Hartsock has quite rightly pointed out: Somehow it seems highly suspicious that it is at the precise moment when so many groups have been engaged in "nationalisms" which involve redefinitions of the marginalized Others that

suspicions emerge about the nature of the "subject," about the possibilities for a general theory ^{which can describe the world, about historical progress.} "Why is it that just at the moment when so many of us who have been silenced begin to demand the right to name ourselves, to act as subjects rather than objects of history, that just then the concept of subjecthood becomes problematic? Just when we are forming our own theories about the world, uncertainty emerges about whether the world can be theorized." (Foucault on Power 163-64)

Macro and micropolitics are inherently different and can't be combined—starting from identity means it's impossible to address broad-scale change

Myers 13 (Ella Myers, "Worldly Ethics: Democratic Politics and Care for the World", Google Books, February 26th, 2013)

It is true that the arts of the self Connolly theorizes are meant to foster sensibilities that will, in turn, facilitate participation in public life rather than act as a substitute for it. And as I argued above, Connolly's inquiry into the ethics of self-care is most evocative and apt when such care is theorized as both inspired by and inspiring of collective democratic activity. Yet it is equally important not to exaggerate the connection between them. A genuine gap separates practices of self-artistry from collaborative efforts to shape the habitat in which people live, though Connolly's approach tends to cover it over, as his distinctive vocabulary indicates. "Action by the self on itself" is labeled micropolitics and paired with macropolitics, designating an array of large-scale institutional formations and shared practices, including efforts by social movements to disrupt hegemonic patterns of behavior and push for greater pluralization. Connolly's point is to insist on the political significance of arts of the self, and he marks this claim with the word micropolitics. The trouble with this representation, however, is that it designates the self-artistry undertaken by an individual to desanctify her identity and those collective struggles by which a constituency attempts to alter an element of shared conditions as two types of the same phenomenon. Indeed, the labels Connolly relies on imply that the individually practiced reflexive care of the self differs from the collectively pursued care of the world only in terms of scale: one is micro, the other is macro. This framing, I suggest, exaggerates the affinities between building a self and building a world. By presenting arts of the self and collective citizen movements as variations on a single theme, Connolly's writings conceal the unique orientation that democratic politics entails, which sets it apart from any reflexive self-relation. Associative democratic endeavors are distinguished not only by the involvement of multiple actors but by the presence of a common object around which they organize. Thus any movement between the micropolitics of self-constitution and the macropolitics of transforming worldly habits, practices, laws, and norms is decidedly more complicated than Connolly's framing indicates, because it demands a turn away from oneself as the object of attention and toward a different and shared object of concern that serves as a site of mutual energy and advocacy.

Cutting

The more post structuralist aspects of her text, on the other hand, participate in the limits of a ludic postmodern politics, specifically the textualization of resistance and the reification of the local and the particular. Gallop's discourse, like ludic postmodernism as a whole, is an anti theory theory—think of Derrida's Glas, Richard Rorty's Relativism, and Truth, de Man's Resistance or Theory, Gregory Ulmer's a text which also Teletheory, Objectivity, reifies experience as "my

story. Theory in these discourses is essentialized as a phallogocentric, abstract, instrumental, dominating system whose main apparatus is the concept (which is equated with an identity of language and reality) with its rigid, reductive fixity. Ludic opposition to this mastering theory involves displacing its concepts and subverting its categories through such deconstructive strategies as punning, parody, and cultivating the tropic play of signifiers—the dissemination of difference—that exceeds the controlling argument of the system. Thus we have Ulmer's "puncture" (147) and Naomi Schor's "patriody": a form of tropic play and difference that "hovers between parody and parricide" (xii). This ludic notion of theory, to which Gallop and other post-structuralist feminists subscribe, is obviously similar to the dominant feminist essentialization of theory as a masculinist abstraction and provides a site for many for the convergence of some forms of feminism and ludic postmodernism. But the limits of the feminist ludic resistance to theory are quite evident in Gallop's claims for the disruptive potential of the body. As she points out in her discussion of the Marquis de Sade, the conflict is "between rational order, that is, 'philosophy' and irrational bodily materiality.... [T]here is always some disorderly specific which exceeds the systematizing discourse" (*Thinking through the Body* 47) and disrupts the mastering impulse of knowledge. Thus, in her discussion of *Justine* and *The New Justine* Gallop claims that [t]he pedagogical examination which attempts to regulate the student on the basis of external rules, of the teacher's rules, is attempted, regulated, messed up by the *regles*, the rules, flowing from within. The bodily, fluid, material, feminine sense of *regles* [as "woman's bloody (menstrual) 'rules' or period"] undermines the Sadian, pederastic pedagogue's attempt at exact examination, at subjugation of the pupil to his rational, masterful rules. (52) This is a fairly subtle and sophisticated reading of Sade, exposing both rationalism's violence toward the body and the body's uncontrollable excess. But what is its political effectivity? It exposes and disrupts dominant rational categories, but does it move beyond a local, subversive annotation? Does it transform them? Gallop asserts that "the really disturbing violence is not physical violence but the physical as it violates the rational categories that would contain and dominate it" (18). In other words, in a very ludic move, she proposes that what is disturbing is not the violent exploitation and abuse of the body but the body's violation of rational categories. And by this she does not mean a revolutionary act of resistance by the body as agency of conscious social change but rather the excessive, disorderly, irrational details and predictions of the body—its differences—that passively escape rational logic. This, in effect, is a textualizing of violence, of the physical, a dehistoricizing of the social, and an erasure of the economic, all in the name of the body. It is a subversion of linguistic categories on behalf of a concept—that conceals its own conceptuality—a concept of the body as fragmented, nomadic details that escape knowing: its difference from itself. We need to keep in mind that the texts Gallop is attempting to disrupt through the tropic excess and violence of a textual body are ones in which teachers and fathers sexually assault, physically abuse, cut up, and murder mothers and daughters. This is not merely some pornographic fantasy, some libertarian rationalism gone amuck—this is the reality, the historical situation of exploitation of innumerable women in racist, patriarchal capitalism today. According to MacKinnon, only "7.8% of women in the United States have not been sexually assaulted or harassed in their lifetime" (*Feminism Unmodified* 6). Moreover, only 17% of all incidents of rapes and attempted rapes are committed by strangers; the majority are committed by men the women know—acquaintances, friends, lovers, relatives, authority figures (247)—and "women of color (... specifically ... Black women) are raped four times as often as white women" (82). The ludic textualization of violence that Gallop is articulating ends up erasing the political economy of the body in the social relations of exploitation and turning resistance into a tropic game. In what way does Gallop's textualized

body in excess transform the mind-body split? It merely reinscribes woman in the same place she has also been in the patriarchal hierarchy: in the unknowable, unrepresentable, bloody body that exists in opposition to concepts. This anxiety over concepts in ludic postmodernism and humanist feminism is, to my mind, especially counterproductive for an emancipatory politics. Concepts are not only unavoidable, they are also a necessary means for social change. Thinking/experience without concepts is impossible: concepts are the "mediating" frames of intelligibility through which we know the world. Experience-which is put forth as liberation from concepts/thinking by ludic feminists (such as Gallop) and cultural feminists (as different as Susan Griffin and Camille Paglia)-is itself intelligible only through the mediation of concepts. The issue here is not to romantically dismiss concepts but to question how we theorize and use them.

Antiblackness K

INC

The only ethical demand available to modern politics is that of the Slave and the Savage, the demand for the end of America itself. This demand exposes the grammar of the Affirmative for larger institutional access as a fortification of antiblack civil society

Wilderson 07- [Frank B. Wilderson, Assistant professor of African American Studies and Drama at UC Irvine, *Red, White, & Black: Cinema and the Structure of U.S. Antagonisms*, 5-7]

When I was a young student at Columbia University in New York there was a Black woman who used to stand outside the gate and yell at Whites, Latinos, and East- and South Asian students, staff, and faculty as they entered the university. She accused them of having stolen her sofa and of selling her into slavery. She always winked at the Blacks, though we didn't wink back. Some of us thought her outbursts too bigoted and out of step with the burgeoning ethos of multiculturalism and "rainbow coalitions" to endorse. But others did not wink back because we were too fearful of the possibility that her isolation would become our isolation, and we had come to Columbia for the express, though largely assumed and unspoken, purpose of foreclosing upon that peril. Besides, people said she was crazy. Later, when I attended UC Berkeley, I saw a Native American man sitting on the sidewalk of Telegraph Avenue. On the ground in front of him was an upside down hat and a sign informing pedestrians that here was where they could settle the "Land Lease Accounts" that they had neglected to settle all of their lives. He too, so went the scuttlebutt, was "crazy." Leaving aside for the moment their state of mind, it would seem that the structure, that is to say the rebar, or better still the grammar of their demands—and, by extension, the grammar of their suffering—was indeed an ethical grammar. Perhaps their grammars are the only ethical grammars available to modern politics and modernity writ large, for they draw our attention not to the way in which space and time are used and abused by enfranchised and violently powerful interests, but to the violence that underwrites the modern world's capacity to think, act, and exist spatially and temporally. The violence that robbed her of her body and him of his land provided the stage upon which other violent and consensual dramas could be enacted. Thus, they would have to be crazy, crazy enough to call not merely the actions of the world to account but to call the world itself to account, and to account for them no less! The woman at Columbia was not demanding to be a participant in an unethical network of distribution: she was not demanding a place within capital, a piece of the pie (the demand for her sofa notwithstanding). Rather, she was articulating a triangulation between, on the one hand, the loss of her body, the very dereliction of her corporeal integrity, what Hortense Spillers charts as the transition from being a being to becoming a "being for the captor" (206), the drama of value (the stage upon which surplus value is extracted from labor power through commodity production and sale); and on the other, the corporeal integrity that, once ripped from her body, fortified and extended the corporeal integrity of everyone else on the street. She gave birth to the commodity and to the Human, yet she had neither subjectivity nor a sofa to show for it. In her eyes, the world—and not its myriad discriminatory practices, but the world itself—was unethical. And yet, the world passes by her without the slightest inclination to stop and disabuse her of her claim. Instead, it calls her "crazy." And to what does the world attribute the Native American man's insanity? "He's crazy if he thinks he's getting any money out of us?" Surely, that doesn't make him crazy. Rather it is simply an indication that he does not have a big enough gun. What are we to make of a world that responds to the most lucid

enunciation of ethics with violence? What are the foundational questions of the ethico-political? Why are these questions so scandalous that they are rarely posed politically, intellectually, and cinematically—unless they are posed obliquely and unconsciously, as if by accident? Return Turtle Island to the “Savage.” Repair the demolished subjectivity of the Slave. Two simple sentences, twelve simple words, and the structure of U.S. (and perhaps global) antagonisms would be dismantled. An “ethical modernity” would no longer sound like an oxymoron. From there we could busy ourselves with important conflicts that have been promoted to the level of antagonisms: class struggle, gender conflict, immigrants rights. When pared down to twelve words and two sentences, one cannot but wonder why questions that go to the heart of the ethico-political, questions of political ontology, are so unspeakable in intellectual meditations, political broadsides, and even socially and politically engaged feature films.

The affirmative’s call for surveillance curtailment is a form of the bill of sale that allows for genocide of the indigenous, and the exploitation of the black body

Farley 12 [Anthony Paul Farley, James Campbell Matthews Distinguished Professor of Jurisprudence at Albany Law School, “Critical Race Theory and Marxism: Temporal Power”]

Repetition is the mode in which we preserve that which overwhelms us. That which overwhelms us sets itself up in our soul as a repetition of what seems to have been the original catastrophe. We become a permanent wave of our own undoing.⁹ But the precise nature of our own trauma continually eludes us. We give chase, but only through repetition. We become what we do and this fact of repetition makes what was said of us, “they know not what they do”, true. What we do is repeat the disaster that originally left us traumatized. Through repetition we become the very disaster that was our original, albeit unremembered, disaster. It was unspeakable. It remains unsaid. But the cruelty from which we imagine ourselves escaped is what we become, and that which we continually make of ourselves. There are cruelties that happen to us as individuals (“[a]nd I only am escaped alone to tell thee”¹¹) and there are cruelties that happen to us as collectives (“[I]et my people go”¹²). What happens in the individual can happen to the collective and so, as the long story of philosophy verifies, each is a window to the other. The individual is not the unity it is often imagined to be (“[m]y name is Legion”¹³), nor are the borders of the collective as distinct as they are often imagined to be (“[t]hings fall apart”¹⁴). Nevertheless, it is useful to speak of the individual (“I think, therefore I am”¹⁵) and the collective (“[w]e the people . . .”¹⁶) when what is hard to see in the one is easy to make out in the other. Our beginning was the scene of an unspeakable event. That unspeakable event keeps repeating. Capital arrived in the world “dripping . . . with blood and dirt.”¹⁷ If, as Margaret Thatcher infamously put it, “There is no alternative”¹⁸ to capitalism, then there must not have been a time before capitalism. Capital, like trauma, is outside of history, outside of the world of things that change, or so it claims by asserting that there is no alternative. The fact that capitalism presents itself to us as a horizon less world should give us pause. But it does not give us pause: We are on the clock—repeating and not living—and so we go on and on not thinking at all about Modern Times, just repeating.¹⁹ Marxism has as its zero degree the disclosure of the unspeakably cruel event that threw the modern world up all around us. Its name is Legion,²⁰ but three were introduced in Capital’s first volume with these birthnames: genocide in the New World, colonialism in the Orient, and the conversion of the Dark Continent into a hunting ground for slaves. These three mass murders were race-making moments. These three mass murders were the original accumulation, the first capital. These three mass

murders made capitalism a world system. Modernity is the repetition of the original accumulation. We are, in other words, still in that original moment to the extent that we are modern and have always been modern. Time has not passed. We passed out of the time of the real and into the false eternity of the spectacle. As psychoanalysis revealed: A condition has long been known and described which occurs after severe mechanical concussions, railway disasters and other accidents involving a risk to life; it has been given the name "traumatic neurosis." The terrible war which has just ended gave rise to a great number of illnesses of this kind . . . The chief weight in their causation seems to rest on the factor of surprise.²¹ Before World War I, Josef Breuer and Sigmund Freud observed, "Hysterics suffer mainly from reminiscences."²² After the war to end all wars, Freud wrote: In the war neuroses, too, observers . . . have been able to explain certain motor symptoms by fixation to the moment at which the trauma occurred. I am not aware, however, that patients suffering from traumatic neurosis are much occupied in their waking lives with memories of their accident. Perhaps they are more concerned with not thinking about it.²³ History is this way for us as a collective. We are much concerned with "not thinking about it."²⁴ Uranus is castrated by Cronos. The open sky is violated by the desperate hours. Call the perpetrator and the violated by their Greek names or by any other names and the scene remains the same: blood rains down on the water, and from that meeting the Furies are born. The Furies—unceasing Alecto, resentful Tisiphone, avenging Megaera—immortals all, are born of that meeting of blood and water, and are forever punishing violations of the order that allows "no alternative."²⁵ James Baldwin understood the Furies: History, as no one seems to know, is not merely something to read. And it does not refer merely, or even principally, to the past. On the contrary, the great force of history comes from the fact that we carry it within us, are unconsciously controlled by it in many ways, and history is literally present in all that we do. It could scarcely be otherwise, since it is to history we owe our frames of reference, our identities, and our aspirations. And it is with great pain and terror that one begins to realize this.²⁶ The time that seems to pass only seems to pass. Baldwin understood false time. Baldwin understood that this false time of ours is not even "ours": it is the time of the spectacle.²⁷ We belong to it, not the other way round. What is the "spectacle"? The spectacle is the system's endless hymn of self-praise. When we have been here 10,000 years / bright shining as the sun / we will have no less time to sing its praise / than when we'd first begun. That is the spectacle. We are within the false time of the spectacle, within the repetitions. The repetitions are spectacular time. We do not live spectacular time, we only repeat, and repetition is not living. The death event that produces the first capital begins with a mark made or found ready-made on the body: The discovery of gold and silver in America, the extirpation, enslavement and entombment in the mines of the indigenous population of that continent, the beginnings of the conquest and plunder of India, and the conversion of Africa into a preserve for the commercial hunting of black skins, are all things which characterize the dawn of capitalist production.²⁸ Before the great death event all flesh is common. After the event a mark, insignificant in itself, is made to signify life or death. The mark is a line, a color line, which separates life from death and connects now with then. After the mark life becomes having and not having becomes its opposite. After the murders reach a certain mass, death follows in an unbending line from now till then, and then becomes a hole in the universe, a hole through which we fall and are now falling, forever.²⁹ The New World was not new before the killing. The blacks were not black before the killing. The colonized were not colonized before the killing. The

murders constitute and mark a new species. The production of race is the production of a race that is to have and another race, subordinate to the first, that is to have not. The abundance belonging to the One and the lack that is the chief property of the Other are conjoined twins, born of the same unspeakable event. The black can trace its origin only as far back as a bill of sale. James Baldwin, speaking in London, was clear on this point: I tried to explain that if I was originally from [an African point of origin] I couldn't find out where it was because my entry into America was a bill of sale. And that stops you from going any further. At some point I became Baldwin's Nigger.³⁰ But is the same for the white? The bill of sale is the official screen memory of the mass murder that is the origin of capital. The bill of sale is the alpha and omega of law. The bill of sale is a death certificate, ours. The bill of sale is the recording angel assigned to the children of slaves and children of slave masters. The legality of that bill of sale is what keeps the chains, the genealogies of property that bind now to then, and all of us to the repetitions, together.

The 1AC is a form of phallicized whiteness that posits a neutral subject that eradicates difference in the name of freedom

Winnubst 06 [Shannon Winnubst, Associate Professor of Women's Studies at The Ohio State University, "Queering Freedom" page 37-43]

Cultures of phallicized whiteness are grounded in the constitutive and categorical exclusion of useless expenditure. While Locke attempts to maintain the absolute reign of utility by reasserting a different kind of 'use' in the functions of money as capital, the fundamental tension between systems of value based in utility and those grounded in endless expenditure threatens utility's domination. This tension worsens as politics of race, sexual difference, and sexuality compound this nascent politics of class (and, less explicitly, religion) that we find in Locke's texts. While money appears in Locke's texts to be the inevitable outgrowth of utility's preference for future-oriented labor, cultivated land, and private property, it also introduces an order of value that may not be reducible to the final judgment of utility. The introduction of money appears to render utility's closed system rather fragile, a phenomenon and tension that will resurface repeatedly across the following chapters. The sort of worldview that we find in Locke is thereby one dominated by the twin logics of property and utility. Labor, which man must undertake due to an ontological lack, connects these twin logics: it **encloses the world and one's self into units of private property and then**, elevated into the form of money, **invites reason to overstep utility's boundary and hoard more property than one can use.** Labor initiates **the twin expressions of the logic of the limit: enclosure and prohibition.** We ought not own more than we can use; yet, true to the dynamic of desire grounded in lack, we are drawn toward transgressing the fundamental prohibition of waste proclaimed by nature's law, reason. Labor develops into a system of expression that appears to twist the dynamics of scarcity and abundance beyond the reach of utility, while simultaneously using utility to judge all acts within it: one's labor must be deemed useful if one is to enter into the desired life of propertied abundance, a possibility that will always be scarce in advanced capitalist cultures of phallicized whiteness. Locke's normative model for the liberal individual thereby becomes he who is bound by his ability to labor within a concept of the future sufficient to stake out a piece of land as property. While Cynthia Willett gives Locke credit for trying to articulate a middle-class resistance to "the leisure class and its idle games," she

nonetheless argues that Locke remains entrapped by a conception of rationality “in terms of the English middle-class appreciation for the market value of productive labor and property” (2001, 71). Not only are his concepts of rationality shaped by these historical preferences, but his concepts of man’s condition—man’s desire, destiny, labor, and individuality— all carry these historical preferences into universalized discourses that continue to serve as the bedrock of many of our cultural assumptions and practices. Although Locke’s politics were moderately progressive for the late seventeenth century, **the lasting damage of these concepts still haunts our political quandaries and the very frameworks through which we continue to seek redress. The logic of limit as enclosure, as the ways that the state of society becomes demarcated from—and always preferred over, even while romanticizing—the state of nature,** continuously rewrites itself in several registers across the political histories of the U.S. It fundamentally grounds our understanding of the individual as the person who is clearly demarcated from nature. **The individual becomes that ‘civilized’ man who takes his natural origin, as an enclosed body that is a product of God’s labor, and produces private property that is enclosed into durable forms which persist into and even control the future.** From this critical enclosure of the world and the self, written in the register of property, other modern epistemologies and political projects easily attach themselves to this clear and distinct unit, the individual. (Adam Smith, for example, quickly comes to mind.) **The individual, carved out of nature through productive labor and conceiving the world and himself on the model of appropriating private property, emerges as the cornerstone of political theories and practices in cultures of phallicized whiteness. The individual thereby comes to function as an ahistorical unit defined by its productive labor’s distancing relation to the state of nature,** not by any historico-political forces. (With his unhistorical thinking, Locke acts perfectly as a liberal individual.) Classical **liberalism writes the individual as the (allegedly) neutral substratum of all political decisions, positioning it as separable from historico-political forces.** In carving the individual out of both the natural and socio-historico-political landscapes, **modern political and epistemological projects turn around Locke’s fundamental metaphors of enclosure. The individual, that seat of political and personal subjectivity, is enclosed and thus cut off from all other forces circulating in the social environment. The individual effectively functions as a piece of private property, with the strange twist of owning itself, impervious to all intruders and protected by the inherent right of ownership, derived from the ontological right to one’s own enclosed body. History then is reduced to a collection of what Kelly Oliver has aptly called “discrete facts that can be known or not known, written in history books, and [that] are discontinuous with the present”** (2001, 130). History is that collection of events that occurred in the past and is now tightly sealed in that past. History is simply what has happened, with no fundamental effect or influence upon what is happening now or might happen in the future. Historicity is unthought and unthinkable here. **The modern rational self—the liberal individual—exists in a temporally and historically sealed vacuum, made possible by the clear disjunction between past, present, and future.** Cartesian concepts of time as discrete moments that do not enter into contact or affect one another dominate this conception of the individual.¹⁰ **The logic of the limit thereby demarcates the past sharply and neatly from the present, turning each into objects about which we can develop concepts, facts, and truths. The future, that temporal horizon initiated by preferred forms of complex labor,**

becomes the sole focus of intention and desire. But the future never arrives. Therefore, if historicity and ‘the historical’ mean reading present ideas, values, or concepts as undergoing a constant shaping and reshaping by material forces, this divorce of the past from the present effectively renders all temporal zones—past, present, future, and all permutations—ahistorical. Existence itself is radically dehistoricized. And the individual, that bastion of political activity and value, accordingly resides in a historical vacuum, untouched by historical forces—the very realm of whiteness. This ahistorical view of history perpetuates the modern project of classical liberalism and its damages, creating a particular kind of individual. The individual becomes the locus of identity, selfhood, and subjectivity in the modern political project. Demarcated from historical existence, it also requires careful delineation from other bodies, whether persons, institutions, history, or social attitudes. This concept of the individual develops with a pronounced insistence on its neutrality, rendering specific attributes of the individual merely particular qualities that function, again, on the model of private property: characteristics such as race, gender, religion, or nationality remain at a distance from this insistent neutral individual. (I use the pronoun “it” to emphasize the function of this alleged neutrality, a dynamic that is central to the valorization of the white propertied Christian male as the subject of power in phallicized whiteness.) This insular existence, underscored by its ahistorical status, is further ensured by claims of radical autonomy, whereby the individual is the source, site, and endpoint of all actions, desires, thoughts, and behaviors: we choose what we do. And we choose it, of course, because we are rational: Kantian ethics become the proper bookend to Locke’s initiating of “high modernity’s”¹¹ schemas. This demarcation of the individual then carves the critical division between internal and external, and its political-psychic counterpart, that between self and Other. The self is located squarely and exclusively in one’s rational faculties, the natural law that, according to Locke, civilizes us into economies of labor, utility, and a strange mix of scarcity and abundance. The modern rational self is radically self-contained—enclosed. It is a sovereign self, unaffected by and independent from any thing or force external to it, whether materiality or the Other. Assuming it exercises rationality appropriately, this self is radically autonomous, choosing its own place in the world. (Pointing to America, Locke insists that civilized men are free to leave society.) It does not heed any call of the Other. It is effectively autogenous, existing in a pre-Hegelian philosophical world.¹² Utility and its epistemological counterpart, instrumentality, subsequently become the operative conceptions of power in this schema of the liberal individual as the self. Autonomous, autogenous, and ahistorical, the modern rational individual is in full control of its self. **Its power is thereby something that it owns and wields, as it chooses. Power is not some force that might shape the individual without its assent or, at a minimum, its acknowledgment. It is something that an individual, even if in the form of an individual state, wields intentionally.** It can still use this power legitimately or illegitimately, but that is a matter of choice. The individual controls power and the ways that it affects the world: this is its expression of freedom. Accordingly, the role of the law becomes to vigilantly protect this ahistorical unit, the individual, from the discriminations and violences of historical vicissitudes. The role of the law is to protect the individual’s power, the seat of its freedom. We are far from Foucaultian ideas that perhaps power and history constitute the ways we view and experience the world, shaping our categories and embedding us in this very notion of the individual as autonomous, autogenous, and ahistorical. The liberal individual, untouched by material, po-

litical, and historical conditions, is a neutral substratum that freely wields its power as it chooses: this is the liberal sovereignty and mastery of freedom. **Because the individual is this neutral substratum, differences may or may not attach themselves to it. But those differences are cast into that incon-sequential space of material conditions along with history and the Other.** The odd twist of self-ownership surfaces more fully here. Following Locke's metaphors of enclosure, the individual is enclosed and sealed off not only from all historical and social forces in the environment, but also from the very attributes of difference within itself. While specific attributes that constitute "difference" in North American culture continuously shift, with new categories emerging and old ones receding, the particular vector of difference that matters depends on our historical location, and all its complexities.¹³ Consequently, these attributes do not fundamentally affect the neutrality of the modern individual. These differences occur at the level of the body and history, realms of existence that do not touch the self-contained individual. The neutral individual relates to these differences through the models of enclosure and ownership. It experiences these discrete parts of itself (e.g., race, gender, religion, nationality) as one owns a variety of objects in economies of (scarce) private property: one chooses when one wishes to purchase, own, display, or wear such objects as one freely desires. The unnerving influence of power surfaces, however, as we realize that this free choice becomes the exclusive power of the subject position valorized in cultures of phallicized whiteness, the white propertied Christian (straight) male¹⁴ who determines when, how, and which differences matter. **Neutrality thus functions as the conceptual glue of the modern political project of classical liberalism.** It allows the model of ownership to take hold as the dominant conception of selfhood: one's true self resides in a neutral space and from that space one owns one's power, one's freedom, and one's attributes. Just as the capitalist fantasy still convinces us today that we choose and control our private property, the neutral individual also resides in a self-enclosed, self-contained space that hovers above these matters. Just as the kind of car an American drives today supposedly does not affect the kind of person that he or she is, so too the rational and therefore neutral individual resides in a space that transcends material conditions and their entrapments. Differences between individuals, whether of race or religion or gender or nationality or sexuality, become a mere matter of ownership—i.e., what one has and has not chosen to own. And as the inherent rights of private property imply, one consequently has the right to protect or dispense with one's property: the individual is free to choose how to wield its power and how to respond to these (inconsequential) differences. Not to have this ability—i.e., not to be able to choose and control when and how one's gender, race, nationality, sexuality, or religion matters—signifies a lack of individualism, a lack of power, a lack of civility.¹⁵ The individual thus becomes the proprietor of its differences and the various, discrete rights obtaining to them. The logic of enclosure and demarcation, expressing the logic of the limit here, grounds the conceptions of difference itself in these schemas of classical liberalism. One owns—encloses—one's differences and, additionally, the differences themselves are discrete—demarcated—from one another. The language of rights derives from the overarching model of ownership, just as we find it developed out of the fundamental right to one's own enclosed body in Locke's text. The modern project of liberal individualism thereby reads difference as that which is, can be, or ought to be demarcated, delimited, enclosed—and owned. When I turn to contemporary debates around affirmative action below, I will return to several dynamics that have emerged here. First of all, **the liberal individual exists as a neutral substratum to**

which differences, caused by history and materiality (the body), attach themselves. Equality consequently resides in that neutral substratum of the individual and we access it only by stripping away the merely historical attributes of difference: equality and neutrality mutually constitute one another. Consequently, those who cannot abstract from merely historical attributes of difference (e.g., race and gender) will be read as unequal to those for whom these historical differences do not matter. Secondly, freedom is understood as the expression of power, over which one has conscious and rational control. Power, framed as a tool that one wields, is derived from the model of instrumental reason. And, finally, the liberal individual experiences differences such as race, gender, religion, and nationality as attributes that it owns. It consequently exercises rights over them such as those derived from the inherent right of ownership that Locke locates in the natural imperative to labor: the language of rights assumes, thrives in, and thereby perpetuates an economy of scarcity, the economy in which debates around affirmative action are firmly entrenched. Each of these colludes to give phallicized whiteness the necessary tools to maintain the white propertied Christian (straight) male as the valorized subject in power. Functioning through the rhetoric of neutrality, this specific subject disavows its historical and material conditioning and thereby gains the power to determine when, how, and which differences matter. Grounded in the fundamental value of neutrality, difference should not matter; hence, for example, contemporary rhetorics of color-blindness dominate discourses about the desired endpoint of a 'just'—and therefore raceless—society.¹⁷ However, in those circumstances in which difference insists on its existence (i.e., circumstances in which 'minorities' or the disenfranchised insist on their rights, voices, and even votes), the decisions about when, how, and which differences matter will remain in the power of the neutral individual, the subject in power—and the one who is free.

-Insert book is racist/appropriative link here-

The AFFs politics of inclusion is structural adjustment of the black body that forecloses black liberation. If we win their scholarship produces this structural violence that is a reason to vote negative

Wilderson 2010- Frank B Wilderson III- Professor at UC irvine- Red, White and Black- p. 8-10

I have little interest in assailing political conservatives. Nor is my argument wedded to the disciplinary needs of political science, or even sociology, where injury must be established, first, as White supremacist event, from which one then embarks on a demonstration of intent, or racism; and, if one is lucky, or foolish, enough, a solution is proposed. If the position of the Black is, as I argue, a paradigmatic impossibility in the Western Hemisphere, indeed, in the world, in other words, if a Black is the very antithesis of a Human subject, as imagined by Marxism and psychoanalysis, then his or her paradigmatic exile is not simply a function of repressive practices on the part of institutions (as political science and sociology would have it). This banishment from the Human fold is to be found most profoundly in the emancipatory meditations of Black people's staunchest "allies," and in some of the most "radical" films. Here—not in restrictive policy, unjust legislation, police brutality, or conservative scholarship—is where the Settler/Master's sinews are most resilient. The polemic animating this research stems from (1) my reading of Native and Black American meta-commentaries on Indian

and Black subject positions written over the past twenty-three years and (2) a sense of how much that work appears out of joint with intellectual protocols and political ethics which underwrite political praxis and socially engaged popular cinema in this epoch of multiculturalism and globalization. The sense of abandonment I experience when I read the meta-commentaries on Red positionality (by theorists such as Leslie Silko, Ward Churchill, Taiaiake Alfred, Vine Deloria Jr., and Haunani-Kay Trask) and the meta-commentaries on Black positionality (by theorists such as David Marriott, Saidiya Hartman, Ronald Judy, Hortense Spillers, Orlando Patterson, and Achille Mbembe) against the deluge of multicultural positivity is overwhelming. One suddenly realizes that, though the semantic field on which subjectivity is imagined has expanded phenomenally through the protocols of multiculturalism and globalization theory, Blackness and an unflinching articulation of Redness are more unimaginable and illegible within this expanded semantic field than they were during the height of the F B I ' S repressive Counterintelligence Program (C O I N T E L P R O) . On the semantic field on which the new protocols are possible, Indigenism can indeed IO become partially legible through a grammatics of structural adjustment (as fits our globalized era). In other words, for the Indians' subject position to be legible, their positive registers of lost or threatened cultural identity must be foregrounded, when in point of fact the antagonistic register of dispossession that Indians "possess" is a position in relation to a socius structured by genocide. As Churchill points out, everyone from Armenians to Jews have been subjected to genocide, but the Indigenous position is one for which genocide is a constitutive element, not merely an historical event, without which Indians would not, paradoxically, "exist." 9 Regarding the Black position, some might ask why, after claims successfully made on the state by the Civil Rights Movement, do I insist on positing an operational analytic for cinema, film studies, and political theory that appears to be a dichotomous and essentialist pairing of Masters and Slaves? In other words, why should we think of today's Blacks in the United States as Slaves and everyone else (with the exception of Indians) as Masters? One could answer these questions by demonstrating how nothing remotely approaching claims successfully made on the state has come to pass. In other words, the election of a Black president aside, police brutality, mass incarceration, segregated and substandard schools and housing, astronomical rates of H I V infection, and the threat of being turned away en masse at the polls still constitute the lived experience of Black life. But such empirically based rejoinders would lead us in the wrong direction; we would find ourselves on "solid" ground, which would only mystify, rather than clarify, the question. We would be forced to appeal to "facts," the "historical record," and empirical markers of stasis and change, all of which could be turned on their head with more of the same. Underlying such a downward spiral into sociology, political science, history, and public policy debates would be the very rubric that I am calling into question: the grammar of suffering known as exploitation and alienation, the assumptive logic whereby subjective dispossession is arrived at in the calculations between those who sell labor power and those who acquire it. The Black qua the worker. Orlando Patterson has already dispelled this faulty ontological grammar in *Slavery and Social Death*, where he demonstrates how and why work, or forced labor, is not a constituent element of slavery. Once the "solid" plank of "work" is removed from slavery, then the conceptually coherent notion of "claims against the state"—the proposition that the state and civil society are elastic enough to even contemplate the possibility of an emancipatory project for the Black position—disintegrates into thin air.

The imaginary of the state and civil society is parasitic on the Middle Passage. Put another way, No slave, no world. And, in addition, as Patterson argues, no slave is in the world. If, as an ontological position, that is, as a grammar of suffering, the Slave is not a laborer but an anti-Human, a position against which Humanity establishes, maintains, and renews its coherence, its corporeal integrity; if the Slave is, to borrow from Patterson, generally dishonored, perpetually open to gratuitous violence, and void of kinship structure, that is, having no relations that need be recognized, a being outside of relationality, then **our analysis cannot be approached through the rubric of gains or reversals in struggles with the state and civil society, not unless and until the interlocutor first explains how the Slave is of the world. The onus is not on one who posits the Master/Slave dichotomy but on the one who argues there is a distinction between Slaveness and Blackness.** How, when, and where did such a split occur? The woman at the gates of Columbia University awaits an answer.

The alternative is an unflinching paradigmatic analysis that poses the question of whether civil society is ethical

Wilderson 10 [Frank, Professor of African American Studies and Drama at UC Irvine, Ph.D. in Rhetoric/Film Studies from UC Berkeley, “Red, White, & Black”, pp ix-]

STRANGE AS it might seem, this book project began in South Africa. During the last years of apartheid I worked for revolutionary change in both an underground and above-ground capacity, for the Charterist Movement in general and the ANC in particular. During this period, **I began to see how essential an unflinching paradigmatic analysis is to a movement dedicated to the complete overthrow of an existing order. The neoliberal compromises that the radical elements of the Chartist Movement made with the moderate elements were due, in large part, to our inability or unwillingness to hold the moderates' feet to the fire of a political agenda predicated on an unflinching paradigmatic analysis. Instead, we allowed our energies and points of attention to be displaced by and onto pragmatic considerations. Simply put, we abdicated the power to pose the question—and the power to pose the question is the greatest power of all.** Elsewhere, I have written about this unfortunate turn of events (Incognegro: A Memoir of Exile and Apartheid), so I'll not rehearse the details here. Suffice it to say, this book germinated in the many political and academic discussions and debates that I was fortunate enough to be a part of at a historic moment and in a place where the word revolution was spoken in earnest, free of qualifiers and irony. For their past and ongoing ideas and interventions, I extend solidarity and appreciation to comrades Amanda Alexander, Franco Barchiesi, Teresa Barnes, Patrick Bond, Ashwin Desai, Nigel Gibson, Steven Greenberg, Allan Horowitz, Bushy Kelebonye (deceased), Tefu Kelebonye, Ulrike Kistner, Kamogelo Lekubu, Andile Mngxitama, Prishani Naidoo, John Shai, and S'bu Zulu.

The black body is the site of social death par excellence, having become dead by a 700-year injunction barring its subjectivity. Social death is a condition of existence and not some avoidable impact—how we relate to this condition is all that is important

Wilderson 02 - The Prison Slave as Hegemony's (Silent) Scandal-Presented at #Imprisoned Intellectuals # Conference Brown University]

Civil society is not a terrain intended for the Black subject. It is coded as waged

and wages are White. Civil society is the terrain where hegemony is produced, contested, mapped. And the invitation to participate in hegemony's gestures of influence, leadership, and consent is not extended to the unwaged. We live in the world, but exist outside of civil society. **This structurally impossible position is a paradox, because the Black subject, the slave, is vital to political economy: s/he kick-starts capital at its genesis and rescues it from its over-accumulation crisis at its end. But Marxism has no account of this phenomenal birth and life-saving role played by the Black subject:** from Marx and Gramsci we have consistent silence. In taking Foucault to task for assuming a universal subject in revolt against discipline, in the same spirit in which I have taken Gramsci to task for assuming a universal subject, the subject of civil society in revolt against capital, Joy James writes: The U.S. carceral network kills, however, and in its prisons, it kills more blacks than any other ethnic group. American prisons constitute an "outside" in U.S. political life. In fact, our society displays waves of concentric outside circles with increasing distances from bourgeois self-policing. The state routinely polices the 14 unassimilable in the hell of lockdown, deprivation tanks, control units, and holes for political prisoners (Resisting State Violence 1996: 34). But this peculiar preoccupation is not Gramsci's bailiwick. His concern is with White folks; or with folks in a White (enough) subject position that they are confronted by, or threatened by the removal of, a wage -- be it monetary or social. **But Black subjectivity itself disarticulates the Gramscian dream as a ubiquitous emancipatory strategy, because Gramsci, like most White activists, and radical American movements like the prison abolition movement, has no theory of the unwaged, no solidarity with the slave. If we are to take Fanon at his word when he writes, #Decolonization, which sets out to change the order of the world, is, obviously, a program of complete disorder # (37) then we must accept the fact that no other body functions in the Imaginary, the Symbolic, or the Real so completely as a repository of complete disorder as the Black body. Blackness is the site of absolute dereliction at the level of the Real, for in its magnetizing of bullets the Black body functions as the map of gratuitous violence through which civil society is possible: namely, those other bodies for which violence is, or can be, contingent. Blackness is the site of absolute dereliction at the level of the Symbolic, for Blackness in America generates no categories for the chromosome of History, no data for the categories of Immigration or Sovereignty; it is an experience without analog # a past, without a heritage. Blackness is the site of absolute dereliction at the level of the Imaginary for #whoever says #rape # says Black, # (Fanon), whoever says #prison # says Black, and whoever says #AIDS # says Black (Sexton) # the #Negro is a phobogenic object # (Fanon). Indeed &a phobogenic object &a past without a heritage &the map of gratuitous violence &a program of complete disorder. But whereas this realization is, and should be cause for alarm, it should not be cause for lament, or worse, disavowal # not at least, for a true revolutionary, or for a truly revolutionary movement such as prison abolition. 15 If a social movement is to be neither social democratic, nor Marxist, in terms of the structure of its political desire then it should grasp the invitation to assume the positionality of subjects of social death that present themselves; and, if we are to be honest with ourselves we must admit that the "Negro" has been inviting Whites, and as well as civil society's junior partners, to the dance of social death for hundreds of years, but few have wanted to learn the steps. They have been, and remain today # even in the most anti-racist movements, like the prison abolition movement # invested elsewhere. This is not**

to say that all oppositional political desire today is pro-White, but it is to say that it is almost always "anti-Black" which is to say it will not dance with death. Black liberation, as a prospect, makes radicalism more dangerous to the U.S. Not because it raises the specter of some alternative polity (like socialism, or community control of existing resources) but because its condition of possibility as well as its gesture of resistance functions as a negative dialectic: a politics of refusal and a refusal to affirm, a program of complete disorder. One must embrace its disorder, its incoherence and allow oneself to be elaborated by it, if indeed one's politics are to be underwritten by a desire to take this country down. If this is not the desire which underwrites one's politics then through what strategy of legitimation is the word #prison # being linked to the word #abolition #? What are the lines of political accountability? There is nothing foreign, frightening, or even unpracticed about the embrace of disorder and incoherence. The desire to be embraced, and elaborated, by disorder and incoherence is not anathema in and of itself: no one, for example, has ever been known to say #gee-whiz, if only my orgasms would end a little sooner, or maybe not come at all. # But few so-called radicals desire to be embraced, and elaborated, by the disorder and incoherence of Blackness # and the state of political movements in America today is marked by this very Negrophobogenesis: #gee-whiz, if only Black rage could be more coherent, or maybe not come at all. # Perhaps there is something more terrifying about the joy of Black, then there is about the joy of sex (unless one is talking sex with a Negro). Perhaps coalitions today prefer to remain in-orgasmic in the face of civil society # with hegemony as a handy prophylactic, just in case. But if, through this stasis, or paralysis, they try to do the work of prison abolition # that work will fail; because it is always work from a position of coherence (i.e. the worker) on behalf of a position of incoherence, the Black subject, or prison slave. In this way, social formations on the Left remain blind to the contradictions of coalitions between workers and slaves. They remain coalitions operating within the logic of civil society; and function less as revolutionary promises and more as crowding out scenarios of Black antagonisms # they simply feed our frustration. Whereas the positionality of the worker # be s/he a factory worker demanding a monetary wage or an immigrant or White woman demanding a social wage # gestures toward the reconfiguration of civil society, the positionality of the Black subject # be s/he a prison-slave or a prison-slave-in-waiting # gestures toward the disconfiguration of civil society: from the coherence of civil society, the Black subject beckons with the incoherence of civil war. A civil war which reclaims Blackness not as a positive value, but as a politically enabling site, to quote Fanon, of "absolute dereliction": a scandal which rends civil society asunder. Civil war, then, becomes that unthought, but never forgotten understudy of hegemony. A Black specter waiting in the wings, an endless antagonism that cannot be satisfied (via reform or reparation) but must nonetheless be pursued to the death.

Links

[Some other (probably better) links can also be found in the case section. You can also get links through C-X—ask them about the historical usage of black slave women as breeders and why they think it’s okay for them to appropriate this narrative for a white narrator]

Antiblackness shapes gender oppression

Sexton 08 (Jared Sexton, “Amalgamation Schemes: Antiblackness and the Critique of Multiracialism”, 2008)

But all of this is not to mark difference for difference sake, much less to participate in the ranked determination of suffering. It is, instead, to properly locate the political dynamics and to outline the ethical stakes at hand. Antiblackness is not only unique (something rightly ascribed to any number of political histories). My argument turns on the further point that it is both historically and ontologically prior to, thereby enabling, the range of racial inequalities against which the multiracial Left does battle, just as it subtends the formations of globalizing capital (Vilderson 2003) and thoroughly conditions the elaborations of gender power and the regulations of sexuality (Jackson 2003). This is why the idea of a new racism in the United States, or the pluralizing concept of racisms, indexes the centralization of a politics of immigration across the global North (a process we might think of as the political “Europeanization” of the United States, where race talk is exhausted by concern for the discriminations of immigration policy, the dangers of xenophobia, and the legacies of colonialism; in another register, we could speak of the debilitating leveling effects of Third World-ism or the disabling fallout of the “people of color” heading). This is also why introducing questions about antiblackness, prompted often enough by the mere entrance of black people to multiracial spaces of intellectual inquiry or political activism, throws the discussion into disarray. The politics of multiracialism provides an object lesson in this governing tendency.

Antiblackness is the root cause of all oppression

Sexton 11 (Jared Sexton, “People-of-Color-Blindness”, <http://www.artandeducation.net/videos/jared-sexton-people-of-color-blindness/>, 2011)

In this 2011 talk at University of California, Berkeley, noted critical race scholar Jared Sexton draws on his recent articles to develop some of the most trenchant implications of the Afro-Pessimist position as a historical reading, a performative analysis and a political ontology. He is concerned to emphasize both the foundational character of racial slavery to modernity – including modernity’s salient categories of freedom, rights and personhood – and its specificity as a total social institution in Orlando Patterson’s emblematic term, ‘social death’. There is an urgency to reconstruct the categories of political philosophy around the figure of the slave (departing from Agamben’s injunction that the paradigmatic political figure of our time is the refugee). This should be the first step of a response to the question ‘what is the world that slavery made possible?’ Sexton goes on to critique the universalization of slavery to diverse historical situations of racialized subjugation and exploitation, such as Achille Mbembe’s term ‘necropolitics’ to describe the condition of the ‘post-colony’. Gender and class are both re-positioned as not ‘intersecting’ with but directly produced through the social formation of racial slavery as the matrix for the sorting of humans from ‘anti-humans’ and property from persons.

The affirmative appropriates black suffering which delegitimizes black resistance

Sexton 10 (Jared Sexton, “People-of-Color-Blindness: Notes on the Afterlife of Slavery”, 2010)

The disqualification of black resistance is not unrelated to the peculiar and long-standing cross-racial phenomenon in which the white bourgeois and proletarian revolutions on both sides of the

Atlantic can allegorize themselves as revolts against slavery, while the hemispheric black struggle against actually existing slavery and its afterlife cannot authorize itself literally in those same terms. The latter must code itself as the apotheosis of the French and American revolutions (with their themes of Judeo-Christian deliverance) or, later, the Russian and Chinese revolutions (with their themes of secular messianic transformation) or, still later, the broad anticolonial movements in Asia, Africa, and Latin America of the mid-twentieth century (with their themes of indigenous reclamation and renaissance). 56 The metaphoric transfer that dismisses the legitimacy of black struggles against racial slavery (and what Wacquant calls its “functional surrogates”) while it appropriates black suffering as the template for nonblack grievances remains one of the defining features of contemporary political culture. That notable black academics, artists, and activists participate in this gesture is nothing new, of course, but their increasing degrees of self-consciousness and virulence in so doing signal the hegemony it presently enjoys.

Their choice to absent women of color from their movement sets racial issues to the backburner and never truly includes women of color—turns the case **Ware 15** (Vron Ware, “Beyond the Pale: White Women, Racism, and History”, accessed through Google Books, Jun. 9, 2015,)

When *Beyond the Pale* was first published, I was a senior in a predominantly white high school, struggling to work out my relationship with the feminism espoused by some of my classmates that didn't seem to include women like me. Women who grew up in the inner city without two parents, or even a picket fence in sight. Women for whom the right to work was never going to be in question. Instead ours was a fight to be paid a living wage and not to have our bodies and hair marked out as unprofessional simply for existing. Perhaps if I had read it then, I would have been better equipped to manage conversations about the intersection of race and gender. Instead, I floundered when white friends took offence at a plan to perform for colored girls who have considered suicide when the rainbow is enuf by Ntozake Shange - the Obie and Tony Award-winning theater piece about the experiences of seven women of colour in a racist and sexist society - with a cast comprised solely of girls of colour. There was an air of 'white women are oppressed too!' that I didn't know how to dissect in order to show them that their response was oppressive. When the idea of the play was first floated, their immediate reaction was 'It's not fair to us!' and 'Why put on a show we can't be in?' despite the fact that most shows at the school had casts that were all white or nearly so. Selections like *Pirates of Penzance* or *Brigadoon* were more likely to be produced than *Porgy and Bess* or *A Raisin in the Sun*, much less anything as modern as *for colored girls* who have considered suicide and no one said a word about those plays, even when it came up (as it did periodically) that hardly any plays written by or about communities of colour were even considered for the drama programme. In retrospect, I am certain that the Girl Power rhetoric that was our intro to feminism covered everything but race and class. That pop-music inspired feminism focused more on women being able to work outside the home than on the type of work they might be doing there. It was about having it all, but in a way that had white women in boardrooms with women of colour as their secretaries. It was never overtly stated that way, but in retrospect a lot of imagery from that time either had no women of colour or only one amid a group of white women. Sure my friends wanted the girls of colour to have parts in the school plays, an activity that is typically prime material for enhancing college applications, but not at their own perceived expense. Even one show a year (out of the four to six that were usually performed) was too much space in the limelight for them to give up. It's easy to dismiss such an occurrence as the behaviour of children who didn't know any better, but that same phenomenon can be found in modern mainstream feminist circles among adults. Whether the problem is feminist events that ignore topics like food access, police brutality, or schools in favour of a focus on how to become a CEO, or an insistence that women of colour be patient about their issues for the 'greater good' (i.e., Elizabeth Cady Stanton and other notable suffragettes prioritizing women's rights over the abolition of lynching), the end result is the same. In order for solidarity between white women and women of colour to develop on a broader basis, the history behind the former's failure to support women of colour confronting

problems like¶ racial inequality and immigration must be examined and¶ addressed so that these issues can cease to be replicated in¶ each successive generation.

AT Dodson/Intersectionality

They do not critique the book—7 minutes of the 1AC rave about how great the book are and Dodson (who I'm pretty sure is white) also does not critique the book or say it's bad but talks about racism as a whole

This card is awful—it literally says that one line in the book of the protagonist going, “Wow I feel sorry for those poor people of color now!” That's not an excuse for erasing women of color from the book when the entire narrative is appropriative. The card mentions that “Atwood IMPLIES” things or “this could be taken to mean” and most of the warrants are in fact from OTHER authors like “Ain't I a Woman?” Which is a speech by a black woman. There's no mention of a direct critique of Atwood's narrative—the book and premise of the 1AC itself is inherently appropriative.

This book is not intersectional—THERE ARE NO WOMEN OF COLOR IN THE ENTIRE BOOK. Even if they talk about things like forced breeding that ignores and papers over the particularity of violence that occurs against black women and other women of color

Also even if Offred somehow recognizes her own privilege that does not matter because Atwood is still using the struggles of black women for her book so her “recognition” isn't actually doing much when she's still perpetuating the fungibility of the black body—this is the same as when white women invaded black spaces and took over these spaces under the well-meaning but misguided masking of “we also emphasize with you”—that means they cannot solve for movements of women of color

AT: Atwood checks her privilege

Authorial intent doesn't matter

Keep 2k (Christopher Keep, “Death of the Author”, <http://www2.iath.virginia.edu/elab/hfl0226.html>)

Until recently, an author was an unproblematic concept; an author was someone who wrote a book. Roland Barthes' landmark essay, “The Death of Author,” however, demonstrates that an author is not simply a “person” but a socially and historically constituted subject. Following Marx's crucial insight that it is history that makes man, and not, as Hegel supposed, man that makes history, Barthes emphasizes that an author does not exist prior to or outside of language. In other words, it is writing that makes an author and not vice versa. “[T]he writer can only imitate a gesture that is always anterior, never original. His only power is to mix writings [...] in such a way as never to rest on any one of them” (146). Thus the author cannot claim any absolute authority over his or her text because, in some ways, he or she did not write it. This is not to say that someone named Margaret Atwood did not spend many months toiling away at book called Lady Oracle, rather that we must re-think what it means when we say “Margaret Atwood” and “Lady Oracle.” Barthes throws the emphasis away from an all-knowing, unified, intending subject as the site of production and on to language and, in so doing, hopes to liberate writing from the despotism of what he calls the work, or what we have called The Book:¶ To give a text an Author is to impose a limit on that text, to furnish it with a final signified, to close the writing [...] [However] by refusing to assign a 'secret,' an ultimate meaning, to the

text (and the world as text), liberates what may be called an anti-theological activity, an activity that is truly revolutionary since to refuse to fix meaning is, in the end, to refuse God and his hypostases--reason, science, law. (147)

Just because Atwood talked about black feminism later doesn't mean the book's not eligible for critique—author intent shouldn't be evaluated when it comes to critique of narrative

Rosenberg 14 (Alyssa Rosenberg, “The literary theory idea that explains how we talk about pop culture”, August 28th, 2014, <https://www.washingtonpost.com/news/act-four/wp/2014/08/28/the-literary-theory-idea-that-explains-how-we-talk-about-pop-culture/>)

Rather than trying to resolve the unresolvable and aligning creators' intentions with our own feelings, I think we ought to try to do something different: learn to live with ambiguous stories, and to embrace conflicts between authorial intent and our own interpretation.¶ The critic and cultural historian Jeet Heer took to Twitter last night to point readers to Northrop Frye's “Anatomy of Criticism,” which lays out what Heer thinks is a good standard for how to regard authorial intent.¶ “The poet may of course have some critical ability of his own, and so be able to talk about his own work. But the Dante who writes a commentary on the first canto of the Paradiso is merely one more of Dante's critics.” Frye wrote. “What he says has a peculiar interest, but not a peculiar authority.”¶ To flesh this out a bit, I think authorial intent is interesting precisely because it sets up a particular space for inquiry. The gap between what an author believes he or she has communicated and what audiences take away from a work can be a way to measure how clearly or effectively a creator executed on his or her intentions. Even if we are not using authorial intent to measure whether a work is good or bad, it can be a fascinating test of what creators think constitutes a well-developed female character, a searing look into the misogynist mind or even a sexual assault.

AT: Permutation

You don't get a permutation—this is a methodology debate, you chose to start from the starting point of gender and you shouldn't get to magically include antiblackness when we brought it up— K affs shouldn't get permutations because they're already untopical and don't have stable ground, means a perm is even harder to pin down and they shouldn't get to tack our methodology onto theirs

that means there's a Backburner DA to the permutation, they only include antiblackness as a checkbox on their laundry list, an afterthought—this failing to center antiblackness means that the perm is still structured around the politics and antiblackness of white civil society, leading to the impacts of the K

Hijacking disad - Their attempt to capture and redirect our alternative is similar to the Kennedy Association's involvement the Civil Rights Movement so that he could control the movement and strip out everything that posed an actual threat to the interests of the white elite. The alt will be violently suppressed the moment it no longer aligns with their model of comfortable, peaceful, white-friendly, resistance – a sovereign and violently oppositional resistance movement is key to alt solvency.

AT Speaking for Others

There's a difference between speaking for others and their arg—this debate is literally going: they read a book, we call them out say that book's racist, and they say we're speaking on behalf of black people? There are no black individuals in this debate right now so if we hadn't spoken out then the 1AC would have gone unchallenged which is a net worse than reading the kritik—it would be different if I was telling someone who was black that I would talk for them, but all I'm doing is calling out their book—

They're the ones objectifying black bodies—Atwood literally took the narrative of the slave women, tacked it onto white women—that's definitely worse than our instance

AT Non-black people can't talk about social death

There's a distinction between what we're doing and independently theorizing about social death—of course we don't know what it's like to be black and experience social death, but most of our authors are black and presumably do know what it's like and they've written about it extensively—we're just talking about their theories

AT: Hudson/Nonontological

Civil society is founded on the social death of the slave—they can't win this when they've conceded the card on the 1NC that says that social death is a condition that is fundamentally tied to modernity—the opposite of freedom is the slave, our concepts of what defines a human is predicated against the binary of the slave—other explanations don't and cannot explain things like gratuitous violence

Perm

cutting

If the oppression of nonblack people of color in, and perhaps beyond, the United States seems conditional to the historic instance and functions at a more restricted empirical scope, antiblackness seems invariant and limitless (which does not mean that the former is somehow negligible and short-lived or that the latter is exhaustive and unchanging). If pursued with some consistency, the sort of comparative analysis outlined above would likely impact the formulation of political strategy and modify the demeanor of our political culture. In fact, it might denature the comparative instinct altogether in favor of a relational analysis more adequate to the task. Yet all of this is obviated by the silencing mechanism par excellence in Left political and intellectual circles today: “Don’t play Oppression Olympics!” The Oppression Olympics dogma levels a charge amounting to little more than a leftist version of “playing the race card.” To fuss with details of comparative (or relational) analysis is to play into the hands of divide-and-conquer tactics and to promote a callous immorality.⁷² However, as in its conservative complement, one notes in this catchphrase the unwarranted translation of an inquiring position of comparison into an insidious posture of competition, the translation of ethical critique into unethical attack. This point allows us to understand better the intimate relationship between the censure of black inquiry and the recurrent analogizing to black suffering mentioned above: they bear a common refusal to admit to significant differences of structural position born of discrepant histories between blacks and their political allies, actual or potential. We might, finally, name this refusal people-of-color-blindness, a form of colorblindness inherent to the concept of “people of color” to the precise extent that it misunderstands the specificity of antiblackness and presumes or insists upon the monolithic character of victimization under white supremacy⁷³—thinking (the afterlife of) slavery as a form of exploitation or colonization or a species of racial oppression among others.⁷⁴ The upshot of this predicament is that obscuring the structural position of the category of blackness will inevitably undermine multiracial coalition building as a politics of radical opposition and, to that extent, force the question of black liberation back to the center of discussion. Every analysis that attempts to understand the complexities of racial rule and the machinations of the racial state without accounting for black existence within its framework—which does not mean simply listing it among a chain of equivalents or returning to it as an afterthought—is doomed to miss what is essential about the situation. Black existence does not represent the total reality of the racial formation—it is not the beginning and the end of the story—but it does relate to the totality; it indicates the (repressed) truth of the political and economic system. That is to say, the whole range of positions within the racial formation is most fully understood from this vantage point, not unlike the way in which the range of gender and sexual variance under patriarchal and heteronormative regimes is most fully understood through lenses that are feminist and queer.⁷⁵ What is lost for the study of black existence in the proposal for a decentered, “postblack” paradigm is a proper analysis of the true scale and nature of black suffering and of the struggles—political, aesthetic, intellectual, and so on—that have sought to transform and undo it. What is lost for the study of nonblack nonwhite existence is a proper analysis of the true scale and nature of its material and symbolic power relative to the category of blackness.⁷⁶ This is why every attempt to defend the rights and liberties of the latest victims of state repression will fail to make substantial gains insofar as it forfeits or sidelines the fate of blacks, the

prototypical targets of the panoply of police practices and the juridical infrastructure built up around them. Without blacks on board, the only viable political option and the only effective defense against the intensifying cross fire will involve greater alliance with an antiblack civil society and further capitulation to the magnification of state power. At the apex of the midcentury social movements, Kwame Ture and Charles Hamilton wrote in their 1968 classic, *Black Power: The Politics of Liberation*, that black freedom entails “the necessarily total revamping of the society.”⁷⁷ For Hartman, thinking of the entanglements of the African diaspora in this context, the necessarily total revamping of the society is more appropriately envisioned as the creation of an entirely new world: “I knew that no matter how far from home I traveled, I would never be able to leave my past behind. I would never be able to imagine being the kind of person who had not been made and marked by slavery. I was black and a history of terror had produced that identity. Terror was “captivity without the possibility of flight,” inescapable violence, precarious life. There was no going back to a time or place before slavery, and going beyond it no doubt would entail nothing less momentous than yet another revolution.”⁷⁸

Ocularcentrism

Notes

The second card can also be read on case

1NC

The 1AC's usage of visual metaphors is similar to society's bias towards all things visual—this bias affects our conceptions of social difference

Hibbits 94 (Bernard J., Assoc. Prof of Law @ Pitt, "Making Sense of Metaphors: Visuality, Aurality, and the Reconfiguration of American Legal Discourse" Cardozo Law Review, 229, http://law.pitt.edu/archive/hibbits/meta_p2.htm)

The traditional American bias towards the visual is aptly captured by the observation that "[i]n our society, . . . to be real, a thing must be visible."⁴⁵ We⁴⁶ demonstrate our visual bias in numerous ways and in numerous contexts, usually without recognizing that such a bias even exists. Every time we sing the first line of the national anthem, we ask a question about looking: "Oh say can you see . . .?" We pay for goods and services with dollar bills that bear a staring eye on their backs.⁴⁷ We go on vacation not to hear the sounds, but to "see the sights"; we take along cameras, not tape recorders.⁴⁸ [2.4] We give aesthetic priority to visual effect. Our glass and steel buildings are monuments to the power of sight, rather than sound or touch.⁴⁹ Our idea of personal beauty is primarily visual.⁵⁰ So is our idea of art, to the point where, in ordinary discourse, that term denotes purely visual painting, not music or dance.⁵¹ Our visual orientation even colors our approach to art forms which, at least in theory, are not altogether dependent on visual appreciation: we regularly highlight the visuality of sculpture-and, at the same time, neutralize its tactility-by posting signs in our museums and art galleries that read "Do Not Touch." Is it any wonder that in such a context, our sculpture should have become "painterly,"⁵² i.e., designed much more for seeing than feeling?[†] [2.5] Less obviously, but more fundamentally, our visuality shapes our sense of social identity and difference. We tend to group one another more on the basis of similar visual appearance than on, say, similar accent.⁵³ This is most obvious when we categorize individuals according to the color of their skin: in our visualist culture, most Americans are "white" or "black." Visual identity has indeed become so important to us that we not only differentiate, but actually discriminate against one another on a visual basis. Having skin of a certain color may in practice entitle us to, or alternatively, it may disqualify us from educational opportunity, economic wealth, and political power.

This fixation on the visual has aided in the development of the male "gaze" and control over women—leads to patriarchy

Hibbits 94 (Bernard J., Assoc. Prof of Law @ Pitt, "Making Sense of Metaphors: Visuality, Aurality, and the Reconfiguration of American Legal Discourse" Cardozo Law Review, 229, http://law.pitt.edu/archive/hibbits/meta_p2.htm)

It may be argued that the extent of their involvement with written material has led American men as a group-like men in other Western societies- to take a great interest in the phenomenon of visual observation that has been the source of so much of their textual knowledge and authority²²¹ As modern feminist scholarship has taken pains to emphasize (if not necessarily explain), the "gaze" has historically been more of a "male" than a "female" medium.²²² In the American tradition, men have been primarily responsible for reducing the world-and, in the process, women-to visual two-dimensional texts, paintings, photographs,²²³ electronic images,²²⁴ diagrams, and equations.²²⁵ In their capacities as school administrators, college professors, historians, curators, and archivists, American men have long been in charge of preserving and perpetuating the corpus of American visual culture over time. As scientists and philosophers, they have further indulged their visuality by using mostly visual metaphors to describe the central intellectual operations of thinking and knowing: they have made "observations," offered

"perspectives," and "speculated" on the nature of reality.²²⁶[2.33] The desire and even the need to look that has animated American male experience has frequently been coupled with a limited and somewhat selective devaluation of aurality and evocatively aural forms. At least since the late eighteenth century, most American men have rejected dialogue and story as respectable vehicles for the communication of important written information.²²⁷ More generally, American men as a group have been eager to prescribe silence as a positive personal and social value for others, if not necessarily for themselves.²²⁸ This latter strategy has been feasible in part because many American men have had access to a visual medium of communication (writing) which in their experience has not depended on sound to provide its sense. The strategy has moreover been politically useful because it has enabled American men to consolidate their control of other groups that have been more dependent on aural expression. The command that women (not to mention children) be "seen and not heard"-implicitly evoked from the anti-scolding laws of the seventeenth century²²⁹ through the marital evidence laws of the nineteenth century²³⁰-has been a prime guarantor of patriarchal power.

The Alt— Reject the Affirmative’s visual metaphors and advocate the parts of the 1AC that don’t reference the visual.

2NC Extensions

Privileging of vision is uniquely bad in epistemology and philosophy

Levin 93 (David Levin, “Modernity and the Hegemony of Vision”, 1993, accessed using Google Books)

In a series of recent articles Martin Jay has focused on criticism of the ocularcentrism of Western culture. By ocularcentrism, Jay means the epistemological privileging of vision that begins at least as early as Plato's notion that ethical universals must be accessible to "the mind's eye" and continues with the Renaissance, the invention of printing, and the development of the modern sciences. For Descartes, truth is associated with clear and distinct ideas discerned by a "steadfast mental gaze," while for Bacon objectivity is associated with observation, and objective knowledge is that knowledge obtained through sight. But such a privileging of sight lens also inspired a deep distrust, a distrust that one can find in Berwon's work and that runs through the work of Wagner, Nietzsche, and Heidegger. More recently it has taken form in Foucault's analysis of modern surveillance techniques, in Guy Debonl's condemnation of the society of the spectacle, and in Richard Rorty's critique of ocular metaphors in phi-losophy. Many contemporary feminists, hermeneuticists, deconstruc-tionists, and Marxists now attack any supposed association between vision and the critique of ideology. Marx could still rely on the power of the idea of clear vision in his comparison of ideology to a camera obscura that inverts the way "men and their circumstances" appear, just as the physical life process inverts objects on the retina. For contemporary critics, however, ideology is no longer to be connected to distortions in vi-sion but to distortions of language. ¶ In Jay's view, such an analysis follows from a renewed respect for the truths of interpretation over the methods of scientific observation. Vision is conceived of as synchronic, antihistorical, and pointillist, °producing an external prescence without my meaningful continuity between past and future." Sight can only grasp external appearances and behav-ior, never inner meaning. It externalizes only the given moment and can¶ never envision its context. In contrast, interpretation involves decoding¶ meaning by listening to its expression connecting meaning to what has¶ been said or will be said and understanding the context of action or expression. For this reason, it seems to allow more space for sustained criticism. To connect ideology to obscured vision is to suppose that the¶ social critic is somehow suited to seeing social reality for what it is. To con-¶ nect ideology with language is to open up avenues for critical interpreta-¶ tion that focus on the kinds of discourses that have power in a culture or¶ society and to claim that language includes hierarchal relations of dom-¶ ination. The overcoming of ideology is thus no longer associated within-¶ sight, clear vision, or

even enlightenment. Social criticism does not reveal the truth of 'men and their circumstances' for all to see. Instead, it cleans language and communication of their hidden relations to power.

Case

This book is bad and you should feel bad

The very premise of the Handmaid's tale is flawed and diminishes the struggle of people of color; it effectively appropriates their suffering in order to create a vehicle for white feminism (1nc)

Berlatsky 14 (Noah Berlatsky, "The Handmaid's Tale and Bad Slavery Comparisons", 8/19/14, <http://splicetoday.com/politics-and-media/the-handmaid-s-tale-and-bad-slavery-comparisons>)

A way to answer that question is to consider one of the most famous feminist novels of the last 30 years: Margaret Atwood's The Handmaid's Tale. Atwood's book, published in 1985, is set in a dystopian near future in which right-wing family-values religious fanatics have taken control of the United States. The nameless protagonist and narrator was a librarian prior to the coup. The new rulers stripped her of her money, profession, and child and marriage, the last of which is considered invalid since her husband was previously divorced. She's forced by the new government of Gilead to become a Handmaid, assigned to various important men as a kind of official mistress, in hopes that she will bear them children—an imperative since chemical and radioactive pollution has sterilized much of the population.¶ The Handmaid's Tale clearly owes a debt to other totalitarian dystopias, most notably 1984. But it also borrows liberally from the experiences of non-white women. In fact, the novel's horror is a nightmare vision in which white, college-educated women like Atwood are forced to undergo the experiences of women of color.¶ This transposition is not subtle, nor meant to be. Handmaids wear red, full-body coverings and veils that reference the burqa. In case the parallel isn't sufficiently obvious, Atwood has the narrator directly compare the Handmaids waiting to perform their procreative duties to "paintings of harems, fat women lolling on divans, turbans on their heads, or velvet caps, being fanned with peacock tails, a eunuch in the background standing guard." The narrator has been teleported into an Orientalist fever dream, the irony only emphasized early in the novel by a group of modern, Japanese tourists, who stare at the debased Occidental women just as Westerners stereotypically stare at the debased women of the Orient. The stigma against Islam is leveraged along with, and blurs into, the stigma against prostitutes. The horror here is that middle-class, college-educated white women will be forced into the position of sex workers.¶ Slave experiences are appropriated with similar bluntness. The network that secretly ferrets Handmaid refugees over the border to Canada in the novel is called, with painful obliviousness, the Underground Femaleroad. We learn, in an aside, that the regime hates the song "Amazing Grace"—originally an anti-slavery song, its reference to "freedom" has been repurposed here to apply to Gilead's gender inequities. The specific oppressions the Handmaids face also seem lifted from slave experience—their children are taken; they're not allowed to read; they need passes to go out; if they violate any of innumerable rules, they're publicly hanged. The tension between white mistresses and black women on slave plantations is even reproduced; the narrator's Commander wants to see her outside of the proscribed procreation ceremony. She can't refuse, but when she finds out it provokes the Commander's wife to dangerous sexual jealousy. This is a familiar dynamic from any number of slave narratives (12 Years a Slave is a high-profile recent example) with the one difference that here, not just the oppressor, but also the oppressed, is white.¶ Atwood is hardly the first science-fiction author to create a white future from elements of past non-white oppression. As I've written before, this kind of reversal is central to the genre; H.G. Wells, explicitly compares the invasion of the Martians in The War of the Worlds to European colonization of Tasmania. Wells presents this parallel as a moral lesson; he asks Europeans to imagine themselves in the position of the colonized, and to think about how that would feel. You could argue that Atwood is doing something similar—that she's trying to get white people, and particularly white women, to imagine themselves in the position of non-white women, and to be more appreciative of and sympathetic to their struggles. You could see The Handmaid's Tale as analogous to Orange Is The New Black, where a white woman is a convenient point of entry to focus on and think about the lives of non-white women.¶ Orange Is the New Black actually

includes black and Latina women as characters, though. **The Handmaid's Tale emphatically does not.** The book does mention that the Gilead regime is very racist, but the one direct mention of black people in the book is an assertion of their erasure. The narrator sees a news report that declares, "Resettlement of the Children of Ham is continuing on schedule." Here **Atwood and Gilead are in cahoots, resettling black people somewhere else, so that we can focus, untroubled by competing trauma, on the oppression of white people.** Atwood created Gilead. You can hear an echo of the writer's thoughts in Moira, the narrator's radical lesbian friend, who is not shocked by the Gilead takeover. Instead, the narrator says, Moira seems, "In some strange way she was gleeful, as if this was what she'd been expecting for some time and now she'd been proven right." **The Handmaid's Tale presents a world in which white middle-class women are violently oppressed by Christian religious fanatics. As such, it is not just a dystopia, but also a kind of utopia, the function of which, as Moira says, is to prove a certain kind of feminist vision right.** That vision is one in which women, and effectively white women, contain all oppressions within themselves. **The Handmaid's Tale is a dream of vaunting, guiltless suffering.** Maybe that's why Stop Patriarchy finds the slavery metaphor so appealing. **Using slavery as a comparison is not just an intensifier, but also a way to erase a complicated, uncomfortable history in which the oppressed can also sometimes be oppressors.**

Reject the narrative of the Handmaid's Tale—it reinforces western and xenophobic conceptions of Islam and generalizes the oppression that women of color face

Berlatsky 15 (Noah Berlatsky, "The Handmaid's Tale Is Overrated—Here's What You Should Read Instead", 3/18/15, <http://www.ravishly.com/2015/03/17/handmaids-tale-overrated%E2%80%94heres-what-you-should-read-instead>)

Thirty years after it was first published, Margaret **Atwood's The Handmaid's Tale remains popular**, both with readers and with teachers. In part, this is **no doubt because this particular nightmarish future remains a favorite nightmarish future.** In *The Handmaid's Tale*, **the bad guys are repressive, anti-sex, right-wing religious whackos who have conquered America**—they're a stand-in for the moral majority of the Reagan era, a Christian right which is with us still. **But** those bad guys also reference **Western visions of Islamic evils—the oppressed handmaids** in Atwood's future America of Gilead **wear what are essentially burkas, and there's a telling reference to "paintings of harems, fat women lolling on divans."** **The Handmaid's Tale takes the repression and exotification of women of color and generalizes it to all women. The result is a fairly straightforward morality tale, in which (all) women are oppressed by a non-specific, generalized conservative fanaticism.** You can see why that still resonates in a post-9/11 world, **in which the egalitarian liberty of the West is often defined in opposition to "Islamofascism."** **The Handmaid's Tale can easily be read as a prescient warning against sharia law; the book is conservative in the sense that it takes a stand against an incursion of foreign values and foreign culture.** It says, don't let those people make us over in their image.

The Handmaid's tale fails to mention and appropriates the suffering of black women (1nc)

Coleman 13 (Arianna Coleman, "Thoughts on Margaret Atwood's "The Handmaid's Tale", <https://aconerlycoleman.wordpress.com/2013/12/30/thoughts-on-margaret-atwoods-a-handmaids-tale-part-2/>, December 30th, 2013)

For instance, I did not take into account the category of "Unwomen." **As Offred is the (presumed) white narrator of the text** situated within the Republic of Gilead, a theocratic regime borne of conservative anxieties about the state (and future—hence the emphasis on the (re)productive capabilities of the Handmaids) of a white nation (or "race"), **she takes whiteness to be the assumed norm, even when she talks about Jews** ("Sons of Jacob") **and Blacks** ("Sons of Ham") **being**

forcibly moved to the margins or simply killed. So, when Offred uses the term “Unwoman” she refers to a category reserved for people with uteruses who did not have sufficient socio-economic (or marital) status within the regime to be afforded protection in the event that they are “sterile” or “infertile.” More pertinently, the category of “Unwomen” in Atwood’s text is implicitly white. And this implicit understanding is premised on the erasure of Black women from the story.¶ Indeed, the “Children of Ham” are said to be relegated to National Homelands, not unlike those of the South African Apartheid regime, but nowhere in the book are Black women named or mentioned. This omission is particularly glaring in light of Atwood’s decision to analogize The Underground Railroad with the “Underground Femaleroad.” In *The Handmaid’s Tale*, the “Underground Femaleroad” is an illegal (extralegal?) network of resisters who acted as a safe haven for runaway Handmaids. On page 246, Moira (a former inmate who shared quarters with Offred) recalls being brought from Quaker household to Quaker household to a short-lived freedom. Now, as a reader who is also a Black woman and a descendant of enslaved Africans within the institution of chattel/racial slavery, I am curious whether there could be a Harriet Tubman in the “Underground Femaleroad,” but I know the answer, because Black women are neither named nor seen in the text.¶ This omission is doubly egregious when one takes the forcible removal and adoption of babies under the Republic of Gilead into consideration. In the contemporary (and historical) United States that presumably precedes the Republic of Gilead, there is a strong pattern of state interventions which led to the forcible sterilization of women of color (notably Black, Native and Latin@ women, as well as poor women and people with disabilities - legal in 27 states), in addition to the forcible removal of children in Black, Native, low-income, etc households. Dorothy Roberts’ “Shattered Bonds: The Color of Child Welfare” covers this in a very thorough manner. For Black women in particular, the forcible removal of children from their homes is part of a long history- one rooted in the institution of chattel/racial slavery, where Black children were regularly wrested from the breasts of their mothers and sold for a profit. In short, it is an appropriation (I do not use this word lightly) of the pain of Black women.

The Handmaid’s tale assumes a default white perspective which excludes women of color

Coleman 13 (Arianna Coleman, “Thoughts on Margaret Atwood’s “The Handmaid’s Tale”, <https://aconerlycoleman.wordpress.com/2013/12/29/thoughts-on-margaret-atwoods-the-handmaids-tale/>, December 22nd, 2013)

So I’m (re)reading Margaret Atwood’s “The Handmaid’s Tale” and wondering what the story would be like if Of-fred had been a Black woman. Of course, Black people are only referenced once in the book- in an off-hand manner about “Children of Ham” being relegated to “National Homelands” (reminiscent of Bantustans in Apartheid South Africa).¶ This could be read as a convenient way of avoiding addressing the afterlife of slavery- because the reader is expected to understand that the valued, fecund bodies are those of cisgender white women (not Jews, termed “Children of Jacob” or Blacks termed “Children of Ham”, etc). Offred is allowed to be the ‘neutral’ narrator with whom the reader identifies because whiteness is presumed to be a universal and ubiquitous solvent- a solvent that dissolves, assimilates and destroys.¶ If this text were to center a Black subject, the reader would have to confront the afterlife of slavery- a reality in which Black bodies which were previously valued for their fecundity and (re)productive value are now devalued, deemed ‘queer’ (or ‘deviant’) and ‘excess’ in the face of nationalisms that prize whiteness/heteronormativity/etc above all. Another interesting angle to look at the surreptitious use of contraceptives and methods to induce miscarriage among enslaved Africans, and the ways that the regime’s staunchly anti-abortion stance would doubly criminalize Black subjects on this basis.

The Handmaid's Tale is nothing more than white privileged narrative that hides black oppression
Merriman 09 (Ben Merriman, "White-washing oppression in Atwood's The Handmaid's Tale", University of Chicago, 2009, <http://www.thefreelibrary.com/White-washing+oppression+in+Atwood%27s+The+Handmaid%27s+Tale.-a0206534450>)

White privilege is rarely manifested in intentional, positive acts. It is, in Peggy McIntosh's terms, "invisible," "unearned," and "cashed in each day" ("White Privilege and Male Privilege" in Critical White Studies: Looking Behind the Mirror [Philadelphia: Temple UP, 1997]: 291). To be White is to be the norm, universal. This norm functions automatically, and unless the universality of White experience is explicitly questioned or subverted, racial distortions may appear even against the conscious intent of an author. Such distortions appear throughout Margaret Atwood's The Handmaid's Tale (NY: Houghton-Mifflin, 1986). Atwood attempts to offer an archetypal account of female exploitation, but the stand-in for this universal experience is Offred, a White, college-educated American. Offred would seem an unlikely victim, but at no point in the text does Atwood acknowledge that sexism in America has, generally, been modulated by forms of race and class oppression, nor does she acknowledge the parallels between her own story and the experience of Black slavery. Because these historically-specific oppressions are removed from their broader context, the Tale drifts from speculative fiction, which is anchored in reality, into conceptually suspect and politically hazardous fantasy. Atwood's dystopia is set in the late 20th Century, when a cadre of fundamentalist Christians have overthrown the U.S. government and created the theocratic Republic of Gilead. Due to an unexplained fertility crisis, the government has impressed unmarried women of proven fertility into a state of sexual servitude. Many others work as domestic slaves in an autarkic, inefficient command economy. Women are forbidden to read or to meet without supervision. The novel thus places particular emphasis on the most persistent forms of female victimization: the sexual exploitation, isolation, and compelled ignorance that accompany severe economic and political powerlessness. These forms of victimization do not function in a vacuum, and in the United States they have been associated most strongly with the enslavement of African-Americans. Forced procreation arose from widespread slavery associated with plantation agriculture, particularly during in the 19th Century, when the Trans-Atlantic slave trade was on the wane and industrialization increased the demand for raw materials. This form of abuse followed a specific vector, from the White slaveholding man to the Black enslaved woman. In The Handmaid's Tale, victimization does appear to function in a historical and causal vacuum. The Republic of Gilead is an all-White enclave, and Blacks are erased from the novel in a single line, cloaked in Old Testament euphemism: "'Resettlement of the Children of Ham is continuing on schedule,' says the reassuring pink face, back on the screen. 'Three thousand have arrived this week in National Homeland One, with another two thousand in transit.'" (83) While the demand for Black slaves had a well-established economic cause, Offred is forced to copulate because of the novel's two ill-supported pretenses: the coup, which is glossed over in less than a paragraph, and the nebulous, unexplained "fertility crisis." These are clearly fantastic rather than speculative devices, and it is only by this inventive leap that Atwood can write a White professional into the position of a Black slave. The restrictions on reading and assembly in the Tale are similarly contrived. Tight controls on literacy have been the norm throughout Christian history, but these controls have not been exclusively gendered. The hegemony of Latin into the 16th Century functioned as a form of class oppression. In the Antebellum South, restrictions on literacy were based on race, not gender, and here Atwood again draws from the precedent of Black slavery without acknowledgement. The novel is understood to be a transcript of a recitation given by Offred on the night of her escape into Canada. In the slave narrative genre, the "orality" of the text owed to the illiteracy of the narrator, or to the fact that the narrative was recited for a gathered crowd. Offred, a former librarian, is highly literate, and she is speaking to a tape recorder. This orality has the putative function of letting Offred's fate remain unknown to the reader. However, its deeper function is precisely the opposite. Leaving Offred in suspension, without access to paper, allows Atwood to maintain the increasingly dubious parallels to the experience of slavery. Atwood's intentions for writing The Handmaid's Tale are noble, and most readers find it smooth and convincing. It is thus an object lesson in the pernicious character of White Privilege--a well-written, imaginative, and humane novel can nonetheless hide the link between racism and sexism. In fact, Atwood's exercise of racial privilege is more

problematic because of her talent. She deftly parodies the clumsy language of racial propaganda and offers a convincing portrait of the placid, banal evil of the religious extremist. **The intersection between race and sex is itself hidden in plain sight**, in the improbable but extremely sympathetic Offred, and only a cad would greet her with suspicion.

Can you not be transphobic k thanks

The 1AC's emphasis on women with vaginas reinscribes gender binaries and static notions of sexuality—the narrative focus on women as being valued for their “unique reproductive organs” is one that excludes Trans* and gender queer women

Seawell 14

(Sophia Seawell, Blue Stockings Magazine, “Not Buying Into It: On Language, Capitalism and Menstruation,” http://bluestockingsmag.com/2014/02/05/edit___title-menstruation/, 2/5/2014)

On July 27, 2011, I added a new post on my feminist coming-of-age blog (now inactive) This Girl on Girls, titled “Why is Menstruation Taboo?” In it, I discussed the sexist stigmas attached to menstruation, including but not limited to the prescribed silence and shame around the process. It was certainly a well-intentioned piece, and I still believe that society (or more specifically, sexism) uses menstruation as a marker of the dirtiness or impurity of the female body and female sexuality. But what I can now recognize that I didn't at the time is the way in which **discourses about menstruation, whether they are medical or academic or everyday and whether they are sexist or feminist, are prone to falling into a ciscentric trap of framing menstruation as inherently a ‘female’ experience**. In my post, I wrote **things like “menstruation is completely normal and natural,” and that when a woman menstruates, “her body is doing exactly what it's supposed to be doing. We should all embrace that.”** I can see what I was trying to do: destigmatize menstruation and work towards accepting and potentially celebrating it. I think this is a worthwhile project but that it needs to be executed with care and intentionality and not, for starters, by emphasizing the heightened stigma in “other cultures,” as I did at the time. **Talking about menstruation as if it is something only women-identified people experience erases the experience of people who may not identify as women but still have uteri, as well as of those who do identify as women but do not have uteri, like trans women. And are they not women? There are also cisgender women who, often for health-related reasons, do not menstruate. Are they not women? While on a conscious level most of us who talk about women and menstruation are not intentionally trying to exclude the experiences of trans, genderqueer or gender non-conforming people, our language can and does have that effect. This kind of essentializing language reflects our binarist conceptualization of gender, sex and the body as neatly corresponding to either male or female—that, I would argue, is the larger problem. In summary: not all women menstruate, and not all people who menstruate are women.** Another layer I'd like to add to my initial discussion of menstruation is how it relates to industry and the environment. The tropes used to convince people who menstruate to buy a particular product often involve presenting menstruation as a problem to be fixed or avoided, and this product is often a bleached tampon that puts users at risk for Toxic Shock Syndrome. It's not healthy and it's not environmentally friendly—a person who menstruates and uses tampons/pads will produce 62,415 pounds of garbage over their lifetime—but hey, you should buy it! As the video above mentions, there are other options: there are menstrual cups like the Keeper, made from latex, and the Divacup, made from silicone. Because they are non-absorbent, they don't harbor bacteria like tampons, and there's also no risk of TSS. For people who menstruate who don't want to or can't use internal products, GladRags are the reusable counterpart to more commercially available pads. Of course it's crucial to recognize that these choices still involve purchasing a product and that, though they save money and waste in the long run, these particular products are more expensive than the non-reusable options on the market. The arguments I've put forth, particularly in relation to cissexist language, are also applicable to other ‘women's issues’ such as reproductive justice. **And while many argue that changing the language would muddle the message, I'm not interested in a political movement that privileges progress for cisgender women at the expense of trans women or other gender-oppressed people. The project of resistance to sexism necessarily entails resistance to cissexism, and to pretend otherwise means getting nowhere, fast.**

Defining gender based on biology excludes transgender individuals subjected to everyday violence

Goldberg 14 (Michelle Goldberg, “What Is a Woman?

The dispute between radical feminism and transgenderism”, <http://www.newyorker.com/magazine/2014/08/04/woman-2>, August 4th, 2014)

On May 24th, a few dozen people gathered in a conference room at the Central Library, a century-old Georgian Revival building in downtown Portland, Oregon, for an event called Radfems Respond. The conference had been convened by a group that wanted to defend two positions that have made radical feminism anathema to much of the left. First, the organizers hoped to refute charges that the desire to ban prostitution implies hostility toward prostitutes. Then they were going to try to explain why, at a time when transgender rights are ascendant, radical feminists insist on regarding transgender women as men, who should not be allowed to use women’s facilities, such as public rest rooms, or to participate in events organized exclusively for women.¶ The dispute began more than forty years ago, at the height of the second-wave feminist movement. In one early skirmish, in 1973, the West Coast Lesbian Conference, in Los Angeles, furiously split over a scheduled performance by the folksinger Beth Elliott, who is what was then called a transsexual. Robin Morgan, the keynote speaker, said:• I will not call a male “she”; thirty-two years of suffering in this androcentric society, and of surviving, have earned me the title “woman”; one walk down the street by a male transvestite, five minutes of his being hassled (which he may enjoy), and then he dares, he dares to think he understands our pain? No, in our mothers’ names and in our own, we must not call him sister.¶ Such views are shared by few feminists now, but they still have a foothold among some self-described radical feminists, who have found themselves in an acrimonious battle with trans people and their allies. Trans women say that they are women because they feel female—that, as some put it, they have women’s brains in men’s bodies. Radical feminists reject the notion of a “female brain.” They believe that if women think and act differently from men it’s because society forces them to, requiring them to be sexually attractive, nurturing, and deferential. In the words of Lierre Keith, a speaker at Radfems Respond, femininity is “ritualized submission.”¶ In this view, gender is less an identity than a caste position. Anyone born a man retains male privilege in society; even if he chooses to live as a woman—and accept a correspondingly subordinate social position—the fact that he has a choice means that he can never understand what being a woman is really like. By extension, when trans women demand to be accepted as women they are simply exercising another form of male entitlement. All this enrages trans women and their allies, who point to the discrimination that trans people endure; although radical feminism is far from achieving all its goals, women have won far more formal equality than trans people have. In most states, it’s legal to fire someone for being transgender, and transgender people can’t serve in the military. A recent survey by the National Center for Transgender Equality and the National Gay and Lesbian Task Force found overwhelming levels of anti-trans violence and persecution. Forty-one per cent of respondents said that they had attempted suicide.

The usage of the term “women” to refer to only people with vaginas is exclusive of and responsible for violence against transgender individuals

Jones 14 (Kelsie Jones, “Trans-Exclusionary Radical Feminism: What Exactly Is It, And Why Does It Hurt?”, Huffington Post, October 2nd, 2014, http://www.huffingtonpost.com/kelsie-brynn-jones/trans-exclusionary-radical-terf_b_5632332.html)

Trans-Exclusionary Radical Feminism, or TERF, is a loosely-organized collective with a message of hate and exclusion against transgender women in particular, and transgender people as a whole. They have attached themselves to radical feminism as a means to attempt to deny trans women basic access to health care, women’s groups, restroom facilities, and anywhere that may be considered women’s space.¶ Long time feminist and advocate, Gloria Steinem, used to hold an exclusionary opinion, but has since said that she fully supports the inclusion of trans women

in the feminist movement. However, not all radical feminists agree. Janice Raymond, author of *The Transsexual Empire: The Making of the She-Male* authored a paper in the early 1980s that the Health and Human Services branch of the U.S. Government used to deny trans men and women trans-related medical care, for example.¶ Since then, they have continued to use anti-transgender rhetoric, using the banner of feminism in the same way that Westboro Baptist Church uses Christianity. They consistently use rhetoric suggesting that trans women are would-be rapists, that we are "men invading women's spaces" -- (Cathy Brennan, head of Gender Identity Watch) and are "forcing penises on lesbians" -- (Justin Norwood, Gender Identity Watch), intimating that "penis" is a threat, with the assumption that trans women are nothing more than whatever genitals they may have been born with. The statistics, however, consistently show disproportional sexual aggression against transgender women, and to a lesser degree transgender men, when compared with the cisgender (simply a term meaning those whose gender identity matches their assigned sex at birth) population.¶ When speaking out against the TERF movement, one is at risk of being "outed" on social media. In one instance, the group Gender Identity Watch worked with the right-wing anti-gay group, Pacific Justice Institute, to help prevent a Colorado teen from being able to use the women's restroom. The leader, Cathy Brennan, outed the teen, who was already being bullied, and she was subsequently put on suicide watch. Their actions often incite others to denigrate or discriminate a minority -- which is the definition of a hate group.¶ The verbiage often used by the TERF groups are problematic for the transgender community. Not because of the way in which they deliberately seek to dehumanize and denigrate trans women, but because of the reliance of tropes that medical science have for many years proven wrong, that feed into misunderstandings people may have regarding what being transgender truly means. In their words, a transgender woman is a nothing but a "self loathing gay man" and they claim that trans women are gay men who, rather than stand up and come out as gay, would rather "hide" by being transgender, as if it makes things more palatable for friends, family and co-workers. The reverse is unfortunately the truth.¶ We are often portrayed as fetishists by hate groups such as Gender Identity Watch -- the "Man in a Dress" trope is widely applied to us, and that transgender men are still women. TERFs hold the belief that if someone is born with a penis, they are male for life, and a vagina, female for life. The quandary to those who believe the misinformation spread by the TERF movement is that if someone was born with a functional vagina and clitoromegaly, for example, and the doctors decided to assign the baby as a male because they believed that the child would have a better normalization experience (the term that the medical profession use for butchering infants genitals that don't match Cathy Brennan's narrow definitions) -- then is that child a male, or a female? Nature has many variations of physical gender that occur naturally, in fauna and flora. Quite simply then, logic dictates that Cathy Brennan's definition of gender does not stand up to basic real-world scrutiny.¶ As a transgender woman, I can assure the readers that I have not met one trans person who would deliberately choose to stand out among their peers to be singled out for abuse, assault, for rape, or to be murdered in the horrific way that transgender women are being killed around the world. In the U.S., when a cisgender woman is murdered, the violence against the murdered woman is eclipsed by the way that trans women are more often than not mutilated, dismembered, or set on fire in an orgy of hate. Being transgender is not a choice, it is a scientific medical reality. It would be far easier for someone who is gay than transgender. Simply put, gay people generally look the same as everyone else. This does not mean that our brothers and sisters within the LGBT do not have their own struggles, many of which are part of the shared experience within the LGBT. However while we have many commonalities and shared goals, there are significant differences, such as access to healthcare and a significantly higher murder rate.¶ Another tactic of the TERF movement is using the widely discredited trope that being transgender is a mental health issue. It's true that because of societies reaction towards transgender people, particularly trans women and trans women of color, many trans people suffer from depression and bodily dysphoria. However, this is not the cause of someone being transgender, but the symptom of abuse that those such as the TERF groups like to perpetrate against them daily. No one is mentally ill for being transgender -- medical science has already proven this, and transgender is no longer listed in the DSM-V as a result, but this does not stop the TERFs from claiming that something must be "wrong" with a transgender person for "mutilating" themselves through surgery, according to Cathy Brennan.¶ Whenever a trans individual such as myself is critical of TERF ideology, we are labelled "misogynists" or "Men's Rights Activists", which is an interesting tactic and one that seems to actually make people question the TERF ethos more than swing the undecided towards their viewpoint. Merely by taking a stand against them, I and others like myself have been subjected to threats against our personal safety, been bombarded with spam, pornography, and signed up to various mailing lists in an attempt to silence our voices. Yet many transgender individuals are brave enough to continue pointing out where TERFs are wrong, in the hope that, at least for the transgender community, we can be treated as the men and women we truly are.

Painting gender as tied to reproductive capacity is transphobic and diminishes reproductive rights

Truitt 13 (Jos Truitt, "On trans issues within feminism and strengthening the movement's gender analysis", <http://feministing.com/2013/06/11/on-trans-issues-within-feminism-and-strengthening-the-movements-gender-analysis/>)

I've taken some time away from blogging while I've been in grad school, and it's given me an opportunity for some perspective on the feminist blogosphere. I started working at Feministing in 2009 with a goal of centering trans issues within feminism. I think the oppression trans folks face, particularly the extreme marginalization and violence aimed at trans women in this misogynist culture, is exactly what feminism can exist to change. I understand feminism as a response to gendered oppression in a patriarchal context, where femininity is devalued. I see the worst of our gender hierarchy landing on the shoulders of folks who fail to meet the strict rules of the compulsory gender binary in a way that's perceived as feminine. This plays out when, for example, queer men and trans women are specifically targeted with violence. So I see the exclusion of trans women and our issues from feminism (or the feminist movement's active perpetuation of transmisogyny) as a problem that needs to be addressed.¶ Centering the issues of trans and gender non-conforming folks requires a shift in thinking for folks who's feminism is based in cisgender norms, though. The norm in our culture is to assume someone will identify with the gender assigned to them at birth based on a doctor looking at their crotch. Which means we assume a link between gender and genitals, which leads to a supposed link between gender and someone's sexual role and reproductive capacity as well. As I pointed out regarding the "War on Women" rhetoric about attacks on reproductive rights, most reproductive rights organizing packs the assumption that woman = person with a vagina who can make babies. This is true for a lot of women, but it's not the experience of all women. And painting all women as fundamentally baby making factories is exactly what the anti-choice movement wants. Feminism that's based in a link between gender and genitals doesn't just exclude people who's bodies don't fit – it's a fundamentally flawed analysis that perpetuates an essentialist idea that feminism partially exists to combat. Feminism that centers a trans feminist take on gender, that recognizes that woman ≠ vagina, offers a more accurate gender analysis in general that benefits everyone.

Sci-fi is for nerds

Politicizing science fiction is bad—leads to silencing of alternative views

Reynolds 14 (Glenn Reynolds, "Politics don't belong in science fiction:

A writer shouldn't be punished for his political beliefs", April 28th, 2014, <http://www.usatoday.com/story/opinion/2014/04/28/hugo-awards-science-fiction-reading-politics-larry-correia-column/8282843/>)

There was a time when science fiction was a place to explore new ideas, free of the conventional wisdom of staid, "mundane" society, a place where speculation replaced group think, and where writers as different as libertarian-leaning Robert Heinlein, and left-leaning Isaac Asimov and Arthur Clarke would share readers, magazines, and conventions.¶ But then, there was a time when that sort of openness characterized much of American intellectual life. That time seems to be over, judging by the latest science fiction dust-up. Now, apparently, a writer's politics are the most important thing, and authors with the wrong politics are no longer acceptable, at least to a loud crowd that has apparently colonized much of the world of science fiction fandom.¶ The Hugo Awards are presented at the World Science Fiction Society's convention ("Worldcon") and nominees and awardees are chosen by attendees and supporters. The Hugo is one of the oldest and most prestigious awards in science fiction, but in recent years critics have accused the award process — and much of science fiction fandom itself — of becoming politicized.¶ That's certainly been the experience of Larry Correia, who was nominated for a Hugo this year. Correia, the author of numerous highly successful science fiction books like Monster Hunter International and Hard Magic, is getting a lot of flak because he's a right-leaning libertarian. Makes you wonder if Robert Heinlein could get a Hugo Award today. (Answer: Probably not.)¶ Here's how Correia, writing on his blog, characterizes what's happened since he was nominated.¶ The libel and slander over the last few days have been so ridiculous that my wife was contacted by people she hasn't talked to for years, concerned that she was married to such a horrible, awful, hateful, bad person, and that they were worried for her safety. I wish I was exaggerating. Don't take my word for it. My readers have been collecting a lot of them in the comments of the previous Hugo post and on my Facebook page. Plug my name into Google for the last few days. Make sure to read the comments to the various articles, too. They're fantastic. ... I've said for a long time that the awards are biased against authors because of their personal beliefs. Authors can either

cheerlead for left-wing causes, or they can keep their mouth shut. Open disagreement is not tolerated and will result in being sabotaged and slandered. Message or identity politics has become far more important than entertainment or quality. I was attacked for saying this. I knew that when an admitted right winger got in they would be maligned and politicked against, not for the quality of their art but rather for their unacceptable beliefs.¶ The ins and outs of politics and science fiction fandom are inside baseball to most people, though lately they've been juicier than usual. But unfortunately, this sort of thing is symptomatic of what's going on in a lot of places these days. Purging the heretics, usually but not always from the left, has become a popular game in a lot of institutions. It just seems worse in science fiction because SF was traditionally open and optimistic about the future, two things that purging the heretics doesn't go with very well.

Images of dystopian violence desensitize viewers to real, mass violence (not a stellar card)

Giroux 13 (Henry Giroux, “Beyond Savage Politics and Dystopian Nightmares”, November 22nd, 2013, <http://billmoyers.com/content/beyond-savage-politics-and-dystopian-nightmares/>)

Unfortunately, the dark and dire images of America’s dysimagination machine made visible endlessly in all the mainstream cultural apparatuses have been exceeded by a society rooted in a savage politics in which extreme forms of violence have become both spectacle and modus operandi of how American society governs and entertains itself. Evidence of the decay of American democracy is not only found in the fact that the government is now controlled by a handful of powerful right-wing and corporate interests, it is also increasingly made manifest in the daily acts of cruelty and violence that shroud that American landscape like a vast and fast-moving dust storm. Unspeakable violence, extending from the murder of young people and children at Columbine High School, Virginia Tech University and Sandy Hook Elementary School, to name a few, to the recent mass shootings at Fort Hood, Texas and the Washington Navy Yard give credence to the notion that violence now becomes the most important element of power and mediating force in shaping social relationships. Mass violence has become so routine that it no longer evokes visceral responses from the public. For instance, when such violence engulfs major cities such as Chicago, the public barely blinks. And as the mass shootings increase, they will barely be covered by mainstream media, who have no critical language by which to engage such events except as aberrations with no systemic causes.¶ The line between the spectacle of violence and the reality of everyday violence has become blurred, making it difficult to respond to and understand the origins of symbolic and institutional violence in the economic, political and social formations that now rule American society. Violence has become so normalized that it no longer has a history. That is, its political and economic structures have become invisible and the painful memories it evokes disappear quickly among the barrage of spectacles of violence and advertisements addressing us not as moral beings but as customers seeking new commodities, instant pleasure and ever-shocking thrills. At the same time, violence in America is fed by a culture of fear – shaped, in part, by a preoccupation with surveillance, incarceration and the personal security industry. And, as a result, American society has made “a sinister turn towards intense social control,” [ii] and a “political culture of hyper punitiveness.” [iii]

Dystopian portrayals are bad, especially to young adults—disincentivizes political action

Tindale 15 (Hannah Tindale/'HannahLoveBook', “Why are YA books about politics always dystopian?”, The Guardian, May 6th, 2015, <http://www.theguardian.com/childrens-books-site/2015/may/06/why-ya-books-about-politics-election-always-dystopian>)

The time has come, the general election is upon us, and in a few days we will have a new government, with new ideas and new theories about how to run the UK. With the growing anticipation to find out who will soon be in charge, I began to wonder how politics is represented to young adults in literature – and the more I looked, the more I couldn't get away from one genre: dystopian fiction.¶ Take Divergent, or The Hunger Games, both hugely successful series with a film-based franchise to boot, yet both of these governments are portrayed as totalitarian, repressing the populations they rule over. And these aren't the only ones: Uglies by Scott Westerfeld, Perfect Ruin by Lauren Destefano and the Matched trilogy by Ally Condie all portray their political leaders as deranged in the sense of being highly oppressive and depriving their populations of free will.

Filtering through the cracks of these dystopian novels is a pervasive sense of futility, perhaps even inevitability, which could slowly have an influence on how young people perceive politics.¶ So if dystopian novels really have somehow become the norm for representing politics to young readers then what is the impact of this on our opinion of politics and our expectations in the real world? Are dystopian politics trying to show us that there is no room for rebellion in the 21st century? Or perhaps they are telling us that one person, like Katniss, can make a stand and lead a rebellion. That we can be like Tris and that it is OK to have different views and opinions on society and laws created by politics. The five factions of Divergent could be interpreted as a mirror to our modern 21st-century society, with the numerous political parties vying to create a government; Tris, nevertheless, bravely carves out her own direction. Within these two prime examples of dystopian novels we could say that the message which we encounter is that it is important for young readers to take an interest in politics and make a stand. Obviously there are some caveats: Tris is 16 and Katniss is a similar age when making a stand against their governments, yet in the UK the voting age is 18 years old. And of course every teenager dreams of saving the world, making their mark on it before they are forced to participate in adult life – but that still doesn't answer the question, why are the governments these characters are rebelling against almost always presented as dystopian? What are authors really attempting to communicate here? It seems to me that this use of teenage rebellion set within dystopian worlds could be telling us something else. Looking at dystopian novels and the ways in which politics is treated as a threat against individuality, I think authors are using dystopian politics to highlight failures in our own politics, trying to make young readers eager to question authority, and warning us that we really aren't that far off from this type of politics ourselves.¶ Yet despite this, only 41% of first time voters will definitely be voting, leaving two million with no voice. Whatever its intentions, then, does the dystopian representation of politics in literature affect or have any influence on young people making that decision to vote or not? Has it reduced our opinion of government so far that we're just not interested, or do we care about the politics but think, what can I do? After all, no one is Katniss or Tris or Cassia (from Matched), or Morgan (from Perfect Ruin); we aren't the individual who will stand up and make their voice heard simply because... well, because life isn't a fantasy. There are consequences in life and we don't have a writer behind the typewriter or computer screen making sure our rebellion runs smoothly.¶ I did find one series which begins to portray government in a positive light. Well, for the first couple of books at least... This is the Ministry of Magic in JK Rowling's Harry Potter series. We are at first presented in Harry Potter and the Philosopher's Stone with a fully-functioning government which works well. And yet again, looking further into these novels, we see the Ministry becoming very dark and dystopian. So even this example isn't the best to show a positive representation of politics and this could be the point: there really aren't any good, realistic examples of government and politics.¶ And this is the thing: perhaps if there was more contemporary fiction with political aspects this might present a more positive view and encourage more young people to take an active interest in it. We need fiction to be teaching us to stand up and make our voices heard – just maybe not by starting a full-scale civil war to do so!

Apocalyptic fiction lacks any political meaning and is unable to create political change

Kunkel 08 (Benjamin Kunkel, "Dystopia and the End of Politics", Fall 2008, <http://www.dissentmagazine.org/article/dystopia-and-the-end-of-politics>)

This is the highly compromised "individualism" promoted by our collection of futuristic novels: individuality here means escape from the bad collective (cannibals, the corporate state) but does not entail real individuation. Our literary sci-fi novels are bereft of strongly individual characters—the apocalyptic ones even more depopulated than they know, the clone narratives at least bespeaking the anxiety that their characters are redundant—and the ongoing merger of genre fiction (where the reader is accustomed to finding no complex characters) with literature (which no one would think to accuse of being indifferent to individuality) has allowed the liquidation of character to pass virtually unnoticed. And this, it seems, is likely to be among the most accurately futuristic features of the "literary" genre novels: they will have been the harbingers of a literary sea change in which complex characters are rejected by critics and ordinary readers alike as morally unattractive (compared to generic heroes), hopelessly self-involved (because capable of introspection), and annoyingly irresolute (because subject to deliberation). These prejudices are already articulate and operative whenever fiction is discussed, thanks in large part to the incomplete literature-genre fiction merger, and the prestige such prejudices acquire through that merger allows them to be expressed without the taint of philistinism.¶ In sum, when the contemporary novelist contemplates the future—including, it seems, the future of the novel—he or she often forfeits the ability to imagine unique and irreplaceable characters, can no longer depict love credibly, and responds to political problems by rejecting politics for personal life, albeit one made

meaningless by interchangeable characters and a zoological conception of family and love. The result is political novels without politics, social novels without society, and romances free of love, amounting, in the end, to “literature” that isn’t. All of this deprives the resulting books of much political, artistic, or psychological value—but they may at least capture something of our present-day situation in an accidental and symptomatic way. For if lately we find ourselves fearing that the complexity of our civilization is nothing so much as an index of its fragility, the strange character of the neoliberal apocalypse is to placate the very dread that it evokes. There are grounds for fearing that this civilization devoted to private happiness and private gain will end by intruding pain and loss horribly upon our own households and personal relationships. In the meantime the likelihood of disaster is only abetted by our sense of the hopeless corruption of public life and the need to defend our wealth, our conveniences, and the small happiness of our homes against the sacrifices our governments or our consciences might otherwise exact. In the neoliberal apocalypse, we see the collapse brought about by this approach to life—as well as the eternal triumph of the same approach, at least for those who survive the wars and epidemics and successfully evade the gangs of thugs stalking a devastated planet.

Science fiction is bad—papers over REAL historical atrocities committed against the black body
Ferrara 12 (Beatrice Ferrara, “My measurement of race is rate of vibration”: Afrofuturism and the ‘molecularization’ of race”, November 29th, 2012,
<http://www.darkmatter101.org/site/2012/11/29/%E2%80%9Cmy-measurement-of-race-is-rate-of-vibration%E2%80%9D-afrofuturism-and-the-%E2%80%98molecularization%E2%80%99-of-race/>)

It was with a question that the trigger was pulled: “Why do so few African-Americans write science fiction, a genre whose close encounters with the Other – the strange in a strange land – would seem uniquely suited to the concerns of African-American novelists?”[12] A provocative question, indeed – which immediately smacks the readers of Mark Dery’s 1993 essay “Black to the Future” with the uncanny equivalence central to that cultural sensibility Dery himself will call ‘Afrofuturism’: that between a ‘slave ship’ and a ‘space ship’.[13]¶ In fact, the opening question evokes the spectre of a second and more subtle interrogation: ‘How could it go unnoticed that all of what has been relegated to the science-fictional imaginary has in fact already happened to a whole culture?’¶ African-Americans are, in a very real sense, the descendants of alien abductees; they inhabit a sci-fi nightmare in which unseen but no less impassable force fields of intolerance frustrate their movement; official histories undo what has been done; and technology is too often brought to bear on black bodies (branding, forced sterilization, the Tuskegee experiment, and tasers come readily to mind).[14]¶ Through these two questions – both pointing towards the delineation of a zone of convergence between black people and the non-human creatures of science-fiction – Dery renders immediately effective the potential of this conceptual overlap to induce an embarrassing short-circuit into the reassuring ‘normality’ of white (hegemonic) culture. From this, he sets forth to excavate and unpack the hidden traces of future imaginaries and technological speculations disseminated in black culture, to break open a critical interval in the ‘master narratives’ which have been immobilizing and relegating black cultures to ‘prehistory’ on a supposedly linear and progressive sequence of time.[15] Further, the recuperation of the traces of a long tradition of anti-humanism in black culture also complicates the stable frame of ‘the human’ as interpellative and performative function.[16]

Dystopian fiction does squat to challenge traditional gender roles

Booker 94 (M. Keith Booker, “Woman on the Edge of a Genre: The Feminist Dystopias of Marge Piercy”, Science Fiction Studies, November 1994
<http://www.depauw.edu/sfs/backissues/64/booker.htm>)

In some ways dystopian fiction would seem to be a natural genre for feminist writers, despite the fact that such writers have more typically been associated with utopian fiction. Centrally concerned with the clash between individual desire and societal demand, dystopian fiction often focuses on sexuality and relations between the genders as elements of this conflict. For example, the governments of dystopian societies like those described in *We*, *Brave New World*, and *1984* all focus on sexuality as a crucial matter for their efforts at social control. And it is also clear that this focus comes about largely because of a perception on the part of these governments that sexuality is a potential locus of powerful subversive energies.¶ On the other hand, despite this

consistent focus on sexuality in dystopian fiction, the major works of the genre have done relatively little to challenge conventional notions of gender roles. Despite giving frequent lip service to equality of the genders, literary dystopias (and utopias, for that matter) have typically been places where men are men and women are women, and in relatively conventional ways. As in many other ways, More's original Utopia sets the tone for this trend. In contrast to his belief that social and economic inequality is the source of most of the ills of his contemporary European society, More's Raphael Hythloday describes an ideal Utopian society where equality is emphasized above all else, even to the point of suppression of individual liberty and imposition of a potentially oppressive conformity. However, despite this demand for complete social homogeneity, More's Utopia is still a strongly patriarchal society. The principal political unit is the family household, and households are generally ruled by the eldest male member of the family. Upon marriage women transfer to the household of their husband's family, while males remain members of their own family for life. Within the household, meanwhile, the hierarchy of authority is clearly defined: "Wives are subject to their husbands, children to their parents, and generally the younger to their elders" (41).

Other cards

Sole focus on micropolitics doesn't solve—is coopted

Best and Kellner 01 (Steven Best and Douglas Kellner, "Postmodern Politics and the Battle for the Future," <http://www.uta.edu/huma/illuminations/kell28.htm>)

The emphasis on local struggles and micropower, cultural politics which redefine the political, and attempts to develop political forms relevant to the problems and developments of the contemporary age is extremely valuable, but there are also certain limitations to the dominant forms of postmodern politics. While an emphasis on micropolitics and local struggles can be a healthy substitute for excessively utopian and ambitious political projects, one should not lose sight that key sources of political power and oppression are precisely the big targets aimed at by modern theory, including capital, the state, imperialism, and patriarchy. Taking on such major targets involves coalitions and multi-front struggle, often requiring a politics of alliance and solidarity that cuts across group identifications to mobilize sufficient power to struggle against, say, the evils of capitalism or the state.¶ Thus, while today we need the expansion of localized cultural practices, they attain their real significance only within the struggle for the transformation of society as a whole. Without this systemic emphasis, cultural and identity politics remain confined to the margins of society and are in danger of degenerating into narcissism, hedonism, aestheticism, or personal therapy, where they pose no danger and are immediately coopted by the culture industries. In such cases, the political is merely the personal, and the original intentions of the 1960s goal to broaden the political field are inverted and perverted. Just as economic and political demands have their referent in subjectivity in everyday life, so these cultural and existential issues find their ultimate meaning in the demand for a new society and mode of production.¶

The aff fails to engage larger structures of power—forecloses possibility of change

Ebert 93 (Teresa Ebert, "Ludic Feminism, the Body, Performance, and Labor: Bringing "Materialism" Back into Feminist Cultural Studies", <http://www.jstor.org/stable/1354189>, winter 1992-1993)

A move toward an emancipatory politics for feminism needs to be based on a materialist cultural critique. But in order to be effective, cultural critique must intervene in the system of patriarchal oppression at both the macropolitical level of the structural organization of domination (a transformative politics of labor relations) and the micropolitical level of different and contradictory manifestations of oppression (cultural politics). Ludic postmodern cultural studies and much recent feminist theory all tend to confine their analysis to the micropolitics of oppression and the local level of differences. In doing so, they inhibit any effective intervention in the structures of totalities like patriarchy. I believe resistance postmodern cultural studies and postmodern materialist feminism, with their dialectical critiques of both the

structures of difference-in-relation and the specific enunciations of these differences, will develop a transformative theory and practice that can contribute to the end of patriarchal exploitation. For it is through the unrelenting critique of the socioeconomic relations of differences, particularly the division of labor, and the way they construct and restrict the meanings and subjectivities they require that feminist cultural studies can help bring about the nonexploitative future.

Using the rhetoric of the male gaze only serves to strengthen patriarchal notions of power
Snow 89 (Edward Snow, “Theorizing the Male Gaze: Some Problems”, Representations
No. 25 (Winter, 1989), pp. 30-41)

Perhaps all powerful critical positions have to be built with partial truths, this one continues to produce brilliant, ground-breaking readings. Probably the vast majority of male-engendered images of women deserve its point of view. But I still feel discomfited—as a male viewer framed by the theory, of course, but also as someone whose own work has long been drawn to feminism. It seems to me that such a theory can—and in practice often does—become an unwitting agent of the very forces of surveillance it wishes to oppose. Crucial as the unmasking of patriarchal/ideological/pornographic motives may be, the demystifying project runs the risk of occluding whatever in the gaze resists being understood in those terms. The fugitive elements within vision that elude or strain against the ideological can all too easily get ground up in the machinery that seeks to expose the ideological, so that the critical apparatus winds up functioning as a simulacrum and supplement of the ideological apparatus itself. **Nothing could better serve the paternal superego than to reduce masculine vision completely to the terms of power, violence, and control, to make disappear whatever in the male gaze remains outside the patriarchal, and pronounce outlawed, guilty, damaging, and illicitly possessive every male view of woman.** It is precisely on such grounds that the father's law institutes and maintains itself in vision. **A feminism not attuned to internal difference risks becoming the instrument rather than the abrogator of that law.**

Theorizing is useless without application to the real world

Wark 12 (McKenzie Wark, “How Do You Occupy an Abstraction?”,
<https://larvalsubjects.wordpress.com/2012/08/04/mckenzie-wark-how-do-you-occupy-an-abstraction/>, 8/4/12)

The crisis of contemporary politics is thus the crisis of the erasure of site. In the age of hyperobjects, we come to dwell in a world where there is no clear site of political antagonism and therefore no real sense of how and where to engage. Here I'm also inclined to say that we need to be clear about system references in our political theorizing and action. We think a lot about the content of our political theorizing and positions, but I don't think we think a lot about how our political theories are supposed to actually act in the world. As a result, much contemporary leftist political theory ends up in a performative contradiction. It claims, following Marx, that its aim is not to represent the world but to change it, yet it never escapes the burrows of academic journals, conferences, and presses to actually do so. Like the Rat-Man's obsessional neurosis where his actions in returning the glasses were actually designed to fail, there seems to be a built-in tendency in these forms of theorization to unconsciously organize their own failure. And here I can't resist suggesting that this comes as no surprise given that, in Lacanian terms, the left is the position of the hysteric and as such has “a desire for an unsatisfied desire”. In such circumstances the worst thing consists in getting what you want. **We on the left need to traverse our fantasy so as to avoid this sterile and self-defeating repetition; and this entails**

shifting from the position of political critique (hysterical protest), to political construction— actually envisioning and building alternatives.

Text: The United States Federal Government should track healthcare companies' quality of care by mandating that Department of Health and Human Services evaluate health care companies for privacy protections. The United States Federal Government should mandate that health institutions use high security cloud computing to store sensitive data about patients by enforcing encryption and redaction measures.

Cloud computing has potential to secure patient data if health care providers implement encryption and redaction measures

Filkins 14 (Barbara Filkins. Senior SANS Analyst and Healthcare Specialist. "New Threats Drive Improved Practices: State of Cybersecurity in Health Care Organizations." December 2014. P. 19. <https://www.sans.org/reading-room/whitepapers/analyst/threats-drive-improved-practices-state-cybersecurity-health-care-organizations-35652>)/EMerz

This emphasis indicates that the cloud-computing industry has matured. Respondents are now looking toward secure access and data-centric controls and are less concerned with operational considerations such as monitoring of cloud applications for vulnerabilities and threats. Cloud computing may be an area where secure, multifactor authentication, which combines two or more independent credentials—such as what the user knows (password), what the user has (security token) and what the user is (biometric verification)—also takes off. This year, 60% of respondents said they are using multifactor authentication as their top control to address the risk to data and applications in the cloud. This represents a shift from 2013, where APIs for data reporting, auditing and providing alerts were cited by respondents as the top security control for addressing cloud security concerns. Cloud computing is also driving a more data-centric method of security, which focuses on protecting data rather than just protecting the network or application in which the data lives. Starting a data-centric security plan involves learning and understanding where sensitive data resides, as well as how that information will be used, accessed, managed, retained or retired across its life cycle. The next step is to assess the risks and determine the policies and resources needed and available to monitor and control risk in cloud-based computing models. For example, storing data in the cloud demands encryption for the data at rest. Is that provided through the internal application or the cloud services provider? Sharing that same data among individuals with different roles and levels of access might demand further modification of data to protect it, such as redaction, masking or a combination of both.

Data breaches are likely with current cloud computing technology—new security measures and technology can prevent them

Filkins 14 (Barbara Filkins. Senior SANS Analyst and Healthcare Specialist. "New Threats Drive Improved Practices: State of Cybersecurity in Health Care Organizations." December 2014. P. 19. <https://www.sans.org/reading-room/whitepapers/analyst/threats-drive-improved-practices-state-cybersecurity-health-care-organizations-35652>)/EMerz

Trends such as mobile and cloud computing are game changers for the way individuals and organizations must approach the security of their systems, the privacy of protected sensitive data, and compliance. Health care organizations must complement traditional, infrastructure-driven

controls such as network perimeter security with protections for the newer and evolving threat vectors where their data and applications are outside of the protected network. Providers, payment plans, insurers and other related industries now allow patients unprecedented access to helpful, sophisticated health information and digital tools. Patients have online access to their doctors, and immense social support is also provided online. The fact is that the attack surfaces are many, and the movement to detect, protect and defend in the health care industry, as shown by the small improvements in this survey, is still not enough to keep up the pace. Investment in understanding the new threat landscape and designing solutions to protect against these attacks, including leveraging newer tools for protecting data and responding to new forms of attacks, become critical to staying ahead of attackers.

This institutional trust is key to solve

Rowe and Calnan 6 (Rosemary Rowe and Michael Calnan. Professor of Medical Sociology, School of Social Policy, Sociology and Social Research at the University of Kent. “Trust Relations in Health Care- the New Agenda.” 2006.

<http://eurpub.oxfordjournals.org/content/eurpub/16/1/4.full.pdf>)//EMerz

Given that trust remains important, how can new forms of trust relations be developed and sustained? There is considerable evidence as to what factors encourage patient trust in clinicians: the clinician’s technical competence, respect for patient views, information sharing, and their confidence in patient’s ability to manage their illness.⁸ Patient participation per se does not necessarily result in higher trust, rather it is associated with value congruence regarding participation, patient involvement produced higher trust where patients wanted to participate.⁹ In contrast, evidence as to what builds institutional trust is sparse, with trust relations between providers and between providers and managers a particularly neglected area. Hall et al US survey of HMO members found that system trust could help the development of interpersonal trust, where there was no prior knowledge of the clinician, but it is not known how interpersonal trust affects institutional trust. Medical errors and cost containment are associated with distrust of health care systems, whereas relationship building with the local community is regarded as an important trust building mechanism. However, little research has been conducted to identify how different modes of governance affect institutional trust. The focus of trust relationships may of course differ according to the model of health care delivery; in market based systems such as the US patient trust may be more important to secure loyalty to particular providers whereas in tax-financed systems which are organized by national or regional agencies public trust may be more necessary. However, as health systems converge and increasingly share common challenges including: providing adequate patient choice; managing a mixed economy of provision; and more explicit rationing, then both interpersonal and institutional trust will continue to be important for all health systems. In conclusion, we would argue that clinicians and managers need to address and respond to the changing nature of trust relations in health care. The benefits of trust demonstrate the value to be Trust and the sociology of the professions⁵ gained from ensuring that both interpersonal and institutional trust are developed, sustained, and where necessary rebuilt. Trust is still fundamental to the clinician–patient relationship but as that relationship has changed so has the nature of trust. Trust is now conditional and has to be negotiated but, whilst clinicians may have to earn patients’ trust, there is good evidence as to what is required to build and sustain such interpersonal trust. The lack of knowledge about how institutional trust can be developed indicates the need for research, ideally through inter-country comparisons to identify whether such trust varies by health system and how it can be generated. The cost of failing to recognize the importance of trust and to address the changing nature of trust relations could be substantial: economically, politically, and most important of all, in terms of health outcomes.

Government monitoring of healthcare quality ensures trust in patients

CQHCA '1 (Committee on the Quality of Health Care in America. "Crossing the Quality Chasm: A New Health System for the 21st Century." March 1, 2001.

<http://www.ncbi.nlm.nih.gov/books/NBK222265//EMerz>

Recommendation 2: All health care organizations, professional groups, and private and public purchasers should pursue six major aims; specifically, health care should be safe, effective, patient-centered, timely, efficient, and equitable. The committee believes substantial improvements in safety, effectiveness, patient-centeredness, timeliness, efficiency, and equity are achievable throughout the health care sector. This opportunity for improvement is not confined to any sector, form of payment, type of organization, or clinical discipline. Problems in health care quality affect all Americans today, and all can benefit from a rededication to improving quality, regardless of where they receive their care. The committee applauds the Administration and Congress for their current efforts to establish a mechanism for tracking the quality of care. Title IX of the Public Health Service Act (42 U.S.C. 299 et seq.; Agency for Healthcare Research and Quality Part A) provides support for the development of a National Quality Report, which is currently ongoing. Section 913(a)(2) of the act states: "Beginning in fiscal year 2003, the Secretary, acting through the Director, shall submit to Congress an annual report on national trends in the quality of health care provided to the American people." Recommendation 3: **Congress should continue to authorize and appropriate funds for, and the Department of Health and Human Services should move forward expeditiously with the establishment of, monitoring and tracking processes for use in evaluating the progress of the health system in pursuit of the above-cited aims of safety, effectiveness, patient-centeredness, timeliness, efficiency, and equity.** The Secretary of the Department of Health and Human Services should report annually to Congress and the President on the quality of care provided to the American people. Without ongoing tracking of quality to assess the country's progress in meeting the aims set forth in this chapter, interested parties—including patients, health care practitioners, policy makers, educators, and purchasers—cannot identify progress or understand where improvement efforts are most needed. Continued funding for this activity should be ensured.

Health institutions use weak cloud services to transmit sensitive patient data

Filkins 14 (Barbara Filkins. Senior SANS Analyst and Healthcare Specialist.

"New Threats Drive Improved Practices: State of Cybersecurity in Health Care Organizations." December 2014. P. 10-11. <https://www.sans.org/reading-room/whitepapers/analyst/threats-drive-improved-practices-state-cybersecurity-health-care-organizations-35652//EMerz>

Health care organizations rely on cloud services for applications processing sensitive information, including protected health care patient records as well as PCI-protected financial information. Respondents plan to expand these services in the next 12 months. Open-ended responses by several respondents reflect the bias against cloud services, most often prompted by concerns over loss of control or oversight over sensitive data, but more than 60% are either using or planning to use the cloud for multiple applications containing sensitive data, as shown in Figure 4. Mobile devices are also a source of additional risk, according to respondents. Not surprisingly, 92% of respondent organizations allow access to calendar and email via mobile devices. However, 52% also allow respondents to access health record information from their mobile devices, and nearly as many access data from cloud-based applications, through which they may be processing highly sensitive data, as discussed previously (see Figure 5).

Secure cloud computing increases patient trust in health care institutions

CSCC 12 (Cloud Standards Customer Council. Advocacy group dedicated surrounding the transition to the cloud. "Impact of Cloud Computing on Healthcare." November 2012. P. 12.

<http://www.cloud-council.org/cscchealthcare110512.pdf//EMerz>

“Patient centricity” has become the key trend in healthcare provisioning and is leading to the steady growth in adoption of electronic medical records (EMR), electronic health records (EHR), personal health records (PHR), and technologies related to integrated care, patient safety, point-of-care access to demographic and clinical information, and clinical decision support. **Availability of data**, irrespective of the location of the patient and the clinician, **has become the key to both patient satisfaction and improved clinical outcomes**. **Cloud technologies can significantly facilitate this trend**. Cloud computing offers significant benefits to the healthcare sector: doctor’s clinics, hospitals, and health clinics require quick access to computing and large storage facilities which are not provided in the traditional settings. Moreover, healthcare data needs to be shared across various settings and geographies which further burden the healthcare provider and the patient causing significant delay in treatment and loss of time. **Cloud caters to all these requirements thus providing the healthcare organizations an incredible opportunity to improve services to their customers, the patients, to share information more easily** than ever before, and improve operational efficiency at the same time.

Doesn’t link to the net benefit- health businesses that use cloud computing still adhere to status quo HIPAA procedures

CSCC 12 (Cloud Standards Customer Council. Advocacy group dedicated surrounding the transition to the cloud. “Impact of Cloud Computing on Healthcare.” November 2012. P.7. <http://www.cloud-council.org/cscchealthcare110512.pdf>//EMerz

In the United States, every healthcare entity (e.g., hospital, university research facility, physician’s office) that deals with Protected Health Information (PHI) must adhere to the guidelines stipulated under the Health Information Portability and Accountability Act (HIPAA). HIPAA is a U.S. Federal law that was designed to protect patient privacy, and does so by mandating and enforcing strict privacy and security rules over how medical information is collected, handled, used, disclosed and protected. While the HIPAA Privacy rule pertains to patients’ privacy and rights for their personal health information, the HIPAA Security rule, focuses on assuring the availability, confidentiality, and integrity, of electronic protected health information through a series of administrative, physical and technical safeguards. Under Title II of HIPAA, most of a patient’s medical record and payment history are considered PHI, and is protected under the law. PHI may only be disclosed to other medical entities on a “need to know” basis, only upon the permission of the individual patient and only the “minimum data fields required for the purpose involved”. As a result, one of the challenges is “Patient Consent Management” and managing PHI in a way that is sufficiently simple to enable use by the general public. The owner of the data must require the cloud service provider (aka the “business associate”) to contractually agree to maintain all PHI in adherence with HIPAA standards. The HIPAA Privacy rule defines a business associate as “a person or entity that performs certain functions or activities that involve the use or disclosure of protected health information on behalf of, or provides services to, a covered entity”. Covered entities are institutions, organizations or persons who electronically transmit any health information in connection with transactions for the United States Health and Human Services (HHS) adopted standards. While ultimate responsibility for compliance always resides at the covered entity, the actual implementation of certain operational and control aspects of securing the data occurs at the business associate cloud provider.

Text: The 50 states and relevant US territories should apply strict scrutiny to public health surveillance programs.

State privacy protections are extremely effective

Terry 14 (Nicolas P. Terry. “Big Data Proxies and Health Privacy Exceptionalism.” 2014. P. 19-21 https://www.ftc.gov/system/files/documents/public_comments/2014/01/00004-89091.pdf)/EMerz

Health privacy and HIPAA frequently are viewed as indistinguishable. However, health privacy exceptionalism is not restricted to federal law. In the decade and a half since the appearance of the HIPAA regulations and notwithstanding the Privacy Rule’s limitation on preemption, state law regarding health privacy appears to have receded into the background. The Bush Administration’s health information technology narrative included the characterization of divergent state laws as impeding EHR implementation. 144 Furthermore, in the intervening years several states have normalized their laws with HIPAA. There are explicit protections of privacy in a handful of State constitutions.¹⁴⁶ And some state supreme courts have implied such a right¹⁴⁷ that subsequently has been applied in cases involving medical information.¹⁴⁸ Yet there is nothing that could be as described as exceptional. In contrast, many state legislatures embraced strong, exceptional health privacy models (particularly in the pre-HIPAA years).¹⁴⁹ Indeed many state privacy statutes continue to escape preemption due to HIPAA’s “more stringent” provision. **Any generalized account fails to credit the resilience of health privacy exceptionalism in some states**. Of course, there should be little surprise that California has built on its enviable consumer protective reputation with additional substantive and enforcement provisions. The state’s original Confidentiality of Medical Information Act dates from 1981. It is notable for possessing a broader reach than HIPAA, applying, for example, to health data custodians who are not health care providers.¹⁵¹ California passed one of the first health information breach notification laws.¹⁵² More recently the state established the Office of Health Information Integrity to “ensure the enforcement of state law mandating the confidentiality of medical information and to impose administrative fines for the unauthorized use of medical information”¹⁵³ which requires: Every provider of health care shall establish and implement appropriate administrative, technical, and physical safeguards to protect the privacy of a patient’s medical information. Every provider of health care shall reasonably safeguard confidential medical information from any unauthorized access or unlawful access, use, or disclosure. Perhaps more surprisingly Texas enacted similarly broad protection for health information. In sharp contrast to the narrow HIPAA conception of a “covered entity,” the Texas law applies to “any person who . . . engages . . . in the practice of assembling, collecting, analyzing, using, evaluating, storing, or transmitting protected health information.”¹⁵⁵ Texas also requires “clear and unambiguous permission” before using health information for marketing¹⁵⁶ and broadly prohibits the sale of an individual’s protected health information.¹⁵⁷ As discussed above, HITECH (together with a change in administration) provided the enforcement focus that HIPAA had lacked.¹⁵⁸ However, the 2009 legislation did not alter the longstanding HIPAA position of not permitting private rights of action.¹⁵⁹ Of course a small number of states permit such actions under their health privacy statutes.¹⁶⁰ However, almost all jurisdictions allow some species of the breach of confidence action in such cases,¹⁶¹ and some even allow HIPAA in through the “back door” establishing a standard of care in negligence per se cases.¹⁶² For example, *Resnick v. AvMed, Inc.*, concerned two unencrypted laptops that were stolen from the defendant managed care company. The compromised data concerned 1.2 million persons, some of whom subsequently became victims of identity theft. Dealing with Florida law allegations of breach of contract, breach of implied contract, breach of the implied covenant of good faith and fair dealing, and breach of fiduciary duty, the Eleventh Circuit addressed the question whether plaintiffs had alleged a sufficient nexus between the data theft and the identity theft. The court concluded that the plaintiffs had “pled a cognizable injury and . . . sufficient facts to allow for a plausible inference that AvMed’s failures in securing their data resulted in their identities being stolen. They have shown a sufficient nexus between the data breach and the identity theft beyond allegations of time and sequence.”¹⁶⁴ **Overall there seems to be a proliferation of data breach cases being filed in state courts. State privacy case law and legislation are continually evolving both in and out of the health care space. However, there is reason to believe that health privacy exceptionalism remains an accepted tenet among state courts and legislatures.**

The states are sufficient

Jason **Kreag** (Visiting Assistant Professor, University of Arizona James E. Rogers College of Law) **2015** “GOING LOCAL: THE FRAGMENTATION OF GENETIC SURVEILLANCE” http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2583957

While a federal law would be most effective, there are other options to achieve some of the benefits of the reforms outlined in Part III.C. For example, each state could be encouraged to adopt a model statute that includes these reforms. The prospect of quick action by each state seems considerably less likely to occur without the stick of being excluded from CODIS that could be a part of federal regulation. However, Alaska, Vermont, and Washington have demonstrated that some states are capable of regulating local databases. In addition, there are options aside from legislation. Existing regulatory bodies could promote these reforms as best practices for local DNA databases. For example, the recently created National Commission on Forensic Science (“NCFS”), a joint project of the Department of Justice and the National Institute of Standards and Technology (“NIST”), describes part of its mission as “reduc[ing] fragmentation and improve[ing] federal coordination of forensic science.”³²³ Similarly, NIST’s newly-formed Organization of Scientific Area Committees (“OSACs”) represents another potential source for external regulation.³²⁴ Whereas the NCSF will outline broad policies, the OSACs are designed to adopt specific “standards and guidelines” for each forensic discipline.³²⁵ These organizations, which include national leaders from law enforcement, practice, and academia, are limited to adopting non-binding recommendations. However, even recommended procedures could be powerful forces to alter current practices. Finally, while this Article argues that external regulation is optimal and necessary,³²⁶ it is at least possible that the early adopters of local databases could organize a working group to develop uniform standards. Director Harran of Bensalem has considered holding a meeting with the agencies that use local databases to explore the adoption of standard procedures.³²⁷ A working group offers at least three potential incremental benefits. First, simply starting the dialogue would force some agencies to articulate their practices and procedures. Second, a discussion about what regulations are needed could encourage law enforcement to consider some of the external costs of local databases. Finally, even if the working group did not possess the power to adopt binding regulations, it is possible that some agencies—motivated by the self-interested desire to continue using their own local databases—could pressure others to act more cautiously so as not to generate interest from external regulators.

CONCLUSION Given the pressure on police to solve crimes and reduce criminal activity, it is not surprising that law enforcement aggressively adapts surveillance technology to its benefit. Such actions are often commendable and encouraged. Indeed, the very manner in which law enforcement agencies measure their absolute and comparative success—through crime rates and clearance rates—incentivizes local agencies to push the boundaries of crimesolving tools. Early adopters of local databases are doing just that, trying to maximize the ability of forensic DNA analysis to fight and deter crime. Palm Bay, Bensalem, and others have shown that local databases offer great promise when measured on that scale. But a narrow focus on crime rates and clearance rates is not the only relevant metric when allocating policing resources in general, and public surveillance in particular. Rather, policing has the potential to generate positive and negative externalities unrelated to crime rates and clearance rates, and these externalities are often difficult to measure reliably. Furthermore, there is little incentive for law enforcement to identify or measure these externalities, particularly negative ones. This Article is the first attempt to identify the full implications of local databases. While it is beyond its scope to measure these externalities, identifying their existence and recognizing law enforcement’s failure

to consider them calls for some level of external regulation of local databases. Because the empirical work needed to measure the external costs of local databases has not been developed, the reforms proposed in this Article are modest. It is possible, although, in the opinion of the author, unlikely that the external costs of local databases will outweigh their benefits. If that proves true, states should follow Vermont's lead and ban local databases. More than likely, the result of a full-scale empirical study of local databases will call for something in the middle, rejecting the total prohibition in Vermont and rejecting the current landscape, where local agencies are free to develop and use local databases without external regulation.

Solvency – Flexibility

States solve better

Duffy et al 11 (Effective State-Based Surveillance for Multidrug-Resistant Organisms Related to Health Care-Associated Infections, Jonathan Duffy, MD, MPH,^{a,b} Dawn Sievert, PhD, MS,^a Catherine Rebmann, MPH,^a Marion Kainer, MD, MPH,^{c,d} Ruth Lynfield, MD,^{c,e} Perry Smith, MD,^{c,f} and Scott Fridkin, MD^a Division of Healthcare Quality Promotion, Centers for Disease Control and Prevention, Epidemic Intelligence Service, Centers for Disease Control and Prevention, Atlanta, GA 2011 Mar-Apr; <http://www.ncbi.nlm.nih.gov.proxy.lib.umich.edu/pmc/articles/PMC3056030/?tool=pmcentrez>)

A primary aim of public health surveillance is to direct prevention and control activities and monitor their effectiveness. Collection of surveillance data by itself does not control disease or constitute public health action. As public health agencies operate with finite resources, implementation of surveillance tools should occur in conjunction with a plan to interpret and act on the data collected. Resources should be devoted to MDRO surveillance activities only when resources are also available for specific MDRO infection- or transmission-prevention activities or to build capacity to respond with public health action to the MDRO surveillance data. Moreover, integrating input from local partners and key opinion leaders in infection control and prevention to ensure that any surveillance and response strategy is consistent with regional priorities or concerns is critical. A state is more likely to develop a surveillance system that meets its particular needs and functions well within the constraints of its available resources if the state health department takes an active role in deciding what MDRO surveillance activities are appropriate for its circumstances. Surveillance activities developed in response to mandates created without health department input could lack these characteristics.

Solvency - Speed

States solve – quicker public health responses

Galva et al 5 (Jorge, JD MHA, Christopher Atchison, MPA, Samuel Levy, PhD SM, analysts for Public Health Reports, “Public Health Strategy and the Police Powers of the State” <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2569983/> 2005 JM)

The preparedness of the U.S. public health system to respond to acts of terrorism has received a great deal of attention since September 11, 2001, and especially subsequent to the anthrax attacks later that year. The use of biologic agents as a weapon has served as a catalyst to better aligning public safety and health strategies through public health law reforms. Associated with this work is the renewal of the debate over the most appropriate means to both protect the public and assure the rights of individuals when implementing readiness strategies. A key element of the debate focuses on what is a reasonable application of state-based police powers to ensure community

public health standards. The doctrine of state “police power” was adopted in early colonial America from firmly established English common law principles mandating the limitation of private rights when needed for the preservation of the common good. **It was one of the powers reserved by the states** with the adoption of the federal Constitution and was limited only by the Constitution's Supremacy Clause—which mandates preeminence of federal law in matters delegated to the federal government—and the individual rights protected in the subsequent Amendments.^{1,2} The application of police power has traditionally implied a capacity to (1) promote the public health, morals, or safety, and the general well-being of the community; (2) enact and enforce laws for the promotion of the general welfare; (3) regulate private rights in the public interest; and (4) extend measures to all great public needs.³ The application of “police powers” is not synonymous with criminal enforcement procedures; rather, this authority establishes the means by which communities may enforce civil self-protection rules. More specifically, **public health police power allows the states to pass and enforce isolation and quarantine, health, and inspection laws to interrupt or prevent the spread of disease.** Historically, **the exercise of public health police power was enforced with strong support of the courts and restraint of police power occurred only when there was open disregard for individual rights.** The abilities of states to exercise their police powers has been constrained since the 1960s by the legal and social reexamination of the balance of power between the individual, the states, and the federal government, which affects contemporary efforts to reform public health law in the face of terrorism. Given the development of the criminally based threats to health marked by bioterrorism, the **relatively recent emphasis on the personal rights side of the equation should be reassessed.**⁴ A reexamination of the legal, ideological, and social limits of police power is appropriate since **increased state capacity can be crucial for first responses to terrorist threats or actions.** Effective first responses may be hampered in the absence of pragmatically designed realignments of the state-individual relationship and the redesign of state public health infrastructures.⁵ This article begins with an historical overview of the doctrine of state police power, addresses recent limitations imposed on the implementation of public health police powers, then uses the example of the imposition of quarantine orders to illustrate the state's capability to impose such orders in exercise of its police power. Finally, it **suggests changes in state public health agency governance, focus, and regulation to rebalance public and private interests.**

Solvency – General

States solve best—have a balance of privacy and effectiveness

Galva et al 5 (Jorge, JD MHA, Christopher Atchison, MPA, Samuel Levy, PhD SM, analysts for Public Health Reports, “Public Health Strategy and the Police Powers of the State” <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2569983/> 2005 JM)

Population-based **measures in response to increased public health threats assume diverse forms.** These are essentially clustered in two distinct groups: prevention (detection, data-basing, and tracking), and remediation (containment of actual damage). **Preventive measures entail mechanisms to control and track the movement of persons and things.** This type of activity **may involve the enactment and enforcement of unsympathetic laws and regulations affecting real or perceived spheres of rights.** Effective enforcement will depend on the public health authorities' **ability to safely overcome resistance to these measures.** The control of the flow of information may also result in restrictions to the access and publication of public health information.

Remediation demands even greater degrees of control over persons and property. Remediation measures could include: (1) quarantine and involuntary holds when and where necessary for an indefinite period limited only by the cessation of the state of emergency; (2) suspension of habeas corpus in case of quarantine with very limited post-detention remedies for the individuals affected; and (3) property rights (establishment of “public interest easements” on private property in anticipation of an emergency and deputization/commandeering private-sector resources for public use during an emergency). Remediation measures must be rapidly implemented in the event of biological attack or new infectious disease.⁶⁵ Significant normative measures in this respect have been proposed at both the federal and state levels.⁶⁶ The Model State Emergency Health Powers Act (MSEHPA) illustrates this effort. The MSEHPA contains projected measures based on potential terrorist threats and proposed preventive and remedial measures as well as a detailed description of the protection of individual and business rights during an emergency.⁶⁷ The State Emergency Powers Act's purpose is to create a unified response system whereby the states put into effect standardized measures.⁶⁸ The driving principle behind this uniform legislation is twofold: on the one hand, standardization and modernization of obsolete or inapplicable state laws regulating public health responses, and on the other, creation of balance between states' ability to control individual activity and constitutional rights.⁴ The goals of the MSEHPA are, inarguably, meritorious.⁶⁹ Nevertheless, there are valid concerns regarding the effects of the attempted balance of public and private interests on the states' ability to carry out an effective public health response. There is foundation for these concerns. The MSEHPA's balancing act may sidestep the needed mechanics of infectious disease control by unduly incorporating post-Warren Court legal restraints—pre-intervention notices, hearings, heightened burden of proof, and access to witnesses—into the law.⁷⁰ The MSEHPA fails to restore the historic deference to public health activities or enhance the crucial scientific and administrative underpinnings of public health enforcement actions. Stringent preventive and remedial public health measures are necessary to face contagion. The recent experience with quarantine measures as the principal method used against SARS validates this conclusion.⁴⁴ Taiwan successfully implemented a broad quarantine program: 131,132 persons were placed under strict quarantine orders that required them to stay where they were quarantined, submit to periodic temperature checks, and sharply restrict transportation or visits to public places. These measures were needed because of the unknown transmissibility of SARS; they are associated with the rapid control of the epidemic in that country.⁷¹ Although the Canadian government attempted to use voluntary isolation, ultimately orders were issued for mandatory quarantine when the use of voluntary isolation became difficult.⁷² The Canadian government's response was later characterized as deficient, while the limited spread of SARS in Canada has been attributed to chance.⁷³ It is hard to envision the application of the MSEHPA in a manner congruent with stringent quarantine measures. The procedural guarantees in the MSEHPA may well be impossible to implement due to the risk of exposing judges, witnesses, and the public to possible contagion. In addition, the judiciary and public authorities are not prepared to implement quarantine orders due to lack of familiarity with public health doctrines or logistical shortcomings.^{74,75} The effects of one successful injunction resulting from these shortcomings—very likely under the MSEHPA—allowing, for example, a single SARS super-spreader to avoid quarantine, could be devastating.⁷⁶ A perfect balance between private and public rights in the face of a highly infectious disease may not be attainable, or even desirable. **Emergency activities will be effective if the states' exercise of public health police power is strengthened by good scientific practices and rigorous application of justified means of control.** Expiration of any extraordinary powers once the emergency is controlled remains an obligatory feature unless there is reauthorization on the basis

of solid scientific evidence. The ultimate goal of public health law should be the reinforcement of public health on the basis of historic principles of police power allowing broad but temporary administrative activities that are needed to face an impending emergency when the situation warrants.⁷⁷ This necessitates a return to the traditional historic bases of public health police power. Recommended steps in this direction should include: (1) reinforcing the administrative capability for the issuance of robustly evidence-based public health orders properly issued under authority of law; (2) removing all judicial pre-intervention review measures of such orders while limiting review of public health orders to the post-execution phase; (3) subjecting all public health orders to automatic expiration terms and making renewal of the orders contingent on the same robust degree of evidence allowing the original order.

The issue of health information is the jurisdiction for the state

O’connor et al 11(Informational Privacy, Public Health, and State Laws, 2011 October Jean O’Connor, JD, DrPHcorresponding author and Gene Matthews, JD with the Centers for Disease Control and Prevention, Atlanta, GA. Gene Matthews is with the North Carolina Institute of Public Health, Chapel Hill. <http://www.ncbi.nlm.nih.gov.proxy.lib.umich.edu/pmc/articles/PMC3222345/?tool=pmcentrez>)

The US Constitution does not impart a broad right to the privacy of individual health information.⁷ At the federal level, statutes place boundaries around the collection, use, and disclosure of certain types of health-related information. These statutes include the Freedom of Information Act,⁸ the Privacy Act of 1974,⁹ the Department of Health and Human Services (HHS) Human Subject Protection Regulations,¹⁰ the E-Government Act of 2002,¹¹ the Family Educational Rights and Privacy Act,¹² the Federal Drug and Alcohol Confidentiality provisions,¹³ and the Genetic Information Nondiscrimination Act.¹⁴ These statutes restrict the use of information for different purposes. For example, the HHS Human Subjects Protection Regulations focus on protecting information in the research context. However, the most frequently cited law in discussions of the privacy of public health information is the Health Insurance Portability and Accountability Act (HIPAA) and its associated regulations. The HIPAA Privacy Rule protects most health records from disclosure but permits health care providers to make disclosures to public health officials and for certain other purposes.¹⁵ The rule does not protect information possessed by public health officials from disclosure, except in limited circumstances. HIPAA also does not preempt state laws on the use or disclosure of data by public health authorities.¹⁶ Because there is no national standard for safeguarding all data held by public health agencies, state laws remain central to discussions of the privacy, confidentiality, security, use, and disclosure of information within the public health system.¹⁷ These state laws have been reported to be fragmented and antiquated, and to “fail to effectively balance competing individual interests in privacy with the need to share public health data and information for the common good.”¹⁸(p1389) For more than a decade, both public health advocates and privacy advocates have responded to this need by calling for clearer protections for state public health information and developing model state policies.^{17,19,20} To disseminate ideas to update state public health privacy laws, Gostin et al. developed the Model State Health Privacy Act (MSHPA), a model statute for states to use as a guide in developing new laws, in 1999.¹⁸ The MSHPA contains detailed language about the appropriate acquisition and use of public health information, terms for when it is appropriate for state health departments to disclose that information, and penalties for noncompliance. After the events in the fall of 2001, the Model

State Emergency Health Powers Act (MSEHPA) was drafted to promote the adoption of state public health emergency statutes that contained, among other things, language related to the disclosure of public health information.²¹ Despite these efforts, anecdotal information suggests that few states have adopted public health privacy and disclosure provisions recommended in the MSHPA and MSEHPA.²² To address the lack of adoption of provisions by states and the continuing development of new approaches to data exchange, Lee and Gostin recently recommended a set of national principles for protecting public health data.¹⁷ The principles included discussion of use of data for legitimate public health purposes, collection or use of the minimum information necessary, data use agreements and security measures, and stewardship and trust. The need to develop a common approach to the use and disclosure of public health information has also been recognized as more than solely a domestic problem; various professional organizations (e.g., the International Epidemiological Association²²) have developed guidelines for the use of data by their members, and an international collaborative is seeking to develop a collective code of conduct for the use of public health data.²³ An analysis of current public health privacy laws can inform these efforts. The success of a national or international set of principles for the use and disclosure of personally identifiable health information under the control of the public health system depends, in part, on acknowledging the specific political and historical factors that have resulted in existing laws. In the United States, understanding current state laws may assist in identifying approaches to bridging the gap between the reality that state and local public health agencies face and ideal policies, frameworks, or practices for the use and disclosure of public health information. Identifying approaches and patterns in existing state laws is also an essential first step in further analyses of what laws are effective.

States solve best – only way to avoid circumvention

Pritts 13 (Joy L. Pritts JD is a lawyer who practices in Washington DC and earned her degree at Georgetown University. “Altered States: State Health Privacy Laws and the Impact of the Federal Health Privacy Rule” <http://digitalcommons.law.yale.edu/cgi/viewcontent.cgi?article=1047&context=yjhple>)//CW

States have traditionally been the primary regulators of health care information. While the promulgation of the Federal Health Privacy Rule changes the regulatory landscape, it need not supplant the importance of state health privacy laws. In fact, states have often become more active after the enactment of federal privacy laws, enacting statutes that either mirror or build upon the federal protections. **This approach**, endorsed by the Privacy Protection Study Commission in the 1970s, **ensures that the states will be able to enforce the law and protect their citizens**.^{8 4} Because the Federal Health Privacy Rule does not preempt current or future stronger state health privacy laws, the states have ample opportunity to fill the gaps and strengthen the weaknesses of the federal regulation. States therefore should not rely solely on the Federal Health Privacy Rule to protect the privacy rights of their citizens. Rather, states should take advantage of the need to evaluate their health privacy laws in light of the Federal Health Privacy Rule and take appropriate action. States with little statutory protection of health information in place may want to use Federal Health Privacy Rule as a roadmap for enacting comprehensive state health privacy laws. At a bare minimum, states can mirror the federal protections, thereby allowing enforcement to occur at the state level. However, to afford truly comprehensive protection, states should directly regulate not only the entities governed by the Federal Health Privacy Rule, but also the other major generators and holders of health information (such as employers and life insurers). Additionally, states should directly regulate the recipients of health information from these core record keepers. Furthermore, states should strengthen some of the weak provisions of the Federal Health Privacy Rule, such as the use of health information for marketing purposes. States with fairly well developed health privacy rules should also reevaluate their laws in light of the Federal Health Privacy Rule. Some state and federal rules may accomplish the same goals through slightly different requirements (e.g., different content requirements for a notice advising the patient of information practices). In this situation, a state may want to harmonize its provisions with the Federal Rule in order to avoid confusion and to afford some degree of uniformity between states. States should also use this as an opportunity to fill in gaps in state law that may exist (such as having statutory access rights to hospital records but not doctor's records).

CP solves – more stringent state laws take precedence over federal regs

Holloway 3 (Jennifer Daw Holloway is a communications manager at Ipas, an organization dedicated to safe abortions. “What takes precedence: HIPAA or state law?” January 03, <http://www.apa.org/monitor/jan03/hipaa.aspx>///CW

With the Health Insurance Portability and Accountability Act (HIPAA) privacy rule compliance date--April 14--fast approaching, psychologists must explore how the new federal rules interact with their current state laws.¶ HIPAA's privacy rule governs how health-care providers handle the use or disclosure of protected health information (PHI). In effect, PHI is defined as individually identifiable health information relating to the condition of a patient, the provision of health care or payment for care. All states already have privacy laws that apply to such information. Areas such as patient consent, access to records and subpoena rights, to name a few, are included under HIPAA as well as state laws.¶ So, will HIPAA's rules preempt state laws?¶ **"The general standard is that if a state law is more protective of the patient, then it takes precedence over HIPAA."** says Doug Walter, legislative and regulatory counsel in APA's Practice Directorate.¶ Conversely, if a state law is less stringent than HIPAA, then HIPAA takes over, he says.¶ The following examples illustrate the interplay between state laws and HIPAA and how that will affect psychologists:¶ Consent for payment, treatment and health-care operations. Dr. Smith, a psychologist in Utah, has scheduled a new patient. When the patient comes for her general appointment, Dr. Smith's office must be sure she signs a consent form for the disclosure of her records. Utah law requires that psychologists obtain signed consent, while the HIPAA privacy rule does not require consent. So, Utah law applies instead of HIPAA in this case because the state law gives patients greater privacy protection. Other states may have similar laws that would take precedence over HIPAA. Patient access to psychotherapy notes. Under HIPAA, patients are granted access to their records, with the exception of "psychotherapy notes," better known as what psychologists traditionally call "process notes." But in some states, such as Vermont, patients can access their psychotherapy notes under state law. So, when a patient of Vermont practitioner Dr. Jones asks to see his notes, Dr. Jones must permit the patient to see the notes. Because Vermont law provides greater rights from the patient's standpoint for the patient to access his or her psychotherapy notes, it takes precedence over the HIPAA requirements. Again, several other states may have such protective laws. Subpoena of patient records. Dr. Milton, a psychologist in New Hampshire, receives a subpoena requesting one of his patient's records. Attached to the subpoena is a notice from the requesting party's attorney stating that her office has made diligent but unsuccessful efforts to reach the patient to serve notice that his records are being requested. This is an adequate attempt to notify the patient under HIPAA and, therefore, the psychologist would not be barred from producing the patient's records if HIPAA took precedence. However, under New Hampshire law, psychologists are precluded from producing their patients' records for a third party absent a court order or patient consent. New Hampshire law is more protective than HIPAA with respect to records subpoena. Therefore, state law preempts HIPAA in this case.¶ There are myriad examples--aside from the three above--of how state laws may take precedence over HIPAA. The simple rule of thumb is that any provision--in state laws or HIPAA--that gives greater protection to patients' privacy or right to access their own health information takes precedence. The HIPAA privacy rule **"won't impair the effectiveness of state laws that are more protective of privacy"**, says Russ Newman, PhD, JD, APA's executive director for practice. And, he notes, in states where protective laws haven't been enacted, HIPAA will not prevent states from enacting laws that provide greater patient privacy protection.¶ HIPAA assumes that practitioners know the ins and outs of their state laws, but figuring out which law will take precedence involves a complicated analysis of state statutes, regulations and common law decisions.¶ The APA Practice Organization and the APA Insurance Trust are developing comprehensive resources for psychologists that will facilitate compliance with the HIPAA privacy rule. Along with several offerings, a new product, "HIPAA for Psychologists"--which will include the necessary state-specific forms that comply with both the HIPAA privacy rule and relevant state law--will be available for purchase online at the Practice Organization's new practitioner portal.¶

Health Data is important for state use

O'Connor et al 11(Informational Privacy, Public Health, and State Laws, 2011 October Jean O'Connor, JD, DrPHcorresponding author and Gene Matthews, JD with the Centers for Disease Control and Prevention, Atlanta, GA. Gene Matthews is with the North Carolina Institute of Public Health, Chapel Hill. <http://www.ncbi.nlm.nih.gov.proxy.lib.umich.edu/pmc/articles/PMC3222345/?tool=pmcentrez>)

Developments in information technology that make it possible to rapidly transmit health information also raise questions about the possible inappropriate use and protection of identifiable (or potentially identifiable) personal health information.¶ Despite efforts to improve state laws,

adoption of provisions has lagged. We found that half of states have no statutes addressing nondisclosure of personally identifiable health information generally held by public health agencies. Exceptional treatment of HIV, sexually transmitted infections, or tuberculosis-related information was common. Where other provisions were found, there was little consistency in the laws across states.^a The variation in state laws supports the need to build consensus on the appropriate use and disclosure of public health information among public health practitioners.^a

Surveillance, epidemiological, and laboratory data are essential to the practice of public health, particularly at the state and local level.¹ Public health practitioners within government agencies use data to identify new cases of disease and to make decisions about when to apply public health interventions. The exchange of information between health officials in different jurisdictions has been demonstrated to be essential to managing outbreaks of well-understood diseases, such as measles, and identifying and responding to new and emerging threats, such as severe acute respiratory syndrome and pandemic influenza A (H1N1). However, the very developments in information technology and health care policy that make it increasingly possible to rapidly transmit health information, such as electronic medical records and health information exchanges, continue to raise questions about the possible inappropriate use and lack of protection of personally identifiable health information.^{2–4} In highly charged situations, such as the recent influenza A (H1N1) pandemic, variations in state laws and incomplete understanding among jurisdictions can easily lead to inconsistent public health disclosure practices, resulting in media questions about the integrity of information access policies.^{5,6} Clearly, consideration should now be given to a more cohesive approach to public health information sharing.

State prohibition of re-identification of patient information is crucial in preventing widespread sharing of personal patient files

Terry 14 (Nicolas P. Terry. “Big Data Proxies and Health Privacy Exceptionalism.” 2014. P. 16-19 https://www.ftc.gov/system/files/documents/public_comments/2014/01/00004-89091.pdf)/EMerz

There has always been something lopsided about the HIPAA regulatory model. Rather than concentrating on securing health data, most of the Privacy Rule provisions detail wide-ranging exceptions (public health, judicial and regulatory) to data protection or outline the process by which patients can consent to disclosure. Just recently, for example, a pharmacy chain made the headlines by conditioning its loyalty rewards program on a broad HIPAA authorization.⁸⁶ It is no surprise, therefore, to learn that **there has been leakage of health data through the very system set up to protect it.** Such leakage has been exacerbated by the mission creep exhibited by the recipients of data under HIPAA, particularly public health agencies. As Wendy Mariner notes: Today, almost everyone, regardless of station, could be subject to public health surveillance. **The scope of public health surveillance has grown significantly beyond its contagious disease origins.** . . . [A] new generation of reporting laws reflects a goal of many people in public health: to collect data about chronic diseases outside the context of a research study and without the need to obtain any individual patient's informed consent. . . . Do they offer the promise of medical advances, or the threat of “general searches, which the authors of the Bill of Rights were so concerned to protect against?”⁸⁷ For example, a 2013 report from the Citizens’ Council for Health Freedom alleges broad state health surveillance based on individual and often identifiable records.⁸⁸ However, public health authorities are not only voraciously consuming patient data but also abetting the acquisition of the same by big data companies. Researchers at Harvard’s Data Privacy Lab have found that thirty-three states re-release patient hospital discharge data that they

have acquired as HIPAA-permitted recipients of patient data. 89 Generally states release this data (that is no longer in the HIPAA protected zone) in somewhat de-identified or anonymized form but with little restriction on future use of the data. The naïve thought that such data was only being released to academic researchers was upended by the Data Privacy Lab's discovery that many of the major buyers of such state health databases were big data companies.⁹⁰ Most states only charge small fees that are not a major source of revenue for them, and many are oblivious to this practice.⁹¹ **The obvious solution is for the state public health agencies to contractually prohibit re-identification.** For example, the National Practitioner Data Bank (NPDB) collects information about physician malpractice awards, adverse licensure reports and Medicare/Medicaid exclusions. Although it is not a public resource the NPDB does release de-identified data. Following a re-identification episode NPDB now contains a prohibition on re-identification, specifically against using its “dataset alone or in combination with other data to identify any individual or entity or otherwise link information from this file with information in another dataset in a manner that includes the identity of an individual or entity.” Clearly, state health departments and any similarly placed recipients of HIPAA data should require similar restrictions. Indeed, the proposed FTC privacy framework would mandate such: . . . [I]f a company makes such de-identified data available to other companies – whether service providers or other third parties – it should contractually prohibit such entities from attempting to re-identify the data. The company that transfers or otherwise makes the data available should exercise reasonable oversight to monitor compliance with these contractual provisions and take appropriate steps to address contractual violations.⁹⁵ **Until such prohibitions are instituted HIPAA's public health exception unpardonably will continue to facilitate the “laundering” of protected patient data as it is transferred from a data protected domain to unprotected space.**

Politics – Link

Congress has no interest in changing health surveillance standards

Evans 13 (Barbara J. Evans. Professor of Law; Co-director, Health Law & Policy Institute; Director, Center on Biotechnology & Law, University of Houston Law Center, Yale Law School; M.S., Ph.D. Stanford University; Post-doctoral Fellow, The University of Texas M.D. Anderson Cancer Center. “Institutional Competence to Balance Privacy and Competing Values: The Forgotten Third Prong of HIPAA Preemption Analysis.” P.1189-1190.
http://lawreview.law.ucdavis.edu/issues/46/4/Articles/46-4_Evans.pdf//EMerz

The problem, however, **is that Congress appears to lack this desire**. An excellent opportunity to address this problem came and went when Congress introduced major amendments to the HIPAA statute in the 2009 Health Information Technology for Economic and Clinical Health (“HITECH”) Act.⁷⁴ Congress declined to expand HIPAA’s preemption of state privacy law. Pragmatism counsels that **HIPAA’s preemption provisions are not likely to change**. Those who favor a more uniform legal framework to support large, interoperable public health data networks and public health uses of data must find a way to achieve these goals within the existing preemption framework. To paraphrase Donald Rumsfeld, “You go to war with the [HIPAA preemption provisions] you have, not the [provisions] you might want or wish to have at a later time.”⁷⁵ Accordingly, this Article takes a fresh look at HIPAA’s existing preemption provisions to check for tactical opportunities that earlier scouts may have overlooked.

Privacy rulings are extremely unpopular and take up the entire floor- HIPAA empirics proves

Evans 13 (Barbara J. Evans. Professor of Law; Co-director, Health Law & Policy Institute; Director, Center on Biotechnology & Law, University of Houston Law Center, Yale Law School; M.S., Ph.D. Stanford University; Post-doctoral Fellow, The University of Texas M.D. Anderson Cancer Center. “Institutional Competence to Balance Privacy and Competing Values: The Forgotten Third Prong of HIPAA Preemption Analysis.” P. 1212-1213.
http://lawreview.law.ucdavis.edu/issues/46/4/Articles/46-4_Evans.pdf//EMerz

The HIPAA Privacy Rule had a famously contentious rulemaking history. The proposed regulation drew more than 52,000 public comments and the final rule of December 2000 subsequently was reopened for a second round of comments and amendments. **Consensus was hard to achieve and, in fact, was not fully achieved.** The Privacy Rule continues to be disliked by all sides. For example, it is simultaneously criticized for allowing too much and not enough access to data and biospecimens. Modestly positioning the Privacy Rule as a floor of privacy protections may have had a calming effect during the fractious rulemaking process. By its own terms, the Privacy Rule is merely a floor, and that was all that needed to be discussed during the rulemaking. The Privacy Rule only becomes a ceiling in one narrow context — public health uses of data and biospecimens — and then only when read in conjunction with the HIPAA statute. The rulemaking carefully set the stronger statutory preemption provision at 42 U.S.C. § 1320d-7(b) to one side and avoided making it a topic of rulemaking discussions.

No political constituency for the plan – politicians will defer to law enforcement

Jason **Kreag** (Visiting Assistant Professor, University of Arizona James E. Rogers College of Law) **2015** “GOING LOCAL: THE FRAGMENTATION OF GENETIC SURVEILLANCE” http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2583957

The lack of legislative interest in regulating local DNA databases is not surprising.²⁸⁷ Absent a public outcry, there is normally little political upside for politicians to initiate legislation to curb police use of a tool that law enforcement has identified as effective.²⁸⁸ And the possibility of a public outcry resulting from surveillance techniques like local databases, which disproportionately impact people with comparatively little socioeconomic standing and political power, seems unlikely because “citizens tend not to see themselves as the subjects of future police investigations.”²⁸⁹ Furthermore, even if policy makers would be interested in regulating a particular surveillance method, they are often not notified of new techniques in advance, leaving the new methods to gain a foothold absent external oversight.²⁹⁰

The debate over the plan get dragged into the ObamaCare debate

Katherine **Gasztonyi** (associate in the firm’s Washington, DC office and a member of the Privacy & Data Security and Intellectual Property Rights practice groups) **2014** “House Republicans Signal Push for Data Breach Legislation” <http://www.insideprivacy.com/united-states/congress/house-republicans-signal-push-for-data-breach-legislation/>

In the wake of the recent Target Corp. credit card data breach, Congress is once again turning its attention to data breach legislation. In a memorandum to Republican lawmakers on January 2, House Majority Leader Eric Cantor (R-Va.) stated that he intends to schedule legislation on security and breach notification requirements for federally facilitated healthcare exchanges when Congress resumes session next week. Democratic leaders characterized the news as yet another effort by Republican lawmakers to undermine the Affordable Care Act rather than a serious effort to deal with data security issues.

Case

1NC Link Turn

Despite privacy concerns - substantial numbers of patients are still engaging the medical system now

Erin **McCann** (Managing Editor of Healthcare IT News) November **2014** “Trust issues over health privacy persist” <http://www.healthcareitnews.com/news/trust-issues-over-health-privacy-persist>

Healthcare industry, listen up: You've got a consumer distrust issue on your hands. The majority of American consumers continue to have serious doubts over the privacy and security of their medical records – so much so that a sizable number of them actually withheld information from care providers over those concerns. This according to a new Office of the National Coordinator for Health IT survey, which took a pulse of consumer perceptions toward healthcare privacy and security. The numbers are telling. After surveying more than 2,000 consumers, ONC officials found that about three-quarters of them were either very or somewhat concerned over the privacy and security of their medical records. What's more, 10 percent of respondents withheld information from their healthcare provider who used an electronic health record. (This compared to the 6 percent who withheld data from providers who used paper medical records.) The differences between the two were not statistically different, ONC pointed out. The lion's share of Americans are also not keen on their medical records being sent electronically or through fax, with about 60 percent of consumers indicating concern over unauthorized access of their medical records when they're sent in these two forms. These numbers appear to align with a similar study conducted by Harvard researchers just last year. The study, which assessed the privacy perceptions of U.S. adults, found similarly that more than 12 percent of the 1,500 respondents withheld information from care providers over medical security concerns. Findings supported "the need for enhanced and sustained measures to ensure the confidentiality, integrity and availability of PHI," Harvard School of Public Health researchers wrote in the study. Despite all these concerns, as ONC officials highlighted in Tuesday's HIT Policy Committee meeting, most respondents still "wanted healthcare providers to use an EHR despite any potential privacy and security concerns," with some 76 percent indicating this. "In spite of the fact that a majority of Americans expressed concerns regarding the privacy and security of both their medical records and with sharing of their medical records, support for EHRs and electronic health information exchange remained consistently strong," said Vaishali Patel, senior advisor at the Office of the National Coordinator for Health IT.

Restrictions on health surveillance destroys medical research and disease prevention – anonymization and consent are too burdensome – turns the entire aff

Chris **Verity et al.** (Child Development Centre, Addenbrooke's Hospital, past chairman, British Paediatric Surveillance Unit Executive Committee, Agnus Nicoll, PHLS Communicable Disease Surveillance Centre, and Donal Manning, Child Development Centre, Addenbrooke's Hospital) **2002** “Consent, confidentiality, and the threat to public health surveillance / Commentary” British Medical Journal, International edition 324.7347 (May 18, 2002): 1210-3

Why is surveillance important? Since the 1980s the public has become increasingly concerned about health protection against real and perceived hazards, including HIV, bovine spongiform encephalopathy/variant Creutzfeldt-Jakob disease, food poisoning, possible adverse effects of

medicines and vaccines, etc.¹⁶ People expect that health surveillance will be undertaken efficiently and effectively. When outbreaks of infectious disease occur, local public health doctors, regional epidemiologists, or, centrally, the Communicable Disease Surveillance Centre, mount rapid investigations to enable them to provide protective measures, identify hazards, and reduce the risk of further infections and disease. Is surveillance acceptable? When the rationale for surveillance is explained to colleagues in primary care and in hospitals, they are almost always cooperative, as are affected patients and healthy "controls," sometimes providing personal information over the phone. Similarly, feedback from parents of children with rare but important disorders indicates that they support surveillance and would not welcome changes that threaten its completeness or accuracy. No major effort, however, has been made to explain surveillance mechanisms or their importance to the public. Threats to health surveillance The present arrangements for health surveillance are threatened by the proposal that either explicit consent should be sought from patients for use of their personal data, or data must be completely anonymised. Obtaining explicit consent before sharing identifiable patient data Simple but unrealistic suggestions have been made to solve the complex problems surrounding surveillance, consent, and confidentiality One is that consent for reporting can readily be obtained from patients or parents. Almost all reporting and referral of clinical specimens relies on the cooperation of busy people such as clinicians and microbiologists who are providing patient care with growing workloads in an increasingly bureaucratic environment For example, over 90% of paediatricians return the British Paediatric Surveillance Unit's monthly surveillance card, but the data the card requests are purposely kept to a minimum in order to sustain good response rates.¹⁷ It is our considered opinion, and that of our colleagues, that if explicit consent for sharing data had to be obtained the completeness and timeliness of reporting would be dangerously disrupted. Obtaining explicit consent would be most difficult for single consultations—for example for an acute infection when the need for a report is often only appreciated some time after collection of the specimen or after initial diagnosis. It is usually impossible to determine at the time of a consultation which specimen will reveal a significant pathogen. For laboratory reporting, clinicians would have to ask for consent for sharing of data or specimens for every proposed investigation, or else pathologists would later be ringing up clinicians to ask them to trace and contact patients for consent. Neither system could be expected to work well. When approached, families almost always wish to cooperate,⁴ but reporting doctors do not readily want to add the task of obtaining consent to their other work commitments,^{4 18} as a sequential surveillance and research investigation undertaken by the Royal Colleges of Ophthalmologists and Paediatrics and Child Health on retinopathy of prematurity illustrates. In this study, 235 cases were initially reported through conventional surveillance (without seeking explicit consent from parents). Later, reporting doctors were asked to obtain consent because an additional research study involved seeking parental views. In some cases repeated reminders to clinicians were needed although there were only three parental refusals. Eventually consent was obtained for 188 of 221 eligible cases (85%), and each consent took on average 3 months to obtain (L Haines, personal communication, 2001). The percentage would have been far lower had not the investigators been able, from prior knowledge of existing cases, to remind clinicians that consent was outstanding. Other specialties have had similar experiences. Introduction of the requirement for consent for cancer registration resulted in a 70% drop in notifications to the long established Hamburg cancer register, destroying its comparative value—it is no longer referred to in European publications (M Parkin, International Agency for Research on Cancer, personal communication, 2001). An American study on consent found that the requirement for consent led to selective exclusion of some patients and hence introduced bias.¹⁹ In the United Kingdom, a belief that patient consent

was needed before inclusion in a general practitioner diabetes register contributed to ascertainment of only 60% of eligible diabetic patients,²⁰ mainly because some doctors never got round to obtaining consent (S Burnett, UCL London, personal communication, 1999). A disturbing recent development is that, notwithstanding official reassurances 9 10 12 some NHS trusts have instructed doctors not to transfer data about patients unless they do have consent, and this has inhibited some doctors who were keen to contribute to, for example, cancer registries. This has already impaired the work of the cancer registries, and the reporting of infectious diseases might be similarly affected. Anonymising data before transfer It has been suggested that removal of the identifiers from patient data will obviate the need for consent, but in a number of health surveillance studies the identifiers are essential links to other sources of health information about individuals that provide validation and eliminate duplication (table). An alternative suggestion is to use NHS numbers instead of such identifiers as names and dates of birth, but at present NHS numbers are rarely included in routine data sets, so this solution would also interfere with surveillance. Conclusions Health surveillance is essential to protect public health, and existing surveillance mechanisms work reasonably well. Surveillance could be seriously threatened if it was thought that there was an over-riding need to maintain patient confidentiality or always to have to seek explicit consent to sharing of data. We are very concerned that restrictive interpretations of some of the recent guidance on patient consent would so damage surveillance mechanisms that they would cease to protect the health of the public, thus resulting in preventable ill health and deaths.

Rigid health privacy protections collapses public health – expansive surveillance key

Amy **Fairchild** (associate professor in the Department of Sociomedical Sciences and assistant director for scholarly and academic affairs at the Center for the History and Ethics of Public Health at the Joseph L. Mailman School of Public Health, Columbia University in New York City) Ronald **Bayer** (professor of public health and codirector of the Center for the History and Ethics of Public Health at the Joseph L. Mailman School of Public Health, Columbia University in New York City) and James **Colgrove** (assistant professor in the Department of Sociomedical Sciences at the Joseph L. Mailman School of Public Health, Columbia University in New York City) December 2007 “Privacy and Public Health Surveillance: The Enduring Tension” <http://journalofethics.ama-assn.org/2007/12/mhst1-0712.html>

The discovery that cases of paralytic polio in 1955 were caused by a single manufacturer of Salk vaccine, the linkage of toxic shock syndrome to tampons in 1979, the identification of the sentinel cases of AIDS on the East and West coasts in the early 1980s, the recognition of West Nile, SARS, and avian flu at the turn of the twenty-first century—were all the result of surveillance systems, through which alert and troubled physicians could communicate with public health officials, thus enabling emerging patterns to be identified. In each instance, such vigilance made it possible to initiate measures that could limit the human toll. Surveillance serves as the eyes of public health. Name-based reporting of cases has provided the foundation for planning, intervention, and prevention and has been critical for epidemiological research into patterns of morbidity and mortality for a wide variety of diseases and conditions. Registries have been essential for tracking individuals and their conditions over time. Surveillance has also served to trigger the imposition of public health control measures, such as contact tracing, mandatory treatment, and quarantine. The threat of such intervention and long-term monitoring has provoked

alarm and rendered surveillance suspect for those concerned about the unwarranted exercise of state authority in the name of public health. Thus the history of surveillance has been bounded by a promise and a specter. Over the course of the 20th century, public health officials reiterated the importance of surveillance, arguing that without the name and location of diseased individuals they worked "in the darkness of ignorance" and might "as well hunt birds by shooting into every green bush" [1]. It was the prospect of what surveillance might offer that raised hopes—for the delivery of services, for lifesaving knowledge, and for protection of individuals and communities. Hermann Biggs, a titanic figure in the history of public health, who was perhaps the most important late 19th- and early 20th-century architect and philosopher of U.S. public health surveillance, made it clear that names of the diseased were never collected "in order to keep clerks or adding machines busy" [2]. Toward the end of the 20th century, Surgeon General David Satcher would state the value of surveillance as plainly as had Biggs: "In public health, we can't do anything without surveillance. that's where public health begins" [3]. When surveillance opened the doors to vital services and knowledge, its subjects could well become among its most ardent advocates, thus underscoring a politics that goes beyond the politics of privacy. In the late 19th and early 20th centuries, as public health was extending the ambit of surveillance, the medical community reacted with hostility, particularly when it came to tuberculosis surveillance and seemingly threatened to intrude on the sanctity of the clinical relationship, over which the physician was guardian. Medical Record editor George Shrady thus complained of TB surveillance, The compulsory step taken is a mistaken, untimely, irrational, and unwise one.... The real obnoxiousness of this amendment to the sanitary code is its offensively dictatorial and defiantly compulsory character. It places the Board [of Health] in the rather equivocal position of dictating to the profession and of creating a suspicion of an extra bid for public applause [4]. "Already," he continued, "the profession as a whole has watched with jealous eye the encroachments of the Board upon many of the previously well-recognized privileges of the medical attendant" [4]. Over time, disease reporting was extended to chronic, noncontagious conditions such as cancer, birth defects, and occupational illnesses. Not only physicians but laboratories were often required to report cases to local health authorities. The surveillance of chronic diseases, of course, differs because these conditions do not represent a direct threat to the health of others. And, indeed, when state and local health departments first began tracking conditions like congenital malformations and cancers in the first half of the 20th century, these initiatives typically served epidemiological or research purposes only. These reporting efforts, critically, also became linked to the assessment and improvement of clinical care. Tumor registries, for example, emphasized patient care improvement since the 1950s and, currently, data from the National Cancer Institute's SEER program (Surveillance, Epidemiology, and End Results Program) are routinely used for quality improvement initiatives. It was not until the AIDS epidemic that activists challenged the long-standing tradition of name-based reporting. Even so, as AIDS has become a more treatable disease, resistance to reporting has all but vanished. In the 1990s, the promulgation of national standards to safeguard the privacy of medical records, as dictated by HIPAA (the Health Insurance Portability and Accountability Act), provoked intense public debate. But there was virtually no opposition to carving out an exception in the guidelines for the reporting of diseases to public health agencies. While there was initial uncertainty among physicians and researchers about whether hospitals could continue to provide cancer data to state registries, the Department of Health and Human Services made clear that HIPAA did not serve as an obstacle to reporting. In the early 20th century it was physicians who spearheaded opposition to surveillance; since the 1970s, patients have often been at the forefront of challenges to reporting diseases. Parents of children with disabilities, for example, successfully changed the

terms of birth defects surveillance in Minnesota, requiring the state to allow unwilling parents to opt out of reporting. Patient advocates within the American Diabetes Association forced New York City health officials to place limits on an initiative to track cases of diabetes. But just as often, patients with serious illnesses have pushed for better tracking of their conditions. Breast cancer survivors have emerged as the most ardent defenders of universal name-based cancer reporting, recognizing how important surveillance and the research it makes possible is to their own well-being. Similarly, communities concerned about "cancer clusters" and environmental threats have demanded access to the data that only cancer registries can accumulate. Patients expect their privacy to be protected, of course, but also maintain that a rigid commitment to privacy could hobble the usefulness of registries. In these instances, public health officials, committed to the paramount importance of surveillance, have been extremely wary about disclosing any data that could potentially compromise individual privacy.

Disrupts biomedical research

Hansson et al 12 (Mats, Centre for Research Ethics & Bioethics at Uppsala University; Bengt Simonsson, Department of Medical Sciences at Uppsala University; Nils Feltelius, The Swedish Medical Products Agency; Joanna Forsberg, Centre for Research Ethics & Bioethics at Uppsala University; Joerg Hasford, Institut für med Informationsverarbeitung, “Medical registries represent vital patient interests and should not be dismantled by stricter regulation,” July 2012, *The International Journal of Cancer Epidemiology, Detection, and Prevention*, p. 3-4)//JL

Rothstein foresees criticism of his proposal for leading to selection bias in research, delaying the introduction of new treatment and safety procedures in medicine, but he claims that at present there is an “insufficient empirical basis to assert that adding some level of privacy and autonomy protection to deidentified health information and biological samples will invariably and unreasonably disrupt biomedical research” (p. 8). However, as has been argued by several, inclusivity and universality are the keys to successful registry research [10,11]. There is a price to be paid since all requirements for informed consent, opt-out, re-consent, etc. imply that the registry will be affected both by those included and those not included. The likely result is incomplete information and data bank bias that will prevent researchers from tracking success and failure of treatment and drug efficacy and safety. The immediate victims of this will be the patients, with those suffering from rare diseases like CML paying the highest price. There are several examples of bureaucratic ethical review procedures and requests for consent that seriously jeopardized the possibility of doing biomedical research, at the end exposing patients to increased risks [12,13]. There are recent assessments available of the cost in lives caused by hurdles related to information and consent procedures [14].

Privacy is a prerequisite to any form of successful health surveillance

Khaled El **Emam** (founder and CEO of Privacy Analytics Inc, senior scientist at the Children’s Hospital of Eastern Ontario (CHEO) Research Institute and Director of the multi-disciplinary Electronic Health Information Laboratory (EHIL) team) **2014** “Public Health Surveillance and

Privacy in the Age of Ebola” <https://privacyassociation.org/news/a/public-health-surveillance-and-privacy-in-the-age-of-ebola/>

Being able to introduce anonymization methods into practice to ensure data custodians are willing to share data for public health purposes is important in the age of such epidemics as Ebola. The efficiency with which we track and investigate outbreaks is directly related to the spread of the disease. There is an urgency to get access to data. And it is not always health data that is important. Ongoing public health surveillance systems would allow rapid detection of and reaction to outbreaks. But this can only happen if privacy concerns that currently act as a barrier are addressed. Privacy does not have to be an obstacle, but it is an issue that needs be dealt with upfront when these surveillance systems are put into place. We cannot take for granted that data custodians are willing to share their data, even when there is an outbreak, as we saw during H1N1.

Thomas R. **Frieden** (Director, U.S. Centers for Disease Control and Prevention; Administrator, Agency for Toxic Substances and Disease Registry) September **2012** “Non-Communicable Diseases and the New Global Health” <http://www.cfr.org/diseases-noncommunicable/non-communicable-diseases-new-global-health/p35310>

Really, let me say one thing about the problem and one thing about the solution. Noncommunicable diseases are sometimes mischaracterized as diseases of affluence because we have the concept that as people get richer, they do more unhealthy things, and these diseases follow. But actually, I think these are fundamentally diseases of poverty. They're diseases of poverty because in most countries, not only do they disproportionately affect the poor, but they perpetuate poverty in individuals, in families, in communities and, perhaps most importantly, in countries. Noncommunicable diseases are an enormous drag on economic development, on health care systems, on workplace productivity. And so they have enormous economic implications for individuals, families, communities, work sites and countries. The global burden of disease has really shifted. For the first time in human history, we have more people living in cities than in rural areas. We have more people who are overweight than underweight. We have more deaths among adults than among children. And we also have more people dying from noncommunicable diseases in poor countries than in rich countries, with higher rates of noncommunicable diseases in poor countries than rich countries. In fact, in poor countries, half of all deaths from noncommunicable diseases occur before the age of 70. In rich countries, it's about a quarter of all deaths from noncommunicable disease before the age of 70. So these are huge differences, and now non-communicable diseases kill more people than communicable diseases, about two-thirds of all of the world's deaths, and that burden is not only high, but it is increasing and on a trajectory to increase even further.

Mass health surveillance is good – its key to medical effectiveness and drug development

Freedland 14 (Jonathon Freedland is the Guardian’s executive editor. He also writes for the NYT and New York Review of Books. He won the Orwell special prize for journalism and the columnist of the year in What the Papers Say. “We now trust no one with our data – not even our doctors” 1/31/14 <http://www.theguardian.com/commentisfree/2014/jan/31/nhs-medical-data-trust-doctors-edward-snowden>)///CW

If you thought someone snooping around your emails and listening to your phone calls was bad, imagine them looking at your medical records. The private realm may be ever-shrinking – in an age when we reveal so much of ourselves online and

when we know the eavesdroppers of the NSA and GCHQ are never far away – but if there's one thing we'd want to keep behind high walls, it's surely the intimate histories of our mental and physical health.¶ So there can be little surprise that privacy campaigners are recoiling at the expansion of NHS England's data collection, which from this spring will take in information from the place where most people experience the NHS: their GP's surgery. Until now, the NHS in England kept the stats from hospital visits but not from those day-to-day encounters with your local doctor. As 26.5m leaflets pop through letterboxes, explaining the new "care.data" project, groups such as medConfidential.org are urging patients to opt out in the name of basic privacy. One survey found that up to 40% of GPs plan to keep their own personal records out of the scheme. My first, unreflective instinct would be to stay out too – and others will surely feel the same way. Indeed, the appeal of that stance says much about the times we live in, both online and in the physical world.¶ For one thing, less than a year after Edward Snowden's revelations of mass surveillance, the notion that our medical records will remain closely guarded, viewed only by those doctors and scientific researchers who need to see them, arouses instant scepticism. Sure, we think. They said the same about our emails. After Snowden, many will assume that if the authorities want to know whether we are HIV-positive or once suffered from depression, they'll be able to find out with just one click. As medConfidential's Phil Booth told the FT: "Everyone agrees medical research is a good thing but, after the NSA scandal, people are getting wise to the dangers of these massive data sets." [paywalled link]¶ It doesn't even have to be that sinister. It wasn't that long ago that government ministers were apologising from the floor of the House of Commons after Revenue & Customs mislaid two discs containing the names, dates of birth, national insurance numbers and, where relevant, bank details of 25 million people. What, one wonders now, is to stop the geniuses who brought us that disaster messing up again, except this time losing not our tax details but the stories of our lives and bodies?¶ Advertisement¶ Campaigners worry too about who might want to take a look at all that info. Won't the big drug companies be desperate to pore over that information, the better to profit from our frailties? And if private health and life insurance companies get access to that data, won't they start charging higher premiums if they know what once took us to see the doctor?¶ Given all those worries, you can see why some want to opt out. And yet that first, gut instinct might be wrong. It's not just that the vast bulk of the information will be rendered anonymous, with individuals blurred out in all but the most controlled circumstances, or that there are strict rules in place over access to this information. Nor even that there is an explicit declaration that this data will not be shared with insurance or marketing companies – so no prospect of a Strepsils ad popping up on your screen just after you've seen your GP over a sore throat.¶ Rather, it's the great gain that this information will provide. Small, clinical studies only tell you so much. Sometimes it's mass data you need. It was mass information that disproved the link between MMR and autism, or that spotted the connection between Thalidomide and birth defects, or between smoking and cancer. Ethically you can't conduct trials on pregnant women or children, so you're reliant on knowing what's happening in the population. If you can know that swiftly and at scale, you can act faster and more effectively. As the leaflet popping through the door puts it: "Better information means better care."¶ The pragmatic truth is that this logic extends even to the private drug companies. Like it or not, it's through pharmaceutical companies that new medicines are developed: they're the ones who fund the trials, turning research into medication. As Nicola Perrin of the Wellcome Trust, which strongly backs care.data, put it to me: "If we want access to the best possible drugs, the drug companies need access to the best possible information."¶ There is a principle at stake here too. In a subtle piece for the Socialist Health Association, Prof Dave Byrne recalls the traditional method of teaching medical students, in which a senior doctor on a ward-round would urge them to look at and learn from real-life individuals and their treatment: care.data is just a hi-tech version of that process, says Byrne, gathering together doctors' experience of treating patients. Viewed this way, our individual experience of treatment – suitably anonymised – is not our private property, even if it should remain private. Those who treated us have the right to use that experience to benefit others, to help the collective good.¶ But anonymity is the key. None of these arguments in favour of care.data works unless we can be sure those rules on access hold firm and that the identity of individual patients remains concealed – and not easily hacked as some currently fear. And yet online anonymity remains vexed. All too often it seems we don't have it when we should, whether through data loss or NSA-style state intrusion. At the same time, we have too much anonymity when we shouldn't: witness the social media trolls and abusers, or phoney, astroturf campaigners, able to stay hidden when they would surely shrivel if exposed to the daylight and forced to reveal their true identities.¶ The larger obstacle confronting this new scheme goes beyond the virtual realm. It is a change that is infecting almost every aspect of our shared lives: loss of trust. So the government can issue guarantees of privacy protection and our first thought is of missing discs, GCHQ eavesdroppers or perhaps hacked phones. Too many institutions have been exposed as having betrayed their unspoken promises, whether it's MPs, the security services, the police, the banks or the BBC.¶ For many years the NHS stood alone, immune to this trend, doctors topping every index of trust. But thanks to Mid-Staffs and scandals like it, the NHS too has been found wanting. Which is why a good idea like a project to share our broad, unnamed data can face such resistance. We take nothing on trust these days – not even the word of a doctor.

Medical Research Extensions

Even the current minimal protections provided by HIPAA drastically impede research

Steinberg and Rubin 9 (Mindy Steinberg and Elaine Rubin. Steinberg is a program associate at the Association for Academic Health Centers. Rubin is the vice president for policy and program at AAHC. “The HIPAA Privacy Rule: Lacks Patient Benefit, Impedes Research Growth.” 2009. P. 1-2.

http://www.aahcdc.org/Portals/0/pdf/AAHC_HIPAA_Privacy_Rule_Impedes_Research_Growth.pdf////EMerz

The Privacy Rule of the Health Insurance Portability and Accountability Act (HIPAA), a regulation designed to protect the privacy of health information, continues to have a negative impact on the nation’s research enterprise, according to the latest survey of academic health center research administrators and principal investigators by the Association of Academic Health Centers (AAHC). Since the 2003 implementation of the Privacy Rule (45 CFR 160, 164), studies have shown that it has imposed barriers to research at academic health centers, the nation’s major research institutions, thus slowing the pace of research, increasing the costs, and significantly hindering participation of individuals in important research studies. Research was not intended to be governed by the HIPAA Privacy Rule, but neither was it exempted from the regulation. However, the new constructs and restrictions on information mandated by the Rule have had untold consequences for the conduct of research and the advance of science and discovery in the United States. Despite repeated efforts by the research community to highlight the negative consequences of the HIPAA Privacy Rule, policymakers have made little attempt to address the Rule and consider options to remedy the situation. With the U.S. facing critical socioeconomic challenges, including an aging population and the desire for new treatments and cures for disease and illness, it is essential that policymakers reexamine the HIPAA Privacy Rule. The AAHC called for changes to the HIPAA Privacy Rule and recommended options to address these critical research issues based on evidence from a limited number of focus groups conducted with researchers throughout the country in 2007.⁴ This year, to broaden its information base, the AAHC developed a questionnaire that was administered online to 102 members of the AAHC’s executive leadership group of Vice Presidents for Research as well as other senior leaders (e.g., legal counsel and chief compliance officers) who are members of the Vice Presidents for Research Workgroup on HIPAA. The vice presidents for research were also asked to forward the survey to 2-4 principal investigators at their institution in the interest of including the perspective of researchers along with that of senior research administrators.

Privacy legislation destroys scientists’ motivation to conduct research- it’s too expensive with protections in place

Steinberg and Rubin 9 (Mindy Steinberg and Elaine Rubin. Steinberg is a program associate at the Association for Academic Health Centers. Rubin is the vice president for policy and program at AAHC. “The HIPAA Privacy Rule: Lacks Patient Benefit, Impedes Research Growth.” 2009. P. 3.

http://www.aahcdc.org/Portals/0/pdf/AAHC_HIPAA_Privacy_Rule_Impedes_Research_Growth.pdf////EMerz

In short, the majority of survey respondents believe the HIPAA Privacy Rule had a significant negative impact on the scope, pace, and costs of research. The greatest concern was expressed about the negative impact on the costs of research. Respondents also indicated they were aware of research studies that were stopped or never pursued because of Privacy Rule related problems. The negative perceptions of research leaders are especially significant. The HIPAA Privacy Rule imposes another limitation on America's ability to fulfill the promises of new science. A lack of interest in scientific careers, and decreased federal funding of research when coupled with the HIPAA Privacy Rule, create a burdened and troubled environment for the future.⁸

That turns case- patients health will be worse off if there are more barriers to DNA research
Steinberg and Rubin 9 (Mindy Steinberg and Elaine Rubin. Steinberg is a program associate at the Association for Academic Health Centers. Rubin is the vice president for policy and program at AAHC. "The HIPAA Privacy Rule: Lacks Patient Benefit, Impedes Research Growth." 2009. P. 3.
http://www.aahcdc.org/Portals/0/pdf/AAHC_HIPAA_Privacy_Rule_Impedes_Research_Growth.pdf////EMerz

The problems with the HIPAA Privacy Rule are extensive and are likely to be even broader than the survey suggests. Furthermore, there is no clear evidence that the Rule is achieving its intended purpose in the research arena. Given the longstanding history of the Common Rule in research, it would be most expedient and effective to exempt research from the HIPAA Privacy Rule and to defer to the Common Rule. The Common Rule — an essential safeguard that has worked successfully — has been responsible for ensuring the protection of research participants' safety and privacy for more than 30 years. The negative impact of the HIPAA Privacy Rule on research ultimately translates into negative consequences for patients, with more terminally ill patients missing out on the opportunity to participate in clinical trials that have the potential to save their lives. To remedy this threat to research and the American people, revision of the HIPAA Privacy Rule is imperative. The AAHC recommends that research be exempt from the HIPAA Privacy Rule and that it be solely governed by the Common Rule. Furthermore, the AAHC recommends a revision of the Common Rule to incorporate more explicit standards for the privacy of health information and to augment the protections of the Common Rule to accommodate new technologies and guard against new threats to patient safety and privacy

Privacy-based critiques fail and undermine research

Hansson et al 12 (Mats, Centre for Research Ethics & Bioethics at Uppsala University; Bengt Simonsson, Department of Medical Sciences at Uppsala University; Nils Feltelius, The Swedish Medical Products Agency; Joanna Forsberg, Centre for Research Ethics & Bioethics at Uppsala University; Joerg Hasford, Institut für med Informationsverarbeitung, "Medical registries represent vital patient interests and should not be dismantled by stricter regulation," July 2012, The International Journal of Cancer Epidemiology, Detection, and Prevention, p. 3-4)//JL

3. Registries criticized for threatening privacy Accordingly, vital patient interests are in the balance in association with the EUTOS for CML and other similar registrations and data-sharing efforts. However, within the ethics and legal literature collaborations between medical registries of this kind are seen as controversial because they pose a potential threat to the individual privacy of the patients. Mark Rothstein has recently argued

that collection and use of large quantities of health information create a substantial challenge for protecting the privacy of patients and research subjects that is accentuated when biological samples are involved [8]. De-identification, he suggests, does not solve the problem since the process of removing identifiers implies that someone will actually have to do it thus representing an intrusion in private matters. It has also been claimed that re-identification may be possible by using publicly available databases, provided that one have access to reference samples [9]. Rothstein suggests that rules about de-identification are insufficient for privacy protection and need to be comple-mented with rules about notice provisions to patients, such as informed consent, strategies for opt-out, and giving individual patients a degree of control over the use of data and, where relevant, biological samples. 4. **The critique fails for four reasons** In light of the experience with the EUTOS for CML registry we believe that Rothstein's argument fails for four reasons. 1. **Rothstein foresees criticism of his proposal for leading to selection bias in research, delaying the introduction of new treatment and safety procedures in medicine, but he claims that at present there is an "insufficient empirical basis to assert that adding some level of privacy and autonomy protection to deidentified health information and biological samples will invariably and unreasonably disrupt biomedical research"** (p. 8). However, as has been argued by several, inclusivity and universality are the keys to successful registry research [10,11]. **There is a price to be paid since all requirements for informed consent, opt-out, re-consent, etc. imply that the registry will be affected both by those included and those not included.** The likely result is incomplete information and data bank bias that will prevent researchers from tracking success and failure of treatment and drug efficacy and safety. The immediate victims of this will be the patients, with those suffering from rare diseases like CML paying the highest price. There are several examples of bureaucratic ethical review procedures and requests for consent that seriously jeopardized the possibility of doing biomedical research, at the end exposing patients to increased risks [12,13]. There are recent assessments available of the cost in lives caused by hurdles related to information and consent procedures [14]. 2. **Rothstein acknowledges that research concerns should not be dismissed lightly, but, he continues: "On the other hand, the interests of patients and the public also deserve respect and consideration"** (p. 8). **His argument for privacy relies, as stated, on a perceived dichotomy between the clinical researcher on the one side with the patient and the public at the opposite side, a normative description of the relationship that is questionable. This dichotomization seems to be a rather common phenome-non** [15]. As Dixon-Woods et al. have recently argued, the ethical, legal and sociological accounts of medical research that influence the policy debates describe research as operating in opposition to the norms and interests of the general public and of the patient [16]. Based on empirical studies in a pediatric oncology research context they were, in contrast to this alleged dichotomy, able to show how sentiments of coalition and partnership characterized the relationships between the patient families, their doctors and the researchers. 3. **Rothstein argues for the need of increased protection of privacy and autonomy based on these interests as fundamentally protected by constitutional law.** Wendy Mariner argues in a similar vein for the need of limiting intrusion into medical privacy and has suggested that a constitutional challenge could dismantle cancer registration [17]. **Health is regarded as an important concern but must sometimes give way to inherent principles of law, e.g. protection of privacy** [18]. **That privacy is a vital interest of citizens and democratic societies is not controversial.** However, the values that are associated with a secluded life are all kinds of social value [19]. They presuppose and acquire their meaning only in a context where various kinds of social relationships with other individuals are involved. To be banished to seclusion on a desert island, certainly implies that one will be left in peace, but it is not the kind of situation which people wishing to protect their private life, strive for. **Individuals, as far as their own personal matters are concerned, have an interest in being left in peace but they also wish to participate** in the possibilities that are available to citizens in a society. **This includes having access to new medical knowledge attainable only when personal medical data is recorded and shared within the format of large well-managed registries. In order to further strengthen his argument Rothstein suggests that autonomy is only one aspect of the broader concept of "respect for persons"** (p. 8) and that this should imply closer regulation of registry research. However, **patients have interests also at the end of the research line,** e.g. in new possibilities to follow up the effects of medical drugs with regard to treatment response and adverse reactions, and if they became aware of the costs of stricter regulation undermining the possibilities of participating in the development of scientific knowledge they may be more likely to feel disrespected. 4. **Rothstein is critical of partnership with commercial interests** in association with biomedical research, something not uncom-monly questioned by ethicists and lawyers [20]. However, we suggest that **partnership between academic and commercial partners is essential for making progress in medical research** and is intrinsic to concerns about assessment of drug efficacy, safety and effectiveness. **This claim does not imply that one should be nai"ve.** For the benefit of patients sharing of data should go in both directions, also when a pharmaceutical

company enjoys a monopoly. Potential conflicts of interest may arise and should not be taken lightly. The increasing collaboration between industry and patients' organizations should be considered. However ELN provides an interesting example of how doctors and researchers may be able to collaborate with the pharmaceutical industry while preserving their own integrity. A working party has just started a controlled trial in order to find out when treatment of CML patients with TKI should be stopped because the patient will not benefit from prolonged treatment with the drug. Such a study may, arguably, not be in the best (economic) interest of the drug companies.

HIPAA's protections of individual health records have prevented vital research

Pritts 13 (Joy L. Pritt. "The Importance and Value of Protecting the Privacy of Health Information: The Roles of the HIPAA Privacy Rule and the Common Rule in Health Research." 2013. P. 1-2

[//EMerz">http://iom.nationalacademies.org/~media/Files/Activity%20Files/Research/HIPAAandResearch/PrittsPrivacyFinalDraftweb.ashx\)//EMerz](http://iom.nationalacademies.org/~media/Files/Activity%20Files/Research/HIPAAandResearch/PrittsPrivacyFinalDraftweb.ashx)

The privacy of personal information, and of health information in particular, continues to be a vexing issue in the United States. As more and more health information is computerized, individuals express concern about their privacy and that they are losing control over their personal health information. To help allay public concerns, federal rules governing the use and disclosure of health information were promulgated under the Health Insurance Portability and Accountability Act (known as the HIPAA Privacy Rule). While the HIPAA Privacy Rule does not directly regulate researchers, it does restrict the manner in which health care providers may use and disclose health information for health research. Health researchers have been critical of the HIPAA Privacy Rule since its inception, concerned that it would interfere with valuable research. Various research organizations and others have requested that the Rule be revised to lessen its effect on research. Most recently, an Institute of Medicine (IOM) committee was formed and charged with reviewing the impact of the Privacy Rule on health research. This paper was commissioned by that committee, the IOM Committee on Health Research and the Privacy of Health Information: The HIPAA Privacy Rule.

Disease Turn - Military

Surveillance key to check tick-based disease outbreaks --- specifically likely on military installations

Peterson et al, masters in entomology qualifications of other authors: Medical

Entomologist/epidemiologists, **2015** (Wade, "Tick-borne disease surveillance", published in U.S. Army Medical Department Journal, jan-march edition, Academic OneFile)//roetlin

Tick-borne diseases (TBDs) represent some of the world's most rapidly expanding arthropod-borne infectious diseases. (1) (p1) In the United States, ticks are responsible for more human disease than any other arthropod group. The incidence and the number of pathogens transmitted by ticks are increasing. For example, Lyme disease is now the most commonly reported arthropodborne illness in the United States. (2)

Anaplasmosis, ehrlichioses, and rickettsioses are also on the rise. (1) (p1) In most parts of the world, TBDs are potentially serious health threats to troops, civilian employees, and residents at military installations. (2) (p6)

Companion animals and military working dogs (MWD) are also at risk in areas where ticks and TBDs are endemic or emerging. Risk of TBD increases with the introduction of exotic tick species into new areas and the expansion of historical tick ranges. One example of exotic ticks that effects the United States is *Boophilus annulatus* and *B. microplus*, also known respectively as the cattle fever tick and the southern cattle tick, that were imported here by Spanish colonists who brought tick-infested cattle and horses with them. These ticks transmit a severe disease to cattle called Texas fever or cattle fever that caused enormous losses to the US cattle industry in the past. Present efforts to keep this tick out of the United States exist as the Cattle Fever Tick Eradication Program. (3) Nilgai antelopes, native to India, Nepal, and Pakistan, that were released into southern Texas are also hosts to the cattle fever ticks, posing a threat as maintenance hosts of cattle fever. (4) There are many other examples of exotic tick introductions from migratory birds, exotic and wildlife species, and domestic animals. (5) Changes in climate may also alter the geographic distribution of tick vectors, and in turn, cause a change in the currently recognized demographic patterns, seasonality, and incidence of TBDs. (1) (p61) For example, the range of the Gulf Coast tick (*Amblyomma maculatum*) has historically been along the Gulf of Mexico and

southern Atlantic coast as far north as South Carolina, and extending approximately 100-150 miles inland. However, resident populations of these ticks are now established in Arkansas, Oklahoma, and Kansas, (6) and they have been collected on the east coast as far north as Delaware and Maryland. (7) Another example is the lone star tick (*A. americanum*) which has moved northward as far as Maine and westward into central Texas and Oklahoma. (8) Incidental introductions of these ticks, and the diseases they carry beyond endemic regions, occur with increasing frequency. This is likely due to the feeding of immature ticks on migrating birds, and the transportation of tick-infested livestock and wildlife into new areas. (6) These introductions may also come from pets belonging to people who move from one area to another. In addition, suburbanization has contributed to the increase in TBD transmission in North America by bringing people and their pets close to ticks and by creating new tick habitat. (9) In the northeastern United States, the highest risk for Lyme disease occurs around the homes of those who have been infected. (10) As communities continue to expand into tick habitat, and people are encouraged to enjoy outdoor recreation and pursue activities such as urban farming, the risk for peridomestic exposure to ticks and TBDs may increase. The National Notifiable Disease Surveillance System (NNDSS) of the Centers for Disease Control and Prevention (CDC) maintains a list of diseases that are considered to be of public interest by reason of their contagiousness, severity, or frequency. The 7 TBDs on the NNDSS list are shown in the Table. Many of these diseases, which are caused by closely related tick-borne pathogens, can also be acquired internationally. There are also many TBDs that can be acquired abroad that do not occur in the continental United States. In addition to transmitting disease, ticks can cause irritation, pain, and swelling at attachment sites, otoacariasis (invasion of the auditory canal), paralysis, allergic reactions, and anaphylactic reactions. (11) Heavy infestations of ticks on animals can cause debilitation due to blood loss. Direct effects from TBDs include troop and MWD morbidity and mortality. There are also many indirect effects, such as illness of dependents or Department of Defense (DoD) civilian personnel, and related healthcare costs. Both types of effects can be mitigated through aggressive surveillance, public education, and prevention/control programs, together with prompt diagnosis and treatment. (2) (p6) **TICK BIOLOGY AND DISEASE TRANSMISSION** Ticks are grouped into 2 separate families. Family Ixodidae, also called hard ticks, have 4 developmental stages: egg, larva, nymph, and adult. The latter 3 each take one large blood meal and then molt to the next stage, or lay eggs in the case of the adult. Hard ticks have mouthparts with recurved teeth that allow them to firmly anchor themselves to hosts while feeding with the assistance of a cement-like substance secreted by the salivary glands. This allows them to feed for extended periods of time that can vary from 2 to 12 days or longer, depending on species, life stage, and gender. Family Argasidae, also called soft ticks, have the same 4 developmental stages, but most have multiple nymph stages. Soft ticks have mouthparts that allow them to hold fast to their host, as hard ticks do, but they do not secrete cement. Although some soft ticks can remain attached to the host for several days, (11) (p501) others can complete a meal within minutes to hours. (12) This is still much longer than other bloodsucking arthropods such as mosquitoes, and is one of the factors that contribute to their high vector potential because it increases the likelihood of pathogen ingestion and allows them to secrete large amounts of host-derived fluid and salivary secretions, which contain pathogens, back into the host. Other factors that make ticks efficient disease vectors include a highly sclerotized body that protects them from environmental stresses, high reproductive potential, and a long life span (compared to other blood feeding arthropods). Although the majority of TBDs are transmitted during normal feeding activity, they can be transmitted by other routes as well, including through regurgitation and feces. Argasid ticks can also release pathogens through excess liquid excreted from the coxal glands located adjacent to the first segment (coxa) of the front legs. (11) (p512) Adding to their efficiency as vectors, the larvae and nymphs are very small. The presence of an immature tick on a host often goes unnoticed, enabling the tick to feed to repletion and drop off without detection, which increases the likelihood of pathogen transmission. Ticks can also transmit more than one pathogen at a time. For example, Ixodes ticks can simultaneously or sequentially infect their hosts with *Borrelia burgdorferi*, *Anaplasma phagocytophilum*, and *Babesia microti*. (1) (p61) Co-infections with these pathogens have been reported from wild and domestic animals, including dogs, as well as humans. These infections can result in more severe and longer illnesses and can complicate diagnoses. (1) (p493) Ticks are also effective disease reservoirs. In some species, pathogens can be transmitted from the adult female to its offspring (transovarial transmission) and from one developmental stage to the next (transstadial transmission). Infected ticks can also transmit viruses to uninfected ticks while feeding simultaneously on an uninfected host. (11) (p512) Therefore, they can maintain and transmit infections even if they have not fed on an infected host. **SURVEILLANCE** Surveillance is the process of determining the presence of vectors and pests, estimating their general population levels, and determining if pathogens of concern are present in the population. It gives quantifiable data on which to base control and education programs and is the starting point in the prevention of any arthropod-borne disease. The analysis and interpretation of information gained from surveillance is the basis for developing quantitative and qualitative risk assessments that can be used to predict the occurrence of pest outbreaks or vector-borne diseases. (13) (p7) Various methods can be used to describe disease risk. One commonly used index is called the Entomologic Risk Index (ERI), an indicator of the number of infected ticks that a person might come into contact with over a set distance. The ERI is calculated as the number of infected ticks collected over a 1,000-meter drag (described below). Accurate ERIs are obtained by testing ticks for pathogens to determine tick infection rate. Public health officials can use indices like the ERI in public education efforts and to determine if, when, and what control measures should be implemented. (13) (p7)

That collapses military readiness

Peterson et al, masters in entomology qualifications of other authors: Medical Entomologist/epidemiologists, **2015** (Wade, “Tick-borne disease surveillance”, published in U.S. Army Medical Department Journal, jan-march edition, Academic OneFile)//roetlin

Ticks are one of the major vectors of disease that threatens **military personnel**, families, and civilian employees on US military installations. (25) The presence of tickborne disease in military personnel, including our military working animals, **may result in the loss of training days, decreased force strength, and may adversely affect unit **readiness and effectiveness.**** Tick-borne disease also affects **DoD civilians and the families** of our troops. **Soldier and unit readiness may be affected when family members and companion animals are sickened by TBDs.** The **information gained from tick surveillance regarding tick vectors, disease incidence, and pathogen prevalence is invaluable.** It allows medical personnel to educate personnel regarding tick-bite and TBD **recognition and prevention.** Tick surveillance information also enables leaders to make decisions regarding the application of safety and control measures during training and operations to prevent TBDs. As with any disease, prevention of TBDs is highly preferable to treating the short- and long-term consequences once they occur. (1(p155))

Readiness solves lashout

Jack **Spencer, 2k**, Research Fellow in Nuclear Energy Policy at The Heritage Foundation's Roe Institute for Economic Policy Studies. “The Facts About Military Readiness” Sep. 15, 2k. accessed July 31, 2010 <http://www.heritage.org/Research/Reports/2000/09/BG1394-The-Facts-About-Military-Readiness/>

Military readiness is vital because declines in America's military readiness **signal to the rest of the world that the United States is not prepared to defend its interests.** Therefore, potentially hostile nations will be more likely to **lash out** against American allies and interests, inevitably leading to U.S. involvement in combat. **A high state of military readiness is more likely to deter potentially hostile nations** from acting aggressively in regions of vital national interest, thereby preserving peace.

Disease Turn – A2 Privacy

Aggregated data is good – doesn't hurt privacy and facilitates effective treatment

Hansson et al 12 (Mats, Centre for Research Ethics & Bioethics at Uppsala University; Bengt Simonsson, Department of Medical Sciences at Uppsala University; Nils Feltelius, The Swedish Medical Products Agency; Joanna Forsberg, Centre for Research Ethics & Bioethics at Uppsala University; Joerg Hasford, Institut for med Informationsverarbeitung, “Medical registries represent vital patient interests and should not be dismantled by stricter regulation,” July 2012, The International Journal of Cancer Epidemiology, Detection, and Prevention, p. 3-4)//JL

Development of **medical registries with sharing of data is intrinsic for the protection of patient benefits and patient safety.** If, linked to the medical record, and used also for clinical decision making in dialogue with the patient the benefit and legitimacy of clinical registries might increase even more. **The patient** in our view **should have the right to quality assured medical treatment** and care and the clinicians and hospitals should have a corresponding duty to document relevant quality

measures for long term follow up of treatment. There is a well-recognized duty to document at the individual patient level but today there is a lack of systematic collection and analysis of aggregated registry data. It was objected by one reviewer that registries for quality assurance are seldom considered a problem from a data inspection point of view, because the exact use of data is clearly specified at outset and the registries are used for the same, usually repetitive quality assurance analyses while research implies that new questions are being raised as science develops. However, there is an increasing awareness of the need for aggregated data for quality assessments and drug efficacy/safety assessments. Recent developments in genomics in fact blur the traditional line between quality assurance and research through the rapidly increasing possibilities to identify genotypes as well as environmental factors regulating the treatment benefit/risk scenarios. It is actually strange that the demand of mandatory quality assurance that is common in so many other areas in society is not implemented as rigorously in health care where lives are at stake each day. Furthermore, in order to assure the patient the best medical treatment available at each time research based on those registries is necessary and should in principle be approved and supported. From the patient's perspective there is no conflict between the interest of documentation in a medical record, the interest of follow-up and long-term assessment through medical registries (whether local, national or collaborative on a global level) and the interest of receiving the at each moment best available treatment based on research. This, we believe, holds not only for rare diseases like CML but also for all medical treatment.

Registries don't hurt privacy and are key to solve diseases – empirics prove
Hansson et al 12 (Mats, Centre for Research Ethics & Bioethics at Uppsala University; Bengt Simonsson, Department of Medical Sciences at Uppsala University; Nils Feltelius, The Swedish Medical Products Agency; Joanna Forsberg, Centre for Research Ethics & Bioethics at Uppsala University; Joerg Hasford, Institut for med Informationsverarbeitung, “Medical registries represent vital patient interests and should not be dismantled by stricter regulation,” July 2012, The International Journal of Cancer Epidemiology, Detection, and Prevention, p. 3-4)//JL

The EUTOS for CML Registry clearly illustrates the benefits of aggregated, long-term clinical data for the assessment of drug effectiveness, in particular for orphan diseases but the same logic applies to all diseases, i.e. the more standardized, relevant and validated data available in quality registries, the better. Although values such as autonomy and privacy are important and should be safeguarded, it must be kept in mind that these registries exist for the good of patients and therefore it seems inconsistent and even unethical to hinder their optimal utilization. Transparency and safeguarding personal integrity are necessary to preserve trust but rules and legislations to protect integrity should not prevent the development of registries and performance of clinical trials in both national and transnational collaborations. That would be detrimental to vital patient interest of reaping the benefits of collaborating with others.

Systemic data collection over a wide range of health issues is inevitable and required for a wide range of issues --- the plans reversal is bad --- it's a linear case turn

Gostin, an internationally recognized scholar in law and public health, professor of Law at Georgetown University; Professor of Public Health at the Johns Hopkins University; and the Director of the Center for Law & the Public's Health at Johns Hopkins and Georgetown Universities, 2001 – (Lawrence, “Health Information: Reconciling Personal Privacy with the Public Good of Human Health”, published in Healthcare Analysis vol 9,

A health care system supported by data on almost any relevant subject, accessible to a diverse and significant number of users, is an integral part of the vision for the health care system. Plans for

the systematic collection, storage, use, and dissemination of a huge volume of uniform data sets in electronic form are already under way and have an **aura of inevitability**. This new health information infrastructure is the subject of reports published by the Congressional Office of Technology Assessment (Congressional Office of Technology Assessment, 1993, 1988, 1986), the General Accounting Office (Information Management and Technology Division, General Accounting Office, 1993a, 1993b, 1991), the National Academy of Sciences (Donaldson and Lohr, 1994), the Department of Health and Human Services (Task Force on Privacy, U.S. Dep't of Health and Human Servs., 1993; Task Force on the Privacy of Private Sector Health Records, U.S. Dep't of Health and Human Servs., 1995), the Physician Payment Review Commission (Physician Payment Review Comm'n, Annual Report to Congress, 1994, 1993, 1992) 322 and the Centers for Disease Control and Prevention.¹ The U.S. Department of Health and Human Services issued final regulations on health information privacy in 2001 (Gostin, 2001). Contrary to the assertions of some privacy advocates, **powerful reasons exist for the broad collection and use of health data**. High quality data are needed to help consumers make informed choices among health plans and providers, to provide more effective clinical care, to assess the quality and cost effectiveness of health services, to monitor fraud and abuse, to track and evaluate access to health services and patterns of morbidity and mortality among underserved populations, and to research the determinants, prevention, and treatment of disease.

Surveillance is key to solve economy—saves money, resources, and labor

Mirza et al 13 (Nabila, Tera Reynolds, Michael Coletta, Katie Suda, Ireneous Soyiri, Ariana Markle, Henry Leopold, Leslie Lenert, Erika Samoff, Alan Siniscalchi, and Laura Streichert researchers and analysts for OJPHI, “Steps to a Sustainable Public Health Surveillance Enterprise A Commentary from the International Society for Disease Surveillance” <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC3733763/> July 2013 JM)

Recognize systematic and ongoing public health surveillance as a core public health function that is essential for population health, economic stability, and national security. Public health surveillance data is the foundation of public health programs and is required for a number of purposes, including: to demonstrate the size and impact of the public health problem being addressed by a program; to identify the population groups to which additional prevention efforts should be directed; to determine whether the problem is growing in size or abating; to provide feedback to data providers; and as part of an overall program evaluation strategy. The significant health impacts and economic costs of disease outbreaks illustrate the critical importance of effective public health surveillance and rapid response, as well as the cost of inaction [11]. Table 1 provides examples of the health and financial burdens posed by some naturally occurring and intentional infectious disease outbreaks. The values reported in Table 1 do not fully reflect additional indirect costs of diseases and their potentially crippling effects on a community, nor do they address costs that are underreported/ unreported due to lack of data. Higher rates of illness, for example, can lead to lower worker productivity [11], while premature mortality can reduce the size of the labor force, both of which have economic ramifications. There is growing evidence that these **economic and societal costs can be mitigated by surveillance systems that are stable**; a stable system provides the best foundation for identifying whether the problem being addressed is getting bigger or smaller or disproportionately affecting a section of the population, etc., while still allowing flexibility to provide useful information quickly about emerging issues. The optimum mix of stability and flexibility will depend on the purpose(s) of surveillance and the particular health condition under surveillance. For example, in the case of SARS, an effective surveillance system has the potential to decrease the size of an epidemic by one-third and the duration by 4 weeks, with significant cost savings [25]. Another study found that the early detection of an outbreak of highly infectious bacterial meningitis saved approximately \$2 for every dollar invested in infectious disease surveillance [26]. Yet another evaluation of surveillance practice found that technological improvements in a sentinel influenza-like illness (ILI) surveillance system in Virginia saved over \$9,500 (1,992 hours) in staff-time during the 2007-2008 influenza seasons [27]. Ongoing surveillance can also inform the design and evaluation of prevention and intervention programs in order to control the escalating costs associated with chronic diseases in the U.S. and abroad [28]. Some experts forecast that chronic disease prevention programs could save up to \$48.9 billion per year by 2030 [29], while others predict applying electronic medical record implementation and networking to the prevention and management of chronic disease will exceed the currently projected \$81 billion in annual savings [30].

Bioterror Links

More surveillance is key to solve the aff impacts

White House 12 (The White House, from the President of the United States Barak Obama, “NATIONAL STRATEGY FOR BIOSURVEILLANCE”

https://www.whitehouse.gov/sites/default/files/National_Strategy_for_Biosurveillance_July_2012.pdf July 31 2012 JM)

A well-integrated, national biosurveillance enterprise is a national security imperative. Our ability to detect quickly and characterize a potential incident of national significance that affects human, animal, or plant health is of paramount importance. Rapid detection and enhanced situational awareness are critical to saving lives and improving incident outcomes, whether the result of a bioterror attack or other weapons of mass destruction (WMD) threat, an emerging infectious disease, pandemic, environmental disaster, or a food-borne illness. Beyond our need to protect domestic interests, and because health threats transcend national borders, the United States also plays a vital role within an international network of biosurveillance centers across the globe. For years, there have been dedicated efforts to promote and strengthen biosurveillance capabilities. There exists a strong foundation of capacity arrayed in a tiered architecture of Federal, State, local, tribal, territorial, and private capabilities. We can strengthen the approach with focused attention on a few core functions and an increased integration of effort across the Nation. In these fiscally challenging times, we seek to leverage distributed capabilities and to add value to independent, individual efforts to protect the health and safety of the Nation through an effective national biosurveillance enterprise. A key to improving all-hazards incident management is to focus efforts on collecting, analyzing, and disseminating information to facilitate timely decisionmaking, whether a health incident is a naturally occurring phenomenon, accidental, or deliberate in nature. From the individual, to primary care providers, to hospital practitioners, to state and local health officers, to Federal entities responsible for health emergency response, to the President of the United States, there exists an imperative to identify incidents early and to make decisions swiftly to save lives, even amidst great uncertainty. The goal is to achieve a well-integrated national biosurveillance enterprise that saves lives by providing essential information for better decisionmaking at all levels. Our Strategy is to integrate and enhance national biosurveillance efforts to answer specific key questions that guide decisionmaking in times of crisis: enable more rapid detection and foster improved situational awareness by further extending a dynamic, distributed national network of expertise and capabilities; and put into practice new thinking to facilitate decisionmaking processes in conditions of significant ambiguity. This enhanced national biosurveillance capability will be applied broadly to identify and understand potential human, animal, or plant health impacts resulting from chemical, biological, radiological, and nuclear (CBRN) and environmental incidents, as well as influenza and other public health trends, all of which may also be leveraged in the service of global health efforts. We must be resolved to strengthen life-saving biosurveillance capabilities within our existing resources. We can do this by leveraging more effectively our existing national network of expertise and capabilities, and through targeted enhancements that provide benefits across the enterprise. There are no higher priorities than the health, well being, and security of the American people.

Outbreak reaction plans require the necessary data in real time to work effectively

[Lindsey **Thomas**, Professor @ UC Santa Barbara “Pandemics of the future: Disease surveillance in real time” 2014]

In 2013, the World Health Organization (WHO) published a document on the 2009 H1N1 influenza pandemic entitled Evolution of a Pandemic. This document traces the disease outbreak from April 2009 to August 2010 and documents how the WHO responded to the crisis. The document particularly emphasizes the importance of preparedness plans to mitigating the effects of the pandemic: it claims that investment “in developing national and regional pandemic preparedness plans” by WHO member nations had “paid major dividends” and that these plans “helped make the world better prepared to cope with public health emergencies” (WHO 2013a: 9, 43). Such plans involved the “active surveillance of diseases and public health events” and rapid response to “unexpected, internationally-spreading events” (WHO 2013c). Active surveillance and rapid response are important features of what’s known as global health security, which emphasizes preparing for pandemics before they occur through the adoption of international frameworks for pandemic response. These frameworks, or preparedness plans, allow public health officials to react quickly, in real time, to mitigate the effects of pandemics when they occur (Lakoff 2007). Global health security can be seen as part of a

larger program of preparedness, a security paradigm that emphasizes planning for future catastrophic events in the present. Preparedness, which moved to the center of United States national security policy after September 11, 2001, has also been adopted by international organizations like the WHO in order to secure against potentially catastrophic pandemics. It is one among several modes of what Ben Anderson has called “anticipatory action”: these modes, which also include precaution and preemption, are all security paradigms that focus on making possible futures available in the present (Anderson 2010; also see Grusin 2010). Preparedness emphasizes institutional readiness and emergency management, treating a variety of potential catastrophic threats—terrorist attacks, hurricanes, pandemics—under the same rubric. Because the probability and severity of such catastrophes cannot be calculated, preparedness focuses not on trying to prevent such events but rather on preparing officials and experts for their eventual emergence. A variety of techniques and technologies make such preparation possible. For global health security, this has involved not only the creation of international preparedness plans, but also of international disease surveillance systems that monitor emerging infectious disease outbreaks. These systems allow public health officials to collect and manage huge amounts of data on disease outbreaks as they occur. Such systems attempt to harness the power of big data to get ahead of the catastrophic pandemic that is coming, not necessarily in order to prevent it from happening (because we can’t), but rather to better deal with its effects (de Goede and Randalls 2009; Lakoff and Collier 2010).

Health surveillance exists for a reason --- terror results in unique risks to public health that this surveillance remedies --- specifically checks against bioterror

Gostin, an internationally recognized scholar in law and public health, professor of Law at Georgetown University; Professor of Public Health at the Johns Hopkins University; and the Director of the Center for Law & the Public’s Health at Johns Hopkins and Georgetown Universities, November 2001 – (Lawrence, “Public Health Law In An Age Of Terrorism: Rethinking Individual Rights And Common Goods”, published on HealthAffairs vol 21 no. 6)//roetlin

The balance between individual interests and common goods needs to be recalibrated in an age of terrorism. Public health agencies should have a robust infrastructure to conduct essential public health services at a level of performance that matches evolving threats to the health of the public.

This includes a well-trained workforce, electronic information, surveillance, and laboratory capacity. This paper explains modern efforts at public health law reform: a Model Public Health Statute and the Model State Emergency Health Powers Act (MSEHPA), which has been enacted wholly or in part by nineteen states and the District of Columbia. Next, the paper shows why existing public health laws provide a weak foundation for public health practice. Finally, the paper offers a systematic defense of MSEHPA, which has galvanized the public debate around the appropriate balance between public goods and individual rights.

PROLOGUE: Following the 2001 anthrax attacks, an outbreak of concern about the inadequacies of the public health infrastructure caught the nation in the grip of a profound ambivalence about what we expect from government. For the past twenty years distrust of public institutions has severely dampened public health spending and so dominated the political landscape that even the Institute of Medicine’s stern warning about deterioration of the infrastructure in 1988 did not generate renewed investment. Then, in the wake of the anthrax scare, the refrain suddenly became, “Why aren’t we better prepared?” The following essay by legal scholar Lawrence Gostin suggests that our collective confusion about public health goes deeper than dollars. To perform its essential functions, the public health system needs legal authority to act. Yet most of its statutory foundations, which lie primarily in the domain of state government, have not been updated for half a century. Even before last fall’s terrorist attacks, efforts were under way to develop new model laws for the states. The focus of the model legislation is to confer enough authority that public health agencies can mount adequate preparations, obtain information, and act in an emergency to protect those who are threatened. But some sacrifice of personal rights and freedoms is necessary to achieve this end, and these legal initiatives have been controversial. “In a country so tied to rights rhetoric..., any proposal that has the appearance of strengthening governmental authority was bound to travel in tumultuous political waters,” Gostin concludes. Three Perspectives that follow Gostin’s paper highlight the extent of the disagreement that still exists, nearly a year after the model law was last revised. Gostin is ideally suited to clarify the difficult issues involved. He is a professor of law at Georgetown University; a professor of public health at the Johns Hopkins University; and director of the Center for Law and the Public’s Health, which drafted the Model State Emergency Health Powers Act at the request of the Centers for Disease Control and Prevention. In defense of a model act that was written to bring public health law into the modern age. Public and scholarly discourse in the late twentieth century became highly oriented toward “rights.” The political community stressed the importance of individual freedoms rather than the health, security, and well-being of the community. The salience of individualism could be seen on both sides of the political spectrum. The ideological left favored a set of personal interests,

principally autonomy, privacy, and liberty. This meant that individuals should be free to make choices, restrict the flow of health information, and have unfettered movement, without regard to the needs and desires of the wider community. The ideological right favored a set of proprietary interests, principally the freedom to contract, conduct business, use and develop property, and pursue a profession. This meant that entrepreneurs should be permitted to engage in free enterprise without the fetters of, for example, occupational health and safety regulations, inspections and products liability, zoning and nuisance abatements, and licenses. In this civil and property rights society, the tone has been distinctly antigovernment. The State has been perceived as inefficient, bureaucratic, and burdensome. Citizens have opposed taxation and broad health and welfare spending as well as oppressive regulation. From a funding perspective, this has meant that health dollars have been allocated primarily to advanced biotechnology and health care, which serve the needs of individual patients, particularly those who can afford private health insurance. Funding for traditional prevention and population-based services represents only a small fraction of health spending, estimated at around 1 percent at the state level and less than 5 percent at the federal level.¹ As a result of chronic underspending, the public health infrastructure is badly deteriorated.² Public health agencies lack the capacity to conduct essential public health services at a level of performance that matches the constantly evolving threats to the health of the public. Critical components of that infrastructure include a well-trained workforce, electronic information and communications systems, rapid disease surveillance and reporting, laboratory capacity, and emergency response capability.³ The public health law infrastructure is equally deficient. The law establishes the mission, functions, and powers of public health agencies. Yet public health laws are highly antiquated, after many decades of neglect. Very little consideration has been given to modernizing these laws to reflect advances in public health practice and constitutional law. Reform of public health law is essential to ensure that public health agencies have clear missions and functions, stable sources of financing, adequate powers to avert or manage health threats, and restraints on powers to maintain respect for personal rights and liberties. The balance between individual interests and common goods needs to be recalibrated in an age of terrorism. The attacks on the World Trade Center and Pentagon on 11 September 2001 and the subsequent dispersal of anthrax spores through the U.S. postal system reawakened the public to the importance of public health, safety, and security.⁴ The president's 2003 budget reflects changing priorities, with an influx of funding to prevent and respond to bioterrorism.⁵ However, even in this budget, disproportionate funding is devoted to biotechnology rather than to basic prevention and population-based services.⁶

Bioterrorism – Link Uniqueness

Current electronic system effective—economy, disease prevention and treatment

Freudenheim 12(Milt, reporter for the NY times, “Fast Access to Records Helps Fight Epidemics”

http://www.nytimes.com/2012/06/19/health/states-using-electronic-medical-records-to-track-epidemics.html?_r=0 6/19/12 JM)

Public health departments around the country have long scrutinized data from local hospitals for indications that diseases like influenza, tuberculosis, AIDS, syphilis and asthma might be on the rise, and to monitor the health consequences of heat waves, frigid weather or other natural phenomena. In the years since 9/11, this scrutiny has come to include signs of possible bioterrorism. When medical records were maintained mainly on paper, it could take weeks to find out that an infection was becoming more common or that tainted greens had appeared on grocery shelves. But the growing prevalence of electronic medical records has had an unexpected benefit: By combing through the data now received almost continuously from hospitals and other medical facilities, some health departments are spotting and combating outbreaks with unprecedented speed. More than one-third of the nation's 5,000 acute care hospitals now use electronic medical records, and the share of primary care doctors using them has doubled to 40 percent in the last two years, said Dr. Farzad Mostashari, the Obama administration's national coordinator for health information technology. The technology's spread is helping “officials faced with events of public health significance to know sooner, act faster and manage better,” said Dr. Seth Foldy, a senior adviser to the Centers for Disease Control and Prevention. In February, public health officials in Michigan noted an increase in electronic reports from clinical laboratories indicating E. coli cases in several counties. Eleven patients were identified, including six who were hospitalized. In less than a week, officials had enough evidence to warn the public that the infection appeared to be linked to clover sprouts in food at the Jimmy John's sandwich chain, said James Collins, director of the communicable diseases division at the state's Department of Community Health. The chain quickly removed the sprouts, and by April, the 11-state outbreak was over. “You can see it happen in real time and zero in on the cause faster,” said David A. Ross, director of the Public Health Informatics Institute, a nonprofit organization that helps write digital standards. “That can save both lives and money.” In Massachusetts, the data are being used to prevent hepatitis infections. Medical labs transmit more than 100,000 electronic reports annually to the state health department. Names are confidential, though available to certain medical personnel. The agency's software sorts through the reports and every year identifies more than 1,500 cases of hepatitis B for follow-up. Infected women ages 14 to 44 get special attention. Health officials alert their medical providers to infections; they in turn identify

anyone who is pregnant or recently gave birth. Their newborns are vaccinated and then monitored. Without that prompt protection, those babies risk lifelong infection with hepatitis B and its consequences, liver disease, cirrhosis and cancer. With paper records, locating at-risk babies would take weeks or months, said Kevin Cranston, director of the infectious disease bureau at the Massachusetts Department of Public Health. "That would be too late to be of benefit to the newborn," he said. Although the C.D.C. recommends prompt hepatitis B vaccination for all newborns, nationally, four in 10 did not get that protection, according to an agency report last year.

When the H1N1 flu pandemic broke out in 2009, Wisconsin laboratories generated thousands of positive H1N1 test results, said Dr. Foldy, who was then chief medical officer of the Wisconsin Health Information Exchange. "We were able to route this electronically into our case management system to alert public health nurses," Dr. Foldy said. "Because we were getting near real-time information from hospitals, we could see that even with the large numbers of emergency room visits for flulike symptoms, very few were being admitted as inpatients," he added.

This provided an early glimpse of how the pandemic was rising and then declining. Public health officials in Marion County, Ind., were among the first to sound the all-clear in the flu outbreak by tracking the drop in cases from electronic reports from hospitals and laboratories, forwarded by the Indiana Health Information Exchange. More than 150 health information exchanges are now operating or being set up across the country. (These differ from the insurance exchanges mandated under the Affordable Care Act.) Each exchange receives electronic medical data from clinical laboratories, hospital admissions offices and emergency rooms and relays it to relevant public health agencies. Health care providers are required to provide pertinent data electronically to local and state public health officials, who feed into a national digital network coordinated by the C.D.C. in Atlanta. Using an electronic records registry, the Urban Health Plan, a network of clinics in the South Bronx and Queens, was able to triple its caseload of mostly young, low-income asthma patients to 8,100. "We are in the heart of asthma country," said Dr. Samuel De Leon, a lung specialist who is Urban Health's chief medical officer. His group compared spending per patient with a Medicaid managed care plan in the city that did not then have electronic monitoring. Using its record system to keep tabs on its patients, Dr. De Leon said, Urban Health was able to reduce emergency room visits and hospital admissions. "For children, we saved about 39 percent of the cost of care. For adults, savings were in the 25 percent range," he said. New York City health officials began using electronic medical records six years ago. After reviewing the incoming medical data, city health department officials recently discovered that smoking rates are a little higher in Staten Island than in the other boroughs. Now, instead of sending trainers on routine visits to every primary care doctor to help them learn to use electronic records to improve care, the visits are concentrated to help those physicians whose patients need it most. "We can identify and monitor trends in high-priority diseases and health problems by geography and groups," said Dr. Amanda Parsons, a deputy commissioner at the city's Department of Health and Mental Hygiene. "We can tell where things are improving or getting worse.

Bioterrorism – Impact Uniqueness

Synthetic biology makes bioterror inevitable- creates means and motive

Rose, 14 -- PhD, recognized international biodefense expert

[Patrick, Center for Health & Homeland Security senior policy analyst & biosecurity expert, National Defense University lecturer, and Adam Bernier, expert in counter-terrorism, "DIY Bioterrorism Part II: The proliferation of bioterrorism through synthetic biology," CBRNePortal, 2-24-14, www.cbrneportal.com/diy-bioterrorism-part-ii-the-proliferation-of-bioterrorism-through-synthetic-biology/, accessed 8-16-14]

In Part I of this series, we examined how the advancement of **synthetic biology has made bio-engineering accessible to the mainstream biological community.** **Non-state actors** who wish to employ biological agents for ill intent **are sure to be aware of how tangible bio-weapons are becoming as applications of synthetic biology become more affordable** and the probability of success increases with each scientific breakthrough. The willingness of non-state actors to engage in biological attacks is not a new concept; however, the past biological threat environment has been subdued compared to that of conventional or even chemical terrorism. The frequency and deadliness of biological attacks has, thankfully, been limited; much of which can be attributed to the technical complexity or apparent ineptitude of the perpetrators developing biological weapons. **Despite the infrequency and ineffectiveness of biological attacks in the last four decades, the threat may be changing with the continued advancement of synthetic biology applications.** **Coupled with the ease of information sharing and a rapidly growing do-it-yourself-biology (DIYbio) movement** (discussed in Part I), **the chances of not only more attacks, but potentially more deadly ones will inevitably increase.** During the last half century **terrorist organizations have consistently had an interest in using biological weapons** as a means of attacking their targets, but only few have actually made a weapon and used it. The attraction is that terrorist activities with biological weapons are difficult to detect and even more difficult to attribute without a specific perpetrator claiming responsibility. Since 1971 there have been more than 113,113 terrorist attacks globally and 33 of them have been biological. The majority of bio-terrorism incidents recorded during the year 2001 (17 of the 33); before 2001 there were 10 incidents and since 2001 there were 6 (not counting the most recent Ricin attacks). The lack of a discernable trend in use of bio-terrorism does not negate the clear intent of extremist organizations to use biological weapons. In fact, the capacity to harness biological weapons

more effectively today only increases the risk that they will successfully be employed.¶ **The landscape is changing**: previously the instances where biological attacks had the potential to do the most harm (e.g., Rajneeshees cult's Salmonella attacks in 1984, Aum Shinri Kyo's Botulinum toxin, and Anthrax attacks in the early 90's) included non-state actors with access to large amounts of funding and scientists. Funding and a cadre of willing scientists does not guarantee success though. **The assertion was thus made that biological weapons are not only expensive, they require advanced technical training to make and are even more difficult to effectively perpetrate** acts of terrorism with. While it is difficult to determine with certainty whether the expense and expertise needed to create biological weapons has acted as a major deterrent for groups thinking of obtaining them, many experts would argue that the cost/expertise barrier makes the threat from biological attacks extremely small. This assertion is supported by the evidence that the vast majority of attacks have taken place in Western countries and was performed by Western citizens with advanced training in scientific research.¶ **In the past decade the cost/expertise assertion has become less accurate.** Despite the lack of biological attacks, **there are a number of very dangerous and motivated organizations that have or are actively pursuing biological weapons.** The largest and most outspoken organization has been the global Al Qaeda network, whose leaders have frequently and passionately called for the development (or purchase) of Weapons of Mass Destruction (WMD). The principal message from Al Qaeda Central and Al Qaeda in the Arabian Peninsula (AQAP) has included the call to use biological WMDs to terrorize Western nations. Al Qaeda has had a particular focus on biological and nuclear weapons because of their potential for greatest harm. Osama Bin Laden, Ayman al-Zawahiri and Anwar al-Awlaki have all called for attacks using biological weapons, going so far as to say that Muslims everywhere should seek to kill Westerners wherever possible and that obtaining WMDs is the responsibility of all Muslims. Before the US-led invasion of Afghanistan, Al Qaeda had spent significant funds on building a bio-laboratory and had begun collecting scientists from around the world; however, the Afghanistan invasion and subsequent global War on Terrorism is thought to have disrupted their capabilities and killed or captured many of their assets. Despite the physical setbacks, this **disruption does not appear to have changed the aggressive attitude towards obtaining WMDs** (e.g., more **recently U.S. Intelligence has been concerned about AQAP attempting to make Ricin**).¶ **The emergence of synthetic biology and DIYbio has increased the likelihood that Al Qaeda will succeed in developing biological WMDs. The low cost and significantly reduced level of necessary expertise may change how many non-state actors view biological weapons as a worthwhile investment.** This is not to say that suddenly anyone can make a weapon or that it is easy. To the contrary making an effective biological weapon will still be difficult, only much easier and cheaper than it has been in the past.¶ **The rapid advancements of synthetic biology could be a game changer, giving organizations currently pursuing biological weapons more options, and encouraging other organizations to reconsider their worth.** Because **the bar for attaining biological weapons has been lowered and is likely to continue to be lowered** as more advances in biological technology are made, it is important that the international community begin to formulate policy that protects advances in science that acts to prevent the intentional misuse of synthetic biology. **Disregard for this consideration will be costly. A successful attack with a potent biological weapon, where no pharmaceutical interventions might exist, will be deadly and the impact of such an attack will reverberate around the globe because biological weapons are not bound by international borders.**

Doctor-Patient Trust - Data Breach Inevitable

Patient-Doctor relations low now

Appari and Johnson 10, (Ajit, Eric, Tuck School of Business, "Information security and privacy in healthcare: current state of research," Dartmouth, 4, 2010, <http://www.ists.dartmouth.edu/library/501.pdf>)/IB

Healthcare information systems are largely viewed as the single most important factor in improving US healthcare quality and reducing related costs. According to a recent RAND study, the USA could potentially save \$81B annually by moving to a universal Electronic Health Record (EHR) system (Hillestad et al., 2005). Not surprisingly, recent government initiatives have pushed for wide-scale adoption of universal EHR by 2014 (Goldschmidt, 2005). Yet, IT spending in healthcare sector trails that of many other industries, typically 3–5% of revenue, far behind industries like financial services where closer to 10% is the norm (Bartels, 2006). Anecdotal evidences from recent years suggest that a lack of adequate security measures has resulted in numerous data breaches, leaving patients

exposed to economic threats, mental anguish and possible social stigma (Health Privacy Project, 2007). A recent survey in the USA suggests that 75% of patients are concerned about health websites sharing information without their permission (Raman, 2007). Possibly, this patient perception is fuelled by the fact that medical data disclosures are the second highest reported breach (Hasan and Yurcik, 2006). In response to these increasing threats to health information and privacy, new regulations at both the state and the federal level have been proposed in the USA, e.g., Health Insurance Portability and Accountability Act (HIPAA).

Medical identity theft is an expanding issue that current legal protections fail to prevent

Terry 14 (Nicolas P. Terry. “Big Data Proxies and Health Privacy Exceptionalism.” 2014. P. 8-10 https://www.ftc.gov/system/files/documents/public_comments/2014/01/00004-89091.pdf)/EMerz

With a legislative requirement to notify a data subject of a data breach, the data custodian’s duty is triggered upon loss of control of the data, making a breach notification rule the definitive downstream protective model. Breach notification laws proliferated because of the dramatic increase in identity theft.²⁷ Although all federal agencies are subject to a robust breach notification policy,²⁸ federal legislation to cover private parties has been proposed but not yet passed.²⁹ In contrast, and in the decade following California’s 2002 example, forty-six states and the District of Columbia have enacted breach notification laws.³¹ **More recently attention has turned to medical identity theft.**³² It has been argued that medical identities are highly valued by criminals because of the comprehensive data that are contained in, for example, a stolen electronic medical record (EMR).³³ A 2006 report from The World Privacy Forum focused attention on the issue,³⁴ and in 2009 the Office of the National Coordinator for Health Information Technology (ONC) commissioned a study on the subject from Booz Allen Hamilton.³⁵ Today both HHS’s Office of Inspector General³⁶ and the Federal Trade Commission ³⁷ web sites have information pages concerning medical identity theft. According to a 2012 Ponemon Institute study, 52% of health care organizations experienced one or more incidents of medical identity theft. The 2013 Survey on Medical Identity Theft (also conducted by the Ponemon Institute) **estimated a 19 per cent increase in medical identity theft victims year-to-year.**³⁹ Relatively few states include health data within their definition of the personal information subject to breach notification. Others, true to the US sector-based approach to privacy regulation, exclude data covered by, say, HIPAA or the Gramm-Leach-Bliley Act of 1999 (GLBA).⁴¹ HITECH introduced two closely related breach notification regimes. The first, introduced by section 13402, requires HIPAA covered entities and HIPAA BAs to provide notification following a breach of “unsecured protected health information.”⁴⁴ The second, courtesy of section 13407, imposes a similar duty on vendors of personal health records (PHR) ⁴⁵ and their third party service providers ⁴⁶ with regard to “Unsecured PHR Identifiable Health Information.”⁴⁷ Rulemaking authority and enforcement are vested in the HHS regarding the former and the (Federal Trade Commission) FTC regarding the latter. **The regulation of PHRs is a limited (but ultimately unsuccessful) attempt to expand health data protection** from a narrow sector provider based model (e.g., information held by a covered entity) to a data-type based model. Unfortunately it stopped short of a broad datatype model (e.g., by protecting the data itself held by any data custodian), limiting the custodian cohort to PHR providers.⁴⁹ It is an interesting question why HITECH added a breach notification data protection model. Certainly medical identity theft was being raised as an issue.⁵⁰ As likely this rethinking of the approach to data protection may have been triggered by the expansion of personal health records services offered by non-health companies such as Google Inc.⁵¹ Maybe the HITECH architects could not agree on a way to open up the broader and established HIPAA model to apply to nontraditional

custodians of health data (BAs aside) and so had to settle on a new but limited data protection model as the legislative alternative. Notwithstanding, the result was that HITECH authorized regulatory activity by the FTC that would mirror the work of HHS in the more narrowly defined, traditional health space. Ironically, however, by the time HITECH was passed the PHR business was slowing and Google Health, the PHR poster-child, soon would be closed.⁵²

Healthcare data breaches are inevitable

Appari and Johnson 10, (Ajit, Eric, Tuck School of Business, “Information security and privacy in healthcare: current state of research,” Dartmouth, 4, 2010, <http://www.ists.dartmouth.edu/library/501.pdf>)/IB

These attackers may have resources ranging from modest financial backing and computing skills to a well-funded infrastructure. Additionally, the nature of the threats typically depends on the technical capability of the attackers. Moreover, with the growing underground cyber economy (Knapp and Boulton, 2006), an individual possessing adequate financial resources and with the intent to acquire data may be able to buy the services of sophisticated hackers to breach healthcare data.

Government Access to records greatly expands the risk of data disclosure

Appari and Johnson 10, (Ajit, Eric, Tuck School of Business, “Information security and privacy in healthcare: current state of research,” Dartmouth, 4, 2010, <http://www.ists.dartmouth.edu/library/501.pdf>)/IB

Although health information privacy has been widely discussed in the social science and business press (Etzioni, 1999), the academic literature lacks systematic investigation to identify and classify various sources of threats to information privacy and security. Recent policy-based studies (such as NRC, 1997; Rindfleisch, 1997) broadly categorise privacy threats, or source of information security, into two areas: 1 organisational threats that arise from inappropriate access of patient data by either internal agents abusing their privileges or external agents exploiting a vulnerability of the information systems 2 systemic threats that arise from an agent in the information flow chain exploiting the disclosed data beyond its intended use (NRC, 1997). Organisational Threats: These threats assume different forms, such as an employee who accesses data without any legitimate need or an outside attacker (hacker) that infiltrates an organisation’s information infrastructure to steal data or render it inoperable. At the outset, these organisational threats could be characterised by four components: motives, resources, accessibility and technical capability (NRC, 1997).

Government will leak private data

Appari and Johnson 10, (Ajit, Eric, Tuck School of Business, “Information security and privacy in healthcare: current state of research,” Dartmouth, 4, 2010, <http://www.ists.dartmouth.edu/library/501.pdf>)/IB

Recent studies suggest that the broad spectrum of organisational threats could be categorised into five levels, listed in increasing order of sophistication (NRC, 1997): • Accidental disclosure: Healthcare personnel unintentionally disclose patient information to others (e.g., e-mail message sent to wrong address or inadvertent web-posting of sensitive data). • Insider curiosity: An insider with data-access privilege pries upon a patient’s records out of curiosity or for their own purpose (e.g., a nurse accessing information about a fellow employee to determine possibility of a sexually transmitted disease or medical personnel accessing potentially embarrassing health information about a celebrity and transmitting it to the media). • Data breach by insider: Insiders access patient information and transmit it to outsiders for profit or revenge. • Data breach by outsider with physical intrusion: An outsider enters the physical facility either by coercion or forced entry and gains access to the system. • Unauthorised intrusion of network system: An outsider, including former employees, patients, or hackers, intrudes into an organisation’s network from

the outside to gain access to patient information or render the system inoperable. Systemic Threats: Etzioni (1999), in discussing the 'limits to privacy', observed that a major threat to patient privacy occurs, not from outside of the information flow chain, but from insiders who are legally privileged to access patient information. For example, insurance firms may deny life insurance to patients based on their medical conditions, or an employer having access to employees' medical records may deny promotion or terminate employment. Patients or payer organisations may incur financial losses from fraud including upcoding of diagnoses or for rendering medically unnecessary services.

They cant solve --- technological advances make illegal dissemination unpreventable
Ruebner and Reis, professor former professor of law at The *John Marshall* Law School, 1/1/2004 – (Ralph, Leslie, "Hippocrates to HIPAA: A Foundation for a Federal Physician-Patient Privilege, 77 Temp. L. Rev. 505 (2004)", published in the Temple Law Review at The *John Marshall* Law School)//roetlin

HHS commented on the inherent conflict between technology and privacy, in particular, the connection between the increasing use of interconnected electronic information systems in the health care context and the loss of health information privacy. 6 3 In doing so, HHS emphasized the fact that advances in technologies used to collect and disseminate patient health information have "reduced or eliminated many of the financial and logistical obstacles that previously served to protect the confidentiality of health information and the privacy interests of individuals." 6 4 Simply, the pervasiveness of and access to medical information in electronic form creates the likelihood that such information will be wrongfully disclosed or used in a manner that may harm the patient. 6 5 Technological advancements in information systems "may provide a reason for institutionalizing privacy protections in situations where the risk of harm did not previously justify writing such protections into law." 6 6

Health information data breaches inevitable now – triggers all aff links

New York Times April 2015 "Patients' Medical Records Under Threat From Data Breaches"
<http://www.nytimes.com/aponline/2015/04/14/health/ap-us-med-breached-health-records-.html>

Your private medical information is under threat. That's according to a study that found almost 30 million health records nationwide were involved in criminal theft, malicious hacking or other data breaches over four years. The incidents seem to be increasing. Compromised information included patients' names, home addresses, ages, illnesses, test results or Social Security numbers. Most involved electronic data and theft, including stolen laptops and computer thumb drives. The study didn't examine motives behind criminal breaches, or how stolen data might have been used, but cyber-security experts say thieves may try to use patients' personal information to fraudulently obtain medical services. Cases that didn't involve malicious intent included private health information being inadvertently mailed to the wrong patient. Hackings doubled during the study, from almost 5 percent of incidents in 2010 to almost 9 percent in 2013. Hackings are particularly dangerous because they can involve a high number of records, said Dr. Vincent Liu, the lead author and a scientist at Kaiser Permanente's research division in Oakland, California. "Our study demonstrates that data breaches have been and will continue to be a persistent threat to patients, clinicians, and health care systems," Liu said. The study appears in Tuesday's Journal of the American Medical Association. A JAMA editorial says there's evidence that the incidents are leading some patients to avoid giving doctors sensitive information about their health, including substance abuse, mental health problems, and HIV status. "Loss of trust in an electronic

health information system could seriously undermine efforts to improve health and health care in the United States," the editorial said. Patients should be alert to cyber threats, including "phishing" emails from hackers posing as doctors, hospitals or health insurance companies, said Lisa Gallagher, a cybersecurity expert at the Healthcare Information and Management Systems Society. Those messages require clicking on a link to get information, and patients should instead should call the purported sender to verify whether the email is legitimate, she said Patients should also double check doctor bills and other insurance company information. "Don't throw away your explanation of benefits. Take a look at them," Gallagher said. "If you see care that wasn't provided to you, or dates and names of providers that don't make sense, go to the provider and report that." For the study, Liu and colleagues analyzed an online database regulated by the U.S. Department of Health and Human Services and containing mandated reports of breaches in health information protected by federal privacy law. Over the four years, 949 data breaches were reported across the country. The numbers climbed annually, from 214 in 2010 to 265 in 2013. Nearly 60 percent involved theft.

Doctor-Patient Turst – Privacy Not Key

Patients don't actually expect privacy

Appari and Johnson 10, (Ajit, Eric, Tuck School of Business, "Information security and privacy in healthcare: current state of research," Dartmouth, 4, 2010, <http://www.ists.dartmouth.edu/library/501.pdf>)/IB

Bansal et al. (2007) developed a set of constructs based on utility theory and prospect theory as antecedents of trust formation and privacy concern that impact users' personal disposition to disclose their health information to online health websites. In particular, they reported that users' current health status, personality traits, culture, and prior experience with websites and online privacy invasions play a major role in users' trust_in the health website and their degree of privacy concerns. On the other hand, in a mail-based survey with adult patients in England, Campbell et al. (2007) found that about 28–35% of patients are neutral to their health information – such as age, gender, ethnicity, reason for treatment, medical history, personal habits impacting health, type of treatment obtained, side effects of treatment – being used by physicians for other purpose. Only about 5–21% of patients, however, expected to be asked for permission to use their information by their physicians. Similarly, only about 10% of the patients expected to be asked for permission if their doctors used their health information for a wide variety of purposes, including combining data with other patients' data to provide better information to future patients, sharing treatment outcomes with other physicians, teaching medical professionals and writing research articles about diseases and treatments.

No internal link – patients don't care

McCarthy 15 (Kevin McCarthy covers healthcare tech and policy regulations, "Why EHRs do not harm the doctor-patient relationship" 6/3/15 <http://www.nuemd.com/news/2015/06/03/ehrs-do-not-harm-doctor-patient-relationship>)

It's no secret that the road to widespread implementation of electronic health records has been a difficult one for some clinicians. While large providers may have had the capital to throw at a problem like staff training and new equipment purchases, small practices were faced with financial and operational issues that, while challenging, proved not to be as unsolvable as some critics had predicted. According to the U.S. Centers for Medicare and Medicaid Services, over 447,000 providers have implemented and been compensated for EHR systems in their offices.¶ Now that EHR software has become a large part of the medical industry, experts have turned their gazes back to an issue that dominated the discussion when federal agencies first started pushing the platform as reform alternative. The question of how EHRs affect the physician-patient relationship can seem simple at times - more screens separating clinicians from their patients can only seem wrong - but, as EHR Intelligence explained, the underlying factors may point to a different and more positive interpretation for EHRs in the workplace.¶ Office manners¶ The doctor-patient relationship goes all the way back to the days when house calls and personal physicians were only the domain of the super wealthy. Today, every patient has a right to expect their doctors to be open, polite, informative, and, most of all, confidential. Such a natural relationship fosters trust between both

parties, and when outpatient treatments are the only ones possible, this level of mutual respect is necessary for both sides to move toward a positive care outcome.¶ However, with the rise of EHRs, especially on mobile devices, creating a meaningful doctor-patient relationship isn't as easy as it used to be. In an interview with EHR Intelligence, James Avallone, director of physician research for Manhattan Research, explained that EHR use is most certainly up, but its impact on the personal dynamics between patients and doctors is much less clear.¶ "Whether it is too much or too little, it is difficult for us to say from our perspective," Avallone said. "In the past four to five years, we have seen a fair share of complaints in terms of the efficiency of EHRs and how [they are] changing bedside manners for physicians overall. I do think we are starting to see some efficiencies come about in terms of efficient use of these platforms and that includes at the point of care. It is certainly something that physicians are getting used to as it becomes more ingrained in their day-to-day behaviors. They have had more time to streamline workflow and that is something that we are seeing in terms of how these devices are being used at the point of care."¶ Avallone noted that research from a recent Manhattan study found that 66 percent of physicians self-reported as being more efficient with their EHRs than in the past. While part of this may be due to a greater sense of familiarity with the product and how to fit it into workflows, EHR vendors have also caught up with the trends of the day by developing software that intuitively meshes with physicians' daily tasks.¶ A minor annoyance¶ While EHRs may be an easy target for opponents of the technology, studies show that EHRs are not a top concern among physicians who are worried about losing the trust and goodwill of their patients.¶ According to a 2013 study published in Health Affairs, only 25.8 percent of physicians reported that EHRs were threatening the doctor-patient relationship. Administrative burdens like the ICD-10 transition and HIPAA compliance regulations, on the other hand, were noted by more than 41 percent of those surveyed. ¶ If industry experts are truly concerned about protecting the quality of the doctor-patient relationship, then EHR software should not be the primary focus. Instead, it should be highlighted during discussions with patients to show them just how powerful it can be. From there, patients may not care so much about the time doctors spend inputting their information into a piece of software that could save their lives.

Healthcare privacy is not key to trust

Dan **Munro** (Writer for Forbes and Quora specializing in healthcare related topics) November **2014** "Trust Trumps Privacy In Battle For Patient Health Data"

<http://www.forbes.com/sites/danmunro/2014/11/09/trust-trumps-privacy-in-battle-for-patient-health-data/>

There's no shortage of advocates on behalf of the "free your health data" movement. The keywords, of course, are "your," "health data" and "free" (as in donating your health data for the global benefit of clinical research). The latest demand was an article that appeared last week in Wired – You Should Share Your Health Data: Its Value Outweighs The Privacy Risk by Beth Seidenberg, MD (a partner at the venture firm Kleiner Perkins Caufield & Byers). Dr. Seidenberg's medical credentials are definitely compelling (including Chief Medical Officer of Amgen AMGN -0.82%), but it's always a red flag to me when a total stranger (especially one with medical credentials) boldly demands that I "should" do anything online – with my health – which includes my health data. While Dr. Seidenberg's demand is noble in the conclusion that we can all benefit from the clinical research, her argument is based squarely on the false premise that privacy is the largest gating factor in the reluctance of consumers (or patients) to share their health data. I'm sure that privacy is a reason for many, but it's certainly not for me. I know just how easy all health data can be breached – and wrote about it earlier this year when I logged onto the network of a 300+ bed hospital using just a browser and my desktop PC (here). It's not that the electronic door to the hospital was unlocked – or even open. There was simply no door at all. The only thing missing was a banner ad saying "Click here for free health data." The larger trend for health data breaches (including this year's 2nd largest ever – 4.5 million by CHS) is alarming. But risk of data breach – cloaked as 'privacy' – is not the issue. At least it's not mine. The issue I see is much larger – trust. Given the importance of getting this priority right, it's really tone deaf for anyone anywhere to demand that we do anything with our personal health data. Dr. Seidenberg's demand makes sense, of course, because the interests of venture capitalists are well aligned with many commercial interests in healthcare – much of which has been optimized around revenue and profits – not safety and quality. The lack of trust I see is clearly evident in

countless stories of courageous patients, battling openly (almost entirely at their own expense) for access to their health data. Privacy issues (and HIPAA) are often cited as the legal reason for prohibiting access, of course, but that's just an excuse. Absent data security (clearly evident) there is no privacy and the real reason masquerading behind these false claims isn't privacy protection – it's revenue protection. This isn't just hospitals. The data battle for many patients encompasses medical device manufacturers, pharmaceutical companies and electronic health record vendors too. Our collective rights as patients are entirely secondary – if at all. Here's one example that appeared just yesterday in the New York Times – Medical Records: Top Secret (by Elisabeth Rosenthal). The story outlines the continuing case of Mr. Drier – a patient Ms. Rosenthal wrote about previously who was billed \$117,000 after a 3-hour neck surgery. Mr. Drier's efforts to get his health record (for ongoing management of his health condition) resulted in this summary: The six-week ordeal included requests that needed to be made via regular mail, numerous phone calls, consent forms and an estimate for copying fees that totaled \$100. This was topped off by an actual visit to the hospital by Mr. Drier, who sat in an office until he had paper documents in hand. The problem is enormous – and longstanding. The above example is simply one case that highlights what little progress we've made in the course of 5 years. I reference that timeframe because this last September marked the 5-year anniversary of Dave deBronkart's battle cry at the Medicine 2.0 event in Toronto. He opened his keynote with this slide. Working with his physician – Dr. Danny Sands – he was finally able to download his health record electronically. The data that came into view, however, was largely based on billing records and loaded with inaccuracies (including the fact that an x-ray from 2003 identified him as a 53 year-old woman). He summarized his experience with transferring his health data into Google GOOGL +1.71% Health (now defunct) this way: In other words, the data that arrived in Google Health was essentially unusable. Dave deBronkart – Imagine someone had been managing your data, and then you looked – April, 2009 Hugo Campos is another example. Hugo continues to work tirelessly on getting access to the data from the cardiac defibrillator inside his own chest. His TEDxCambridge talk highlights his dilemma and his ongoing battle with Medtronic MDT - 0.73% for access to the data his own heart generates – again to manage his own health. Like other device manufacturers, Medtronic believes they should own the data – and patients who actually generate the data have no legal rights. The ICD device collects a lot of data about its own function and about the patient's clinical status. It's a pretty complex little computer, but unfortunately, none of this very valuable data is made available to the patient who originates it. The best we can do is get a print-out or a hardcopy of an interrogation report (typically at 6 or 12 month intervals). These reports are designed for doctors – not really for patients – so a lot of patients are discouraged from even getting this information. It's hard to read.” Hugo Campos – TEDxCambridge 2011 Earlier this year, I wrote about Anna McCollister-Slipp and her battle with the data that she needs to manage her Type 1 diabetes. So I have all of this incredible information literally 24/7 – not just from my prescription medical devices – but also from my Fitbit, from a Bluetooth blood pressure monitor, from my digital scale and from a variety of different iPhone apps that are used for nutrition tracking etc. None of it connects. They're all in completely different data streams, and even though each of them provides something that would be an incredibly vital element for me to truly understand how to manage my disease, how to predict when I need to change insulin in response to exercise, or stress, or schedule changes, or whatever the case may be – I can't get that information all in one place. Even though it's electronic – even though it's all downloadable in one form or another – it's all on different platforms, different computing systems and it doesn't work together. Anna McCollister-Slipp – The View Of Digital Health From An Engaged Patient These are just a few examples – there are

millions more – most of which will remain forever silent for reasons of personal privacy (or embarrassment) and they all exist because the business models don't support sharing data with the people who create it in the first place – patients. Venture capitalists are notably absent when it comes to funding any patient-centered solutions because there's simply no way to avoid the first question – who pays? Healthcare needs our clinical (and genetic) data for the purpose of advancing diagnosis and treatment of disease. I get that. What's hard to believe is the misaligned priority of demanding our health data in advance of important efforts to break down the impenetrable barriers of our own access – to our own data. Tone deaf may be a harsh characterization, but if it doesn't apply here – where does it? There is no question that all this data has enormous value, but getting the priority right makes all the difference in establishing trust. As Dr. Peter Diamandis suggested in his keynote at CHIME earlier this month, “privacy is dead.” Whether he's right or not is immaterial. Trust most certainly isn't dead – and that trumps privacy everywhere. Especially in healthcare.

Beth **Seidenberg** (M.D. general partner with Kleiner Perkins Caufield & Byers) November **2014** “You Should Share Your Health Data: Its Value Outweighs the Privacy Risk”
<http://www.wired.com/2014/11/on-sharing-your-medical-info/>

Single issue focus under patient-physician trust is flawed - key issues constantly shift

Steven **Pearson** and Lisa **Raeke** (Center for Ethics in Managed Care, Harvard Medical School and Harvard Pilgrim Health Care, Boston, Mass) **2000** “Patients' Trust in Physicians: Many Theories, Few Measures, and Little Data”
<http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1495476/>

The importance of trust in patient-physician relationships is not questioned, but our understanding of it has depended largely on the passionate thoughts and anecdotes of physicians who cherish the special bond they feel with their patients. For practicing clinicians and for those who teach medical students and residents, the elements of physician behavior that foster trust can continue to reflect the instincts of physician-theorists: competence, compassion, reliability, integrity, and open communication. A widely accepted empirical conceptualization and understanding of trust is yet to come. In recent years, other complex and once believed intangible concepts, those of “satisfaction”^{24,25} and “health status,”^{26,27} have yielded to rigorous qualitative and quantitative research, and investigators and policy leaders now have standardized instruments with which to measure these concepts in a wide variety of health care settings. Although attempts to operationalize patient-physician trust are in their infancy, with models emerging recently through the effort of investigators such as Kao and Safran, a refinement and convergence of techniques may soon allow trust to be measured and discussed as routinely and rigorously as many other elements of health care. For patient-physician trust to be strengthened, our ability to measure the mediators and outcomes of trust must mature. However, a single measure of patient trust is unlikely to achieve long-lasting predominance, nor should it. The evolving nature of the health care system will continue to cast new light on patient-physician relationships. There will be new

threats to trust that appear on the horizon, while other threats will be perceived to fade in importance. Much as the threat of overly paternalistic physicians provided the chief concern in the 1970s, researchers are now more interested in measuring patients' concerns about physicians' conflict of interest in the setting of strong financial incentives. As the focus of measures of trust have evolved, from the earliest measure of Dedrick and Anderson to the latest measure of Kao et al., measures of patient-physician trust must also continue to evolve to address changes in the health care system and in how our society views the key elements of trust.

Doctor-Patient Trust - Uniqueness

Doctor-Patient trust high now

Gregory **Giroux** (writer for Bloomberg Business News) July 14, **2014** “Doctors Running for Congress Ditch Suits for White Coats” www.bloomberg.com/news/2014-07-14/doctors-running-for-congress-ditch-suits-for-white-coats.html

It's no accident: polls show nurses and doctors are among the most trusted people in America. Politicians are among the least trusted. All three commercials for Monica Wehby, an Oregon Republican seeking to unseat Democratic Senator Jeff Merkley, have shown her in a hospital setting. “As a pediatric neurosurgeon, I know firsthand how devastating Obamacare is for Oregon families and patients,” Wehby said in one of her ads, which was interspersed with footage of the candidate in surgical scrubs. The “Grey’s Anatomy” backdrop comes as Republicans seek to gain control of the U.S. Senate and, with their House majority counterparts, pass a law repealing 2010’s Affordable Care Act. The quest is gaining urgency as Americans become more accepting of the law. Republicans need a net gain of six seats for a Senate majority. Fifty-three percent of Americans oppose the law, though just 32 percent say it should be repealed, according to a Bloomberg National Poll last month. Fifty-six percent say they want to keep Obamacare with “small modifications.” Wardrobe Messaging The latest wardrobe preferences for political ads also put distance between some candidates and the unpopular Congress they are seeking to join. About 82 percent of Americans say nurses have a “high or very high level” of honesty and ethical standards, the top spot among 22 professions rated in a December Gallup survey. Pharmacists were tied for second at 70 percent, and medical doctors were tied with military veterans for fourth at 69 percent. Medical professionals have high approval ratings because people view them as “primary care-givers,” said Frank Newport, Gallup’s editor-in-chief.

Doctor-Patient Trust – Uniqueness o/w Link

Doctor-Patient trust is at an all-time low – suspicion is deep-rooted and privacy doesn’t solve Fiaz **Fazili** (M.D., King Fahad Hospital Medina La Munawarah Kingdom Of Saudi Arabia, Surgery; Minimal invasive and acute care) June 16, **2015** “A Lost Trust” <http://www.greaterkashmir.com/news/opinion/story/189486.html>

Medicine still is a noble profession. To most of us, medicine is more than a job of care providing- putting patients' interest first. Unfortunately, in quest of big business, nobility of noble this profession is vanishing, and the doctor-patient trust is running all time low. Sadly, there is a general perception in public that the ethics of medical profession have degenerated, Doctors are accused of not attending to patients with same zeal and compassion as it used to be. Contrarily, in their own private clinic attitudes often are different. There is a conflicts of Interest. Is your doctor

paid to promote a drug or device? Are doctors prescribing what is best for you? Today, patients, or their relatives carry a lot of prejudice and preconceived notions when they enter a doctor's chamber for consultation; a mindset of suspicions that doctors also behave like businessmen. Recognition and avoidance of conflicts of interest represent a core issue of professionalism, and are well covered in State and Indian medical council bye-laws of, as most of our doctors are honest, follow the rules, avoiding situations in which the interest of the doctor is placed above that of the patient. Honesty is a major concern in medical ethics and carries an important value for a medical practitioner where doctor is perceived as a messiah – a healer. Quality of care varies dramatically between individual doctors and hospitals, but those differences are invisible to patients. Whether it is a systemic failure, lack of uniformity in standards of care, organizational disarray, trust deficit or attitude problem. A number of common problems arise within the 'expectation zone', environment, and circumstances. Valley medicos often cry insecurity, seek action and protection from concerned authorities. Isn't it time to lift the veil on this sad reality for finding some important remedial measures to restore the dignity, honor and trust of overwhelming majority of the doctors who don't succumb to kickbacks or other lucrative incentives from pharmaceutical companies, who are unwilling to prescribe a drug, or implant a device, refusing facilitation for conferences, symposiums and research? Generalizing a statement, doctors fleecing patients in their private clinics or nursing home, is a myth in our valley when you compare similar circumstances outside the state. Agreeably, there might be a few even in our state who disgrace the profession, as there are in any profession but factually majority of doctors are altruistic. I don't say that all doctors are like priests, not driven by a greed. Some among us do resort to practices that are unethical practices to make money. This menace once limited to corporate hospitals is now infiltrating the state administered hospitals through these dishonest elements who need to be identified and let the writ of law take its course. My humble appeal goes to public and patients for change in perception, don't look through tainted glasses on this profession. Our dedicated, intelligent health care staff need recognition of for the hard work they do.

Doctor-Patient Trust – A2 Disease Impacts

Status quo solves – antifolates – breakthroughs have already happened and are going to trials
Colin **Poitras** (writer for the UConn Today) July 23, **2014** “Possible Breakthrough in Battle Against Drug-Resistant Diseases” <http://today.uconn.edu/blog/2014/07/possible-breakthrough-in-battle-against-drug-resistant-diseases/>

In the war against drug-resistant diseases and so-called “superbugs”, the family of bacteria known as CREs are a particularly nasty bunch. The bacteria, whose scientific name is carbapenem-resistant Enterobacteriaceae – include notorious strains of E. coli and Klebsiella and are a constant health concern in hospitals and nursing homes, where the germs breed in ventilators, catheters, and intravenous lines. CREs have been flagged as an “urgent threat” by the Centers for Disease Control and Prevention because of their strong resistance to antibiotics and easy transmission between humans. Some CRE bacteria are resistant to all known antibiotics. The mortality rate is high. As many as 50 percent of patients infected with CRE bacteria die because

there is no drug to fight them. But two UConn scientists may be gaining new ground against the public health threat. Professors Amy Anderson and Dennis Wright, along with their students in the School of Pharmacy, have developed a group of drug compounds that appear to be particularly effective against CREs in early tests. A lead is a preliminary molecule that shows promise and is poised for further development. The potent compounds – part of a group of drugs known as antifolates – were a long time coming for the two, who have been searching for effective treatments for drug-resistant diseases like MRSA, E. coli, and Klebsiella pneumoniae for more than 10 years. Working with drug-resistant strains is particularly challenging for researchers, as the diseases constantly morph and evolve to fend off attacks to kill them. “It has been a **holy grail** to kill these types of CREs,” says Anderson, a professor of medicinal chemistry and interim head of the Department of Pharmaceutical Sciences. “These (CRE) bacteria have an extra thick, tight membrane meshed with proteins that makes it very hard for drugs to penetrate. We’ve spent years trying.” After testing hundreds of different compounds, delicately altering each one’s chemical structure with the hope of finding the magic recipe that would serve as a CRE knockout blow, Anderson and Wright recently started seeing positive results in one particular group. ‘Our goal was to inhibit a certain enzyme in the bacteria so it can’t function and the bacteria can’t survive,’ Anderson says. “When we finally got a very potent inhibition of the enzyme, that was definitely a eureka moment.” The pair recently received a five-year, \$2.7 million grant from the National Institutes of Health to further study these compounds and prepare them for clinical trials. Together, Anderson’s and Wright’s labs have received more than \$10 million in federal research support since they began working on the project. Wright, a professor of medicinal chemistry, synthesizes the new drugs; Anderson evaluates them and determines the atomic details of how they interact with their intended target. “We want to make compounds that are potent inhibitors of the growth of the bacteria and at the same time are safe, with good drug properties, so down the line they will be effective when used at a clinic,” says Wright. At this stage in the research, Anderson and Wright are trying to learn more about the physical and chemical processes that allow their compounds to penetrate the armor-like coating around CREs when so many others have failed. Understanding why their compounds are working may allow them to apply the same biological chemistry to different compounds that could be used to fight other persistent infections. Associate professor of pharmacy practice Jeffrey Aeschlimann from UConn Health is helping with the CRE drug characterizations. University of Montana professor of chemistry Nigel Priestley is assisting with testing in early animal pre-clinical trials. “Right now, what makes our compounds attractive is that they seem to have a very low rate of resistance.” says Wright. “We’ve made compounds that are very hard for these CREs to fend off.”

Recently discovered fungus

Catholic Online July 2014 “How one fungus may stop superbugs”

<http://www.catholic.org/news/health/story.php?id=56093>

Scientists at McMaster University in Ontario discovered a compound that instantly turned off a gene in several harmful bacteria that made them highly resistant to treatment with a class of antibiotics used to fight so-called superbug infections. There are still thousands of children who need just one light in the darkness. Aspergillomarasmine A (AMA), was the compound that was found in a soil sample extracted from a common fungus found in soil and mold. Antibiotic resistance is a growing public-health threat. Common germs such as Escherichia coli (E. coli) are becoming harder to treat because of increasing immunities to common antibiotics. In the United

States alone, some two million people are infected with antibiotic-resistant diseases, and around 23,000 die as a result, according to information released from the Centers for Disease Control and Prevention (CDC). The World Health Organization (WHO) has called antibiotic resistant a threat to global public health. Using the compound, the Canadian team was able to disarm a gene-New Delhi Metallo-beta-Lactamase-1 (NDM-1) that has become the WHO's number one enemy since it was discovered in 2009. , "Discovery of a fungus capable of rendering these multidrug-resistant organisms incapable of further infection is huge " said Irena Kenneley, a microbiologist and infectious disease specialist at Frances Payne Bolton School of Nursing at Cleveland's Case Western Reserve University. "The availability of more treatment options will ultimately save many more lives."

Squo solves

Anne **Trafton** (writer for the MIT News Office) September 21, **2014** "Battling superbugs"
<http://newsoffice.mit.edu/2014/fighting-drug-resistant-bacteria-0921>

In recent years, new strains of bacteria have emerged that resist even the most powerful antibiotics. Each year, these superbugs, including drug-resistant forms of tuberculosis and staphylococcus, infect more than 2 million people nationwide, and kill at least 23,000. Despite the urgent need for new treatments, scientists have discovered very few new classes of antibiotics in the past decade. MIT engineers have now turned a powerful new weapon on these superbugs. Using a gene-editing system that can disable any target gene, they have shown that they can selectively kill bacteria carrying harmful genes that confer antibiotic resistance or cause disease. Led by Timothy Lu, an associate professor of biological engineering and electrical engineering and computer science, the researchers described their findings in the Sept. 21 issue of Nature Biotechnology. Last month, Lu's lab reported a different approach to combating resistant bacteria by identifying combinations of genes that work together to make bacteria more susceptible to antibiotics. Lu hopes that both technologies will lead to new drugs to help fight the growing crisis posed by drug-resistant bacteria. "This is a pretty crucial moment when there are fewer and fewer new antibiotics available, but more and more antibiotic resistance evolving," he says. "We've been interested in finding new ways to combat antibiotic resistance, and these papers offer two different strategies for doing that." Cutting out resistance Most antibiotics work by interfering with crucial functions such as cell division or protein synthesis. However, some bacteria, including the formidable MRSA (methicillin-resistant Staphylococcus aureus) and CRE (carbapenem-resistant Enterobacteriaceae) organisms, have evolved to become virtually untreatable with existing drugs. In the new Nature Biotechnology study, graduate students Robert Citorik and Mark Mimee worked with Lu to target specific genes that allow bacteria to survive antibiotic treatment. The CRISPR genome-editing system presented the perfect strategy to go after those genes. CRISPR, originally discovered by biologists studying the bacterial immune system, involves a set of proteins that bacteria use to defend themselves against bacteriophages (viruses that infect bacteria). One of these proteins, a DNA-cutting enzyme called Cas9, binds to short RNA guide strands that target specific sequences, telling Cas9 where to make its cuts. Lu and colleagues decided to turn bacteria's own weapons against them. They designed their RNA guide strands to target genes for antibiotic resistance, including the enzyme NDM-1, which allows bacteria to resist a broad range of beta-lactam antibiotics, including carbapenems. The genes encoding NDM-1 and other antibiotic resistance factors are usually carried on plasmids — circular strands of DNA separate from the bacterial genome — making it easier for them to spread through populations. When the researchers turned the CRISPR system against NDM-1,

they were able to specifically kill more than 99 percent of NDM-1-carrying bacteria, while antibiotics to which the bacteria were resistant did not induce any significant killing. They also successfully targeted another antibiotic resistance gene encoding SHV-18, a mutation in the bacterial chromosome providing resistance to quinolone antibiotics, and a virulence factor in enterohemorrhagic E. coli. In addition, the researchers showed that the CRISPR system could be used to selectively remove specific bacteria from diverse bacterial communities based on their genetic signatures, thus opening up the potential for “microbiome editing” beyond antimicrobial applications. To get the CRISPR components into bacteria, the researchers created two delivery vehicles — engineered bacteria that carry CRISPR genes on plasmids, and bacteriophage particles that bind to the bacteria and inject the genes. Both of these carriers successfully spread the CRISPR genes through the population of drug-resistant bacteria. Delivery of the CRISPR system into waxworm larvae infected with a harmful form of E. coli resulted in increased survival of the larvae. The researchers are now testing this approach in mice, and they envision that eventually the technology could be adapted to deliver the CRISPR components to treat infections or remove other unwanted bacteria in human patients. “This work represents a very interesting genetic method for killing antibiotic-resistant bacteria in a directed fashion, which in principle could help to combat the spread of antibiotic resistance fueled by excessive broad-spectrum treatment,” says Ahmad Khalil, an assistant professor of biomedical engineering at Boston University who was not part of the research team. High-speed genetic screens Another tool Lu has developed to fight antibiotic resistance is a technology called CombiGEM. This system, described in the Proceedings of the National Academy of Sciences the week of Aug. 11, allows scientists to rapidly and systematically search for genetic combinations that sensitize bacteria to different antibiotics. To test the system, Lu and his graduate student, Allen Cheng, created a library of 34,000 pairs of bacterial genes. All of these genes code for transcription factors, which are proteins that control the expression of other genes. Each gene pair is contained on a single piece of DNA that also includes a six-base-pair barcode for each gene. These barcodes allow the researchers to rapidly identify the genes in each pair without having to sequence the entire strand of DNA. “You can take advantage of really high-throughput sequencing technologies that allow you, in a single shot, to assess millions of genetic combinations simultaneously and pick out the ones that are successful,” Lu says. The researchers then delivered the gene pairs into drug-resistant bacteria and treated them with different antibiotics. For each antibiotic, they identified gene combinations that enhanced the killing of target bacteria by 10,000- to 1,000,000-fold. The researchers are now investigating how these genes exert their effects. “This platform allows you to discover the combinations that are really interesting, but it doesn’t necessarily tell you why they work well,” Lu says. “This is a high-throughput technology for uncovering genetic combinations that look really interesting, and then you have to go downstream and figure out the mechanisms.” Once scientists understand how these genes influence antibiotic resistance, they could try to design new drugs that mimic the effects, Lu says. It is also possible that the genes themselves could be used as a treatment, if researchers can find a safe and effective way to deliver them. CombiGEM also enables the generation of combinations of three or four genes in a more powerful way than previously existing methods. “We’re excited about the application of CombiGEM to probe complex multifactorial phenotypes, such as stem cell differentiation, cancer biology, and synthetic circuits,” Lu says.

Its already got a patent – will be scaled up for commercial and national needs now

Kenneth **Ma** (Lawrence Livermore National Laboratory) October 7, **2014** “Bio researchers receive patent to fight superbugs” <https://www.llnl.gov/news/newsreleases/2014/Oct/NR-14-10-3.html>

Superbugs, or antibiotic-resistant bacteria, have been on the rise since antibiotics were first introduced 80 years ago. That's because these germ-fighting agents have lost their punch from being overprescribed and misused, allowing bacteria pathogens to develop immunities against them. As a result, superbugs sicken nearly 2 million Americans each year and roughly 23,000 people die annually from these infections, according to the Centers for Disease Control and Prevention. Many more people die from other conditions that are complicated by antibiotic-resistant infections. Lawrence Livermore National Laboratory scientists have figured out a way to reverse this trend by developing novel antibiotics that effectively kill superbugs. They were recently issued a patent for producing antimicrobial compounds that degrade and destroy antibiotic-resistant bacteria by using the pathogen's own genes against it. Their approach can be used to fight superbugs such as antibiotic-resistant E. coli, Salmonella, Campylobacter, Methicillin-resistant Staphylococcus aureus (MRSA), Bacillus anthracis and many others. Antimicrobial compounds available today are designed to treat a host of bacteria, not target specific ones. While this is effective in the short term, bacteria are able to modify themselves over time to prevent a number of antibiotics from inhibiting their growth, rendering the antibiotics useless. To prevent this, the LLNL team created a process to discover new antibiotics designed to eradicate targeted bacterium responsible for a specific infection. Their technique uses computational tools and genome sequencing to identify which genes inside a bacterium encode for lytic proteins that can be used to kill it. Lytic proteins are enzymes that normally produce nicks in cell walls that allow cells to divide and multiply. But used in high concentrations, these enzymes cause rapid cell-wall degradation and cell rupture, a process known as lysis. Lytic proteins circumvent any defenses that bacteria have developed against today's broadly focused antimicrobials. Once genes encoding lytic proteins are identified in a bacterium, Lab researchers synthesize those genes and produce the lytic proteins in a laboratory setting. They are then experimentally introduced to the cell walls of targeted pathogens to destroy them. "We knew about these proteins because they were primarily coded and identified in bacteriophages, virus particles that attack bacterium and make copies of themselves," said Matthew Coleman, a member of the LLNL research team. "Bacteriophages need a way to get out of the bacteria once they make enough copies. So they encode a lytic protein, called an endolysin that breaks down the cell wall, causing the cell to die. The wall is what gives the cell its strength." The team's unique discovery was the existence of lytic proteins that are not associated with bacteriophages. They learned that bacteria themselves encode their own versions of these lytic proteins, which they use under tight regulatory control to remodel their cell wall during cell division. Tight regulatory production means that lytic protein is not overproduced because too much of it will kill the cells. The team conducted lab experiments that show lytic protein produced by bacteria killed pathogens more effectively than lytic protein produced by bacteriophages. LLNL's resources allowed the team to sequence genomes within a few weeks to obtain information on new pathogens, unknown bacteria species and even species yet to be sequenced. This data helps the team determine which genes encode lytic proteins and reproduce those proteins in large quantities to eliminate targeted pathogens. So far, the team's novel approach has been extremely effective in lab testing. In CDC experiments, the LLNL-produced lytic protein killed 100 percent of Bacillus

anthracis cells, the bacterium that causes anthrax. "We can isolate these genes to support the development of effective antimicrobial agents for commercial and national needs," Coleman said.

Multi-drug resistance is unlikely- Combination therapy

Cobey et al. 15, (Gabriel G. Perron, R. Fredrik Inglis, Pleuni S. Pennings and Sarah Cobey, Evolutionary Applications, "Fighting microbial drug resistance: a primer on the role of evolutionary biology in public health," 23 MAR 2015, <http://onlinelibrary.wiley.com/doi/10.1111/eva.12254/full//IB>)

The shortage of new antibiotics motivated the search for novel strategies to manage resistance evolution. For example, combination therapy showed that some antibiotics have nonlinear inhibitory activities when used together (King et al. 1981; Yeh et al. 2009). Extensive phenotypic screens revealed that many classes of antibiotics could inhibit the effects of other antibiotics given their modes of activity (Yeh et al. 2006), often caused by regulatory conflicts in the expression of the antibiotics' cellular targets (Bollenbach and Kishony 2011) or by reductions in bacterial growth rates (Ocampo et al. 2014). Subsequent studies have shown that such interactions could modulate resistance evolution (Yeh et al. 2009): Multidrug resistance is unlikely to evolve against sets of antibiotics that inhibit each other's activity, as resistance evolution to one antibiotic would expose the bacterium to the full efficiency of the second antibiotic (Michel et al. 2008). However, additional clinical trials are required to see whether this finding can be put into practice.

Alt Cause – Laundry List

Series of factors affect the doctor-patient relationship and trust

Goold and Lipkin 99 (Susan Dorr Goold, MD, MHSA, MA, Received from the Division of General Medicine, University of Michigan Medical Center, Ann Arbor, Mich. AND Mack Lipkin, Jr., MD, New York University Medical Center, New York)("The Doctor–Patient Relationship: Challenges, Opportunities, and Strategies", J Gen Intern Med. 1999 Jan; 14(Suppl 1): S26–S33. doi: 10.1046/j.1525-1497.1999.00267.x)//ASMITH

A series of organizational or system factors also affect the doctor–patient relationship. The accessibility of personnel, both administrative and clinical, and their courtesy level, provide a sense that patients are important and respected, as do reasonable waiting times and attention to personal comfort. The availability of covering nurses and doctors contributes to a sense of security. Reminders and user-friendly educational materials create an atmosphere of caring and concern. Organizations can promote a patient-centered culture,²⁹ or one that is profit- or physician-centered, with consequences for individual doctor–patient relationships. Organizations (as well as whole health care systems) can promote continuity in clinical relationships, which in turn affects the strength of in those relationships. For instance, a market-based system with health insurance linked to employers' whims, with competitive provider networks and frequent mergers and acquisitions, thwarts long-term relationships. A health plan that includes the spectrum of outpatient and inpatient, acute and chronic services has an opportunity to promote continuity across care settings. The competition to enroll patients is often characterized by a combination of exaggerated promises and efforts to deliver less. Patients may arrive at the doctor's office expecting all their needs to be met in the way they themselves expect and define. They discover instead that the employer's negotiator defines their needs and the managed care company has communicated them in very fine or incomprehensible print. Primary care doctors thus become the bearers of the bad news, and are seen as closing gates to the patient's wishes and needs. When this

happens, an immediate and enduring barrier to a trust-based patient-doctor relationship is created. The doctor–patient relationship is critical for vulnerable patients as they experience a heightened reliance on the physician's competence, skills, and good will. The relationship need not involve a difference in power but usually does,³⁰ especially to the degree the patient is vulnerable or the physician is autocratic. United States law considers the relationship fiduciary; i.e., physicians are expected and required to act in their patient's interests, even when those interests may conflict with their own.⁹ In addition, the doctor–patient relationship is remarkable for its centrality during life-altering and meaningful times in persons' lives, times of birth, death, severe illness, and healing. Thus, providing health care, and being a doctor, is a moral enterprise. An incompetent doctor is judged not merely to be a poor businessperson, but also morally blameworthy, as having not lived up to the expectations of patients, and having violated the trust that is an essential and moral feature of the doctor–patient relationship.³¹ Trust is a fragile state. Deception or other, even minor, betrayals are given weight disproportional to their occurrence, probably because of the vulnerability of the trusting party (R.L. Jackson, unpublished manuscript).

Alt Cause – Staff/Expertise

Budget cuts and staff shortages short-circuit all health surveillance

Edward **Richards** (Harvey A. Peltier Professor of Law and Director, Program in Law, Science, and Public Health at the Paul M. Herbert Law Center, Louisiana State University) **2009**

“DANGEROUS PEOPLE ,UNSAFE CONDITIONS T HE CONSTITUTIONAL BASIS FOR PUBLIC HEALTH SURVEILLANCE” The Journal of Legal Medicine, 30:27–50, http://biotech.law.lsu.edu/Articles/ULGM_A_369622_O.pdf

The Constitution grants broad authority for public health surveillance. As long as public health authorities do not use administrative searches as a subterfuge for criminal law searches, the courts will uphold these searches when they are conducted either pursuant to an area warrant or through the reg- ulated industries exception to a warrant requirement. Surveillance, however, is just the first step in protecting the public health and safety. Surveillance data must be combined with good epidemiologic analysis, and then become the basis for public health interventions. There have been few abuses of public health administrative searches. Public health authorities, if anything, have been too reticent to use proper surveillance techniques. Although some of this reticence is because of con- cerns about being seen as violating individual rights, most of it stems from lack of staff and other resources. ¹¹³ Despite the push on public health preparedness since the terrorist attacks on September 11, 2001, health departments around the United States continue to suffer budget and staff cuts. The impacts of these cuts are exacerbated by legislatures pushing ever-increasing responsi- bilities on health departments without providing the budgets or staff to carry out these new tasks. ¹¹⁴ The hardest issue for public health policy makers is to avoid pressures to transform public health agencies into extensions of the Department of Homeland Security. As we have seen from the adoption of Draconian emergency powers laws, it is more

difficult to maintain a balance between individual rights and community protection than to attempt to satisfy political pressures by swinging wildly between extreme positions.

Staff and expertise shortages take out the aff

Bernard **Choi** (Injury Prevention Research Centre, Medical College of Shantou University, Shantou, China and Department of Epidemiology and Community Medicine, University of Ottawa, Ottawa, Canada) 2012 “The Past, Present, and Future of Public Health Surveillance” *Scientifica* Volume **2012** (2012), Article ID 875253, 26 pages
<http://dx.doi.org/10.6064/2012/875253>

To avoid fragmentation in national surveillance efforts [107, 144], there is a need for federal agencies to provide national facilitation to foster interstate and intercounty collaboration. Central guidance can lead to coordination across states and counties, interstate technology transfer, and opportunity to learn from the successes and failures of other localities. Needless expense, unnecessary development time, and failure to rapidly share information on innovative systems can be avoided [205]. No attempt to meet the current challenges in public health surveillance will succeed unless it recognizes the fundamental importance of providing and maintaining a cadre of highly trained and motivated public health professionals in every local health agency in the country [5]. To use surveillance information to better prioritize, plan, deliver, and evaluate programming, public health staff must possess the required knowledge and skills. While it is neither feasible nor necessary for all staff to receive postgraduate academic training, a greater proportion of the public health workforce will need to acquire the knowledge and skills necessary to effectively understand and use surveillance concepts and techniques. Public health surveillance systems must be strengthened by (1) allocating resources, including human resources, for the effective use of health surveillance data and tools and (2) recognizing the need for existing staff to acquire new skills [77].

Alt Cause – Commercialization/Pharma

Alt causes – commercialization of health and Ebola

Collins 14 (Sam P.K. Collins is a health reporter for ThinkProgress. He previously provided general news coverage of the D.C. metropolitan area for the Washington Informer, and wrote reports of President Barack Obama’s activities as a White House press pool reporter for American Urban Radio Networks. Sam holds a master’s degree in public policy, and a bachelor’s degree in journalism and mass communication from George Washington University. “American’s Don’t Trust The Medical Profession” 10/23/14 <http://thinkprogress.org/health/2014/10/23/3583625/americans-skeptical-doctors///CW>

Americans count among the least trusting of the medical profession, according to an international health care survey. The findings, which appeared in a recent issue of the New England Journal of Medicine, show significant levels of suspicion of doctors, especially among those who make less than \$30,000 annually.¶ Researchers studied public health polls dating back four decades, including one conducted by a consortium of universities between 2011 and 2013 during which people in 29 countries answered survey questions. In that poll, 58 percent of Americans said they trust the medical profession, placing the United States in 24th place with Croatia.¶ “It fits with decades of data on the American public’s trust in institutions, in general,” Michael Gusmano, a scholar at the Hastings Center, a Garrison, N.Y.-based research institute that focuses on health care, told WebMD.¶ Skepticism of the medical profession hasn’t happened without any reason. Experts point to unequal access to health care and the “commercialization” of American medicine as key factors at play in that damaged relationship. Some people say that members of the medical field often seem more concerned about protecting their financial interests than caring for patients, especially those from less affluent backgrounds.¶ Big Pharma has historically tried to influence the advice that doctors give patients, something that may make Americans wary of the field in general. In exchange for their endorsement of prescription medications, physicians receive free samples and gifts that include coffee mugs emblazoned with the drug company’s logo, tickets to sporting events, expensive dinners, and trips to exotic

destinations. At the peak of Big Pharma's profitable relationship with the medical industry in 2007, more than 100,000 representatives made visits to more than 650,000 physicians across the country.¶ This can sometimes have a direct effect on patients. A Centers for Disease Control and Prevention (CDC) study in August, for example, found that doctors in hospitals with a strong black patient base encouraged breastfeeding to expectant mothers at a rate 15 percentage points less than that of their white counterparts, due in part to a relationship between the facility and manufacturers of baby formula.¶ Americans' mistrust of the medical industry has been on full display in the weeks since American Ebola patient zero Thomas Eric Duncan died in a Dallas hospital.¶ Days after CDC officials assured Americans that the disease would spread no further, two nurses who treated Duncan tested positive for Ebola. Many of the nurses who had direct contact with patient zero before he succumbed criticized the medical establishment, saying nurses at Presbyterian Hospital in Dallas treated Duncan for days in an open space in the emergency room under constantly changing protocols and without sufficient protective gear.¶ The controversy has discouraged some Americans from trusting what CDC officials are saying about the United States' ability to contain the virus. According to one recent poll, nearly half of Americans don't think their local hospital could safely treat an Ebola case.¶ That has facilitated the spread of panic about Ebola — anxiety that may pose a bigger threat to Americans than the virus itself. Instead of listening to federal health officials, many Americans have looked to sensationalized media reports and reckless words of commentators and politicians as indicators of Ebola's impact in the United States.¶ There are other examples of how some Americans' mistrust of the medical profession undermines public health. An increasing number of parents are skipping or delaying their children's recommended vaccination, due in part to a belief that the injections cause autism and other sicknesses. Members of the scientific community beg to differ, especially since vaccinations in the last two decades have prevented nearly 700,000 deaths. But the parents who choose to delay their kids' vaccines don't trust scientists' opinions on the subject.¶ The study recently published in the New England Journal of Medicine does have another significant finding: Even when Americans are skeptical of the medical industry as a whole, they do trust their own doctor. So information about things like Ebola and vaccinations might need to come from those immediate sources rather than national spokespeople.

Genetics Surveillance – Data Leaks Inevitable

Impossible to keep genetic data anonymous – data leaks inevitable

Gina **Kolata** (Medical reporter for the New York Times) June **2013** “Poking Holes in Genetic Privacy” http://www.nytimes.com/2013/06/18/science/poking-holes-in-the-privacy-of-dna.html?pagewanted=all&_r=0

For years now, a steady stream of research has eroded scientists' faith that DNA can be held anonymously. The first shock came in 2008, when David W. Craig, a geneticist at TGen, a research institute in Phoenix, and his colleagues imagined a theoretical problem. Suppose you are trying to learn what percentage of intravenous drug users are infected with hepatitis, and you collect DNA from discarded needles and amass it in a database to look for signs of the virus in the genetic material. Is there any way, they wondered, to find a particular person's DNA is in this soup of genes? Most researchers would have said the task was impossible, worse than looking for a needle in a haystack. But Dr. Craig and his colleagues found a way to do it, exploiting the four million or so tiny, and usually inconsequential, differences in DNA letters between one individual and another. With their method, using the combinations of hundreds of thousands of DNA markers, the researchers could find a person even if his or her DNA constituted just 0.1 percent of the total in the mix. So explosive was the finding that Dr. Craig deliberately chose to write about it only very technically. The N.I.H. understood what he had accomplished, though, and quickly responded, moving all genetic data from the studies it financed behind Internet firewalls to prevent the public or anyone not authorized from using the data and, it was hoped, to protect the identities of research subjects. But another sort of genetic data — so-called RNA expression profiles that show patterns of gene activity — were still public. Such data could not be used to identify people, or so it was thought. Then Eric E. Schadt of Mount Sinai School of Medicine discovered that RNA expression data could be used not only to identify someone but also to learn a great deal about that person. “We can create a profile that reflects your weight, whether you are diabetic, how old you are,” Dr. Schadt said. He and a colleague also were able to tell if a person is

infected with viruses, like HPV or H.I.V., that change the activity of genes. Moreover, they were able to make what they called a genetic bar code that could be used to identify a person in a number of DNA databases. Then, this year, in perhaps the most disturbing exercise, Yaniv Erlich, a genetics researcher at the Whitehead Institute, used a new computational tool he had invented to identify by name five people from their DNA, which he had randomly selected from a research database containing the genes of one thousand people. Experts were startled by what Dr. Erlich had done. “We are in what I call an awareness moment,” said Eric D. Green, director of the National Human Genome Research Institute at the National Institutes of Health. Research subjects who share their DNA may risk a loss of not just their own privacy but also that of their children and grandchildren, who will inherit many of the same genes, said Mark B. Gerstein, a Yale professor who studies large genetic databases. Even fragments of genetic information can compromise privacy. James Watson, a discoverer of DNA’s double helix shape, had his genes sequenced and made the information public — except for one, the sequence for ApoE, a gene that has a variant linked to an increased risk of Alzheimer’s disease. Researchers noticed, though, that they could still figure out if Dr. Watson had that variant by examining the DNA on either side of the gene he had removed. They did not reveal whether he had it. With so many questions about the privacy and security of genetic data, researchers wonder what research subjects should be told. Leaks and identification of study subjects will never be completely avoidable, said George Church, a Harvard geneticist. And as much as investigators might like to find a way to keep genetic data secure and private, he does not think there is an exclusively technical solution. “If you believe you can just encrypt terabytes of data or anonymize them, there will always be people who hack through that.” Dr. Church said. He believes that people who provide genetic information should be informed that a loss of privacy is likely, rather than unlikely, and agree to provide DNA with that understanding. Other researchers say the idea is not far-fetched, and some suggest that scientists be licensed before they are given access to genetic databases, with severe penalties for those who breach privacy. “My fear is not so much that someone will take everyone’s genomes and put them on the Web,” Dr. Gerstein said. “It is that a graduate student in some lab somewhere will naïvely post bits of genomes on his Facebook page. The idea is that before he could get access to genomes, he would be taught he can’t do that. And if he did he would lose his license.” The amount of genetic data that has been gathered so far is minuscule compared with what will be coming in the next few years, Dr. Altshuler noted, making it important to address the problems before the data deluge makes them worse. “We see substantial issues,” he said. “We want to have serious discussions now.”

Genomic data breaches happen all the time- the health system does not have enough protections in place to secure private genetic information

McEwen et al 13 (Jean E. McEwen, Ethical, Legal, and Social Implications Program, Division of Genomics and Society, National Human Genome Research Institute, National Institutes of Health, Ethical, Legal, and Social Implications Program, Division of Genomics and Society, National Human Genome Research Institute, National Institutes of Health. Joy T. Boyer, Senior Program Analyst, and Kathie Y. Sun, Program Analyst. “Evolving Approaches to the Ethical Management of Genomic Data.” February 28, 2013. <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC3665610/>)/EMerz

The genetic studies and test protocols that dominated the field 15–20 years ago were generally highly targeted, and tended to view the risks to participants or patients (apart from the physical

risks associated with blood drawing) as straightforwardly informational [17–19]. Thus, consent materials in use prior to the mid-2000s, if they mentioned non-physical risks at all, tended to focus on the potential for breach of privacy, with insurance and employment usually listed as the two areas of main concern [20–22]. Data security measures of the time were, by today's standards, remarkably "low tech," often consisting of little more than coding samples and data and storing samples and data in locked freezers and cabinets. Still, consent forms, if they addressed the issue at all, typically described the risk of a security breach as low; at the time that assessment seemed reasonably accurate, predating as it did the development of massive, web-accessible genomic databases and expanded data sharing norms. Early consent forms rarely addressed the issue of whether individual findings from studies would be returned to participants [20, 21]. The usual default presumption was that they would not be [23], because most findings emanating from studies of the time interrogated only limited regions of the genome, so the likelihood of generating incidental findings (apart from occasional evidence of undisclosed adoption or misattributed paternity [24]) was relatively low. Another feature of early consent forms was their characteristically narrow scientific scope [8, 20, 21]. Most described only the immediate study for which samples were being collected or the specific disease being analyzed; although the possibility of sharing with close collaborators working on the same disease was sometimes mentioned, obtaining broad consent to an unspecified range of future uses was the exception, not the norm. **Often, consent documents were simply silent about plans for any future sharing,** and in such cases, the **absence of an explicit prohibition against sharing was generally interpreted** (or, at least over time came to be interpreted) **as tacit permission to share** [23]. In 1994, long-percolating concerns among bioethicists about the practice of using stored, linkable samples without obtaining new consent from those from whom they had been obtained culminated in the publication of a highly influential paper that recommended against continuing this practice [25]. Following this recommendation, consent documents gradually began to be written with greater specificity about whether, with whom, and for what purposes, samples and data would be shared. In practice, however, the recommendation was often interpreted as applying only to prospectively collected samples. Thus, as was recently called to public attention in a best-selling book, archived samples collected under widely varying and sometimes questionable consent conditions – and cell lines derived from such samples - are often still being used today.

Genetic Surveillance – No Impact

There's no impact to genetic discrimination- their evidence is just rhetoric

Begley 4 (Sharon Begley. Senior health & science correspondent at Reuters. "Bill Seeking to Ban DNA Discrimination Isn't Really Necessary." February 6, 2004. <http://www.wsj.com/articles/SB107595572756521572>)/EMerz

When it comes to genetic discrimination, there is a yawning chasm between rhetoric and reality. As law professor Henry Greely of Stanford University puts it, "Genetic discrimination is a much greater threat in people's fears than it is in reality, today or in the foreseeable future....Failure to ban [it] will not make the sky fall, [or] the employment markets crumble." Genetic discrimination means being denied employment or health insurance (or being charged more for it) as a result of testing positive for a gene that raises your risk of developing a disease such as cancer or Alzheimer's. Since at least 1990, it has been cast as the dark underbelly of the human genome project, which dutifully set aside 3% to 5% -- almost \$100 million -- of its annual budget to study such ethical, legal and social issues. Francis Collins, director of the project, has called genetic

discrimination "a vexing problem" and praised the Senate's "important" bill. The emperor, however, is wearing skivvies. Just as genome enthusiasts, and much of the media, have hyped the medical benefits of decoding humankind's double helix, so they (and we) have grossly overstated the threat and the reality of genetic discrimination. If you probe beneath the anecdotes, evidence of genetic discrimination melts away. Bioethicists and genetic counselors, for instance, say they've heard of people being fired or denied health coverage after testing positive for a risk gene, but concede they know of no such patients firsthand. When they do offer an actual case, it turns out that the discrimination was based not on a predictive genetic test (finding a genetic variant that raises the risk of cancer, perhaps) but on family history or actual symptoms of, say, the blood disorder hereditary hemochromatosis. That may be medical discrimination, but it isn't genetic discrimination as usually understood. In an effort to get beyond anecdote, a 2000 study examined the effect of state laws barring genetic discrimination in health insurance. To their surprise, Mark Hall and Stephen Rich of Wake Forest University in Winston-Salem, N.C., found that states with such laws had no fewer cases of genetic discrimination than states without them. Why? Because you can't have fewer cases than zero, and zero is about how much genetic discrimination the study turned up. "We found almost no cases of health insurers asking for or using the results of predictive genetic tests," Prof. Hall says. "The laws have so little impact because almost no genetic discrimination is occurring," as more-recent studies confirm. Dawn Allain, president of the National Society of Genetic Counselors, agrees: "We haven't seen any real cases of genetic discrimination." Health insurers have little financial incentive to set rates based on predictive genetic tests, Prof. Hall explains. For group coverage, it's much simpler to tote up last year's costs and factor in inflation. For individual coverage, people change carriers so frequently that even if they develop a disease 15 years down the road, as a genetic test might predict, it will likely be on another insurer's dime. Although the warnings of bioethicists (including, Prof. Greely sheepishly admits, "an earlier version of myself") haven't come true, some now argue that we need federal legislation for symbolic reasons, to protect people from even the theoretical risk of genetic discrimination. This "what harm does it do?" argument is OK, says William Nowlan, chief medical officer of the National Life Insurance Co., Montpelier, Vt., who has written widely on the myth of genetic discrimination. But then let's admit that the Senate bill addresses a problem that exists solely in the public's imagination. As far as I can tell, the bill's only real benefit would be to allay the fears of people who reject genetic tests in the belief that a positive result could make them uninsurable and unemployable. That's a worthwhile goal. But it comes at a cost. **By enshrining genetic status in federal law, we reinforce the widespread and pernicious belief that DNA is destiny.** It isn't. Risk genes for common diseases aren't like those for the exceedingly rare Huntington's or Tay-Sachs, where carrying the gene means you definitely will get the disease. Instead, risk genes are low in what biologists call "penetrance:" They increase your chance of developing the disease, but to nothing like 100%. In one fascinating 2000 study, Swedish scientists calculated that genes account for less than half of the risk of developing 11 common cancers. The cancers with the highest genetic component, the study found, are prostate (42%) and colorectal (35%). A woman's risk of getting breast cancer if her identical twin does is only 13%. Supporters of the genetic discrimination bill should make clear that what they want to guard against is no more than a theoretical risk. They should make equally clear that the risk genes they're so worried about are not all they're cracked up to be.

Even if genetic surveillance contains invasive information, it doesn't require much protection-few people are qualified to read DNA

Lauss et al 13 (Georg Lauss, Arndt Bialobrzeski, Matthias Korkhaus, Karoliina Snell, Johannes Starkbaum, Andréa E. Vermeer, Jukka Weigel, Herbert Gottweis, Ilpo Helén, Jochen Taupitz, Peter Dabrock. "BEYOND GENETIC PRIVACY PAST, PRESENT AND FUTURE OF BIOINFORMATION CONTROL REGIMES." 2013. http://private-gen.eu/uploads/media/PRIVATE_Gen_FINAL-REPORT_2013_01.pdf//EMerz

Ultimately, some genetic information might merit special treatment because it has a number of characteristics which, although they may be individually present in respect of other forms of information, are present to a high degree in the case of genetic information and combine to give it a special status in some contexts. [p.31] The report emphasizes the importance of context. Genetic information might not always be sensitive in itself. What makes genetic information – and arguably information in general – sensitive is its context and the way a piece of information is combined with other information. Since information about a person or a state of affairs takes on meaning only if it is put into a social context and if it is combined with other information, it was even be argued that genetic information is even better protected from widespread third-party misuse than other types of (medical) information because it requires a high level of expert knowledge and expert resources to “read” it and interpret it in meaningful ways. In a certain sense, it has a comparably high legibility threshold [24]. Moreover, empirical research has shown the likelihood that genetic information and its related research may be seen as problematic, but it appears that people perceive other types of information as being sensitive, as well, and that their concerns revolve around the concrete context in which data and materials are used and the intention behind a particular inquiry

Genetic Surveillance Good - Crime

Genetic research base is key to solving violent crimes and exonerating criminals

[David H. **Kaye**, Penn State Law “Trawling DNA Databases for Partial Matches: What is the FBI Afraid of?” 2009]

Across the globe, many countries have established DNA databases-collections of computer-searchable records of the DNA profiles of suspected or convicted offenders.¹ England started the first national criminal DNA database in 1995.² In the United States, the state and federal databases as combined in the National DNA Index System (NDIS) hold over seven million short tandem repeat (STR) profiles from convicted offenders as well as a growing number of people who were merely arrested or detained.³ When investigators recover a DNA sample from the scene of a crime, they can search these databases to discover if any of the recorded profiles match. Such "cold hits" from these database trawls have led police to serial rapists and murderers who have long eluded detection.⁴ Indeed, even dead men have been "accused" through this technology.⁵ In addition, database trawls have considerable potential to solve common property crimes.⁶ In one case, an observant police inspector in Finland noticed a dead mosquito in a stolen vehicle.⁷ The mosquito's body contained human blood from its last meal. Testing the blood against Finland's database yielded a DNA profile match, giving the police a likely suspect.⁸

At least 10,000 people are wrongfully convicted annually for crimes they didn't commit – the plan stop the exoneration process and is a helping hand in human rights abuse
[Shaun King “An exoneration happens every three days in America. What this really says about our justice system” March 24th 2015]

According to the National Registry of Exonerations at the University of Michigan, 1,569 men and women in the United States, most of them African American, have been completely exonerated after being wrongfully convicted and sent to prison. The number of people exonerated for wrongful convictions actually broke a record high in 2014 with 125 exonerations, including six people who were actually on death row awaiting execution. Less than every three days in our country, some man or woman is released back into society after spending a tragic portion of their life behind bars for a crime they never committed. Few injustices can compare to the horror of spending one hour in prison for something you didn't do. Ricky Jackson of Ohio spent 341,640 hours, or 39 years, behind bars before he was exonerated. Just a teenager when he was convicted, he was nearly a senior citizen when he was released. Jonathan Fleming was serving the 25th year of a 25-year sentence when he was finally exonerated after a wrongful conviction. Glenn Ford, on death row for 30 years in Louisiana, was 64 years old when he was released and was exonerated. Stricken with lung cancer, he was only expected to live a few more months. One study determined that nearly 10,000 people are likely to be wrongfully convicted for serious crimes annually. Another study estimates that as many as 340 people are likely to have been executed in the United States before they were properly exonerated. This is a travesty. Anyone who says otherwise is sick. Jump below the fold for more. But the conversation should not end at our conclusion that these wrongful convictions are a travesty. It appears, though, that an entire section of America refuses to believe that police or prosecutors can ever do any wrong at all. Except they do. Often. Detective Louis Scarcella of the NYPD is accused of framing suspects, forcing fake confessions, and using the same single eyewitness for multiple murders. Many men who were wrongfully convicted under his watch have recently been exonerated and 50 of his cases are under review. Chicago has now been called the "false confession capital" as more and more details are uncovered on how the city's police officers are torturing men and women to confess to crimes they didn't commit. They were so good at it, in fact, that Detective Richard Zuley was brought from Chicago to Guantanamo Bay to directly oversee one of the most brutal torturing operation in modern history. The prosecutor of Glenn Ford, shipped off to death row at Angola State Prison in Louisiana in 1984, now openly admits that he was "sick ... arrogant, judgemental, narcissistic and very full of myself" when he sought the wrongful conviction of Ford, who spent 30 years of his life in one of the most brutal prisons in the world. Four police officers in Fort Lauderdale, Florida, were just caught sending texts to one another about "killing nigg*rs" and giving them the "early death penalty." This is not okay. It's wrong. Our justice system is altogether broken. This brokenness, though, must not be understood in some abstract way. It's broken because the people leading it are often sick, disturbed racists who care very little for those on the receiving end of their sickness. It's not good enough to simply give wrongfully convicted men an insufficient check and an apology. **We must repair the broken system so these instances go away for good.**

Genetic surveillance stops crime

Lindley 11 (Brooke, reporter for CTV news Vancouver, “Could a new technique catch a serial rapist in B.C.?” <http://bc.ctvnews.ca/could-a-new-technique-catch-a-serial-rapist-in-b-c-1.597435> 1/18/11 JM)

A contentious DNA analysis that helped snag one of America's most notorious suspected murderers could be used in the hunt for a serial rapist in Vancouver, according to a lawyer who pushed to have it approved south of the border. DNA evidence has linked a single unknown man to three sex assaults in Vancouver, and police say he could be responsible for five more unsolved cases. But the genetic evidence taken at the scene of the assaults doesn't match anyone in the national DNA databank, and police have been left to plead with the public for tips. Vancouver police made a public appeal for help on Thursday, but five days later, there are no new **leads. In the U.K. and some parts of the U.S., police would have had one more option before hitting a dead end.** That's because laws in those places allow investigators to search for partial matches in the offender DNA databank and identify possible family members of unknown criminals. "Using familial DNA searching, you can continue to try and solve a case when those other steps have failed," said Rockne Harmon, a retired California deputy district attorney and one of the technique's biggest proponents. "We do know that crime seems to run in families for complicated

reasons." Privacy advocates have lobbied against allowing the new technique in Canada, arguing that it submits relatives of convicted offenders to unfair genetic surveillance. But thanks to familial DNA searching, Los Angeles police were able to identify Lonnie Franklin Jr. as a suspect in the brutal "Grim Sleeper" killings -- the murders of at least 10 people over 25 years. When investigators compared genetic samples taken from the scenes of the Grim Sleeper murders with California's offender DNA database, there were no exact hits, but investigators were able to create a list of about 150 close matches -- potential family members of the vicious murderer. Analysts then compared the Y sex chromosomes from those 150 people with the Grim Sleeper's, and found a match so close, the offender had to be either the father or the son of the serial killer. As it turns out, Franklin's son had recently been arrested, and swabbed for DNA. When police followed the elder Franklin to a restaurant, they were able to take a sample from his cup, and found a perfect match for the Grim Sleeper's DNA. Familial DNA searching is currently not permitted in Canada, and in the U.S., only California and Colorado allow it, although Virginia appears to be on the brink of approval. Harmon was the driving force behind California's decision to allow the unique searching technique, and he says that Canada should consider it, too. **"Why would you have a law that would keep you from something that can solve crimes?" he told ctvbc.ca. "It'll help make the world a safer place."**

Solvency – Circumvention

Federal oversight can't minimize health surveillance- the biggest offenders are private businesses that use big data

Terry 14 (Nicolas P. Terry. "Big Data Proxies and Health Privacy Exceptionalism." 2014. P. 13-16 https://www.ftc.gov/system/files/documents/public_comments/2014/01/00004-89091.pdf)/EMerz

Big data is so named because of its unprecedented volume and for its "complexity, diversity, and timeliness." Big data refers not only to the collection and storage of extremely large data sets but also the data mining and predictive analytic routines that process the data, the latter being understood as "[t]echnology that learns from experience (data) to predict the future behavior of individuals in order to drive better decisions."⁷⁴ Essentially big data is the latest type of business intelligence (BI), or, to frame it slightly differently, the latest BI analytics are what extract value from big data. ⁷⁵ Not surprisingly, MBA-speak business jargon dominates the space. Thus, according to Gartner, Inc., "'Big data' is high-volume, -velocity and -variety information assets (sic) that demand (sic) cost-effective, innovative forms of information processing for enhanced insight and decision making."⁷⁶ It is important not to underestimate one of these three properties—high-variety. Big data does not use structured databases (or at least is not as reliant on them as previous generation systems such as credit reporting) but is capable of absorbing high-variety data. Data sources (or data pools) continually change and expand; yet big data is seems adept at digesting them. As described in a recent report by the Centre For Information Policy Leadership, While traditionally analytics has been used to find answers to predetermined questions, its application to big data enables exploration of information to see what knowledge may be derived from it, and to identify connections and relationships that are unexpected or were previously unknowable. When organisations employ analytics to explore data's potential for one use, other possible uses that may not have been previously considered often are revealed. Big

data's potential to yield unanticipated insights, the dramatically low cost of information storage and the rapidly advancing power of algorithms have shifted organisations' priorities to collecting and harnessing as much data as possible and then attempting to make sense of it.⁷⁷ The analytics of big data seek to predict the behavior not only of populations or cohorts but also of individuals. In Predictive Analytics: The Power to Predict Who Will Click, Buy, Lie, or Die, computer scientist Eric Siegel explained the distinction as follows: Forecasting makes aggregate predictions on a macroscopic level. How will the economy fare? Which presidential candidate will win more votes in Ohio? Whereas forecasting estimates the total number of ice cream cones to be purchased next month in Nebraska, predictive technology tells you which individual Nebraskans are most likely to be seen with cone in hand.⁷⁸ In the context of health information the business intelligence grail is to identify and exploit a patient's differential health status. According to Neil Biehn with such segmentation "organizations can more easily identify anomalous buying behavior and make intelligent product and offer recommendations that are statistically more likely to be purchased. Biehn continues, "If two customers are alike but not buying the same products, the data analysis can advise which opportunities the sales team might be missing," concluding "[t]his is the type of Big Data viability that moves the needle in the real world."⁷⁹ The privacy implications of individuated big data analysis are profound. Beyond the expropriation or "using" objections to such data collection and processing, such as Commissioner Brill's critique quoted at the beginning of this article,⁸⁰ **the computer modeling of predictive analytics predicts a world of dehumanizing "data determinism,"** described by FTC Chairwoman Edith Ramirez as the judgment of persons "not because of what they've done, or what they will do in the future, but because inferences or correlations drawn by algorithms suggest they may behave in ways that make them poor credit or insurance risks, unsuitable candidates for employment or admission to schools or other institutions, or unlikely to carry out certain functions."⁸¹ Finally, there is the "Doomsday" scenario—a big data breach. The industrial scale data-warehousing model is the antithesis of the "silo" model of data storage used in the pre-information age. The lack of data liquidity (with all of its informational disadvantages) inherent in that model meant that there was little profit or harm in an isolated security breach. The opposite is true with big data storage. However, there are reports that big data brokers are not immune from the same security breaches that are plaguing other businesses.⁸²

Individuals willingly give up their health records by using non-protected mediums- means state legislation can't solve

Terry 14 (Nicolas P. Terry. "Big Data Proxies and Health Privacy Exceptionalism." 2014. P. 19-21 https://www.ftc.gov/system/files/documents/public_comments/2014/01/00004-89091.pdf)/EMerz

Ironically **one of the greatest threats to an individual's health privacy is . . . the individual.** One of the first examples of theretofore HIPAA-protected data migrating to HIPAA-free space was during President George W. Bush's administration at a time when the slowing of the administration's provider-curated EMR program coincided with the launching of PHR platforms by Google and Microsoft.⁹⁶ As a result the HITECH Act architects attempted to protect for the first time health data that migrated from a protected to an unprotected (or marginally protected) zone. However, they chose to do so with a swiftly outmoded, downstream breach notification model.⁹⁷ In the interim different (and unregulated) **technologies have emerged that encourage patient rather than provider curation of health data.** The most obvious example is the federal government's "Blue Button" technology that allows patients to download their records to their

own devices. The “Blue Button” approach to patient access and hence control of their health data has become a rallying cry for many (if not all) patient privacy advocates and has been encouraged by President Obama’s administration. 101 Indeed, then ONC National Coordinator Farzad Mostashari announced a Blue Button Mash-Up challenge to build software for patients designed to combine their downloaded Blue Button information with other data sources.¹⁰² At root such patient curation of health data bespeaks autonomy and is symbolic of patient ownership of the data. However, it fails to take into account one practical limitation—the canonical version of the record will remain in the provider’s control – and one legal limitation— that only the provider-curated copy is protected by HIPAA-HITECH. In contrast, the patient-curated “copy” attracts little meaningful privacy protection. Well-meaning privacy advocates should think carefully before promoting this autonomy-friendly “control” model until data protection laws (not to mention patient education as to good data practices) catch up with patient curated data. A similarly dichotomous result is likely as the medically quantified self develops. The quantified-self movement concentrates on personal collection and curation of inputs and performance. 103 Obviously, health, wellness and medically inflected data will likely comprise a large proportion of such data. A similar, if less formal, scenario is emerging around health and wellness apps on smartphones and connected domestic appliances such as scales and blood pressure cuffs. 104 Smartphones are crammed with sensors for location, orientation, sound and pictures that add richness to data collection.¹⁰⁵ And there is ongoing and explosive growth in the medical apps space that seeks to leverage such sensors. **More and more we are going to demand control of information about ourselves and generate medically inflected and core health data about ourselves.** These processes will in most cases lead to medically inflected data that exists outside of the HIPAA-HITECH protected zone.

Circumvention inevitable- police legally collect DNA all the time

Scherr 13 (Albert E. Scherr. Professor of Law, University of New Hampshire. “Genetic Privacy & the Fourth Amendment: Unregulated Surreptitious DNA Harvesting.” 2013. P. 448-449. <http://georgialawreview.org/wp-content/uploads/2015/02/Download-PDF-V47-I2-Scherr.pdf>)/EMerz

So why does the law regard genetic privacy issues in criminal and civil contexts differently? Why do surreptitious-DNA harvesting practices by private parties get appreciably more legal scrutiny than such practices by police? One broad-brush answer is that society places more value on the public-safety goal of solving crimes than on the needs of amateur genealogists, divorce lawyers, and genetic researchers. That broad-brush answer is unsatisfactory. Current Fourth Amendment jurisprudence on surreptitious harvesting creates an all-or-nothing dynamic. If a putative suspect—one for whom the police have some reasonable suspicion but not enough for a search warrant—abandons his DNA in a public place, the police can do with the sample what they will, without limitation. The police can do the same for a suspect for whom they have only a hunch. They can also do the same for someone for whom they have no suspicion, including a victim or a witness. They can do so without a suspect’s, a witness’s, or a victim’s consent or knowledge. If surreptitious DNA harvesting is not a “search” under the Fourth Amendment, the police can do whatever they want with anyone’s DNA.

Solvency - Alt Causes

Too many alt causes

Outdated legal codes

THEIR AUTHOR Gostin, an internationally recognized scholar in law and public health, professor of Law at Georgetown University; Professor of Public Health at the Johns Hopkins University; and the Director of the Center for Law & the Public's Health at Johns Hopkins and Georgetown Universities, November 2001 – (Lawrence, “Public Health Law In An Age Of Terrorism: Rethinking Individual Rights And Common Goods”, published on HealthAffairs vol 21 no. 6)//roetlin

The public health law infrastructure is equally deficient. The law establishes the mission, functions, and powers of public health agencies. Yet public health laws are highly antiquated, after many decades of neglect. Very little consideration has been given to modernizing these laws to reflect advances in public health practice and constitutional law. Reform of public health law is essential to ensure that public health agencies have clear missions and functions, stable sources of financing, adequate powers to avert or manage health threats, and restraints on powers to maintain respect for personal rights and liberties.

Underfunding and infrastructure

THEIR AUTHOR Gostin, an internationally recognized scholar in law and public health, professor of Law at Georgetown University; Professor of Public Health at the Johns Hopkins University; and the Director of the Center for Law & the Public's Health at Johns Hopkins and Georgetown Universities, November 2001 – (Lawrence, “Public Health Law In An Age Of Terrorism: Rethinking Individual Rights And Common Goods”, published on HealthAffairs vol 21 no. 6)//roetlin

As a result of chronic underspending, the public health infrastructure is badly deteriorated.² Public health agencies lack the capacity to conduct essential public health services at a level of performance that matches the constantly evolving threats to the health of the public. Critical components of that infrastructure include a well-trained workforce, electronic information and communications systems, rapid disease surveillance and reporting, laboratory capacity, and emergency response capability.

Faulty allocations and income inequality

THEIR AUTHOR Gostin, an internationally recognized scholar in law and public health, professor of Law at Georgetown University; Professor of Public Health at the Johns Hopkins University; and the Director of the Center for Law & the Public's Health at Johns Hopkins and Georgetown Universities, November 2001 – (Lawrence, “Public Health Law In An Age Of Terrorism: Rethinking Individual Rights And Common Goods”, published on HealthAffairs vol 21 no. 6)//roetlin

In this civil and property rights society, the tone has been distinctly antigovernment. The State has been perceived as inefficient, bureaucratic, and burdensome. Citizens have opposed taxation and broad health and welfare spending as well as oppressive regulation. From a funding perspective, this has meant that health dollars have been allocated primarily to advanced biotechnology and health care, which serve the needs of individual patients, particularly those who can afford private health insurance. Funding

for traditional prevention and population-based services represents only a small fraction of health spending, estimated at around 1 percent at the state level and less than 5 percent at the federal level.¹

Solvency – A2 Judicial Modelling

No court influence now

Liptac 08, (Adam, New York Times US, “U.S. Court Is Now Guiding Fewer Nations,” September 17, 2008, <http://www.nytimes.com/2008/09/18/us/18legal.html?pagewanted=all>)/IB

But now American legal influence is waning. Even as a debate continues in the court over whether its decisions should ever cite foreign law, a diminishing number of foreign courts seem to pay attention to the writings of American justices. “One of our great exports used to be constitutional law,” said Anne-Marie Slaughter, the dean of the Woodrow Wilson School of Public and International Affairs at Princeton. “We are losing one of the greatest bully pulpits we have ever had.” From 1990 through 2002, for instance, the Canadian Supreme Court cited decisions of the United States Supreme Court about a dozen times a year, an analysis by The New York Times found. In the six years since, the annual citation rate has fallen by half, to about six. Australian state supreme courts cited American decisions 208 times in 1995, according to a recent study by Russell Smyth, an Australian economist. By 2005, the number had fallen to 72. The story is similar around the globe, legal experts say, particularly in cases involving human rights. These days, foreign courts in developed democracies often cite the rulings of the European Court of Human Rights in cases concerning equality, liberty and prohibitions against cruel treatment, said Harold Hongju Koh, the dean of the Yale Law School. In those areas, Dean Koh said, “they tend not to look to the rulings of the U.S. Supreme Court.” The rise of new and sophisticated constitutional courts elsewhere is one reason for the Supreme Court’s fading influence, legal experts said. The new courts are, moreover, generally more liberal than the Rehnquist and Roberts courts and for that reason more inclined to cite one another. Another reason is the diminished reputation of the United States in some parts of the world, which experts here and abroad said is in part a consequence of the Bush administration’s unpopularity around the world. Foreign courts are less apt to justify their decisions with citations to cases from a nation unpopular with their domestic audience. “It’s not surprising, given our foreign policy in the last decade or so, that American influence should be declining,” said Thomas Ginsburg, who teaches comparative and international law at the University of Chicago. Aversion to Foreign Law The adamant opposition of some Supreme Court justices to the citation of foreign law in their own opinions also plays a role, some foreign judges say. “Most justices of the United States Supreme Court do not cite foreign case law in their judgments,” Aharon Barak, then the chief justice of the Supreme Court of Israel, wrote in the Harvard Law Review in 2002. “They fail to make use of an important source of inspiration, one that enriches legal thinking, makes law more creative, and strengthens the democratic ties and foundations of different legal systems.”

Surveillance K Links

Trying to curtail the medical surveillance state starts from the wrong position—ignoring the interaction between the self and the collective body leads to reinforcing the biopolitics of the state and recreates the impacts of the 1AC through risk calculations

Baur and Olsen 9 (Susanne, professor at the University of Copenhagen, and Jan, professor at University of Copenhagen, “Observing the Others, Watching Over Oneself: themes of medical surveillance in society” file:///C:/Users/Jessi/Downloads/3252-5562-2-PB.pdf 2009 JM)

This paper is an attempt to explore the reconfiguration of space, body and gaze in recent biomedicine. The constellations of the body and the medical gaze and their location in space were closely intertwined with specific epistemologies of medical science and practice at different historical periods. Michel Foucault localized the birth of the clinic in the spatialization of disease and bodies, which took place with the structuring of hospitals according to nosological categories (Foucault 1963). Inspired by Foucault’s analyses of the clinical space, David Armstrong coined the **term ‘surveillance medicine’ as ‘a significant alternative model to hospital medicine and pathology,** which emerged during the 20th century **around the observation of seemingly healthy populations’** (Armstrong 1995: 393). Medical thinking in terms of surveillance embraces probabilistic rationality and prediction, which have continuously proliferated in medical research and in public health, for instance in early diagnostics or decision-making in the clinic and in preventive medicine. Drawing on examples from clinical diagnostics on the one hand and population health surveillance on the other hand, we explore recent reconfigurations of the clinical gaze in western biomedicine. In these recent forms of diagnostic monitoring an augmented space of digital visualization and statistical data, an abundance of numbers and images is created and the clinical gaze is being delocalized. In large-scale epidemiological studies, **health data from whole populations are used for risk calculations that inform policy making.** Both the body and society are governed by data analyses and numerical profiling; interventions are made in a rationality of prevention at ever earlier stages. This paper thus refers to developments that take place within western biomedicine and are products of the latter; in a global perspective, however, there remains a digital divide in terms of access and availability of information technologies. Our themes – **monitoring the patient-body and population surveillance** – can be read as **representing** both poles of **biopower,** in the sense the term has been introduced by Foucault: **the gaze is directed both upon the individual body and the self as well as upon the collective ‘population body’.** Taking up these two poles of biopower, we explore the digitized and transparent individual patient body of the clinic on the one hand and the epidemiological databases originating through public health surveillance practices on a population scale on the other hand. In doing so, we pay particular attention to the more distributed forms of contemporary surveillance, which go beyond the classic spatialization of the body in the clinic and the accounts of Jeremy Bentham’s panopticon (Foucault 1975). Drawing on surveillance studies, we take inspiration in the concept of panopticism and synopticism, as proposed by Thomas Mathieson (1997). In other words, **we are asking about who is observing and who is being watched.** What constellations between individuals, bodies and data do we encounter in the worlds of biomedicine and epidemiology? Which specific modes of knowing do such digital assemblages bring about? What is the location of the body and knowledge on the body – is it still in the macroanatomic body or rather on the hard drive or in population databases? How do imaging and visualization techniques mediate medical procedures, clinical and political decision-making? What kinds of

body and control practices do we face with the data avalanches of imaging techniques and databasing in the health sector? In exploring these questions, we will examine selected biomedical sites and contexts in which surveillance is at work – often as taken-for granted and widely accepted if not desired practice. By exploring the effects of surveillance from perspectives situated in the cultural studies of medicine, this article attempts to expose the digital reconfiguration of the body as object of medical monitoring and intervention.

Health monitoring relies on statistics that are informed by the biopolitical state—their evidence is predicated off of skewed data epistemes have constructed to support themselves

Baur and Olsen 9 (Susanne, professor at the University of Copenhagen, and Jan, professor at University of Copenhagen, “Observing the Others, Watching Over Oneself: themes of medical surveillance in society” file:///C:/Users/Jessi/Downloads/3252-5562-2-PB.pdf 2009 JM)

Monitoring population health has a long tradition in demography, government statistics and social policy; in 18th century political arithmetic, population thinking, probability theory and the field of political economy were closely entangled (Desrosières 1998). The production of population data has long been intertwined with biopolitical frameworks, e.g. of central state governance, life insurance and actuary reasoning. The panoptic constellation of monitoring and managing a collective ‘population body’ continues to play a central role in contemporary concepts and practices of evaluation and governance. In public health, surveillance, as defined by Alexander Langmuir, means ‘the continued watchfulness over the distribution and trends of incidence through the systematic collection, consolidation and evaluation of morbidity and mortality reports and other relevant data’ for purposes of prevention of disease or injury’ (Langmuir 1992). Epidemiologist Alfredo Morabia described surveillance as the ‘bedrock of public health’ (Morabia 2000: 22); securing generation and access to valid data is critical in epidemiologic research. Survey and monitoring techniques bring about statistical entities and make them perceptible; subsequent data visualization works as a tool for inspection of multiple aspects ‘at a glance’, similar to techniques of mapping. A survey is an act of viewing, examining and inspecting; the term ‘survey’ originated in 19th century land surveys and geology (Converse 1987). Different from land surveys for the mapping of geographical space, the data patterns visualized in epidemiology refer to multiple levels and diverse contexts. The extent and modalities in which data are collected has differed between countries; often so-called ‘routine data’ such as demographic data on births and deaths (‘vital statistics’) are collected for the entire population. The Nordic countries maintain central population registries which allow record linkage between different sectors (for example population registries, social services and health care data). Health research relies heavily on data from these routine administrative monitoring techniques as well as on the data recording systems of health-related registries. Registry research has become a sub-discipline in epidemiologic research in the Nordic countries (Mortensen 2004). Further, specific epidemiological studies are usually conducted for representative samples of the population, for example longitudinal follow-up studies or cross-sectional surveys. Health surveys among representative or random samples of the population are used to gain quick ‘comparative snapshots’ of the population’s health. Not only has the anatomic atlas of the macroanatomical body been replaced by a statistical and digitized body; at a population level health and disease are documented for instance in national cancer atlases, as done for example in Denmark since the 1970s. Visual mapping as part of descriptive epidemiology creates new epistemological infrastructures; the surveillant gaze takes up these new data patterns as grids of orientation, in

which one is able to navigate. More than a metaphor the visual episteme plays is key to design and display of health statistics. Alluding to the objectivity effects of photography, Catherine Waldby has described epidemiological surveillance as an imaging process that is conceived to provide ‘accurate photographs of population health’ (Waldby 1996: 99). Graphs, charts and tables visualise and spatialize data; they mediate research design and risk communication. While as part of state administrative procedures, routine data are recorded and stored to evaluate health and disease at the population level, it is also new forms of accountability that drive the implementation of monitoring and evidence-based decision-making; these in turn nurture the need for documentation, visibility and transparency. This **data hunger of quality management has contributed to the vast bureaucracies that accompany medical practice and health care systems.**

The plan fails – only questioning broader surveillance structures solves

Whetton 13 (Suzanne, Lecturer at University of Tasmania, “Health informatics discourses and the use of personal health information: Which piper, which tune, who pays?”, July 2013, University of Tasmania, <http://eprints.utas.edu.au/17110/2/whole-Whetton-thesis.pdf>)/JL

The health informatics community has the option of continuing to participate in discussions within the parameters established by the privacy framework, or it may go beyond these parameters to challenge the dominant approach to personal health information management and, in doing so, address issues beyond a private trouble/public interest level. To adopt this form of critique would mean exploring alternative approaches to conceptualizing information management issues. It would mean challenging the representation of the privacy framework as neutral. It would also mean identifying links between the collection of personal health information and broader social practices and power relations in Australia. Such a challenge would ‘invoke broader questions of social control and warn of the dangers of the creeping surveillance society’ (Bennett, 2011, p. 485). It would explain this creeping surveillance society in terms of disciplinary power and control not only of some individuals and groups but of the population as a whole. The willingness to critique is increasingly imperative as the Australian Government progresses its plans for an Individual Health Identifier (IHI) and a Personally Controlled Electronic Health Record (PCEHR). As health information networks expand to intersect with other personal information networks, creating the potential for new, more widespread and more intrusive forms of surveillance, it becomes even more imperative that the health informatics community participate in the critical debate.

Biopolitical disease surveillance sets the stage for the militarization of health and society – culminates in authoritarianism

Youde 10 (Jeremy Youde is a professor of Political Science at the University of Minnesota Duluth, “BIOPOLITICAL SURVEILLANCE AND PUBLIC HEALTH IN INTERNATIONAL POLITICS” p. 31-34)/CW

The other major concern about the increased surveillance associated with biopolitics focuses on overly militarized responses. As we redefine infectious disease as a security threat, critics have warned that governments may inappropriately rely on traditional security apparatuses to address the problem. Deudney raised a similar concern with the environment. If environmental degradation is deemed a security threat that concerns national and international stability, it may lead political leaders to call on military forces to confront the threat. Militaries may be useful for traditional threats,

but they may be poorly equipped to respond to environmental degradation or infectious disease.⁷³ **Militaries can and do play a role in biopolitical surveillance.** Some of this is concentrated on the members of the armed forces. **Military commanders have an obvious interest in ensuring that their forces are healthy** and able to respond to situations as they arise. The military often creates its own parallel public health infrastructure specifically for its members. Like any other public health system, the **military** seeks to monitor, treat, and prevent illnesses. However, those same **capabilities can be extended to monitor civilian populations.** Militaries may have laboratory and diagnostic capabilities beyond those of traditional public health organizations. They may also have the logistical and organizational capabilities to facilitate rapid deployment in epidemic regions and the communication technologies to communicate with WHO officials in a timely manner.⁷⁴ Indeed, in developing countries, the military may be the only organization with these capabilities. **Such an extension of military capabilities into decidedly nonmilitary realms raises fears of the militarization of society.** Chretien et al. suggest that some **governments have essentially turned the provision of public health services and disease surveillance over to military forces** “by providing health services for civilians in remote areas and reporting military surveillance data to the ministry of health.”⁷⁵ **This extends the role of the military into a more prominent place within the domestic arena.** The connections between military forces and public health are not limited to developing countries. **Within the United States,** much of the global infectious disease surveillance system is linked to the Department of Defense (DoD). In the 1990s, the U.S. government established the Global Emerging Infectious Surveillance and Response System (GEIS). The system set up mobile laboratories that could quickly respond to disease outbreaks around the world. Interestingly, GEIS comes under the administrative aegis of the DoD, not one of the diplomatic or humanitarian bureaucracies in the government. “Their location in the DoD, as opposed to the United States Agency for International Development (USAID) or Center for Disease Control (CDC) demonstrates how seriously the United States views the response to infectious disease as a key national security strategy.”⁷⁶ **Surveillance becomes inextricably linked with the military and the deployment of military personnel in foreign countries.** Fears arise that **this could cloud the state’s response, leading to rely too heavily on military, as opposed to health, means.** It also could potentially place the military in a strong position for ensuring and regulating the population’s health. Pandemic influenza preparations have further stoked fears about the links between biopolitical surveillance and the role of the military. In 2005, U.S. President Bush released the document National Strategy for Pandemic Influenza. The document focuses on preparedness, surveillance, and containment. This strategy calls upon government officials at the local, state, and federal government to develop mitigation strategies, build greater lines of communication between officials, and collaborate with international partners. To contain an outbreak, the strategy acknowledges that military capabilities may be used domestically to provide additional medical facilities and to engage in “infrastructure-sustainment activities.”⁷⁷ Bush expanded upon the military’s potential role during a press conference. He remarked: “If we had an outbreak somewhere in the United States, do we not then quarantine that part of the country, and how do you then enforce a quarantine? When—it’s one thing to shut down airplanes; it’s another thing to prevent people from coming in to get exposed to the avian flu. And who best to be able to effect a quarantine? One option is the use of a military that’s able to plan and move.”⁷⁸ Some have seized upon this potential role for the military as proof that **governments are using the threat of an infectious disease outbreak to introduce an overly militaristic response that could border on martial law.** The United States’ pandemic influenza program specifically carves out a special role for the military in providing medical services, enforcing quarantines, and ensuring continuity of government and economy. Some critics of this program have argued that it essentially allows for the declaration of martial law.⁷⁹ Greger argues that using the **military** to institute some sort of **quarantine,** as he suggests the National Strategy for Pandemic Influenza allows, **would** serve only to **increase stigmatization and discrimination. This would drive people further away from medical attention** and exacerbate an epidemic.⁸⁰ Irwin Redlener, the dean of Columbia University’s Mailman School of Public Health, called the militarized aspect of the government’s response “extraordinarily draconian” and equated it with martial law.⁸¹ More bombastically, Michael Osterholm, an advisor to the U.S. government on its pandemic flu preparations, paints the following doomsday scenario: “Border security would be made a priority, especially to protect potential supplies of pandemic-specific vaccines from nearby desperate countries. Military leaders would have to develop strategies to defend the country and also protect against domestic insurgency with armed forces that would likely be compromised by the disease.”⁸² He goes on to discuss the fallout from the government’s failure to properly securitize pandemic influenza: “Someday, after the next pandemic has come and gone, a commission much like the 9/11 Commission will be charged with determining how well government, business, and public health leaders prepared the world for the catastrophe when they had clear warning. What will be the verdict?”⁸³ Osterholm’s prognostication envisions widespread looting and the need for roaming militias to ensure access to drug supplies as he envisions millions of people dying. He speaks strongly about the need to protect our borders to prevent people from coming to the United States to get America’s drugs. This also suggests that pharmaceutical manufacturing capabilities may become a national security issue, as could access to antiretroviral drugs in developing countries. Garrett notes that pharmaceutical patent protections are stoking anti-Western sentiments in some countries, threatening to create greater problems.⁸⁴ These **concerns about the role of the military in responding to a disease outbreak get to the very heart of surveillance.** Fears have

arisen¶ about the potential for overt coercion going hand in hand with increased government surveillance in public health. Government officials¶ have linked increasing adherence with universal standards embodied¶ within increased health surveillance with a loss of sovereignty,¶ attempts to weaken the state, and domination by Western states.

*****Impact Framing*****

No War - General

No risk of global war – economic costs, democracy, treaties, interdependence and multiple other reasons check conflict escalation

[John **Aziz**, former economics and business editor @ The Week. “Don't worry: World War III will almost certainly never happen” **2014**]

Next year will be the seventieth anniversary of the end of the last global conflict. There have been points on that timeline — such as the Cuban missile crisis in 1962, and a Soviet computer malfunction in 1983 that erroneously suggested that the U.S. had attacked, and perhaps even the Kosovo War in 1999 — when a global conflict was a real possibility. Yet today — in the shadow of a flare up which some are calling a new Cold War between Russia and the U.S. — I believe the threat of World War III has almost faded into nothingness. That is, **the probability of a world war is the lowest it has been in decades**, and perhaps the lowest it has ever been since the dawn of modernity. This is certainly a view that current data supports. Steven Pinker's studies into the decline of violence reveal that deaths from war have fallen and fallen since World War II. But **WE should not just assume that the past is an accurate guide** to the future. Instead, we must look at the factors which have led to the reduction in war and try to conclude whether the decrease in war is sustainable. So what's changed? Well, the first big change after the last world war was **the arrival of mutually assured destruction**. It's no coincidence that the end of the last global war coincided with the invention of atomic weapons. The possibility of complete annihilation **provided a huge disincentive to launching and expanding total wars**. Instead, the great powers now fight proxy wars like Vietnam and Afghanistan (the 1980 version, that is), rather than letting their rivalries expand into full-on, globe-spanning struggles against each other. Sure, accidents could happen, but the possibility is incredibly remote. More importantly, **nobody in power wants to be the cause of Armageddon**. But what about a non-nuclear global war? Other changes — economic and social in nature — have made that highly unlikely too. **The world has become much more economically interconnected** since the last global war. Economic **cooperation treaties and free trade agreements have intertwined the economies** of countries around the world. This has meant there has been a huge rise in the volume of global trade since World War II, and especially since the 1980s. Today consumer goods like smartphones, laptops, cars, jewelery, food, cosmetics, and medicine are produced on a global level, with supply-chains criss-crossing the planet. An example: The laptop I am typing this on is the cumulative culmination of thousands of hours of work, as well as resources and manufacturing processes across the globe. It incorporates metals like tellurium, indium, cobalt, gallium, and manganese mined in Africa. Neodymium mined in China. Plastics forged out of oil, perhaps from Saudi Arabia, or Russia, or Venezuela. Aluminum from bauxite, perhaps mined in Brazil. Iron, perhaps mined in Australia. These raw materials are turned into components — memory manufactured in Korea, semiconductors forged in Germany, glass made in the United States. And it takes gallons and gallons of oil to ship all the resources and components back and forth around the world, until they are finally assembled in China, and shipped once again around the world to the consumer. **In a global war**, global trade becomes a nightmare. **Shipping becomes more expensive** due to higher insurance costs, and riskier because it's subject to seizures, blockades, ship sinkings. Many goods, intermediate components or resources — including energy supplies like coal and oil, components for military hardware, etc, may become temporarily unavailable in certain areas. Sometimes — such as occurred in the Siege of Leningrad during World War II — **the supply of food can be cut off**. This is why countries hold strategic reserves of things like helium, pork, rare earth metals and oil, coal, and gas. These kinds of breakdowns were troublesome enough in the economic landscape of the early and mid-20th century, when the last global wars occurred. But in today's ultra-globalized and ultra-specialized economy? The level of **economic adaptation — even for large countries** like Russia and the United States with lots of land and natural resources — required to adapt to a world war **would be crushing**, and huge numbers of business and livelihoods would be wiped out. In other words, global trade **interdependency has become**, to borrow a phrase from finance, **too big to fail**. It is easy to complain about the reality of **big business** influencing or **controlling politicians**. But big business has just about the most to lose from breakdowns in global trade. A practical example: If Russian oligarchs make their money from selling gas and natural resources to Western Europe, and send their children to schools in Britain and Germany, and lend and borrow money from the West's financial centers, are they going to be willing to tolerate Vladimir Putin starting a regional war in Eastern Europe (let alone a world war)? Would the Chinese financial industry be happy to see their multi-trillion dollar investments in dollars and U.S. treasury debt go up in smoke? Of course, world wars have been waged despite international business interests, but the world today is far more globalized than ever before and well-connected domestic interests are more dependent on access to global markets, components and resources, or the repayment of foreign debts. These are huge disincentives to global war. But what of the military-industrial complex? While other businesses might be hurt due to a breakdown in trade, surely military contractors and weapons manufacturers are happy with war? Not necessarily. As the last seventy years illustrates, it is perfectly possible for weapons contractors to enjoy the profits from huge military spending without a global war. And the uncertainty of a breakdown in global trade could hurt weapons contractors just as much as other industries in terms of losing access to global markets. That means weapons manufacturers may be just as uneasy about the prospects for large-scale war as other businesses. Other changes have been social in nature. Obviously, **democratic countries do not** tend to **go to war** with each other, and the spread of **liberal democracy is correlated against the decrease in war** around the world. But the spread of internet technology and social media has brought the world much closer together, too. As late as the last world war, populations were separated from each other by physical distance, by language barriers, and by lack of mass communication tools. This means that it was easy for war-mongering politicians to sell a population on the idea that the enemy is evil. It's

hard to empathize with people who you only see in slanted government propaganda reels. Today, people from enemy countries can come together in cyberspace and find out that the "enemy" is not so different, as occurred in the Iran-Israel solidarity movement of 2012. More importantly, violent incidents and deaths can be broadcast to the world much more easily. Public shock and disgust at the brutal reality of war broadcast over YouTube and Facebook makes it much more difficult for governments to carry out large scale military aggressions. For example, the Kremlin's own pollster today released a survey showing that 73 percent of Russians disapprove of Putin's handling of the Ukraine crisis, with only 15 percent of the nation supporting a response to the overthrow of the government in Kiev. There are, of course, a few countries like North Korea that deny their citizens access to information that might contradict the government's propaganda line. And sometimes countries ignore mass anti-war protests — as occurred prior to the Iraq invasion of 2003 — but generally a more connected, open, empathetic and democratic world has made it much harder for war-mongers to go to war. The greatest trend, though, may be that the world as a whole is getting richer. Fundamentally, wars arise out of one group of people deciding that they want whatever another group has — land, tools, resources, money, friends, sexual partners, empire, prestige — and deciding to take it by force. Or they arise as a result of grudges or hatreds from previous wars of the first kind. We don't quite live in a superabundant world yet, but the long march of human ingenuity is making basic human wants like clothing, water, food, shelter, warmth, entertainment, recreation, and medicine more ubiquitous throughout the world. This means that countries are less desperate to go to war to seize other people's stuff. But the tendency toward inertia is strong. It is clear at least that the incentives for world war are far lower than they were in previous decades, and the disincentives are growing. The apocalyptic visions of a new world war between nations or empires that three generations of children have been raised into continue to diminish.

Empirics prove that mutually assured destruction prevents war because all actors are rational and nuclear war is fundamentally unwinnable

Tepperman 9 (Jonathan Tepperman is an editor, writer, and analyst working on international affairs. He was appointed Managing Editor of Foreign Affairs—the magazine published by the New York-based Council on Foreign Relations—in February 2011. Tepperman has a BA in English Literature from Yale University and law degrees from Oxford and NYU. He is Vice Chairman of the Halifax International Security Forum and a Fellow of the New York Institute of Humanities. “How Nuclear Weapons Can Keep You Safe” 8/28/9 <http://www.newsweek.com/how-nuclear-weapons-can-keep-you-safe-78907>///CW

The argument that nuclear weapons can be agents of peace as well as destruction rests on two deceptively simple observations. First, nuclear weapons have not been used since 1945. Second, there's never been a nuclear, or even a nonnuclear, war between two states that possess them. Just stop for a second and think about that: it's hard to overstate how remarkable it is, especially given the singular viciousness of the 20th century. As Kenneth Waltz, the leading "nuclear optimist" and a professor emeritus of political science at UC Berkeley puts it, "We now have 64 years of experience since Hiroshima. It's striking and against all historical precedent that for that substantial period, there has not been any war among nuclear states."¶ To understand why—and why the next 64 years are likely to play out the same way—you need to start by recognizing that all states are rational on some basic level. Their leaders may be stupid, petty, venal, even evil, but they tend to do things only when they're pretty sure they can get away with them. Take war: a country will start a fight only when it's almost certain it can get what it wants at an acceptable price. Not even Hitler or Saddam waged wars they didn't think they could win. The problem historically has been that leaders often make the wrong gamble and underestimate the other side—and millions of innocents pay the price.¶ Nuclear weapons change all that by making the costs of war obvious, inevitable, and unacceptable. Suddenly, when both sides have the ability to turn the other to ashes with the push of a button—and everybody knows it—the basic math shifts. Even the craziest tin-pot dictator is forced to accept that war with a nuclear state is unwinnable and thus not worth the effort. As Waltz puts it, "Why fight if you can't win and might lose everything?"¶ Why indeed? The iron logic of deterrence and mutually assured destruction is so compelling, it's led to what's known as the nuclear peace: the virtually unprecedented stretch since the end of World War II in which all the world's major powers have avoided coming to blows. They did fight proxy wars, ranging from Korea to Vietnam to Angola to Latin America. But these never matched the furious destruction of full-on, great-power war (World War II alone was responsible for some 50 million to 70 million deaths). And since the end of the Cold War, such bloodshed has declined precipitously. Meanwhile, the nuclear powers have scrupulously avoided direct combat, and there's very good reason to think they always will. There have been some near misses, but a close look at these cases is fundamentally reassuring—because in each instance, very different leaders all came to the same safe conclusion.¶ Take the mother of all nuclear standoffs: the Cuban missile crisis. For 13 days in October 1962, the United States and the Soviet Union each threatened the other with destruction. But both countries soon stepped back from the brink when they recognized that a war would have meant curtains for everyone. As important as the fact that they did is the reason why: Soviet leader Nikita Khrushchev's aide Fyodor Burlatsky said later on, "It is impossible to win a nuclear war, and both sides realized that, maybe for the first time."¶ The record since then shows the same pattern repeating: nuclear-armed enemies slide toward war, then pull back, always for the same reasons. The best recent example is India and Pakistan, which fought three bloody wars after

independence before acquiring their own nukes in 1998. Getting their hands on weapons of mass destruction didn't do anything to lessen their animosity. But it did dramatically mellow their behavior. Since acquiring atomic weapons, the two sides have never fought another war, despite severe provocations (like Pakistani-based terrorist attacks on India in 2001 and 2008). They have skirmished once. But during that flare-up, in Kashmir in 1999, both countries were careful to keep the fighting limited and to avoid threatening the other's vital interests. Sumit Ganguly, an Indiana University professor and coauthor of the forthcoming *India, Pakistan, and the Bomb*, has found that on both sides, officials' thinking was strikingly similar to that of the Russians and Americans in 1962. The prospect of war brought Delhi and Islamabad face to face with a nuclear holocaust, and leaders in each country did what they had to do to avoid it.

No War – Nuclear Winter

Nuke war is unlikely – conventional weapons are prioritized and there is no impact to nuclear winter

Brian **Dunning** (co-founded and was chief technology officer for Buylink, technical editor for FileMaker Advisor Magazine, hosted and produced Skeptoid: Critical Analysis of Pop Phenomenon, winner of the 2010 Parsec Award for "Best Fact Behind the Fiction Podcast".[14] In August 2010 he received an award recognizing his contributions in the skeptical field from the Independent Investigations Group (IIG) during its 10th Anniversary Gala) **2011** “Nuclear War and Nuclear Winter” <http://skeptoid.com/episodes/4244>

Other cataclysmic events have proven that the nuclear winter scenario is not at all far-fetched. The eruption of Mt. Pinatubo in the Philippines, also in 1991, threw some 17 million tons of particulates into the upper atmosphere that caused global temperatures to drop by about a degree for several months. Sunlight dropped by 10%. This temperature drop did not, however, have any long-term effect on agriculture. Pinatubo was only a blip compared to the K-T extinction event of some 65 million years ago, when a theorized asteroid hit us with one hundred million megatons of destructive force, lighting virtually the entire world on fire. The evidence of this is called the K-T boundary, a layer of clay found all around the world. Sunlight was reduced by 10-20% for ten years, which caused a massive cascading extinction of species from plants to herbivores to carnivores. But we shouldn't expect anything like this to happen from a nuclear war. Times continue to change, including the nature of warfare. Nations no longer stockpile the megaton class weapons popular in the 1950s and 1960s; typical yields now are a fraction of a megaton. The United States' conventional capability is now SO GOOD that it can effectively destroy an entire nation's ability to wage large-scale war overnight, using only conventional weapons. But that doesn't mean the nuclear forces are no longer needed. Should a superpower strike first against the United States with nuclear weapons, the response would more than likely be nuclear, bringing Mutually Assured Destruction into play. But what about a small nation striking first? What about nukes in the trunks of cars parked in major cities? In the modern era, it's much less clear that any superpower would necessarily have anyone to shoot back at. And so, while the nuclear winter scenario is a good prediction of the effects of a worst-case scenario, when all the variables are at their least favorable, the strongest probabilities favor a much less catastrophic nuclear autumn; and even those effects depend strongly on variables like whether the war happens during the growing season. A bomb in Los Angeles might result in history's worst firestorm, while a bomb in the mountains of Pakistan might create no fires at all. The simple fact is that there are too many unpredictable variables to know what kind of climate effects the smoke following nuclear fires will produce, until it actually happens. Obviously we're all very mindful of the many terrible implications of nuclear combat, and if it ever happens, the prospect of a nuclear autumn will likely be among the least of our concerns. The physicist Freeman Dyson perhaps described it best when he said "(TTAPS is) an absolutely atrocious piece of science, but I quite despair of setting the public record straight... Who wants to be accused of being in favor of nuclear war?"

Nuclear winter can't be proven—their studies are politically biased

AIP (American Institute of Physics) **2011** “Wintry Doom”

<https://www.aip.org/history/climate/Winter.htm>

Atmospheric scientists were well-placed to take up the question of smoke from a nuclear war.

Measurements like Crutzen's of the effects of soot and the like had greatly advanced since the 1975 study. Richard Turco and others,

working on the dinosaur extinction problem, had developed a computer model of a haze-filled atmosphere, and it had occurred to them that dust lofted by the explosions of a nuclear world war might have effects comparable to the dust from an asteroid impact. Meanwhile the surprising observation that a giant dust storm was cooling the atmosphere of Mars had inspired two more scientists, James Pollack and Brian Toon, into new calculations of dust effects. This led them into work with Carl Sagan on how the aerosols emitted by volcanic eruptions could affect climate. Now these scattered scientists joined forces to calculate the consequences of an exchange of hydrogen bombs. Their ominous conclusion was that the sooty smoke from burning cities could bring on a "nuclear winter" — months or even years of cold so severe it would gravely endanger living creatures.⁽⁸⁾ The scientists did this work mainly for public consumption. When they announced their results in 1983, it was with the explicit aim of promoting international arms control. Surely the likelihood that all-out nuclear war was literally suicidal would persuade nations to reduce their arsenals? As a side effect, the studies helped to improve scientific understanding of how aerosols could affect climate.⁽⁹⁾ The computer models were so simplified, and the data on smoke and other aerosols were still so poor, that the scientists could say nothing for certain. Critics, mostly people opposed to nuclear disarmament, quickly pointed out the deficiencies. In the mid 1980s, detailed studies confirmed that a nuclear war would probably alter global climate temporarily. But as Schneider and a coauthor explained in a widely read article, it was not likely to bring an apocalyptic winter, but it would bring a damaging "nuclear fall." (According to more recent research, smoke following even a limited, regional war would probably dim sunlight enough to kill many more people through starvation than would die directly under the bombs.)⁽¹⁰⁾

No War - A2 Irrational Actors

Even the wildest leaders are deterrable – if Mao and Stalin didn't start a nuclear war then nobody will

Tepperman 9 (Jonathan Tepperman is an editor, writer, and analyst working on international affairs. He was appointed Managing Editor of Foreign Affairs—the magazine published by the New York-based Council on Foreign Relations—in February 2011. Tepperman has a BA in English Literature from Yale University and law degrees from Oxford and NYU. He is Vice Chairman of the Halifax International Security Forum and a Fellow of the New York Institute of Humanities. “How Nuclear Weapons Can Keep You Safe” 8/28/9 <http://www.newsweek.com/how-nuclear-weapons-can-keep-you-safe-78907>)/CW

Nuclear pessimists—and there are many—insist that even if this pattern has held in the past, it's crazy to rely on it in the future, for several reasons. The first is that today's nuclear wannabes are so completely unhinged, you'd be mad to trust them with a bomb. Take the sybaritic Kim Jong II, who's never missed a chance to demonstrate his battiness, or Mahmoud Ahmadinejad, who has denied the Holocaust and promised the destruction of Israel, and who, according to some respected Middle East scholars, runs a messianic martyrdom cult that would welcome nuclear obliteration. These regimes are the ultimate rogues, the thinking goes—and there's no deterring rogues. ¶ But are Kim and Ahmadinejad really scarier and crazier than were Stalin and Mao? It might look that way from Seoul or Tel Aviv, but history says otherwise. Khrushchev, remember, threatened to "bury" the United States, and in 1957, Mao blithely declared that a nuclear war with America wouldn't be so bad because even "if half of mankind died ... the whole world would become socialist." Pyongyang and Tehran support terrorism—but so did Moscow and Beijing. And as for seeming suicidal, Michael Desch of the University of Notre Dame points out that Stalin and Mao are the real record holders here: both were responsible for the deaths of some 20 million of their own citizens. ¶ Yet when push came to shove, their regimes balked at nuclear suicide, and so would today's international bogeymen. For all of Ahmadinejad's antics, his power is limited, and the clerical regime has always proved rational and pragmatic when its life is on the line. Revolutionary Iran has never started a war, has done deals with both Washington and Jerusalem, and sued for peace in its war with Iraq (which Saddam started) once it realized it couldn't win. North Korea, meanwhile, is a tiny, impoverished, family-run country with a history of being invaded; it's overwhelming preoccupation is survival, and every time it becomes more belligerent it reverses itself a few months later (witness last week, when Pyongyang told Seoul and Washington it was ready to return to the bargaining table). These countries may be brutally oppressive, but nothing in their behavior suggests they have a death wish.

Yes War - General

Nuclear war is possible – India, Pakistan, China, North Korea, and terrorism

Duz 14 (Sergei Duz is a writer for the Voice of Russia, “Nuclear war more likely than ever: threat comes from South Asia and nuke terrorists” 1/2/14 http://sputniknews.com/voiceofrussia/2014_01_02/Nuclear-war-more-likely-than-ever-threat-comes-from-South-Asia-and-nuke-terrorists-1915/)

The main reason for this is the ongoing erosion of the non-proliferation regime, experts say. The Non-Proliferation Treaty has been continuously bashed as “unfair,” but it is in fact the exclusive geopolitical environment and ensuing nuclear responsibility of a handful of states that has so far kept mankind away from the total wipeout. ¶ The theory of reciprocal deterrence wasn’t there all the time. A long two decades after the A-bomb was invented, the powers who had it in their arsenals thought of it as fair game, a weapon you could actually use in a conflict, rather than a deterrent. ¶ The Cuban Missile Crisis came as a wakeup call. It brought home the danger of nuclear weapons and led to the non-proliferation regime as conceived by the so-called “nuclear club,” which included the Soviet Union, the US, Britain, France and China. Under the NPT, only countries that made and set off a nuclear bomb prior to January 1, 1967 were granted the status of a nuclear power. Washington, London and Moscow were the first to sign the treaty in 1968, with Paris and Beijing committing themselves to it years later. But all of the signatories abided by the rules. ¶ Those times have passed. NPT controls have become so loose and new nuclear powers so numerous, there’s no counting them anymore. India, Pakistan, Israel and North Korea have never even applied for “nuclear club” membership. On the contrary, they created their own shadow club with no rules. The official club with all its nukes poses less threat to the human race than this bunch of neophytes. Volatility has spread, though South Asia plays a separate role in it. ¶ “Some South Asian countries have a full arsenal of nukes,” says Pyotr Topychkanov, a senior researcher at the International Security Center of the Institute of World Economy and International Relations at the Russian Academy of Sciences. “They have enough nuclear warheads and vehicles. They have only one equal in the Middle East, which is Israel. Iran has no nuclear weapons yet.” ¶ “The same is true of North Korea, which has weapon-grade fissile nuclear materials. They have built and tested explosive devices, but it’s still a long way to fully-fledged nukes for them.” ¶ The countries that really cause concern are India, Pakistan and China. China and Pakistan are longtime partners, including their nuclear agenda. India borders on China and Pakistan and is certainly aware of this partnership. It doesn’t have faith in either. Were a conflict to spark off, it would be trilateral and include not only India and Pakistan, but India, Pakistan and China.” ¶ About 30 to 40 countries are on their way towards nuclear status. Many of them are inches away, like Germany, Japan and Canada, who could have had an A-bomb long ago – but simply didn’t wish to. The Sunni Saudi Arabia has hinted it will make a bomb the moment the Shiite Iran lays its hands on one. ¶ The principle of uncontrolled nuclear proliferation was formulated back in 1965, when Pakistan’s foreign chief Zulfikar Ali Bhutto said: “There’s a Christian bomb, a Jewish bomb and now even a Hindu bomb. It’s high time we got a Muslim bomb.” ¶ Nuclear terrorism is yet another problem. Terrorists can’t make a nuke. But they do know how to pit countries and eventually provoke them to an inadequate response. There’s no lacking of short-sighted politicians who can take that last step, for instance Republican Senator Steve Buyer who nudged the government after 9/11 to nuke Tora Bora caves, instead of sending a task force to Afghanistan. ¶ In that sense, the threat of a full-scale nuclear war has transformed into the menace of a local nuclear conflict, or even a string of them. You shouldn’t be lulled by their seeming locality though, since a precise nuclear strike will be felt globally, says PIR Center Internet Project Director Andrei Baklitsky. ¶ A nuclear conflict will have dramatic consequences for all of us, because nuclear weapons are weapons of mass destruction. They are not selective. A nuclear attack in the Middle East would be most tragic, first of all, because of its huge oil fields, and a burning oil field is a big trouble. Secondly, any strike on the Middle East will skyrocket oil prices across the world and plunge the global economy back into an even worse economic crisis than before. ¶ The consequences of using an A-bomb in an Indo-Pakistani conflict would be just as grave for these densely populated countries, driving millions of refugees out of their homes and turning agriculture lands into barren wastes.” ¶ Unfortunately, the world is home to many paradoxes. Despite a drop in amounts of nuclear weapons worldwide, the collapse of the bipolar world has made the risk of a manmade apocalypse palpable.

Nuclear war is possible – accidents and poor risk calculation

Gobry 14 (Pascal-Emmanuel Gobry is a writer and fellow at the Ethics and Public Policy Center. His writing has appeared at Forbes, The Atlantic, First Things, Commentary Magazine, The Daily Beast, The Federalist, Quartz, and other places, “The end of nuclear deterrence” 12/12/14 <http://theweek.com/articles/441584/end-nuclear-deterrence>)//CW

Since the end of the Cold War, the public mind has pretty much forgotten about the existence of nuclear weapons, except in the Middle East. And yet, they still exist — thousands and thousands of them, ready to destroy all of human civilization several times over. In response, a new nuclear disarmament movement is getting underway.¶ This week, I attended the Vienna conference on the Humanitarian Impact of Nuclear Weapons. (Full disclosure: one of the sponsoring organizations, the Nuclear Threat Initiative, invited me all expenses paid.) The conference was striking in describing the utter, absolute destruction that can be caused by nuclear weapons.¶ I came in as a supporter of the doctrine of nuclear deterrence, which says that the world's major power-brokers should have nuclear weapons as a way of preventing a new world war. Advocates of this doctrine point to the Cold War, which never went hot, as a success for deterrence.¶ But supporters of disarmament — including the Red Cross, Pope Francis, and, believe it or not, Henry Kissinger — say that's wrong. These are serious, sober-minded people, not just pie-in-the-sky activists, and they say that deterrence doesn't work in a multipolar world. Instead, the presence of nuclear weapons just creates an incentive for more proliferation, as small countries try to one-up their regional adversaries.¶ What's more — and this was the most striking thing at the conference — they point to the risks inherent in the existence of nuclear weapons. History has recorded many close calls in which nuclear weapons were almost fired. (This, in turn, could have led to a nightmare scenario where an accidental strike is met with a riposte, triggering Armageddon.) For example, in 2007, six U.S. nuclear warheads went missing because of a bureaucratic mistake. Then there's the story of the U.S. nuclear missile launch officer with the drug problem.¶ If this stuff can happen in the U.S., which has the oldest, best-funded, and most sophisticated nuclear force, one shudders to think about what might be going on in Russia or Pakistan. Given the way human nature and technology works, advocates warn, it is not a matter of if, but when a catastrophic accident will occur. The only solution is simply to ban nuclear weapons for good.¶ This is where I started rethinking my position. A lot of research has shown that human brains are wired in such a way that it is very difficult for us to rationally process risks that have a very low probability but a very high cost. This is essentially what caused the 2008 financial crisis: a very low risk was treated as non-existent, so that when the event occurred, the system collapsed. This is exactly the kind of risk we are talking about with nuclear weapons.

Peace isn't inevitable – framing it as such increases the risk of conflict by altering threat perceptions

Jehangir 12 {Hamza, Research Associate on a National Priorities Research Project (Texas A&M – Qatar), Masters of Arts, International Relations and Globalization (University of Salford, UK) and Bachelor of Social Science, International Relations (SZABIST, Islamabad, Pakistan), “Realism, Liberalism and the Possibilities of Peace,” E-IR, 2/19, <http://www.e-ir.info/2012/02/19/realism-liberalism-and-the-possibilities-of-peace/>}

When Plato said that only the dead have seen the end of war, his remarks echoed the history of his time. War was all too often of an occurrence in ancient Greece, so much so that it might've been considered a necessity in some cases but a menace in others. From Plato's time to the contemporary period of political science and international relations theorizing, philosophers and theorists have been primarily concerned with discovering human nature, its role in social and political life as well as ways and means of giving meaning to human life. Peace has been central to this process of inquiry and thought which has led humanity to its present condition. Theories of peace and war have been central to this cognitive exercise. However, in the last three centuries, relations between nation-states have taken the central stage. Theories have come to light which illuminate our understanding of how nations interact, what causes them to go to war, what motivations might they have to establish peace and how these causes and motivations might be managed to reach a stage where peace is not “an armistice in a war” as Thucydides (431BCE) stated but “a virtue, a state of mind, a disposition for benevolence, confidence, justice” as Baruch Spinoza (1670) considered it to be. Nonetheless, there are still considerable obstacles that remain in the pursuit of peace. Theorists have outlined them and literature has shed light on these hurdles whereas in some cases the pre-occupation with peace has also led towards a more hostile state of international affairs amongst nations as well as peoples.

Yes great power war – realism, fear of worse alts, failed political processes, violent human nature – their evidence twists definitions to exclude our scenarios

Lyon 14 {Rod, director of the strategy and international program at the Australian Strategic Policy Institute, executive editor of The Strategist, “No, Great Power War Isn’t Obsolete,” The Diplomat, 8/22, <http://thediplomat.com/2014/08/no-great-power-war-isnt-obsolete/>}

August has seen a wave of reflection on major war. It’s a question we seem to revisit every time the key anniversaries of WWI and WWII roll around, but especially this year because it’s the 100th anniversary of the outbreak of WWI. Some pundits are keen to draw parallels between 1914 and 2014—though on its face it’s not apparent to me why 2014 should be more like 1914 than 2013. Academic strategists familiar with their disciplinary history will know that the issue of whether major war’s obsolete received a detailed coverage back in Survival magazine in the late 1990s. To save readers the trouble of digging through their archives, one contributor, John Mueller, argued that it was obsolete—gone the way of slavery and dueling—while others wrestled partly over how to define obsolescence and even more over how to define major war. Was the Vietnam War “major?” Was the Cold War a “war?” Michael Mandelbaum argued that perhaps major war was just a poor policy option nowadays—because of the steep rise in the costs and the thin rewards for success. It’s intriguing that the question about the obsolescence of war is typically qualified by the adjective “major.” No one seems particularly keen to claim that nasty little wars—in particular, nasty little wars in faraway places—are obsolete, perhaps because they patently aren’t. From memory, Mueller didn’t want to call those conflicts “wars,” though; he saw those more as “opportunistic predation” (That’s the reason the cover of his book, *The Remnants of War*, features an image—from the Balkan conflict in 1991—of a thug swigging from a bottle.) Then 9/11 came along and sideswiped that whole debate. The nasty little wars of the 1990s didn’t stay in faraway places. A superpower got up and marched off to war—albeit a war against al Qaeda, its supporters, and all its works. Somewhere along the line the mission became conflated with a host of other problems, and Washington ended up obsessing about the Global War on Terror for longer than it probably should have done. But Washington’s behavior at least answered one question related to the Big One: did great powers still go to war? Yes. Now, the question still unanswered—unanswered since 1945 if you think major war has to be hot; unanswered since 1991, if you think major war can be cold—is whether or not major powers still go to war with each other. Psychologist Steven Pinker has recently argued that the better angels of our nature are making us turn away from violence. I’m not wholly convinced by his argument—the better angels of our nature seem pretty militant to me, and always have been. (See Ephesians, 6:12.) But academic research from a few decades back suggests that great-power wars against each other aren’t common. Jack Levy in his research on war in the international system between 1495 and 1975 found only nine of what he would call “world wars”—wars where almost all great powers were involved. Much more commonly, he found “interstate wars”—113 of which engaged a great power. I cite those figures to underline two points. First, if world wars are rare, maybe we don’t need special explanations to say why there hasn’t been one since 1945 (hot) or 1991 (cold). Second, that definition of major war is still a problem. Let’s put aside the academic arguments and look straight at the case that most worries us. Is a great-power war between the U.S. and China possible? I think we could answer that question directly: possible, yes; likely, no. Great powers, especially nuclear-armed ones, don’t go to war with each other lightly. But sometimes wars happen. And they aren’t accidents. They’re about international order. They’re about, as Raymond Aron said, the life and death of states. And the principal reason for fighting them is that not doing so looks like a worse alternative. Moreover, the paths to war—including rare major-power war—are not reserved solely for conventionally-armed states. Where both powers are nuclear-armed we should expect a conflict, even one at the lower rungs of the escalation ladder, to be fought with a high degree of political control, and an understanding that the objectives of the conflict are limited. Naturally, it would help if both sides shared a common understanding of where the firebreaks were between conventional and nuclear conflict, and already had in place a set of crisis-management procedures, but it’s possible that neither of those conditions might exist. (Neither would prevent a war, but both would provide a better sense of the likely escalation dynamics of a particular conflict.) Indeed, it’s because major

war is possible that we retain such a keen interest in war termination. Unconstrained escalation doesn't lead to a happy place.

Yes War – A2 Interdependence

Trade doesn't solve war – empirics prove it only applies for two Western nations

Hafner-Burton and Montgomery 12 (Emilie M. Hafner-Burton PhD is a professor at the University of California, San Diego. Alexander H. Montgomery is Department Chair and Associate Professor of Political Science at Reed College. He has a B.A. 1996, Physics, University of Chicago. M.A. 1999, Energy and Resources, University of California at Berkeley. M.A. 2003, Sociology, Stanford University. Ph.D. 2006, Political Science, Stanford University. He has published articles on dismantling proliferation networks and on the effects of social networks of international organizations on interstate conflict. His research interests include political organizations, social networks, weapons of mass disruption and destruction, social studies of technology, and interstate social relations. “War, Trade, and Distrust: Why Trade Agreements Don't Always Keep the Peace”)//CW

Many before us have been skeptical of the claim that interdependence promotes peace among states. It is well understood that international institutions can have adverse effects on conflicts among member states, mismanaging crisis situations and worsening conflict intensity (Gallarotti, 1991), or producing rivalry among states due to their relative social positions (Hafner-Burton and Montgomery, 2006). We are nevertheless among the first to directly tackle the principal claims supporting the liberal thesis that trade institutions dampen conflict, and to propose an explanation for why conflict often characterizes outcomes. This is important because we observe significant instances of violent conflict between PTA members: the 1990s alone included border clashes between Armenia and Azerbaijan, members of the Commonwealth of Independent States (CIS); the outbreak of war in the Great Lakes, with foreign involvement in the Democratic Republic of Congo from Angola, Namibia, Rwanda, Uganda, and Zimbabwe, all members of the Common Market for Eastern and Southern Africa (COMESA); the Iraqi invasion of Kuwait and violent border clashes between Egypt and Sudan, all members of the Council of Arab Economic Unity (CAEU); and fighting between India and Pakistan, members of the South Asian Association for Regional Cooperation (SAARC). North and South Korea frequently are involved in violent incidents; both are members of the Global System of Trade Preferences Among Developing Countries (GSTP). A majority of these disputants are also members of the WTO. Powers contends that in Africa, 16% of all militarized international disputes registered by the Correlates of War data from 1950 to 1992 occurred between PTA members (Powers, 2003, 2004). These examples show clearly that members of the same trade institution can and do conflict, that conflict often breaks out into violence, and that commerce is frequently not enough to keep the peace. They stand in sharp contrast to the liberal expectation that trade institutions dampen conflict through an increase in trust. Trade institutions do increase repeated contact between members; however, contact does not necessarily build trust or a sense of community. The lessons of European integration theory suggest that building community through upgrading the common interest between PTA members requires a minimum level of homogeneity: a pluralist social structure, a high level of economic and industrial development, and ideological similarity (Haas, 1960). Security communities are also most likely to develop through economic relations among Western nations, as even the most institutionalized forms of integration in the developing world cannot be said to create the mutual identification at the core of the concept (Bearce, 2003). Although evidence suggests that economic integration has led to the formation of a collective identity and trust among member states of the European Union over time, it is well understood that “democratic features of liberal democracies enable the community in the first place” (Russett and Oneal, 2001: 166). The liberal argument that trade institutions dampen conflict by building trust among leaders to overcome commitment problems consequently chiefly applies to the Western world of advanced democratic nations. Yet the overwhelming majority of trade institutions manage trade between partners that include at least one developing or nondemocratic state, and there is no evidence to show that these institutions build trust over asymmetrical distribution of gains. Boehmer, Gartzke, and Nordstrom cogently argue that states that belong to many different international institutions may have a greater number of international interests to competitively defend and a greater array of opportunities to enact aggressive behavior in defense of those perceived interests (Boehmer et al., 2002). We extend this argument one step further; trade institutions create and shape states' interests, affecting not only the number of potential issues for dispute, but also establishing conditions that can lead to distrust. Institutions do this by placing states in social positions of power within international relations, which shape expectations for behavior by defining which issues are legitimate for contestation via military means and enable states to coerce, bribe, reward, or punish each other. We address this possibility in the next section.

Leaders value short-term benefits of aggression over long-term economic harms – economic MAD fails

Solomon 15 (Jon Solomon is a writer at Information Dissemination, a naval information blog. He is citing Eric Lorber and Jacquelyn Schneider. Eric Lorber is a PhD candidate in Political Science at Duke and a JD candidate at the University of Pennsylvania Law School. His research focuses on civil-military relations, the use of force against non-state actors, and the credibility of security guarantees. He has been a fellow at the Duke University American Grand Strategy Program, worked for the RAND Corporation, and is currently an adjunct staff member at the Institute for Defense Analyses. Jacquelyn Schneider is a PhD student in Political Science at George Washington University. Her research focuses on the intersection of national security, technology, and political psychology and covers a diverse range of topics from intelligence to unmanned technologies to cyber policy. She has won awards for Best Graduate Student Paper at both the International Studies Association Annual Meeting (Foreign Policy Section and International Security Studies Section) and the Southwestern Social Sciences Association Annual Meeting and is a two-time award winner of the AFCEA National Intelligence Writing Contest. She holds a B.A. in Economics and Political Science from Columbia University and a M.A. in Political Science from Arizona State University. “The Fallacy of “Mutually Assured Economic Destruction” 4/24/15 <http://www.informationdissemination.net/2015/04/the-fallacy-of-mutually-assured.html>///CW

In an excellent War on the Rocks article last week, Eric Lorber and Jacquelyn Schneider argued that economic sanctions cannot serve as standalone deterrents against aggression by another state. They noted in particular how prospect theory and credibility considerations affect the utility of threatened economic punishments as a deterrent within an opponent’s decision-making: ¶ “...while these new, sophisticated sanctions often cause medium- and long-term damage to a country’s economy, the prospect of such damage may not deter aggressive actors from taking immediate actions contrary to U.S. interests. For example, in the case of Russia, while the sanctions have certainly taken a toll, the Russian economy, when supported by capital reserves, is sufficiently resilient to put off the worst impacts of the sanctions for a few years. In the short-term, however, Russia has been able to annex Crimea and exercise significant influence in rebel-controlled areas deep in Eastern Ukraine. Thus, while the prospect of economic damage may loom down the road, this risk may be insufficient to deter an aggressive actor from pursuing short-term benefits... ¶ ...Likewise and in the Russia context, given the discord among European Union member states about how to respond to additional Russian aggression, Russia may not believe that the United States and the European Union will impose additional, extremely painful sanctions on the country, and therefore may not be deterred from engaging in additional destabilizing action in Ukraine.” ¶ They conclude that a defender must understand “the aggressive actor’s intentions and motivations” in order to determine whether deterrence by economic punishment is likely to succeed: ¶ “Policymakers in Washington need to do better than conclude that ‘these sanctions will cause economic pain, therefore they will deter.’ Rather, they must analyze whether the particular sanctions on the table will influence a malicious actor’s decision-making.” ¶ In other words, the opponent’s leaders’ political objectives and perceptions of the strategic circumstances (including pressures stemming from domestic popular passions) are central variables in determining a deterrence policy’s probable efficacy. ¶ While all deterrence policies face this challenge to some degree, it tends to especially impact deterrence by punishment. The amount of threatened pain must significantly exceed the opponent’s discomfort with continuing to honor the status quo. A threat of certain national economic catastrophe is not sufficient if opponent’s leaders value some other political objective more highly or suffer from exceptional ‘strategic desperation.’ Japanese leaders proved that exact point in their decision for war during the late summer and early fall of 1941. ¶ **This does not change if a threatened economic catastrophe would affect both the aggressor and the defender. This is the premise behind ‘mutually assured economic destruction,’ a concept rooted in the longstanding idea that the likelihood of war between competing states decreases as their economic interdependence increases.** In theory, two competing countries should be mutually restrained by the risk of devastating their entwined economies. One does not have to look that far back into history to see the fallacy in this thinking: the aggressors in both World Wars valued other objects more highly than the prospects of economic disaster (to the extent economics factored into their calculus at all).

Trade doesn’t solve war

Martin et. al. ‘8 (Phillipe, University of Paris 1 Pantheon—Sorbonne, Paris School of Economics, and Centre for Economic Policy Research; Thierry MAYER, University of Paris 1 Pantheon—Sorbonne, Paris School of Economics, CEPII, and Centre for Economic Policy Research, Mathias THOENIG, University of Geneva and Paris School of Economics, The Review of Economic Studies 75, 2008)

Does globalization pacify international relations? The “liberal” view in political science argues that increasing trade flows and the spread of free markets and democracy should limit the incentive to use military force in interstate relations. This vision, which can partly be traced back to Kant’s *Essay on Perpetual Peace* (1795), has been very influential: The main objective of the European trade integration process was to prevent the killing and destruction of the two World Wars from ever happening again.¹ Figure 1 suggests² however, that during the 1870–2001 period, the correlation between trade openness and military conflicts is not a clear cut one. The first era of globalization, at the end of the 19th century, was a period of rising trade openness and multiple military conflicts, culminating with World War I. Then, the interwar period was characterized by a simultaneous collapse of world trade and conflicts. After World War II, world trade increased rapidly, while the number of conflicts decreased (although the risk of a global conflict was obviously high). There is no clear evidence that the 1990s, during which trade flows increased dramatically, was a period of lower prevalence of military conflicts, even taking into account the increase in the number of sovereign states.

Yes War – A2 Deterrence

Deterrence fails – correlation isn’t causation and complex situations mean nuclear war is always possible – prefer magnitude to probability

Pelopidas 15 (Benoît Pelopidas is a lecturer (assistant professor with tenure) in international relations at the University of Bristol (Global Insecurities Center) and an affiliate of the Center for International Security and Cooperation at Stanford University. He has been awarded two international prizes for his research, from the International Studies Association and the James Martin Center for Nonproliferation Studies. His research focuses on the global politics of nuclear vulnerability, cases of near-use of nuclear weapons, and lessons learned from global nuclear history and French nuclear policies. He is currently completing an edited volume on the experience of the Cuban missile crisis worldwide as an early set of experiences of global nuclear vulnerability and its implications for security, responsibility, and alliance dynamics. “Challenging the Assumptions of Classical Nuclear Deterrence Theory: The War That Must Never Be Fought” 3/12/15, can be downloaded at <http://www.hoover.org/research/challenging-assumptions-classical-nuclear-deterrence-theory>///*CW*

We cannot know for sure what caused the absence of great-power wars over the last seventy years.¹⁷ We are left with dueling counterfactuals and the need to bet and trust.¹⁸ The opponents of the goal of a world without nuclear weapons create a false dichotomy between what we know for a fact and what we hypothesize. On the one hand, they argue, is the hard fact of the nuclear peace; on the other hand are other hypotheses or counterfactual reasonings. But the nuclear peace is not a fact. It is a hypothesis, trying to link two observable facts: the existence of nuclear weapons in the world since 1945 and the absence of war between the United States and the Soviet Union during the same period. The fact is that the idea of the nuclear peace and competing explanations share the same status: all are hypotheses, requiring a rerun of the history of the last seventy years without nuclear weapons to see whether war would have broken out. The nuclear peace hypothesis is no less a counterfactual than its rivals.¹⁹ It faces the challenge of proving a negative. In these circumstances, faith in the nuclear peace becomes a bet or a matter of trust.²⁰ Moreover, we know that complex and tightly coupled systems like nuclear weapons are doomed to fail eventually, even if the frequency of failure is very low. This is because their complexity and tight coupling don’t allow for anticipating and testing of every possible failure.²¹ Given this epistemological challenge, which relies ultimately on the trust one puts in one potential cause of peace at the expense of the others and on the expected timing of nuclear versus non-nuclear disasters, at least one question arises: is seventy years a high enough standard of evidence for us to surrender our fate to nuclear weapons forever?²²

Multiple factors complicate nuclear deterrence

Lyon 15 (Dr Rod Lyon is a Fellow - International Strategy. Rod was most recently a Senior Analyst with ASPI. He has previously lectured in International Relations at the University of Queensland where he taught courses on conflict, international security, and civil-military relations. His research interests focus on a range of problems associated with global security, nuclear strategy and Australian security. He previously worked in the Strategic Analysis Branch of the Office of National Assessments between 1985 and 1996. As a Fulbright scholar in 2004, he was a visiting research fellow at Georgetown University in Washington DC, researching a project on the future of security partnerships in the post-September 11 environment. He was appointed to the National Consultative Committee on International Security Issues in April 2005. “The New Dilemmas of Nuclear Deterrence” 7/3/15 <http://thediplomat.com/2015/07/the-new-dilemmas-of-nuclear-deterrence/>///*CW*

With nuclear modernisation programs under way across a range of countries, Russia asserting its right to deploy nuclear weapons in the Crimea, NATO reviewing the role of nuclear weapons in the alliance, and a recent report in the US arguing for a more versatile arsenal of tactical nuclear weapons, it's clear the world's revisiting an old problem: how to build effective nuclear deterrence arrangements.¶ Since the end of the Cold War, thinking about deterrence issues has been mainly confined to the academic and think-tank world. But policymakers are now having to re-engage with those issues. And the problem has a new twist: we no longer enjoy the luxury of a bipolar world. Indeed, as Therese Delpech observed in her RAND monograph Nuclear deterrence in the 21st century, nowadays 'the actors are more diverse, more opaque, and sometimes more reckless'.¶ Done properly, deterrence is a contest in threats and nerve, or—to use Thomas Schelling's phraseology—'the manipulation of risk'. (The chapter so titled in Schelling's *Arms and Influence* is a great starting point for anyone wanting to think through the broader deterrence problem.) That helps explain why some thought the concept 'ugly'. It's hard to make a policy threatening massive damage to societies and civilians sound noble and aspirational. Still, the bad news is that the alternatives are worse. And if deterrence is going to remain the dominant approach in nuclear weapon strategy, we need to fit the strategy to the contemporary geopolitical environment.¶ Historical experience of the deterrence problem is greatest in relation to two competing superpowers, separated by intercontinental distances, endowed with the resources to manage challenges, and both knowing well the costs of major war. We've had relatively little experience of nuclear deterrence in contests between giants and midgets (US v North Korea), between established and fast-rising powers (US v China), and amongst players in a multipolar system. Even our understanding of the role nuclear deterrence plays in relations between regional rivals (think South Asia) remains under-developed. It's entirely possible that the old superpower deterrence model might not fit those new challenges well. Indeed, maybe the old model doesn't even fit the US–Russian strategic relationship well these days: Russia's no longer governed by a sclerotic CPSU.¶ Some years back INSS' Elaine Bunn (now a senior official in the Obama administration) wrote a paper unpacking the notion of 'tailored' deterrence introduced in the 2006 Quadrennial Defense Review. True, deterrence has always been characterized by particular strategic wrinkles, but Bunn's paper was an attempt to bring those wrinkles to the fore in relation to the possibility of a nuclear-armed North Korea, Iran, or transnational terrorist group. Her exploration of three different forms of tailoring—tailoring to specific actors and specific situations; tailoring capabilities; and tailoring communications—helps to illustrate the growing complexity of the deterrence challenge.¶ It now seems likely that we're headed back into a set of complicated deterrence debates. A strategy that might make sense in one strategic setting—for example, a degree of restraint by a giant engaged in a conflict with a midget—might well risk flagging unintended messages in another. In the giant–midget case, almost any crossing of the nuclear threshold by the giant risks imposing a set of desperate choices on the midget's leadership, and desperate choices tend not to be good ones.¶ Deterrence in the context of an established power versus a fast-rising power has a different wrinkle. One effect of a deterrence-dominated world is to reward passivity over initiative. As Schelling notes, in the world of the arthritic, passivity tends to be the default choice. But fast-rising powers aren't arthritic. Turning one aside from a revisionist agenda will probably be more challenging than deterring another established player.¶ Multipolarity brings its own wrinkles, including a more mixed set of adversarial relationships, asymmetrical contests, inadvertent signalling, and third-party exploitation of bilateral rivalries. Capability issues become more vexed: actors require the capabilities to deter and defend against another, but also the residual capabilities to remain a player in other contests. The pressure must surely be towards larger rather than smaller arsenals. And reputational issues become more dominant: just as Margaret Thatcher fought the Falklands War in part to show the Soviet Union that the West wouldn't buckle in the face of force, so too players in a multipolar nuclear world will want to show resolve in one contest because of its implications for others.¶ Finally, and perhaps most controversially, deterrence turns upon a credible threat to cross the nuclear threshold if push comes to shove. During the 1960s the US advocated a doctrine of flexible response, arguing for a model of deterrence that would fail in small packets rather than in one catastrophic breakdown. Notwithstanding the giant–midget problem outlined above, there's usually good sense behind such a doctrine: it makes deterrent threats more credible, avoids global annihilation in any initial crossing of the nuclear threshold, maintains a degree of 'intra-war deterrence' from the options still on the table, and optimizes prospects for negotiated war termination. But historically the doctrine invited questions about the relative balance between usability and credibility in US nuclear policy—questions buried rather than resolved by the end of the Cold War.¶ Tailoring, messaging, usability, credibility, and thresholds: I suspect policymakers will soon be thinking about all those questions again, across a range of deterrence relationships.¶

Asymmetry of multipolar world takes out deterrence theory

Goodby 15 (James E. Goodby has served in the US Foreign Service, achieving the rank of Career Minister, and was appointed to five ambassadorial-rank positions by Presidents Carter, Reagan, and Clinton, including ambassador to Finland. He taught at Georgetown, Syracuse, and Carnegie Mellon Universities and is Distinguished Service Professor Emeritus at Carnegie Mellon. Ambassador Goodby has worked with former Secretary of State George Shultz at Hoover since 2007. He is a research fellow at the Hoover Institution and a senior fellow with the Center for Northeast Asia Policy Studies at the Brookings Institution.¶ He was a

Distinguished Service Professor at Carnegie Mellon University from 1989 to 1999 and is now a professor emeritus. Selected for the US Foreign Service through competitive examinations in 1952, Goodby rose to the rank of career minister in the Senior Foreign Service and was given five presidential appointments to ambassadorial rank, including ambassador to Finland (1980–81). During his Foreign Service career he was involved as a negotiator or as a policy adviser in the creation of the International Atomic Energy Agency, the negotiation of the limited nuclear test ban treaty, START, the Conference on Disarmament in Europe, and cooperative threat reduction (the Nunn-Lugar program). Goodby's awards include the Presidential Distinguished Service Award, the State Department's Superior and Distinguished Honor Awards, and the Commander's Cross of the Order of Merit of Germany. He was named a Distinguished Fellow of the US Institute of Peace in 1992. He was the recipient of the inaugural Heinz Award in Public Policy in 1995. In 1996, he was awarded an honorary doctor of laws degree by the Stetson University College of Law. **"The New Dilemmas of Nuclear Deterrence" 7/3/15 <http://thediplomat.com/2015/07/the-new-dilemmas-of-nuclear-deterrence/>///CW**

During the Cold War, nuclear deterrence was essentially a US-Soviet calculation. After the Cold War, China began to loom larger in US planning, but the premise that deterrence was essentially a bilateral interaction remained. In the future, situations that are not demonstrably bilateral may become the norm. Even now, but especially in the event global nonproliferation efforts fail to meet current challenges, the nuclear deterrence calculations of the United States and other states armed with nuclear weapons will have to be based on a much more complex set of global and regional dynamics. In such a system, if nuclear weapons were used or even if their use were threatened, there would be an action-and-reaction effect that might involve several nations, not just two as in the Cold War paradigm. For example, the alert status of nuclear delivery systems probably would be changed to a higher level of readiness by several nations. There might be movements of air and naval forces equipped with nuclear weapons. A great deal of ambiguity can be expected in the event of a nuclear explosion as to which nation had detonated a nuclear weapon. Once nuclear weapons attacks occurred, terminating the war could be difficult. Conceivably, three or four nuclear-armed states could become engaged in hostilities that might have originated with just one nation initiating a nuclear attack. The dynamics of nuclear conflict in the Middle East, South Asia, or Northeast Asia would require qualitatively different deterrent calculations from those the five Non-Proliferation Treaty nuclear weapons states have been accustomed to making. "Catalytic" nuclear war was one of the worries of the Kennedy and Johnson administrations. It meant that the United States could become engaged in a nuclear war because a nuclear-armed US ally had used a nuclear weapon and their common adversary, the Soviet Union, had decided to use nuclear weapons in response. Those worries would also figure in a complex world of perhaps fifteen or so nuclear-armed states, which would also include the unknown capabilities of terrorist groups and the likelihood that cyber-mischief would accompany any nuclear attack. How does one measure strategic stability in such a situation?

Luck, not deterrence, accounts for nuclear peace

Pelopidas 15 (Benoît Pelopidas is a lecturer (assistant professor with tenure) in international relations at the University of Bristol (Global Insecurities Center) and an affiliate of the Center for International Security and Cooperation at Stanford University. He has been awarded two international prizes for his research, from the International Studies Association and the James Martin Center for Nonproliferation Studies. Luck is too often taken as a confirmation that nuclear deterrence kept the peace.²⁸ But luck should not be misread as successful deterrence.²⁹ More accurately, as Thomas Schelling noted, leaders of nuclear-armed states can make threats that "leave something to chance"³⁰—recognizing that things could spiral out of control and nuclear weapons could be used even if they do not intend to use them—to make those threats more credible. But including luck in a successful deterrence strategy, as if you could control it, is both a conceptual confusion and a retrospective illusion.³¹ Luck was on our side this time, but this is not a consequence of purposeful action. For example, during the night of October 26–27, 1962, at the height of the Cuban missile crisis, an American U-2 spy plane strayed into Soviet airspace over the Arctic. Soviet fighter jets scrambled to intercept the U-2 while F-102 interceptors were sent to escort it home and prevent Soviet MIGs from freely entering US airspace. Given the circumstances, the F-102s conventional air-to-air missiles had been replaced with nuclear-tipped ones and their pilots could decide to use nuclear weapons. According to Scott Sagan in *The Limits of Safety*, "the interceptors at Galena were armed with the nuclear Falcon air-

to-air missiles and, under existing safety rules, were authorized to carry the weapons in full readiness condition in any 'active air defense' mission."³² Fortunately, the spy plane turned back and the Soviet jets held their fire.³³ There are many other instances in which deterrence cannot account for favorable outcomes.³⁴ Robert McNamara was direct about the role of luck during the Cuban missile crisis: According to former Soviet military leaders, at the height of the crisis, Soviet forces in Cuba possessed 162 nuclear warheads, including at least 90 tactical warheads. [And the United States was not aware of that at the time.] At about the same time, Cuban President Fidel Castro asked the Soviet ambassador to Cuba to send a cable to Soviet Premier Nikita Khrushchev stating that Castro urged him to counter a U.S. attack with a nuclear response. Clearly, there was a high risk that in the face of a U.S. attack, which many in the U.S. government were prepared to recommend to President Kennedy, the Soviet forces in Cuba would have decided to use their nuclear weapons rather than lose them. Only a few years ago did we learn that the four Soviet submarines trailing the U.S. Naval vessels near Cuba each carried torpedoes with nuclear warheads. Each of the sub commanders had the authority to launch his torpedoes. The situation was even more frightening because, as the lead commander recounted to me, the subs were out of communication with their Soviet bases, and they continued their patrols for four days after Khrushchev announced the withdrawal of the missiles from Cuba. The lesson, if it had not been clear before, was made so at a conference on the crisis held in Havana in 1992. . . . Near the end of that meeting, I asked Castro whether he would have recommended that Khrushchev use the weapons in the face of a U.S. invasion, and if so, how he thought the United States would respond. "We started from the assumption that if there was an invasion of Cuba, nuclear war would erupt," Castro replied. "We were certain of that. . . . [W]e would be forced to pay the price that we would disappear." He continued, "Would I have been ready to use nuclear weapons? Yes, I would have agreed to the use of nuclear weapons." And he added, "If Mr. McNamara or Mr. Kennedy had been in our place, and had their country been invaded, or their country was going to be occupied . . . I believe they would have used tactical nuclear weapons." I hope that President Kennedy and I would not have behaved as Castro suggested we would have. . . . Had we responded in a similar way the damage to the United States would have been unthinkable. But human beings are fallible [emphasis added].³⁵ This fascinating account shows how lack of information, misperception, and ideology could have led to disaster if we had not been lucky. But false information, lack of information, and misperceptions were not the only reason why luck was the decisive cause of the positive outcome of the Cuban missile crisis. Limits of safety, limits of command and control, and organizational problems also have to be taken into account. As Scott Sagan wrote: Many serious safety problems, which could have resulted in an accidental or unauthorized detonation or a serious provocation to the Soviet government, occurred during the crisis. None of these incidents led to inadvertent escalation or an accidental war. All of them, however, had the potential to do so. President Kennedy may well have been prudent. He did not, however, have unchallenged final control over U.S. nuclear weapons.³⁶ Most-recent studies show that sloppy practices in nuclear weapons management have occurred at all levels of decision-makers, leaders, nuclear safety and security teams, and top-level military personnel in most nuclear-weapon states. They also show the limits of learning from past sloppy practices. Confidence in perfect nuclear safety is still a matter of wishing for the best and relying on luck.³⁷ One telling example of this occurred at Minot Air Force Base in North Dakota in 2007. This offers a well-documented case of multiple sloppy practices and suggests the limits of learning after the incident was identified. On August 29–30, 2007, six US nuclear-armed cruise missile warheads were mistakenly flown to Barksdale Air Force Base in Louisiana. They had been placed by mistake under the wings of a B-52; the weapons had not been guarded appropriately during a thirty-six-hour period. Had the plane experienced any problems in flight, the crew would not have followed the proper emergency procedures.³⁸ After this widely publicized case of sloppy practices,³⁹ US Secretary of Defense Robert Gates emphasized the need for responsibility in handling nuclear weapons: "The problems were the result of a long-standing slide in the Service's nuclear stewardship. . . . For your part, you must never take your duties lightly. There is simply no room for error. Yours is the most sensitive mission in the entire US military."⁴⁰ Change and improvement were supposed to follow, but even on the base where the incident took place and where the Secretary of Defense came to give his speech, it was necessary to repeat the order to leave no room for error. In April 2013, one officer from the 91st Missile Wing at the same Air Force Base in North Dakota was punished for sleeping on the job while having the blast door open behind him. (Sleeping wasn't prohibited on a twenty-four-hour shift, but leaving the blast door open was.) He was one of two missile officers sanctioned that year for such a fault and he told his superiors that it wasn't the first time.⁴¹ Air Force officers told the Associated Press that such violations of the safety procedures had happened more often than just in the two documented cases.⁴² The limits of safety, the limits of command and control, and the persistence of sloppy practices even in the US nuclear forces suggest that the role of luck is likely to have been even more important than we can document here. (three different groups) of the payload installed in those cruise missiles, those procedures were not followed." The quotes for the account of this particular accident are taken from the unclassified account available in the February 2008 report from the Defense Science Board Permanent Task Force on Nuclear Weapons Surety, entitled Report on the Unauthorized Movement of Nuclear Weapons. There are no reliable records of nuclear weapons accidents or close calls in most nuclear-weapon states.

A2 Tepperman

Tepperman's thesis ignores complexities and accidents – expert consensus

Shaw 9 (Douglas B. Shaw serves as the Associate Dean for Planning, Research, and External Relations at the George Washington University's Elliott School of International Affairs with a concurrent appointment as an Assistant Professor of International Affairs. Doug previously served as Director of Policy Planning in the Office of the President at Georgetown University, on the U.S. Department of Energy's Nuclear Material Security Task Force, at the U.S. Arms Control and Disarmament Agency, and in leadership roles for a number of non-governmental organizations including Physicians for Social Responsibility, the Lawyers Alliance for World Security, and the Institute on Religion and Public Policy. Doug holds a Ph.D. in international relations from Georgetown University and has lectured on nuclear nonproliferation and disarmament on four continents. "Newsweek misrepresents nuclear weapons scholarship" 9/1/9
<http://nukesonablog.blogspot.com/2009/09/newsweek-misrepresents-nuclear-weapons.html>///CW

Jonathan Tepperman's thesis in his September 7th Newsweek article "Why Obama should Learn to Love the Bomb" that "a growing and compelling body of research suggests that nuclear weapons may not, in fact, make the world more dangerous" badly misrepresents the state of scholarship on this crucial topic.¶ First, Tepperman references a handful of scholars to make his argument while dismissing the majority who disagree with him. George P. Shultz, William J. Perry, Henry A. Kissinger, and Sam Nunn opposed this view in two op-eds in the Wall Street Journal and other leading scholars and practitioners participated in a 2007 conference at Stanford University, now memorialized as a 500-page volume, Reykjavik Revisited. Scores of experts are summarily excluded from Tepperman's article.¶ Second, Tepperman suggests a robust understanding of how deterrence relates to today's challenges where none exists. Nuclear deterrence scholar Sir Lawrence Freedman observed a "lost generation" of nuclear weapons specialists in remarks at the Elliott School of International Affairs this spring and Commander of the U.S. Strategic Command, General Kevin Chilton, observed this summer "we have allowed an entire generation to skip class, as it were, on the subject of strategic deterrence." More scholarship is needed to translate "nuclear optimism" and other Cold War concepts into the Twenty-first Century.¶ Third, in over 2,700 words on deterrence, not one of them is "accident." This is a catastrophic flaw in characterizing scholarly debate on nuclear weapons. Kenneth Waltz, cited by Tepperman as "the leading nuclear optimist" underlines this point by co-authoring a book titled The Spread of Nuclear Weapons: A Debate Renewed with Stanford University's Scott Sagan who has done decades of careful scholarship to demonstrate the relevance of accidents to nuclear deterrence.¶ Tepperman's "iron logic" of deterrence is undermined by a more unstable plutonium logic that can only be understood by the combined lights of physics, engineering, political science, economics, and at least more than a dozen other disciplines that James Doyle of Los Alamos National Laboratory argues constitute "nuclear security science." The nuclear future ahead of us is long, imperfect, and badly in need of more research and more informed public debate.¶

A2 Empirics

Their empirics argument is historically false

Pelopidas 15 (Benoît Pelopidas is a lecturer (assistant professor with tenure) in international relations at the University of Bristol (Global Insecurities Center) and an affiliate of the Center for International Security and Cooperation at Stanford University. He has been awarded two international prizes for his research, from the International Studies Association and the James Martin Center for Nonproliferation Studies. His research focuses on the global politics of nuclear vulnerability, cases of near-use of nuclear weapons, and lessons learned from global nuclear history and French nuclear policies. His is currently completing an edited volume on the experience of the Cuban missile crisis worldwide as an early set of experiences of global nuclear vulnerability and its implications for security, responsibility, and alliance dynamics. "Challenging the Assumptions of Classical Nuclear Deterrence Theory: The War That Must Never Be Fought" 3/12/15, can be downloaded at <http://www.hoover.org/research/challenging-assumptions-classical-nuclear-deterrence-theory>///CW

The limits of nuclear deterrence as a peacemaker²³¶ Critics of abolition portray a world without nuclear weapons as warprone¶ and believe that nuclear weapons are a necessary and sufficient¶ cause for great-power peace. This is only the latest instance of an idea¶ that has repeatedly been proven wrong, since at least 1860: the expectation¶ that the unprecedented destructiveness of a new weapon system¶ and the threat of its use will put an end to war. This was wrong for dynamite,¶ submarines, artillery, smokeless powder, the machine gun, and poison¶ gas.²⁴ Was nuclear deterrence a necessary and sufficient cause for¶ peace among great powers? Most critics of the idea of a world without¶ nuclear weapons maintain that it was. They argue that the nuclear-armed,¶ states never fought a war

against each other.²⁵ This can now be proven wrong. The 1969 border clash between China and Russia²⁶ and, more recently, the 1999 Kargil crisis between India and Pakistan show that the conventional wisdom that a nuclear-armed state cannot be attacked is historically inaccurate. Moreover, nuclear-armed states have been attacked by non-nuclear-weapon states on multiple occasions. US troops were attacked by Chinese forces in 1950 in Korea and by Vietnamese forces in the 1960s and 1970s; Israel was attacked by Syria and Egypt in 1973 and by Iraq in 1991; and in 1982, Argentina invaded the British Falkland Islands.²⁷ This narrows down the claims for nuclear weapons as peacemakers. More importantly, even this narrower claim needs to be reexamined taking into account two facts: (1) avoidance of several nuclear disasters was due to luck and cannot be explained by nuclear deterrence; and (2) deterrence as a strategy has favored more risk-prone strategies and in some cases made war possible instead of preventing it.

High-Magnitude, Low Probability = Good

High magnitude, low probability events first

Bostrom 13

[Nick, Philosopher and professor (Oxford), Ph.D. (LSOE), director of The Future of Humanity Institute and the Programme on the Impacts of Future Technology, of course, he's also the inaugural recipient of "The Eugene R. Gannon Award for the Continued Pursuit of Human Advancement," "Existential Risk Prevention as Global Priority," Global Policy, Vol 4, Issue 1, <http://www.existential-risk.org/concept.html>]

1. The maxim rule 1.1. Existential risk and uncertainty An existential risk is one that threatens the premature extinction of Earth-originating intelligent life or the permanent and drastic destruction of its potential for desirable future development (Bostrom 2002). Although it is often difficult to assess the probability of existential risks, there are many reasons to suppose that the total such risk confronting humanity over the next few centuries is significant Estimates of 10-20% total existential risk in this century are fairly typical among those who have examined the issue, though inevitably such estimates rely heavily on subjective judgment.¹ The most reasonable estimate might be substantially higher or lower. But perhaps the strongest reason for judging the total existential risk within the next few centuries to be significant is the extreme magnitude of the values at stake. Even a small probability of existential catastrophe could be highly practically significant (Bostrom 2003; Matheny 2007; Posner 2004; Weitzman 2009). Humanity has survived what we might call natural existential risks for hundreds of thousands of years; thus it is prima facie unlikely that any of them will do us in within the next hundred.² This conclusion is buttressed when we analyze specific risks from nature, such as asteroid impacts, supervolcanic eruptions, earthquakes, gamma-ray bursts, and so forth: Empirical impact distributions and scientific models suggest that the likelihood of extinction because of these kinds of risk is extremely small on a time scale of a century or so.³ In contrast, our species is introducing entirely new kinds of existential risk — threats we have no track record of surviving. Our longevity as a species therefore offers no strong prior grounds for confident optimism. Consideration of specific existential-risk scenarios bears out the suspicion that the great bulk of existential risk in the foreseeable future consists of anthropogenic existential risks — that is, those arising from human activity. In particular, most of the biggest existential risks seem to be linked to potential future technological breakthroughs that may radically expand our ability to manipulate the external world or our own biology. As our powers expand, so will the scale of their potential consequences — intended and unintended, positive and negative. For example, there appear to be significant existential risks in some of the advanced forms of biotechnology, molecular nanotechnology, and machine intelligence that might be developed in the decades ahead. The bulk of existential risk over the next century may thus reside in rather speculative scenarios to which we cannot assign precise probabilities through any rigorous statistical or scientific method. But the fact that the probability of some risk is difficult to quantify does not imply that the risk is negligible. Probability can be understood in different senses. Most relevant here is the epistemic sense in which probability is construed as (something like) the credence that an ideally reasonable observer should assign to the risk's materializing based on currently available evidence.⁴ If something cannot presently be known to be objectively safe, it is risky at least in the subjective sense relevant to decision making. An empty cave is unsafe in just this sense if you cannot tell whether or not it is home to a hungry lion. It would be rational for you to avoid the cave if you reasonably judge that the expected harm of entry outweighs the expected benefit. The uncertainty and error-proneness of our first-

order assessments of risk is itself **something we must factor into** our all-things-considered probability assignments. This factor often **dominates in low-probability, high-consequence risks** – especially those involving poorly understood natural phenomena, complex social dynamics, or new technology, or that are difficult to assess for other reasons. Suppose that some scientific analysis A indicates that some catastrophe X has an extremely small probability $P(X)$ of occurring. Then the probability that A has some hidden crucial flaw may easily be much greater than $P(X)$.⁵ Furthermore, the conditional probability of X given that A is crucially flawed, $P(X|A)$, may be fairly high. We may then find that most of the risk of X resides in the uncertainty of our scientific assessment that $P(X)$ was small (figure 1) (Ord, Hillerbrand and Sandberg 2010).

Possibilistic thinking best for decision-making

Clarke 5

[Lee, member of a National Academy of Science committee that considered decision-making models, Anschutz Distinguished Scholar at Princeton University, Fellow of AAAS, Professor Sociology (Rutgers), Ph.D. (SUNY), “Lee Clarke's Worst Cases: An Interview with Lee Clarke,” UChicago press, <http://www.press.uchicago.edu/Misc/Chicago/108597in.html>]

Question: **Why focus on worst cases?** They probably won't happen, right? **Why not focus on scenarios that have a greater degree of probability?** Lee Clarke: One of the main ideas in Worst Cases is that **we can use possibilistic thinking to balance probabilistic thinking**. Over the past couple of hundred years **probabilism has come to be thought of as the only way to reason rationally**. But I think that it sometimes makes **perfectly good sense to take worst case consequences into account** when people are making decisions. For example, **the chances of getting into a commercial airline crash are extremely low**. People who fly know that, and that's why they're willing to defy gravity every day. **But they also know** what happens if the plane gets into serious trouble at thirty thousand feet. That's **worst case, possibilistic thinking. It is reasonable to worry about both**. It is true, in a sense, that **worst cases probably won't happen**. Still, as the political scientist Scott Sagan has said, **things that have never happened before happen all the time**. Just think of Chernobyl or 9/11. They had a low probability of occurring at any given time, **but who would say now that we should have ignored them?** It's the same kind of thing as when you buy **life insurance**. Is it likely that you will die today? Probably not. But if you have life insurance you're actually betting the insurance company that, in fact, you will die today. **Is that irrational? Not at all**. We say that people who don't buy life insurance are **irresponsible**.

Consequentialism Good

Public Health surveillance requires consequentialist framing- public health outweighs minor violations of rights most of the time

Petrini 13 (Carlo Petrini. Unità di Bioetica, Presidenza, Istituto Superiore di Sanità. “Ethics in Public Health Surveillance.” 2013. P. 352.

<http://www.scielosp.org/pdf/aiss/v49n4/v49n4a05.pdf>)EMerz

The ethical problems posed by public health surveillance have been specifically addressed in numerous studies in the past, and various factors have led to an increase in this interest in recent years, including the diffusion of new and unforeseen epidemics and a greater awareness of and sensitivity towards the issues involved [57]. The checklists shown above can help to assess the compatibility of public health surveillance programmes with ethical principles. One of the major problems highlighted by these tools is the fact that, given the virtual impossibility of obtaining informed consent, programmes for public health surveillance frequently necessitate an

infringement of the principle of autonomy. Today it is widely accepted that “Overriding individual autonomy must be justified in terms of the obligation of public health to improve population health, reduce inequities, attend to the health of vulnerable and systematically disadvantaged persons, and prevent harm. In addition, data elements collected without consent must represent the minimal necessary interference, lead to effective public health action, and be maintained securely” [15]. Returning to Childress and co-authors, they suggest five useful “conditions intended to help determine whether promoting **public health warrants overriding such values** as individual liberty or justice in particular cases”. These conditions encapsulate the key criteria referred to in the various checklists. They are: effectiveness; proportionality; necessity; least infringement; public justification” [55]. In summarising the criteria listed above it may also be helpful to refer to a proposal formulated by the noted biolaw expert Lawrence Gostin on the spread of Severe Acute Respiratory Syndrome (SARS). His concise proposal makes a suitable and practical conclusion: “Coercive measures, which violate individual rights, are acceptable when: - the risk to public health is demonstrable; - the intervention is likely to be effective, cost-effective, not overly invasive, fairly distributed; - the process for pursuing intervention is just and publicly transparent” [58].

Utilitarianism Good

Adopt a framework of public health utilitarianism – this avoids the traditional trap of sacrificing the few for the many but maintains the best possible consequences

Gostin 10 (Lawrence O. Gostin has more qualifications than any other card put out in the past 30 years. He is University Professor, Georgetown University's highest academic rank conferred by the University President. Prof. Gostin directs the O'Neill Institute for National and Global Health Law and was the Founding O'Neill Chair in Global Health Law. He served as Associate Dean for Research at Georgetown Law from 2004 to 2008. He is Professor of Medicine at Georgetown University, Professor of Public Health at the Johns Hopkins University, and Director of the Center for Law & the Public's Health at Johns Hopkins and Georgetown Universities. Prof. Gostin is the Director of the World Health Organization Collaborating Center on Public Health Law & Human Rights. He also serves on the WHO Director-General's Advisory Committee on Reforming the World Health Organization. In 2007, the WHO Director-General appointed Prof. Gostin to the International Health Regulations (IHR) Roster of Experts and the Expert Advisory Panel on Mental Health. In a 2012 systematic empirical analysis of legal scholarship, independent researchers ranked Prof. Gostin 1st in the nation in productivity among all law professors, and 11th in in impact and influence. “Public Health Law, Ethics, and Human Rights: Mapping the Issues” <http://www.publichealthlaw.net/Reader/ch1/ch1.htm>///**CW**

The application of general ethical principles to public health decisions can be difficult and complicated. Since the mission of public health is to achieve the greatest health benefits for the greatest number of people, it draws from the traditions of utilitarianism or consequentialism. The “public health model,” argue Buchanan (2000) and his colleagues, uncritically assumes that the appropriate mode of evaluating options is some form of cost-benefit (or cost-effectiveness) calculation— the aggregation of goods and bads (costs and benefits) across individuals. Public health, according to this view, appears to permit, or even require, that the most fundamental interests of individuals be sacrificed in order to produce the best overall outcome. This characterization misperceives, or at least oversimplifies, the public health approach. The field of public health is interested in securing the greatest benefits for the most people. But public health does not simply aggregate benefits and burdens, choosing the policy that produces the most good and the least harm. Rather, the overwhelming majority of public health interventions are intended to benefit the whole population, without knowingly harming individuals or groups. When public health authorities work in the areas of tobacco control, the environment, or occupational safety, for example, their belief is that everyone will

benefit from smoking cessation, clean air, and safe workplaces. Certainly, public health focuses almost exclusively on one vision of the “common good” (health, not wealth or prosperity), but this is not the same thing as sacrificing fundamental interests to produce the best overall outcome.¶ The public health approach, of course, does follow a version of the harm principle. Thus, public health authorities regulate individuals or businesses that endanger the community. The objective is to prevent unreasonable risks that jeopardize the public’s health and safety— e.g, polluting a stream, practicing medicine without a license, or exposing others to an infectious disease. More controversially, public health authorities often recommend paternalistic interventions such as mandatory seat belt or motorcycle helmet laws. Public health authorities reason that the sacrifice asked of individuals is relatively minimal and the communal benefits substantial. Few public health experts advocate denial of fundamental interests in the name of paternalism. In the public health model, individual interests in autonomy, privacy, liberty, and property are taken seriously, but they do not invariably trump community health benefits.¶ The public health approach, therefore, differs from modern liberalism primarily in its preferences for balancing— public health favors community benefits, while liberalism favors liberty interests. Characterizing public health as a utilitarian sacrifice of fundamental personal interests is as unfair as characterizing liberalism as a sacrifice of vital communal interests. Both traditions would deny this kind of oversimplification.

Bioethics in the context of health surveillance requires that the government value public health over individual interests

Childress 2 (James Childress. University Professor and the John Allen Hollingsworth Professor of Ethics at the University of Virginia. “Public Health Ethics: Mapping the Terrain.” 2002. P. 171. file:///C:/Users/Emily/Downloads/Childress_et_al-2002-The_Journal_of_Law,_Medicine_&_Ethics.pdf)//EMerz

In view of public health’s goal of producing net health benefits for the population, this meaning of public is very important. In measurement and analysis, the “numerical public” reflects the utilitarian view that each individual counts as one and only one. In this context, ethical analysis focuses on issues in measurement, many of which raise considerations of justice. For example, how should we define a population, how should we compare gains in life expectancy with gains in health-related quality of life, and whose values should be used in making those judgments? Second, public is what we collectively do through government and public agency - we can call this “political public.” Government provides much of the funding for a vast array of public health functions, and public health professionals in governmental roles are the focal point of much collective activity. In the United States, as Lawrence Gostin notes, government “is compelled by its role as the elected representative of the community to act affirmatively to promote the health of the people,” even though it “cannot unduly invade individuals’ rights in the name of the communal The government is a central player in public health because of the collective responsibility it must assume and implement. The state’s use of its police powers for public health raises important ethical questions, particularly about the justification and limits of governmental coercion and about its duty to treat all citizens equally in exercising these powers. In a liberal, pluralistic democracy, the justification of coercive policies, as well as other policies, must rest on moral reasons that the public in whose name the policies are carried out could reasonably be expected to accept.I Third, public, defined as what we do collectively in a broad sense, includes all forms of social and community action affecting public health - we can call this “communal public.” Ethical analysis on this level extends beyond the political public. People collectively, outside of government and with private funds, often have greater freedom to undertake public

health interventions since they do not have to justify their actions to the political public. However, their actions are still subject to various moral requirements, including, for instance, respect for individual autonomy, liberty, privacy and confidentiality, and transparency in disclosure of conflicts of interest.

Using a cost benefit analysis to address health surveillance is key to balance conflict of interests

Childress 2 (James Childress. University Professor and the John Allen Hollingsworth Professor of Ethics at the University of Virginia. “Public Health Ethics: Mapping the Terrain.” 2002. P. 171. file:///C:/Users/Emily/Downloads/Childress_et_al-2002-The_Journal_of_Law,_Medicine_&_Ethics.pdf)//EMerz

Conceptions of morality usually recognize a formal requirement of universalizability in addition to a substantive requirement of attention to human welfare. Whatever language is used, this formal feature requires that we treat similar cases in a similar way. This requirement undergirds casuistical reasoning in morality as well as in law. In public health ethics, for example, any recommendations for an HIV screening policy must take into account both past precedents in screening for other infectious diseases and the precedents the new policy will create for, say, screening for genetic conditions. Much of the moral argument will hinge on which similarities and differences between cases are morally relevant, and that argument will often, though not always, appeal to general moral considerations.* We can establish the relevance of a set of these considerations in part by looking at the kinds of moral appeals that public health agents make in deliberating about and justifying their actions as well as at debates about moral issues in public health. The relevant general moral considerations include: producing benefits; avoiding, preventing, and removing harms; producing the maximal balance of benefits over harms and other costs (often called utility); distributing benefits and burdens fairly (distributive justice) and ensuring public participation, including the participation of affected parties (procedural justice); respecting autonomous choices and actions, including liberty of action; protecting privacy and confidentiality; keeping promises and commitments; disclosing information as well as speaking honestly and truthfully (often grouped under transparency); and building and maintaining trust. Several of these general moral considerations - especially benefiting others, preventing and removing harms, and utility - provide a prima facie warrant for many activities in pursuit of the goal of public health. It is sufficient for our purposes to note that public health activities have their grounding in general moral considerations, and that public health identifies one major broad benefit that societies and governments ought to pursue. The relation of public health to the whole set of general moral considerations is complex. Some general moral considerations support this pursuit; institutionalizing several others may be a condition for or means to public health (we address this point later when we discuss human rights and public health); and yet, in particular cases, some of the same general moral considerations may limit or constrain what may be done in pursuit of public health. Hence, conflicts may occur among these general moral considerations

Utilitarianism Bad

Health care should use a deontological approach – the ends don’t justify the means

MM 07 (Morning’s Minion is a Catholic blog, “Utilitarianism in Health Care” 8/23/07 <http://voxnova.com/2007/08/23/utilitarianism-in-health-care/>)//CW

On all three grounds, she argues that social justice considerations do not support a transfer from the young and healthy to the old and sick on social justice grounds. As I read this, I felt there was something very wrong with her reasoning. Personally, I am in favor of single payers systems, and on the record as saying so. But I’m the first to admit that there are valid Catholic arguments against single

payer systems. There is nothing intrinsically evil about choosing to fund health care in a different manner.¶ But still, at least from a Catholic perspective, there is something fundamentally flawed in McArdle's reasoning. Here is the problem: it treats social justice not from the point of view of the common good, but from an individualist ethic ultimately derived from utilitarianism. Like all teleological philosophies, it is only outcomes that matter, and these outcomes are defined in terms of maximum utility, or happiness (utilitarianism is of course, a special application of consequentialism). The main problem, of course, is that it takes no account of whether an act is inherently right or wrong, irrespective of consequences. This kind of thinking arose directly from the Enlightenment, and a flawed concept of rationality based on what can be demonstrated empirically. As Pope Benedict noted, in a world based on calculations, it is the calculation of consequences that determines what should be considered moral and immoral.¶ I think this manner of thinking owes as much to Thomas Hobbes as it does to classic utilitarians like Bentham. It was Hobbes who, more than anybody else, led to the idea of social contracts overtaking the common good as the object of policy. Hobbes did not see humanity as an organic community underpinned by the common good; he saw instead a collection of individuals all seeking mastery over each other, necessitating some form of "social contract" to keep the peace. The individual is everything, the community, nothing. It follows naturally that social justice flows from the aggregation of individual happiness, rather than an organic conception of the common good. But the common good stems from the dignity, unity and equality of all people, not some mechanical calculation. It refers to "the sum total of social conditions which allow people, either as groups or as individuals, to reach their fulfilment more fully and more easily". It is the social and community dimension of the moral good. While it is underpinned by the dignity of the human person, it is not an individualist ethic; rather, it recognizes that there is no fulfilment if the individual does not recognize that he or she exists "with" others and "for" others.¶ To see the bankruptcy of the contracts approach to justice, consider abortion. Clearly, the unborn are not agents that can participate in a social contract. Clearly, their welfare must therefore be discounted, and subjugated to the welfare of others, who are proper contracting agents. It is this notion that underpins the pro-abortion position today, and it stems from a failure to understand the encompassing and organic nature of the common good.¶ Back to health care. McArdle engages in a classic utilitarian calculus to argue that social welfare is not increased by a transfer from the young and healthy to the old and sick. It's all about individuals, and "welfare" is limited to wealth. Whereas the right to health care is regarded by the Church as basic to the common good, the utilitarian approach instead sees only a collection of individuals out for themselves, and therefore largely responsible for their own health care. Within this individualist ethic, a social contract can indeed justify redistribution, but this is based on extremely limited characteristics, such as luck and personal worthiness. Nowhere in sight is the core principle of solidarity, a "a firm and persevering determination to commit oneself to the common good". Nowhere is the idea that our interdependence coupled with the right to health care may call for the young and healthy to look after the needs of the old and infirm, irrespective of circumstances. And that is what troubled me most about McArdle's reasoning.

Evaluate the debate through the lens of personalism – utilitarianism alone fails but combining it with an ethic for constant respect for a human's dignity solves

Petrini and Gaintoti 08 (Carlo Petrini PhD is with the Bioethics Unit, Office of the President, Italian National Institute of Health, Rome, Italy. Sabina Gainotti works at The National Center for Rare Diseases in Rome and focuses on Qualitative Social Research, Quantitative Social Research, and Ethics. "A personalist approach to public-health ethics")

<http://www.who.int/bulletin/volumes/86/8/08-051193/en///CW>

Philosophical theories are also applied to bioethics and public-health ethics. In public health, some positions are more common: positions based on outcomes (utilitarianism), positions focused on rights and opportunities (Kantian theories), views that emphasize sociality and solidarity (communitarianism).¹ Utilitarianism asserts that decisions should be judged by their consequences, in particular by their effect on the total sum of individual wellbeing. Following this view, public-health policies must be aimed to produce "the greatest happiness of the greatest number".³⁵ This approach is very intuitive in public health but has some limitations. Difficulties arise for example in the measurement of wellbeing which can be defined with reference to an individual's personal experiences or to more objective and measurable components, e.g. quality-adjusted life years (QALYs) or disability-adjusted life years (DALYs).³⁶ However, the most important critique to utilitarianism is grounded on the view that it easily leads to unfairness and to the sacrifice of individual rights

and freedoms to warrant the public utility.³⁷ Individual rights and freedoms are the main good to be preserved in Kantian theories. Kant argued that human beings ought to be treated with respect, as ends in themselves, not as means to another individual's ends.³⁸ This assertion has important consequences in public-health policies, but is not without ambiguities. Indeed two kinds of liberalism can be drawn: libertarians and egalitarians.³⁹ Libertarians believe that only negative rights deserve protection to warrant individual freedom. By contrast, egalitarian liberals argue that the right to choice is meaningless without adequate resources. Respectively, the two perspectives entail a minimal or, vice versa, a strong state intervention for the sake of individual health.¶ Critics of utilitarianism and liberalism point out that these theories neglect the collective dimension of public-health ethics that is strongly valued in communitarianism. Communitarianism values highly the social dimension of health-care policies and involves visions of the appropriate social order and the virtues that will maintain such an order in a particular community. However, a basic question in communitarianism is: who decides what is virtuous? Every community could define its own norms or, by contrast, a single form of good society may serve as a reference for all communities. Ethics-of-care feminism can also be mentioned. Ethics-of-care proponents argue that real people live in families and real caring relationships are not impartial, impersonal or equal. Health-care policies must hence consider the factual dimension of caring, which is mostly carried out by women, and must be more supportive towards caring roles.³⁹ All the outlined theories in our view may offer a contribution to a continuing discussion about how to deal ethically with public-health matters and how to organize society. What is missing in these theories is a clear definition of the concept and value of the human person: a primary point in personalism.¶ From traditional philosophy to personalism¶ Personalism may offer some compensation for the conflicts and shortcomings of principlism. For reasons of comprehensiveness, it might be useful here to mention its most elementary, and possibly obvious, aspects. Personalism should not be confused with individualism, which considers auto-decisions as the main (or only) constitutive feature of person. Personalism is based upon our common shared human nature. It takes as its primary ethical principle that all human beings deserve respect. A human is the only being capable of self-reflection and comprehension of the meaning of life.⁴⁰¶ The principles of ontologically- based personalism in bioethics may be summed up as follows:³1 the defence, intangibility and sacredness of human life; the therapeutic principle whereby any intervention on life is justified only if it has a therapeutic purpose; the freedom and responsibility principle, where freedom recognizes respect for life as its objective limitation; the sociality and subsidiarity principle, consisting of the achievement of common good through individual well-being. Some consider the traditional value of the person as a cumbersome dimension. Hence some modern thinkers focus on the individual but not on the person. Post modern philosophers not only dissolve the concept of person but also that of subject.⁴¹ Excessive positions like these are also present in bioethics. Still bioethics, especially when applied to clinical and experimental issues, is generally attentive to the individual person. The problem arises in defining the person and the moment when he/she begins and ends, from the status of the human embryo to the dignity of the dying. Personalism strongly emphasizes the need to protect the weakest and the sickest persons in society. In a personalistic view, the being and dignity of the person are fundamental and inalienable values. Moral actions can thus be measured in respect of the person's being and dignity.⁴² This can be stated through a formulation that is similar to the second Kantian imperative: the person "should never be treated as a simple means, as an instrument that can be used for the purpose of achieving any other end: on the contrary, the person should be treated as an end, or – more specifically – respecting, and in some cases promoting, its own ends".⁴³ In Kant's philosophy, however, this imperative has a negative connotation.⁴⁴ Personalism does not simply exclude negative behaviours but requires positive attitudes.¶ Personalism and its application to public health¶ When applied to public health, personalistic principles include a set of duties which derive from respect of the person. These include respect of the individual's autonomy, the safeguard of confidentiality within a collective and potentially de-personifying framework, the effort to guarantee equity and equal opportunities for everyone in the allocation of health-care resources.^{45,46} Personalism is not opposed to other ethical theories as it can have both points in common and divergences with them. In a personalist view, for example, the consequentialist-utilitarian approach can certainly be part of a public-health policy as long as the lives and well-being of individuals are preserved.⁴⁷¶ Respect for individual rights and freedom is also an essential requisite of human coexistence if it comes with regard to the "correct exercising" of freedom that is bonded to respect for life. In public health there might be cases where freedom must be sacrificed to the advantage of the common good. A minimum limit however should never be exceeded and decisions should never heavily penalize a person's living conditions. If the wellbeing of the community is at stake, personalism does not exclude "moderate patronizing." Gerald Dworkin defines patronizing as "the interference with a person's freedom of action for reasons which exclusively refer to the wellbeing, good, happiness, needs, interests or values of a person who is subjected to the coercion".⁴⁸ A moderate form of patronizing is justified both in serious or emergency circumstances (such as during epidemics where persons need to be isolated to prevent the spread of a disease), and in routine conditions where the subject may not be in full charge of the situation and hence it becomes necessary to force certain behaviours (such as the compulsory wearing of seatbelts).¶

Cautionary policies based on the precaution principle are also significant in terms of public-health ethics. When scientific data are contradictory or quantitatively scarce, it is possible to appeal the precautionary principle. This principle shows the need for making temporary decisions that may be modified on the basis of new facts that eventually become known.^{49¶} Some authors have singled out the precautionary principle as one fundamental value in public-health ethics, alongside justice, transparency and the choice of the least restrictive alternative for people's autonomy.⁵⁰ Special importance has been attached to the precautionary principle by European ethics.⁵¹ Its relevance is also underlined by the Italian Committee on Bioethics and the Pontifical Council for Justice and Peace, with reference to the ethics of social and collective problems and to environmental issues.^{52,53} Personalism strongly values principles of sociality and solidarity. However, the individual's good is the basis for common good. The social dimension of personalism, which was highly emphasized at the beginning of the 1920s, contributed to the renewal of classical personalism and the foundation of the modern personalism of Emmanuel Mounier and Jacques Maritain.^{54,55¶}

Utilitarian framing of health surveillance is flawed- it overlooks individual health issues and autonomy

Rubel 12 (Alan Rubel. Ph.D., Department of Philosophy, University of Wisconsin-Madison; J.D., magna cum laude, University of Wisconsin Law School Assistant Professor. "Justifying Public Health Surveillance: Basic Interests, Unreasonable Exercise, and Privacy." 2012. P. 9-10. https://kiej.georgetown.edu/home_files/22.1.rubel.pdf)/EMerz

Parmentier provides some important guidance in applying this perspective to assessing the health of populations when she compares and contrasts the population perspective with utilitarianism. In her view, utilitarianism provides some support for the population perspective insofar as it is a maximizing theory. The difference between the two is that the good to be maximized on the population perspective is much narrower—health within a defined group instead of utility among all individuals (2009, p. 15). However, the view that the population perspective, and hence public health generally, "seeks to maximize group health" (Parmentier 2009, p. 16) is problematic. The comparison with utilitarianism shows why. Utilitarianism is a moral theory that is consequentialist, welfarist, and sum-ranking: it is concerned with the consequences of actions (rather than with, for example, virtues or respect for autonomy), the consequence that matters is individual welfare, and the best state of affairs is the one in which the aggregate welfare of all relevant individuals is maximized. The population perspective mimics utilitarianism insofar as it is consequentialist and sumranking (i.e., maximizing) and differs only in that the consequence that matters is health within a population (presumably measured in terms of quality-adjusted life years, disability-adjusted life years, or the like). The problem comes in using the population perspective to determine policy. It is true that public health interventions can at times be justified insofar as they can maximize health within a population in cases in which individuals acting alone or along with health care providers would fail—consider the efficacy of public sanitation measures relative to individual efforts to drink clean water absent such measures. **But if our guiding principle is health maximization, interventions at the individual level will be justified if they do in fact increase aggregate health**. The state of affairs with such an individual intervention will rank ahead of the state of affairs without it. In other words, a sum-ranking view fails to distinguish individual and population health and therefore is liable to opt for individual health interventions on the grounds that they increase population health, independently of whether they comport with individuals' own senses of good. A related problem is that a consequentialist view that maximizes the particular good of health within a population will necessarily subordinate nonhealth interests. Some individual behaviors decrease aggregate health only insofar as the decision-maker's health decreases (e.g., avoiding doctors, being sedentary, not flossing). Surely, though, some efforts to change those behaviors would be unwarranted on the grounds that people are within their rights to engage in them.⁷ Thus, coercive measures to increase aggregate health require at least some justification to override individual autonomy. That justification might be the negative effects of individual behaviors on others' health, sufficient risk

to individual health to warrant strongly paternalistic actions, or something else altogether, but simple appeal to marginal increase in aggregate health would not suffice.

Utilitarianism is bad in the context of public health surveillance – substitutes individual welfare for state affairs

Rubel 12 (Alan Rubel. Ph.D., Department of Philosophy, University of Wisconsin-Madison; J.D., magna cum laude, University of Wisconsin Law School Assistant Professor. “Justifying Public Health Surveillance: Basic Interests, Unreasonable Exercise, and Privacy.” Kennedy Institute of Ethics Journal, Volume 22, Number 1, March 2012, pp. 1-33 (Article). John Hopkins University Press, DOI: 10.1353/ken.2012.0001. Card from P. 9-11.)//ASMITH

Although the research/practice distinction fails to provide an adequate guide for resolving conflicts between public health surveillance and privacy, another approach, which takes the proper scope of public health into account, may be more promising. Just how to understand the term “public health” is the subject of significant debate. For instance, there is a question as to whether factors that affect health—such as education, homelessness, and human rights—are constitutive of public health (Rothstein 2002). Nonetheless, for the purposes of this article, it is promising to begin with the traditional view that public health should be understood as population health. The Institute of Medicine states that public health is what a society does “collectively to assure the conditions for people to be healthy” (Committee for the Study of the Future of Public Health 1988, p. 19; Rothstein 2002, p. 145). A full articulation of this kind of view comes in a recent book by Wendy Parmet. Parmet offers an account of public health that centers on what she calls the “population perspective.” According to this view, health is understood from a social or community perspective, and the “health of populations qua populations is an important goal of social life” (2009, p. 14). Parmet provides some important guidance in applying this perspective to assessing the health of populations when she compares and contrasts the population perspective with utilitarianism. In her view, utilitarianism provides some support for the population perspective insofar as it is a maximizing theory. The difference between the two is that the good to be maximized on the population perspective is much narrower—health within a defined group instead of utility among all individuals (2009, p. 15). However, the view that the population perspective, and hence public health generally, “seeks to maximize group health” (Parmet 2009, p. 16) is problematic. The comparison with utilitarianism shows why. Utilitarianism is a moral theory that is consequentialist, welfarist, and sum-ranking: it is concerned with the consequences of actions (rather than with, for example, virtues or respect for autonomy), the consequence that matters is individual welfare, and the best state of affairs is the one in which the aggregate welfare of all relevant individuals is maximized.⁶ The population perspective mimics utilitarianism insofar as it is consequentialist and sumranking (i.e., maximizing) and differs only in that the consequence that matters is health within a population (presumably measured in terms of quality-adjusted life years, disability-adjusted life years, or the like). The problem comes in using the population perspective to determine policy. It is true that public health interventions can at times be justified insofar as they can maximize health within a population in cases in which individuals acting alone or along with health care providers would fail—consider the efficacy of public sanitation measures relative to individual efforts to drink clean water absent such measures. But if our guiding principle is health maximization, interventions at the individual level will be justified if they do in fact increase aggregate health.

The state of affairs with such an individual intervention will rank ahead of the state of affairs without it. In other words, a sum-ranking view fails to distinguish individual and population health and therefore is liable to opt for individual health interventions on the grounds that they increase population health, independently of whether they comport with individuals' own senses of good. A related problem is that a consequentialist view that maximizes the particular good of health within a population will necessarily subordinate nonhealth interests. Some individual behaviors decrease aggregate health only insofar as the decision-maker's health decreases (e.g., avoiding doctors, being sedentary, not flossing). Surely, though, some efforts to change those behaviors would be unwarranted on the grounds that people are within their rights to engage in them.⁷ Thus, coercive measures to increase aggregate health require at least some justification to override individual autonomy. That justification might be the negative effects of individual behaviors on others' health, sufficient risk to individual health to warrant strongly paternalistic actions, or something else altogether, but simple appeal to marginal increase in aggregate health would not suffice. Fortunately, there is a better way to interpret public health from the population perspective and using it to guide action, which I refer to as the basic interests approach, following a framework developed by Alex London (2003).⁸ Even though one natural interpretation of population health—the one Parmet explicitly makes and which Mark Rothstein argues is implicit in other accounts—is aggregative and sum-ranking, it need not be (Rothstein 2002, pp. 145–46; Parmet 2009, p. 16). A different approach is to see public health as securing a set of interests that is public in the sense that the interests are shared by all members of a society, just in virtue of the fact that they are reasonable, rational persons.⁹ To see why, it is useful to consider John Rawls's understanding of primary goods. People in a modern, liberal democracy have widely diverging interests and projects. Some people will want opportunities for certain types of athletic recreation, others will seek intensive religious experiences, still others will look to intellectual or artistic projects, and many will order their lives around interest or social groups. Often these will conflict. For example, creating the opportunity for people to play baseball on a new field might undermine others' opportunity to hunt in the location where the field would be placed, and vice versa. That is exactly as we would expect in a pluralistic society. These interests are personal interests. However, the existence of such a society requires social cooperation, which on Rawls's view demands that citizens in the society be able to exercise two moral powers: the ability to form and revise a conception of the good (i.e., to be rational) and the ability to form a sense of justice and what is right and hence the ability to abide by fair terms of cooperation (i.e., to be reasonable) (1996, pp. 301–2). Based on this conception of a citizen, Rawls posits that each citizen has a number of fundamental interests (or primary goods) regardless of his or her particular conception of the good and personal interests. Among these are basic rights, liberties, and opportunities, and social bases for self-respect. They also include certain “natural goods,” among them health, which are only partly a function of the basic structure of society (1999, p. 54). The important point here is the idea that there are basic interests that every person in a society would want more of, and those interests must be treated as basic in a liberal, pluralistic society. Being deprived of the basic goods undermines persons' ability to form their own conceptions of the good and to be reasonable such that they can abide fair terms of social cooperation. Moreover, restriction of a person's basic interests (e.g., deprivation of basic rights and liberties, curtailment of opportunities, imperilment of health) gives rise to a claim on the rest of society to ameliorate these restrictions.

Utilitarianism justifies viewing people as only valuable for their contribution to larger society which justifies discrimination and destroys value to life

Hunnell 15 (Dr. Denise Jackson Hunnell is a Fellow of Human Life International. She graduated from Rice University with a BA in biochemistry and psychology. She earned her medical degree from The University of Texas Southwestern Medical School. She went on to complete a residency in family medicine at Marquette General Hospital, Marquette, Michigan. She also teaches anatomy and physiology at Northern Virginia Community College Woodbridge Campus. Other affiliations include the American Academy of Family Physicians, The Catholic Medical Association, and the National Catholic Bioethics Center. She received her certification in health care ethics from the National Catholic Bioethics Center in 2009. “When Utilitarianism Designs a Healthcare System...” <http://www.truthandcharityforum.org/when-utilitarianism-designs-a-healthcare-system/////CW>

Ezekiel Emanuel, the architect of President Obama’s signature health care legislation, has penned a provocative piece published in The Atlantic and entitled Why I Hope to Die at 75. In this essay he argues that people over the age of 75 are a drain on society and it would serve the common good if they would just die sooner rather than later. He is very clear that he is not advocating for euthanasia or assisted suicide. But what he is doing is laying the groundwork for age-based rationing of health care.¶ It must be understood that Dr. Emanuel is a utilitarianist. He believes that the value of a person lies in his contribution to the economic structure of a society. Non-contributors are worth less than those who are economically productive and are therefore entitled to less of the community resources, including health care.¶ Nurse_in_geriatry Emanuel argues that age associated declines in mental-processing speed and creativity make older individuals a burden. He notes that most great scientists, writers, composers, and artists have made their most significant contributions by the time they are in their late forties or early fifties. He declares that it is a rare individual who still has the intellectual capacity to produce great work past the age of 75, so we should stop striving for longevity at that point and refuse all life-prolonging medical care.¶ It is quite disturbing to read his cold assessment of those with even the most minor disabilities associated with age. He has no respect for the elderly enjoying their golden years and pursuing avocations instead of professional excellence:¶ The American immortal, once a vital figure in his or her profession and community, is happy to cultivate avocational interests, to take up bird watching, bicycle riding, pottery, and the like. And then, as walking becomes harder and the pain of arthritis limits the fingers’ mobility, life comes to center around sitting in the den reading or listening to books on tape and doing crossword puzzles. And then ...¶ Of course, many of us would counter his arguments with a discussion of the non-economic benefits the elderly provide. I have had the good fortune to know several centenarians in my lifetime. They provided a window to the past that could not be captured in any history textbook. I think of my relationships with several of my grandparents and great-grandparents who lived well past the age of 75 and know that my life was immeasurably enriched by these encounters with my elders, even when they were challenged by infirmities and disabilities. I hope to similarly influence my own grandchildren.¶ Ezekiel Emanuel discounts any value to familial relationships. In fact he states, “Our living too long places real emotional weights on our progeny... there is much less pressure to conform to parental expectations and demands after they are gone.” His further explanation of this reveals a prideful, self-centered motivation. He is concerned that if he lives past the age of 75, he will be remembered as a burden instead of as someone who was vibrant and a joy to be around.¶ After laying out his arguments for why life after age 75 is just not worth living, Emanuel goes on to outline the health care policy implications of his position. After the age of 75 he advocates for virtually no health care. No screening tests, no treatment for cancer, no flu shots, no antibiotics. Palliative care to keep the elderly comfortable is all that he sees as reasonable.¶ Here is where Emanuel errs most dramatically. He is judging the patient as to his worthiness for treatment, instead of judging the treatment as to its worthiness for the patient. There is no question that there are many medical tests and treatments that are not appropriate for patients over the age of 75. Following cholesterol levels, screening mammograms in asymptomatic women, screening colonoscopies for colon cancer are all tests that can be discontinued by this age. However, the reason is not that patients over the age of 75 are not valuable enough to receive this medical care. It is that the burden these tests impose on the elderly is not justified by the expected benefit of these tests. Decisions about the appropriateness of any medical test or intervention need to be made on an individual basis, taking into account the specific burden to benefit analysis for a given treatment in a given patient. Arbitrarily declaring that all those over the age of 75 are unworthy of anything but palliative medical care is unjust ageism.¶ Caring for an elderly relative can present physical, emotional, and financial challenges. But facing these challenges is an opportunity for great spiritual growth. We are better people and create a better society when we generously love and care for those with infirmities and disabilities. Through their lives, the elderly generously offer us the opportunity to cultivate virtue. As Pope Francis said, “A population that does not take care of the elderly and of children and the young has no future, because it abuses both its memory and its promise.”¶ Emanuel explicitly rejects such thinking as existential nonsense.¶ Many of us have suppressed, actively or passively, thinking about God, heaven and hell, and whether we return to the worms. We are agnostics or atheists, or just don’t think about whether there is a God and why she should care at all about mere mortals. We also avoid constantly thinking about the purpose of our lives and the mark we will leave. Is making money, chasing the dream, all worth it? Indeed, most of us have found a way to live our lives comfortably without acknowledging, much less answering, these big questions

on a regular basis. We have gotten into a productive routine that helps us ignore them.¶ I actually feel sorry for Ezekiel Emanuel that he cannot see the value of human life in any terms other than economic productivity. How sad that he does not cherish the rich dimensions the elderly add to our lives. We learn from their experiences, their faith, and, yes, even their suffering. The question before us in American health care policy is whether or not we will value each human life from the moment of conception to the moment of natural death and treat each individual according to his individual needs. Or, will we follow the utilitarian approach and declare whole classes of the population as economically unproductive and therefore unworthy of medical care?

Social injustices worsen health- recognizing human rights is a step in the right direction that allows us to make effective policy changes

Childress 2 (James Childress. University Professor and the John Allen Hollingsworth Professor of Ethics at the University of Virginia. "Public Health Ethics: Mapping the Terrain." 2002. P. 177. file:///C:/Users/Emily/Downloads/Childress_et_al-2002-The_Journal_of_Law,_Medicine_&_Ethics.pdf)//EMerz

We have noted potential and actual conflicts between promoting the good of public health and other general moral considerations. But it is important not to exaggerate these conflicts. Indeed, the societal institutionalization of other general moral considerations in legal rights and social-cultural practices generally contributes to public health. **Social injustices expressed in poverty, racism, and sexism have long been implicated in conditions of poor health.** In recent years, some evidence suggests that societies that embody more egalitarian conceptions of socioeconomic justice have higher levels of health than ones that do not.²⁰ Public health activity has traditionally encompassed much more than medicine and health care. Indeed, historically much of the focus of public health has been on the poor and on the impact of squalor and sanitation on health. The focus today on the social determinants of health is in keeping with this tradition. The data about social determinants are impressive even though not wholly uncontroversial. At any rate, they are strong enough to warrant close attention to the ways conditions of social justice contribute to the public's health. Apart from social justice, some in public health argue that embodying several other general moral considerations, especially as articulated in human rights, is consistent with and may even contribute to public health. For example, Jonathan Mann contended that public health officials now have two fundamental responsibilities - protecting and promoting public health and protecting and promoting human rights. Sometimes **public health programs burden human rights, but human rights violations "have adverse effects on physical, mental, and social well-being" and "promoting and protecting human rights is inextricably linked with promoting and protecting health."**²¹ Mann noted, and we concur, that, ultimately, "ethics and human rights derive from a set of quite similar, if not identical, core values," several of which we believe are captured in our loose set of general moral considerations.²² Often, as we have suggested, the most effective ways to protect public health respect general moral considerations rather than violate them, employ voluntary measures rather than coercive ones, protect privacy and confidentiality, and, more generally, express rather than impose community. Recognizing that promoting health and respecting other general moral considerations or human rights may be mutually supportive can enable us to create policies that avoid or at least reduce conflicts. While more often than not public health and human rights - or general moral considerations not expressed in human rights - do not conflict and may even be synergistic, conflicts do sometimes arise and require resolution.~~ Sometimes, in

particular cases, a society cannot simultaneously realize its commitments to public health and to certain other general moral considerations, such as liberty, privacy, and confidentiality. We have tried to provide elements of a framework for thinking through and resolving such conflicts. This process needs to be transparent in order to engender and sustain public trust.

Disease Outweighs

Disease is the greatest impact- more people die from disease than all wars combined- disease spread is the root cause of structural prejudice and the biggest threat to security

Selgelid 9 (M.J. Selgelid. Center for Applied Philosophy and Public Ethics (CAPPE), The Australian National University, Canberra, Australia. "Public Health: Pandethics." 2009. <http://www.sciencedirect.com/science/article/pii/S0033350608003314>)/EMerz

The ethical importance of infectious diseases is partly revealed by the fact that their consequences are almost unrivalled. 1 Historically, **they have caused more morbidity and mortality than any other cause, including war.** 2 The Black Death eliminated one-third of the European population over the course of a few years during the mid 14th Century; tuberculosis killed 1 billion people from 1850 to 1950; the 1918 flu killed between 20 and 100 million people; and smallpox killed between 300 and 500 million people during the 20th Century alone, i.e. **three times more than were killed by all the wars of that period.** Infectious diseases are currently the biggest killers of children and young adults, and the continuing threat of infectious diseases is revealed by the emergence of many new infectious diseases during recent decades [including human immunodeficiency virus/acquired immunodeficiency syndrome (HIV/AIDS), Ebola, severe acute respiratory syndrome (SARS) and avian influenza], the growing problem of drug resistance and the spectre of bioterrorism. Second, infectious diseases raise difficult ethico-philosophical questions of their own. Although measures such as surveillance, mandatory treatment and vaccination, isolation and quarantine may sometimes be important to the protection of public health, they may each involve infringement of basic rights and liberties, i.e. the right to privacy, informed consent to medical intervention, and freedom of movement. Given that most deny that either the goal to promote public health or the goal to protect individual rights and liberties should always take absolute priority over the other, a difficult ethical question is how to strike a balance between these two types of goals in cases of conflict. Third, the topic of infectious disease is closely connected to the topic of justice. Malnutrition, dirty water, overcrowded living and working conditions, lack of sanitation and hygiene, poor education, and lack of access to health care make poor people more likely to become infected and more likely to suffer poor outcomes when infection occurs. As bad health, in turn, exacerbates poverty, a vicious cycle promotes both poverty and disease. Fourth, **infectious diseases are prone to promote fear, panic, stigma, discrimination, and emotional and irrational decision and policy making.** Fifth, and finally, **infectious diseases pose threats to security. Security dangers are associated with fast-moving infectious disease outbreaks that overwhelm response capacity and cause chaos.** In 2007, the World Health Organization described pandemic influenza as 'the most feared security threat',⁸ and former US President George W. Bush suggested that a military response may be necessary in the event of a flu pandemic. Security may also be jeopardized for economic reasons in the case of slower-moving epidemics. HIV/AIDS, for example, has brought numerous African societies to the verge of economic collapse. Historical studies reveal that factors such as

high infant mortality, low life expectancy and decreasing life expectancy – especially salient in sub-Saharan Africa at present, largely as a result of HIV/AIDS – are among the most reliable indicators of societal upheaval.

Prefer a focus on non-communicable chronic diseases

Zarocostas 10 (John Zarocostas is a Geneva-based independent international correspondent and broadcaster, with more than 20 years experience in covering international global issues, including world health, development and humanitarian issues. His news dispatches have been published in The Lancet, The BMJ, McClatchy Newspapers, the International Herald Tribune, The National Law Journal, The New York Times, The Straits Times, Lloyd's List, The Canberra Times, The Globe & Mail, The Times, The Irish Times, The Journal of Commerce, and the South China Morning Post. “Need to increase focus on non-communicable diseases in global health, says WHO” <http://www.bmj.com/content/341/bmj.c7065///CW>

Governments worldwide need to increase the priority given to fighting non-communicable diseases especially in the poorest nations, the World Health Organization says.¶ The sense of urgency by WHO is driven by the high and projected increases in the prevalence rates of non-communicable diseases—cardiovascular diseases, cancers, diabetes, and chronic lung diseases.¶ These four major groups of diseases share four risk factors—tobacco use, unhealthy diet, physical inactivity, and the harmful use of alcohol.¶ Ala Alwan, WHO’s top official for non-communicable diseases and mental health, said, “The reason for the focus on these four major group of diseases is because they are responsible for about 80-85% of mortality due to chronic diseases, and because they also share the same risk factors.”¶ Dr Alwan told reporters the magnitude is increasing globally. Non-communicable diseases are currently responsible for 60% of all deaths, or more than 35 million deaths every year, of which 80% occur in low and middle income countries.¶ Up to 25% of deaths from non-communicable diseases occur in people under 60 years of age, he said.¶ “They are not only an enormous health problem, but they are also a problem that has very negative socioeconomic consequences,” he added.¶ Dr Alwan said that according to mortality estimates in all regions except Africa more than 50% of deaths are caused by non-communicable diseases and among these, the leading cause of death is cardiovascular disease.¶ The WHO predicts that global mortality from non-communicable diseases will increase by 17.6% during 2006 to 2015; by more than 24% in some regions such as Africa, and by 23% in the Western Pacific and South East Asia.¶ The treatment and health care for people with non-communicable diseases is also expensive, and increasing, Dr Alwan said. In poor populations a substantial proportion of families with a relative with cancer or heart disease will experience catastrophic expenditure, which will drive the family below the poverty line.¶ “We see higher levels of risk factors like tobacco, and overweight and obesity in the lower social-economic class[es] and we also see the highest prevalence of diabetes occurring in developing populations,” he said.¶ Dr Alwan, a former minister of health of Iraq, also highlighted that non-communicable diseases are “largely preventable if we address risk factors with tobacco control, address unhealthy diet and physical inactivity.”¶ He said international efforts to implement a global strategy to control and prevent non-communicable diseases is leading to the development of indicators similar to the millennium development goals together with a monitoring mechanism. Greater priority needs to be given to non-communicable diseases in health and broader development agendas, he said.¶ Dr Alwan added that the private sector, including the food and beverages industries, also has to provide some solutions. These include responsible marketing, especially for children, and a greater emphasis on more healthy products.

Prefer chronic disease – media creates a bias toward ISIS and nuclear war

Fisher 14 (Max Fisher is a writer at Vox, “Threats to Americans, ranked (by actual threat instead of media hype” 8/17/14 [http://www.vox.com/2014/10/17/6988377/threats-to-americans-ranked-ebola-isis-russia-furniture\)///CW](http://www.vox.com/2014/10/17/6988377/threats-to-americans-ranked-ebola-isis-russia-furniture)///CW)

Americans are inundated with media coverage and politicians warning them of dire threats: Ebola, the Islamic State of Iraq and Syria (ISIS), the war on Christmas.¶ The truth, though, is that the most-hyped threats are often not actually that threatening to Americans, while larger dangers go mostly ignored. That should tell you something about how our political system and media can distort threats, leading Americans to overreact to minor dangers while ignoring the big, challenging, divisive problems — like climate change — that we should actually be worried about.¶ An actual poll featured on Fox News (Nick Martin)¶ Obsessing about possible threats is something of a beloved national past-time here in America, which is objectively one of the safest places on Earth, so we want to help you do it right. Here, then, is a highly un-scientific and incomplete ranking of threats to the United States — sorted by the current danger to Americans, worst-case danger to Americans, and how freaked out you should be.¶ 9) Ebola¶ Threat to Americans: If you are an American in West Africa in close proximity with Ebola victims, the threat is moderate. If you are an American health worker in the US assisting an Ebola victim or someone who frequently comes into physical contact with one, the threat of infection is

minor if you use proper protective equipment. Otherwise, the threat is pretty close to zero.¶ Worst-case scenario: The outbreak could get much worse in West Africa, but even in that scenario the disease will remain unlikely to affect many Americans outside of the region.¶ How freaked out should you be: If you have loved ones in Liberia, Sierra Leone, or Guinea, it is not unreasonable to urge them to take all possible precautions. Otherwise, you would do better to worry about the other items on this list.¶ A health worker demonstrates Ebola treatment practices in London (Dan Kitwood/Getty)¶ 8) Your own furniture¶ Threat to Americans: According to a report by the Consumer Product Safety Commission, just under 30 Americans are killed every year by "tip-over," which is when "televisions, furniture, and appliances" fall onto their owners. The report also found that over 40,000 Americans receive "emergency department-treated injuries" from tip-over every year.¶ Worst-case scenario: This is America. We can always find ways to make a bigger, heavier, deadlier TV.¶ How freaked out should you be: Council on Foreign Relations scholar Micah Zenko found that tip-over kills about as many Americans per year as terrorism does, and injures many more. In theory, then, you should be just as freaked out by tip-over as you are by terrorism. Based on the fatality rate, you should be much more freaked out about tip-over than you are about Ebola.¶ 7) ISIS¶ Threat to Americans: Presently, the threat to Americans outside of Iraq and Syria is extremely low, as ISIS has no demonstrated intent or capability to launch such an attack. And since 2001, the US has gotten much, much better at preventing terror plots.¶ Worst-case scenario: ISIS does control a giant stretch of territory, boast thousands of fighters (some with Western passports), earn lots of oil revenue, and field heavy US-made weapons seized from the Iraqi army. Oh, and it now has access to rotting but still-deadly chemical weapons. They could decide to use those resources to try to attack the US, or could allow other terrorists to use their territory as a safe haven.¶ How freaked out should you be: Not very. If ISIS decides to turn its attention to attacking the US, the prospect it might succeed is real, but remote. And even if it did pull off a successful attack, it would almost certainly kill only a small fraction of the number of Americans that guns and cars are virtually certain to kill every single year.¶ Smoke from a battle between Iraqi Kurds and ISIS (SAFIN HAMED/AFP/Getty)¶ 6) The flu¶ Threat to Americans: The flu kills thousands of Americans every year, many times more people than Ebola. The elderly and infirm are especially at risk.¶ Worst-case scenario: An especially bad outbreak in 2004 killed 48,000 Americans.¶ How freaked out should you be: If you're elderly, very young, or immunosuppressed, you should get a flu shot or nasal spray immediately. (Even if you're not, you should still get off your lazy butt and get a flu shot, unless you are some kind of monster who doesn't care about herd immunity.) But if you're young and otherwise healthy, you'll probably be fine even if you do catch the flu.¶ 5) World War III breaking out in the Baltics¶ Threat to Americans: No one wants a global thermo-nuclear war between the West and Russia, including Vladimir Putin. But his meddling in Baltic NATO countries like Estonia, which the US and Western Europe are committed to defend, could inadvertently trigger what we avoided throughout the Cold War: open military conflict between the major nuclear powers. Both Putin and President Obama have threatened as much to try to scare one another out of acting aggressively.¶ Worst-case scenario: Russia does in Estonia what it did in Ukraine, that snowballs into war between Russia and the US/NATO, and the nukes start falling.¶ How freaked out should you be: To be very clear: the odds of this happening are extremely low. But the danger is real enough that everyone is taking it seriously (Russia is holding major nuclear exercises). If it did happen, it would be many, many times worse than every other item on this list combined.¶ Russian tanks in a military parade in St. Petersburg (OLGA MALTSEVA/AFP/Getty)¶ 4) Climate change¶ Danger to Americans: Potentially dire. The greatest near-term harm may be from a rise in extreme weather events. Over the next 100 years, that could include deadly heat waves, droughts, flooding, and a rise in sea levels that would affect coastal cities.¶ Worst-case scenario: The world is trying to limit the global temperature rise to 2°C, because any more than that is considered dangerous. A temperature rise of 4°C would cause "substantial species extinctions" and "large risks to global and regional food security," as well as rising sea levels, according to the Intergovernmental Panel on Climate Change. In other words, a total catastrophe.¶ How freaked out should you be: If you care about the world your kids and grandkids will grow up in, pretty freaked out. Averting disaster requires immediate, massive, global cuts to carbon emissions. With the US and China particularly dragging their feet, it may simply be too late.¶ 3) Guns¶ Danger to Americans: Guns kill more than 30,000 Americans every year, about as many deaths as caused by motor vehicles. But only about one in three of those deaths is a homicide. A few thousand are from accidents but most are due to suicide.¶ Worst-case scenario: We have already chosen to live in a society with the world's highest gun ownership rate and some of its loosest gun control laws, so the worst-case scenario is pretty much here. Still, gun deaths per year are on the rise.¶ How freaked out should you be: It all depends on whether you see America's uniquely permissive gun laws as worth the trade-off. But you — and, yes, your children — are at risk, regardless of your views about gun regulations.¶ A customer inspects a totally legal AR-15 assault rifle at a gun store in Wendell, North Carolina (Chuck Liddy/Raleigh News & Observer/MCT via Getty)¶ 2) Traffic accidents¶ Danger to Americans: Very high. About 34,000 deaths in 2011 (the last year with complete data), more than one in four of all deaths related to unintentional injuries.¶ Worst-case scenario: Drunk driving. Don't do it.¶ How freaked out should you be: The motor vehicle death rate is declining, but getting in your car is still dangerous. Stay alert and don't drink.¶ 1) Heart disease and cancer (tie)¶ Danger to Americans: The number-one and number-two killers in the US, collectively responsible for just over 50 percent of all American deaths.¶ Worst-case scenario: These could become even deadlier as Americans get unhealthier. Heart disease correlates with rising obesity. Cancer rates also correlate with obesity, smoking, and other unhealthy practices.¶ How freaked out should you be: The odds are that one of these two things will kill you, so you should be thinking about this. The good news: it's pretty easy to reduce that risk by making healthy lifestyle choices and screening regularly for cancer. Much easier for any given American, at least, than combatting West African Ebola outbreaks or Middle Eastern terrorist groups.

Extinction- engineered pathogens

Sandberg, 8 -- Oxford University Future of Humanity Institute research fellow

[Anders, PhD in computation neuroscience, and Milan Cirkovic, senior research associate at the Astronomical Observatory of Belgrade, "How can we reduce the risk of human extinction?" Bulletin of the Atomic Scientists, 9-9-2008, thebulletin.org/how-can-we-reduce-risk-human-extinction, accessed 8-13-14]

The risks from anthropogenic hazards appear at present larger than those from natural ones. Although great progress has been made in reducing the number of nuclear weapons in the world, humanity is still threatened by the possibility of a global thermonuclear war and a resulting nuclear winter. We may face even greater risks from emerging technologies. **Advances in synthetic biology might make it possible to engineer pathogens capable of extinction-level pandemics. The knowledge, equipment, and materials needed to engineer pathogens are more accessible than those needed to build nuclear weapons. And unlike other weapons, pathogens are self-replicating, allowing a small arsenal to become exponentially destructive. Pathogens have been implicated in the extinctions of many wild species. Although most pandemics "fade out" by reducing the density of susceptible populations, pathogens with wide host ranges in multiple species can reach even isolated individuals.** The intentional or unintentional release of **engineered pathogens with high transmissibility, latency, and lethality might be capable of causing human extinction.** While such an event seems unlikely today, the likelihood may increase as biotechnologies continue to improve at a rate rivaling Moore's Law.

Emerging diseases and bioterrorism are comparatively the largest impact

Milne 4 – Formerly a practicing veterinarian in New Jersey and Maryland, Dr. Milne attended Johns Hopkins University in 1987-88 where he earned a master's degree in public health with a concentration in epidemiology. For six years, he worked for the New Jersey Department of Health in risk assessment as well as legislative and regulatory review, and finally served as Emergency Response Coordinator. Dr. Milne joined Tufts University's Center for the Study of Drug Development in 1998 as a Senior Research Fellow, after graduation from law school. His research interests include the evaluation of regulatory initiatives affecting the pharmaceutical and biotechnology industries, and incentive programs for the development of new medicines for neglected diseases of the developing world. Dr. Milne is currently Assistant Director at the Center and a member of the bar in New Hampshire

(Christopher, "Racing the Globalization of Infectious Diseases: Lessons from the Tortoise and the Hare," 11 New Eng. J. Int'l & Comp. L. 1)

Although we have faced planet-killing events such **as a nuclear brinkmanship** during the Cold War **and mega-meteors** colliding with earth in pre-history, **the most imminent threat is** one we face everyday from the **globalization of infectious diseases.** Leading authorities in government, medical institutions, and schools of public health have been ringing the warning bell for over a decade about the major threats to global public health. ²Link to the text of the note Threats such as **infectious diseases** in the developing world, **drug resistant bacteria, and** the problem of **multiple HIV strains, remain unaddressed.** The public health community lacks answers to key scientific questions for an AIDS vaccine, and needs to press harder on research for a tuberculosis (TB) vaccine, a process which could take twenty to fifty years. ³Link to the text of the note **Experts believe that the threat warning level has risen from orange to red,** comparing the **circumstances favoring a** pandemic today to **the "Perfect Storm," due to** the continuing increase of worldwide **antimicrobial resistance, diminished** U.S. **capacity to** recognize and **respond** to microbial threats, **and** the likelihood of **intentional releases of biological agents.** [¶]The sources of this public health challenge derive from a panoply of emerging and re-emerging natural plagues, thirty of which have been recognized just in the last few decades with thirteen occurring in North America. ⁴Link to the text of the note According to Anthony Fauci, Director of the National Institutes [3] of Allergies and Infectious Diseases (NIAID), emerging diseases are defined as ones that have not been previously recognized, such as acquired immunodeficiency syndrome (AIDS) or severe acute respiratory syndrome

(SARS). Comparatively, re-emerging disease has usually been in existence for a long time but has changed location, as did the West Nile Virus. Dr. Fauci considers bioterrorism to be a part of the continuum of emerging and re-emerging diseases, and points out that when it comes to bioterror: "The Worst Bioterrorist May be Nature Itself." 5Link to the text of the note¶ **Infectious diseases with the potential to be global killers come in two basic forms: the "slow**

epidemic," taking months or years to reach pandemic status, with an insidious onset and long latency, that resists treatment - the archetypical example being AIDS, 6Link to the text of the note **and the "fast epidemic," rapidly spreading from country to country,** typically **aerosol-borne, with fairly quick onset, and high mortality and morbidity** - most recently manifested in pandemic SARS. 7Link to the text of

the note Both **forms have potential uses as bioweapons,** although most of the counter-terror attention focuses on the SARS-like diseases.¶ Part II of this article will discuss the scenarios for a global pandemic presented by SARS, AIDS, or bioweaponized incarnations - what they have done, what they could do, and why it is so hard to stop them. Part III will describe the scope of the public health problem, particularly the globalization factors that serve as enablers of the pandemic potential of these diseases, as well as a host of ill-defined "x" factors that have served to further complicate the dynamics of dealing with these global killers. Part IV will consider solutions to the problem by discussing what we have versus what we need. Part V will present recommendations for how government, pharmaceutical and biotechnology industries, as well as international non-governmental organizations can be part of the solution. Lastly, Part VI provides a conclusion.¶ "Ring around the rosie, pocket full of posies,¶ Ashes, ashes - we all fall down!" - According to legend, a children's rhyme dating from the time of the plague in medieval Europe.¶ II. Scenes from a Plague¶ SARS has been compared to the bubonic plague of the Middle Ages, but the Black Death was not a "fast epidemic" due to the limitations of its [4] mode of transmission, as well as the modes of medieval transportation. While SARS is somewhat comparable to flu epidemics of the last century and to the putative bioterror agents of today, AIDS has the dubious distinction of being closer to the experience of the Black Death. However, unlike that ancient pandemic, which was more limited temporally and geographically, AIDS is embarking upon what, Dr. Peter Piot, executive director of UNAIDS, refers to as a "true globalization phase." 8Link to the text of the note¶ A. Black Death Redux¶ The superlatives used to describe the public health impact of AIDS never seem to be exhausted. One commentator noted that AIDS will soon exceed the death toll of the Bubonic Plague, making it the most "numerically lethal pandemic" the world has ever known. 9Link to the text of the note The World Health Organization (WHO) refers to it more prosaically, but with similar notoriety, as the "toughest health assignment the world has ever faced." 10Link to the text of the note Even after twenty years, AIDS is still something of a medical and scientific conundrum. Diversity of the virus increases with duration of infection, further complicating drug treatment. 11Link to the text of the note Vaccine development is similarly complicated due to existence of ten major genetic types or clades of HIV-1, each with a distinct geographical spread. 12Link to the text of the note¶ What we do know is that AIDS is caused by an infection with the human immunodeficiency virus (HIV), transmitted through unprotected sex, sharing hypodermic needles, transfusions of contaminated blood, or from mother to child during pregnancy, labor, delivery, or breast-feeding. The virus attacks the immune system by infecting white blood cells, known as CD4+ cells, making it difficult for the body to fight off infections. AIDS itself is considered the final stage of HIV disease. 13Link to the text of the note Without treatment, HIV will progress to full-blown AIDS within nine to eleven years, and is usually fatal within two years after that point. 14Link to the text of the note The AIDS/HIV toll is [5] approaching forty million infected, with fourteen thousand new infections daily and ninety-five percent of new infections occurring in the developing world. 15Link to the text of the note¶ What we do not know is just how soon and how much of an impact AIDS will have. In sub-Saharan Africa, only an estimated ten percent of the predicted illness and death has occurred; the full impact on people, communities, and economies is still to come. 16Link to the text of the note Nonetheless, one forecast is that seventy million will die of AIDS by 2020, mostly in Africa and Asia. 17Link to the text of the note Besides its own death-dealing impact, AIDS exacerbates the morbidity and mortality of other "slow epidemics" like malaria and tuberculosis, and drains resources that would otherwise be dedicated to their treatment. 18Link to the text of the note By 2010, a report by the Central Intelligence Agency (CIA) states that five countries - Nigeria, Ethiopia, Russia, India, and China - will suffer a total of fifty to seventy-five million cases of HIV/AIDS. 19Link to the text of the note¶ For a preview of the AIDS wasteland that faces us without a serious course change, consider the devastation wrought by AIDS on Botswana. Before the AIDS epidemic reached Botswana in the early 1990s, per-capita income had risen tenfold over the previous thirty years, primary school enrollment had doubled, and infant mortality had decreased almost threefold. A decade after AIDS swept over the land, thirty percent of the country's economic growth was erased and the number of years each citizen is expected to contribute to the economy has been reduced from fifteen-to-thirty productive years to just five. Moreover, one-fifth of Botswana's children will soon be AIDS orphans. 20Link to the text of the note Botswana now has the lowest life expectancy of any country in the world at 30.8 years of age, which is about three times less than the highest life expectancy of 83.5 years in the European nation of Andorra. 21Link to the text of the note At the current pace, close to [6] fifty percent of the world's population could live in countries gripped by the AIDS pandemic by the end of the decade.¶ B. Cold Virus on Steroids¶ The official acronym for severe acute respiratory syndrome is SARS-CoV, which derives from the fact that it is a coronavirus, the same family of viruses that cause the common cold. However, SARS acts more like a cold virus pumped up on anabolic steroids. According to statistics, the recent outbreak of SARS was both debilitating and deadly: eleven percent of its victims died; sixty percent required hospitalization; twenty to thirty percent needed treatment in intensive care units with intubations; six to twenty percent suffered respiratory sequelae; and thirty to sixty percent experienced post-traumatic stress. 22Link to the text of the note Ultimately, the SARS pandemic led to ten billion dollars in economic losses. 23Link to the text of the note¶ The SARS incubation period is typically six days, but can range anywhere from two to twenty days. SARS is more environmentally stable than other respiratory viruses. However, unlike most respiratory viruses the role of seasonality is unknown, noting that most respiratory viruses are winter creatures. SARS is primarily transmitted by respiratory droplets or fomites (i.e., inanimate objects or substances that transfer an infectious agent), in health care and hospital settings, but also by contaminated sewage. Old age and co-existing illness are contributory factors to SARS, but children tend to contract a more mild form of the illness. SARS is believed to be of an animal origin, but unlike most other species jumpers, SARS has also become efficient at human-to-human transmission. 24Link to the text of the note¶ Although we are still learning from the SARS pandemic, some lessons are clear: **animal pathogens pose**

major risks: a problem in a remote area can become a world problem within weeks; molecular virology can identify and sequence genetic structures of new pathogens within weeks; the epidemiological tracks of a disease can be followed even in remote areas; basic infection control measures work well; and the phenomena of the superspreader (i.e., an infected person responsible for a disproportionate number of transmissions), airborne transmission, and heightened risk to health care workers (i.e., twenty-one percent of SARS infections were in health care workers 25Link to the text of the note) complicate control efforts. 26Link to the text of the note Another lesson is that [7] humans can be the worst enemy regarding transmission. Four SARS outbreaks occurred within one year in Singapore, Taipei, and Beijing from laboratory accidents. 27Link to the text of the note The loose ends that dangle perilously from the tail of the SARS epidemic caused one SARS researcher to remark ominously: "this is not the end of the story..." 28Link to the text of the note¶ C. Black Wind of Death¶ A warning on a radical Islamic fundamentalist website stated that a "Black Wind of Death" would soon be visited upon the enemies of Islam. Some believe that this statement refers to the use of a bioweapon. A conservative estimate of the number of naturally occurring potential bioterror agents is about seventy to eighty, but the possibilities for genetically engineered pathogens are practically limitless. In fact, the pioneers of the Soviet bioweapons program were able to refine the "binary inoculatory," in which treatment of the first microbe would set off infection with a more deadly second microbe. The combinations were limitless, but the results were always the same - the ultimate nightmare. For example, if a person contracts a dreaded disease, such as the plague, and is treated with tetracycline, the treatment may unleash a second disease lying dormant, such as Ebola, for which there is no cure.¶ The question remains: How much lethal know-how is out there? In the 1980s, the Soviets' bioweapons industry employed about sixty thousand people, half of whom were scientists. In the past thirty years, critical masses of two to three thousand new pathogens have appeared; some developing from nature and some designed in the lab, but not always as bioweapons. Fully mapping and understanding the complex interactions of hosts and pathogens for the known biological entities that could be weaponized would take decades. 29Link to the text of the note D.A. Henderson, senior advisor for the Center for Biosecurity at the University of Pittsburgh, framed this problem: "Like it or not, I'm afraid the threat is with us forever." 30Link to the text of the note [8] "Globalization, after all, is fundamentally about market expansion, the rise of new political, social, and cultural movements, and changes in the state and institutions." - Hitchner, Tufts University¶ III. Scope¶ For better or worse, globalization is also about public health. The scope of the public health challenge faced today must now be considered within the context of other globalization factors. Just as addressing the

problems of **globalization,** public health **must also be taken into account.** This is especially true **for infectious diseases, as West Nile virus, monkey pox, SARS, avian flu, and antibiotic-resistant bugs** are only the beginning. According to one expert, "the new normal" has become a public health problem uniquely created by globalization. 31Link to the text of the note¶ A. The Global Village: A Good Place to Raise Deadly Offspring¶ 1. The Urbanization Triplets: Crowding, Poverty, and Destruction of Habitat¶ Certain sequelae of globalization have been identified as facilitating the spread of global infectious diseases. Urbanization, which is defined as rapid population growth in the cities, especially in tropical and subtropical areas in less developed countries, results in large populations coming into closer contact with one another, increasing the probability of infectious diseases. Urbanization is also characterized by poverty and poor sanitation. 32Link to the text of the note Poverty is considered both a cause and an effect of widespread disease. For instance, poverty often results in malnutrition, which in turn weakens the population's ability to fight off diseases, such as malaria. Malaria can cause the deaths of up to half of a million children per year in sub-Saharan Africa alone, resulting in a loss of one percent of the region's GNP. 33Link to the text of the note Urbanization and poverty also contribute to overcrowding in hospitals and health care facilities, which then leads to a struggle with sterilization and isolation procedures. Cross-contamination through blood and instruments occurs more readily. Due to the favorable environment, microbes increase in number and become more diverse through mutations. If a virulent "bug" pops up, it has a good chance of becoming established quickly.¶ Urbanized areas are often large population centers and are served by [9] modern transportation routes. Once an individual becomes infected, they are only a plane ride away from anywhere in the world. 34Link to the text of the note Urbanization also causes destruction of natural habitats, resulting in the release of previously unknown infectious diseases. Many such diseases have

been unleashed by the increased human contact with animal reservoirs, due to altered land-use patterns and changing movement of animal and human populations. 35Link to the text of the note In fact, many of the thirty or so new pathogens recognized in the past three decades originated in animals. 36Link to the text of the note¶ 2. The "T-way" of Global Plague¶ Through the pathways provided by the "3Ts" of globalization - **travel, trade, and tourism** - humans **have** inadvertently **paved the way**

for pandemics. Two million people travel internationally everyday, 37Link to the text of the note with approximately five hundred million traveling by commercial airlines every year, 38Link to the text of the note and millions of tons of food, hazardous materials, and waste in transport daily. 39Link to the text of the note With international travel increasing by fifty percent each decade, the prospects of containing new outbreaks of disease are diminishing. 40Link to the text of the note We are no longer protected by formerly formidable natural barriers like oceans, and even less so by artificial barriers, such as political borders.¶ B. The "X" Factors: The Known, the Unknown, and the Unknowable¶ The factors discussed are complex and their impacts are still under study, but to some degree, they are "known" factors that are quantifiable in the calculus of planning for the future. There are also a number of biological, environmental, socioeconomic, cultural, legal, and political factors that continue to crop up in unpredictable manners. Some were previously unknown but have been factored into the problem equation. Others seem to be so random in occurrence and incalculable as to outcomes [10] that the ultimate impacts remain "unknowable."¶ 1. Microbial Resistance¶ Resistant strains to antibiotics developed within a few years of the discovery of antibiotics some fifty years ago. However, according to the United States Food and Drug Administration (FDA), the difference now is that resistance is no longer an isolated problem, especially in hospitals. 41Link to the text of the note For example, in the United States, about seventy percent of bacteria causing infections in hospitals are resistant to at least one of the most common drugs used to treat them. 42Link to the text of the note In the United Kingdom, the infection rate for methicillin-resistant Staphylococcus aureus, a common hospital contaminant, has risen six-hundred percent over the last ten years. 43Link to the text of the note The WHO warned that due to the overuse of antibiotics in rich countries and the under use in poor countries, drug resistance is a worldwide problem. The result is wasting of billions of dollars that could have been better spent on research and development (R&D) for infectious disease treatments over the last few years. 44Link to the text of the note¶ Antibiotics are not the only medicines with resistance problems. The main drugs used to combat AIDS, the so-called anti-retrovirals (ARVs), are also a source of concern. A recent study showed that ten percent of all newly infected patients in Europe 45Link to the text of the note are infected with drug-resistant strains. In San Francisco, the rate is twenty-seven percent. 46Link to the text of the note According to a recent survey of infectious disease specialists in the U.S., only forty-one percent of patients are able to be treated with the most commonly used ARV regimen, while another forty-five percent are on back-up regimens. For fourteen percent of infected patients, treatment with ARVs has all but failed. 47Link to the text of the note¶ [11] Experts agree that resistance is also a problem in the developing world, 48Link to the text of the note further complicated by factors such as counterfeit drugs, irregular access to treatments, environmental degradation, inconsistent compliance, and diversion of drugs to the black market. 49Link to the text of the note¶ 2. Sociocultural¶ None of the problems associated with the globalization of infectious diseases seem to be confined to one part of the world. For instance, half of reported polio cases worldwide occurred in Nigeria, due to disruption of vaccination efforts. This interruption stemmed from a rumor that the United States government was clandestinely implementing population control by adding contraceptives to the vaccine. 50Link to the text of the note In the U.S., a surgeon recently reported that a several-year-long effort to convince a hospital staff to regularly use a sixty percent alcohol gel for hand disinfection was almost thwarted by a rumor that the gel would reduce fertility. 51Link to the text of the note¶ Actions taken by the general public are often at cross-purposes with actions taken to protect the public health. One of the most crucial problems involved with tackling AIDS in the developing world is the extreme fear and social stigma associated with the disease. These sentiments are exemplified by violence and abuse against women in Africa 52Link to the text of the note and discrimination against HIV patients by their own families and hospitals in India. 53Link to the text of the note In the U.S., the population is so risk-averse that the construction of three Biosafety Level Four labs in California, Texas, and Massachusetts are being vigorously disputed by residents. 54Link to the text of the note¶ [12] ¶ 3. Legal¶ The criminal element always seems to find a way to further complicate an already complicated situation, which is not dissimilar to opportunistic infections. Up to ten percent of the world's drug supply is counterfeit, and may be perhaps as high as fifty percent in many developing countries. 55Link to the text of the note Diversion of medicines to the black market is most common in certain parts of the developing world, but occurs universally. Serostim, a growth hormone prescribed to fight wasting syndrome in AIDS patients, has found an underground recreational use as a bodybuilding drug in the United States. The drug costs about eighty thousand dollars for a year's supply, often paid for by Medicaid, but on the black market, it can fetch two thousand dollars for a week's supply. 56Link to the text of the note Even a new disease, such as SARS, did not take long to develop a criminal element. In May 2002, the FDA issued a special alert regarding internet marketing of bogus SARS prevention products. 57Link to the text of the note¶ In addition to violations of the law, tensions exist within the law as well. The needs of bioscience and the concerns for biosecurity are often adverse. The regulations for "select agents" are so confusing that one researcher was reportedly arrested simply because he traversed a room where a select agent was stored. 58Link to the text of the note Such incidents are one reason why an international group of scientists seeks to keep SARS off the select agents list, arguing [13] that restrictions would stifle research and hurt public health efforts. 59Link to the text of the note However, other experts acknowledge that the transfer of knowledge among scientists is often a leaky process, and scientists may become unwitting accomplices to global bioterror. 60Link to the text of the note careful balance must be struck between freedom in research endeavors and controls designed to prevent the misuse of material and knowledge. 61Link to the text of the note¶ Conflicts of law also exist between public health and privacy. Due to the evolving nature of the newly implemented medical privacy regulations under the Health Insurance Portability and Accountability Act (HIPAA), 62Link to the text of the note state health officials believe themselves to be limited in releasing information regarding deaths from the flu or other reportable diseases, due to new legal protections afforded to patients. However, HIPAA contains a public health exception, and most officials argue that releasing certain information is required by state public health laws to provide information about risk factors that the public should be aware of. 63Link to the text of the note¶ The United States Security and Exchange Commission (SEC) has become embroiled in this problem as well. SEC regulations are an issue, not only due to antitrust laws prohibiting collaboration on countermeasures by "competing" companies, 64Link to the text of the note but also due to accounting regulations that determine when a company can recognize revenue from a stockpile. Under the current scheme, the United States Department of Health and Human Services (HHS) plans to purchase vaccines, but have companies store them until needed to avoid additional cost and logistical problems for HHS. Problems then arise under current SEC regulations, as entities may not declare revenue from

undelivered products. 65Link to the text of the note¶ [14] ¶ 4. The Ultimate "X" Factor¶ **Global infectious disease, bioterror, and national security are becoming strange bedfellows.** The HHS Secretary announced in the fall of 2003 that grants totaling 350 million dollars over five

years would be made available for the establishment of eight Regional Centers of Excellence for Biodefense and Emerging Infectious Diseases Research (RCEs), stating: "These new grants add to this effort and will not only better prepare us for a bioterrorism attack, but will also enhance our ability to deal with any public health crisis, such as SARS. . . ." 66Link to the text of the note Concern regarding the public health crisis precipitated by SARS was believed to have caused some "holdouts" waffling on support of Bioshield to come on board. 67Link to the text of the note The President of the Association of State and Territorial Health Officials believes that the infusion of dollars into bioterrorism awareness has helped to improve the public health system capacity to deal with health emergencies in general. 68Link to the text of the note¶ Internationally, the Security Council of the United Nations (UN) discussed a health issue for the first time as a threat to world stability: HIV/AIDS in Africa. 69Link to the text of the note The African, Caribbean, and Pacific Ocean sectors of the World Trade Organization (WTO) petitioned the WTO's Council for Trade-Related Aspects of Intellectual Property Rights (TRIPS) to find a solution to the deadlock over access to affordable drugs, as the outbreak of diseases such as SARS had made it "a matter of urgency." 70Link to the text of the note The deadlock was broken. In a report by the United States National Intelligence Council, experts emphasized the worldwide threat presented by infectious disease to military capacity, socioeconomic development, international trade and travel, and global stability. 71Link to the text of the note¶ [15] However, common goals can sometimes result in competition instead of cooperation when time, money, and resources are limited. The media reported that National Institute of Health (NIH) studies on AIDS, TB, malaria, and other infectious diseases would be shortened in length due to a White House mandate shifting funding to development of an anthrax vaccine. 72Link to the text of the note While the NIAID budget grew twenty-fold from 1980 to 2004, the increase was mainly due to efforts to combat changing priorities of life-threatening infectious diseases, such as AIDS in the 1990s and bioterror in the 2000s. 73Link to the text of the note In fact, the NIAID budget allotment for AIDS R&D has flat lined for 2002 through 2005, while the biodefense budget went up from \$ 200 million in 2002 to \$ 1.6 billion slated for 2005. 74Link to the text of the note In a survey of nearly four hundred scientists, forty-six percent felt that government spending on bioterror R&D diverts monies from more important investigative work. 75Link to the text of the note Internationally, in January 2002, the WHO's Executive Board stated that it was focusing attention on the health effects of poverty, but also needed to devote attention to preparations for "newer threats such as the deliberate use of anthrax and smallpox agents." 76Link to the text of the note¶ C. The World as a Marketplace, Health Care as a Business¶ Due to the globalization of infectious diseases, the distinction between national and international public health programs have as little relevance as political borders. 77Link to the text of the note However, this also implies that public health counter-measures must be considered within the context of market realities driving globalization. There is a strengthening current within the international public health community to consider access to health care as a universal human right shared by rich and poor alike. 78Link to the text of the note However, one must inquire: Where does the money for health research come from? Independent [16] foundations and charities contribute only about four percent of the billions spent globally each year on health research. 79Link to the text of the note Regarding medicine, a sizeable amount of the funding for basic research comes from governments, but the lion's share of the funding for applied research that turns concepts brewing in test-tubes on lab benches into bottles for injection on clinic shelves comes from private industry. In particular, these are the major pharmaceutical companies, also known as "big pharma." 80Link to the text of the note¶ They don't call it big pharma for nothing! The industry's financial might and resources are impressive. When the list of the world's one hundred largest public companies by market value is released each year, close to one-fifth are pharmaceutical companies. Monsanto, a life-science multinational corporation, has a R&D budget more than twice the R&D budget of the entire worldwide network of public sector tropical medicines research institutes. 81Link to the text of the

note¶ **These resources must be brought to bear if the global community is to make any headway against the globalization of infectious diseases.** However, this is where the economic and political realities of globalization are actualized.

According to previous work on providing incentives to industry to conduct R&D for neglected parasitic and infectious diseases in the developing world, five disincentives must be

addressed: lack of interest on the part of big pharma; an unfavorable cost/risk ratio for big pharma; the fact that only impoverished markets exist for the products of such R&D; the difficulty of directing capacity in the Northern hemisphere to address the needs of the South; and the realities of the vaccine market. The problem, however, **is that Congress appears to lack this desire**. An excellent opportunity to address this problem came and went when Congress introduced major amendments to the HIPAA statute in the 2009 Health Information Technology for Economic and Clinical Health (“HITECH”) Act.⁷⁴ Congress declined to expand HIPAA’s preemption of state privacy law. Pragmatism counsels that **HIPAA’s preemption provisions are not likely to change**. Those who favor a more uniform legal framework to support large, interoperable public health data networks and public health uses of data must find a way to achieve these goals within the existing preemption framework. To paraphrase Donald Rumsfeld, “You go to war with the [HIPAA preemption provisions] you have, not the [provisions] you might want or wish to have at a later time.”⁷⁵ Accordingly, this Article takes a fresh look at HIPAA’s existing preemption provisions to check for tactical opportunities that earlier scouts may have overlooked.

Privacy rulings are extremely unpopular and take up the entire floor- HIPAA empirics proves

Evans 13 (Barbara J. Evans. Professor of Law; Co-director, Health Law & Policy Institute; Director, Center on Biotechnology & Law, University of Houston Law Center, Yale Law School; M.S., Ph.D. Stanford University; Post-doctoral Fellow, The University of Texas M.D. Anderson Cancer Center. “Institutional Competence to Balance Privacy and Competing Values: The Forgotten Third Prong of HIPAA Preemption Analysis.” P. 1212-1213.

http://lawreview.law.ucdavis.edu/issues/46/4/Articles/46-4_Evans.pdf//EMerz

The HIPAA Privacy Rule had a famously contentious rulemaking history. The proposed regulation drew more than 52,000 public comments and the final rule of December 2000 subsequently was reopened for a second round of comments and amendments. **Consensus was hard to achieve and, in fact, was not fully achieved.** The Privacy Rule continues to be disliked by all sides. For example, it is simultaneously criticized for allowing too much and not enough access to data and biospecimens. Modestly positioning the Privacy Rule as a floor of privacy protections may have had a calming effect during the fractious rulemaking process. By its own terms, the Privacy Rule is merely a floor, and that was all that needed to be discussed during the rulemaking. The Privacy Rule only becomes a ceiling in one narrow context — public health uses of data and biospecimens — and then only when read in conjunction with the HIPAA statute. The rulemaking carefully set the stronger statutory preemption provision at 42 U.S.C. § 1320d-7(b) to one side and avoided making it a topic of rulemaking discussions.

No political constituency for the plan – politicians will defer to law enforcement

Jason **Kreag** (Visiting Assistant Professor, University of Arizona James E. Rogers College of Law) **2015** “GOING LOCAL: THE FRAGMENTATION OF GENETIC SURVEILLANCE” http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2583957

The lack of legislative interest in regulating local DNA databases is not surprising.²⁸⁷ Absent a public outcry, there is normally little political upside for politicians to initiate legislation to curb police use of a tool that law enforcement has identified as effective.²⁸⁸ And the possibility of a public outcry resulting from surveillance techniques like local databases, which disproportionately impact people with comparatively little socioeconomic standing and political power, seems unlikely because “citizens tend not to see themselves as the subjects of future police investigations.”²⁸⁹ Furthermore, even if policy makers would be interested in regulating a particular surveillance method, they are often not notified of new techniques in advance, leaving the new methods to gain a foothold absent external oversight.²⁹⁰

The debate over the plan get dragged into the ObamaCare debate

Katherine **Gasztonyi** (associate in the firm’s Washington, DC office and a member of the Privacy & Data Security and Intellectual Property Rights practice groups) **2014** “House Republicans Signal Push for Data Breach Legislation” <http://www.insideprivacy.com/united-states/congress/house-republicans-signal-push-for-data-breach-legislation/>

In the wake of the recent Target Corp. credit card data breach, Congress is once again turning its attention to data breach legislation. In a memorandum to Republican lawmakers on January 2, House Majority Leader Eric Cantor (R-Va.) stated that he intends to schedule legislation on security and breach notification requirements for federally facilitated healthcare exchanges when Congress resumes session next week. Democratic leaders characterized the news as yet another effort by Republican lawmakers to undermine the Affordable Care Act rather than a serious effort to deal with data security issues.

****States CP****

Frontline

1NC

The 50 U.S. states and relevant U.S. territories should uniformly:

-apply strict scrutiny to public health surveillance programs.

-Substantially reduce state health surveillance and refuse federal assistance for state and local health surveillance programs

-ban local and state level DNA databases

-and coordinate to ensure uniformity through standardization of the current Health Information Exchange System

State privacy protections are extremely effective

Terry 14 (Nicolas P. Terry. “Big Data Proxies and Health Privacy Exceptionalism.” 2014. P. 19-21 https://www.ftc.gov/system/files/documents/public_comments/2014/01/00004-89091.pdf)//EMerz

Health privacy and HIPAA frequently are viewed as indistinguishable. However, health privacy exceptionalism is not restricted to federal law. In the decade and a half since the appearance of the HIPAA regulations and notwithstanding the Privacy Rule’s limitation on preemption, state law regarding health privacy appears to have receded into the background. The Bush Administration’s health information technology narrative included the characterization of divergent state laws as impeding EHR implementation. 144 Furthermore, in the intervening years several states have normalized their laws with HIPAA. There are explicit protections of privacy in a handful of State constitutions.¹⁴⁶ And some state supreme courts have implied such a right¹⁴⁷ that subsequently has been applied in cases involving medical information.¹⁴⁸ Yet there is nothing that could be as described as exceptional. In contrast, many state legislatures embraced strong, exceptional health privacy models (particularly in the pre-HIPAA years).¹⁴⁹ Indeed many state privacy statutes continue to escape preemption due to HIPAA’s “more stringent” provision. **Any generalized account fails to credit the resilience of health privacy exceptionalism in some states**. Of course, there should be little surprise that California has built on its enviable consumer protective reputation with additional substantive and enforcement provisions. The state’s original Confidentiality of Medical Information Act dates from 1981. It is notable for possessing a broader reach than HIPAA, applying, for example, to health data custodians who are not health care providers.¹⁵¹ California passed one of the first health information breach notification laws.¹⁵² More recently the state established the Office of Health Information Integrity to “ensure the enforcement of state law mandating the confidentiality of medical information and to impose administrative fines for the unauthorized use of medical information”¹⁵³ which requires: Every provider of health care shall establish and implement appropriate administrative, technical, and physical safeguards to protect the privacy of a patient's medical information. Every provider of health care shall reasonably safeguard confidential medical information from any unauthorized access or unlawful access, use, or disclosure. Perhaps

more surprisingly Texas enacted similarly broad protection for health information. In sharp contrast to the narrow HIPAA conception of a “covered entity,” the Texas law applies to “any person who . . . engages . . . in the practice of assembling, collecting, analyzing, using, evaluating, storing, or transmitting protected health information.” 155 Texas also requires “clear and unambiguous permission” before using health information for marketing 156 and broadly prohibits the sale of an individual’s protected health information.157 As discussed above, HITECH (together with a change in administration) provided the enforcement focus that HIPAA had lacked.158 However, the 2009 legislation did not alter the longstanding HIPAA position of not permitting private rights of action.159 Of course a small number of states permit such actions under their health privacy statutes.160 However, almost all jurisdictions allow some species of the breach of confidence action in such cases,161 and some even allow HIPAA in through the “back door” establishing a standard of care in negligence per se cases.162 For example, *Resnick v. AvMed, Inc.*, concerned two unencrypted laptops that were stolen from the defendant managed care company. The compromised data concerned 1.2 million persons, some of whom subsequently became victims of identity theft. Dealing with Florida law allegations of breach of contract, breach of implied contract, breach of the implied covenant of good faith and fair dealing, and breach of fiduciary duty, the Eleventh Circuit addressed the question whether plaintiffs had alleged a sufficient nexus between the data theft and the identity theft. The court concluded that the plaintiffs had “pled a cognizable injury and . . . sufficient facts to allow for a plausible inference that AvMed’s failures in securing their data resulted in their identities being stolen. They have shown a sufficient nexus between the data breach and the identity theft beyond allegations of time and sequence.”164 Overall there seems to be a proliferation of data breach cases being filed in state courts. State privacy case law and legislation are continually evolving both in and out of the health care space. However, there is reason to believe that health privacy exceptionalism remains an accepted tenet among state courts and legislatures.

The states solve every 1AC internal link

Jason **Kreag (1AC Author)** (Visiting Assistant Professor, University of Arizona James E. Rogers College of Law) **2015** “GOING LOCAL: THE FRAGMENTATION OF GENETIC SURVEILLANCE” http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2583957

While a federal law would be most effective, there are other options to achieve some of the benefits of the reforms outlined in Part III.C. For example, each state could be encouraged to adopt a model statute that includes these reforms. The prospect of quick action by each state seems considerably less likely to occur without the stick of being excluded from CODIS that could be a part of federal regulation. However, Alaska, Vermont, and Washington have demonstrated that some states are capable of regulating local databases. In addition, there are options aside from legislation. Existing regulatory bodies could promote these reforms as best practices for local DNA databases. For example, the recently created National Commission on Forensic Science (“NCFS”), a joint project of the Department of Justice and the National Institute of Standards and Technology (“NIST”), describes part of its mission as “reduc[ing] fragmentation and improve[ing] federal coordination of forensic science.”323 Similarly, NIST’s newly-formed Organization of Scientific Area Committees (“OSACs”) represents another potential source for external regulation.324 Whereas the NCSF will outline broad policies, the OSACs are designed to adopt specific “standards and guidelines” for each forensic discipline.325 These organizations, which include national leaders from law enforcement, practice, and academia, are limited to adopting non-binding recommendations. However, even recommended procedures could be

powerful forces to alter current practices. Finally, while this Article argues that external regulation is optimal and necessary,³²⁶ it is at least possible that the early adopters of local databases could organize a working group to develop uniform standards. Director Harran of Bensalem has considered holding a meeting with the agencies that use local databases to explore the adoption of standard procedures.³²⁷ A working group offers at least three potential incremental benefits. First, simply starting the dialogue would force some agencies to articulate their practices and procedures. Second, a discussion about what regulations are needed could encourage law enforcement to consider some of the external costs of local databases. Finally, even if the working group did not possess the power to adopt binding regulations, it is possible that some agencies—motivated by the self-interested desire to continue using their own local databases—could pressure others to act more cautiously so as not to generate interest from external regulators. CONCLUSION Given the pressure on police to solve crimes and reduce criminal activity, it is not surprising that law enforcement aggressively adapts surveillance technology to its benefit. Such actions are often commendable and encouraged. Indeed, the very manner in which law enforcement agencies measure their absolute and comparative success—through crime rates and clearance rates—incentivizes local agencies to push the boundaries of crimesolving tools. Early adopters of local databases are doing just that, trying to maximize the ability of forensic DNA analysis to fight and deter crime. Palm Bay, Bensalem, and others have shown that local databases offer great promise when measured on that scale. But a narrow focus on crime rates and clearance rates is not the only relevant metric when allocating policing resources in general, and public surveillance in particular. Rather, policing has the potential to generate positive and negative externalities unrelated to crime rates and clearance rates, and these externalities are often difficult to measure reliably. Furthermore, there is little incentive for law enforcement to identify or measure these externalities, particularly negative ones. This Article is the first attempt to identify the full implications of local databases. While it is beyond its scope to measure these externalities, identifying their existence and recognizing law enforcement’s failure to consider them calls for some level of external regulation of local databases. Because the empirical work needed to measure the external costs of local databases has not been developed, the reforms proposed in this Article are modest. It is possible, although, in the opinion of the author, unlikely that the external costs of local databases will outweigh their benefits. If that proves true, states should follow Vermont’s lead and ban local databases. More than likely, the result of a full-scale empirical study of local databases will call for something in the middle, rejecting the total prohibition in Vermont and rejecting the current landscape, where local agencies are free to develop and use local databases without external regulation.

1NC–Alt Text for Local DNA Plank

<< replace “ban local DNA databases” with “Certify that local databases within their jurisdiction follow the reforms outlined in the Krag evidence”>>

(here are the reforms – put in the text if you care to)

1. Require Adequate Record Keeping

2. Require Consent
3. Prohibit the Inclusion of Victim DNA Profiles
4. Mandate Time Limits for Suspect DNA Profile Retention
5. Monitor Use

The counterplan would solve – 5 things the states need to do to resolve collection

Kreag 2015 (Jason, Visiting Assistant Professor, University of Arizona James E. Rogers College of Law “GOING LOCAL: THE FRAGMENTATION OF GENETIC SURVEILLANCE” http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2583957, mmv)

With these limitations in mind, this Section outlines five substantive regulations that should be adopted to oversee the use of local databases. Two scholars have previously proposed regulations that would severely curtail law enforcement’s use of these databases. For example, Professor Elizabeth Joh has proposed that law enforcement should be required to obtain a “warrant whenever police seek abandoned DNA from a targeted person.”²⁹⁵ Professor Wayne Logan has gone further, recommending that the “government should be barred from using identity evidence secured from a lawful arrestee for any purpose other than identity verification.”²⁹⁶ The recommendations offered below would not go as far. However, they would help limit many of the potential negative implications of local databases while at the same time leaving sufficient room for law enforcement to expand its use of DNA to high-volume crimes

1. Requiring Adequate Record Keeping Maintaining adequate and accurate records is crucial to regulating law enforcement’s use of local databases.²⁹⁷ Agencies using local databases should be required to record aggregate data regarding the DNA profiles in their databases. This information should include the percentage of DNA profiles from known individuals versus profiles derived from crime-scene evidence. Furthermore, the DNA profiles from known individuals should be further disaggregated. For example, regulations should mandate the collection of information regarding whether the known profiles were collected by consent, from abandoned biological material, or surreptitiously. Law enforcement should also be required to collect information regarding the sources of the known DNA profiles. That is, was the profile generated from a suspect, a victim, a victim’s family member, or a witness? Finally, regulations should require the collection of data on the age, race, and gender of the individuals whose profiles are in local databases. In addition to collecting this aggregate data, law enforcement should be required to track these same categories for each individual officer who collects reference samples. Finally, this data should be recorded in a manner that makes it readily accessible. If law enforcement is not required to collect this information, it will be difficult to monitor whether local databases are utilized in a fair manner and if their burdens are sufficiently distributed.²⁹⁸ This is particularly true because law enforcement officials have considerable discretion in who they target.²⁹⁹ For example, it would be important to know if a law enforcement agency only collects abandoned DNA samples from young men of color. It would also be helpful to know if an individual officer’s practices follow the same pattern.³⁰⁰ Without this information we will not be able to reliably measure the extent of several of the potential negative consequences identified in Part II.

2. Regulating Consent As is demonstrated in Part I.B., law enforcement’s use of local databases is dependent on collecting

consensual samples from known individuals. In particular, local databases are different from CODIS because they often include profiles from people police have identified as suspects or potential future suspects. The reliance on consensual samples as opposed to legally coerced samples—e.g., from arrestees or convicted individuals—renders it important for regulations to address under what circumstances law enforcement should be able to request a consensual sample. Regulations should also help to ensure that consent is voluntary. In the absence of regulation, law enforcement can approach anyone and request a consensual DNA sample for inclusion in its local database. Furthermore, no external regulation requires that law enforcement disclose to the targeted individual its plan to add the profile to the local database. Without regulation, there are only two things limiting law enforcement’s ability to request a sample from every person police encounter. First, despite the fact that DNA processing is significantly less expensive than it was even five years ago, it is still economically prohibitive to develop DNA profiles from everyone willing to submit samples. Second, and in part motivated by those costs, some agencies have adopted minimal internal regulations to limit from whom they seek reference samples.³⁰¹ However, these limitations will ease as the cost of DNA processing declines. As a result, it is reasonable to consider whether law enforcement should face limits on seeking consensual DNA samples. Privacy scholars often frame this question as whether one has a right to be left alone.³⁰² Courts have addressed this issue in regulating police-citizen encounters. For example, New York courts have identified a common law right that provides more protection than the Fourth Amendment to limit law enforcement’s ability to initiate consensual searches. In short, “[b]efore the police may stop a person pursuant to [law enforcement’s] common law right to inquire there must exist at that moment a founded suspicion that criminal activity is present.”³⁰³ In *People v. Hollman*, New York’s highest court applied this right in reversing a narcotics conviction that resulted from narcotics found after a citizen consented to the search of his bag.³⁰⁴ The court held that the undercover officer did not possess sufficient suspicion even to seek consent to search the bag.³⁰⁵ Admittedly, the protection offered by *Hollman* is limited. It would not prevent officers from seeking consensual DNA samples from individuals for whom police possessed a reason to stop.³⁰⁶ Furthermore, the Supreme Court’s holding in *Whren* would seem to permit pretextual stops designed to give police an opportunity to seek consensual DNA samples.³⁰⁷ However, recognizing a minimal right to be free from law enforcement’s request for a consensual sample—which is often an inherently coercive interaction given the imbalance of power between law enforcement and the target—would limit law enforcement’s discretion to some degree. Independent of whether law enforcement should be prohibited from seeking consensual DNA samples without limitation, whenever seeking samples by consent, law enforcement should at least be required to disclose its plans for the sample. If those plans include adding the profile to law enforcement’s database, then that should be made clear. Such a requirement would help ensure that the consent was truly voluntary.

3. Prohibiting the Inclusion of Victim DNA Profiles Regulations should prohibit local law enforcement from including DNA profiles from victims in local databases. The practice of including victims’ profiles is driven by law enforcement’s presumption that there is often overlap between crime victims and perpetrators.³⁰⁸ Indeed, many law enforcement officials interviewed during this project repeated variations on the phrase, “Today’s victim is tomorrow’s perpetrator.” Without questioning the accuracy of this presumption, there remain many reasons to prohibit law enforcement from including victim profiles in local databases. Crime victims seek the assistance of law enforcement to remedy the wrong they faced. In the context of the property crimes that are often the focus of local databases, victims seek to recover their belongings, to obtain a police report needed to file an insurance claim, or simply to alert law enforcement that an offender has targeted them so as to

help law enforcement identify patterns or develop leads. In reporting crimes to police, victims voluntarily give up some privacy. Reporting the crime may mean that law enforcement enters their home, takes a statement from them, talks to other potential witnesses, and, in some cases, collects a DNA sample for elimination purposes. To the extent that law enforcement turns the tables on a victim, making the victim the target of law enforcement's broader investigative and surveillance activities, they undermine the justification for their initial intrusion. Collecting DNA samples from victims for inclusion in databases adds a significant cost to what victims must already bear when reporting a crime. Such a practice requires victims not only to submit to the immediate invasion of privacy that results from seeking law enforcement's help, but it also requires victims to submit to a lifetime of genetic surveillance. This cost will undoubtedly cause some victims to avoid calling police. Others may reluctantly seek assistance from police, but they will remain dismayed that they were required to pay a genetic-surveillance tax in exchange for police assistance. 4. Time Limits for Suspect DNA Profile Retention Regulations should address how long law enforcement is able to retain DNA profiles in local databases. For example, if police collect a consensual sample from a 22-year-old suspect that an officer stopped while walking down the street in a manner that caught the officer's attention, that profile should be removed automatically from the database after five or 10 years if, during that period, the profile had not been matched to a crime-scene DNA profile. Such a regulation would at least cap what would otherwise have been a lifetime of genetic surveillance for the 22-year-old for simply appearing suspicious. Given the Supreme Court's holding in *Maryland v. King*, in which it upheld the constitutionality of collecting DNA samples from arrestees,³⁰⁹ the time limit restrictions could be limited to samples collected from mere suspects, as opposed those arrested or convicted of crimes.³¹⁰ 5. Monitoring Use Regulations should also require adequate procedures to ensure that individual officers do not abuse the use of local databases.³¹¹ For example, the architect of Palm Bay's database emphasized his stern warning that officers not use the database for personal snooping.³¹² But stern warnings are not enough. The infrastructure for local databases already includes the ability to monitor individual users. For example, SmallPond includes a feature called Audit Trail, which produces a record of every user interaction with the system, including which searches were performed and which DNA profiles were uploaded.³¹³ Given that this tool is readily available, law enforcement agencies should be required to utilize it to help ensure against misuse.³¹⁴

Extensions

2NC States Solve

Most surveillance is done by the 50 states – they solve best

1ac Brase 13 (Twila Brase. President Citizen's Council for Health Freedom. "Patient Privacy and Public Trust: How Health Surveillance Systems Are Undermining Both." August 2013. <http://www.cchfreedom.org/pr/50%20States%20Databases%20Full%20Report.pdf>)

Health surveillance is a significant and ever expanding activity of state public health agencies, yet few people realize these patient tracking systems exist. Although this report details four surveillance systems across the country, these systems are just a subset of the vast array of public health surveillance systems now in place and expanding primarily as a result of federal funding.

Using laws, regulations, and electronic access to medical records, government health officials are daily collecting personal data on individuals and families without the knowledge or consent of subjects.

As a result of birth, illness or injury, individuals have become the unwitting subjects of government surveillance. They have no choice and there is little to no public notice of this infringement on their privacy rights. Often, even if the law gives them the right to opt-out, they are:

1) not told they are “in” the system; 2) not told they have a choice to get out of the system; and 3) not told that if they opt-out, the government retains a permanent record of their choice.

Until individuals know about the vast array of health surveillance systems, they cannot protect themselves or take the necessary action to stop government data collection and analysis and sharing. Protective actions could include advancing state legislation to limit the permissive sharing under HIPAA and to require informed written consent. This report uses research, tables of statutes, and a 50-state chart of raw data gathered from official sources to inform the public about the hidden health surveillance systems that currently allow government intrusion into the private lives of individuals in the name of “public health.”

States solve best—have a balance of privacy and effectiveness

Galva et al 5 (Jorge, JD MHA, Christopher Atchison, MPA, Samuel Levy, PhD SM, analysts for Public Health Reports, “Public Health Strategy and the Police Powers of the State”
<http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2569983/> 2005 JM)

Population-based measures in response to increased public health threats assume diverse forms. These are essentially clustered in two distinct groups: prevention (detection, data-basing, and tracking), and remediation (containment of actual damage). Preventive measures entail mechanisms to control and track the movement of persons and things. This type of activity may involve the enactment and enforcement of unsympathetic laws and regulations affecting real or perceived spheres of rights. Effective enforcement will depend on the public health authorities' ability to safely overcome resistance to these measures. The control of the flow of information may also result in restrictions to the access and publication of public health information. Remediation demands even greater degrees of control over persons and property. Remediation measures could include: (1) quarantine and involuntary holds when and where necessary for an indefinite period limited only by the cessation of the state of emergency; (2) suspension of habeas corpus in case of quarantine with very limited post-detention remedies for the individuals affected; and (3) property rights (establishment of “public interest easements” on private property in anticipation of an emergency and deputization/commandeering private-sector resources for public use during an emergency). Remediation measures must be rapidly implemented in the event of biological attack or new infectious disease.⁶⁵ Significant normative measures in this respect have been proposed at both the federal and state levels.⁶⁶ The Model State Emergency Health Powers Act (MSEHPA) illustrates this effort. The MSEHPA contains projected measures based on potential terrorist threats and proposed preventive and remedial measures as well as a detailed description of the protection of individual and business rights during an emergency.⁶⁷ The State Emergency Powers Act's purpose is to create a unified response system whereby the states put into effect standardized measures.⁶⁸ The driving principle behind this

uniform legislation is twofold: on the one hand, standardization and modernization of obsolete or inapplicable state laws regulating public health responses, and on the other, creation of balance between states' ability to control individual activity and constitutional rights.⁴ The goals of the MSEHPA are, inarguably, meritorious.⁶⁹ Nevertheless, there are valid concerns regarding the effects of the attempted balance of public and private interests on the states' ability to carry out an effective public health response. There is foundation for these concerns. The MSEHPA's balancing act may sidestep the needed mechanics of infectious disease control by unduly incorporating post-Warren Court legal restraints—pre-intervention notices, hearings, heightened burden of proof, and access to witnesses—into the law.⁷⁰ The MSEHPA fails to restore the historic deference to public health activities or enhance the crucial scientific and administrative underpinnings of public health enforcement actions. Stringent preventive and remedial public health measures are necessary to face contagion. The recent experience with quarantine measures as the principal method used against SARS validates this conclusion.⁴⁴ Taiwan successfully implemented a broad quarantine program: 131,132 persons were placed under strict quarantine orders that required them to stay where they were quarantined, submit to periodic temperature checks, and sharply restrict transportation or visits to public places. These measures were needed because of the unknown transmissibility of SARS; they are associated with the rapid control of the epidemic in that country.⁷¹ Although the Canadian government attempted to use voluntary isolation, ultimately orders were issued for mandatory quarantine when the use of voluntary isolation became difficult.⁷² The Canadian government's response was later characterized as deficient, while the limited spread of SARS in Canada has been attributed to chance.⁷³ It is hard to envision the application of the MSEHPA in a manner congruent with stringent quarantine measures. The procedural guarantees in the MSEHPA may well be impossible to implement due to the risk of exposing judges, witnesses, and the public to possible contagion. In addition, the judiciary and public authorities are not prepared to implement quarantine orders due to lack of familiarity with public health doctrines or logistical shortcomings.^{74,75} The effects of one successful injunction resulting from these shortcomings—very likely under the MSEHPA—allowing, for example, a single SARS super-spreader to avoid quarantine, could be devastating.⁷⁶ A perfect balance between private and public rights in the face of a highly infectious disease may not be attainable, or even desirable. **Emergency activities will be effective if the states' exercise of public health police power is strengthened by good scientific practices and rigorous application of justified means of control.** Expiration of any extraordinary powers once the emergency is controlled remains an obligatory feature unless there is reauthorization on the basis of solid scientific evidence. The ultimate goal of public health law should be the reinforcement of public health on the basis of historic principles of police power allowing broad but temporary administrative activities that are needed to face an impending emergency when the situation warrants.⁷⁷ This necessitates a return to the traditional historic bases of public health police power. Recommended steps in this direction should include: (1) reinforcing the administrative capability for the issuance of robustly evidence-based public health orders properly issued under authority of law; (2) removing all judicial pre-intervention review measures of such orders while limiting review of public health orders to the post-execution phase; (3) subjecting all public health orders to automatic expiration terms and making renewal of the orders contingent on the same robust degree of evidence allowing the original order.

States solve best – only way to avoid circumvention

Pritts 13 (Joy L. Pritts JD is a lawyer who practices in Washington DC and earned her degree at Georgetown University. “Altered States: State Health Privacy Laws and the Impact of the Federal Health Privacy Rule”

<http://digitalcommons.law.yale.edu/cgi/viewcontent.cgi?article=1047&context=yjhple>///CW

States have traditionally been the primary regulators of health care information. While the promulgation of the Federal Health Privacy Rule changes the regulatory landscape, it need not supplant the importance of state health privacy laws. In fact, states have often become more active after the enactment of federal privacy laws, enacting statutes that either mirror or build upon the federal protections. **This approach** endorsed by the Privacy Protection Study Commission in the 1970s, **ensures that the states will be able to enforce the law and protect their citizens.** Because the Federal Health Privacy Rule does not preempt current or future stronger state health privacy laws, the states have ample opportunity to fill the gaps and strengthen the weaknesses of the federal regulation. States therefore should not rely solely on the Federal Health Privacy Rule to protect the privacy rights of their citizens. Rather, states should take advantage of the need to evaluate their health privacy laws in light of the Federal Health Privacy Rule and take appropriate action. States with little statutory protection of health information in place may want to use Federal Health Privacy Rule as a roadmap for enacting comprehensive state health privacy laws. At a bare minimum, states can mirror the federal protections, thereby allowing enforcement to occur at the state level. However, to afford truly comprehensive protection, states should directly regulate not only the entities governed by the Federal Health Privacy Rule, but also the other major generators and holders of health information (such as employers and life insurers). Additionally, states should directly regulate the recipients of health information from these core record keepers. Furthermore, states should strengthen some of the weak provisions of the Federal Health Privacy Rule, such as the use of health information for marketing purposes. States with fairly well developed health privacy rules should also reevaluate their laws in light of the Federal Health Privacy Rule. Some state and federal rules may accomplish the same goals through slightly different requirements (e.g., different content requirements for a notice advising the patient of information practices). In this situation, a state may want to harmonize its provisions with the Federal Rule in order to avoid confusion and to afford some degree of uniformity between states. States should also use this as an opportunity to fill in gaps in state law that may exist (such as having statutory access rights to hospital records but not doctor's records).

CP solves – more stringent state laws take precedence over federal regs

Holloway 3 (Jennifer Daw Holloway is a communications manager at Ipas, an organization dedicated to safe abortions. “What takes precedence: HIPAA or state law?” January 03, <http://www.apa.org/monitor/jan03/hipaa.aspx>///CW

With the Health Insurance Portability and Accountability Act (HIPAA) privacy rule compliance date--April 14--fast approaching, psychologists must explore how the new federal rules interact with their current state laws. HIPAA's privacy rule governs how health-care providers handle the use or disclosure of protected health information (PHI). In effect, PHI is defined as individually identifiable health information relating to the condition of a patient, the provision of health care or payment for care. All states already have privacy laws that apply to such information. Areas such as patient consent, access to records and subpoena rights, to name a few, are included under HIPAA as well as state laws. So, will HIPAA's rules preempt state laws? **"The general standard is that if a state law is more protective of the patient, then it takes precedence over HIPAA,"** says Doug Walter, legislative and regulatory counsel in APA's Practice Directorate. Conversely, if a state law is less stringent than HIPAA, then HIPAA takes over, he says. The following examples illustrate the interplay between state laws and HIPAA and how that will affect psychologists: Consent for payment, treatment and health-care operations. Dr. Smith, a psychologist in Utah, has scheduled a new patient. When the patient comes for her general appointment, Dr. Smith's office must be sure she signs a consent form for the disclosure of her records. Utah law requires that psychologists obtain signed consent, while the HIPAA privacy rule does not require consent. So, Utah law applies instead of HIPAA in this case because the state law gives patients greater privacy protection. Other states may have similar laws that would take precedence over HIPAA. Patient access to psychotherapy notes. Under HIPAA, patients are granted access to their records, with the exception of "psychotherapy notes," better known as

what psychologists traditionally call "process notes." But in some states, such as Vermont, patients can access their psychotherapy notes under state law. So, when a patient of Vermont practitioner Dr. Jones asks to see his notes, Dr. Jones must permit the patient to see the notes. Because Vermont law provides greater rights from the patient's standpoint for the patient to access his or her psychotherapy notes, it takes precedence over the HIPAA requirements. Again, several other states may have such protective laws. Subpoena of patient records. Dr. Milton, a psychologist in New Hampshire, receives a subpoena requesting one of his patient's records. Attached to the subpoena is a notice from the requesting party's attorney stating that her office has made diligent but unsuccessful efforts to reach the patient to serve notice that his records are being requested. This is an adequate attempt to notify the patient under HIPAA and, therefore, the psychologist would not be barred from producing the patient's records if HIPAA took precedence. However, under New Hampshire law, psychologists are precluded from producing their patients' records for a third party absent a court order or patient consent. New Hampshire law is more protective than HIPAA with respect to records subpoena. Therefore, state law preempts HIPAA in this case.¶ There are myriad examples--aside from the three above--of how state laws may take precedence over HIPAA. The simple rule of thumb is that any provision--in state laws or HIPAA--that gives greater protection to patients' privacy or right to access their own health information takes precedence. The HIPAA privacy rule "**won't impair the effectiveness of state laws that are more protective of privacy,**" says Russ Newman, PhD, JD, APA's executive director for practice. And, he notes, in states where protective laws haven't been enacted, HIPAA will not prevent states from enacting laws that provide greater patient privacy protection.¶ HIPAA assumes that practitioners know the ins and outs of their state laws, but figuring out which law will take precedence involves a complicated analysis of state statutes, regulations and common law decisions.¶ The APA Practice Organization and the APA Insurance Trust are developing comprehensive resources for psychologists that will facilitate compliance with the HIPAA privacy rule. Along with several offerings, a new product, "HIPAA for Psychologists"--which will include the necessary state-specific forms that comply with both the HIPAA privacy rule and relevant state law--will be available for purchase online at the Practice Organization's new practitioner portal.¶

States should restrict the current HIE info-sharing system

Christiansen 11 (John Christiansen, J.D., for the National Governors Association Center for Best Practices. "State and Federal Consent Laws Affecting Interstate Health Information Exchange," March 2011. www.nga.org/files/live/sites/NGA/files/pdf/1103HIECONSENTLAWSREPORT.PDF)

Findings

HIPAA articulates the national baseline standard for consent as "No Consent" required for treatment, payment and health care operations disclosures, and includes specific Opt-In or Opt-out processes for sensitive health information (i.e., particular conditions, treatments or diagnoses deemed to require additional protections). Some states have placed additional requirements on the disclosure of health information, thereby leaving organizations and providers confused about which laws apply when exchanging health information across state lines.

This report identifies several key findings:

□ Many state laws vest greater control of health information in individuals than HIPAA does, especially with respect to sensitive health information. Individuals need to comply with both state

and federal laws, which can be difficult to reconcile. The Consents Toolkit will help states and health information organizations (HIOs) identify applicable laws dealing with consent.

State and Federal Consent Laws Affecting Interstate Health Information Exchange

□ Recipients of health information are only required to follow the consent laws of the place in which they are physically located, including applicable federal and state laws, when using and disclosing information received through HIE. HIOs that wish to require higher standards can incorporate them contractually.

□ Reconciling differences in state laws can occur through contract, memorandum of understanding or alignment of state laws.

Recommendations for States, and HIOs, and Providers There is no single model for HIE consent, and approaches in this area will continue to have to balance the values of administrative efficiency and clinical improvement against patient control and public trust. There are several recommendations for states and HIOs as they develop policies to protect and exchange health information:

□ States should develop guidance and standards for intra- and interstate HIE to help organizations best meet the requirements under both federal and state law.

Based on state analyses and guidance, HIOs should develop clear guidance for providers.

□ If sensitive health information is included in HIE, consent processes should be implemented to enforce permission limitations when they are more stringent than HIPAA limitations and must take into consideration existing state and federal laws, such as 42 CFR Part 2. Interstate differences should be specifically discussed and consistent ways of addressing these differences should be established and articulated to all participating entities.

□ If highly granular access controls are not available, it may be necessary to exclude transactions involving sensitive health information. While a uniform nationwide HIE consent model may be adopted at some point, current variations in state and federal law indicate that some variation in consent approaches is probably inevitable and possibly desirable. In the absence of a national uniform solution, consent processes for HIE will have to adapt to variations in law and preferences of the states. Operational strategies based on a process that recognizes the variation in consent laws among states and different processes among HIE models will only help all stakeholders achieve interstate exchange of health information. This report provides a foundation of best practices on such strategies.

The issue of health information is the jurisdiction for the state

O'Connor et al 11 (Informational Privacy, Public Health, and State Laws, 2011 October Jean O'Connor, JD, DrPHcorresponding author and Gene Matthews, JD with the Centers for Disease Control and Prevention, Atlanta, GA. Gene Matthews is with the North Carolina Institute of Public Health, Chapel Hill. <http://www.ncbi.nlm.nih.gov.proxy.lib.umich.edu/pmc/articles/PMC3222345/?tool=pmcentrez>)

The US Constitution does not impart a broad right to the privacy of individual health information.⁷ At the federal level, statutes place boundaries around the collection, use, and

disclosure of certain types of health-related information. These statutes include the Freedom of Information Act,⁸ the Privacy Act of 1974,⁹ the Department of Health and Human Services (HHS) Human Subject Protection Regulations,¹⁰ the E-Government Act of 2002,¹¹ the Family Educational Rights and Privacy Act,¹² the Federal Drug and Alcohol Confidentiality provisions,¹³ and the Genetic Information Nondiscrimination Act.¹⁴ These statutes restrict the use of information for different purposes. For example, the HHS Human Subjects Protection Regulations focus on protecting information in the research context. However, the most frequently cited law in discussions of the privacy of public health information is the Health Insurance Portability and Accountability Act (HIPAA) and its associated regulations. The HIPAA Privacy Rule protects most health records from disclosure but permits health care providers to make disclosures to public health officials and for certain other purposes.¹⁵ The rule does not protect information possessed by public health officials from disclosure, except in limited circumstances. HIPAA also does not preempt state laws on the use or disclosure of data by public health authorities.¹⁶ Because there is no national standard for safeguarding all data held by public health agencies, state laws remain central to discussions of the privacy, confidentiality, security, use, and disclosure of information within the public health system.¹⁷ These state laws have been reported to be fragmented and antiquated, and to “fail to effectively balance competing individual interests in privacy with the need to share public health data and information for the common good.”¹⁸(p1389) For more than a decade, both public health advocates and privacy advocates have responded to this need by calling for clearer protections for state public health information and developing model state policies.^{17,19,20} To disseminate ideas to update state public health privacy laws, Gostin et al. developed the Model State Health Privacy Act (MSHPA), a model statute for states to use as a guide in developing new laws, in 1999.¹⁸ The MSHPA contains detailed language about the appropriate acquisition and use of public health information, terms for when it is appropriate for state health departments to disclose that information, and penalties for noncompliance. After the events in the fall of 2001, the Model State Emergency Health Powers Act (MSEHPA) was drafted to promote the adoption of state public health emergency statutes that contained, among other things, language related to the disclosure of public health information.²¹ Despite these efforts, anecdotal information suggests that few states have adopted public health privacy and disclosure provisions recommended in the MSHPA and MSEHPA. To address the lack of adoption of provisions by states and the continuing development of new approaches to data exchange, Lee and Gostin recently recommended a set of national principles for protecting public health data.¹⁷ The principles included discussion of use of data for legitimate public health purposes, collection or use of the minimum information necessary, data use agreements and security measures, and stewardship and trust. The need to develop a common approach to the use and disclosure of public health information has also been recognized as more than solely a domestic problem; various professional organizations (e.g., the International Epidemiological Association²²) have developed guidelines for the use of data by their members, and an international collaborative is seeking to develop a collective code of conduct for the use of public health data.²³ An analysis of current public health privacy laws can inform these efforts. The success of a national or international set of principles for the use and disclosure of personally identifiable health information under the control of the public health system depends, in part, on acknowledging the specific political and historical factors that have resulted in existing laws. In the United States, understanding current state laws may assist in identifying approaches to bridging the gap between the reality that state and local public health agencies face and ideal policies, frameworks, or practices for the use and disclosure of public health information. Identifying approaches and

patterns in existing state laws is also an essential first step in further analyses of what laws are effective.

CP solves – more stringent state laws take precedence over federal regs

Holloway 3 (Jennifer Daw Holloway is a communications manager at Ipas, an organization dedicated to safe abortions. “What takes precedence: HIPAA or state law?” January 03, <http://www.apa.org/monitor/jan03/hipaa.aspx>)//CW

With the Health Insurance Portability and Accountability Act (HIPAA) privacy rule compliance date--April 14--fast approaching, psychologists must explore how the new federal rules interact with their current state laws.¶ HIPAA's privacy rule governs how health-care providers handle the use or disclosure of protected health information (PHI). In effect, PHI is defined as individually identifiable health information relating to the condition of a patient, the provision of health care or payment for care. All states already have privacy laws that apply to such information. Areas such as patient consent, access to records and subpoena rights, to name a few, are included under HIPAA as well as state laws.¶ So, will HIPAA's rules preempt state laws?¶ **"The general standard is that if a state law is more protective of the patient, then it takes precedence over HIPAA,"** says Doug Walter, legislative and regulatory counsel in APA's Practice Directorate.¶ Conversely, if a state law is less stringent than HIPAA, then HIPAA takes over, he says.¶ The following examples illustrate the interplay between state laws and HIPAA and how that will affect psychologists:¶ Consent for payment, treatment and health-care operations. Dr. Smith, a psychologist in Utah, has scheduled a new patient. When the patient comes for her general appointment, Dr. Smith's office must be sure she signs a consent form for the disclosure of her records. Utah law requires that psychologists obtain signed consent, while the HIPAA privacy rule does not require consent. So, Utah law applies instead of HIPAA in this case because the state law gives patients greater privacy protection. Other states may have similar laws that would take precedence over HIPAA. Patient access to psychotherapy notes. Under HIPAA, patients are granted access to their records, with the exception of "psychotherapy notes," better known as what psychologists traditionally call "process notes." But in some states, such as Vermont, patients can access their psychotherapy notes under state law. So, when a patient of Vermont practitioner Dr. Jones asks to see his notes, Dr. Jones must permit the patient to see the notes. Because Vermont law provides greater rights from the patient's standpoint for the patient to access his or her psychotherapy notes, it takes precedence over the HIPAA requirements. Again, several other states may have such protective laws. Subpoena of patient records. Dr. Milton, a psychologist in New Hampshire, receives a subpoena requesting one of his patient's records. Attached to the subpoena is a notice from the requesting party's attorney stating that her office has made diligent but unsuccessful efforts to reach the patient to serve notice that his records are being requested. This is an adequate attempt to notify the patient under HIPAA and, therefore, the psychologist would not be barred from producing the patient's records if HIPAA took precedence. However, under New Hampshire law, psychologists are precluded from producing their patients' records for a third party absent a court order or patient consent. New Hampshire law is more protective than HIPAA with respect to records subpoena. Therefore, state law preempts HIPAA in this case.¶ There are myriad examples--aside from the three above--of how state laws may take precedence over HIPAA. The simple rule of thumb is that any provision--in state laws or HIPAA--that gives greater protection to patients' privacy or right to access their own health information takes precedence. The HIPAA privacy rule "won't impair the effectiveness of state laws that are more protective of privacy," says Russ Newman, PhD, JD, APA's executive director for

practice. And, he notes, in states where protective laws haven't been enacted, HIPAA will not prevent states from enacting laws that provide greater patient privacy protection.¶ HIPAA assumes that practitioners know the ins and outs of their state laws, but figuring out which law will take precedence involves a complicated analysis of state statutes, regulations and common law decisions.¶ The APA Practice Organization and the APA Insurance Trust are developing comprehensive resources for psychologists that will facilitate compliance with the HIPAA privacy rule. Along with several offerings, a new product, "HIPAA for Psychologists"--which will include the necessary state-specific forms that comply with both the HIPAA privacy rule and relevant state law--will be available for purchase online at the Practice Organization's new practitioner portal.¶

Health Data is important for state use

O'Connor et al 11(Informational Privacy, Public Health, and State Laws, 2011 October Jean O'Connor, JD, DrPHcorresponding author and Gene Matthews, JD with the Centers for Disease Control and Prevention, Atlanta, GA. Gene Matthews is with the North Carolina Institute of Public Health, Chapel Hill. <http://www.ncbi.nlm.nih.gov.proxy.lib.umich.edu/pmc/articles/PMC3222345/?tool=pmcentrez>)

Developments in information technology that make it possible to rapidly transmit health information also raise questions about the possible inappropriate use and protection of identifiable (or potentially identifiable) personal health information.¶ Despite efforts to improve state laws, adoption of provisions has lagged. We found that half of states have no statutes addressing nondisclosure of personally identifiable health information generally held by public health agencies. Exceptional treatment of HIV, sexually transmitted infections, or tuberculosis-related information was common. Where other provisions were found, there was little consistency in the laws across states.¶ The variation in state laws supports the need to build consensus on the appropriate use and disclosure of public health information among public health practitioners.¶ **Surveillance, epidemiological, and laboratory data are essential to the practice of public health, particularly at the state and local level.** 1 Public health practitioners within government agencies use data to identify new cases of disease and to make decisions about when to apply public health interventions. The exchange of information between health officials in different jurisdictions has been demonstrated to be essential to managing outbreaks of well-understood diseases, such as measles, and identifying and responding to new and emerging threats, such as severe acute respiratory syndrome and pandemic influenza A (H1N1). However, the very developments in information technology and health care policy that make it increasingly possible to rapidly transmit health information, such as electronic medical records and health information exchanges, continue to raise questions about the possible inappropriate use and lack of protection of personally identifiable health information.2–4¶ In highly charged situations, such as the recent influenza A (H1N1) pandemic, variations in state laws and incomplete understanding among jurisdictions can easily lead to inconsistent public health disclosure practices, resulting in media questions about the integrity of information access policies.5,6 Clearly, consideration should now be given to a more cohesive approach to public health information sharing.

State prohibition of re-identification of patient information is crucial in preventing widespread sharing of personal patient files

Terry 14 (Nicolas P. Terry. “Big Data Proxies and Health Privacy Exceptionalism.” 2014. P. 16-19 https://www.ftc.gov/system/files/documents/public_comments/2014/01/00004-89091.pdf)/EMerz

There has always been something lopsided about the HIPAA regulatory model. Rather than concentrating on securing health data, most of the Privacy Rule provisions detail wide-ranging exceptions (public health, judicial and regulatory) to data protection or outline the process by which patients can consent to disclosure. Just recently, for example, a pharmacy chain made the headlines by conditioning its loyalty rewards program on a broad HIPAA authorization.⁸⁶ It is no surprise, therefore, to learn that **there has been leakage of health data through the very system set up to protect it.** Such leakage has been exacerbated by the mission creep exhibited by the recipients of data under HIPAA, particularly public health agencies. As Wendy Mariner notes: Today, almost everyone, regardless of station, could be subject to public health surveillance. **The scope of public health surveillance has grown significantly beyond its contagious disease origins.** . . . [A] new generation of reporting laws reflects a goal of many people in public health: to collect data about chronic diseases outside the context of a research study and without the need to obtain any individual patient's informed consent. . . . Do they offer the promise of medical advances, or the threat of “general searches, which the authors of the Bill of Rights were so concerned to protect against?”⁸⁷ For example, a 2013 report from the Citizens' Council for Health Freedom alleges broad state health surveillance based on individual and often identifiable records.⁸⁸ However, public health authorities are not only voraciously consuming patient data but also abetting the acquisition of the same by big data companies. Researchers at Harvard's Data Privacy Lab have found that thirty-three states re-release patient hospital discharge data that they have acquired as HIPAA-permitted recipients of patient data. ⁸⁹ Generally states release this data (that is no longer in the HIPAA protected zone) in somewhat de-identified or anonymized form but with little restriction on future use of the data. The naïve thought that such data was only being released to academic researchers was upended by the Data Privacy Lab's discovery that many of the major buyers of such state health databases were big data companies.⁹⁰ Most states only charge small fees that are not a major source of revenue for them, and many are oblivious to this practice.⁹¹ **The obvious solution is for the state public health agencies to contractually prohibit re-identification.** For example, the National Practitioner Data Bank (NPDB) collects information about physician malpractice awards, adverse licensure reports and Medicare/Medicaid exclusions. Although it is not a public resource the NPDB does release de-identified data. Following a re-identification episode NPDB now contains a prohibition on re-identification, specifically against using its “dataset alone or in combination with other data to identify any individual or entity or otherwise link information from this file with information in another dataset in a manner that includes the identity of an individual or entity.” Clearly, state health departments and any similarly placed recipients of HIPAA data should require similar restrictions. Indeed, the proposed FTC privacy framework would mandate such: . . . [I]f a company makes such de-identified data available to other companies – whether service providers or other third parties – it should contractually prohibit such entities from attempting to re-identify the data. The company that transfers or otherwise makes the data available should exercise reasonable oversight to monitor compliance with these contractual provisions and take appropriate steps to address contractual violations.”⁹⁵ **Until such prohibitions are instituted HIPAA's public health exception unpardonably will continue to facilitate the “laundering”**

of protected patient data as it is transferred from a data protected domain to unprotected space.

State policy change key – inconsistency

Christiansen 11 (John Christiansen, J.D., for the National Governors Association Center for Best Practices. "State and Federal Consent Laws Affecting Interstate Health Information Exchange," March 2011. www.nga.org/files/live/sites/NGA/files/pdf/1103HIECONSENTLAWSREPORT.PDF)

Recipients of health information are only required to use and disclose information received through HIE in accordance with the law that applies to the recipient, including applicable federal law reconciled with the law of the state where they are located. Additional redisclosure limitations may be imposed by agreements such as business associate contracts, qualified services organization agreements or HIO agreements, or may be a condition to receipt by electronic agreement or by law under the 42 CFR Part 2 redisclosure provisions. Downstream recipients are not otherwise required to comply with the law of the state in which the health information originated.

Both Gatekeepers and downstream redisclosers are subject to HIPAA's various consent requirements if they are Covered Entities or Business Associates. Since most if not all entities participating in HIE are one of these or the other, HIPAA provides a national baseline for consent requirements.

4. Many state laws vest greater control of health information in individuals than HIPAA does, especially with respect to sensitive health information such as AIDS/HIV status, genetic information, and behavioral health status. Similarly, 42 CFR Part 2 provides for a higher degree of control for drug and alcohol treatment, consistent with the sensitivity of such information.

Recommendations

1. State agencies, and state-supported public-private initiatives, should develop guidance and standards for intra- and interstate HIE to help organizations best meet the requirements under both federal and state law. This can be done by developing and providing clear guidance in HIE projects and initiatives, which can help resolve consent obstacles to HIE in the short term pending longer-term policy solutions.

2. HIOs should develop authoritative guidance for Gatekeepers, based upon standards and analyses developed by state agencies or broader stakeholder groups which include state participation.

3. If sensitive health information is intended to be included in HIE, consent processes should be implemented which communicate and enforce permission limitations when they are more stringent than HIPAA limitations. Except where 42 CFR Part 2 or rarely a state redisclosure law applies, such limitations may not be enforceable in the absence of a contract between the parties, so contractual enforcement mechanisms (such as a HIO agreement) should be considered. Alternative solutions, if feasible may include access controls which prevent disclosures for non-permitted transactions.

4. If highly granular access controls are not available, it may be appropriate to exclude transactions involving sensitive health information at the HIO participation level, or on a case-by-case information disclosure transaction basis at the operational level.

2NC Flexibility

States solve better

Duffy et al 11 (Effective State-Based Surveillance for Multidrug-Resistant Organisms Related to Health Care-Associated Infections, Jonathan Duffy, MD, MPH, a, b Dawn Sievert, PhD, MS, a Catherine Rebmann, MPH, a Marion Kainer, MD, MPH, c, d Ruth Lynfield, MD, c, e Perry Smith, MD, c, f and Scott Fridkin, MD, a Division of Healthcare Quality Promotion, Centers for Disease Control and Prevention, Epidemic Intelligence Service, Centers for Disease Control and Prevention, Atlanta, GA 2011 Mar-Apr; <http://www.ncbi.nlm.nih.gov.proxy.lib.umich.edu/pmc/articles/PMC3056030/?tool=pmcentrez>)

A primary aim of public health surveillance is to direct prevention and control activities and monitor their effectiveness. Collection of surveillance data by itself does not control disease or constitute public health action. As public health agencies operate with finite resources, implementation of surveillance tools should occur in conjunction with a plan to interpret and act on the data collected. Resources should be devoted to MDRO surveillance activities only when resources are also available for specific MDRO infection- or transmission-prevention activities or to build capacity to respond with public health action to the MDRO surveillance data. **Moreover, integrating input from local partners and key opinion leaders in infection control and prevention to ensure that any surveillance and response strategy is consistent with regional priorities or concerns is critical. A state is more likely to develop a surveillance system that meets its particular needs and functions well within the constraints of its available resources if the state health department takes an active role in deciding what MDRO surveillance activities are appropriate for its circumstances. Surveillance activities developed in response to mandates created without health department input could lack these characteristics.**

2NC Speed

Stats solve – quicker public health responses

Galva et al 5 (Jorge, JD MHA, Christopher Atchison, MPA, Samuel Levy, PhD SM, analysts for Public Health Reports, “Public Health Strategy and the Police Powers of the State” <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2569983/> 2005 JM)

The preparedness of the U.S. public health system to respond to acts of terrorism has received a great deal of attention since September 11, 2001, and especially subsequent to the anthrax attacks later that year. The use of biologic agents as a weapon has served as a catalyst to better aligning public safety and health strategies through public health law reforms. Associated with this work is the renewal of the debate over the most appropriate means to both protect the public and assure the rights of individuals when implementing readiness strategies. A key element of the debate focuses on what is a reasonable application of state-based police powers to ensure community public health standards. The doctrine of state “police power” was adopted in early colonial America from firmly established English common law principles mandating the limitation of private rights when needed for the preservation of the common good. **It was one of the powers**

reserved by the states with the adoption of the federal Constitution and was limited only by the Constitution's Supremacy Clause—which mandates preeminence of federal law in matters delegated to the federal government—and the individual rights protected in the subsequent Amendments.^{1,2} The application of police power has traditionally implied a capacity to (1) promote the public health, morals, or safety, and the general well-being of the community; (2) enact and enforce laws for the promotion of the general welfare; (3) regulate private rights in the public interest; and (4) extend measures to all great public needs.³ The application of “police powers” is not synonymous with criminal enforcement procedures; rather, this authority establishes the means by which communities may enforce civil self-protection rules. More specifically, public health police power allows the states to pass and enforce isolation and quarantine, health, and inspection laws to interrupt or prevent the spread of disease. Historically, the exercise of public health police power was enforced with strong support of the courts and restraint of police power occurred only when there was open disregard for individual rights. The abilities of states to exercise their police powers has been constrained since the 1960s by the legal and social reexamination of the balance of power between the individual, the states, and the federal government, which affects contemporary efforts to reform public health law in the face of terrorism. Given the development of the criminally based threats to health marked by bioterrorism, the **relatively recent emphasis on the personal rights side of the equation should be reassessed.**⁴ A reexamination of the legal, ideological, and social limits of police power is appropriate since **increased state capacity can be crucial for first responses to terrorist threats or actions.** Effective first responses may be hampered in the absence of pragmatically designed realignments of the state-individual relationship and the redesign of state public health infrastructures.⁵ This article begins with an historical overview of the doctrine of state police power, addresses recent limitations imposed on the implementation of public health police powers, then uses the example of the imposition of quarantine orders to illustrate the state's capability to impose such orders in exercise of its police power. Finally, it suggests changes in state public health agency governance, focus, and regulation to rebalance public and private interests.

2NC Uniformity: HIE Plank

The states can coordinate over healthcare – HIE proves.

Banger et al 14 (Alison Banger, Public health analyst at RTI International with an MPH in Health Policy from Emory University, Robert Bailey, Professor of Epidemiology at the University of Illinois at Chicago with an MPH in Epidemiology, Stephanie Rizk, Health IT Research Analyst at RTI International, “Effective Methods for Interstate Collaboration in Health Information Exchange,” RTI International, March 2014, https://www.healthit.gov/sites/default/files/onc_shpc_interstatecollabmeth_rpt.pdf)

**Modified for language

**State HIE = State Health Information Exchange

The SHPC methodology offers a framework for other initiatives operating in a rapidly evolving environment that requires extensive collaboration to make progress, but where barriers and

constraining factors may not be known until they are encountered. The layered management approach, incorporating Federal sponsorship and guidance, State-level activity, and project management support from RTI allowed ONC to pursue high-value outcomes and achievements. It also removed from States the burden of contracting with one another and retaining required expertise. Several factors have contributed to the success of the collaborative model: thought leadership at the State level, collaboration across States, successful placement within the overall HIE environment (determined by Federal sponsorship and by limiting applications to HIE grantees or appropriate designees), the leveraging of established relationships, and flexible and adaptable leadership within the consortia, the RTI team, and the ONC sponsors.

Using the agile policy investigation methodology described here has enabled consortium projects to:

- address legal and technical barriers to the exchange of behavioral health data between health care providers, among organizations, and across State lines and pilot exchange using these solutions.
- establish a set of policies and technical solutions to support Direct exchange between Health Information Service Providers (HISPs), advance HIE across State borders, and demonstrate how local agreements and trust structures can be established to support interstate HIE with federated provider directory services.
- create a repository of HIE-related assets, to facilitate their discovery and reuse.
- conduct a series of pilots to demonstrate the value of enabling patients to access their data using Direct secure messaging by populating untethered PHRs
- complete an environmental scan of prevalent PHR functionalities and develop an assessment framework for determining high-impact PHR functionalities.
- develop a roadmap of technical assistance and educational materials to support patient-mediated exchange
- develop a full-length documentary film which educates the general population about HIE
- develop a strategic plan for sharing health information during and following a declared natural disaster, featuring a phased approach and actionable recommendations addressing key legal, technical and governance issues
- observe the use of Direct exchange by diverse health and social service provider organizations in multiple states, demonstrating the value of Direct to small practices
- develop a standard, shared consent form that meets the requirements of participating States, solutions for exchanging consent data electronically, and a framework for developing an interstate consent management solution
- support four State projects designed to increase consumers' ability to obtain, view, and manage their own clinical information including vaccination records and claims data and to use Blue Button technology to enhance PHR functionality

- support a multistate project designed to support SIM grantees and consider how to best capture or combine data, create or refine performance measures across providers, and generate reports or provide feedback in ways that promote health care quality improvement

The number and diversity of these achievements demonstrates the efficacy of the SHPC agile policy investigation methodology. This method supports grassroots initiatives, providing “bottom-up” solutions that balance States’ needs to meet “top-down” Federal requirements. The push toward conflict allowed consortium participants to recognize conflicts as opportunities to develop solutions collaboratively. In a time-limited project where transformation and innovation are the goals, rapidly identifying problems and finding solutions is critical. While a thoughtful and methodical approach has been followed throughout, these projects have been guided by a singular vision [idea]: to identify barriers to HIE and develop practical solutions that allow health information to be exchanged where and when needed. The projects completed under SHPC reflect this vision [idea] and offer additional insights into the work necessary to achieve interoperable health information exchange.

2NC Uniformity: More Mechs

50 states can coordinate – food and health workshops prove.

Plaisier and Taylor 14 (Melinda K. Plaisier, Associate Commissioner for Regulatory Affairs at the Food and Drug Administration, Michael R. Taylor, Deputy Commissioner for Foods at the FDA, “50 States, One Goal: Working Together to Keep Our Food Safe,” FDA, 28 August 2014, <http://blogs.fda.gov/fdavoices/index.php/2014/08/50-states-one-goal-working-together-to-keep-our-food-safe/>)

The August 12 conference in St. Louis of the Partnership for Food Protection (PFP) was truly a meeting of the minds. This 50-state workshop drew food and feed safety experts from federal, state, local, tribal and territorial government agencies. These organizations make up the PFP. Our shared goal? To continue working towards a food safety system in our country that makes our food as safe as possible.

Partnerships have become increasingly important in our efforts. Simply put, we can’t do it alone. The scope of the public health mission is too vast. We need to take advantage of the unique contributions state and local partners can make through their food safety commitment, knowledge of local conditions and practices, and local presence to deliver training, technical assistance and compliance oversight. Together, we can ensure an effective public health safety net.

States often collaborate over health – they share information and tactics.

HHS 12 (U.S. Department of Health and Human Services, “Forms of Interstate Assistance,” Public Health Emergency, 14 February 2012, <http://www.phe.gov/Preparedness/planning/mscc/handbook/Chapter6/Pages/forms.aspx>)

While the importance of sharing information and data with other affected States, in real time, is easily recognized, most efforts to address this issue have focused on communications technology. A major shortcoming of these efforts is that they neglect to first establish what type of information is important to share, where to obtain it, and who needs to receive it; these

requirements should be set during preparedness planning. The types of information to share include the following:

Situation assessments: Provide current reports of relevant incident information regarding public health and medical issues, as well as specific epidemiological information that may be useful in developing respective State IAPs.

Resource assessments: Provide updated reports on the status of resources that are committed to the response and those that remain available. This helps managers or officials from other States gauge the severity of hazard impact, as well as the potential impact that may occur if people evacuate an area. It also provides a means to anticipate likely requests for mutual aid.

General strategies and specific tactics: Offer insight into how a State's effort is organized. This is beneficial to other States that may be confronted with similar problems and promotes resolution of conflicting tactics before such discrepancies are highlighted by the media.

Safety information: Describes State or jurisdictional approaches to health and medical issues affecting responders (such as recommendations for vaccination or medication prophylaxis). This can help standardize safety protocols for responders across disciplines and State boundaries.

Public health and medical disciplines face a unique challenge because of the complexity and quantity of information that must be shared during a major response. This is compounded by the presence of multiple information outlets, many of which provide unofficial data. For example, media trying to "break" news stories may provide situation assessments that misrepresent the actual severity of an incident or the progress of response. Therefore, information that is shared between States should be channeled first through formal mechanisms at the State level (Tier 4) to verify its accuracy. This is commonly done by releasing all information through the State public health agency or the Multiagency Coordination Center or MACC (i.e., State EOC).

[AT: States Can't Reg DNA Data](#)

The states have the authority to regulate DNA collection and storage – state legislation solves the aff

Mercer and Gabel 2014 (Stephen, Jessica, Chief Attorney, and Associate professor of law, "SHADOW DWELLERS: THE UNDERREGULATED WORLD OF STATE AND LOCAL DNA DATABASES" 2014, https://annualsurveyofamericanlaw.files.wordpress.com/2015/01/69-3_mercer_gabel.pdf, mmv)

States are responsible for developing their own regulations governing state and local DNA databases.⁹² A minority of states regulate the categories of DNA profiles that can be stored and searched at the state or local levels. For example, Alaska permits only certain categories of DNA samples that cannot be uploaded to NDIS to be retained in the state database.⁹³ It also prohibits categories of samples from being entered in the state identification system that are not expressly permitted.⁹⁴ A local database practice that is in conflict with state law is preempted.⁹⁵ The only exemption to this regulation is that it must not prevent "a local law enforcement agency from performing DNA identification analysis in individual cases to assist law enforcement officials and prosecutors in the preparation and use of DNA evidence for presentation in court."⁹⁶

By contrast, Michigan allows a suspect's DNA to be taken, but limits that "any other DNA identification profile obtained by the department shall not be permanently retained by the department but shall be retained only as long as it is needed for a criminal investigation or criminal prosecution."⁹⁷ Vermont permits DNA profiles to be stored only at the state level and prohibits the entry into the state database of DNA "voluntarily submitted or obtained by the execution of a nontestimonial identification order . . ."⁹⁸ Other states that subject local DNA databases to statutory requirements include Connecticut, Missouri, and Washington.⁹⁹ Yet other states appear to prohibit the use of local DNA databases altogether.¹⁰⁰

The vast majority of states, however, do not curb or regulate the categories of DNA samples from known persons that may be stored in the state or local databases. These states allow the warehousing of far more DNA profiles and information than is allowed at the national level or by other states.¹⁰¹ In the absence of affirmative statutory authorization for these local databases to contain DNA profiles that cannot be entered into the national databank, state law limiting the collection of DNA to qualifying offenders may implicitly prohibit the entry of such profiles.¹⁰² Underregulated DNA databases may also violate state privacy law.¹⁰³ Further, the passage of state statutes to regulate the mandatory collection of DNA from convicted offenders and arrestees is a legislative recognition of the potential for misuse of DNA databases.¹⁰⁴ Nevertheless, state and local governments are empowered, subject to constitutional limitations, to authorize official police agencies to investigate and prevent crime to further the health, general welfare, and safety of the community, which may include the use of underregulated state or local DNA databases.¹⁰⁵

AT: States Can't Refuse Federal Assistance

States can refuse to cooperate with the federal government – empirics prove.

Stein 15 (Jason Stein is a staff reporter for the Tribune News Service. Feb 19, 2015. "Scott Walker Refuses Federal Funding for Medicaid Expansion, Again," www.governing.com/topics/health-human-services/tns-scott-walker-medicaid-expansion-wisconsin.html)

The state would stay the course and turn down federal money to expand Wisconsin's health programs for the needy, under Gov. Scott Walker's budget proposal.

Also Monday, the Legislature's nonpartisan budget office reported that Walker is delaying May debt repayment of \$108 million to help balance the state's shortfall in the current budget ending on June 30.

In 2013, the Republican governor rejected taking federal incentives to expand the state's Medicaid programs, saying the deal risked entangling the state in exponentially growing future costs.

Democrats say that Walker's approach means that state taxpayers today are paying more to cover fewer people in the BadgerCare Plus health plan.

At the heart of the issue lies the question of how Wisconsin should handle the federal Affordable Care Act, often called Obamacare, which sought to persuade states to add health coverage by promising to pay all of their short-term and most of their long-term costs to do so.

Walker has declined that offer, part of his strategy to limit the state's involvement in the Affordable Care Act, and his 2015-'17 budget proposal would continue that approach.

Text: The United States Federal Government should track healthcare companies' quality of care by mandating that Department of Health and Human Services evaluate health care companies for privacy protections. The United States Federal Government should mandate that health institutions use high security cloud computing to store sensitive data about patients by enforcing encryption and redaction measures.

Cloud computing has potential to secure patient data if health care providers implement encryption and redaction measures

Filkins 14 (Barbara Filkins. Senior SANS Analyst and Healthcare Specialist. "New Threats Drive Improved Practices: State of Cybersecurity in Health Care Organizations." December 2014. P. 19. <https://www.sans.org/reading-room/whitepapers/analyst/threats-drive-improved-practices-state-cybersecurity-health-care-organizations-35652>)/EMerz

This emphasis indicates that the cloud-computing industry has matured. Respondents are now looking toward secure access and data-centric controls and are less concerned with operational considerations such as monitoring of cloud applications for vulnerabilities and threats. Cloud computing may be an area where secure, multifactor authentication, which combines two or more independent credentials—such as what the user knows (password), what the user has (security token) and what the user is (biometric verification)—also takes off. This year, 60% of respondents said they are using multifactor authentication as their top control to address the risk to data and applications in the cloud. This represents a shift from 2013, where APIs for data reporting, auditing and providing alerts were cited by respondents as the top security control for addressing cloud security concerns. Cloud computing is also driving a more data-centric method of security, which focuses on protecting data rather than just protecting the network or application in which the data lives. Starting a data-centric security plan involves learning and understanding where sensitive data resides, as well as how that information will be used, accessed, managed, retained or retired across its life cycle. The next step is to assess the risks and determine the policies and resources needed and available to monitor and control risk in cloud-based computing models. For example, storing data in the cloud demands encryption for the data at rest. Is that provided through the internal application or the cloud services provider? Sharing that same data among individuals with different roles and levels of access might demand further modification of data to protect it, such as redaction, masking or a combination of both.

Data breaches are likely with current cloud computing technology—new security measures and technology can prevent them

Filkins 14 (Barbara Filkins. Senior SANS Analyst and Healthcare Specialist. "New Threats Drive Improved Practices: State of Cybersecurity in Health Care Organizations." December 2014. P. 19. <https://www.sans.org/reading-room/whitepapers/analyst/threats-drive-improved-practices-state-cybersecurity-health-care-organizations-35652>)/EMerz

Trends such as mobile and cloud computing are game changers for the way individuals and organizations must approach the security of their systems, the privacy of protected sensitive data, and compliance. Health care organizations must complement traditional, infrastructure-driven

controls such as network perimeter security with protections for the newer and evolving threat vectors where their data and applications are outside of the protected network. Providers, payment plans, insurers and other related industries now allow patients unprecedented access to helpful, sophisticated health information and digital tools. Patients have online access to their doctors, and immense social support is also provided online. The fact is that the attack surfaces are many, and the movement to detect, protect and defend in the health care industry, as shown by the small improvements in this survey, is still not enough to keep up the pace. Investment in understanding the new threat landscape and designing solutions to protect against these attacks, including leveraging newer tools for protecting data and responding to new forms of attacks, become critical to staying ahead of attackers.

This institutional trust is key to solve

Rowe and Calnan 6 (Rosemary Rowe and Michael Calnan. Professor of Medical Sociology, School of Social Policy, Sociology and Social Research at the University of Kent. "Trust Relations in Health Care- the New Agenda." 2006.

<http://eurpub.oxfordjournals.org/content/eurpub/16/1/4.full.pdf>)//EMerz

Given that trust remains important, how can new forms of trust relations be developed and sustained? There is considerable evidence as to what factors encourage patient trust in clinicians: the clinician's technical competence, respect for patient views, information sharing, and their confidence in patient's ability to manage their illness.⁸ Patient participation per se does not necessarily result in higher trust, rather it is associated with value congruence regarding participation, patient involvement produced higher trust where patients wanted to participate.⁹ In contrast, evidence as to what builds institutional trust is sparse, with trust relations between providers and between providers and managers a particularly neglected area. Hall et al US survey of HMO members found that system trust could help the development of interpersonal trust, where there was no prior knowledge of the clinician, but it is not known how interpersonal trust affects institutional trust. Medical errors and cost containment are associated with distrust of health care systems, whereas relationship building with the local community is regarded as an important trust building mechanism. However, little research has been conducted to identify how different modes of governance affect institutional trust. The focus of trust relationships may of course differ according to the model of health care delivery; **in market based systems such as the US patient trust may be more important to secure loyalty to particular providers** whereas in tax-financed systems which are organized by national or regional agencies public trust may be more necessary. However, as health systems converge and increasingly share common challenges including: providing adequate patient choice; managing a mixed economy of provision; and more explicit rationing, then both interpersonal and institutional trust will continue to be important for all health systems. In conclusion, we would argue that clinicians and managers need to address and respond to the changing nature of trust relations in health care. The benefits of trust demonstrate the value to be Trust and the sociology of the professions ⁵ gained from ensuring that both interpersonal and institutional trust are developed, sustained, and where necessary rebuilt. Trust is still fundamental to the clinician–patient relationship but as that relationship has changed so has the nature of trust. Trust is now conditional and has to be negotiated but, whilst clinicians may have to earn patients' trust, there is good evidence as to what is required to build and sustain such interpersonal trust. The lack of knowledge about how institutional trust can be developed indicates the need for research, ideally through inter-country comparisons to identify whether such trust varies by health system and how it can be generated.

The cost of failing to recognize the importance of trust and to address the changing nature of trust relations could be substantial: economically, politically, and most important of all, in terms of health outcomes.

Government monitoring of healthcare quality ensures trust in patients

CQHCA '1 (Committee on the Quality of Health Care in America. "Crossing the Quality Chasm: A New Health System for the 21st Century." March 1, 2001.

<http://www.ncbi.nlm.nih.gov/books/NBK222265/>//EMerz

Recommendation 2: All health care organizations, professional groups, and private and public purchasers should pursue six major aims; specifically, health care should be safe, effective, patient-centered, timely, efficient, and equitable. The committee believes substantial improvements in safety, effectiveness, patient-centeredness, timeliness, efficiency, and equity are achievable throughout the health care sector. This opportunity for improvement is not confined to any sector, form of payment, type of organization, or clinical discipline. Problems in health care quality affect all Americans today, and all can benefit from a rededication to improving quality, regardless of where they receive their care. The committee applauds the Administration and Congress for their current efforts to establish a mechanism for tracking the quality of care. Title IX of the Public Health Service Act (42 U.S.C. 299 et seq.; Agency for Healthcare Research and Quality Part A) provides support for the development of a National Quality Report, which is currently ongoing. Section 913(a)(2) of the act states: "Beginning in fiscal year 2003, the Secretary, acting through the Director, shall submit to Congress an annual report on national trends in the quality of health care provided to the American people." Recommendation 3: **Congress should continue to authorize and appropriate funds for, and the Department of Health and Human Services should move forward expeditiously with the establishment of, monitoring and tracking processes for use in evaluating the progress of the health system in pursuit of the above-cited aims of safety, effectiveness, patient-centeredness, timeliness, efficiency, and equity**. The Secretary of the Department of Health and Human Services should report annually to Congress and the President on the quality of care provided to the American people. Without ongoing tracking of quality to assess the country's progress in meeting the aims set forth in this chapter, interested parties—including patients, health care practitioners, policy makers, educators, and purchasers—cannot identify progress or understand where improvement efforts are most needed. Continued funding for this activity should be ensured.

Health institutions use weak cloud services to transmit sensitive patient data

Filkins 14 (Barbara Filkins. Senior SANS Analyst and Healthcare Specialist.

"New Threats Drive Improved Practices: State of Cybersecurity in Health Care Organizations." December 2014. P. 10-11. <https://www.sans.org/reading-room/whitepapers/analyst/threats-drive-improved-practices-state-cybersecurity-health-care-organizations-35652/>//EMerz

Health care organizations rely on cloud services for applications processing sensitive information, including protected health care patient records as well as PCI-protected financial information.

Respondents plan to expand these services in the next 12 months. Open-ended responses by several respondents reflect the bias against cloud services, most often prompted by concerns over loss of control or oversight over sensitive data, but more than 60% are either using or planning to

use the cloud for multiple applications containing sensitive data, as shown in Figure 4. Mobile devices are also a source of additional risk, according to respondents. Not surprisingly, 92% of respondent organizations allow access to calendar and email via mobile devices. However, 52% also allow respondents to access health record information from their mobile devices, and nearly as many access data from cloud-based applications, through which they may be processing highly sensitive data, as discussed previously (see Figure 5).

Secure cloud computing increases patient trust in health care institutions

CSCC 12 (Cloud Standards Customer Council. Advocacy group dedicated surrounding the transition to the cloud. “Impact of Cloud Computing on Healthcare.” November 2012. P. 12. <http://www.cloud-council.org/cscchealthcare110512.pdf>)/EMerz

“Patient centricity” has become the key trend in healthcare provisioning and is leading to the steady growth in adoption of electronic medical records (EMR), electronic health records (EHR), personal health records (PHR), and technologies related to integrated care, patient safety, point-of-care access to demographic and clinical information, and clinical decision support. **Availability of data**, irrespective of the location of the patient and the clinician, **has become the key to both patient satisfaction and improved clinical outcomes. Cloud technologies can significantly facilitate this trend.** Cloud computing offers significant benefits to the healthcare sector: doctor’s clinics, hospitals, and health clinics require quick access to computing and large storage facilities which are not provided in the traditional settings. Moreover, healthcare data needs to be shared across various settings and geographies which further burden the healthcare provider and the patient causing significant delay in treatment and loss of time. **Cloud caters to all these requirements thus providing the healthcare organizations an incredible opportunity to improve services to their customers, the patients, to share information more easily** than ever before, and improve operational efficiency at the same time.

Doesn’t link to the net benefit- health businesses that use cloud computing still adhere to status quo HIPAA procedures

CSCC 12 (Cloud Standards Customer Council. Advocacy group dedicated surrounding the transition to the cloud. “Impact of Cloud Computing on Healthcare.” November 2012. P.7. <http://www.cloud-council.org/cscchealthcare110512.pdf>)/EMerz

In the United States, every healthcare entity (e.g., hospital, university research facility, physician’s office) that deals with Protected Health Information (PHI) must adhere to the guidelines stipulated under the Health Information Portability and Accountability Act (HIPAA). HIPAA is a U.S. Federal law that was designed to protect patient privacy, and does so by mandating and enforcing strict privacy and security rules over how medical information is collected, handled, used, disclosed and protected. While the HIPAA Privacy rule pertains to patients’ privacy and rights for their personal health information, the HIPAA Security rule, focuses on assuring the availability, confidentiality, and integrity, of electronic protected health information through a series of administrative, physical and technical safeguards. Under Title II of HIPAA, most of a patient’s medical record and payment history are considered PHI, and is protected under the law. PHI may only be disclosed to other medical entities on a “need to know” basis, only upon the permission of the individual patient and only the “minimum data fields required for the purpose involved”. As a result, one of the challenges is “Patient Consent Management” and managing PHI in a way that is sufficiently simple to enable use by the general public. The owner of the data must require the cloud service provider (aka the “business

associate”) to contractually agree to maintain all PHI in adherence with HIPAA standards. The HIPAA Privacy rule defines a business associate as “a person or entity that performs certain functions or activities that involve the use or disclosure of protected health information on behalf of, or provides services to, a covered entity”. Covered entities are institutions, organizations or persons who electronically transmit any health information in connection with transactions for the United States Health and Human Services (HHS) adopted standards. While ultimate responsibility for compliance always resides at the covered entity, the actual implementation of certain operational and control aspects of securing the data occurs at the business associate cloud provider.

Federal regulations and funding are ineffective in the squo – pushing collection and funding to the state and private sphere – their author

Kreag 2015 (Jason, Visiting Assistant Professor, University of Arizona James E. Rogers College of Law “GOING LOCAL: THE FRAGMENTATION OF GENETIC SURVEILLANCE” http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2583957, mmv)

I. THE EXPANSION OF LOCAL DNA DATABASES The expansion of local DNA databases comes on the heels of a deep and sustained commitment from Congress to build a national network of DNA databases overseen by the FBI. In a flurry of legislation beginning in 1994, Congress authorized the creation and expansion of that network, which is called the Combined DNA Index System (“CODIS”).³⁹ Under the CODIS umbrella, the FBI created a three-tiered hierarchy of databases made up of the National DNA Index System (“NDIS”), the State DNA Index System (“SDIS”), and the Local DNA Index System (“LDIS”).⁴⁰ Congress designated the FBI to regulate CODIS, and the FBI designed protocols to integrate the three levels into a unified whole.⁴¹ In the decade after authorizing CODIS, Congress passed several laws to expand the CODIS network.⁴² Yet, despite this expansion, local law enforcement agencies have increasingly sought to create their own, non-CODIS DNA databases. This Part analyzes what caused this shift. It then provides a description of the local databases in Palm Bay, Florida; Bensalem Township, Pennsylvania; and the state of Arizona. A. Fragmentation of Genetic Surveillance While the FBI continues to exert significant control over law enforcement’s use of DNA databases, its grip is weakening as a result of the expansion of local databases. This fragmentation, which leaves local agencies increasingly in control of the use of genetic surveillance, is the result of several factors. They include: 1) restrictions in the CODIS regulations, which, according to many local law enforcement officials, limit law enforcement’s ability to take full advantage of DNA databases to solve crime;⁴³ 2) advances in DNA technology—allowing for quicker processing and the analysis of extremely small biological samples—that have coincided with reduced costs; 3) federal funding that allows local law enforcement officials to bypass the local budget process; and 4) private firms interested in expanding the use of forensic DNA analysis.

1. CODIS Limitations Early adopters of local DNA databases have pointed to two reasons why CODIS does not adequately meet their needs. First, they argue that the CODIS authorizing statute and the FBI’s regulations for its use are too restrictive, preventing law enforcement from performing certain searches and from including DNA profiles from certain individuals in CODIS.⁴⁴ Second, they argue that because much of CODIS’s growth is the result of adding DNA profiles from known violent offenders who are often serving lengthy prison sentences, CODIS remains an ineffective crime-solving tool. The FBI has adopted an extensive regulatory scheme for CODIS,⁴⁵ and it regularly audits participating public crime laboratories to ensure compliance.⁴⁶ These regulations are designed to ensure the database is reliable and secured.⁴⁷ For example, the FBI will only allow the inclusion and search of DNA profiles if the profiles were processed by public DNA laboratories that are a part of the CODIS network.⁴⁸ Second, federal regulations prohibit inclusion in CODIS of many types of partial DNA profiles,⁴⁹ and limit law enforcement’s ability

to compare a partial profile to the other profiles in CODIS.⁵⁰ Third, the process of confirming a match in CODIS can take up to one month,⁵¹ and this is in addition to the six to 12 months often needed for the actual DNA processing at CODIS-participating laboratories.⁵² Fourth, federal regulations require the removal of profiles from CODIS if a convicted offender's conviction is overturned, or, in the case of an arrestee, if the charges are dismissed.⁵³ Finally, as a result of its emphasis on building a database of convicted offenders and arrestees, the FBI's regulations prohibit the inclusion of DNA profiles from individuals, including suspects, who provide law enforcement consensual DNA samples.⁵⁴ Local DNA databases are not required to comply with any of these federal regulations. For example, they are free to include consensual DNA samples from people deemed merely suspicious, victims, victims' family members, and witnesses. These consensual samples have driven the growth of local databases.⁵⁵ Local DNA databases are also built with DNA processing from private laboratories.⁵⁶ Furthermore, local law enforcement is free to set its own protocols for including and searching partial DNA profiles in their databases and for expunging DNA records.⁵⁷

Laundry list of alt causes to distrust – Big Pharma, health care access and CDC credibility

Collins 2014 (Sam, health reporter, "Americans Don't Trust The Medical Profession" October 23 2014, <http://thinkprogress.org/health/2014/10/23/3583625/americans-skeptical-doctors/>, mmv)

Americans count among the least trusting of the medical profession, according to an international health care survey. The findings, which appeared in a recent issue of the New England Journal of Medicine, show significant levels of suspicion of doctors, especially among those who make less than \$30,000 annually. Researchers studied public health polls dating back four decades, including one conducted by a consortium of universities between 2011 and 2013 during which people in 29 countries answered survey questions. In that poll, 58 percent of Americans said they trust the medical profession, placing the United States in 24th place with Croatia. "It fits with decades of data on the American public's trust in institutions, in general." Michael Gusmano, a scholar at the Hastings Center, a Garrison, N.Y.-based research institute that focuses on health care, told WebMD. Skepticism of the medical profession hasn't happened without any reason. Experts point to unequal access to health care and the "commercialization" of American medicine as key factors at play in that damaged relationship. Some people say that members of the medical field often seem more concerned about protecting their financial interests than caring for patients, especially those from less affluent backgrounds. Big Pharma has historically tried to influence the advice that doctors give patients, something that may make Americans wary of the field in general. In exchange for their endorsement of prescription medications, physicians receive free samples and gifts that include coffee mugs emblazoned with the drug company's logo, tickets to sporting events, expensive dinners, and trips to exotic destinations. At the peak of Big Pharma's profitable relationship with the medical industry in 2007, more than 100,000 representatives made visits to more than 650,000 physicians across the country. This can sometimes have a direct effect on patients. A Centers for Disease Control and Prevention (CDC) study in August, for example, found that doctors in hospitals with a strong black patient base encouraged breastfeeding to expectant mothers at a rate 15 percentage points less than that of their white counterparts, due in part to a relationship between the facility and manufacturers of baby formula. Americans' mistrust of the medical industry has been on full display in the weeks since American Ebola patient zero Thomas Eric Duncan died in a Dallas hospital. Days after CDC officials assured Americans that the disease would spread no further, two nurses who treated Duncan tested

positive for Ebola. Many of the nurses who had direct contact with patient zero before he succumbed criticized the medical establishment, saying nurses at Presbyterian Hospital in Dallas treated Duncan for days in an open space in the emergency room under constantly changing protocols and without sufficient protective gear. The controversy has discouraged some Americans from trusting what CDC officials are saying about the United States' ability to contain the virus. According to one recent poll, nearly half of Americans don't think their local hospital could safely treat an Ebola case. That has facilitated the spread of panic about Ebola — anxiety that may pose a bigger threat to Americans than the virus itself. Instead of listening to federal health officials, many Americans have looked to sensationalized media reports and reckless words of commentators and politicians as indicators of Ebola's impact in the United States.

2NC – XT – Laundry List

3 alt causes to public trust – experience, in-fighting, and lack of leadership – the plan isn't enough, the industry needs to take the first steps

Keckley 2014 (Paul, PhD and independent health care industry analyst, “A Closer Look at Public Trust in Healthcare”, May 22 2014, <http://thehealthcareblog.com/blog/2014/05/22/a-closer-look-at-public-trust-in-healthcare/>, mmv)

1-Consumer trust in the health system is based on impressions and experiences over facts about its performance. Most consumers trust the doctors they use, but do little to validate that the accuracy of the treatment recommendations made or their costs. Most believe the drugs they use are efficacious and safe, and few take them as directed. Most think hospitals are expensive but pay little attention to costs and have no concept of the hospital's safety record. Most think health insurance is important but distrust insurers. Most don't have a clue about what the “US health system” is or how it operates, nor does more than a handful have a basis for comparing our system to others. Personal experiences are important but substantive facts about the system's performance are more useful in gauging its results. Though media coverage about fraud and bad outcomes in a treatment episode gets attention, the lion's share of the public's trust in the U.S. system is built on subjective impressions rather than facts. The bright spotlight of public opinion coupled with laws that open access to sensitive data about the health system's performance are exposing substantial flaws in the system—data about fraud, unnecessary tests and procedures, errors, misdiagnoses, customer experiences, profitability, conflicts of interest, the disconnect between costs and prices and so on. The data's there. And it's increasingly the focus of social media-fueled public interest and media attention. As the healthcare industry transitions to the digital age, hard data about its performance and malfunctions will be easily accessible and public trust in its performance in jeopardy. Personal impressions matter but data transparency matters more. 2-Our in-fighting compromises public trust. In the U.S. health system, we circle the wagons and shoot in: insurers blame drug companies, hospitals and doctors for the woes of the system. Hospitals despise plans that cut their payments. Drug and device manufacturers challenge insurers that cut their prices and force higher co-payments for their drugs. Primary care physicians, feeling abused and victimized, assail the system's hypocrisy about preventive health even as specialists earn more and investors flock to the latest technologies. Device manufacturers have love-hate relationships with Group Purchasing Organizations (GPOs) and so on. The deep-seeded fragmentation of the industry lends to its lack of coordinated care, redundant costs and

performance malfunctions. The public views the system's fragmentation and infighting as a major contributor to higher costs and poor service. And it is chipping away at the industry's reservoir of good will. 3-The U.S. healthcare industry has done a poor job in managing the public's trust. The reason is simple: we think we are the best system in the world and beyond reproach. We shun transparency fearing it exposes secrets of our system. We invest in relationships that benefit our own specific link in the healthcare food chain and assume others do the same. As a result, overall trust in the U.S. system is subordinated to promoting specific parts instead of the whole. We expect our marketing and PR professionals to operate with hamburger budgets and deliver filet mignon results. But the market is changing: employers are the major catalysts prompting attention to how the system of health operates. Consumers are keen to understand their treatment options independent of a physician's recommendation. Insurer determinations about treatment coverage and their premium-setting mechanics are ripe for public scrutiny as are hospital-physician financial relationships and inducements by drug and device manufacturers to gain a foothold in the \$500B supply chain market. And the Affordable Care Act requires a level of transparency that's certain to unsettle smugness even among the most confident. The U.S. healthcare industry is guilty of public trust neglect. My father was an opera singer and quite introverted. His most stinging criticism of anyone would be a simple observation: 'he believes his own publicity.' Opera singers, like many in our industry, invest heavily in publicity to tout their skills and accomplishments. But hundreds of news releases touting our successes can be offset by one documented report of poor performance. It's time we get serious about building trust and managing our reputation within our sectors and for the overall industry that's 17% of our GDP. Anecdotal impressions may be comfortable for some, but the factuality of our performance will be the public focus in the next phase of health reform. Our industry, like others, has its malfunctions. We can't afford to believe our own publicity. And we can ill afford to take public trust for granted.

Too many factors complicate public trust of the industry

Goold and Lipkin 99 (Susan Dorr Goold, MD, MHSA, MA, Received from the Division of General Medicine, University of Michigan Medical Center, Ann Arbor, Mich. AND Mack Lipkin, Jr., MD, New York University Medical Center, New York)("The Doctor-Patient Relationship: Challenges, Opportunities, and Strategies", J Gen Intern Med. 1999 Jan; 14(Suppl 1): S26-S33. doi: 10.1046/j.1525-1497.1999.00267.x)//ASMITH

A series of organizational or system factors also affect the doctor-patient relationship. The accessibility of personnel, both administrative and clinical, and their courtesy level, provide a sense that patients are important and respected, as do reasonable waiting times and attention to personal comfort. The availability of covering nurses and doctors contributes to a sense of security. Reminders and user-friendly educational materials create an atmosphere of caring and concern. Organizations can promote a patient-centered culture,²⁹ or one that is profit- or physician-centered, with consequences for individual doctor-patient relationships. Organizations (as well as whole health care systems) can promote continuity in clinical relationships, which in turn affects the strength of in those relationships. For instance, a market-based system with health insurance linked to employers' whims, with competitive provider networks and frequent mergers and acquisitions, thwarts long-term relationships. A health plan that includes the spectrum of

outpatient and inpatient, acute and chronic services has an opportunity to promote continuity across care settings. The competition to enroll patients is often characterized by a combination of exaggerated promises and efforts to deliver less. Patients may arrive at the doctor's office expecting all their needs to be met in the way they themselves expect and define. They discover instead that the employer's negotiator defines their needs and the managed care company has communicated them in very fine or incomprehensible print. Primary care doctors thus become the bearers of the bad news, and are seen as closing gates to the patient's wishes and needs. When this happens, an immediate and enduring barrier to a trust-based patient-doctor relationship is created. The doctor–patient relationship is critical for vulnerable patients as they experience a heightened reliance on the physician's competence, skills, and good will. The relationship need not involve a difference in power but usually does,³⁰ especially to the degree the patient is vulnerable or the physician is autocratic. United States law considers the relationship fiduciary; i.e., physicians are expected and required to act in their patient's interests, even when those interests may conflict with their own.⁹ In addition, the doctor–patient relationship is remarkable for its centrality during life-altering and meaningful times in persons' lives, times of birth, death, severe illness, and healing. Thus, providing health care, and being a doctor, is a moral enterprise. An incompetent doctor is judged not merely to be a poor businessperson, but also morally blameworthy, as having not lived up to the expectations of patients, and having violated the trust that is an essential and moral feature of the doctor–patient relationship.³¹ Trust is a fragile state. Deception or other, even minor, betrayals are given weight disproportional to their occurrence, probably because of the vulnerability of the trusting party (R.L. Jackson, unpublished manuscript).

Too many alt causes

Outdated legal codes

THEIR AUTHOR Gostin, an internationally recognized scholar in law and public health, professor of Law at Georgetown University; Professor of Public Health at the Johns Hopkins University; and the Director of the Center for Law & the Public's Health at Johns Hopkins and Georgetown Universities, November 2001 – (Lawrence, “Public Health Law In An Age Of Terrorism: Rethinking Individual Rights And Common Goods”, published on HealthAffairs vol 21 no. 6)//roetlin

The public health law infrastructure is equally deficient. The law establishes the mission, functions, and powers of public health agencies. Yet public health laws are highly antiquated, after many decades of neglect. Very little consideration has been given to modernizing these laws to reflect advances in public health practice and constitutional law. Reform of public health law is essential to ensure that public health agencies have clear missions and functions, stable sources of financing, adequate powers to avert or manage health threats, and restraints on powers to maintain respect for personal rights and liberties.

Underfunding and infrastructure

THEIR AUTHOR Gostin, an internationally recognized scholar in law and public health, professor of Law at Georgetown University; Professor of Public Health at the Johns Hopkins University; and the Director of the Center for Law & the Public's Health at Johns Hopkins and Georgetown Universities, November 2001 – (Lawrence, “Public Health Law In An Age Of

Terrorism: Rethinking Individual Rights And Common Goods”, published on HealthAffairs vol 21 no. 6)//roetlin

As a result of chronic underspending, the public health infrastructure is badly deteriorated.² Public health agencies lack the capacity to conduct essential public health services at a level of performance that matches the constantly evolving threats to the health of the public. Critical components of that infrastructure include a well-trained workforce, electronic information and communications systems, rapid disease surveillance and reporting, laboratory capacity, and emergency response capability.

Faulty allocations and income inequality

THEIR AUTHOR Gostin, an internationally recognized scholar in law and public health, professor of Law at Georgetown University; Professor of Public Health at the Johns Hopkins University; and the Director of the Center for Law & the Public’s Health at Johns Hopkins and Georgetown Universities, November **2001** – (Lawrence, “Public Health Law In An Age Of Terrorism: Rethinking Individual Rights And Common Goods”, published on HealthAffairs vol 21 no. 6)//roetlin

In this civil and property rights society, the tone has been distinctly antigovernment. The State has been perceived as inefficient, bureaucratic, and burdensome. Citizens have opposed taxation and broad health and welfare spending as well as oppressive regulation. From a funding perspective, this has meant that health dollars have been allocated primarily to advanced biotechnology and health care, which serve the needs of individual patients, particularly those who can afford private health insurance. Funding for traditional prevention and population-based services represents only a small fraction of health spending, estimated at around 1 percent at the state level and less than 5 percent at the federal level.¹

2NC – XT – State Funding

Not all databases are funded by the federal government – and local databases might still have grown without federal funding

Kreag 2015 (Jason, Visiting Assistant Professor, University of Arizona James E. Rogers College of Law “GOING LOCAL: THE FRAGMENTATION OF GENETIC SURVEILLANCE” http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2583957, mmv)

3. Federal Funding Because local, non-CODIS databases are in some ways duplicative of CODIS, it is reasonable to presume that even if these databases had strong support from law enforcement officials, their expansion would be limited by cost-conscious local government officials not eager to fund them. This has not been the case, in part, because some local databases have been supported by federal, not local funds.⁶⁵ It is ironic that after allocating such a significant amount of money to develop CODIS,⁶⁶ the federal government is funding non-CODIS databases that are at least potential rivals to the CODIS network.⁶⁷ More importantly, federal funding has allowed local agencies to bypass the local budget process and the limitations it imposes on other law enforcement surveillance techniques.⁶⁸ The primary source of federal funding for local DNA databases are the federal forfeiture laws that return money to local law enforcement officials in exchange for their participation in federal task forces.⁶⁹ These laws allow the Department of

Justice to share the proceeds of the seized property with local agencies that “participated directly in the seizure or forfeiture of the property.”⁷⁰ Local law enforcement agencies have come to depend on this revenue stream,⁷¹ and it has been crucial to the evolution of local DNA databases. For example, resources from federal forfeiture laws fully fund the local database in Bensalem Township,⁷² and local officials view this as a reliable source of funds for the foreseeable future.⁷³ Without this revenue stream, it is unlikely that local databases would have developed as quickly as they have.

2NC – XT – Media

Media hype as well as corruption and high profile malpractice cases prove trust is too far gone – past efforts to restore it have fallen flat

Jacobs, 2005 (Alice, MD; Boston University professor of medicine director of Cardiac Catheterization Laboratory and Interventional Cardiology, "Rebuilding an Enduring Trust in Medicine," *Circulation*, 2005, circ.ahajournals.org/content/111/25/3494.full#xref-ref-3-1, mmv)

To be sure, we will learn about the emerging science and clinical practice of cardiovascular disease over the next four days. But there is an internal disease of the heart that confronts us as scientists, as physicians, and as healthcare professionals. It is a threat to us all—insidious and pervasive—and one that we unknowingly may spread. This threat is one of the most critical issues facing our profession today. How we address this problem will shape the future of medical care.¶ This issue is the erosion of trust.¶ Lack of trust is a barrier between our intellectual renewal and our ability to deliver this new knowledge to our research labs, to our offices, to the bedside of our patients, and to the public. Trust is a vital, unseen, and essential element in diagnosis, treatment, and healing. So it is fundamental that we understand what it is, why it’s important in medicine, its recent decline, and what we can all do to rebuild trust in our profession. Trust is intrinsic to the relationship between citizens around the world and the institutions that serve their needs: government, education, business, religion, and, most certainly, medicine.¶ Albert Einstein recognized the importance of trust when he said, “Every kind of peaceful cooperation among men is primarily based on mutual trust.”¹ In our time, trust has been broken, abused, misplaced, and violated. The media have been replete with commentaries, citing stories of negligence, corruption, and betrayal by individuals and groups in the public and private sectors, from governments to corporations, from educational institutions to the Olympic Organizing Committee. These all are front-page news. Perhaps the most extreme example is terrorism, in which strangers use acts of violence to shatter trust and splinter society in an ongoing assault on our shared reverence for human life.¶ Unfortunately, we are not immune in our own sphere of cardiovascular medicine. The physician-investigator conflicts of interest concerning enrollment of patients in clinical trials, the focus on medical and nursing errors, the high-profile medical malpractice cases, the mandate to control the cost of health care in ways that may not be aligned with the best interest of the patient—all of these undermine trust in our profession. At this time, when more and more public and private institutions have fallen in public esteem, restoring trust in the healthcare professions will require that we understand the importance of trust and the implications of its absence.¶ Trust is intuitive confidence and a sense of comfort that comes from the belief that we can rely on an individual or organization to perform competently, responsibly,

and in a manner considerate of our interests.² It is dynamic, it is fragile, and it is vulnerable. Trust can be damaged, but it can be repaired and restored. It is praised where it is evident and acknowledged in every profession. Yet it is very difficult to define and quantify.[¶] Trust is easier to understand than to measure. For us, trust may be particularly difficult to embrace because it is not a science. Few instruments have been designed to allow us to evaluate it with any scientific rigor. Yet, trust is inherent to our profession, precisely because patients turn to us in their most vulnerable moments, for knowledge about their health and disease. We know trust when we experience it: when we advise patients in need of highly technical procedures that are associated with increased risk or when we return from being away to learn that our patient who became ill waited for us to make a decision and to discuss their concerns, despite being surrounded by competent colleagues acting on our behalf.[¶] Many thought leaders in the medical field understand the importance of trust.³ When asked whether the public health system could be overrun by public panic over SARS and bioterrorism, Centers for Disease Control and Prevention Director Julie Gerberding replied, “You can manage people if they trust you. We’ve put a great deal of effort into improving state and local communications and scaled up our own public affairs capacity...we’re building credibility, competence and trust.”^{4¶} Former Health and Human Services Secretary Donna Shalala also recognized the importance of trust when she said, “If we are to keep testing new medicines and new approaches to curing disease, we cannot compromise the trust and willingness of patients to participate in clinical trials.”^{5¶} These seemingly intuitive concepts of the importance of trust in 21st century medicine actually have little foundation in our medical heritage. In fact, a review of the early history of medicine is astonishingly devoid of medical ethics. Even the Codes and Principles of Ethics of the American Medical Association, founded in 1847, required patients to place total trust in their physician’s judgment, to obey promptly, and to “entertain a just and enduring sense of value of the services rendered.”⁶ Such a bold assertion of the authority of the physician and the gratitude of the patient seems unimaginable today.[¶] It was not until the early 1920s that role models such as Boston’s Richard Cabot linked patient-centered medical ethics with the best that scientific medicine had to offer,⁶ and Frances Weld Peabody, the first Director of the Thorndike Memorial Laboratory at the Boston City Hospital, crystallized the ethical obligation of the physician to his patient in his essay “The Care of the Patient.”⁷ In one particularly insightful passage, Peabody captures the essence of the two elements of the physician’s ethical obligation: He must know his professional business and he must trouble to know the patient well enough to draw conclusions, jointly with the patient, as to what actions are indeed in the patient’s best interest. He states: “The treatment of a disease may be entirely impersonal: The care of the patient must be completely personal. The significance of the intimate personal relationship between physician and patient cannot be too strongly emphasized, for in an extraordinarily large number of cases both diagnosis and treatment are directly dependent on it.” Truly, as Peabody said, “The secret to the care of the patient... is in caring for the patient.”^{7¶} This concept that links the quality of the physician-patient relationship to health outcomes has indeed stood the test of time. Trust has been shown to be important in its own right. It is essential to patients, in their willingness to seek care, their willingness to reveal sensitive information, their willingness to submit to treatment, and their willingness to follow recommendations. They must be willing for us to be able.\

Private companies aren't agents of the government – means the plan can't curtail them – and they collect the most data

Roman-Santos 2011 (Candice, Corporate Counsel and Manager, Healthcare Compliance at Nevro, Associate, Enterprise Regulatory Law Group, Juris Doctor, Certificate in Health Law & Policy, Health Law at University of California, Hastings College of Law “Concerns Associated with Expanding DNA Databases” 2 Hastings Sci. & Tech. L. J. 267
<http://hstlj.org/articles/concerns-associated-with-expanding-dna-databases/>, mmv)

Although there is a Fourth Amendment concern associated with obtaining DNA samples, the Fourth Amendment applies only to government action and is inapplicable to private parties who do not act as agents of the government.[ccxi] This doctrine, however, does not preclude the possibility that law enforcement may be able to access existing repositories of DNA from cooperative private hospitals or laboratories, provided that the government had no involvement in how the DNA was originally obtained and that the state is not engaging in any search or seizure in acquiring DNA in this way.[ccxii] The National Bioethics Advisory Commission estimated that as of 1998, more than 282 million human biological specimens were collected and stored in the U.S. for research studies, newborn screening tests, organ banks, blood banks, forensic DNA databases, and for other purposes, which increases at a rate of 20 million samples per year.[ccxiii] The issue lies in the fact that an individual undergoing diagnostic tests or donating samples for clinical or research purposes has a reasonable expectation of privacy that their test results and DNA will not be shared with a non-medical third party without his or her consent.[ccxiv]

Private companies are collecting and storing information for local law enforcement

Kreag 2015 (Jason, Visiting Assistant Professor, University of Arizona James E. Rogers College of Law “GOING LOCAL: THE FRAGMENTATION OF GENETIC SURVEILLANCE” http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2583957, mmv)

II. IMPLICATIONS OF THE EXPANDED USE OF LOCAL DNA DATABASES The results from Palm Bay and Bensalem demonstrate that local databases have the potential to be a powerful law enforcement tool. Indeed, Director Harran concluded that local databases are “the best thing to come to law enforcement since fingerprints,”¹⁵⁰ and Palm Bay claims that its database prevented \$6 million worth of property crime.¹⁵¹ Given the reduction in property crime and the increased clearance rates credited to local databases, it may appear difficult to question law enforcement’s enthusiasm, particularly when the Supreme Court recently blessed the expansion of DNA databases in *Maryland v. King*.¹⁵² However, in addition to the promise of more efficient crime-solving, local databases carry the potential for serious negative implications that have not been fully considered by law enforcement. This Part discusses the forces that will help to solidify local databases as an accepted surveillance tool, categorizes and analyzes the potential negative effects of these databases, and sets the stage for reforms proposed in Part III A. Entrenching Local DNA Databases There are powerful external forces helping to ensure that once local databases are adopted, they quickly become routine surveillance tools. This Section focuses on three of these external forces: 1) current Fourth Amendment doctrine, which allows law enforcement to tap into the everexpanding pool of personal information collected and stored by

private companies; 2) a nascent genetic surveillance-industrial complex; and 3) growing public acceptance of law enforcement's use of genetic surveillance techniques Current Fourth Amendment doctrine—in particular the principles of the third-party doctrine¹⁵³—allows law enforcement to benefit from the vast amount of information the public voluntarily shares with private companies.¹⁵⁴ This has led some scholars to conclude that law enforcement will respond by altering their surveillance practices. Professor Paul Ohm predicts that “[a]s the surveillance society expands, the police will learn to rely more on the products of private surveillance, and will shift their time, energy, and money away from traditional self-help policing, becoming passive consumers rather than active producers of surveillance.”¹⁵⁵ Professor Ohm's instincts are correct about certain types of surveillance activities. It seems likely that police will be inclined to use information amassed by private sources, decreasing the need for law enforcement to conduct duplicative surveillance. However, not all information sought by law enforcement is captured in the private sector. Specifically, genetic surveillance is one area where law enforcement will continue to be producers, as opposed to consumers, of surveillance. Whereas Google, Facebook, and other companies will feed law enforcement's desire for digital surveillance, the expansion of local databases demonstrates that law enforcement will be the driver of collecting and analyzing genetic evidence. In addition, local law enforcement's use of genetic surveillance will be shaped by corporate interests.¹⁵⁶ Corporate interests have played a role in the development of local DNA databases since their inception.¹⁵⁷ The first local DNA database was designed jointly by a private DNA lab and the Palm Bay Police Department.¹⁵⁸ And private firms are integral to the continued expansion of these databases. Large firms, such as Bode Technology and Orchid Cellmark, view local law enforcement databases as potential revenue streams, particularly because they promise to promote the use of DNA beyond violent crimes (sexual assaults and homicides) to property crimes.¹⁵⁹ These firms see a business opportunity in processing the evidence swabs collected from property crimes. Indeed, in marketing their products, they trumpet the studies that have highlighted DNA's promise for solving these crimes.¹⁶⁰ Similarly, smaller firms have also sought to benefit from and to drive the expansion of local databases. These include SmallPond and IntegenX.¹⁶¹ These companies have been consistent participants in law enforcement conferences in the last several years,¹⁶² and they have sought meetings with local agencies to pitch their products. Furthermore, IntegenX offers to help potential buyers secure grants to purchase its products.¹⁶³ The influence of private firms on policing techniques is not new and is certainly not unique to genetic surveillance.¹⁶⁴ However, it is important to recognize that these private interests will influence the expansion, use, and long-term viability of this surveillance tool. And because these private interests have evolved simultaneously with local law enforcement's push to enter the genetic surveillance space, the prospect of a genetic surveillance industrial complex further entrenching the practice of local databases seems likely. Finally, the very use of these databases will also contribute to the public's acceptance of them. Even those with only a casual understanding of surveillance techniques accept without question law enforcement's ability to collect personal information—including photographs, fingerprints, addresses, etc.—for investigative databases. Furthermore, because CODIS has been around for 20 years, there is widespread understanding that law enforcement collects DNA profiles from at least some segments of the population. Thus, local databases are not a completely new surveillance tool. This incremental evolution of law enforcement investigative databases in general, and DNA databases in particular, will help to solidify local databases as a tolerated, if not accepted, law enforcement tool.¹⁶⁵

2NC – XT – Suspicion

Trust is at an all-time low – suspicion is deep-rooted and privacy doesn't solve

Fiaz **Fazili** (M.D., King Fahad Hospital Medina La Munawarah Kingdom Of Saudi Arabia, Surgery; Minimal invasive and acute care) June 16, **2015** “A Lost Trust”
<http://www.greaterkashmir.com/news/opinion/story/189486.html>

Medicine still is a noble profession. To most of us, medicine is more than a job of care providing- putting patients' interest first. Unfortunately, in quest of big business, nobility of noble this profession is vanishing, and the doctor-patient trust is running all time low. Sadly, there is a general perception in public that the ethics of medical profession have degenerated. Doctors are accused of not attending to patients with same zeal and compassion as it used to be. Contrarily, in their own private clinic attitudes often are different. There is a conflicts of Interest. Is your doctor paid to promote a drug or device? Are doctors prescribing what is best for you? Today, patients, or their relatives carry a lot of prejudice and preconceived notions when they enter a doctor's chamber for consultation; a mindset of suspicions that doctors also behave like businessmen. Recognition and avoidance of conflicts of interest represent a core issue of professionalism, and are well covered in State and Indian medical council bye-laws of, as most of our doctors are honest, follow the rules, avoiding situations in which the interest of the doctor is placed above that of the patient. Honesty is a major concern in medical ethics and carries an important value for a medical practitioner where doctor is perceived as a messiah – a healer. Quality of care varies dramatically between individual doctors and hospitals, but those differences are invisible to patients. Whether it is a systemic failure, lack of uniformity in standards of care, organizational disarray, trust deficit or attitude problem. A number of common problems arise within the 'expectation zone', environment, and circumstances. Valley medicos often cry insecurity, seek action and protection from concerned authorities. Isn't it time to lift the veil on this sad reality for finding some important remedial measures to restore the dignity, honor and trust of overwhelming majority of the doctors who don't succumb to kickbacks or other lucrative incentives from pharmaceutical companies, who are unwilling to prescribe a drug, or implant a device, refusing facilitation for conferences, symposiums and research? Generalizing a statement, doctors fleecing patients in their private clinics or nursing home, is a myth in our valley when you compare similar circumstances outside the state. Agreeably, there might be a few even in our state who disgrace the profession, as there are in any profession but factually majority of doctors are altruistic. I don't say that all doctors are like priests, not driven by a greed. Some among us do resort to practices that are unethical practices to make money. This menace once limited to corporate hospitals is now infiltrating the state administered hospitals through these dishonest elements who need to be identified and let the writ of law take its course. My humble appeal goes to public and patients for change in perception, don't look through tainted glasses on this profession. Our dedicated, intelligent health care staff need recognition of for the hard work they do.

2NC – XT – Prices

Massive pricing spikes deck public trust in the medical industry

Munos 2013 (Bernard, Forbes pharmaceutical innovation writer, “We The People vs. The Pharmaceutical Industry” April 29 2013, <http://www.forbes.com/sites/bernardmunos/2013/04/29/the-pharmaceutical-industry-vs-society/,mmv>)

The pharma industry is in a pickle. It is losing all its friends and handing over sticks to its enemies. In the last few weeks: Novartis lost a major patent dispute in India Merck was denied an injunction against a generic Januvia South Africa announced plans to tighten its patenting requirements to deny IP protection to incremental innovations, often used by drug companies to “evergreen” their patents Germany extended the application of its much-hated pricing formula to the country’s most popular drugs 100 leading oncologists have risen against drug prices, accusing the industry of having lost its moral compass, and demanding major price cuts All this adds up to a giant pushback against the astronomical drug prices that are becoming commonplace. It seems that price tags of \$100,000 or above are becoming the norm. Of 12 cancer drugs approved in 2012, 11 cost more than that. As more drugs are offered at that level and their sponsors get away with it, it seems to set a floor that emboldens drug companies to push the envelope. They are badly misjudging the brewing anger. The industry’s standard defense has been to run warm-hearted stories about the wonders of biomedical innovation, and to point out that drugs represent only 10% of healthcare costs. Both arguments miss the point. Everyone loves biomedical innovation, but the industry’s annual output of 25 to 35 new drugs is a lousy return for its \$135 billion R&D spending. And pointing out that there is a worst culprit on the block is no comfort to patients getting stuck with a \$20,000 co-pay. Perhaps the mood would be different if the industry was a model of efficiency, but this is hardly the case. Examples of massive waste are on display everywhere: Pfizer wants to flatten a 750,000-square-foot facility in Groton, CT, and won’t entertain proposals for alternative uses. Lilly writes off over \$100 million for a half-built insulin plant in Virginia, only to restart the project a few years later in Indiana. AstraZeneca shuts its R&D labs at Alderley Park and goes on to spend \$500 million on a new facility in Cambridge. For American patients, what must be called executive incompetence is part and parcel of drug unaffordability. And every product recall and billion dollar fine compounds the anger, not to mention the oversized compensation of the CEOs responsible for this mess.

2NC – XT – Current Protections

Current privacy protections impede research and harm public perception

Steinberg and Rubin 9 (Mindy Steinberg and Elaine Rubin. Steinberg is a program associate at the Association for Academic Health Centers. Rubin is the vice president for policy and program at AAHC. “The HIPAA Privacy Rule: Lacks Patient Benefit, Impedes Research Growth.” 2009. P. 1-2. http://www.aahcdc.org/Portals/0/pdf/AAHC_HIPAA_Privacy_Rule_Impedes_Research_Growth.pdf////EMerz

The Privacy Rule of the Health Insurance Portability and Accountability Act (HIPAA), a regulation designed to protect the privacy of health information, continues to have a negative

impact on the nation's research enterprise, according to the latest survey of academic health center research administrators and principal investigators by the Association of Academic Health Centers (AAHC). Since the 2003 implementation of the Privacy Rule (45 CFR 160, 164), studies have shown that it has imposed barriers to research at academic health centers, the nation's major research institutions, thus slowing the pace of research, increasing the costs, and significantly hindering participation of individuals in important research studies. Research was not intended to be governed by the HIPAA Privacy Rule, but neither was it exempted from the regulation. However, the new constructs and restrictions on information mandated by the Rule have had untold consequences for the conduct of research and the advance of science and discovery in the United States. Despite repeated efforts by the research community to highlight the negative consequences of the HIPAA Privacy Rule, policymakers have made little attempt to address the Rule and consider options to remedy the situation. With the U.S. facing critical socioeconomic challenges, including an aging population and the desire for new treatments and cures for disease and illness, it is essential that policymakers reexamine the HIPAA Privacy Rule. The AAHC called for changes to the HIPAA Privacy Rule and recommended options to address these critical research issues based on evidence from a limited number of focus groups conducted with researchers throughout the country in 2007.⁴ This year, to broaden its information base, the AAHC developed a questionnaire that was administered online to 102 members of the AAHC's executive leadership group of Vice Presidents for Research as well as other senior leaders (e.g., legal counsel and chief compliance officers) who are members of the Vice Presidents for Research Workgroup on HIPAA. The vice presidents for research were also asked to forward the survey to 2-4 principal investigators at their institution in the interest of including the perspective of researchers along with that of senior research administrators.

2NC – XT – Women

Women have the largest influence on industry perception and they don't trust the government

Market Watch 2015 (Market Watch SOURCE: The Center for Talent Innovation, "Study Uncovers Healthcare Industry Trust and Knowledge Deficit Among Female Consumers", April 23 2014, <http://www.marketwatch.com/story/study-uncovers-healthcare-industry-trust-and-knowledge-deficit-among-female-consumers-2015-04-23-9173141>, mmv)

NEW YORK, NY, Apr 23, 2015 (Marketwired via COMTEX) -- Although women make the vast majority of healthcare decisions for themselves and others, 63 percent of women in the U.S., U.K., Germany, Japan, and Brazil lack confidence in the healthcare decisions they make, according to a study released today by the Center for Talent Innovation (CTI). The Power of the Purse: Engaging Women Decision Makers for Healthy Outcomes finds that women's low confidence is partly due to their lack of access to reliable information and trust in the industry. The report also uncovers the industry opportunity to connect with women by understanding their unique definition of health. While healthcare companies organize their product offerings by disease state, the majority of women define health holistically (as having spiritual and emotional well-being, and being physically fit and well-rested). Across markets, women make healthcare decisions for themselves (94 percent) and also decide for others (59 percent) which medicines to take, health regimens to follow, doctors to see, and how to live a healthy lifestyle. Yet, as primary decision-makers or "Chief Medical Officers" for the health and wellness of others, they lack the

tools to make informed decisions. More than half of women (53 percent) think they can get the best health information from the internet, but 31 percent of these women do not trust the information they receive online. The numbers get worse when it comes to women's trust in the healthcare industry. Seventy-eight percent of women do not fully trust their health insurance company, 83 percent do not fully trust the pharmaceutical companies that make their medicine and 35 percent do not fully trust their own primary healthcare provider. "At a time when the industry is suffering from only 50 percent prescription adherence rates among patients and the general population is getting less healthy, we find female CMOs can be healthcare companies' best allies to achieve better health outcomes for themselves and others," says Carolyn Buck Luce, executive in residence at Center for Talent Innovation. "The sponsoring companies of this report recognize the power of the female CMO purse and have committed to uncovering the solutions to better serve this market segment." To engage this market segment, the report finds, healthcare companies must first adopt a holistic definition of health. Women overwhelmingly list physical fitness and emotional and spiritual well-being in their definitions of health-far more often than they list the industry's definition, "being free of illness." Fully 79 percent of women surveyed say that health means "having spiritual and emotional wellbeing." Seventy-seven percent cite "being physically fit and well rested." Companies must also understand that decision-makers aren't all moms; 43 percent of working women without kids make healthcare decisions for others, and 47 percent of women who are not employed and without children make healthcare decisions for others. To help companies build meaningful connections with female healthcare decision-makers, the report uncovers behaviors -- by sector -- likely to drive trust and satisfaction among these consumers: Trusted healthcare providers: -- Report test results in an understandable way, according to 70 percent of women who trust and are satisfied with their primary healthcare provider -- Discuss preventative care and proactively manages their health, according to 60 percent of women who trust and are satisfied with their primary healthcare provider Trusted health insurance companies: -- Provide coverage for trusted doctors, according to 50 percent of the women who trust and are satisfied with their health insurance company -- Make preventative care affordable, according to 47 percent of the women who trust and are satisfied with their health insurance company Trusted primary pharmacists: -- Provide information to make decisions, according to 41 percent of women who trust and are satisfied with their primary pharmacist -- Ask about and listens to concerns/questions, according to 38 percent of women who trust and are satisfied with their primary pharmacist Trusted pharmaceutical companies: -- Provide clear information along with the prescription to help their patients understand the risks and side effects, according to 27 percent of women who trust and are satisfied with their pharmaceutical company -- Provide gender and ethnic-specific drug recommendations, according to 25 percent of women who trust and are satisfied with their pharmaceutical company "Understanding the behaviors that garner trust and satisfaction will assist the Chief Medical Officer in doing her job well," says Sylvia Ann Hewlett, founder and CEO at the Center for Talent Innovation. "Trusting relationships with healthcare professionals and the organizations they represent can go a long way towards bolstering women's confidence and trust." The healthcare industry employs a large number of women but many of their ideas, insights and capabilities have not yet been fully supported, endorsed, and promoted. As organizations employ many of the women who have real-world insights as "Chief Medical Officers" for themselves and others, they are failing to leverage the valuable assets that can lead to winning the trust of female consumers. The report features best practice examples that can be used as guides for other organizations working to better leverage their top female talent.

2NC – XT – Staff Shortages

Staff and expertise shortages take out the aff

Bernard **Choi** (Injury Prevention Research Centre, Medical College of Shantou University, Shantou, China and Department of Epidemiology and Community Medicine, University of Ottawa, Ottawa, Canada) 2012 “The Past, Present, and Future of Public Health Surveillance” *Scientifica* Volume **2012** (2012), Article ID 875253, 26 pages
<http://dx.doi.org/10.6064/2012/875253>

To avoid fragmentation in national surveillance efforts [107, 144], there is a need for federal agencies to provide national facilitation to foster interstate and intercounty collaboration. Central guidance can lead to coordination across states and counties, interstate technology transfer, and opportunity to learn from the successes and failures of other localities. Needless expense, unnecessary development time, and failure to rapidly share information on innovative systems can be avoided [205]. No attempt to meet the current challenges in public health surveillance will succeed unless it recognizes the fundamental importance of providing and maintaining a cadre of highly trained and motivated public health professionals in every local health agency in the country [5]. To use surveillance information to better prioritize, plan, deliver, and evaluate programming, public health staff must possess the required knowledge and skills. While it is neither feasible nor necessary for all staff to receive postgraduate academic training, a greater proportion of the public health workforce will need to acquire the knowledge and skills necessary to effectively understand and use surveillance concepts and techniques. Public health surveillance systems must be strengthened by (1) allocating resources, including human resources, for the effective use of health surveillance data and tools and (2) recognizing the need for existing staff to acquire new skills [77].

Budget cuts and staff shortages short-circuit all health surveillance

Edward **Richards** (Harvey A. Peltier Professor of Law and Director, Program in Law, Science, and Public Health at the Paul M. Herbert Law Center, Louisiana State University) **2009** “DANGEROUS PEOPLE ,UNSAFE CONDITIONS T HE CONSTITUTIONAL BASIS FOR PUBLIC HEALTH SURVEILLANCE” *The Journal of Legal Medicine*, 30:27–50,
http://biotech.law.lsu.edu/Articles/ULGM_A_369622_O.pdf

The Constitution grants broad authority for public health surveillance. As long as public health authorities do not use administrative searches as a subterfuge for criminal law searches, the courts will uphold these searches when they are conducted either pursuant to an area warrant or through the reg- ulated industries exception to a warrant requirement. Surveillance, however, is just the first step in protecting the public health and safety. Surveillance data must be combined with good epidemiologic analysis, and then become the basis for public health interventions. There have been few abuses of public health administrative searches. Public health authorities, if anything, have been too reticent to use proper surveillance techniques. Although some of this reticence is because of con- cerns about being seen as violating individual rights, most of it stems from lack of staff and other resources. 113 Despite the push on public health preparedness since the terrorist attacks on September 11, 2001, health departments around the United States continue

to suffer budget and staff cuts. The impacts of these cuts are exacerbated by legislatures pushing ever-increasing responsibilities on health departments without providing the budgets or staff to carry out these new tasks. 114 The hardest issue for public health policy makers is to avoid pressures to transform public health agencies into extensions of the Department of Homeland Security. As we have seen from the adoption of Draconian emergency powers laws, it is more difficult to maintain a balance between individual rights and community protection than to attempt to satisfy political pressures by swinging wildly between extreme positions.

Circumvention

1NC

Individuals willingly give up their health records by using non-protected mediums- means state legislation can't solve

Terry 14 (Nicolas P. Terry. "Big Data Proxies and Health Privacy Exceptionalism." 2014. P. 19-21 https://www.ftc.gov/system/files/documents/public_comments/2014/01/00004-89091.pdf)/EMerz

Ironically **one of the greatest threats to an individual's health privacy is . . . the individual.** One of the first examples of theretofore HIPAA-protected data migrating to HIPAA-free space was during President George W. Bush's administration at a time when the slowing of the administration's provider-curated EMR program coincided with the launching of PHR platforms by Google and Microsoft.⁹⁶ As a result the HITECH Act architects attempted to protect for the first time health data that migrated from a protected to an unprotected (or marginally protected) zone. However, they chose to do so with a swiftly outmoded, downstream breach notification model.⁹⁷ In the interim different (and unregulated) **technologies have emerged that encourage patient rather than provider curation of health data.** The most obvious example is the federal government's "Blue Button" technology that allows patients to download their records to their own devices. The "Blue Button" approach to patient access and hence control of their health data has become a rallying cry for many (if not all) patient privacy advocates and has been encouraged by President Obama's administration. 101 Indeed, then ONC National Coordinator Farzad Mostashari announced a Blue Button Mash-Up challenge to build software for patients designed to combine their downloaded Blue Button information with other data sources.¹⁰² At root such patient curation of health data bespeaks autonomy and is symbolic of patient ownership of the data. However, it fails to take into account one practical limitation—the canonical version of the record will remain in the provider's control – and one legal limitation— that only the provider-curated copy is protected by HIPAA-HITECH. In contrast, the patient-curated "copy" attracts little meaningful privacy protection. Well-meaning privacy advocates should think carefully before promoting this autonomy-friendly "control" model until data protection laws (not to mention patient education as to good data practices) catch up with patient curated data. A similarly dichotomous result is likely as the medically quantified self develops. The quantified-self movement concentrates on personal collection and curation of inputs and performance. 103 Obviously, health, wellness and medically inflected data will likely comprise a large proportion of such data. A similar, if less formal, scenario is emerging around health and wellness apps on smartphones and connected domestic appliances such as scales and blood pressure cuffs. 104

Smartphones are crammed with sensors for location, orientation, sound and pictures that add richness to data collection.¹⁰⁵ And there is ongoing and explosive growth in the medical apps space that seeks to leverage such sensors. **More and more we are going to demand control of information about ourselves and generate medically inflected and core health data about ourselves.** These processes will in most cases lead to medically inflected data that exists outside of the HIPAA-HITECH protected zone.

Impossible to keep genetic data anonymous – data leaks inevitable – kills public trust

Gina **Kolata** (Medical reporter for the New York Times) June **2013** “Poking Holes in Genetic Privacy” http://www.nytimes.com/2013/06/18/science/poking-holes-in-the-privacy-of-dna.html?pagewanted=all&_r=0

For years now, a steady stream of research has eroded scientists’ faith that DNA can be held anonymously. The first shock came in 2008, when David W. Craig, a geneticist at TGen, a research institute in Phoenix, and his colleagues imagined a theoretical problem. Suppose you are trying to learn what percentage of intravenous drug users are infected with hepatitis, and you collect DNA from discarded needles and amass it in a database to look for signs of the virus in the genetic material. Is there any way, they wondered, to find a particular person’s DNA is in this soup of genes? Most researchers would have said the task was impossible, worse than looking for a needle in a haystack. But Dr. Craig and his colleagues found a way to do it, exploiting the four million or so tiny, and usually inconsequential, differences in DNA letters between one individual and another. With their method, using the combinations of hundreds of thousands of DNA markers, the researchers could find a person even if his or her DNA constituted just 0.1 percent of the total in the mix. So explosive was the finding that Dr. Craig deliberately chose to write about it only very technically. The N.I.H. understood what he had accomplished, though, and quickly responded, moving all genetic data from the studies it financed behind Internet firewalls to prevent the public or anyone not authorized from using the data and, it was hoped, to protect the identities of research subjects. But another sort of genetic data — so-called RNA expression profiles that show patterns of gene activity — were still public. Such data could not be used to identify people, or so it was thought. Then Eric E. Schadt of Mount Sinai School of Medicine discovered that RNA expression data could be used not only to identify someone but also to learn a great deal about that person. “We can create a profile that reflects your weight, whether you are diabetic, how old you are,” Dr. Schadt said. He and a colleague also were able to tell if a person is infected with viruses, like HPV or H.I.V., that change the activity of genes. Moreover, they were able to make what they called a genetic bar code that could be used to identify a person in a number of DNA databases. Then, this year, in perhaps the most disturbing exercise, Yaniv Erlich, a genetics researcher at the Whitehead Institute, used a new computational tool he had invented to identify by name five people from their DNA, which he had randomly selected from a research database containing the genes of one thousand people. Experts were startled by what Dr. Erlich had done. “We are in what I call an awareness moment,” said Eric D. Green, director of the National Human Genome Research Institute at the National Institutes of Health. Research subjects who share their DNA may risk a loss of not just their own privacy but also that of their children and grandchildren, who will inherit many of the same genes, said Mark B. Gerstein, a Yale professor who studies large genetic databases. Even fragments of genetic information can compromise privacy. James Watson, a discoverer of DNA’s double helix shape, had his genes sequenced and made the information public — except for one, the sequence for ApoE, a gene that has a variant linked to an increased risk of Alzheimer’s disease. Researchers noticed, though, that

they could still figure out if Dr. Watson had that variant by examining the DNA on either side of the gene he had removed. They did not reveal whether he had it. With so many questions about the privacy and security of genetic data, researchers wonder what research subjects should be told. Leaks and identification of study subjects will never be completely avoidable, said George Church, a Harvard geneticist. And as much as investigators might like to find a way to keep genetic data secure and private, he does not think there is an exclusively technical solution. “If you believe you can just encrypt terabytes of data or anonymize them, there will always be people who hack through that.” Dr. Church said. He believes that people who provide genetic information should be informed that a loss of privacy is likely, rather than unlikely, and agree to provide DNA with that understanding. Other researchers say the idea is not far-fetched, and some suggest that scientists be licensed before they are given access to genetic databases, with severe penalties for those who breach privacy. “My fear is not so much that someone will take everyone’s genomes and put them on the Web,” Dr. Gerstein said. “It is that a graduate student in some lab somewhere will naïvely post bits of genomes on his Facebook page. The idea is that before he could get access to genomes, he would be taught he can’t do that. And if he did he would lose his license.” The amount of genetic data that has been gathered so far is minuscule compared with what will be coming in the next few years, Dr. Altshuler noted, making it important to address the problems before the data deluge makes them worse. “We see substantial issues,” he said. “We want to have serious discussions now.”

2NC – XT – Police

Circumvention inevitable- police legally collect DNA all the time

Scherr 13 (Albert E. Scherr. Professor of Law, University of New Hampshire. “Genetic Privacy & the Fourth Amendment: Unregulated Surreptitious DNA Harvesting.” 2013. P. 448-449. <http://georgialawreview.org/wp-content/uploads/2015/02/Download-PDF-V47-I2-Scherr.pdf>)/EMerz

So why does the law regard genetic privacy issues in criminal and civil contexts differently? Why do surreptitious-DNA harvesting practices by private parties get appreciably more legal scrutiny than such practices by police? One broad-brush answer is that society places more value on the public-safety goal of solving crimes than on the needs of amateur genealogists, divorce lawyers, and genetic researchers. That broad-brush answer is unsatisfactory. Current Fourth Amendment jurisprudence on surreptitious harvesting creates an all-or-nothing dynamic. If a putative suspect—one for whom the police have some reasonable suspicion but not enough for a search warrant—abandons his DNA in a public place, the police can do with the sample what they will, without limitation. The police can do the same for a suspect for whom they have only a hunch. They can also do the same for someone for whom they have no suspicion, including a victim or a witness. They can do so without a suspect’s, a witness’s, or a victim’s consent or knowledge. If surreptitious DNA harvesting is not a “search” under the Fourth Amendment, the police can do whatever they want with anyone’s DNA.

2NC – XT – Federal

Federal oversight can't minimize health surveillance- the biggest offenders are private businesses that use big data

Terry 14 (Nicolas P. Terry. "Big Data Proxies and Health Privacy Exceptionalism." 2014. P. 13-16 https://www.ftc.gov/system/files/documents/public_comments/2014/01/00004-89091.pdf)/EMerz

Big data is so named because of its unprecedented volume and for its "complexity, diversity, and timeliness." Big data refers not only to the collection and storage of extremely large data sets but also the data mining and predictive analytic routines that process the data, the latter being understood as "[t]echnology that learns from experience (data) to predict the future behavior of individuals in order to drive better decisions."⁷⁴ Essentially big data is the latest type of business intelligence (BI), or, to frame it slightly differently, the latest BI analytics are what extract value from big data.⁷⁵ Not surprisingly, MBA-speak business jargon dominates the space. Thus, according to Gartner, Inc., "'Big data' is high-volume, -velocity and -variety information assets (sic) that demand (sic) cost-effective, innovative forms of information processing for enhanced insight and decision making."⁷⁶ It is important not to underestimate one of these three properties—high-variety. Big data does not use structured databases (or at least is not as reliant on them as previous generation systems such as credit reporting) but is capable of absorbing high-variety data. Data sources (or data pools) continually change and expand; yet big data is seems adept at digesting them. As described in a recent report by the Centre For Information Policy Leadership, While traditionally analytics has been used to find answers to predetermined questions, its application to big data enables exploration of information to see what knowledge may be derived from it, and to identify connections and relationships that are unexpected or were previously unknowable. When organisations employ analytics to explore data's potential for one use, other possible uses that may not have been previously considered often are revealed. Big data's potential to yield unanticipated insights, the dramatically low cost of information storage and the rapidly advancing power of algorithms have shifted organisations' priorities to collecting and harnessing as much data as possible and then attempting to make sense of it.⁷⁷ The analytics of big data seek to predict the behavior not only of populations or cohorts but also of individuals. In Predictive Analytics: The Power to Predict Who Will Click, Buy, Lie, or Die, computer scientist Eric Siegel explained the distinction as follows: Forecasting makes aggregate predictions on a macroscopic level. How will the economy fare? Which presidential candidate will win more votes in Ohio? Whereas forecasting estimates the total number of ice cream cones to be purchased next month in Nebraska, predictive technology tells you which individual Nebraskans are most likely to be seen with cone in hand.⁷⁸ In the context of health information the business intelligence grail is to identify and exploit a patient's differential health status. According to Neil Biehn with such segmentation "organizations can more easily identify anomalous buying behavior and make intelligent product and offer recommendations that are statistically more likely to be purchased. Biehn continues, "If two customers are alike but not buying the same products, the data analysis can advise which opportunities the sales team might be missing," concluding "[t]his is the type of Big Data viability that moves the needle in the real world."⁷⁹ The privacy implications of individuated big data analysis are profound. Beyond the expropriation or "using" objections to such data collection and processing, such as Commissioner Brill's critique quoted at the beginning of this article,⁸⁰ **the computer modeling of predictive analytics predicts a world of dehumanizing "data determinism,"** described by FTC Chairwoman Edith Ramirez as the judgment of persons "not because of what they've done, or what they will do in the future, but because inferences or correlations drawn by algorithms

suggest they may behave in ways that make them poor credit or insurance risks, unsuitable candidates for employment or admission to schools or other institutions, or unlikely to carry out certain functions.⁸¹ Finally, there is the “Doomsday” scenario—a big data breach. The industrial scale data-warehousing model is the antithesis of the “silo” model of data storage used in the pre-information age. The lack of data liquidity (with all of its informational disadvantages) inherent in that model meant that there was little profit or harm in an isolated security breach. The opposite is true with big data storage. However, there are reports that big data brokers are not immune from the same security breaches that are plaguing other businesses.⁸²

2NC – XT – Leaks

Genomic data breaches happen all the time- the health system does not have enough protections in place to secure private genetic information

McEwen et al 13 (Jean E. McEwen, Ethical, Legal, and Social Implications Program, Division of Genomics and Society, National Human Genome Research Institute, National Institutes of Health, Ethical, Legal, and Social Implications Program, Division of Genomics and Society, National Human Genome Research Institute, National Institutes of Health. Joy T. Boyer, Senior Program Analyst, and Kathie Y. Sun, Program Analyst. “Evolving Approaches to the Ethical Management of Genomic Data.” February 28, 2013. <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC3665610/>)/EMerz

The genetic studies and test protocols that dominated the field 15–20 years ago were generally highly targeted, and tended to view the risks to participants or patients (apart from the physical risks associated with blood drawing) as straightforwardly informational [17–19]. Thus, consent materials in use prior to the mid-2000s, if they mentioned non-physical risks at all, tended to focus on the potential for breach of privacy, with insurance and employment usually listed as the two areas of main concern [20–22]. Data security measures of the time were, by today’s standards, remarkably “low tech,” often consisting of little more than coding samples and data and storing samples and data in locked freezers and cabinets. Still, consent forms, if they addressed the issue at all, typically described the risk of a security breach as low; at the time that assessment seemed reasonably accurate, predating as it did the development of massive, web-accessible genomic databases and expanded data sharing norms. Early consent forms rarely addressed the issue of whether individual findings from studies would be returned to participants [20, 21]. The usual default presumption was that they would not be [23], because most findings emanating from studies of the time interrogated only limited regions of the genome, so the likelihood of generating incidental findings (apart from occasional evidence of undisclosed adoption or misattributed paternity [24]) was relatively low. Another feature of early consent forms was their characteristically narrow scientific scope [8, 20, 21]. Most described only the immediate study for which samples were being collected or the specific disease being analyzed; although the possibility of sharing with close collaborators working on the same disease was sometimes mentioned, obtaining broad consent to an unspecified range of future uses was the exception, not the norm. **Often, consent documents were simply silent about plans for any future sharing,** and in such cases, the **absence of an explicit prohibition against sharing was generally interpreted** (or, at least over time came to be interpreted) **as tacit permission to share** [23]. In 1994, long-percolating concerns among bioethicists about the practice of using stored, linkable samples without obtaining new consent from those from whom they had been obtained culminated in the publication of a highly influential paper that recommended against continuing this practice [25]. Following this recommendation, consent documents gradually began to be

written with greater specificity about whether, with whom, and for what purposes, samples and data would be shared. In practice, however, the recommendation was often interpreted as applying only to prospectively collected samples. Thus, as recently called to public attention in a best-selling book, archived samples collected under widely varying and sometimes questionable consent conditions – and cell lines derived from such samples - are often still being used today.

Medical identity theft is an expanding issue that current legal protections fail to prevent

Terry 14 (Nicolas P. Terry. “Big Data Proxies and Health Privacy Exceptionalism.” 2014. P. 8-10 https://www.ftc.gov/system/files/documents/public_comments/2014/01/00004-89091.pdf)/EMerz

With a legislative requirement to notify a data subject of a data breach, the data custodian’s duty is triggered upon loss of control of the data, making a breach notification rule the definitive downstream protective model. Breach notification laws proliferated because of the dramatic increase in identity theft.²⁷ Although all federal agencies are subject to a robust breach notification policy,²⁸ federal legislation to cover private parties has been proposed but not yet passed.²⁹ In contrast, and in the decade following California’s 2002 example, forty-six states and the District of Columbia have enacted breach notification laws.³¹ **More recently attention has turned to medical identity theft.**³² It has been argued that medical identities are highly valued by criminals because of the comprehensive data that are contained in, for example, a stolen electronic medical record (EMR).³³ A 2006 report from The World Privacy Forum focused attention on the issue,³⁴ and in 2009 the Office of the National Coordinator for Health Information Technology (ONC) commissioned a study on the subject from Booz Allen Hamilton.³⁵ Today both HHS’s Office of Inspector General³⁶ and the Federal Trade Commission ³⁷ web sites have information pages concerning medical identity theft. According to a 2012 Ponemon Institute study, 52% of health care organizations experienced one or more incidents of medical identity theft. The 2013 Survey on Medical Identity Theft (also conducted by the Ponemon Institute) estimated a 19 per cent increase in medical identity theft victims year-to-year.³⁹ Relatively few states include health data within their definition of the personal information subject to breach notification. Others, true to the US sector-based approach to privacy regulation, exclude data covered by, say, HIPAA or the Gramm-Leach-Bliley Act of 1999 (GLBA).⁴¹ HITECH introduced two closely related breach notification regimes. The first, introduced by section 13402, requires HIPAA covered entities and HIPAA BAs to provide notification following a breach of “unsecured protected health information.”⁴⁴ The second, courtesy of section 13407, imposes a similar duty on vendors of personal health records (PHR) ⁴⁵ and their third party service providers ⁴⁶ with regard to “Unsecured PHR Identifiable Health Information.”⁴⁷ Rulemaking authority and enforcement are vested in the HHS regarding the former and the (Federal Trade Commission) FTC regarding the latter. **The regulation of PHRs is a limited (but ultimately unsuccessful) attempt to expand health data protection** from a narrow sector provider based model (e.g., information held by a covered entity) to a data-type based model. Unfortunately it stopped short of a broad datatype model (e.g., by protecting the data itself held by any data custodian), limiting the custodian cohort to PHR providers.⁴⁹ It is an interesting question why HITECH added a breach notification data protection model. Certainly medical identity theft was being raised as an issue.⁵⁰ As likely this rethinking of the approach to data protection may have been triggered by the expansion of personal health records services

offered by non-health companies such as Google Inc.⁵¹ Maybe the HITECH architects could not agree on a way to open up the broader and established HIPAA model to apply to nontraditional custodians of health data (BAs aside) and so had to settle on a new but limited data protection model as the legislative alternative. Notwithstanding, the result was that HITECH authorized regulatory activity by the FTC that would mirror the work of HHS in the more narrowly defined, traditional health space. Ironically, however, by the time HITECH was passed the PHR business was slowing and Google Health, the PHR poster-child, soon would be closed.⁵²

Health information data breaches inevitable now – triggers all aff links

New York Times April 2015 “Patients' Medical Records Under Threat From Data Breaches”
<http://www.nytimes.com/aponline/2015/04/14/health/ap-us-med-breached-health-records-.html>

Your private medical information is under threat. That's according to a study that found almost 30 million health records nationwide were involved in criminal theft, malicious hacking or other data breaches over four years. The incidents seem to be increasing. Compromised information included patients' names, home addresses, ages, illnesses, test results or Social Security numbers. Most involved electronic data and theft, including stolen laptops and computer thumb drives. The study didn't examine motives behind criminal breaches, or how stolen data might have been used, but cyber-security experts say thieves may try to use patients' personal information to fraudulently obtain medical services. Cases that didn't involve malicious intent included private health information being inadvertently mailed to the wrong patient. Hackings doubled during the study, from almost 5 percent of incidents in 2010 to almost 9 percent in 2013. Hackings are particularly dangerous because they can involve a high number of records, said Dr. Vincent Liu, the lead author and a scientist at Kaiser Permanente's research division in Oakland, California. "Our study demonstrates that data breaches have been and will continue to be a persistent threat to patients, clinicians, and health care systems," Liu said. The study appears in Tuesday's Journal of the American Medical Association. A JAMA editorial says there's evidence that the incidents are leading some patients to avoid giving doctors sensitive information about their health, including substance abuse, mental health problems, and HIV status. "Loss of trust in an electronic health information system could seriously undermine efforts to improve health and health care in the United States," the editorial said. Patients should be alert to cyber threats, including "phishing" emails from hackers posing as doctors, hospitals or health insurance companies, said Lisa Gallagher, a cybersecurity expert at the Healthcare Information and Management Systems Society. Those messages require clicking on a link to get information, and patients should instead should call the purported sender to verify whether the email is legitimate, she said Patients should also double check doctor bills and other insurance company information. "Don't throw away your explanation of benefits. Take a look at them," Gallagher said. "If you see care that wasn't provided to you, or dates and names of providers that don't make sense, go to the provider and report that." For the study, Liu and colleagues analyzed an online database regulated by the U.S. Department of Health and Human Services and containing mandated reports of breaches in health information protected by federal privacy law. Over the four years, 949 data breaches were reported across the country. The numbers climbed annually, from 214 in 2010 to 265 in 2013. Nearly 60 percent involved theft.

Healthcare data breaches are inevitable

Appari and Johnson 10, (Ajit, Eric, Tuck School of Business, “Information security and privacy in healthcare: current state of research,” Dartmouth, 4, 2010, <http://www.ists.dartmouth.edu/library/501.pdf//IB>

These attackers may have resources ranging from modest financial backing and computing skills to a well-funded infrastructure. Additionally, the nature of the threats typically depends on the technical capability of the attackers. Moreover, with the growing underground cyber economy (Knapp and Boulton, 2006), an individual possessing adequate financial resources and with the intent to acquire data may be able to buy the services of sophisticated hackers to breach healthcare data.

Government Access to records greatly expands the risk of data disclosure

Appari and Johnson 10, (Ajit, Eric, Tuck School of Business, “Information security and privacy in healthcare: current state of research,” Dartmouth, 4, 2010, <http://www.ists.dartmouth.edu/library/501.pdf//IB>

Although health information privacy has been widely discussed in the social science and business press (Etzioni, 1999), the academic literature lacks systematic investigation to identify and classify various sources of threats to information privacy and security. Recent policy-based studies (such as NRC, 1997; Rindfleisch, 1997) broadly categorise privacy threats, or source of information security, into two areas: 1 organisational threats that arise from inappropriate access of patient data by either internal agents abusing their privileges or external agents exploiting a vulnerability of the information systems 2 systemic threats that arise from an agent in the information flow chain exploiting the disclosed data beyond its intended use (NRC, 1997). Organisational Threats: These threats assume different forms, such as an employee who accesses data without any legitimate need or an outside attacker (hacker) that infiltrates an organisation’s information infrastructure to steal data or render it inoperable. At the outset, these organisational threats could be characterised by four components: motives, resources, accessibility and technical capability (NRC, 1997).

Government will leak private data

Appari and Johnson 10, (Ajit, Eric, Tuck School of Business, “Information security and privacy in healthcare: current state of research,” Dartmouth, 4, 2010, <http://www.ists.dartmouth.edu/library/501.pdf//IB>

Recent studies suggest that the broad spectrum of organisational threats could be categorised into five levels, listed in increasing order of sophistication (NRC, 1997): • Accidental disclosure: Healthcare personnel unintentionally disclose patient information to others (e.g., e-mail message sent to wrong address or inadvertent web-posting of sensitive data). • Insider curiosity: An insider with data-access privilege pries upon a patient’s records out of curiosity or for their own purpose (e.g., a nurse accessing information about a fellow employee to determine possibility of a sexually transmitted disease or medical personnel accessing potentially embarrassing health

information about a celebrity and transmitting it to the media). • Data breach by insider: Insiders access patient information and transmit it to outsiders for profit or revenge. • Data breach by outsider with physical intrusion: An outsider enters the physical facility either by coercion or forced entry and gains access to the system. • Unauthorised intrusion of network system: An outsider, including former employees, patients, or hackers, intrudes into an organisation's network from the outside to gain access to patient information or render the system inoperable. Systemic Threats: Etzioni (1999), in discussing the 'limits to privacy', observed that a major threat to patient privacy occurs, not from outside of the information flow chain, but from insiders who are legally privileged to access patient information. For example, insurance firms may deny life insurance to patients based on their medical conditions, or an employer having access to employees' medical records may deny promotion or terminate employment. Patients or payer organisations may incur financial losses from fraud including upcoding of diagnoses or for rendering medically unnecessary services.

They cant solve --- technological advances make illegal dissemination unpreventable

Ruebner and Reis, professor former professor of law at The *John Marshall* Law School, 1/1/2004 – (Ralph, Leslie, “Hippocrates to HIPAA: A Foundation for a Federal Physician-Patient Privilege, 77 Temp. L. Rev. 505 (2004)”, published in the Temple Law Review at The *John Marshall* Law School)//roetlin

HHS commented on the inherent conflict between technology and privacy, in particular, the connection between the increasing use of interconnected electronic information systems in the health care context and the loss of health information privacy. 6 3 In doing so, HHS emphasized the fact that advances in technologies used to collect and disseminate patient health information have "reduced or eliminated many of the financial and logistical obstacles that previously served to protect the confidentiality of health information and the privacy interests of individuals." 6 4 Simply, the pervasiveness of and access to medical information in electronic form creates the likelihood that such information will be **wrongfully disclosed** or used in a manner that may harm the patient. 6 5 Technological advancements in information systems "may provide a reason for institutionalizing privacy protections in situations where the risk of harm did not previously justify writing such protections into law." 6 6

Judicial Modelling

1NC

No court influence now

Liptac 08, (Adam, New York Times US, “U.S. Court Is Now Guiding Fewer Nations,” September 17, 2008, <http://www.nytimes.com/2008/09/18/us/18legal.html?pagewanted=all>)//IB

But now American legal influence is waning. Even as a debate continues in the court over whether its decisions should ever cite foreign law, a diminishing number of foreign courts seem

to pay attention to the writings of American justices. “One of our great exports used to be constitutional law,” said Anne-Marie Slaughter, the dean of the Woodrow Wilson School of Public and International Affairs at Princeton. “We are losing one of the greatest bully pulpits we have ever had.” From 1990 through 2002, for instance, the Canadian Supreme Court cited decisions of the United States Supreme Court about a dozen times a year, an analysis by The New York Times found. In the six years since, the annual citation rate has fallen by half, to about six. Australian state supreme courts cited American decisions 208 times in 1995, according to a recent study by Russell Smyth, an Australian economist. By 2005, the number had fallen to 72. The story is similar around the globe, legal experts say, particularly in cases involving human rights. These days, foreign courts in developed democracies often cite the rulings of the European Court of Human Rights in cases concerning equality, liberty and prohibitions against cruel treatment, said Harold Hongju Koh, the dean of the Yale Law School. In those areas, Dean Koh said, “they tend not to look to the rulings of the U.S. Supreme Court.” The rise of new and sophisticated constitutional courts elsewhere is one reason for the Supreme Court’s fading influence, legal experts said. The new courts are, moreover, generally more liberal than the Rehnquist and Roberts courts and for that reason more inclined to cite one another. Another reason is the diminished reputation of the United States in some parts of the world, which experts here and abroad said is in part a consequence of the Bush administration’s unpopularity around the world. Foreign courts are less apt to justify their decisions with citations to cases from a nation unpopular with their domestic audience. “It’s not surprising, given our foreign policy in the last decade or so, that American influence should be declining.” said Thomas Ginsburg, who teaches comparative and international law at the University of Chicago. Aversion to Foreign Law The adamant opposition of some Supreme Court justices to the citation of foreign law in their own opinions also plays a role, some foreign judges say. “Most justices of the United States Supreme Court do not cite foreign case law in their judgments,” Aharon Barak, then the chief justice of the Supreme Court of Israel, wrote in the Harvard Law Review in 2002. “They fail to make use of an important source of inspiration, one that enriches legal thinking, makes law more creative, and strengthens the democratic ties and foundations of different legal systems.”

****Genetic Surveillance****

Frontline

1NC

There's no impact to genetic discrimination- their evidence is just rhetoric

Begley 4 (Sharon Begley, Senior health & science correspondent at Reuters. "Bill Seeking to Ban DNA Discrimination Isn't Really Necessary." February 6, 2004. <http://www.wsj.com/articles/SB107595572756521572>)/EMerz

When it comes to genetic discrimination, there is a yawning chasm between rhetoric and reality. As law professor Henry Greely of Stanford University puts it, "Genetic discrimination is a much greater threat in people's fears than it is in reality, today or in the foreseeable future....Failure to ban [it] will not make the sky fall, [or] the employment markets crumble." Genetic discrimination means being denied employment or health insurance (or being charged more for it) as a result of testing positive for a gene that raises your risk of developing a disease such as cancer or Alzheimer's. Since at least 1990, it has been cast as the dark underbelly of the human genome project, which dutifully set aside 3% to 5% -- almost \$100 million -- of its annual budget to study such ethical, legal and social issues. Francis Collins, director of the project, has called genetic discrimination "a vexing problem" and praised the Senate's "important" bill. The emperor, however, is wearing skivvies. Just as genome enthusiasts, and much of the media, have hyped the medical benefits of decoding humankind's double helix, so they (and we) have grossly overstated the threat and the reality of genetic discrimination. If you probe beneath the anecdotes, evidence of genetic discrimination melts away. Bioethicists and genetic counselors, for instance, say they've heard of people being fired or denied health coverage after testing positive for a risk gene, but concede they know of no such patients firsthand. When they do offer an actual case, it turns out that the discrimination was based not on a predictive genetic test (finding a genetic variant that raises the risk of cancer, perhaps) but on family history or actual symptoms of, say, the blood disorder hereditary hemochromatosis. That may be medical discrimination, but it isn't genetic discrimination as usually understood. In an effort to get beyond anecdote, a 2000 study examined the effect of state laws barring genetic discrimination in health insurance. To their surprise, Mark Hall and Stephen Rich of Wake Forest University in Winston-Salem, N.C., found that states with such laws had no fewer cases of genetic discrimination than states without them. Why? Because you can't have fewer cases than zero, and zero is about how much genetic discrimination the study turned up. "We found almost no cases of health insurers asking for or using the results of predictive genetic tests," Prof. Hall says. "The laws have so little impact because almost no genetic discrimination is occurring," as more-recent studies confirm. Dawn Allain, president of the National Society of Genetic Counselors, agrees: "We haven't seen any real cases of genetic discrimination." Health insurers have little financial incentive to set rates based on predictive genetic tests, Prof. Hall explains. For group coverage, it's much simpler to tote up last year's costs and factor in inflation. For individual coverage, people change carriers so frequently that even if they develop a disease 15 years down the road, as a genetic test might predict, it will likely be on another insurer's dime. Although the warnings of bioethicists (including, Prof. Greely sheepishly admits, "an earlier version of myself") haven't come true, some now argue that we need federal legislation for symbolic reasons, to protect people from even the theoretical risk of genetic discrimination. This "what harm does it do?" argument is OK, says William Nowlan, chief medical officer of the National Life Insurance Co., Montpelier, Vt., who has written widely on

the myth of genetic discrimination. But then let's admit that the Senate bill addresses a problem that exists solely in the public's imagination. As far as I can tell, the bill's only real benefit would be to allay the fears of people who reject genetic tests in the belief that a positive result could make them uninsurable and unemployable. That's a worthwhile goal. But it comes at a cost. **By enshrining genetic status in federal law, we reinforce the widespread and pernicious belief that DNA is destiny.** It isn't. Risk genes for common diseases aren't like those for the exceedingly rare Huntington's or Tay-Sachs, where carrying the gene means you definitely will get the disease. Instead, risk genes are low in what biologists call "penetrance:" They increase your chance of developing the disease, but to nothing like 100%. In one fascinating 2000 study, Swedish scientists calculated that genes account for less than half of the risk of developing 11 common cancers. The cancers with the highest genetic component, the study found, are prostate (42%) and colorectal (35%). A woman's risk of getting breast cancer if her identical twin does is only 13%. Supporters of the genetic discrimination bill should make clear that what they want to guard against is no more than a theoretical risk. They should make equally clear that the risk genes they're so worried about are not all they're cracked up to be.

Even if genetic surveillance contains invasive information, it doesn't require much protection- few people are qualified to read DNA

Lauss et al 13 (Georg Lauss, Arndt Bialobrzski, Matthias Korkhaus, Karoliina Snell, Johannes Starkbaum, Andréa E. Vermeer, Jukka Weigel, Herbert Gottweis, Ilpo Helén, Jochen Taupitz, Peter Dabrock. "BEYOND GENETIC PRIVACY PAST, PRESENT AND FUTURE OF BIOINFORMATION CONTROL REGIMES." 2013. http://private-gen.eu/uploads/media/PRIVATE_Gen_FINAL-REPORT_2013_01.pdf//EMerz

Ultimately, some genetic information might merit special treatment because it has a number of characteristics which, although they may be individually present in respect of other forms of information, are present to a high degree in the case of genetic information and combine to give it a special status in some contexts. [p.31] The report emphasizes the importance of context. Genetic information might not always be sensitive in itself. What makes genetic information – and arguably information in general – sensitive is its context and the way a piece of information is combined with other information. Since information about a person or a state of affairs takes on meaning only if it is put into a social context and if it is combined with other information, it was even be argued that genetic information is even better protected from widespread third-party misuse than other types of (medical) information because it requires a high level of expert knowledge and expert resources to “read” it and interpret it in meaningful ways. In a certain sense, it has a comparably high legibility threshold [24]. Moreover, empirical research has shown the likelihood that genetic information and its related research may be seen as problematic, but it appears that people perceive other types of information as being sensitive, as well, and that their concerns revolve around the concrete context in which data and materials are used and the intention behind a particular inquiry

Privacy-based critiques fail and undermine research

Hansson et al 12 (Mats, Centre for Research Ethics & Bioethics at Uppsala University; Bengt Simonsson, Department of Medical Sciences at Uppsala University; Nils Feltelius, The Swedish

Medical Products Agency; Joanna Forsberg, Centre for Research Ethics & Bioethics at Uppsala University; Joerg Hasford, Institut für med Informationsverarbeitung, "Medical registries represent vital patient interests and should not be dismantled by stricter regulation," July 2012, The International Journal of Cancer Epidemiology, Detection, and Prevention, p. 3-4)/JL

3. Registries criticized for threatening privacy Accordingly, vital patient interests are in the balance in association with the EUTOS for CML and other similar registrations and data-sharing efforts. However, within the ethics and legal literature collaborations between medical registries of this kind are seen as controversial because they pose a potential threat to the individual privacy of the patients. Mark Rothstein has recently argued that collection and use of large quantities of health information create a substantial challenge for protecting the privacy of patients and research subjects that is accentuated when biological samples are involved [8]. De-identification, he suggests, does not solve the problem since the process of removing identifiers implies that someone will actually have to do it thus representing an intrusion in private matters. It has also been claimed that re-identification may be possible by using publicly available databases, provided that one have access to reference samples [9]. Rothstein suggests that rules about de-identification are insufficient for privacy protection and need to be complemented with rules about notice provisions to patients, such as informed consent, strategies for opt-out, and giving individual patients a degree of control over the use of data and, where relevant, biological samples. 4. **The critique fails for four reasons** In light of the experience with the EUTOS for CML registry we believe that Rothstein's argument fails for four reasons. 1. Rothstein foresees criticism of his proposal for leading to selection bias in research, delaying the introduction of new treatment and safety procedures in medicine, but he claims that at present there is an "insufficient empirical basis to assert that adding some level of privacy and autonomy protection to deidentified health information and biological samples will invariably and unreasonably disrupt biomedical research" (p. 8). However, as has been argued by several, inclusivity and universality are the keys to successful registry research [10,11]. There is a price to be paid since all requirements for informed consent, opt-out, re-consent, etc. imply that the registry will be affected both by those included and those not included. The likely result is incomplete information and data bank bias that will prevent researchers from tracking success and failure of treatment and drug efficacy and safety. The immediate victims of this will be the patients, with those suffering from rare diseases like CML paying the highest price. There are several examples of bureaucratic ethical review procedures and requests for consent that seriously jeopardized the possibility of doing biomedical research, at the end exposing patients to increased risks [12,13]. There are recent assessments available of the cost in lives caused by hurdles related to information and consent procedures [14]. 2. Rothstein acknowledges that research concerns should not be dismissed lightly, but, he continues: "On the other hand, the interests of patients and the public also deserve respect and consideration" (p. 8). His argument for privacy relies, as stated, on a perceived dichotomy between the clinical researcher on the one side with the patient and the public at the opposite side, a normative description of the relationship that is questionable. This dichotomization seems to be a rather common phenomenon [15]. As Dixon-Woods et al. have recently argued, the ethical, legal and sociological accounts of medical research that influence the policy debates describe research as operating in opposition to the norms and interests of the general public and of the patient [16]. Based on empirical studies in a pediatric oncology research context they were, in contrast to this alleged dichotomy, able to show how sentiments of coalition and partnership characterized the relationships between the patient families, their doctors and the researchers. 3. Rothstein argues for the need of increased protection of privacy and autonomy based on these interests as fundamentally protected by constitutional law. Wendy Mariner argues in a similar vein for the need of limiting intrusion into medical privacy and has suggested that a constitutional challenge could dismantle cancer registration [17]. Health is regarded as an important concern but must sometimes give way to inherent principles of law, e.g. protection of privacy [18]. That privacy is a vital interest of citizens and democratic societies is not controversial. However, the values that are associated with a secluded life are all kinds of social value [19]. They presuppose and acquire their meaning only in a context where various kinds of social relationships with other individuals are involved. To be banished to seclusion on a desert island, certainly implies that one will be left in peace, but it is not the kind of situation which people wishing to protect their private life, strive for. Individuals, as far as their own personal matters are concerned, have an interest in being left in peace but they also wish to participate in the possibilities that are available to citizens in a society. This includes having access to new medical knowledge attainable only when personal medical data is recorded and shared within the format of large well-managed registries. In order to further strengthen his argument Rothstein suggests that autonomy is only one aspect of the broader concept of "respect for persons" (p. 8) and that this should imply closer regulation of registry research. However, patients have interests also at the

end of the research line, e.g. in new possibilities to follow up the effects of medical drugs with regard to treatment response and adverse reactions, and if they became aware of the costs of stricter regulation undermining the possibilities of participating in the development of scientific knowledge they may be more likely to feel disrespected. 4. Rothstein is critical of partnership with commercial interests in association with biomedical research, something not uncommonly questioned by ethicists and lawyers [20]. However, we suggest that partnership between academic and commercial partners is essential for making progress in medical research and is intrinsic to concerns about assessment of drug efficacy, safety and effectiveness. This claim does not imply that one should be naïve. For the benefit of patients sharing of data should go in both directions, also when a pharmaceutical company enjoys a monopoly. Potential conflicts of interest may arise and should not be taken lightly. The increasing collaboration between industry and patients' organizations should be considered. However ELN provides an interesting example of how doctors and researchers may be able to collaborate with the pharmaceutical industry while preserving their own integrity. A working party has just started a controlled trial in order to find out when treatment of CML patients with TKI should be stopped because the patient will not benefit from prolonged treatment with the drug. Such a study may, arguably, not be in the best (economic) interest of the drug companies.

At least 10,000 people are wrongfully convicted annually for crimes they didn't commit – the plan stop the exoneration process and is a helping hand in human rights abuse

King 2015 [Shaun “An exoneration happens every three days in America. What this really says about our justice system” March 24th 2015]

According to the National Registry of Exonerations at the University of Michigan, 1,569 men and women in the United States, most of them African American, have been completely exonerated after being wrongfully convicted and sent to prison. The number of people exonerated for wrongful convictions actually broke a record high in 2014 with 125 exonerations, including six people who were actually on death row awaiting execution. Less than every three days in our country, some man or woman is released back into society after spending a tragic portion of their life behind bars for a crime they never committed. Few injustices can compare to the horror of spending one hour in prison for something you didn't do. Ricky Jackson of Ohio spent 341,640 hours, or 39 years, behind bars before he was exonerated. Just a teenager when he was convicted, he was nearly a senior citizen when he was released. Jonathan Fleming was serving the 25th year of a 25-year sentence when he was finally exonerated after a wrongful conviction. Glenn Ford, on death row for 30 years in Louisiana, was 64 years old when he was released and was exonerated. Stricken with lung cancer, he was only expected to live a few more months. One study determined that nearly 10,000 people are likely to be wrongfully convicted for serious crimes annually. Another study estimates that as many as 340 people are likely to have been executed in the United States before they were properly exonerated. **This is a travesty**. Anyone who says otherwise is sick. Jump below the fold for more. But the conversation should not end at our conclusion that these wrongful convictions are a travesty. It appears, though, that an entire section of America refuses to believe that police or prosecutors can ever do any wrong at all. Except they do. Often. Detective Louis Scarcella of the NYPD is accused of framing suspects, forcing fake confessions, and using the same single eyewitness for multiple murders. Many men who were wrongfully convicted under his watch have recently been exonerated and 50 of his cases are under review. Chicago has now been called the "false confession capital" as more and more details are uncovered on how the city's police officers are torturing men and women to confess to

crimes they didn't commit. They were so good at it, in fact, that Detective Richard Zuley was brought from Chicago to Guantanamo Bay to directly oversee one of the most brutal torturing operation in modern history. The prosecutor of Glenn Ford, shipped off to death row at Angola State Prison in Louisiana in 1984, now openly admits that he was "sick ... arrogant, judgemental, narcissistic and very full of myself" when he sought the wrongful conviction of Ford, who spent 30 years of his life in one of the most brutal prisons in the world. Four police officers in Fort Lauderdale, Florida, were just caught sending texts to one another about "killing nigg*rs" and giving them the "early death penalty." This is not okay. It's wrong. Our justice system is altogether broken. This brokenness, though, must not be understood in some abstract way. It's broken because the people leading it are often sick, disturbed racists who care very little for those on the receiving end of their sickness. It's not good enough to simply give wrongfully convicted men an insufficient check and an apology. **We must repair the broken system so these instances go away for good.**

2NC – XT – Crime

Genetic surveillance stops crime

Lindley 11 (Brooke, reporter for CTV news Vancouver, "Could a new technique catch a serial rapist in B.C.?" <http://bc.ctvnews.ca/could-a-new-technique-catch-a-serial-rapist-in-b-c-1.597435> 1/18/11 JM)

A contentious DNA analysis that helped snag one of America's most notorious suspected murderers could be used in the hunt for a serial rapist in Vancouver, according to a lawyer who pushed to have it approved south of the border. DNA evidence has linked a single unknown man to three sex assaults in Vancouver, and police say he could be responsible for five more unsolved cases. But the genetic evidence taken at the scene of the assaults doesn't match anyone in the national DNA databank, and police have been left to plead with the public for tips. Vancouver police made a public appeal for help on Thursday, but five days later, there are no new **leads. In the U.K. and some parts of the U.S., police would have had one more option before hitting a dead end.** That's because laws in those places allow investigators to search for partial matches in the offender DNA databank and identify possible family members of unknown criminals. "Using familial DNA searching, you can continue to try and solve a case when those other steps have failed," said Rockne Harmon, a retired California deputy district attorney and one of the technique's biggest proponents. "We do know that crime seems to run in families for complicated reasons." Privacy advocates have lobbied against allowing the new technique in Canada, arguing that it submits relatives of convicted offenders to unfair genetic surveillance. But thanks to familial DNA searching, Los Angeles police were able to identify Lonnie Franklin Jr. as a suspect in the brutal "Grim Sleeper" killings -- the murders of at least 10 people over 25 years. When investigators compared genetic samples taken from the scenes of the Grim Sleeper murders with California's offender DNA database, there were no exact hits, but investigators were able to create a list of about 150 close matches -- potential family members of the vicious murderer. Analysts then compared the Y sex chromosomes from those 150 people with the Grim Sleeper's, and found a match so close, the offender had to be either the father or the son of the serial killer. As it turns out, Franklin's son had recently been arrested, and swabbed for DNA. When police followed the elder Franklin to a restaurant, they were able to take a sample from his cup, and found a perfect match for the Grim Sleeper's DNA. Familial DNA searching is currently not

permitted in Canada, and in the U.S., only California and Colorado allow it, although Virginia appears to be on the brink of approval. Harmon was the driving force behind California's decision to allow the unique searching technique, and he says that Canada should consider it, too. **"Why would you have a law that would keep you from something that can solve crimes?" he told ctvbc.ca. "It'll help make the world a safer place."**

Genetic research base is key to solving violent crimes and exonerating criminals

[David H. **Kaye**, Penn State Law "Trawling DNA Databases for Partial Matches: What is the FBI Afraid of?" 2009]

Across the globe, many countries have established DNA databases-collections of computer-searchable records of the DNA profiles of suspected or convicted offenders.¹ England started the first national criminal DNA database in 1995.² In the United States, the state and federal databases as combined in the National DNA Index System (NDIS) hold over seven million short tandem repeat (STR) profiles from convicted offenders as well as a growing number of people who were merely arrested or detained. ³ When investigators recover a DNA sample from the scene of a crime, they can search these databases to discover if any of the recorded profiles match. Such **"cold hits" from these database trawls have led police to serial rapists and murderers who have long eluded detection.** ⁴ Indeed, even dead men have been "accused" through this technology. ⁵ In addition, database trawls have considerable potential to solve common property crimes.⁶ In one case, an observant police inspector in Finland noticed a dead mosquito in a stolen vehicle. ⁷ The mosquito's body contained human blood from its last meal. Testing the blood against Finland's database yielded a DNA profile match, giving the police a likely suspect.⁸

Despite privacy concerns - substantial numbers of patients are still engaging the medical system now

Erin **McCann** (Managing Editor of Healthcare IT News) November **2014** "Trust issues over health privacy persist" <http://www.healthcareitnews.com/news/trust-issues-over-health-privacy-persist>

Healthcare industry, listen up: You've got a consumer distrust issue on your hands. The majority of American consumers continue to have serious doubts over the privacy and security of their medical records – so much so that a sizable number of them actually withheld information from care providers over those concerns. This according to a new Office of the National Coordinator for Health IT survey, which took a pulse of consumer perceptions toward healthcare privacy and security. The numbers are telling. After surveying more than 2,000 consumers, ONC officials found that about three-quarters of them were either very or somewhat concerned over the privacy and security of their medical records. What's more, 10 percent of respondents withheld information from their healthcare provider who used an electronic health record. (This compared to the 6 percent who withheld data from providers who used paper medical records.) The differences between the two were not statistically different, ONC pointed out. The lion's share of Americans are also not keen on their medical records being sent electronically or through fax, with about 60 percent of consumers indicating concern over unauthorized access of their medical records when they're sent in these two forms. These numbers appear to align with a similar study conducted by Harvard researchers just last year. The study, which assessed the privacy perceptions of U.S. adults, found similarly that more than 12 percent of the 1,500 respondents withheld information from care providers over medical security concerns. Findings supported "the need for enhanced and sustained measures to ensure the confidentiality, integrity and availability of PHI," Harvard School of Public Health researchers wrote in the study. Despite all these concerns, as ONC officials highlighted in Tuesday's HIT Policy Committee meeting, most respondents still "wanted healthcare providers to use an EHR despite any potential privacy and security concerns," with some 76 percent indicating this. "In spite of the fact that a majority of Americans expressed concerns regarding the privacy and security of both their medical records and with sharing of their medical records, support for EHRs and electronic health information exchange remained consistently strong," said Vaishali Patel, senior advisor at the Office of the National Coordinator for Health IT.

Restrictions on health surveillance destroys medical research and disease prevention – anonymization and consent are too burdensome – turns the entire aff

Chris **Verity et al.** (Child Development Centre, Addenbrooke's Hospital, past chairman, British Paediatric Surveillance Unit Executive Committee, Agnus Nicoll, PHLS Communicable Disease

Surveillance Centre, and Donal Manning, Child Development Centre, Addenbrooke's Hospital)
2002 "Consent, confidentiality, and the threat to public health surveillance / Commentary"
British Medical Journal, International edition 324.7347 (May 18, 2002): 1210-3

Why is surveillance important? Since the 1980s the public has become increasingly concerned about health protection against real and perceived hazards, including HIV, bovine spongiform encephalopathy/variant Creutzfeldt-Jakob disease, food poisoning, possible adverse effects of medicines and vaccines, etc.¹⁶ People expect that health surveillance will be undertaken efficiently and effectively. When outbreaks of infectious disease occur, local public health doctors, regional epidemiologists, or, centrally, the Communicable Disease Surveillance Centre, mount rapid investigations to enable them to provide protective measures, identify hazards, and reduce the risk of further infections and disease. Is surveillance acceptable? When the rationale for surveillance is explained to colleagues in primary care and in hospitals, they are almost always cooperative, as are affected patients and healthy "controls," sometimes providing personal information over the phone. Similarly, feedback from parents of children with rare but important disorders indicates that they support surveillance and would not welcome changes that threaten its completeness or accuracy. No major effort, however, has been made to explain surveillance mechanisms or their importance to the public. Threats to health surveillance The present arrangements for health surveillance are threatened by the proposal that either explicit consent should be sought from patients for use of their personal data, or data must be completely anonymised. Obtaining explicit consent before sharing identifiable patient data Simple but unrealistic suggestions have been made to solve the complex problems surrounding surveillance, consent, and confidentiality One is that consent for reporting can readily be obtained from patients or parents. Almost all reporting and referral of clinical specimens relies on the cooperation of busy people such as clinicians and microbiologists who are providing patient care with growing workloads in an increasingly bureaucratic environment For example, over 90% of paediatricians return the British Paediatric Surveillance Unit's monthly surveillance card, but the data the card requests are purposely kept to a minimum in order to sustain good response rates.¹⁷ It is our considered opinion, and that of our colleagues, that if explicit consent for sharing data had to be obtained the completeness and timeliness of reporting would be dangerously disrupted. Obtaining explicit consent would be most difficult for single consultations—for example for an acute infection when the need for a report is often only appreciated some time after collection of the specimen or after initial diagnosis. It is usually impossible to determine at the time of a consultation which specimen will reveal a significant pathogen. For laboratory reporting, clinicians would have to ask for consent for sharing of data or specimens for every proposed investigation, or else pathologists would later be ringing up clinicians to ask them to trace and contact patients for consent. Neither system could be expected to work well. When approached, families almost always wish to cooperate,⁴ but reporting doctors do not readily want to add the task of obtaining consent to their other work commitments,^{4 18} as a sequential surveillance and research investigation undertaken by the Royal Colleges of Ophthalmologists and Paediatrics and Child Health on retinopathy of prematurity illustrates. In this study, 235 cases were initially reported through conventional surveillance (without seeking explicit consent from parents). Later, reporting doctors were asked to obtain consent because an additional research study involved seeking parental views. In some cases repeated reminders to clinicians were needed although there were only three parental refusals. Eventually consent was obtained for 188 of 221 eligible cases (85%), and each consent took on average 3 months to obtain (L Haines, personal communication, 2001). The percentage would have been far lower had not the investigators been

able, from prior knowledge of existing cases, to remind clinicians that consent was outstanding. Other specialties have had similar experiences. Introduction of the requirement for consent for cancer registration resulted in a 70% drop in notifications to the long established Hamburg cancer register, destroying its comparative value-it is no longer referred to in European publications (M Parkin, International Agency for Research on Cancer, personal communication, 2001). An American study on consent found that the requirement for consent led to selective exclusion of some patients and hence introduced bias.¹⁹ In the United Kingdom, a belief that patient consent was needed before inclusion in a general practitioner diabetes register contributed to ascertainment of only 60% of eligible diabetic patients,²⁰ mainly because some doctors never got round to obtaining consent (S Burnett, UCL London, personal communication, 1999). A disturbing recent development is that, notwithstanding official reassurances 9 10 12 some NHS trusts have instructed doctors not to transfer data about patients unless they do have consent, and this has inhibited some doctors who were keen to contribute to, for example, cancer registries. This has already impaired the work of the cancer registries, and the reporting of infectious diseases might be similarly affected. Anonymising data before transfer It has been suggested that removal of the identifiers from patient data will obviate the need for consent, but in a number of health surveillance studies the identifiers are essential links to other sources of health information about individuals that provide validation and eliminate duplication (table). An alternative suggestion is to use NHS numbers instead of such identifiers as names and dates of birth, but at present NHS numbers are rarely included in routine data sets, so this solution would also interfere with surveillance. Conclusions Health surveillance is essential to protect public health, and existing surveillance mechanisms work reasonably well. Surveillance could be seriously threatened if it was thought that there was an over-riding need to maintain patient confidentiality or always to have to seek explicit consent to sharing of data. We are very concerned that restrictive interpretations of some of the recent guidance on patient consent would so damage surveillance mechanisms that they would cease to protect the health of the public, thus resulting in preventable ill health and deaths.

Systemic data collection over a wide range of health issues is inevitable and required for a wide range of issues --- the plans reversal is bad --- it's a linear case turn

Gostin, an internationally recognized scholar in law and public health, professor of Law at Georgetown University; Professor of Public Health at the Johns Hopkins University; and the Director of the Center for Law & the Public's Health at Johns Hopkins and Georgetown Universities, 2001 – (Lawrence, “Health Information: Reconciling Personal Privacy with the Public Good of Human Health”, published in Healthcare Analysis vol 9,

A health care system supported by data on almost any relevant subject, accessible to a diverse and significant number of users, is an integral part of the vision for the health care system. Plans for the systematic collection, storage, use, and dissemination of a huge volume of uniform data sets in electronic form are already under way and have an **aura of inevitability**. This new health information infrastructure is the subject of reports published by the Congressional Office of Technology Assessment (Congressional Office of Technology Assessment, 1993, 1988, 1986), the General Accounting Office (Information Management and Technology Division, General Accounting Office, 1993a, 1993b, 1991), the National Academy of Sciences (Donaldson and

Lohr, 1994), the Department of Health and Human Services (Task Force on Privacy, U.S. Dep't of Health and Human Servs., 1993; Task Force on the Privacy of Private Sector Health Records, U.S. Dep't of Health and Human Servs., 1995), the Physician Payment Review Commission (Physician Payment Review Comm'n, Annual Report to Congress, 1994, 1993, 1992) 322 and the Centers for Disease Control and Prevention.¹ The U.S. Department of Health and Human Services issued final regulations on health information privacy in 2001 (Gostin, 2001). Contrary to the assertions of some privacy advocates, **powerful reasons exist for the broad collection and use of health data.** High quality data are needed to help consumers make informed choices among health plans and providers, to provide more effective clinical care, to assess the quality and cost effectiveness of health services, to monitor fraud and abuse, to track and evaluate access to health services and patterns of morbidity and mortality among under served populations, and to research the determinants, prevention, and treatment of disease.

2NC – XT – Solves the Aff

More surveillance is key to solve the aff impacts

White House 12 (The White House, from the President of the United States Barak Obama, “NATIONAL STRATEGY FOR BIOSURVEILLANCE”

https://www.whitehouse.gov/sites/default/files/National_Strategy_for_Biosurveillance_July_2012.pdf July 31 2012 JM)

A well-integrated, national biosurveillance enterprise is a national security imperative. Our ability to detect quickly and characterize a potential incident of national significance that affects human, animal, or plant health is of paramount importance. Rapid detection and enhanced situational awareness are critical to saving lives and improving incident outcomes, whether the result of a bioterror attack or other weapons of mass destruction (WMD) threat, an emerging infectious disease, pandemic, environmental disaster, or a food-borne illness. Beyond our need to protect domestic interests, and because health threats transcend national borders, the United States also plays a vital role within an international network of biosurveillance centers across the globe. For years, there have been dedicated efforts to promote and strengthen biosurveillance capabilities. There exists a strong foundation of capacity arrayed in a tiered architecture of Federal, State, local, tribal, territorial, and private capabilities. We can strengthen the approach with focused attention on a few core functions and an increased integration of effort across the Nation. In these fiscally challenging times, we seek to leverage distributed capabilities and to add value to independent, individual efforts to protect the health and safety of the Nation through an effective national biosurveillance enterprise. A key to improving all-hazards incident management is to focus efforts on collecting, analyzing, and disseminating information to facilitate timely decisionmaking, whether a health incident is a naturally occurring phenomenon, accidental, or deliberate in nature. From the individual, to primary care providers, to hospital practitioners, to state and local health officers, to Federal entities responsible for health emergency response, to the President of the United States, there exists an imperative to identify incidents early and to make decisions swiftly to save lives, even amidst great uncertainty. The goal is to achieve a well-integrated national biosurveillance enterprise that saves lives by providing essential information for better decisionmaking at all levels. Our Strategy is to integrate and enhance national biosurveillance efforts to answer specific key questions that guide decisionmaking in times of crisis: enable more rapid detection and foster improved situational awareness by further extending a dynamic, distributed national network of expertise and capabilities; and put into practice new thinking to facilitate decisionmaking processes in conditions of significant ambiguity. This **enhanced national biosurveillance capability will be applied broadly to identify and understand potential human, animal, or plant health impacts resulting from chemical, biological, radiological, and nuclear (CBRN) and environmental incidents,** as well as influenza and other public health trends, all of which may also be leveraged in the service of global health efforts. We must be resolved to strengthen life-saving biosurveillance capabilities within our existing resources. We can do this by leveraging more effectively our existing national network of expertise and capabilities, and through targeted enhancements that provide benefits across the enterprise. There are no higher priorities than the health, well being, and security of the American people.

Rigid health privacy protections collapses public health – expansive surveillance key

Amy **Fairchild** (associate professor in the Department of Sociomedical Sciences and assistant director for scholarly and academic affairs at the Center for the History and Ethics of Public Health at the Joseph L. Mailman School of Public Health, Columbia University in New York City) Ronald **Bayer** (professor of public health and codirector of the Center for the History and Ethics of Public Health at the Joseph L. Mailman School of Public Health, Columbia University in New York City) and James **Colgrove** (assistant professor in the Department of Sociomedical Sciences at the Joseph L. Mailman School of Public Health, Columbia University in New York City) December **2007** “Privacy and Public Health Surveillance: The Enduring Tension” <http://journalofethics.ama-assn.org/2007/12/mhst1-0712.html>

The discovery that cases of paralytic polio in 1955 were caused by a single manufacturer of Salk vaccine, the linkage of toxic shock syndrome to tampons in 1979, the identification of the sentinel cases of AIDS on the East and West coasts in the early 1980s, the recognition of West Nile, SARS, and avian flu at the turn of the twenty-first century—were all the result of surveillance systems, through which alert and troubled physicians could communicate with public health officials, thus enabling emerging patterns to be identified. In each instance, such vigilance made it possible to initiate measures that could limit the human toll. Surveillance serves as the eyes of public health. Name-based reporting of cases has provided the foundation for planning, intervention, and prevention and has been critical for epidemiological research into patterns of morbidity and mortality for a wide variety of diseases and conditions. Registries have been essential for tracking individuals and their conditions over time. Surveillance has also served to trigger the imposition of public health control measures, such as contact tracing, mandatory treatment, and quarantine. The threat of such intervention and long-term monitoring has provoked alarm and rendered surveillance suspect for those concerned about the unwarranted exercise of state authority in the name of public health. Thus the history of surveillance has been bounded by a promise and a specter. Over the course of the 20th century, public health officials reiterated the importance of surveillance, arguing that without the name and location of diseased individuals they worked "in the darkness of ignorance" and might "as well hunt birds by shooting into every green bush" [1]. It was the prospect of what surveillance might offer that raised hopes—for the delivery of services, for lifesaving knowledge, and for protection of individuals and communities. Hermann Biggs, a titanic figure in the history of public health, who was perhaps the most important late 19th- and early 20th-century architect and philosopher of U.S. public health surveillance, made it clear that names of the diseased were never collected "in order to keep clerks or adding machines busy" [2]. Toward the end of the 20th century, Surgeon General David Satcher would state the value of surveillance as plainly as had Biggs: "In public health, we can't do anything without surveillance. that's where public health begins" [3]. When surveillance opened the doors to vital services and knowledge, its subjects could well become among its most ardent advocates, thus underscoring a politics that goes beyond the politics of privacy. In the late 19th and early 20th centuries, as public health was extending the ambit of surveillance, the medical community reacted with hostility, particularly when it came to tuberculosis surveillance and seemingly threatened to intrude on the sanctity of the clinical relationship, over which the physician was guardian. Medical Record editor George Shrady thus complained of TB surveillance, The compulsory step taken is a mistaken, untimely, irrational, and unwise one....

The real obnoxiousness of this amendment to the sanitary code is its offensively dictatorial and defiantly compulsory character. It places the Board [of Health] in the rather equivocal position of dictating to the profession and of creating a suspicion of an extra bid for public applause [4]. "Already," he continued, "the profession as a whole has watched with jealous eye the encroachments of the Board upon many of the previously well-recognized privileges of the medical attendant" [4]. Over time, disease reporting was extended to chronic, noncontagious conditions such as cancer, birth defects, and occupational illnesses. Not only physicians but laboratories were often required to report cases to local health authorities. The surveillance of chronic diseases, of course, differs because these conditions do not represent a direct threat to the health of others. And, indeed, when state and local health departments first began tracking conditions like congenital malformations and cancers in the first half of the 20th century, these initiatives typically served epidemiological or research purposes only. These reporting efforts, critically, also became linked to the assessment and improvement of clinical care. Tumor registries, for example, emphasized patient care improvement since the 1950s and, currently, data from the National Cancer Institute's SEER program (Surveillance, Epidemiology, and End Results Program) are routinely used for quality improvement initiatives. It was not until the AIDS epidemic that activists challenged the long-standing tradition of name-based reporting. Even so, as AIDS has become a more treatable disease, resistance to reporting has all but vanished. In the 1990s, the promulgation of national standards to safeguard the privacy of medical records, as dictated by HIPAA (the Health Insurance Portability and Accountability Act), provoked intense public debate. But there was virtually no opposition to carving out an exception in the guidelines for the reporting of diseases to public health agencies. While there was initial uncertainty among physicians and researchers about whether hospitals could continue to provide cancer data to state registries, the Department of Health and Human Services made clear that HIPAA did not serve as an obstacle to reporting. In the early 20th century it was physicians who spearheaded opposition to surveillance; since the 1970s, patients have often been at the forefront of challenges to reporting diseases. Parents of children with disabilities, for example, successfully changed the terms of birth defects surveillance in Minnesota, requiring the state to allow unwilling parents to opt out of reporting. Patient advocates within the American Diabetes Association forced New York City health officials to place limits on an initiative to track cases of diabetes. But just as often, patients with serious illnesses have pushed for better tracking of their conditions. Breast cancer survivors have emerged as the most ardent defenders of universal name-based cancer reporting, recognizing how important surveillance and the research it makes possible is to their own well-being. Similarly, communities concerned about "cancer clusters" and environmental threats have demanded access to the data that only cancer registries can accumulate. Patients expect their privacy to be protected, of course, but also maintain that a rigid commitment to privacy could hobble the usefulness of registries. In these instances, public health officials, committed to the paramount importance of surveillance, have been extremely wary about disclosing any data that could potentially compromise individual privacy.

Surveillance of the health system key to stop a public outbreak

Khaled El **Emam** (founder and CEO of Privacy Analytics Inc, senior scientist at the Children's Hospital of Eastern Ontario (CHEO) Research Institute and Director of the multi-disciplinary Electronic Health Information Laboratory (EHIL) team) **2014** "Public Health Surveillance and

Privacy in the Age of Ebola” <https://privacyassociation.org/news/a/public-health-surveillance-and-privacy-in-the-age-of-ebola/>

Being able to introduce anonymization methods into practice to ensure data custodians are willing to share data for public health purposes is important in the age of such epidemics as Ebola. The efficiency with which we track and investigate outbreaks is directly related to the spread of the disease. There is an urgency to get access to data. And it is not always health data that is important. Ongoing public health surveillance systems would allow rapid detection of and reaction to outbreaks. But this can only happen if privacy concerns that currently act as a barrier are addressed. Privacy does not have to be an obstacle, but it is an issue that needs to be dealt with upfront when these surveillance systems are put into place. We cannot take for granted that data custodians are willing to share their data, even when there is an outbreak, as we saw during H1N1.

Registries don't hurt privacy and are key to solve diseases – empirics prove

Hansson et al 12 (Mats, Centre for Research Ethics & Bioethics at Uppsala University; Bengt Simonsson, Department of Medical Sciences at Uppsala University; Nils Feltelius, The Swedish Medical Products Agency; Joanna Forsberg, Centre for Research Ethics & Bioethics at Uppsala University; Joerg Hasford, Institut für med Informationsverarbeitung, “Medical registries represent vital patient interests and should not be dismantled by stricter regulation,” July 2012, The International Journal of Cancer Epidemiology, Detection, and Prevention, p. 3-4)//JL

The EUTOS for CML Registry **clearly illustrates the benefits of aggregated, long-term clinical data** for the assessment of drug effectiveness, in particular for orphan diseases but the same logic applies to all diseases, i.e. the more standardized, relevant and validated data available in quality registries, the better. Although values such as autonomy and privacy are important and should be safeguarded, it must be kept in mind that these registries exist for the good of patients and therefore it seems inconsistent and even unethical to hinder their optimal utilization. Transparency and safeguarding personal integrity are necessary to preserve trust; but rules and legislations to protect integrity should not prevent the development of registries and performance of clinical trials in both national and transnational collaborations. That would be detrimental to vital patient interest of reaping the benefits of collaborating with others.

2NC – XT – Research

Patients health will be worse off if there are more barriers to DNA research

Steinberg and Rubin 9 (Mindy Steinberg and Elaine Rubin. Steinberg is a program associate at the Association for Academic Health Centers. Rubin is the vice president for policy and program at AAHC. “The HIPAA Privacy Rule: Lacks Patient Benefit, Impedes Research

Growth.” 2009. P. 3.

http://www.aahcdc.org/Portals/0/pdf/AAHC_HIPAA_Privacy_Rule_Impedes_Research_Growth.pdf////EMerz

The problems with the HIPAA Privacy Rule are extensive and are likely to be even broader than the survey suggests. Furthermore, there is no clear evidence that the Rule is achieving its intended purpose in the research arena. Given the longstanding history of the Common Rule in research, it would be most expedient and effective to exempt research from the HIPAA Privacy Rule and to defer to the Common Rule. The Common Rule — an essential safeguard that has worked successfully — has been responsible for ensuring the protection of research participants’ safety and privacy for more than 30 years. The negative impact of the HIPAA Privacy Rule on research ultimately translates into negative consequences for patients, with more terminally ill patients missing out on the opportunity to participate in clinical trials that have the potential to save their lives. To remedy this threat to research and the American people, revision of the HIPAA Privacy Rule is imperative. The AAHC recommends that research be exempt from the HIPAA Privacy Rule and that it be solely governed by the Common Rule. Furthermore, the AAHC recommends a revision of the Common Rule to incorporate more explicit standards for the privacy of health information and to augment the protections of the Common Rule to accommodate new technologies and guard against new threats to patient safety and privacy

The aff disrupts biomedical research – kills solvency

Hansson et al 12 (Mats, Centre for Research Ethics & Bioethics at Uppsala University; Bengt Simonsson, Department of Medical Sciences at Uppsala University; Nils Feltelius, The Swedish Medical Products Agency; Joanna Forsberg, Centre for Research Ethics & Bioethics at Uppsala University; Joerg Hasford, Institut für med Informationsverarbeitung, “Medical registries represent vital patient interests and should not be dismantled by stricter regulation,” July 2012, The International Journal of Cancer Epidemiology, Detection, and Prevention, p. 3-4)//JL

Rothstein foresees criticism of his proposal for leading to selection bias in research, delaying the introduction of new treatment and safety procedures in medicine, but he claims that at present there is an “insufficient empirical basis to assert that adding some level of privacy and autonomy protection to deidentified health information and biological samples will invariably and unreasonably disrupt biomedical research” (p. 8). However, as has been argued by several, inclusivity and universality are the keys to successful registry research [10,11]. There is a price to be paid since all requirements for informed consent, opt-out, re-consent, etc. imply that the registry will be affected both by those included and those not included. The likely result is incomplete information and data bank bias that will prevent researchers from tracking success and failure of treatment and drug efficacy and safety. The immediate victims of this will be the patients, with those suffering from rare diseases like CML paying the highest price. There are several examples of bureaucratic ethical review procedures and requests for consent that seriously jeopardized the possibility of doing biomedical research, at the end exposing patients to increased risks [12,13]. There are recent assessments available of the cost in lives caused by hurdles related to information and consent procedures [14].

Privacy legislation destroys scientists' motivation to conduct research- it's too expensive with protections in place

Steinberg and Rubin 9 (Mindy Steinberg and Elaine Rubin. Steinberg is a program associate at the Association for Academic Health Centers. Rubin is the vice president for policy and program at AAHC. "The HIPAA Privacy Rule: Lacks Patient Benefit, Impedes Research Growth." 2009. P. 3.

http://www.aahcdc.org/Portals/0/pdf/AAHC_HIPAA_Privacy_Rule_Impedes_Research_Growth.pdf///EMerz

In short, the majority of survey respondents believe the HIPAA Privacy Rule had a significant negative impact on the scope, pace, and costs of research. The greatest concern was expressed about the negative impact on the costs of research. Respondents also indicated they were aware of **research studies that were stopped or never pursued because of Privacy Rule** related problems. The negative perceptions of research leaders are especially significant. The HIPAA Privacy Rule imposes another limitation on America's ability to fulfill the promises of new science. **A lack of interest in scientific careers, and decreased federal funding of research when coupled with the HIPAA Privacy Rule, create a burdened and troubled environment for the future.**⁸

HIPAA's protections of individual health records have prevented vital research

Pritts 13 (Joy L. Pritt. "The Importance and Value of Protecting the Privacy of Health Information: The Roles of the HIPAA Privacy Rule and the Common Rule in Health Research." 2013. P. 1-2

<http://iom.nationalacademies.org/~media/Files/Activity%20Files/Research/HIPAAandResearch/PrittsPrivacyFinalDraftweb.ashx>///EMerz

The privacy of personal information, and of health information in particular, continues to be a vexing issue in the United States. As more and more health information is computerized, individuals express concern about their privacy and that they are losing control over their personal health information. To help allay public concerns, federal rules governing the use and disclosure of health information were promulgated under the Health Insurance Portability and Accountability Act (known as the HIPAA Privacy Rule). While the HIPAA Privacy Rule does not directly regulate researchers, it does restrict the manner in which health care providers may use and disclose health information for health research. Health researchers have been critical of the HIPAA Privacy Rule since its inception, concerned that it would interfere with valuable research. Various research organizations and others have requested that the Rule be revised to lessen its effect on research. Most recently, an Institute of Medicine (IOM) committee was formed and charged with reviewing the impact of the Privacy Rule on health research. This paper was commissioned by that committee, the IOM Committee on Health Research and the Privacy of Health Information: The HIPAA Privacy Rule.

Mass health surveillance is good – its key to medical effectiveness and drug development

Freedland 14 (Jonathon Freedland is the Guardian's executive editor. He also writes for the NYT and New York Review of Books. He won the Orwell special prize for journalism and the columnist of the year in What the Papers Say. "We now trust no one with our data – not even our doctors" 1/31/14 <http://www.theguardian.com/commentisfree/2014/jan/31/nhs-medical-data-trust-doctors-edward-snowden>)/CW

If you thought someone snooping around your emails and listening to your phone calls was bad, imagine them looking at your medical records. The private realm may be ever-shrinking – in an age when we reveal so much of ourselves online and when we know the eavesdroppers of the NSA and GCHQ are never far away – but if there's one thing we'd want to keep behind high walls, it's surely the intimate histories of our mental and physical health.¶ So there can be little surprise that privacy campaigners are recoiling at the expansion of NHS England's data collection, which from this spring will take in information from the place where most people experience the NHS: their GP's surgery. Until now, the NHS in England kept the stats from hospital visits but not from those day-to-day encounters with your local doctor. As 26.5m leaflets pop through letterboxes, explaining the new "care.data" project, groups such as medConfidential.org are urging patients to opt out in the name of basic privacy. One survey found that up to 40% of GPs plan to keep their own personal records out of the scheme. My first, unreflective instinct would be to stay out too – and others will surely feel the same way. Indeed, the appeal of that stance says much about the times we live in, both online and in the physical world.¶ For one thing, less than a year after Edward Snowden's revelations of mass surveillance, the notion that our medical records will remain closely guarded, viewed only by those doctors and scientific researchers who need to see them, arouses instant scepticism. Sure, we think. They said the same about our emails. After Snowden, many will assume that if the authorities want to know whether we are HIV-positive or once suffered from depression, they'll be able to find out with just one click. As medConfidential's Phil Booth told the FT: "Everyone agrees medical research is a good thing but, after the NSA scandal, people are getting wise to the dangers of these massive data sets." [paywalled link]¶ It doesn't even have to be that sinister. It wasn't that long ago that government ministers were apologising from the floor of the House of Commons after Revenue & Customs mislaid two discs containing the names, dates of birth, national insurance numbers and, where relevant, bank details of 25 million people. What, one wonders now, is to stop the geniuses who brought us that disaster messing up again, except this time losing not our tax details but the stories of our lives and bodies?¶ Advertisement¶ Campaigners worry too about who might want to take a look at all that info. Won't the big drug companies be desperate to pore over that information, the better to profit from our frailties? And if private health and life insurance companies get access to that data, won't they start charging higher premiums if they know what once took us to see the doctor?¶ Given all those worries, you can see why some want to opt out. And yet that first, gut instinct might be wrong. It's not just that the vast bulk of the information will be rendered anonymous, with individuals blurred out in all but the most controlled circumstances, or that there are strict rules in place over access to this information. Nor even that there is an explicit declaration that this data will not be shared with insurance or marketing companies – so no prospect of a Strepsils ad popping up on your screen just after you've seen your GP over a sore throat.¶ Rather, it's the great gain that this information will provide. Small, clinical studies only tell you so much. Sometimes it's mass data you need. It was mass

information that disproved the link between MMR and autism, or that spotted the connection between Thalidomide and birth defects, or between smoking and cancer. Ethically you can't conduct trials on pregnant women or children, so you're reliant on knowing what's happening in the population. If you can know that swiftly and at scale, you can act faster and more effectively. As the leaflet popping through the door puts it: "Better information means better care."¶ The pragmatic truth is that this logic extends even to the private drug companies. Like it or not, it's through pharmaceutical companies that new medicines are developed: they're the ones who fund the trials, turning research into medication. As Nicola Perrin of the Wellcome Trust, which strongly backs care.data, put it to me: "If we want access to the best possible drugs, the drug companies need access to the best possible information."¶ There is a principle at stake here too. In a subtle piece for the Socialist Health Association, Prof Dave Byrne recalls the traditional method of teaching medical students, in which a senior doctor on a ward-round would urge them to look at and learn from real-life individuals and their treatment: care.data is just a hi-tech version of that process, says Byrne, gathering together doctors' experience of treating patients. Viewed this way, our individual experience of treatment – suitably anonymised – is not our private property, even if it should remain private. Those who treated us have the right to use that experience to benefit others, to help the collective good.¶ But anonymity is the key. None of these arguments in favour of care.data works unless we can be sure those rules on access hold firm and that the identity of individual patients remains concealed – and not easily hacked as some currently fear. And yet online anonymity remains vexed. All too often it seems we don't have it when we should, whether through data loss or NSA-style state intrusion. At the same time, we have too much anonymity when we shouldn't: witness the social media trolls and abusers, or phoney, astroturf campaigners, able to stay hidden when they would surely shrivel if exposed to the daylight and forced to reveal their true identities.¶ The larger obstacle confronting this new scheme goes beyond the virtual realm. It is a change that is infecting almost every aspect of our shared lives: loss of trust. So the government can issue guarantees of privacy protection and our first thought is of missing discs, GCHQ eavesdroppers or perhaps hacked phones. Too many institutions have been exposed as having betrayed their unspoken promises, whether it's MPs, the security services, the police, the banks or the BBC.¶ For many years the NHS stood alone, immune to this trend, doctors topping every index of trust. But thanks to Mid-Staffs and scandals like it, the NHS too has been found wanting. Which is why a good idea like a project to share our broad, unnamed data can face such resistance. We take nothing on trust these days – not even the word of a doctor.

Aggregated data is good – doesn't hurt privacy and allows for effective treatment

Hansson et al 12 (Mats, Centre for Research Ethics & Bioethics at Uppsala University; Bengt Simonsson, Department of Medical Sciences at Uppsala University; Nils Feltelius, The Swedish Medical Products Agency; Joanna Forsberg, Centre for Research Ethics & Bioethics at Uppsala University; Joerg Hasford, Institut für med Informationsverarbeitung, "Medical registries represent vital patient interests and should not be dismantled by stricter regulation," July 2012, The International Journal of Cancer Epidemiology, Detection, and Prevention, p. 3-4)//JL

Development of medical registries with sharing of data is intrinsic for the protection of patient benefits and patient safety. If, linked to the medical record, and used also for clinical decision making in dialogue with the patient the

benefit and legitimacy of clinical registries might increase even more. The patient in our view should have the right to quality assured medical treatment and care and the clinicians and hospitals should have a corresponding duty to document relevant quality measures for long term follow up of treatment. There is a well-recognized duty to document at the individual patient level but today there is a lack of systematic collection and analysis of aggregated registry data. It was objected by one reviewer that registries for quality assurance are seldom considered a problem from a data inspection point of view, because the exact use of data is clearly specified at outset and the registries are used for the same, usually repetitive quality assurance analyses while research implies that new questions are being raised as science develops. However, there is an increasing awareness of the need for aggregated data for quality assessments and drug efficacy/safety assessments. Recent developments in genomics in fact blur the traditional line between quality assurance and research through the rapidly increasing possibilities to identify genotypes as well as environmental factors regulating the treatment benefit/risk scenarios. It is actually strange that the demand of mandatory quality assurance that is common in so many other areas in society is not implemented as rigorously in health care where lives are at stake each day. Furthermore, in order to assure the patient the best medical treatment available at each time research based on those registries is necessary and should in principle be approved and supported. From the patient's perspective there is no conflict between the interest of documentation in a medical record, the interest of follow-up and long-term assessment through medical registries (whether local, national or collaborative on a global level) and the interest of receiving the at each moment best available treatment based on research. This, we believe, holds not only for rare diseases like CML but also for all medical treatment.

2NC – MPX – Econ

Surveillance is key to solve economy—saves money, resources, and labor

Mirza et al 13 (Nabila, Tera Reynolds, Michael Coletta, Katie Suda, Ireneous Soyiri, Ariana Markle, Henry Leopold, Leslie Lenert, Erika Samoff, Alan Siniscalchi, and Laura Streichert researchers and analysts for OJPHI, “Steps to a Sustainable Public Health Surveillance Enterprise A Commentary from the International Society for Disease Surveillance” <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC3733763/> July 2013 JM)

Recognize systematic and ongoing public health surveillance as a core public health function that is essential for population health, economic stability, and national security. Public health surveillance data is the foundation of public health programs and is required for a number of purposes, including: to demonstrate the size and impact of the public health problem being addressed by a program; to identify the population groups to which additional prevention efforts should be directed; to determine whether the problem is growing in size or abating; to provide feedback to data providers; and as part of an overall program evaluation strategy. The significant health impacts and economic costs of disease outbreaks illustrate the critical importance of effective public health surveillance and rapid response, as well as the cost of inaction [11]. Table 1 provides examples of the health and financial burdens posed by some naturally occurring and intentional infectious disease outbreaks. The values reported in Table 1 do not fully reflect additional indirect costs of diseases and their potentially crippling effects on a community, nor do they address costs that are underreported/ unreported due to lack of data. Higher rates of illness, for example, can lead to lower worker productivity [11], while premature mortality can reduce the size of the labor force, both of which have economic ramifications. There is growing evidence that these economic and societal costs can be mitigated by surveillance systems that are stable; a stable system provides the best foundation for identifying whether the problem being addressed is getting bigger or smaller or disproportionately affecting a section of the population, etc., while still allowing flexibility to provide useful information quickly about emerging issues. The optimum mix of stability and flexibility will depend on the purpose(s) of surveillance and the particular health condition under surveillance. For example, in the case of SARS, an effective surveillance system has the potential to decrease the size of an epidemic by one-third and the duration by 4 weeks, with significant cost savings [25]. Another study found that the early detection of an outbreak of highly infectious bacterial meningitis saved approximately \$2 for every dollar invested in infectious disease surveillance [26]. Yet another evaluation of surveillance practice found that technological improvements in a sentinel

influenza-like illness (ILI) surveillance system in Virginia saved over \$9,500 (1,992 hours) in staff-time during the 2007-2008 influenza seasons [27]. Ongoing surveillance can also inform the design and evaluation of prevention and intervention programs in order to control the escalating costs associated with chronic diseases in the U.S. and abroad [28]. Some experts forecast that chronic disease prevention programs could save up to \$48.9 billion per year by 2030 [29], while others predict applying electronic medical record implementation and networking to the prevention and management of chronic disease will exceed the currently projected \$81 billion in annual savings [30].

2NC – MPX – Military Readiness

Surveillance key to check tick-based disease outbreaks --- specifically likely on military installations

Peterson et al, masters in entomology qualifications of other authors: Medical Entomologist/epidemiologists, **2015** (Wade, “Tick-borne disease surveillance”, published in U.S. Army Medical Department Journal, jan-march edition, Academic OneFile)//roetlin Tick-borne diseases (TBDs) represent some of the world's most rapidly expanding arthropod-borne infectious diseases. (1) (p1) In the United States, ticks are responsible for more human disease than any other arthropod group. The incidence and the number of pathogens transmitted by ticks are increasing. For example, Lyme disease is now the most commonly reported arthropodborne illness in the United States. (2) Anaplasmosis, ehrlichioses, and rickettsioses are also on the rise. (1) (p1) In most parts of the world, TBDs are potentially serious health threats to troops, civilian employees, and residents at military installations. (2) (p6) Companion animals and military working dogs (MWD) are also at risk in areas where ticks and TBDs are endemic or emerging. Risk of TBD increases with the introduction of exotic tick species into new areas and the expansion of historical tick ranges. One example of exotic ticks that effects the United States is *Boophilus annulatus* and *B microplus*, also known respectively as the cattle fever tick and the southern cattle tick, that were imported here by Spanish colonists who brought tick-infested cattle and horses with them. These ticks transmit a severe disease to cattle called Texas fever or cattle fever that caused enormous losses to the US cattle industry in the past. Present efforts to keep this tick out of the United States exist as the Cattle Fever Tick Eradication Program. (3) Nilgai antelopes, native to India, Nepal, and Pakistan, that were released into southern Texas are also hosts to the cattle fever ticks, posing a threat as maintenance hosts of cattle fever. (4) There are many other examples of exotic tick introductions from migratory birds, exotic and wildlife species, and domestic animals. (5) Changes in climate may also alter the geographic distribution of tick vectors, and in turn, cause a change in the currently recognized demographic patterns, seasonality, and incidence of TBDs. (1) (p61) For example, the range of the Gulf Coast tick (*Amblyomma maculatum*) has historically been along the Gulf of Mexico and southern Atlantic coast as far north as South Carolina, and extending approximately 100-150 miles inland. However, resident populations of these ticks are now established in Arkansas, Oklahoma, and Kansas, (6) and they have been collected on the east coast as far north as Delaware and Maryland. (7) Another example is the lone star tick (*A americanum*) which has moved northward as far as Maine and westward into central Texas and Oklahoma. (8) Incidental introductions of these ticks, and the diseases they carry beyond endemic regions, occur with increasing frequency. This is likely due to the feeding of immature ticks on migrating birds, and the transportation of tick-infested livestock and wildlife into new areas. (6) These introductions may also come from pets belonging to people who move from one area to another. In addition,

suburbanization has contributed to the increase in TBD transmission in North America by bringing people and their pets close to ticks and by creating new tick habitat. (9) In the northeastern United States, the highest risk for Lyme disease occurs around the homes of those who have been infected. (10) As communities continue to expand into tick habitat, and people are encouraged to enjoy outdoor recreation and pursue activities such as urban farming, the risk for peridomestic exposure to ticks and TBDs may increase. The National Notifiable Disease Surveillance System (NNDSS) of the Centers for Disease Control and Prevention (CDC) maintains a list of diseases that are considered to be of public interest by reason of their contagiousness, severity, or frequency. The 7 TBDs on the NNDSS list are shown in the Table. Many of these diseases, which are caused by closely related tick-borne pathogens, can also be acquired internationally. There are also many TBDs that can be acquired abroad that do not occur in the continental United States. In addition to transmitting disease, ticks can cause irritation, pain, and swelling at attachment sites, otoacariasis (invasion of the auditory canal), paralysis, allergic reactions, and anaphylactic reactions. (11) Heavy infestations of ticks on animals can cause debilitation due to blood loss. Direct effects from TBDs include troop and MWD morbidity and mortality. There are also many indirect effects, such as illness of dependents or Department of Defense (DoD) civilian personnel, and related healthcare costs. Both types of effects can be mitigated through aggressive surveillance, public education, and prevention/control programs, together with prompt diagnosis and treatment. (2) (p6)

TICK BIOLOGY AND DISEASE TRANSMISSION

Ticks are grouped into 2 separate families. Family Ixodidae, also called hard ticks, have 4 developmental stages: egg, larva, nymph, and adult. The latter 3 each take one large blood meal and then molt to the next stage, or lay eggs in the case of the adult. Hard ticks have mouthparts with recurved teeth that allow them to firmly anchor themselves to hosts while feeding with the assistance of a cement-like substance secreted by the salivary glands. This allows them to feed for extended periods of time that can vary from 2 to 12 days or longer, depending on species, life stage, and gender. Family Argasidae, also called soft ticks, have the same 4 developmental stages, but most have multiple nymph stages. Soft ticks have mouthparts that allow them to hold fast to their host, as hard ticks do, but they do not secrete cement. Although some soft ticks can remain attached to the host for several days, (11) (p501) others can complete a meal within minutes to hours. (12) This is still much longer than other bloodsucking arthropods such as mosquitoes, and is one of the factors that contribute to their high vector potential because it increases the likelihood of pathogen ingestion and allows them to secrete large amounts of host-derived fluid and salivary secretions, which contain pathogens, back into the host. Other factors that make ticks efficient disease vectors include a highly sclerotized body that protects them from environmental stresses, high reproductive potential, and a long life span (compared to other blood feeding arthropods). Although the majority of TBDs are transmitted during normal feeding activity, they can be transmitted by other routes as well, including through regurgitation and feces. Argasid ticks can also release pathogens through excess liquid excreted from the coxal glands located adjacent to the first segment (coxa) of the front legs. (11) (p512)

Adding to their efficiency as vectors, the larvae and nymphs are very small. The presence of an immature tick on a host often goes unnoticed, enabling the tick to feed to repletion and drop off without detection, which increases the likelihood of pathogen transmission. **Ticks can also transmit more than one pathogen at a time.** For example, Ixodes ticks can simultaneously or sequentially infect their hosts with *Borrelia burgdorferi*, *Anaplasma phagocytophilum*, and *Babesia microti*. (1) (p61) Co-infections with these pathogens have been reported from wild and domestic animals, including dogs, as well as humans. These infections can result in more severe and longer illnesses and can complicate diagnoses. (1) (p493) Ticks are also effective disease

reservoirs. In some species, pathogens can be transmitted from the adult female to its offspring (transovarial transmission) and from one developmental stage to the next (transstadial transmission). Infected ticks can also transmit viruses to uninfected ticks while feeding simultaneously on an uninfected host. (11) (p512) Therefore, they can maintain and transmit infections even if they have not fed on an infected host. **SURVEILLANCE** Surveillance is the process of determining the presence of vectors and pests, estimating their general population levels, and determining if pathogens of concern are present in the population. It gives quantifiable data on which to base control and education programs and is the starting point in the prevention of any arthropod-borne disease. The analysis and interpretation of information gained from surveillance is the basis for developing quantitative and qualitative risk assessments that can be used to predict the occurrence of pest outbreaks or vector-borne diseases. (13) (p7) Various methods can be used to describe disease risk. One commonly used index is called the Entomologic Risk Index (ERI), an indicator of the number of infected ticks that a person might come into contact with over a set distance. The ERI is calculated as the number of infected ticks collected over a 1,000-meter drag (described below). Accurate ERIs are obtained by testing ticks for pathogens to determine tick infection rate. Public health officials can use indices like the ERI in public education efforts and to determine if, when, and what control measures should be implemented. (13) (p7)

That collapses military readiness

Peterson et al, masters in entomology qualifications of other authors: Medical Entomologist/epidemiologists, **2015** (Wade, "Tick-borne disease surveillance", published in U.S. Army Medical Department Journal, jan-march edition, Academic OneFile)//roetlin

Ticks are one of the major vectors of disease that threatens military personnel, families, and civilian employees on US military installations. (25) The presence of tickborne disease in military personnel, including our military working animals, may result in the loss of training days, decreased force strength, and may adversely affect unit readiness and effectiveness. Tick-borne disease also affects DoD civilians and the families of our troops. Soldier and unit readiness may be affected when family members and companion animals are sickened by TBDs. The information gained from tick surveillance regarding tick vectors, disease incidence, and pathogen prevalence is invaluable. It allows medical personnel to educate personnel regarding tick-bite and TBD recognition and prevention. Tick surveillance information also enables leaders to make decisions regarding the application of safety and control measures during training and operations to prevent TBDs. As with any disease, prevention of TBDs is highly preferable to treating the short- and long-term consequences once they occur. (1(p155))

Readiness solves lashout

Jack Spencer, 2k, Research Fellow in Nuclear Energy Policy at The Heritage Foundation's Roe Institute for Economic Policy Studies. "The Facts About Military Readiness" Sep. 15, 2k. accessed July 31, 2010 <http://www.heritage.org/Research/Reports/2000/09/BG1394-The-Facts-About-Military-Readiness/>

Military readiness is vital because declines in America's military readiness signal to the rest of the world that the United States is not prepared to defend its interests. Therefore, potentially hostile nations will be more likely to lash out against American allies and interests, inevitably leading to U.S. involvement in combat. A high state of military readiness is more likely to deter potentially hostile nations from acting aggressively in regions of vital national interest, thereby preserving peace.

1NC – Bioterror

Health surveillance solves bioterrorism - the aff guarantees an attack

Gostin, an internationally recognized scholar in law and public health, professor of Law at Georgetown University; Professor of Public Health at the Johns Hopkins University; and the Director of the Center for Law & the Public's Health at Johns Hopkins and Georgetown Universities, November 2001 – (Lawrence, “Public Health Law In An Age Of Terrorism: Rethinking Individual Rights And Common Goods”, published on HealthAffairs vol 21 no. 6)//roetlin

The balance between individual interests and common goods needs to be recalibrated in an age of terrorism. Public health agencies should have a robust infrastructure to conduct essential public health services at a level of performance that matches evolving threats to the health of the public. This includes a well-trained workforce, electronic information, **surveillance**, and laboratory capacity. This paper explains modern efforts at public health law reform: a Model Public Health Statute and the Model State Emergency Health Powers Act (MSEHPA), which has been enacted wholly or in part by nineteen states and the District of Columbia. Next, the paper shows why existing public health laws provide a weak foundation for public health practice. Finally, the paper offers a systematic defense of MSEHPA, which has galvanized the public debate around the appropriate balance between public goods and individual rights. PROLOGUE: Following the 2001 anthrax attacks, an outbreak of concern about the inadequacies of the public health infrastructure caught the nation in the grip of a profound ambivalence about what we expect from government. For the past twenty years distrust of public institutions has severely dampened public health spending and so dominated the political landscape that even the Institute of Medicine's stern warning about deterioration of the infrastructure in 1988 did not generate renewed investment. Then, in the wake of the anthrax scare, the refrain suddenly became, “Why aren't we better prepared?” The following essay by legal scholar Lawrence Gostin suggests that our collective confusion about public health goes deeper than dollars. To perform its essential functions, the public health system needs legal authority to act. Yet most of its statutory foundations, which lie primarily in the domain of state government, have not been updated for half a century. Even before last fall's terrorist attacks, efforts were under way to develop new model laws for the states. The focus of the model legislation is to confer enough authority that public health agencies can mount adequate preparations, obtain information, and act in an emergency to protect those who are threatened. But some sacrifice of personal rights and freedoms is necessary to achieve this end, and these legal initiatives have been controversial. “In a country so tied to rights rhetoric..., any proposal that has the appearance of strengthening governmental authority was bound to travel in tumultuous political waters,” Gostin concludes. Three Perspectives that follow Gostin's paper highlight the extent of the disagreement that still exists, nearly a year after the model law was last revised. Gostin is ideally suited to clarify the

difficult issues involved. He is a professor of law at Georgetown University; a professor of public health at the Johns Hopkins University; and director of the Center for Law and the Public's Health, which drafted the Model State Emergency Health Powers Act at the request of the Centers for Disease Control and Prevention. In defense of a model act that was written to bring public health law into the modern age. Public and scholarly discourse in the late twentieth century became highly oriented toward "rights." The political community stressed the importance of individual freedoms rather than the health, security, and well-being of the community. The salience of individualism could be seen on both sides of the political spectrum. The ideological left favored a set of personal interests, principally autonomy, privacy, and liberty. This meant that individuals should be free to make choices, restrict the flow of health information, and have unfettered movement, without regard to the needs and desires of the wider community. The ideological right favored a set of proprietary interests, principally the freedom to contract, conduct business, use and develop property, and pursue a profession. This meant that entrepreneurs should be permitted to engage in free enterprise without the fetters of, for example, occupational health and safety regulations, inspections and products liability, zoning and nuisance abatements, and licenses. In this civil and property rights society, the tone has been distinctly antigovernment. The State has been perceived as inefficient, bureaucratic, and burdensome. Citizens have opposed taxation and broad health and welfare spending as well as oppressive regulation. From a funding perspective, this has meant that health dollars have been allocated primarily to advanced biotechnology and health care, which serve the needs of individual patients, particularly those who can afford private health insurance. Funding for traditional prevention and population-based services represents only a small fraction of health spending, estimated at around 1 percent at the state level and less than 5 percent at the federal level.¹ As a result of chronic underspending, the public health infrastructure is badly deteriorated.² Public health agencies lack the capacity to conduct essential public health services at a level of performance that matches the constantly evolving threats to the health of the public. Critical components of that infrastructure include a well-trained workforce, electronic information and communications systems, rapid disease surveillance and reporting, laboratory capacity, and emergency response capability.³ The public health law infrastructure is equally deficient. The law establishes the mission, functions, and powers of public health agencies. Yet public health laws are highly antiquated, after many decades of neglect. Very little consideration has been given to modernizing these laws to reflect advances in public health practice and constitutional law. Reform of public health law is essential to ensure that public health agencies have clear missions and functions, stable sources of financing, adequate powers to avert or manage health threats, and restraints on powers to maintain respect for personal rights and liberties. **The balance between individual interests and common goods needs to be recalibrated in an age of terrorism.** The attacks on the World Trade Center and Pentagon on 11 September 2001 and the subsequent dispersal of anthrax spores through the U.S. postal system reawakened the public to the importance of public health, safety, and security.⁴ The president's 2003 budget reflects changing priorities, with an influx of funding to prevent and respond to bioterrorism.⁵ However, even in this budget, disproportionate funding is devoted to biotechnology rather than to basic prevention and population-based services.⁶

Synthetic biology means that bioterror is inevitable

Rose, 14 -- PhD, recognized international biodefense expert

[Patrick, Center for Health & Homeland Security senior policy analyst & biosecurity expert, National Defense University lecturer, and Adam Bernier, expert in counter-terrorism, "DIY Bioterrorism Part II: The proliferation of bioterrorism through synthetic biology," CBRNePortal, 2-24-14, www.cbrneportal.com/diy-bioterrorism-part-ii-the-proliferation-of-bioterrorism-through-synthetic-biology/, accessed 8-16-14]

In Part I of this series, we examined how the advancement of synthetic biology has made bio-engineering accessible to the mainstream biological community. Non-state actors who wish to employ biological agents for ill intent are sure to be aware of how tangible bio-weapons are becoming as applications of synthetic biology become more affordable and the probability of success increases with each scientific breakthrough. The willingness of non-state actors to engage in biological attacks is not a new concept; however, the past biological threat environment has been subdued compared to that of conventional or even chemical terrorism. The frequency and deadliness of biological attacks has, thankfully, been limited; much of which can be attributed to the technical complexity or apparent ineptitude of the perpetrators developing biological weapons. Despite the infrequency and ineffectiveness of biological attacks in the last four decades, the threat may be changing with the continued advancement of synthetic biology applications. Coupled with the ease of information sharing and a rapidly growing do-it-yourself-biology (DIYbio) movement (discussed in Part I), the chances of not only more attacks, but potentially more deadly ones will inevitably increase. During the last half century terrorist organizations have consistently had an interest in using biological weapons as a means of attacking their targets, but only few have actually made a weapon and used it. The attraction is that terrorist activities with biological weapons are difficult to detect and even more difficult to attribute without a specific perpetrator claiming responsibility. Since 1971 there have been more than 113,113 terrorist attacks globally and 33 of them have been biological. The majority of bio-terrorism incidents recorded occurred during the year 2001 (17 of the 33); before 2001 there were 10 incidents and since 2001 there were 6 (not counting the most recent Ricin attacks). The lack of a discernable trend in use of bio-terrorism does not negate the clear intent of extremist organizations to use biological weapons. In fact, the capacity to harness biological weapons more effectively today only increases the risk that they will successfully be employed. The landscape is changing: previously the instances where biological attacks had the potential to do the most harm (e.g., Rajneeshees cult's Salmonella attacks in 1984, Aum Shinri Kyo's Botulinum toxin, and Anthrax attacks in the early 90's) included non-state actors with access to large amounts of funding and scientists. Funding and a cadre of willing scientists does not guarantee success though. The assertion was thus made that biological weapons are not only expensive, they require advanced technical training to make and are even more difficult to effectively perpetrate acts of terrorism with. While it is difficult to determine with certainty whether the expense and expertise needed to create biological weapons has acted as a major deterrent for groups thinking of obtaining them, many experts would argue that the cost/expertise barrier makes the threat from biological attacks extremely small. This assertion is supported by the evidence that the vast majority of attacks have taken place in Western countries and was performed by Western citizens with advanced training in scientific research. In the past decade the cost/expertise assertion has

become less accurate. Despite the lack of biological attacks, **there are a number of very dangerous and motivated organizations that have or are actively pursuing biological weapons.** The largest and most outspoken organization has been the global Al Qaeda network, whose leaders have frequently and passionately called for the development (or purchase) of Weapons of Mass Destruction (WMD). The principal message from Al Qaeda Central and Al Qaeda in the Arabian Peninsula (AQAP) has included the call to use biological WMDs to terrorize Western nations. Al Qaeda has had a particular focus on biological and nuclear weapons because of their potential for greatest harm. Osama Bin Laden, Ayman al-Zawahiri and Anwar al-Awlaki have all called for attacks using biological weapons, going so far as to say that Muslims everywhere should seek to kill Westerners wherever possible and that obtaining WMDs is the responsibility of all Muslims. Before the US-led invasion of Afghanistan, Al Qaeda had spent significant funds on building a bio-laboratory and had begun collecting scientists from around the world; however, the Afghanistan invasion and subsequent global War on Terrorism is thought to have disrupted their capabilities and killed or captured many of their assets. Despite the physical setbacks, this **disruption does not appear to have changed the aggressive attitude towards obtaining WMDs** (e.g., more **recently U.S. Intelligence has been concerned about AQAP attempting to make Ricin.**)[¶] **The emergence of synthetic biology and DIYbio has increased the likelihood that Al Qaeda will succeed in developing biological WMDs.** **The low cost and significantly reduced level of necessary expertise may change how many non-state actors view biological weapons as a worthwhile investment.** This is not to say that suddenly anyone can make a weapon or that it is easy. To the contrary making an effective biological weapon will still be difficult, only much easier and cheaper than it has been in the past.[¶] **The rapid advancements of synthetic biology could be a game changer, giving organizations currently pursuing biological weapons more options, and encouraging other organizations to reconsider their worth.** Because **the bar for attaining biological weapons has been lowered and is likely to continue to be lowered** as more advances in biological technology are made, it is important that the international community begin to formulate policy that protects advances in science that acts to prevent the intentional misuse of synthetic biology. **Disregard for this consideration will be costly. A successful attack with a potent biological weapon, where no pharmaceutical interventions might exist, will be deadly and the impact of such an attack will reverberate around the globe because biological weapons are not bound by international borders.**

Disease Impact D

1NC

Status quo solves – antifolates – breakthroughs have already happened and are going to trials
 Colin **Poitras** (writer for the UConn Today) July 23, **2014** “Possible Breakthrough in Battle Against Drug-Resistant Diseases” <http://today.uconn.edu/blog/2014/07/possible-breakthrough-in-battle-against-drug-resistant-diseases/>

In the war against drug-resistant diseases and so-called “superbugs”, the family of bacteria known as CREs are a particularly nasty bunch. The bacteria, whose scientific name is carbapenem-

resistant Enterobacteriaceae – include notorious strains of E. coli and Klebsiella and are a constant health concern in hospitals and nursing homes, where the germs breed in ventilators, catheters, and intravenous lines. CREs have been flagged as an “urgent threat” by the Centers for Disease Control and Prevention because of their strong resistance to antibiotics and easy transmission between humans. Some CRE bacteria are resistant to all known antibiotics. The mortality rate is high. As many as 50 percent of patients infected with CRE bacteria die because there is no drug to fight them. But two UConn scientists may be gaining new ground against the public health threat. Professors Amy Anderson and Dennis Wright, along with their students in the School of Pharmacy, have developed a group of drug compounds that appear to be particularly effective against CREs in early tests. A lead is a preliminary molecule that shows promise and is poised for further development. The potent compounds – part of a group of drugs known as antifolates – were a long time coming for the two, who have been searching for effective treatments for drug-resistant diseases like MRSA, E. coli, and Klebsiella pneumoniae for more than 10 years. Working with drug-resistant strains is particularly challenging for researchers, as the diseases constantly morph and evolve to fend off attacks to kill them. “It has been a **holy grail** to kill these types of CREs,” says Anderson, a professor of medicinal chemistry and interim head of the Department of Pharmaceutical Sciences. “These (CRE) bacteria have an extra thick, tight membrane meshed with proteins that makes it very hard for drugs to penetrate. We’ve spent years trying.” After testing hundreds of different compounds, delicately altering each one’s chemical structure with the hope of finding the magic recipe that would serve as a CRE knockout blow, Anderson and Wright recently started seeing positive results in one particular group. ‘Our goal was to inhibit a certain enzyme in the bacteria so it can’t function and the bacteria can’t survive,’ Anderson says. “When we finally got a very potent inhibition of the enzyme, that was definitely a eureka moment.” The pair recently received a five-year, \$2.7 million grant from the National Institutes of Health to further study these compounds and prepare them for clinical trials. Together, Anderson’s and Wright’s labs have received more than \$10 million in federal research support since they began working on the project. Wright, a professor of medicinal chemistry, synthesizes the new drugs; Anderson evaluates them and determines the atomic details of how they interact with their intended target. “We want to make compounds that are potent inhibitors of the growth of the bacteria and at the same time are safe, with good drug properties, so down the line they will be effective when used at a clinic,” says Wright. At this stage in the research, Anderson and Wright are trying to learn more about the physical and chemical processes that allow their compounds to penetrate the armor-like coating around CREs when so many others have failed. Understanding why their compounds are working may allow them to apply the same biological chemistry to different compounds that could be used to fight other persistent infections. Associate professor of pharmacy practice Jeffrey Aeschlimann from UConn Health is helping with the CRE drug characterizations. University of Montana professor of chemistry Nigel Priestley is assisting with testing in early animal pre-clinical trials. “Right now, what makes our compounds attractive is that they seem to have a very low rate of resistance,” says Wright. “We’ve made compounds that are very hard for these CREs to fend off.”

Multi-drug resistance is unlikely- Combination therapy

Cobey et al. 15, (Gabriel G. Perron, R. Fredrik Inglis, Pleuni S. Pennings and Sarah Cobey, Evolutionary Applications, "Fighting microbial drug resistance: a primer on the role of evolutionary biology in public health," 23 MAR 2015, <http://onlinelibrary.wiley.com/doi/10.1111/eva.12254/full>)/IB

The shortage of new antibiotics motivated the search for novel strategies to manage resistance evolution. For example, combination therapy showed that some antibiotics have nonlinear inhibitory activities when used together (King et al. 1981; Yeh et al. 2009). Extensive phenotypic screens revealed that many classes of antibiotics could inhibit the effects of other antibiotics given their modes of activity (Yeh et al. 2006), often caused by regulatory conflicts in the expression of the antibiotics' cellular targets (Bollenbach and Kishony 2011) or by reductions in bacterial growth rates (Ocampo et al. 2014). Subsequent studies have shown that such interactions could modulate resistance evolution (Yeh et al. 2009): Multidrug resistance is unlikely to evolve against sets of antibiotics that inhibit each other's activity, as resistance evolution to one antibiotic would expose the bacterium to the full efficiency of the second antibiotic (Michel et al. 2008). However, additional clinical trials are required to see whether this finding can be put into practice.

2NC – XT – Squo Solves

Squo solves antibiotic resistant bacteria

Kenneth **Ma** (Lawrence Livermore National Laboratory) October 7, **2014** "Bio researchers receive patent to fight superbugs" <https://www.llnl.gov/news/newsreleases/2014/Oct/NR-14-10-3.html>

Superbugs, or antibiotic-resistant bacteria, have been on the rise since antibiotics were first introduced 80 years ago. That's because these germ-fighting agents have lost their punch from being overprescribed and misused, allowing bacteria pathogens to develop immunities against them. As a result, superbugs sicken nearly 2 million Americans each year and roughly 23,000 people die annually from these infections, according to the Centers for Disease Control and Prevention. Many more people die from other conditions that are complicated by antibiotic-resistant infections. Lawrence Livermore National Laboratory scientists have figured out a way to reverse this trend by developing novel antibiotics that effectively kill superbugs. They were recently issued a patent for producing antimicrobial compounds that degrade and destroy antibiotic-resistant bacteria by using the pathogen's own genes against it. Their approach can be used to fight superbugs such as antibiotic-resistant E. coli, Salmonella, Campylobacter, Methicillin-resistant Staphylococcus aureus (MRSA), Bacillus anthracis and many others. Antimicrobial compounds available today are designed to treat a host of bacteria, not target specific ones. While this is effective in the short term, bacteria are able to modify themselves over time to prevent a number of antibiotics from inhibiting their growth, rendering the antibiotics useless. To prevent this, the LLNL team created a process to discover new antibiotics designed to eradicate targeted bacterium responsible for a specific infection. Their technique uses computational tools and genome sequencing to identify which genes inside a bacterium encode for lytic proteins that can be used to kill it. Lytic proteins are enzymes that normally produce nicks in cell walls that allow cells to divide and multiply. But used in high concentrations, these

enzymes cause rapid cell-wall degradation and cell rupture, a process known as lysis. Lytic proteins circumvent any defenses that bacteria have developed against today's broadly focused antimicrobials. Once genes encoding lytic proteins are identified in a bacterium, Lab researchers synthesize those genes and produce the lytic proteins in a laboratory setting. They are then experimentally introduced to the cell walls of targeted pathogens to destroy them. "We knew about these proteins because they were primarily coded and identified in bacteriophages, virus particles that attack bacterium and make copies of themselves," said Matthew Coleman, a member of the LLNL research team. "Bacteriophages need a way to get out of the bacteria once they make enough copies. So they encode a lytic protein, called an endolysin that breaks down the cell wall, causing the cell to die. The wall is what gives the cell its strength." The team's unique discovery was the existence of lytic proteins that are not associated with bacteriophages. They learned that bacteria themselves encode their own versions of these lytic proteins, which they use under tight regulatory control to remodel their cell wall during cell division. Tight regulatory production means that lytic protein is not overproduced because too much of it will kill the cells. The team conducted lab experiments that show lytic protein produced by bacteria killed pathogens more effectively than lytic protein produced by bacteriophages. LLNL's resources allowed the team to sequence genomes within a few weeks to obtain information on new pathogens, unknown bacteria species and even species yet to be sequenced. This data helps the team determine which genes encode lytic proteins and reproduce those proteins in large quantities to eliminate targeted pathogens. So far, the team's novel approach has been extremely effective in lab testing. In CDC experiments, the LLNL-produced lytic protein killed 100 percent of Bacillus anthracis cells, the bacterium that causes anthrax. "We can isolate these genes to support the development of effective antimicrobial agents for commercial and national needs," Coleman said.

Squo solves diseases

Anne **Trafton** (writer for the MIT News Office) September 21, **2014** "Battling superbugs"
<http://newsoffice.mit.edu/2014/fighting-drug-resistant-bacteria-0921>

In recent years, new strains of bacteria have emerged that resist even the most powerful antibiotics. Each year, these superbugs, including drug-resistant forms of tuberculosis and staphylococcus, infect more than 2 million people nationwide, and kill at least 23,000. Despite the urgent need for new treatments, scientists have discovered very few new classes of antibiotics in the past decade. MIT engineers have now turned a powerful new weapon on these superbugs. Using a gene-editing system that can disable any target gene, they have shown that they can selectively kill bacteria carrying harmful genes that confer antibiotic resistance or cause disease. Led by Timothy Lu, an associate professor of biological engineering and electrical engineering and computer science, the researchers described their findings in the Sept. 21 issue of Nature Biotechnology. Last month, Lu's lab reported a different approach to combating resistant bacteria by identifying combinations of genes that work together to make bacteria more susceptible to antibiotics. Lu hopes that both technologies will lead to new drugs to help fight the growing crisis posed by drug-resistant bacteria. "This is a pretty crucial moment when there are fewer and fewer new antibiotics available, but more and more antibiotic resistance evolving," he says. "We've been interested in finding new ways to combat antibiotic resistance, and these papers offer two different strategies for doing that." Cutting out resistance Most antibiotics work by interfering with crucial functions such as cell division or protein synthesis. However, some bacteria, including the formidable MRSA (methicillin-resistant Staphylococcus aureus) and CRE

(carbapenem-resistant Enterobacteriaceae) organisms, have evolved to become virtually untreatable with existing drugs. In the new Nature Biotechnology study, graduate students Robert Citorik and Mark Mimee worked with Lu to target specific genes that allow bacteria to survive antibiotic treatment. The CRISPR genome-editing system presented the perfect strategy to go after those genes. CRISPR, originally discovered by biologists studying the bacterial immune system, involves a set of proteins that bacteria use to defend themselves against bacteriophages (viruses that infect bacteria). One of these proteins, a DNA-cutting enzyme called Cas9, binds to short RNA guide strands that target specific sequences, telling Cas9 where to make its cuts. Lu and colleagues decided to turn bacteria's own weapons against them. They designed their RNA guide strands to target genes for antibiotic resistance, including the enzyme NDM-1, which allows bacteria to resist a broad range of beta-lactam antibiotics, including carbapenems. The genes encoding NDM-1 and other antibiotic resistance factors are usually carried on plasmids — circular strands of DNA separate from the bacterial genome — making it easier for them to spread through populations. When the researchers turned the CRISPR system against NDM-1, they were able to specifically kill more than 99 percent of NDM-1-carrying bacteria, while antibiotics to which the bacteria were resistant did not induce any significant killing. They also successfully targeted another antibiotic resistance gene encoding SHV-18, a mutation in the bacterial chromosome providing resistance to quinolone antibiotics, and a virulence factor in enterohemorrhagic E. coli. In addition, the researchers showed that the CRISPR system could be used to selectively remove specific bacteria from diverse bacterial communities based on their genetic signatures, thus opening up the potential for “microbiome editing” beyond antimicrobial applications. To get the CRISPR components into bacteria, the researchers created two delivery vehicles — engineered bacteria that carry CRISPR genes on plasmids, and bacteriophage particles that bind to the bacteria and inject the genes. Both of these carriers successfully spread the CRISPR genes through the population of drug-resistant bacteria. Delivery of the CRISPR system into waxworm larvae infected with a harmful form of E. coli resulted in increased survival of the larvae. The researchers are now testing this approach in mice, and they envision that eventually the technology could be adapted to deliver the CRISPR components to treat infections or remove other unwanted bacteria in human patients. “This work represents a very interesting genetic method for killing antibiotic-resistant bacteria in a directed fashion, which in principle could help to combat the spread of antibiotic resistance fueled by excessive broad-spectrum treatment,” says Ahmad Khalil, an assistant professor of biomedical engineering at Boston University who was not part of the research team. High-speed genetic screens Another tool Lu has developed to fight antibiotic resistance is a technology called CombiGEM. This system, described in the Proceedings of the National Academy of Sciences the week of Aug. 11, allows scientists to rapidly and systematically search for genetic combinations that sensitize bacteria to different antibiotics. To test the system, Lu and his graduate student, Allen Cheng, created a library of 34,000 pairs of bacterial genes. All of these genes code for transcription factors, which are proteins that control the expression of other genes. Each gene pair is contained on a single piece of DNA that also includes a six-base-pair barcode for each gene. These barcodes allow the researchers to rapidly identify the genes in each pair without having to sequence the entire strand of DNA. “You can take advantage of really high-throughput sequencing technologies that allow you, in a single shot, to assess millions of genetic combinations simultaneously and pick out the ones that are successful,” Lu says. The researchers then delivered the gene pairs into drug-resistant bacteria and treated them with different antibiotics. For each antibiotic, they identified gene combinations that enhanced the killing of target bacteria by 10,000- to 1,000,000-fold. The researchers are now investigating how these genes exert their effects. “This platform allows you

to discover the combinations that are really interesting, but it doesn't necessarily tell you why they work well," Lu says. "This is a high-throughput technology for uncovering genetic combinations that look really interesting, and then you have to go downstream and figure out the mechanisms." Once scientists understand how these genes influence antibiotic resistance, they could try to design new drugs that mimic the effects, Lu says. It is also possible that the genes themselves could be used as a treatment, if researchers can find a safe and effective way to deliver them. CombiGEM also enables the generation of combinations of three or four genes in a more powerful way than previously existing methods. "We're excited about the application of CombiGEM to probe complex multifactorial phenotypes, such as stem cell differentiation, cancer biology, and synthetic circuits," Lu says.

Recently discovered fungus solves antibiotic resistance

Catholic Online July 2014 "How one fungus may stop superbugs"

<http://www.catholic.org/news/health/story.php?id=56093>

Scientists at McMaster University in Ontario discovered a compound that instantly turned off a gene in several harmful bacteria that made them highly resistant to treatment with a class of antibiotics used to fight so-called superbug infections. There are still thousands of children who need just one light in the darkness. Aspergillomarasmine A (AMA), was the compound that was found in a soil sample extracted from a common fungus found in soil and mold. Antibiotic resistance is a growing public-health threat. Common germs such as Escherichia coli (E. coli) are becoming harder to treat because of increasing immunities to common antibiotics. In the United States alone, some two million people are infected with antibiotic-resistant diseases, and around 23,000 die as a result, according to information released from the Centers for Disease Control and Prevention (CDC). The World Health Organization (WHO) has called antibiotic resistant a threat to global public health. Using the compound, the Canadian team was able to disarm a gene-New Delhi Metallo-beta-Lactamase-1 (NDM-1) that has become the WHO's number one enemy since it was discovered in 2009. , "Discovery of a fungus capable of rendering these multidrug-resistant organisms incapable of further infection is huge " said Irena Kenneley, a microbiologist and infectious disease specialist at Frances Payne Bolton School of Nursing at Cleveland's Case Western Reserve University. "The availability of more treatment options will ultimately save many more lives."

Privacy Not Key

1NC

No internal link – patients don't care about privacy

McCarthy 15 (Kevin McCarthy covers healthcare tech and policy regulations, "Why EHRs do not harm the doctor-patient relationship" 6/3/15 <http://www.nuemd.com/news/2015/06/03/ehrs-do-not-harm-doctor-patient-relationship>)

It's no secret that the road to widespread implementation of electronic health records has been a difficult one for some clinicians. While large providers may have had the capital to throw at a problem like staff training and new equipment purchases, small practices were faced with financial and operational issues that, while challenging, proved not to be as unsolvable as some

critics had predicted. According to the U.S. Centers for Medicare and Medicaid Services, over 447,000 providers have implemented and been compensated for EHR systems in their offices.¶ Now that EHR software has become a large part of the medical industry, experts have turned their gazes back to an issue that dominated the discussion when federal agencies first started pushing the platform as reform alternative. The question of how EHRs affect the physician-patient relationship can seem simple at times - more screens separating clinicians from their patients can only seem wrong - but, as EHR Intelligence explained, the underlying factors may point to a different and more positive interpretation for EHRs in the workplace.¶ Office manners¶ The doctor-patient relationship goes all the way back to the days when house calls and personal physicians were only the domain of the super wealthy. Today, every patient has a right to expect their doctors to be open, polite, informative, and, most of all, confidential. Such a natural relationship fosters trust between both parties, and when outpatient treatments are the only ones possible, this level of mutual respect is necessary for both sides to move toward a positive care outcome.¶ However, with the rise of EHRs, especially on mobile devices, creating a meaningful doctor-patient relationship isn't as easy as it used to be. In an interview with EHR Intelligence, James Avallone, director of physician research for Manhattan Research, explained that EHR use is most certainly up, but its impact on the personal dynamics between patients and doctors is much less clear.¶ "Whether it is too much or too little, it is difficult for us to say from our perspective," Avallone said. "In the past four to five years, we have seen a fair share of complaints in terms of the efficiency of EHRs and how [they are] changing bedside manners for physicians overall. I do think we are starting to see some efficiencies come about in terms of efficient use of these platforms and that includes at the point of care. It is certainly something that physicians are getting used to as it becomes more ingrained in their day-to-day behaviors. They have had more time to streamline workflow and that is something that we are seeing in terms of how these devices are being used at the point of care."¶ Avallone noted that research from a recent Manhattan study found that 66 percent of physicians self-reported as being more efficient with their EHRs than in the past. While part of this may be due to a greater sense of familiarity with the product and how to fit it into workflows, EHR vendors have also caught up with the trends of the day by developing software that intuitively meshes with physicians' daily tasks.¶ A minor annoyance¶ While EHRs may be an easy target for opponents of the technology, studies show that EHRs are not a top concern among physicians who are worried about losing the trust and goodwill of their patients.¶ According to a 2013 study published in Health Affairs, only 25.8 percent of physicians reported that EHRs were threatening the doctor-patient relationship. Administrative burdens like the ICD-10 transition and HIPAA compliance regulations, on the other hand, were noted by more than 41 percent of those surveyed. ¶ If industry experts are truly concerned about protecting the quality of the doctor-patient relationship, then EHR software should not be the primary focus. Instead, it should be highlighted during discussions with patients to show them just how powerful it can be. From there, patients may not care so much about the time doctors spend inputting their information into a piece of software that could save their lives.

Healthcare privacy is not key to patient trust – they just don't care

Dan **Munro** (Writer for Forbes and Quora specializing in healthcare related topics) November 2014 “Trust Trumps Privacy In Battle For Patient Health Data”

<http://www.forbes.com/sites/danmunro/2014/11/09/trust-trumps-privacy-in-battle-for-patient-health-data/>

There's no shortage of advocates on behalf of the “free your health data” movement. The keywords, of course, are “your,” “health data” and “free” (as in donating your health data for the global benefit of clinical research). The latest demand was an article that appeared last week in Wired – You Should Share Your Health Data: Its Value Outweighs The Privacy Risk by Beth Seidenberg, MD (a partner at the venture firm Kleiner Perkins Caufield & Byers). Dr. Seidenberg's medical credentials are definitely compelling (including Chief Medical Officer of Amgen AMGN -0.82%), but it's always a red flag to me when a total stranger (especially one with medical credentials) boldly demands that I “should” do anything online – with my health – which includes my health data. While Dr. Seidenberg's demand is noble in the conclusion that we can all benefit from the clinical research, her argument is based squarely on the false premise that privacy is the largest gating factor in the reluctance of consumers (or patients) to share their health data. I'm sure that privacy is a reason for many, but it's certainly not for me. I know just how easy all health data can be breached – and wrote about it earlier this year when I logged onto the network of a 300+ bed hospital using just a browser and my desktop PC (here). It's not that the electronic door to the hospital was unlocked – or even open. There was simply no door at all. The only thing missing was a banner ad saying “Click here for free health data.” The larger trend for health data breaches (including this year's 2nd largest ever – 4.5 million by CHS) is alarming. But risk of data breach – cloaked as ‘privacy’ – is not the issue. At least it's not mine. The issue I see is much larger – trust. Given the importance of getting this priority right, it's really tone deaf for anyone anywhere to demand that we do anything with our personal health data. Dr. Seidenberg's demand makes sense, of course, because the interests of venture capitalists are well aligned with many commercial interests in healthcare – much of which has been optimized around revenue and profits – not safety and quality. The lack of trust I see is clearly evident in countless stories of courageous patients, battling openly (almost entirely at their own expense) for access to their health data. Privacy issues (and HIPAA) are often cited as the legal reason for prohibiting access, of course, but that's just an excuse. Absent data security (clearly evident) there is no privacy and the real reason masquerading behind these false claims isn't privacy protection – it's revenue protection. This isn't just hospitals. The data battle for many patients encompasses medical device manufacturers, pharmaceutical companies and electronic health record vendors too. Our collective rights as patients are entirely secondary – if at all. Here's one example that appeared just yesterday in the New York Times – Medical Records: Top Secret (by Elisabeth Rosenthal). The story outlines the continuing case of Mr. Drier – a patient Ms. Rosenthal wrote about previously who was billed \$117,000 after a 3-hour neck surgery. Mr. Drier's efforts to get his health record (for ongoing management of his health condition) resulted in this summary: The six-week ordeal included requests that needed to be made via regular mail, numerous phone calls, consent forms and an estimate for copying fees that totaled \$100. This was topped off by an actual visit to the hospital by Mr. Drier, who sat in an office until he had paper documents in hand. The problem is enormous – and longstanding. The above example is simply one case that highlights what little progress we've made in the course of 5 years. I reference that timeframe because this last September marked the 5-year anniversary of Dave deBronkart's battle cry at the Medicine 2.0 event in Toronto. He opened his keynote with this slide. Working

with his physician – Dr. Danny Sands – he was finally able to download his health record electronically. The data that came into view, however, was largely based on billing records and loaded with inaccuracies (including the fact that an x-ray from 2003 identified him as a 53 year-old woman). He summarized his experience with transferring his health data into Google GOOGL +1.71% Health (now defunct) this way: In other words, the data that arrived in Google Health was essentially unusable. Dave deBronkart – Imagine someone had been managing your data, and then you looked – April, 2009 Hugo Campos is another example. Hugo continues to work tirelessly on getting access to the data from the cardiac defibrillator inside his own chest. His TEDxCambridge talk highlights his dilemma and his ongoing battle with Medtronic MDT - 0.73% for access to the data his own heart generates – again to manage his own health. Like other device manufacturers, Medtronic believes they should own the data – and patients who actually generate the data have no legal rights. The ICD device collects a lot of data about its own function and about the patient’s clinical status. It’s a pretty complex little computer, but unfortunately, none of this very valuable data is made available to the patient who originates it. The best we can do is get a print-out or a hardcopy of an interrogation report (typically at 6 or 12 month intervals). These reports are designed for doctors – not really for patients – so a lot of patients are discouraged from even getting this information. It’s hard to read.” Hugo Campos – TEDxCambridge 2011 Earlier this year, I wrote about Anna McCollister-Slipp and her battle with the data that she needs to manage her Type 1 diabetes. So I have all of this incredible information literally 24/7 – not just from my prescription medical devices – but also from my Fitbit, from a Bluetooth blood pressure monitor, from my digital scale and from a variety of different iPhone apps that are used for nutrition tracking etc. None of it connects. They’re all in completely different data streams, and even though each of them provides something that would be an incredibly vital element for me to truly understand how to manage my disease, how to predict when I need to change insulin in response to exercise, or stress, or schedule changes, or whatever the case may be – I can’t get that information all in one place. Even though it’s electronic – even though it’s all downloadable in one form or another – it’s all on different platforms, different computing systems and it doesn’t work together. Anna McCollister-Slipp – The View Of Digital Health From An Engaged Patient These are just a few examples – there are millions more – most of which will remain forever silent for reasons of personal privacy (or embarrassment) and they all exist because the business models don’t support sharing data with the people who create it in the first place – patients. Venture capitalists are notably absent when it comes to funding any patient-centered solutions because there’s simply no way to avoid the first question – who pays? Healthcare needs our clinical (and genetic) data for the purpose of advancing diagnosis and treatment of disease. I get that. What’s hard to believe is the misaligned priority of demanding our health data in advance of important efforts to break down the impenetrable barriers of our own access – to our own data. Tone deaf may be a harsh characterization, but if it doesn’t apply here – where does it? There is no question that all this data has enormous value, but getting the priority right makes all the difference in establishing trust. As Dr. Peter Diamandis suggested in his keynote at CHIME earlier this month, “privacy is dead.” Whether he’s right or not is immaterial. Trust most certainly isn’t dead – and that trumps privacy everywhere. Especially in healthcare.

Patients don't actually expect privacy

Appari and Johnson 10, (Ajit, Eric, Tuck School of Business, "Information security and privacy in healthcare: current state of research," Dartmouth, 4, 2010, <http://www.ists.dartmouth.edu/library/501.pdf//IB>

Bansal et al. (2007) developed a set of constructs based on utility theory and prospect theory as antecedents of trust formation and privacy concern that impact users' personal disposition to disclose their health information to online health websites. In particular, they reported that users' current health status, personality traits, culture, and prior experience with websites and online privacy invasions play a major role in users' trust in the health website and their degree of privacy concerns. On the other hand, in a mail-based survey with adult patients in England, Campbell et al. (2007) found that about 28–35% of patients are neutral to their health information – such as age, gender, ethnicity, reason for treatment, medical history, personal habits impacting health, type of treatment obtained, side effects of treatment – being used by physicians for other purpose. Only about 5–21% of patients, however, expected to be asked for permission to use their information by their physicians. Similarly, only about 10% of the patients expected to be asked for permission if their doctors used their health information for a wide variety of purposes, including combining data with other patients' data to provide better information to future patients, sharing treatment outcomes with other physicians, teaching medical professionals and writing research articles about diseases and treatments.

2NC – XT – Multiple Factors

Single issue focus under patient-physician trust is flawed - key issues constantly shift

Steven **Pearson** and Lisa **Raeko** (Center for Ethics in Managed Care, Harvard Medical School and Harvard Pilgrim Health Care, Boston, Mass) **2000** "Patients' Trust in Physicians: Many Theories, Few Measures, and Little Data" <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1495476/>

The importance of trust in patient-physician relationships is not questioned, but our understanding of it has depended largely on the passionate thoughts and anecdotes of physicians who cherish the special bond they feel with their patients. For practicing clinicians and for those who teach medical students and residents, the elements of physician behavior that foster trust can continue to reflect the instincts of physician-theorists: competence, compassion, reliability, integrity, and open communication. A widely accepted empirical conceptualization and understanding of trust is yet to come. In recent years, other complex and once believed intangible concepts, those of "satisfaction"^{24,25} and "health status,"^{26,27} have yielded to rigorous qualitative and quantitative research, and investigators and policy leaders now have standardized instruments with which to measure these concepts in a wide variety of health care settings. Although attempts to operationalize patient-physician trust are in their infancy, with models emerging recently through the effort of investigators such as Kao and Safran, a refinement and convergence of techniques may soon allow trust to be measured and discussed as routinely and rigorously as many other elements of health care. For patient-physician trust to be strengthened, our ability to measure the mediators and outcomes of trust must mature. However, a single measure of patient trust is unlikely to achieve long-lasting predominance, nor should it. The evolving nature of the health care system will continue to cast new light on patient-physician relationships. There will be new

threats to trust that appear on the horizon, while other threats will be perceived to fade in importance. Much as the threat of overly paternalistic physicians provided the chief concern in the 1970s, researchers are now more interested in measuring patients' concerns about physicians' conflict of interest in the setting of strong financial incentives. As the focus of measures of trust have evolved, from the earliest measure of Dedrick and Anderson to the latest measure of Kao et al., measures of patient-physician trust must also continue to evolve to address changes in the health care system and in how our society views the key elements of trust.

****Impact Framing****

Yes War – General

Nuclear war is possible – India, Pakistan, China, North Korea, and terrorism

Duz 14 (Sergei Duz is a writer for the Voice of Russia, “Nuclear war more likely than ever: threat comes from South Asia and nuke terrorists” 1/2/14 http://sputniknews.com/voiceofrussia/2014_01_02/Nuclear-war-more-likely-than-ever-threat-comes-from-South-Asia-and-nuke-terrorists-1915/)

The main reason for this is the ongoing erosion of the non-proliferation regime, experts say. The Non-Proliferation Treaty has been continuously bashed as "unfair," but it is in fact the exclusive geopolitical environment and ensuing nuclear responsibility of a handful of states that has so far kept mankind away from the total wipeout.¶ The theory of reciprocal deterrence wasn't there all the time. A long two decades after the A-bomb was invented, the powers who had it in their arsenals thought of it as fair game, a weapon you could actually use in a conflict, rather than a deterrent.¶ The Cuban Missile Crisis came as a wakeup call. It brought home the danger of nuclear weapons and led to the non-proliferation regime as conceived by the so-called "nuclear club," which included the Soviet Union, the US, Britain, France and China. Under the NPT, only countries that made and set off a nuclear bomb prior to January 1, 1967 were granted the status of a nuclear power. Washington, London and Moscow were the first to sign the treaty in 1968, with Paris and Beijing committing themselves to it years later. But all of the signatories abided by the rules.¶ Those times have passed. NPT controls have become so loose and new nuclear powers so numerous, there's no counting them anymore. India, Pakistan, Israel and North Korea have never even applied for "nuclear club" membership. On the contrary, they created their own shadow club with no rules. The official club with all its nukes poses less threat to the human race than this bunch of neophytes. Volatility has spread, though South Asia plays a separate role in it.¶ "Some South Asian countries have a full arsenal of nukes," says Pyotr Topychkanov, a senior researcher at the International Security Center of the Institute of World Economy and International Relations at the Russian Academy of Sciences. "They have enough nuclear warheads and vehicles. They have only one equal in the Middle East, which is Israel. Iran has no nuclear weapons yet."¶ "The same is true of North Korea, which has weapon-grade fissile nuclear materials. They have built and tested explosive devices, but it's still a long way to fully-fledged nukes for them."¶ The countries that really cause concern are India, Pakistan and China. China and Pakistan are longtime partners, including their nuclear agenda. India borders on China and Pakistan and is certainly aware of this partnership. It doesn't have faith in either. Were a conflict to spark off, it would be trilateral and include not only India and Pakistan, but India, Pakistan and China."¶ About 30 to 40 countries are on their way towards nuclear status. Many of them are inches away, like Germany, Japan and Canada, who could have had an A-bomb long ago – but simply didn't wish to. The Sunni Saudi Arabia has hinted it will make a bomb the moment the Shiite Iran lays its hands on one.¶ The principle of uncontrolled nuclear proliferation was formulated back in 1965, when Pakistan's foreign chief Zulfikar Ali Bhutto said: "There's a Christian bomb, a Jewish bomb and now even a Hindu bomb. It's high time we got a Muslim bomb."¶ Nuclear terrorism is yet another problem. Terrorists can't make a nuke. But they do know how to pit countries and eventually provoke them to an inadequate response. There's no lacking of short-sighted politicians who can take that last step, for instance Republican Senator Steve Buyer who nudged the government after 9/11 to nuke Tora Bora caves, instead of sending a task force to

Afghanistan.¶ In that sense, the threat of a full-scale nuclear war has transformed into the menace of a local nuclear conflict, or even a string of them. You shouldn't be lulled by their seeming locality though, since a precise nuclear strike will be felt globally, says PIR Center Internet Project Director Andrei Baklitsky.¶ "A nuclear conflict will have dramatic consequences for all of us, because nuclear weapons are weapons of mass destruction. They are not selective. A nuclear attack in the Middle East would be most tragic, first of all, because of its huge oil fields, and a burning oil field is a big trouble. Secondly, any strike on the Middle East will skyrocket oil prices across the world and plunge the global economy back into an even worse economic crisis than before.¶ The consequences of using an A-bomb in an Indo-Pakistani conflict would be just as grave for these densely populated countries, driving millions of refugees out of their homes and turning agriculture lands into barren wastes."¶ Unfortunately, the world is home to many paradoxes. Despite a drop in amounts of nuclear weapons worldwide, the collapse of the bipolar world has made the risk of a manmade apocalypse palpable.

Nuclear war is possible – accidents and poor risk calculation

Gobry 14 (Pascal-Emmanuel Gobry is a writer and fellow at the Ethics and Public Policy Center. His writing has appeared at Forbes, The Atlantic, First Things, Commentary Magazine, The Daily Beast, The Federalist, Quartz, and other places, "The end of nuclear deterrence" 12/12/14 <http://theweek.com/articles/441584/end-nuclear-deterrence>)//CW

Since the end of the Cold War, the public mind has pretty much forgotten about the existence of nuclear weapons, except in the Middle East. And yet, they still exist — thousands and thousands of them, ready to destroy all of human civilization several times over. In response, a new nuclear disarmament movement is getting underway.¶ This week, I attended the Vienna conference on the Humanitarian Impact of Nuclear Weapons. (Full disclosure: one of the sponsoring organizations, the Nuclear Threat Initiative, invited me all expenses paid.) The conference was striking in describing the utter, absolute destruction that can be caused by nuclear weapons.¶ I came in as a supporter of the doctrine of nuclear deterrence, which says that the world's major power-brokers should have nuclear weapons as a way of preventing a new world war. Advocates of this doctrine point to the Cold War, which never went hot, as a success for deterrence.¶ But supporters of disarmament — including the Red Cross, Pope Francis, and, believe it or not, Henry Kissinger — say that's wrong. These are serious, sober-minded people, not just pie-in-the-sky activists, and they say that deterrence doesn't work in a multipolar world. Instead, the presence of nuclear weapons just creates an incentive for more proliferation, as small countries try to one-up their regional adversaries.¶ What's more — and this was the most striking thing at the conference — they point to the risks inherent in the existence of nuclear weapons. History has recorded many close calls in which nuclear weapons were almost fired. (This, in turn, could have led to a nightmare scenario where an accidental strike is met with a riposte, triggering Armageddon.) For example, in 2007, six U.S. nuclear warheads went missing because of a bureaucratic mistake. Then there's the story of the U.S. nuclear missile launch officer with the drug problem.¶ If this stuff can happen in the U.S., which has the oldest, best-funded, and most sophisticated nuclear force, one shudders to think about what might be going on in Russia or Pakistan. Given the way human nature and technology works, advocates warn, it is not a matter of if, but when a catastrophic accident will occur. The only solution is simply to ban nuclear weapons for good.¶ This is where I started rethinking my position. A lot of research has shown that human brains are wired in such a way that it is very difficult for us to rationally process risks that have a very low probability but a very high cost. This is essentially what caused the 2008 financial crisis: a very low risk was treated as non-existent, so that when the event occurred, the system collapsed. This is exactly the kind of risk we are talking about with nuclear weapons.

Peace isn't inevitable – framing it as such increases the risk of conflict by altering threat perceptions

Jehangir 12 {Hamza, Research Associate on a National Priorities Research Project (Texas A&M – Qatar), Masters of Arts, International Relations and Globalization (University of Salford, UK) and Bachelor of Social Science, International Relations (SZABIST, Islamabad, Pakistan), “Realism, Liberalism and the Possibilities of Peace,” E-IR, 2/19, <http://www.e-ir.info/2012/02/19/realism-liberalism-and-the-possibilities-of-peace/>}

When Plato said that **only the dead have seen the end of war**, his remarks **echoed** the history of his time. War was all too often of an occurrence in ancient Greece, so much so that it might've been considered a **necessity** in some cases but a **menace** in others. From Plato's time to the contemporary period of political science and international relations theorizing, philosophers and theorists have been primarily concerned with discovering human nature, its role in social and political life as well as ways and means of giving meaning to human life. Peace has been central to this process of inquiry and thought which has led humanity to its present condition. Theories of peace and war have been central to this cognitive exercise. However, in the last three centuries, relations between nation-states have **taken the central stage**. Theories have come to light which illuminate our understanding of how nations interact, what causes them to go to war, what motivations might they have to establish peace and how these causes and motivations might be managed to reach a stage where peace is not “an armistice in a war” as Thucydides (431 BCE) stated but “a virtue, a state of mind, a disposition for benevolence, confidence, justice” as Baruch Spinoza (1670) considered it to be. Nonetheless, there are still **considerable obstacles that remain in the pursuit of peace**. Theorists have outlined them and literature has shed light on these hurdles whereas in some cases the pre-occupation with peace has also **led towards a more hostile state of international affairs amongst nations** as well as peoples.

Yes great power war – realism, fear of worse alts, failed political processes, violent human nature – their evidence twists definitions to exclude our scenarios

Lyon 14 {Rod, director of the strategy and international program at the Australian Strategic Policy Institute, executive editor of The Strategist, “No, Great Power War Isn't Obsolete,” The Diplomat, 8/22, <http://thediplomat.com/2014/08/no-great-power-war-isnt-obsolete/>}

August has seen a wave of reflection on major war. It's a question we seem to revisit every time the key anniversaries of WWI and WWII roll around, but especially this year because it's the 100th anniversary of the outbreak of WWI. Some pundits are keen to draw parallels between 1914 and 2014—though on its face **it's not apparent** to me why 2014 should be more like 1914 than 2013. Academic strategists familiar with their disciplinary history will know that the issue of whether major war's obsolete received a detailed coverage back in Survival magazine in the late 1990s. To save readers the trouble of digging through their archives, one contributor, John Mueller, argued that it was obsolete—gone the way of slavery and dueling—while others wrestled partly over how to define obsolescence and even more over how to define major war. Was the Vietnam War “major?” Was the Cold War a “war?” Michael Mandelbaum argued that perhaps major war was just a poor policy option nowadays—because of the steep rise in the costs and the thin rewards for success. It's intriguing that the question about the obsolescence of war is typically qualified by the adjective “major.” No one seems particularly keen to claim that nasty little wars—in particular, nasty little wars in faraway places—are obsolete, perhaps because they patently aren't. From memory, Mueller didn't want to call those conflicts “wars,” though; he saw those more as “opportunistic predation” (That's the reason the cover of his book, *The Remnants of War*, features an image—from the Balkan conflict in 1991—of a thug swigging

from a bottle.)[¶] Then 9/11 came along and sideswiped that whole debate. The nasty little wars of the 1990s didn't stay in faraway places. A superpower got up and marched off to war—albeit a war against al Qaeda, its supporters, and all its works. Somewhere along the line the mission became conflated with a host of other problems, and Washington ended up obsessing about the Global War on Terror for longer than it probably should have done. But Washington's behavior at least answered one question related to the Big One: **did great powers still go to war? Yes.** Now, the question still unanswered—unanswered since 1945 if you think major war has to be hot; unanswered since 1991, if you think major war can be cold—is whether or not major powers still go to war with each other.[¶] Psychologist Steven Pinker has recently argued that the better angels of our nature are making us turn away from violence. I'm not wholly convinced by his argument—the better angels of our nature **seem pretty militant to me, and always have been.** (See Ephesians, 6:12.) But academic research from a few decades back suggests that great-power wars against each other aren't common. Jack Levy in his research on war in the international system between 1495 and 1975 found only nine of what he would call “world wars”—wars where almost all great powers were involved. Much more commonly, he found “interstate wars”—113 of which engaged a great power.[¶] I cite those figures to underline two points. First, if world wars are rare, maybe we don't need special explanations to say why there hasn't been one since 1945 (hot) or 1991 (cold). Second, that definition of major war is still a problem.[¶] Let's put aside the academic arguments and look straight at the case that most worries us. Is a great-power war between the U.S. and China possible? I think we could answer that question directly: possible, **yes**; likely, no. Great powers, especially nuclear-armed ones, don't go to war with each other lightly. But sometimes wars happen. And they aren't accidents. They're about international order. They're about, as Raymond Aron said, **the life and death of states.** And the **principal** reason for fighting them is that not doing so looks like a worse alternative.[¶] Moreover, the paths to war—including rare major-power war—are not reserved solely for conventionally-armed states. Where both powers are nuclear-armed we should expect a conflict, even one at the lower rungs of the escalation ladder, to be fought with a high degree of political control, and an understanding that the objectives of the conflict are limited. Naturally, it would help if both sides shared a common understanding of where the firebreaks were between conventional and nuclear conflict, and already had in place a set of crisis-management procedures, **but it's possible that neither of those conditions might exist.** (Neither would prevent a war, but both would provide a better sense of the likely escalation dynamics of a particular conflict.) Indeed, it's because major war is possible that we retain such a keen interest in war termination. Unconstrained escalation doesn't lead to a happy place.

Yes War – A2 Interdependence

Trade doesn't solve war – empirics prove it only applies for two Western nations

Hafner-Burton and Montgomery 12 (Emilie M. Hafner-Burton PhD is a professor at the University of California, San Diego. Alexander H. Montgomery is Department Chair and Associate Professor of Political Science at Reed College. He has a B.A. 1996, Physics, University of Chicago. M.A. 1999, Energy and Resources, University of California at Berkeley. M.A. 2003, Sociology, Stanford University. Ph.D. 2006, Political Science, Stanford University. He has published articles on dismantling proliferation networks and on the effects of social networks of international organizations on interstate conflict. His research interests include political organizations, social networks, weapons of mass disruption and destruction, social studies of technology, and interstate social relations. “War, Trade, and Distrust: Why Trade Agreements Don't Always Keep the Peace”)//CW

Many before us have been skeptical of the claim that interdependence promotes[¶] peace among states. It is well understood that international institutions can have[¶] adverse effects on conflicts among member states, mismanaging crisis situations[¶] and worsening conflict intensity (Gallarotti, 1991), or producing rivalry among[¶] states due to their relative social positions (Hafner-Burton and Montgomery,[¶] 2006). We are nevertheless among the first to directly tackle the principal claims[¶] supporting the liberal thesis that trade institutions dampen conflict, and to propose[¶] an explanation for why conflict often characterizes outcomes.[¶] This is important because we observe significant instances of violent conflict[¶] between PTA members: the 1990s alone included border clashes between[¶] Armenia and Azerbaijan, members of the Commonwealth of Independent[¶] States (CIS); the outbreak of war in the Great Lakes, with foreign involvement[¶] in the Democratic Republic of

Congo from Angola, Namibia, Rwanda, Uganda, and Zimbabwe, all members of the Common Market for Eastern and Southern Africa (COMESA); the Iraqi invasion of Kuwait and violent border clashes between Egypt and Sudan, all members of the Council of Arab Economic Unity (CAEU); and fighting between India and Pakistan, members of the South Asian Association for Regional Cooperation (SAARC). North and South Korea frequently are involved in violent incidents; both are members of the Global System of Trade Preferences Among Developing Countries (GSTP). A majority of these disputants are also members of the WTO. Powers contends that in Africa, 16% of all militarized international disputes registered by the Correlates of War data from 1950 to 1992 occurred between PTA members (Powers, 2003, 2004). These examples show clearly that members of the same trade institution can and do conflict, that conflict often breaks out into violence, and that commerce is frequently not enough to keep the peace. They stand in sharp contrast to the liberal expectation that trade institutions dampen conflict through an increase in trust. Trade institutions do increase repeated contact between members; however, contact does not necessarily build trust or a sense of community. The lessons of European integration theory suggest that building community through upgrading the common interest between PTA members requires a minimum level of homogeneity: a pluralist social structure, a high level of economic and industrial development, and ideological similarity (Haas, 1960). Security communities are also most likely to develop through economic relations among Western nations, as even the most institutionalized forms of integration in the developing world cannot be said to create the mutual identification at the core of the concept (Bearce, 2003). Although evidence suggests that economic integration has led to the formation of a collective identity and trust among member states of the European Union over time, it is well understood that “democratic features of liberal democracies enable the community in the first place” (Russett and Oneal, 2001: 166). The liberal argument that trade institutions dampen conflict by building trust among leaders to overcome commitment problems consequently chiefly applies to the Western world of advanced democratic nations. Yet the overwhelming majority of trade institutions manage trade between partners that include at least one developing or nondemocratic state, and there is no evidence to show that these institutions build trust over asymmetrical distribution of gains. Boehmer, Gartzke, and Nordstrom cogently argue that states that belong to many different international institutions may have a greater number of international interests to competitively defend and a greater array of opportunities to enact aggressive behavior in defense of those perceived interests (Boehmer et al., 2002). We extend this argument one step further; trade institutions create and shape states’ interests, affecting not only the number of potential issues for dispute, but also establishing conditions that can lead to distrust. Institutions do this by placing states in social positions of power within international relations, which shape expectations for behavior by defining which issues are legitimate for contestation via military means and enable states to coerce, bribe, reward, or punish each other. We address this possibility in the next section.

Leaders value short-term benefits of aggression over long-term economic harms – economic MAD fails

Solomon 15 (Jon Solomon is a writer at Information Dissemination, a naval information blog. He is citing Eric Lorber and Jacquelyn Schneider. Eric Lorber is a PhD candidate in Political Science at Duke and a JD candidate at the University of Pennsylvania Law School. His research focuses on civil-military relations, the use of force against non-state actors, and the credibility of security guarantees. He has been a fellow at the Duke University American Grand Strategy Program, worked for the RAND Corporation, and is currently an adjunct staff member at the Institute for Defense Analyses. Jacquelyn Schneider is a PhD student in Political Science at George Washington University. Her research focuses on the intersection of national security, technology, and political psychology and covers a diverse range of topics from intelligence to unmanned technologies to cyber policy. She has won awards for Best Graduate Student Paper at both the International Studies Association Annual

Meeting (Foreign Policy Section and International Security Studies Section) and the Southwestern Social Sciences Association Annual Meeting and is a two-time award winner of the AFCEA National Intelligence Writing Contest. She holds a B.A. in Economics and Political Science from Columbia University and a M.A. in Political Science from Arizona State University. “The Fallacy of “Mutually Assured Economic Destruction” 4/24/15 <http://www.informationdissemination.net/2015/04/the-fallacy-of-mutually-assured.html>///CW

In an excellent War on the Rocks article last week, Eric Lorber and Jacquelyn Schneider argued that economic sanctions cannot serve as standalone deterrents against aggression by another state. They noted in particular how prospect theory and credibility considerations affect the utility of threatened economic punishments as a deterrent within an opponent’s decision-making: ¶ “...while these new, sophisticated sanctions often cause medium- and long-term damage to a country’s economy, the prospect of such damage may not deter aggressive actors from taking immediate actions contrary to U.S. interests. For example, in the case of Russia, while the sanctions have certainly taken a toll, the Russian economy, when supported by capital reserves, is sufficiently resilient to put off the worst impacts of the sanctions for a few years. In the short-term, however, Russia has been able to annex Crimea and exercise significant influence in rebel-controlled areas deep in Eastern Ukraine. Thus, while the prospect of economic damage may loom down the road, this risk may be insufficient to deter an aggressive actor from pursuing short-term benefits... ¶ ...Likewise and in the Russia context, given the discord among European Union member states about how to respond to additional Russian aggression, Russia may not believe that the United States and the European Union will impose additional, extremely painful sanctions on the country, and therefore may not be deterred from engaging in additional destabilizing action in Ukraine.” ¶ They conclude that a defender must understand “the aggressive actor’s intentions and motivations” in order to determine whether deterrence by economic punishment is likely to succeed; ¶ “Policymakers in Washington need to do better than conclude that ‘these sanctions will cause economic pain, therefore they will deter.’ Rather, they must analyze whether the particular sanctions on the table will influence a malicious actor’s decision-making.” ¶ In other words, the opponent’s leaders’ political objectives and perceptions of the strategic circumstances (including pressures stemming from domestic popular passions) are central variables in determining a deterrence policy’s probable efficacy. ¶ While all deterrence policies face this challenge to some degree, it tends to especially impact deterrence by punishment. The amount of threatened pain must significantly exceed the opponent’s discomfort with continuing to honor the status quo. A threat of certain national economic catastrophe is not sufficient if opponent’s leaders value some other political objective more highly or suffer from exceptional ‘strategic desperation.’ Japanese leaders proved that exact point in their decision for war during the late summer and early fall of 1941. ¶ **This does not change if a threatened economic catastrophe would affect both the aggressor and the defender.** This is the premise behind ‘mutually assured economic destruction,’ a concept rooted in the longstanding idea that the likelihood of war between competing states decreases as their economic interdependence increases. In theory, two competing countries should be mutually restrained by the risk of devastating their entwined economies. One does not have to look that far back into history to see the fallacy in this thinking: the aggressors in both World Wars valued other objects more highly than the prospects of economic disaster (to the extent economics factored into their calculus at all).

Trade doesn’t solve war

Martin et. al. ‘8 (Phillipe, University of Paris 1 Pantheon—Sorbonne, Paris School of Economics, and Centre for Economic Policy Research; Thierry MAYER, University of Paris 1 Pantheon—Sorbonne, Paris School of Economics, CEPII, and Centre for Economic Policy

Research, Mathias THOENIG, University of Geneva and Paris School of Economics, The Review of Economic Studies 75, 2008)

Does globalization pacify international relations? The “liberal” view in political science argues that increasing trade flows and the spread of free markets and democracy should limit the incentive to use military force in interstate relations. This vision, which can partly be traced back to Kant’s Essay on Perpetual Peace (1795), has been very influential: The main objective of the European trade integration process was to prevent the killing and destruction of the two World Wars from ever happening again.¹ Figure 1 suggests² however, that during the 1870–2001 period, the correlation between trade openness and military conflicts is not a clear cut one. The first era of globalization, at the end of the 19th century, was a period of rising trade openness and multiple military conflicts, culminating with World War I. Then, the interwar period was characterized by a simultaneous collapse of world trade and conflicts. After World War II, world trade increased rapidly, while the number of conflicts decreased (although the risk of a global conflict was obviously high). There is no clear evidence that the 1990s, during which trade flows increased dramatically, was a period of lower prevalence of military conflicts, even taking into account the increase in the number of sovereign states.

Yes War – A2 Deterrence

Deterrence fails – correlation isn’t causation and complex situations mean nuclear war is always possible – prefer magnitude to probability

Pelopidas 15 (Benoît Pelopidas is a lecturer (assistant professor with tenure) in international relations at the University of Bristol (Global Insecurities Center) and an affiliate of the Center for International Security and Cooperation at Stanford University. He has been awarded two international prizes for his research, from the International Studies Association and the James Martin Center for Nonproliferation Studies. His research focuses on the global politics of nuclear vulnerability, cases of near-use of nuclear weapons, and lessons learned from global nuclear history and French nuclear policies. He is currently completing an edited volume on the experience of the Cuban missile crisis worldwide as an early set of experiences of global nuclear vulnerability and its implications for security, responsibility, and alliance dynamics. “Challenging the Assumptions of Classical Nuclear Deterrence Theory: The War That Must Never Be Fought” 3/12/15, can be downloaded at <http://www.hoover.org/research/challenging-assumptions-classical-nuclear-deterrence-theory>///CW

We cannot know for sure what caused the absence of great-power wars over the last seventy years.¹⁷ We are left with dueling counterfactuals and the need to bet and trust.¹⁸ The opponents of the goal of a world without nuclear weapons create a false dichotomy between what we know for a fact and what we hypothesize. On the one hand, they argue, is the hard fact of the nuclear peace; on the other hand are other hypotheses or counterfactual reasonings. But the nuclear peace is not a fact. It is a hypothesis, trying to link two observable facts: the existence of nuclear weapons in the world since 1945 and the absence of war between the United States and the Soviet Union during the same period. The fact is that the idea of the nuclear peace and competing explanations share the same status: all are hypotheses, requiring a rerun of the history of the last seventy years, without nuclear weapons to see whether war would have broken out. The nuclear peace hypothesis is no less a counterfactual than its rivals.¹⁹ It faces the challenge of proving a negative. In these circumstances, faith in the nuclear peace becomes a bet or a matter of trust.²⁰ Moreover, we know that complex and tightly coupled systems like nuclear weapons are doomed to fail eventually, even if the frequency of failure is very low. This is because their complexity and tight coupling don’t allow for anticipating and testing of every possible failure.²¹ Given this epistemological challenge, which relies ultimately on the trust one puts in one potential cause of peace at the expense of the others and on the expected timing of

nuclear versus non-nuclear disasters, at least one question arises: is seventy years a high enough standard of evidence for us to surrender our fate to nuclear weapons forever?²²

Multiple factors complicate nuclear deterrence

Lyon 15 (Dr Rod Lyon is a Fellow - International Strategy. Rod was most recently a Senior Analyst with ASPI. He has previously lectured in International Relations at the University of Queensland where he taught courses on conflict, international security, and civil-military relations. His research interests focus on a range of problems associated with global security, nuclear strategy and Australian security. He previously worked in the Strategic Analysis Branch of the Office of National Assessments between 1985 and 1996. As a Fulbright scholar in 2004, he was a visiting research fellow at Georgetown University in Washington DC, researching a project on the future of security partnerships in the post-September 11 environment. He was appointed to the National Consultative Committee on International Security Issues in April 2005. “The New Dilemmas of Nuclear Deterrence” 7/3/15 <http://thediplomat.com/2015/07/the-new-dilemmas-of-nuclear-deterrence/>///*CW*

With nuclear modernisation programs under way across a range of countries, Russia asserting its right to deploy nuclear weapons in the Crimea, NATO reviewing the role of nuclear weapons in the alliance, and a recent report in the US arguing for a more versatile arsenal of tactical nuclear weapons, it's clear the world's revisiting an old problem: how to build effective nuclear deterrence arrangements.[¶] Since the end of the Cold War, thinking about deterrence issues has been mainly confined to the academic and think-tank world. But policymakers are now having to re-engage with those issues. And the problem has a new twist: we no longer enjoy the luxury of a bipolar world. Indeed, as Therese Delpech observed in her RAND monograph *Nuclear deterrence in the 21st century*, nowadays ‘the actors are more diverse, more opaque, and sometimes more reckless’.[¶] Done properly, deterrence is a contest in threats and nerve, or—to use Thomas Schelling's phraseology—‘the manipulation of risk’. (The chapter so titled in Schelling's *Arms and influence* is a great starting point for anyone wanting to think through the broader deterrence problem.) That helps explain why some thought the concept ‘ugly’. It's hard to make a policy threatening massive damage to societies and civilians sound noble and aspirational. Still, the bad news is that the alternatives are worse. And if deterrence is going to remain the dominant approach in nuclear weapon strategy, we need to fit the strategy to the contemporary geopolitical environment.[¶] Historical experience of the deterrence problem is greatest in relation to two competing superpowers, separated by intercontinental distances, endowed with the resources to manage challenges, and both knowing well the costs of major war. We've had relatively little experience of nuclear deterrence in contests between giants and midgets (US v North Korea), between established and fast-rising powers (US v China), and amongst players in a multipolar system. Even our understanding of the role nuclear deterrence plays in relations between regional rivals (think South Asia) remains under-developed. It's entirely possible that the old superpower deterrence model might not fit those new challenges well. Indeed, maybe the old model doesn't even fit the US–Russian strategic relationship well these days: Russia's no longer governed by a sclerotic CPSU.[¶] Some years back INSS' Elaine Bunn (now a senior official in the Obama administration) wrote a paper unpacking the notion of ‘tailored’ deterrence introduced in the 2006 Quadrennial Defense Review. True, deterrence has always been characterized by particular strategic wrinkles, but Bunn's paper was an attempt to bring those wrinkles to the fore in relation to the possibility of a nuclear-armed North Korea, Iran, or transnational terrorist group. Her exploration of three different forms of tailoring—tailoring to specific actors and specific situations; tailoring capabilities; and tailoring communications—helps to illustrate the growing complexity of the deterrence challenge.[¶] It now seems likely that we're headed back into a set of complicated deterrence debates. A strategy that might make sense in one strategic setting—for example, a degree of restraint by a giant engaged in a conflict with a midget—might well risk flagging unintended messages in another. In the giant–midget case, almost any crossing of the

nuclear threshold by the giant risks imposing a set of desperate choices on the midget's leadership, and desperate choices tend not to be good ones.¶ Deterrence in the context of an established power versus a fast-rising power has a different wrinkle. One effect of a deterrence-dominated world is to reward passivity over initiative. As Schelling notes, in the world of the arthritic, passivity tends to be the default choice. But fast-rising powers aren't arthritic. Turning one aside from a revisionist agenda will probably be more challenging than deterring another established player.¶ Multipolarity brings its own wrinkles, including a more mixed set of adversarial relationships, asymmetrical contests, inadvertent signalling, and third-party exploitation of bilateral rivalries. Capability issues become more vexed: actors require the capabilities to deter and defend against another, but also the residual capabilities to remain a player in other contests. The pressure must surely be towards larger rather than smaller arsenals. And reputational issues become more dominant: just as Margaret Thatcher fought the Falklands War in part to show the Soviet Union that the West wouldn't buckle in the face of force, so too players in a multipolar nuclear world will want to show resolve in one contest because of its implications for others.¶ Finally, and perhaps most controversially, deterrence turns upon a credible threat to cross the nuclear threshold if push comes to shove. During the 1960s the US advocated a doctrine of flexible response, arguing for a model of deterrence that would fail in small packets rather than in one catastrophic breakdown. Notwithstanding the giant-midget problem outlined above, there's usually good sense behind such a doctrine: it makes deterrent threats more credible, avoids global annihilation in any initial crossing of the nuclear threshold, maintains a degree of 'intra-war deterrence' from the options still on the table, and optimizes prospects for negotiated war termination. But historically the doctrine invited questions about the relative balance between usability and credibility in US nuclear policy—questions buried rather than resolved by the end of the Cold War.¶ Tailoring, messaging, usability, credibility, and thresholds: I suspect policymakers will soon be thinking about all those questions again, across a range of deterrence relationships.¶

Asymmetry of multipolar world takes out deterrence theory

Goodby 15 (James E. Goodby has served in the US Foreign Service, achieving the rank of Career Minister, and was appointed to five ambassadorial-rank positions by Presidents Carter, Reagan, and Clinton, including ambassador to Finland. He taught at Georgetown, Syracuse, and Carnegie Mellon Universities and is Distinguished Service Professor Emeritus at Carnegie Mellon. Ambassador Goodby has worked with former Secretary of State George Shultz at Hoover since 2007. He is a research fellow at the Hoover Institution and a senior fellow with the Center for Northeast Asia Policy Studies at the Brookings Institution.¶ He was a Distinguished Service Professor at Carnegie Mellon University from 1989 to 1999 and is now a professor emeritus. Selected for the US Foreign Service through competitive examinations in 1952, Goodby rose to the rank of career minister in the Senior Foreign Service and was given five presidential appointments to ambassadorial rank, including ambassador to Finland (1980–81). During his Foreign Service career he was involved as a negotiator or as a policy adviser in the creation of the International Atomic Energy Agency, the negotiation of the limited nuclear test ban treaty, START, the Conference on Disarmament in Europe, and cooperative threat reduction (the Nunn-Lugar program).¶ Goodby's awards include the Presidential Distinguished Service Award, the State Department's Superior and Distinguished Honor Awards, and the Commander's Cross of the Order of Merit of Germany. He was named a Distinguished Fellow of the US Institute of Peace in 1992. He was the recipient of the inaugural Heinz Award in Public Policy in 1995. In 1996, he was awarded an honorary doctor of laws degree by the Stetson University College of

Law. "The New Dilemmas of Nuclear Deterrence" 7/3/15 <http://thediplomat.com/2015/07/the-new-dilemmas-of-nuclear-deterrence/>///CW

During the Cold War, nuclear deterrence was essentially a US-Soviet calculation. After the Cold War, China began to loom larger in US planning, but the premise that deterrence was essentially a bilateral interaction remained. In the future, situations that are not demonstrably bilateral may become the norm. Even now, but especially in the event global nonproliferation efforts fail to meet current challenges, the nuclear deterrence calculations of the United States and other states armed with nuclear weapons will have to be based on a much more complex set of global and regional dynamics. In such a system, if nuclear weapons were used or even if their use were threatened, there would be an action-and-reaction effect that might involve several nations, not just two as in the Cold War paradigm. For example, the alert status of nuclear delivery systems probably would be changed to a higher level of readiness by several nations. There might be movements of air and naval forces equipped with nuclear weapons. A great deal of ambiguity can be expected in the event of a nuclear explosion as to which nation had detonated a nuclear weapon. Once nuclear weapons attacks occurred, terminating the war could be difficult. Conceivably, three or four nuclear-armed states could become engaged in hostilities that might have originated with just one nation initiating a nuclear attack. The dynamics of nuclear conflict in the Middle East, South Asia, or Northeast Asia would require qualitatively different deterrent calculations from those the five Non-Proliferation Treaty nuclear weapons states have been accustomed to making. "Catalytic" nuclear war was one of the worries of the Kennedy and Johnson administrations. It meant that the United States could become engaged in a nuclear war because a nuclear-armed US ally had used a nuclear weapon and their common adversary, the Soviet Union, had decided to use nuclear weapons in response. Those worries would also figure in a complex world of perhaps fifteen or so nuclear-armed states, which would also include the unknown capabilities of terrorist groups and the likelihood that cyber-mischief would accompany any nuclear attack. How does one measure strategic stability in such a situation?

Luck, not deterrence, accounts for nuclear peace

Pelopidas 15 (Benoît Pelopidas is a lecturer (assistant professor with tenure) in international relations at the University of Bristol (Global Insecurities Center) and an affiliate of the Center for International Security and Cooperation at Stanford University. Luck is too often taken as a confirmation that nuclear deterrence kept the peace.²⁸ But luck should not be misread as successful deterrence.²⁹ More accurately, as Thomas Schelling noted, leaders of nuclear-armed states can make threats that "leave something to chance"³⁰—recognizing that things could spiral out of control and nuclear weapons could be used even if they do not intend to use them—to make those threats more credible. But including luck in a successful deterrence strategy, as if you could control it, is both a conceptual confusion and a retrospective illusion.³¹ Luck was on our side this time, but this is not a consequence of purposeful action. For example, during the night of October 26–27, 1962, at the height of the Cuban missile crisis, an American U-2 spy plane strayed into Soviet airspace over the Arctic. Soviet fighter jets scrambled to intercept the U-2 while F-102 interceptors were sent to escort it

home and prevent Soviet MIGs from freely entering US airspace. Given the circumstances, the F-102s conventional air-to-air missiles had been replaced with nuclear-tipped ones and their pilots could decide to use nuclear weapons. According to Scott Sagan in *The Limits of Safety*, “the interceptors at Galena were armed with the nuclear Falcon air-to-air missiles and, under existing safety rules, were authorized to carry the weapons in full readiness condition in any ‘active air defense’ mission.”³² Fortunately, the spy plane turned back and the Soviet jets held their fire.³³ There are many other instances in which deterrence cannot account for favorable outcomes.³⁴ Robert McNamara was direct about the role of luck during the Cuban missile crisis: According to former Soviet military leaders, at the height of the crisis, Soviet forces in Cuba possessed 162 nuclear warheads, including at least 90 tactical warheads. [And the United States was not aware of that at the time.] At about the same time, Cuban President Fidel Castro asked the Soviet ambassador to Cuba to send a cable to Soviet Premier Nikita Khrushchev stating that Castro urged him to counter a U.S. attack with a nuclear response. Clearly, there was a high risk that in the face of a U.S. attack, which many in the U.S. government were prepared to recommend to President Kennedy, the Soviet forces in Cuba would have decided to use their nuclear weapons rather than lose them. Only a few years ago did we learn that the four Soviet submarines trailing the U.S. Naval vessels near Cuba each carried torpedoes with nuclear warheads. Each of the sub commanders had the authority to launch his torpedoes. The situation was even more frightening because, as the lead commander recounted to me, the subs were out of communication with their Soviet bases, and they continued their patrols for four days after Khrushchev announced the withdrawal of the missiles from Cuba. The lesson, if it had not been clear before, was made so at a conference on the crisis held in Havana in 1992. . . . Near the end of that meeting, I asked Castro whether he would have recommended that Khrushchev use the weapons in the face of a U.S. invasion, and if so, how he thought the United States would respond. “We started from the assumption that if there was an invasion of Cuba, nuclear war would erupt,” Castro replied. “We were certain of that. . . . [W]e would be forced to pay the price that we would disappear.” He continued, “Would I have been ready to use nuclear weapons? Yes, I would have agreed to the use of nuclear weapons.” And he added, “If Mr. McNamara or Mr. Kennedy had been in our place, and had their country been invaded, or their country was going to be occupied . . . I believe they would have used tactical nuclear weapons.” I hope that President Kennedy and I would not have behaved as Castro suggested we would have. . . . Had we responded in a similar way the damage to the United States would have been unthinkable. But human beings are fallible [emphasis added].³⁵ This fascinating account shows how lack of information, misperception, and ideology could have led to disaster if we had not been lucky. But false information, lack of information, and misperceptions were not the only reason why luck was the decisive cause of the positive outcome of the Cuban missile crisis. Limits of safety, limits of command and control, and organizational problems also have to be taken into account. As Scott Sagan wrote: Many serious safety problems, which could have resulted in an accidental or unauthorized detonation or a serious provocation to the Soviet government, occurred during the crisis. None of these incidents led to inadvertent escalation or an accidental war. All of them, however, had the potential to do so. President Kennedy may well have been prudent. He did not, however, have unchallenged final control over U.S. nuclear weapons.³⁶ Most-recent studies show that sloppy practices in nuclear weapons management have occurred at all levels of decision-makers, leaders, nuclear safety and security teams, and top-level military personnel in most nuclear-weapon states. They also show the limits of learning from past sloppy practices. Confidence in perfect nuclear safety is still a matter of wishing for the best and relying on luck.³⁷ One telling example of this occurred at Minot Air Force Base in North Dakota in

2007. This offers a well-documented case of multiple sloppy practices and suggests the limits of learning after the incident was identified. On August 29–30, 2007, six US nuclear-armed cruise missile warheads were mistakenly flown to Barksdale Air Force Base in Louisiana. They had been placed by mistake under the wings of a B-52; the weapons had not been guarded appropriately during a thirty-six-hour period. Had the plane experienced any problems in flight, the crew would not have followed the proper emergency procedures.³⁸ After this widely publicized case of sloppy practices,³⁹ US Secretary of Defense Robert Gates emphasized the need for responsibility in handling nuclear weapons: “The problems were the result of a long-standing slide in the Service’s nuclear stewardship. . . . For your part, you must never take your duties lightly. There is simply no room for error. Yours is the most sensitive mission in the entire US military.”⁴⁰ Change and improvement were supposed to follow, but even on the base where the incident took place and where the Secretary of Defense came to give his speech, it was necessary to repeat the order to leave no room for error. In April 2013, one officer from the 91st Missile Wing at the same Air Force Base in North Dakota was punished for sleeping on the job while having the blast door open behind him. (Sleeping wasn’t prohibited on a twenty-four-hour shift, but leaving the blast door open was.) He was one of two missile officers sanctioned that year for such a fault and he told his superiors that it wasn’t the first time.⁴¹ Air Force officers told the Associated Press that such violations of the safety procedures had happened more often than just in the two documented cases.⁴² The limits of safety, the limits of command and control, and the persistence of sloppy practices even in the US nuclear forces suggest that the role of luck is likely to have been even more important than we can document here. (three different groups) of the payload installed in those cruise missiles, those procedures were not followed.” The quotes for the account of this particular accident are taken from the unclassified account available in the February 2008 report from the Defense Science Board Permanent Task Force on Nuclear Weapons Surety, entitled Report on the Unauthorized Movement of Nuclear Weapons. There are no reliable records of nuclear weapons accidents or close calls in most nuclear-weapon states.

A2 Tepperman

Tepperman’s thesis ignores complexities and accidents – expert consensus

Shaw 9 (Douglas B. Shaw serves as the Associate Dean for Planning, Research, and External Relations at the George Washington University’s Elliott School of International Affairs with a concurrent appointment as an Assistant Professor of International Affairs. Doug previously served as Director of Policy Planning in the Office of the President at Georgetown University, on the U.S. Department of Energy’s Nuclear Material Security Task Force, at the U.S. Arms Control and Disarmament Agency, and in leadership roles for a number of non-governmental organizations including Physicians for Social Responsibility, the Lawyers Alliance for World Security, and the Institute on Religion and Public Policy. Doug holds a Ph.D. in international relations from Georgetown University and has lectured on nuclear nonproliferation and disarmament on four continents. “Newsweek misrepresents nuclear weapons scholarship” 9/1/9 <http://nukesonablog.blogspot.com/2009/09/newsweek-misrepresents-nuclear-weapons.html>///**CW**

Jonathan Tepperman’s thesis in his September 7th Newsweek article “Why Obama should Learn to Love the Bomb” that “a growing and compelling body of research suggests that nuclear weapons may not, in fact, make the world more dangerous” badly misrepresents the state of scholarship on this crucial topic. First, Tepperman references a handful of scholars to make his argument while dismissing the majority who disagree with him. George P. Shultz, William J. Perry, Henry A. Kissinger, and Sam Nunn opposed this view in two op-eds in the Wall Street Journal and other leading scholars and practitioners participated in a 2007 conference at Stanford University, now memorialized as a 500-page volume, Reykjavik Revisited. Scores of experts are

summarily excluded from Tepperman's article.¶ Second, Tepperman suggests a robust understanding of how deterrence relates to today's challenges where none exists. Nuclear deterrence scholar Sir Lawrence Freedman observed a "lost generation" of nuclear weapons specialists in remarks at the Elliott School of International Affairs this spring and Commander of the U.S. Strategic Command, General Kevin Chilton, observed this summer "we have allowed an entire generation to skip class, as it were, on the subject of strategic deterrence." More scholarship is needed to translate "nuclear optimism" and other Cold War concepts into the Twenty-first Century.¶ Third, in over 2,700 words on deterrence, not one of them is "accident." This is a catastrophic flaw in characterizing scholarly debate on nuclear weapons. Kenneth Waltz, cited by Tepperman as "the leading nuclear optimist" underlines this point by co-authoring a book titled *The Spread of Nuclear Weapons: A Debate Renewed* with Stanford University's Scott Sagan who has done decades of careful scholarship to demonstrate the relevance of accidents to nuclear deterrence.¶ Tepperman's "iron logic" of deterrence is undermined by a more unstable plutonium logic that can only be understood by the combined lights of physics, engineering, political science, economics, and at least more than a dozen other disciplines that James Doyle of Los Alamos National Laboratory argues constitute "nuclear security science." The nuclear future ahead of us is long, imperfect, and badly in need of more research and more informed public debate.¶

A2 Empirics

Their empirics argument is historically false

Pelopidas 15 (Benoît Pelopidas is a lecturer (assistant professor with tenure) in international relations at the University of Bristol (Global Insecurities Center) and an affiliate of the Center for International Security and Cooperation at Stanford University. He has been awarded two international prizes for his research, from the International Studies Association and the James Martin Center for Nonproliferation Studies. His research focuses on the global politics of nuclear vulnerability, cases of near-use of nuclear weapons, and lessons learned from global nuclear history and French nuclear policies. He is currently completing an edited volume on the experience of the Cuban missile crisis worldwide as an early set of experiences of global nuclear vulnerability and its implications for security, responsibility, and alliance dynamics. The limits of nuclear deterrence as a peacemaker²³¶ Critics of abolition portray a world without nuclear weapons as warprone,¶ and believe that nuclear weapons are a necessary and sufficient,¶ cause for great-power peace. This is only the latest instance of an idea,¶ that has repeatedly been proven wrong, since at least 1860: the expectation,¶ that the unprecedented destructiveness of a new weapon system,¶ and the threat of its use will put an end to war. This was wrong for dynamite,¶ submarines, artillery, smokeless powder, the machine gun, and poison,¶ gas.²⁴ Was nuclear deterrence a necessary and sufficient cause for,¶ peace among great powers? Most critics of the idea of a world without,¶ nuclear weapons maintain that it was. They argue that the nuclear-armed,¶ states never fought a war against each other.²⁵ This can now be proven,¶ wrong. The 1969 border clash between China and Russia²⁶ and, more,¶ recently, the 1999 Kargil crisis between India and Pakistan show that,¶ the conventional wisdom that a nuclear-armed state cannot be attacked,¶ is historically inaccurate. Moreover, nuclear-armed states have been,¶ attacked by non-nuclear-weapon states on multiple occasions. US troops,¶ were attacked by Chinese forces in 1950 in Korea and by Vietnamese,¶ forces in the 1960s and 1970s; Israel was attacked by Syria and Egypt,¶ in 1973 and by Iraq in 1991; and in 1982, Argentina invaded the British,¶ Falkland Islands.²⁷ This narrows down the claims for nuclear weapons,¶ as peacemakers. More importantly, even this narrower claim needs,¶ to be reexamined taking into account two facts: (1) avoidance of several,¶ nuclear disasters was due to luck and cannot be explained by,¶ nuclear

deterrence; and (2) deterrence as a strategy has favored more, risk-prone strategies and in some cases made war possible instead of, preventing it.

High-Magnitude, Low Probability = Good

High magnitude, low probability events first

Bostrom 13

[Nick, Philosopher and professor (Oxford), Ph.D. (LSOE), director of The Future of Humanity Institute and the Programme on the Impacts of Future Technology, of course, he's also the inaugural recipient of "The Eugene R. Gannon Award for the Continued Pursuit of Human Advancement," "Existential Risk Prevention as Global Priority," Global Policy, Vol 4, Issue 1, <http://www.existential-risk.org/concept.html>]

1. The maxim rule 1.1. Existential risk and uncertainty An existential risk is one that threatens the premature extinction of Earth-originating intelligent life or the permanent and drastic destruction of its potential for desirable future development (Bostrom 2002). Although it is often difficult to assess the probability of existential risks, there are many reasons to suppose that the total such risk confronting humanity over the next few centuries is significant. Estimates of 10-20% total existential risk in this century are fairly typical among those who have examined the issue, though inevitably such estimates rely heavily on subjective judgment.¹ The most reasonable estimate might be substantially higher or lower. But perhaps the strongest reason for judging the total existential risk within the next few centuries to be significant is the extreme magnitude of the values at stake. Even a small probability of existential catastrophe could be highly practically significant (Bostrom 2003; Matheny 2007; Posner 2004; Weitzman 2009). Humanity has survived what we might call natural existential risks for hundreds of thousands of years; thus it is prima facie unlikely that any of them will do us in within the next hundred.² This conclusion is buttressed when we analyze specific risks from nature, such as asteroid impacts, supervolcanic eruptions, earthquakes, gamma-ray bursts, and so forth: Empirical impact distributions and scientific models suggest that the likelihood of extinction because of these kinds of risk is extremely small on a time scale of a century or so.³ In contrast, our species is introducing entirely new kinds of existential risk — threats we have no track record of surviving. Our longevity as a species therefore offers no strong prior grounds for confident optimism. Consideration of specific existential-risk scenarios bears out the suspicion that the great bulk of existential risk in the foreseeable future consists of anthropogenic existential risks — that is, those arising from human activity. In particular, most of the biggest existential risks seem to be linked to potential future technological breakthroughs that may radically expand our ability to manipulate the external world or our own biology. As our powers expand, so will the scale of their potential consequences — intended and unintended, positive and negative. For example, there appear to be significant existential risks in some of the advanced forms of biotechnology, molecular nanotechnology, and machine intelligence that might be developed in the decades ahead. The bulk of existential risk over the next century may thus reside in rather speculative scenarios to which we cannot assign precise probabilities through any rigorous statistical or scientific method. But the fact that the probability of some risk is difficult to quantify does not imply that the risk is negligible. Probability can be understood in different senses. Most relevant here is the epistemic sense in which probability is construed as (something like) the credence that an ideally reasonable observer should assign to the risk's materializing based on currently available evidence.⁴ If something cannot presently be known to be objectively safe, it is risky at least in the subjective sense relevant to decision making. An empty cave is unsafe in just this sense if you cannot tell whether or not it is home to a hungry lion. It would be rational for you to avoid the cave if you reasonably judge that the expected harm of entry outweighs the expected benefit. The uncertainty and error-proneness of our first-order assessments of risk is itself something we must factor into our all-things-considered probability assignments. This factor often dominates in low-probability, high-consequence risks — especially those involving poorly understood natural phenomena, complex social dynamics, or new technology, or that are difficult to assess for other reasons. Suppose that some scientific analysis A indicates that some catastrophe X has an extremely small probability $P(X)$ of occurring. Then the probability that A has some hidden crucial flaw may easily be much greater than $P(X)$.⁵ Furthermore, the conditional probability of X given that A

is crucially flawed, $P(X|\neg A)$, may be fairly high. We may then find that most of the risk of X resides in the uncertainty of our scientific assessment that $P(X)$ was small (figure 1) (Ord, Hillerbrand and Sandberg 2010).

Possibilistic thinking best for decision-making

Clarke 5

[Lee, member of a National Academy of Science committee that considered decision-making models, Anschutz Distinguished Scholar at Princeton University, Fellow of AAAS, Professor Sociology (Rutgers), Ph.D. (SUNY), “Lee Clarke's Worst Cases: An Interview with Lee Clarke,” UChicago press, <http://www.press.uchicago.edu/Misc/Chicago/108597in.html>]

Question: Why focus on worst cases? They probably won't happen, right? Why not focus on scenarios that have a greater degree of probability? Lee Clarke: One of the main ideas in Worst Cases is that we can use possibilistic thinking to balance probabilistic thinking. Over the past couple of hundred years probabilism has come to be thought of as the only way to reason rationally. But I think that it sometimes makes perfectly good sense to take worst case consequences into account when people are making decisions. For example, the chances of getting into a commercial airline crash are extremely low. People who fly know that, and that's why they're willing to defy gravity every day. **But they also know** what happens if the plane gets into serious trouble at thirty thousand feet. That's worst case, possibilistic thinking. It is reasonable to worry about both. It is true, in a sense, that worst cases probably won't happen. Still, as the political scientist Scott Sagan has said, things that have never happened before happen all the time. Just think of Chernobyl or 9/11. They had a low probability of occurring at any given time, but who would say now that we should have ignored them? It's the same kind of thing as when you buy life insurance. Is it likely that you will die today? Probably not. But if you have life insurance you're actually betting the insurance company that, in fact, you will die today. Is that irrational? Not at all. We say that people who don't buy life insurance are **irresponsible**.

Consequentialism Good

Public Health surveillance requires consequentialist framing- public health outweighs minor violations of rights most of the time

Petrini 13 (Carlo Petrini. Unità di Bioetica, Presidenza, Istituto Superiore di Sanità. “Ethics in Public Health Surveillance.” 2013. P. 352.

<http://www.scielosp.org/pdf/aiss/v49n4/v49n4a05.pdf>)EMerz

The ethical problems posed by public health surveillance have been specifically addressed in numerous studies in the past, and various factors have led to an increase in this interest in recent years, including the diffusion of new and unforeseen epidemics and a greater awareness of and sensitivity towards the issues involved [57]. The checklists shown above can help to assess the compatibility of public health surveillance programmes with ethical principles. One of the major problems highlighted by these tools is the fact that, given the virtual impossibility of obtaining informed consent, programmes for public health surveillance frequently necessitate an infringement of the principle of autonomy. Today it is widely accepted that “Overriding individual autonomy must be justified in terms of the obligation of public health to improve population health, reduce inequities, attend to the health of vulnerable and systematically disadvantaged persons, and prevent harm. In addition, data elements collected without consent must represent the minimal necessary interference, lead to effective public health action, and be maintained securely” [15]. Returning to Childress and co-authors, they suggest five useful

“conditions intended to help determine whether promoting **public health warrants overriding such values** as individual liberty or justice in particular cases”. These conditions encapsulate the key criteria referred to in the various checklists. They are: effectiveness; proportionality; necessity; least infringement; public justification” [55]. In summarising the criteria listed above it may also be helpful to refer to a proposal formulated by the noted biolaw expert Lawrence Gostin on the spread of Severe Acute Respiratory Syndrome (SARS). His concise proposal makes a suitable and practical conclusion: “Coercive measures, which violate individual rights, are acceptable when: - the risk to public health is demonstrable; - the intervention is likely to be effective, cost-effective, not overly invasive, fairly distributed; - the process for pursuing intervention is just and publicly transparent” [58].

Utilitarianism Good

Adopt a framework of public health utilitarianism – this avoids the traditional trap of sacrificing the few for the many but maintains the best possible consequences

Gostin 10 (Lawrence O. Gostin has more qualifications than any other card put out in the past 30 years. He is University Professor, Georgetown University's highest academic rank conferred by the University President. Prof. Gostin directs the O'Neill Institute for National and Global Health Law and was the Founding O'Neill Chair in Global Health Law. He served as Associate Dean for Research at Georgetown Law from 2004 to 2008. He is Professor of Medicine at Georgetown University, Professor of Public Health at the Johns Hopkins University, and Director of the Center for Law & the Public's Health at Johns Hopkins and Georgetown Universities. Prof. Gostin is the Director of the World Health Organization Collaborating Center on Public Health Law & Human Rights. He also serves on the WHO Director-General's Advisory Committee on Reforming the World Health Organization. In 2007, the WHO Director-General appointed Prof. Gostin to the International Health Regulations (IHR) Roster of Experts and the Expert Advisory Panel on Mental Health. In a 2012 systematic empirical analysis of legal scholarship, independent researchers ranked Prof. Gostin 1st in the nation in productivity among all law professors, and 11th in in impact and influence. “Public Health Law, Ethics, and Human Rights: Mapping the Issues” <http://www.publichealthlaw.net/Reader/ch1/ch1.htm>///*CW*

The application of general ethical principles to public health decisions can be difficult and complicated. Since the mission of public health is to achieve the greatest health benefits for the greatest number of people, it draws from the traditions of utilitarianism or consequentialism. The “public health model,” argue Buchanan (2000) and his colleagues, uncritically assumes that the appropriate mode of evaluating options is some form of cost-benefit (or cost-effectiveness) calculation—the aggregation of goods and bads (costs and benefits) across individuals. Public health, according to this view, appears to permit, or even require, that the most fundamental interests of individuals be sacrificed in order to produce the best overall outcome.¶ This characterization misperceives, or at least oversimplifies, the public health approach. The field of public health is interested in securing the greatest benefits for the most people. But public health does not simply aggregate benefits and burdens, choosing the policy that produces the most good and the least harm. Rather, the overwhelming majority of public health interventions are intended to benefit the whole population, without knowingly harming individuals or groups. When public health authorities work in the areas of tobacco control, the environment, or occupational safety, for example, their belief is that everyone will benefit from smoking cessation, clean air, and safe workplaces. Certainly, public health focuses almost exclusively on one vision of the “common good” (health, not wealth or prosperity), but this is not the same thing as sacrificing fundamental

interests to produce the best overall outcome.¶ The public health approach, of course, does follow a version of the harm principle. Thus, public health authorities regulate individuals or businesses that endanger the community. The objective is to prevent unreasonable risks that jeopardize the public's health and safety— e.g, polluting a stream, practicing medicine without a license, or exposing others to an infectious disease. More controversially, public health authorities often recommend paternalistic interventions such as mandatory seat belt or motorcycle helmet laws. Public health authorities reason that the sacrifice asked of individuals is relatively minimal and the communal benefits substantial. Few public health experts advocate denial of fundamental interests in the name of paternalism. In the public health model, individual interests in autonomy, privacy, liberty, and property are taken seriously, but they do not invariably trump community health benefits.¶ The public health approach, therefore, differs from modern liberalism primarily in its preferences for balancing— public health favors community benefits, while liberalism favors liberty interests. Characterizing public health as a utilitarian sacrifice of fundamental personal interests is as unfair as characterizing liberalism as a sacrifice of vital communal interests. Both traditions would deny this kind of oversimplification.

Bioethics in the context of health surveillance requires that the government value public health over individual interests

Childress 2 (James Childress. University Professor and the John Allen Hollingsworth Professor of Ethics at the University of Virginia. “Public Health Ethics: Mapping the Terrain.” 2002. P. 171. file:///C:/Users/Emily/Downloads/Childress_et_al-2002-The_Journal_of_Law,_Medicine_&_Ethics.pdf)//EMerz

In view of public health's goal of producing net health benefits for the population, this meaning of public is very important. In measurement and analysis, the “numerical public” reflects the utilitarian view that each individual counts as one and only one. In this context, ethical analysis focuses on issues in measurement, many of which raise considerations of justice. For example, how should we define a population, how should we compare gains in life expectancy with gains in health-related quality of life, and whose values should be used in making those judgments? Second, public is what we collectively do through government and public agency - we can call this “political public.” Government provides much of the funding for a vast array of public health functions, and public health professionals in governmental roles are the focal point of much collective activity. In the United States, as Lawrence Gostin notes, government “is compelled by its role as the elected representative of the community to act affirmatively to promote the health of the people.” even though it “cannot unduly invade individuals' rights in the name of the communal The government is a central player in public health because of the collective responsibility it must assume and implement. The state's use of its police powers for public health raises important ethical questions, particularly about the justification and limits of governmental coercion and about its duty to treat all citizens equally in exercising these powers. In a liberal, pluralistic democracy, the justification of coercive policies, as well as other policies, must rest on moral reasons that the public in whose name the policies are carried out could reasonably be expected to accept.I Third, public, defined as what we do collectively in a broad sense, includes all forms of social and community action affecting public health - we can call this “communal public.” Ethical analysis on this level extends beyond the political public. People collectively,

outside of government and with private funds, often have greater freedom to undertake public health interventions since they do not have to justify their actions to the political public. However, their actions are still subject to various moral requirements, including, for instance, respect for individual autonomy, liberty, privacy and confidentiality, and transparency in disclosure of conflicts of interest.

Using a cost benefit analysis to address health surveillance is key to balance conflict of interests

Childress 2 (James Childress. University Professor and the John Allen Hollingsworth Professor of Ethics at the University of Virginia. "Public Health Ethics: Mapping the Terrain." 2002. P. 171. file:///C:/Users/Emily/Downloads/Childress_et_al-2002-The_Journal_of_Law,_Medicine_&_Ethics.pdf//EMerz

Conceptions of morality usually recognize a formal requirement of universalizability in addition to a substantive requirement of attention to human welfare. Whatever language is used, this formal feature requires that we treat similar cases in a similar way. This requirement undergirds casuistical reasoning in morality as well as in law. In public health ethics, for example, any recommendations for an HIV screening policy must take into account both past precedents in screening for other infectious diseases and the precedents the new policy will create for, say, screening for genetic conditions. Much of the moral argument will hinge on which similarities and differences between cases are morally relevant, and that argument will often, though not always, appeal to general moral considerations.* We can establish the relevance of a set of these considerations in part by looking at the kinds of moral appeals that public health agents make in deliberating about and justifying their actions as well as at debates about moral issues in public health. The relevant general moral considerations include: producing benefits; avoiding, preventing, and removing harms; producing the maximal balance of benefits over harms and other costs (often called utility); distributing benefits and burdens fairly (distributive justice) and ensuring public participation, including the participation of affected parties (procedural justice); respecting autonomous choices and actions, including liberty of action; protecting privacy and confidentiality; keeping promises and commitments; disclosing information as well as speaking honestly and truthfully (often grouped under transparency); and building and maintaining trust. Several of these general moral considerations - especially benefiting others, preventing and removing harms, and utility - provide a prima facie warrant for many activities in pursuit of the goal of public health. It is sufficient for our purposes to note that public health activities have their grounding in general moral considerations, and that public health identifies one major broad benefit that societies and governments ought to pursue. The relation of public health to the whole set of general moral considerations is complex. Some general moral considerations support this pursuit; institutionalizing several others may be a condition for or means to public health (we address this point later when we discuss human rights and public health); and yet, in particular cases, some of the same general moral considerations may limit or constrain what may be done in pursuit of public health. Hence, conflicts may occur among these general moral considerations

Agency to ensure legal compliance with HR obligations is key to restore credibility

Shattuck '08- CEO of the John F. Kennedy Library Foundation and a lecturer on U.S. foreign policy at Tufts University (John S., "Restoring U.S. Credibility on Human Rights," Vol. 35 No. 4, http://www.americanbar.org/publications/human_rights_magazine_home/human_rights_vol35_2008/human_rights_fall2008/hr_fall08_shattuck.html) VD

U.S. Commission on Human Rights. A permanent institution could be created to monitor the U.S. government's compliance with its legal obligations on human rights. I urge you to endorse legislation pending in Congress that would establish a United States Commission on Human Rights with oversight authority and subpoena power. The legislation would require the executive branch to provide regular reports to the commission on its implementation of international human rights treaties such as the Torture Convention and the Geneva Conventions.

Counter-Terrorism Assistance Key to restore US credibility

Shattuck '08- CEO of the John F. Kennedy Library Foundation and a lecturer on U.S. foreign policy at Tufts University (John S., "Restoring U.S. Credibility on Human Rights," Vol. 35 No. 4, http://www.americanbar.org/publications/human_rights_magazine_home/human_rights_vol35_2008/human_rights_fall2008/hr_fall08_shattuck.html) VD

Counterterrorism Assistance. The United States could provide assistance to other countries for counterterrorism operations that comply with basic standards on human rights. "Fighting terror" has become a convenient excuse for repressive regimes around the world to engage in further repression, often leading to more terrorism in an increasing cycle of violence. To break this cycle, this country could provide assistance and training to foreign military and law enforcement personnel in methods of fighting terrorism within the rule of law.

Promotion of Democracy and HR assistant is key to restore US credibility

Shattuck '08- CEO of the John F. Kennedy Library Foundation and a lecturer on U.S. foreign policy at Tufts University (John S., "Restoring U.S. Credibility on Human Rights," Vol. 35 No. 4, http://www.americanbar.org/publications/human_rights_magazine_home/human_rights_vol35_2008/human_rights_fall2008/hr_fall08_shattuck.html) VD

Democracy and Human Rights Assistance. The United States should find appropriate ways to support those seeking to promote the rule of law, democracy, and human rights within their own countries. Democracy and human rights activists are the shock troops in the struggle against terrorism. But democracy and human rights can never be delivered from the barrel of a gun. Assistance to those working to build their own democratic societies must be carefully planned, sustained over time, and based on a thorough understanding of the unique circumstances and profound differences among cultures, religions, and countries. The new administration should work within a multilateral framework to assist those struggling around the world to bring democracy and human rights to their own societies.

Evoking the Doctrine of Responsibility to Protect is key to restore US credibility

Shattuck '08- CEO of the John F. Kennedy Library Foundation and a lecturer on U.S. foreign policy at Tufts University (John S., "Restoring U.S. Credibility on Human Rights," Vol. 35 No. 4, http://www.americanbar.org/publications/human_rights_magazine_home/human_rights_vol35_2008/human_rights_fall2008/hr_fall08_shattuck.html) VD

Responsibility to Protect. The United States should join with other countries, alliances, and international organizations to prevent or stop crimes against humanity and genocide. Mr. President, you could invoke the Doctrine of Responsibility to Protect, adopted by the UN General Assembly in 2006, to work with other leaders to develop effective multilateral methods of preventing human rights catastrophes such as Rwanda, Bosnia, Kosovo, and Darfur. Diplomatic and economic tools should be

employed first to head off impending genocides, but multilateral military intervention must remain available under international law if other means have been exhausted.¶ By recommitting the United States to a foreign policy conducted within a framework of human rights and the rule of law, President Obama, you can restore America's moral leadership in the world, and, by doing so, strengthen U.S. national security.

US HR promotion will have no effect on other countries

Walt '13- Robert and Renée Belfer professor of international relations at Harvard University (Stephen W., "China grades America's human rights conduct," April 2013, <http://foreignpolicy.com/2013/04/23/china-grades-americas-human-rights-conduct/>) VD

One of the cool things about being as powerful and fortunate as the United States is that you get to preach to other countries about how they ought to behave. In that spirit, the U.S. State Department puts out a human rights report every year, and basically wags its finger at countries that don't measure up. Of course, the report tends to go easy on close allies, but it's still a useful document. Among other things, it provides data that scholars interested in human rights can use to test their ideas about the causes of violations and the policies that might alleviate them.¶ But as you might expect, the world isn't just sitting around and passively accepting report cards from Washington anymore. Case in point: China has just released its own human rights report on the United States, and it makes for rather interesting reading. It's hardly an objective assessment of life in America, of course, but much of the information contained within it is factually accurate. The incidence of gun violence and crime in the U.S. is far above the level of other industrial democracies, and having the world's highest incarceration rate is not exactly consistent with being the "Land of the Free." China's point is that the United States is being pretty hypocritical in singling out other countries, and maybe we ought to remove the log in our own eye before we start telling everyone else what to do. Add to this the recent bipartisan report confirming that Bush-era officials authorized the widespread use of torture and the fact that none of them has ever been indicted or prosecuted, and American hypocrisy on this score looks even more damning.¶¶ The Chinese report may not be objective, and the fact that U.S. leaders authorized torture does not mean Washington hasn't done plenty of morally admirable things too. But this gap between America's professed ideals and its actual behavior matters. Not just in moral terms, but in terms of power and global influence too. Smaller and weaker states are more likely to tolerate American primacy if they think the United States is a generally good society and led by individuals who are not just ruthlessly self-interested. They will be more willing to tolerate the asymmetry of power in America's favor if they think that power is used for the greater good. The more that others view the United States as hypocritical, self-absorbed, and indifferent to others, the more likely they are to ignore U.S. advice and to secretly welcome those moments when the U.S. gets taken down a peg or two. The 9/11 attacks produced an unusual outpouring of sympathy for the United States ("nous sommes tous Américains" headlined Le Monde), and we've seen a similar reaction in the wake of the Boston Marathon bombings. But such expressions of solidarity tend to be fleeting and especially when U.S. behavior gives opponents an easy way to heighten dissatisfaction with America's global role. What's going on here is a struggle for legitimacy in the eyes of the wider world, and it would be foolish to believe that we will win that struggle just because we're the "good guys." That may be how we see ourselves, but Americans are only 5 percent of the world's population, and plenty of other people around the world have a rather different view.

No US HR credibility- seen as hypocritical

Carasik '14- clinical professor of law and the director of the international human rights clinic at the Western New England University School of Law, (Lauren C., "Human rights for thee but not for me," <http://america.aljazeera.com/opinions/2014/3/the-us-lacks-moralauthorityonhumanrights.html>) VD

Last month U.S. Secretary of State John Kerry unveiled the State Department's comprehensive annual assessment of human rights around the globe. It painted a grim picture of pervasive violations. Notably absent from the report, however, was any discussion of Washington's own record on human rights. The report elicited sharp rebukes from some of the countries singled out for criticism. Many of them questioned the United States' legitimacy as self-appointed global champion of human rights. China issued its own report, 154 pages long, excoriating the U.S. record on human rights and presenting a list of Washington's violations. Egypt's Foreign Ministry called the report "unbalanced and nonobjective" and censured the U.S. for appointing itself the world's watchdog. Ecuador, Russia and Iran also criticized the report. By signaling that the world cares about human rights violations, the report provides a useful tool for advocates. While the omission of any internal critique is unsurprising, that stance ultimately undermines the State Department's goals of promoting human rights abroad. Abuses unfolding around the world demand and deserve condemnation. But it is difficult for the U.S. to don the unimpeachable mantle, behave hypocritically and still maintain credibility.

cred high now

Rights for undocumented immigrants improving drastically-municipal ID program proves

Medina '15- a multimedia journalist and documentary film-maker, (Daniel M., "Undocumented immigrants in New York get ID cards to open bank accounts," <http://www.theguardian.com/money/us-money-blog/2015/jan/12/undocumented-immigrants-id-cards-new-york>) VD

Lupe is a 35-year-old mother of three who immigrated to New York in 2003 from the eastern Mexican state of Veracruz. On Monday, she says, "The system will acknowledge for the first time that I exist."¶ The reason: New York City will unveil a new municipal ID program that could bring big changes for the city's large undocumented population. Though all residents will be eligible to apply for the new ID, called IDNYC, undocumented New Yorkers are expected to benefit most.¶ There are an estimated 500,000 undocumented immigrants in New York City, an underserved and, at times, exploited population that lives in the shadows of the city's gleaming skyscrapers.¶ In addition to a free one-year membership to the city's leading cultural institutions, the IDNYC card will provide undocumented immigrants with the ability to access state buildings and open bank accounts with a number of participating financial institutions. Those participating banks and credit unions will also be announced as early as Monday, according to city officials.¶ An ID card could be life changing for Lupe. She and her husband, both undocumented, have lived in Brooklyn's Bay Ridge neighborhood for more than a decade without the financial security of even a bank account. ¶ Banks, which require an ID for proof of residency, have turned away Lupe's Mexican passport as insufficient proof that she is a city resident. She says the isolation, in addition to the insecurity of living without an identity in a city that she and her family call home, has been trying.¶ For now, Lupe says the city's ID will provide her an immediate lifeline: "The ID will list my home address for those who question my status as a resident in this city."¶ "I'm basically invisible in this city without proper identification," said Lupe, who refused to provide her surname due to her immigration status. "My husband and I work hard every day, we have children and the security that something as simple as an ID card will give us cannot be overstated."¶ When he ran for office, Mayor Bill De Blasio promised an overhaul to the city's immigration policies as part of his "Tale of Two Cities" campaign. The ID clearly represents a first step, says Betsy Plum, director of special projects at the New York Immigrant Coalition, a city-based advocacy group.¶ "Something as simple as a form of identification could be a quality-of-life improvement for these New Yorkers," said Plum. "For example, if your employer unlawfully fires you and you want to contest it in court, you can't even get into a public building without an ID. There are real tangible benefits here."¶ One of those tangible benefits is legal protection from law enforcement in the case of an arrest, says Muzzaffar Chishti, an expert on US immigration policy who heads the office for the Migration Policy Institute, a Washington-based independent, non-partisan, nonprofit think tank, at New York University's School of Law.¶ "If you're arrested by police, police want to know who you are. The card makes it easier for the police to release you," said Chishti.

No HR abuse in Immigration policy

Veuger '14- resident scholar at the American Enterprise Institute and the editor of AEI Economic Perspectives. His research areas are political economy and public finance, (Stan V., "Good policy, good politics," <https://www.aei.org/publication/good-policy-good-politics/>) VD

After years of playing defense, apologizing for while doubling down on his lies about the Affordable Care Act, President Barack Obama has chosen to go on offense. Not against the junior varsity terrorists of the Islamic State group in any sort of new, more meaningful way, but on the domestic front, by finally taking action to shield large numbers of illegal immigrants from deportation. Later today, in a prime-time address, the president is expected to announce that he will grant millions of undocumented aliens, seemingly mostly those with close family ties to U.S. citizens (often their children), reprieve from deportation and some sort of permission to work legally. These actions appear to be wise ones, both on political and on substantive grounds. What the president is doing, in effect, is going from not enforcing federal immigration law (much like his predecessors) to announcing that he is not enforcing federal immigration law, and detailing more of the specifics of this non-enforcement. In other words, he's gone from not deporting 11 million people to not deporting 5 million or 3 million people. For a number of reasons this is, along practically all dimensions, good and helpful public policy.¶ First and foremost, it brings a sense of safety to the lives of the immigrants in question. They will no longer face the risk, small as it may currently be, of not being able to go home to their children. And hundreds of thousands, if not millions, of U.S. citizens will be able rest assured that their government will not one day decide to tear their families apart. The newly quasi-legal immigrants will also be able to make even more of a contribution to the American economy than they are currently, with their new-found work authorizations and ability to apply for jobs that require more of a legal status than they currently have. This should allow them to perform work they are better suited

for, without too much of a harmful impact on native workers; they have been here for a while, after all. Some native workers and employers will gain a bit, and some native workers will lose a bit – politicians hiring illegal immigrants to work on their lawns while running for office, for example – but the overall impact should be positive. And this positive impact will be felt by the nation’s treasury as well. Reasonable people can, of course, disagree about the exact composition of the group of immigrants to be regularized, but family ties are about as good a criterion as any.

Case

inherency

Plan is non-inherent- Efforts to end Racial Profiling now

Cardin 13 (Senator Benjamin Cardin from Maryland, “THE END RACIAL PROFILING ACT INTRODUCED IN BOTH THE U.S. HOUSE OF REPRESENTATIVES AND THE SENATE.” Introduced in Senate on 5/23/13, Date Accessed: 7/8/15, http://www.naacp.org/action-alerts/entry/the-end-racial-profiling-act-introduced-in-both-the-u.s.-house-of-represent_sZ)

The End Racial Profiling Act has now been introduced in the U.S. Senate by Senator Cardin (MD) (S. 1038) and in the U.S. House of Representatives by Congressman John Conyers, Jr. (MI) (H.R. 2851). The End Racial Profiling Act comprehensively addresses the insidious practice of racial profiling by law enforcement on five levels: first, it clearly defines the racially discriminatory practice of racial profiling by law enforcement at all levels; second, it creates a federal prohibition against racial profiling; thirdly, it mandates data collection so we can fully assess the true extent of the problem; fourth, it provides funding for the retraining of law enforcement officials on how to discontinue and prevent the use of racial profiling; and fifth, it holds law enforcement agencies that continue to use racial profiling accountable. We need to urge Members of both the House and Senate to co-sponsor and help move the bill through to passage as soon as possible. As painfully demonstrated over the past months, racial profiling is a serious problem in the United States, and can lead to deadly consequences. It is difficult for our faith in the American judicial system not to be challenged when we cannot walk down the street, drive down an interstate, go through an airport, or even enter into our own homes without being stopped merely because of the color of our skin. Training law enforcement officers how to more efficiently carry out the essential policing without avoid using this counter-productive procedure will not only help our nation’s criminal justice system at all levels, but it will trickle down to other groups as well, such as neighborhood watch organizations and citizens’ community groups, which often model themselves after their local police and which have taken on additional responsibilities in light of the budget cuts being faced by almost every locality and jurisdiction.

Programs currently exist to decrease gang violence- Proves the plan is not key

OJJDP No Date (Office of Juvenile Justice and Delinquency Prevention, “Gang Violence Reduction Program,” No Date, Date Accessed: 7/9/15, <https://www.nationalgangcenter.gov/spt/programs/71>, SZ)

The Gang Violence Reduction Program targeted mainly older members (ages 17 to 24) of two of the Chicago area’s most violent Hispanic gangs, the Latin Kings and the Two Six. Specifically, the Little Village program targeted more than 200 of the “shooters” (also called influential persons or leaders) of the two gangs. A steering committee was established to support the project. This group was composed of representatives from local churches, two Boys & Girls Clubs, a local community organization, a business group, other social agencies, the local alderman, and local citizens. The priority goal of the project was to reduce the extremely high level of gang violence among youth who were already involved in the two gangs; drug-related activity was not specifically targeted. The main goal was to be accomplished by a combination of outreach work, an Intervention Team, case management, youth services, and suppression. Outreach youth workers aimed to prevent and control gang conflicts in specific situations and to persuade gang youth to leave the gang as soon as possible. Virtually all of these youth workers were former members of the two target gangs. An Intervention Team (mainly the outreach youth workers, police, and probation officers) met biweekly and exchanged information on violence that was occurring (or about to occur) in the community. It provided intensive services to gang members, including crisis intervention, brief family and

individual counseling and referrals for services, and surveillance and suppression activities. Altogether, a good balance of services was provided. Project police were hired to target the two gangs and their most violent members. They used standard policing tactics employed elsewhere in the city by Chicago police in controlling gang violence. The outreach youth workers sometimes collaborated with the project tactical officers in the exchange of information that was vital to the police suppression role, and project police officers often encouraged gang youth to accept services. The suppression contacts reduced the youth's interest in and attachment to the gang. Services such as job placement reduced target youth's time spent with other gang members. The process evaluation of the program revealed that it was well-implemented, achieving an "excellent" rating on 8 of the 18 program-implementation elements: interagency and street (intervention) team coordinators; criminal justice participation; lead agency project management and commitment to the model; social and crisis intervention and outreach work; suppression; targeting, especially of gang members; balance of services; and intensity of services. The outcome evaluation examined the effects of the Little Village project on the approximately 200 targeted, hard-core gang youths during the period in which they were served by the program. Self-reports of criminal involvement showed that the program reduced serious violent and property crimes, and sharp declines were also seen in the frequencies of various types of offenses. The program was more effective with older, high-rate, violent gang offenders than with younger, less violent offenders. Active gang involvement was also reduced among project youths, but mostly among older members, and this change was associated with less criminal activity. Most youth in both targeted gangs improved their educational and employment status during the program period. Employment was associated with a general reduction in youths' criminal activity, especially drug selling

Gang violence decreasing- prefer recent statistics

Brenoff 15 (Ann Brenoff is a Huffington Post Senior Writer/Columnist, "Behind LA's Dramatic Decline In Gang Violence," 2/24/15, Date Accessed: 7/8/15, http://www.huffingtonpost.com/2015/02/24/gang-violence-decline_n_6656840.html, SZ)

From 1988 to 1998 -- known to some as the "decade of death" -- close to a thousand people per year were killed in Los Angeles. Gangs didn't run all the neighborhoods, but the ones they did, they terrorized. Drugs moved openly on street corners, drive-by shootings occurred with dispiriting frequency, and wearing the wrong color T-shirt on the wrong street could be interpreted as a death wish. It all seems improbable now. There are still terrible parts of the city, where brutality and blight reign, but to say that LA is a city unchanged is to ignore the statistics. From 2008 to 2012, violent crime across the nation went down about 16 percent, according to a recent cover story on the subject for Pacific Standard magazine. But in Los Angeles that drop was notably more precipitous in gang areas, the magazine notes: 30 percent in Compton, 50 percent in Bell Gardens and 50 percent in El Monte. Gang-related homicides in Los Angeles have gone down 66.7 percent over the past eight years, and gang-related crimes have seen a 55.3 percent dip since 2005. So, what accounts for this drastic decline? The only thing that everyone -- from police representatives to community organizers to Sam Quinones, the author of the Pacific Standard piece -- can agree on is that there's no single answer. But if you consider the six theories below, and how they interact and build on each other, you can begin to see why city officials say Los Angeles hasn't been this safe since the Eisenhower administration.

Local police enforcement solves Gang violence

Weinberger 15 (Jodi Weinberger is a reporter for the Portland Tribune, "Gang violence declines in 2014," 1/22/15, Date Accessed: 7/9/15, <http://www.pamplinmedia.com/go/42-news/248105-116263-gang-violence-declinesin-2014>, SZ)

Gang violence in Gresham decreased last year following targeted efforts by the police department and city staff. Police Chief Craig Junginger reported this week that only one homicide was gang related in 2014, a sharp decrease from 2013 when five of the seven homicides were linked to gangs. "I think we're making inroads," Junginger

said. “We’re on the right track and we’ll continue our current strategies and add more in the upcoming year.” With grant funding, the police department was able to hire two gang outreach workers in 2014 which allowed the department to increase visibility in many neighborhoods. Police take a multipronged approach to decreasing gang violence with much of it being referring families and children to social services as a gang deterrent. Prevention work starts in the middle schools, Junginger said, when students are most susceptible to joining gangs. Other strategies include keeping a close watch on vacant or foreclosed homes for gang activity. “They have been able to board up properties and keep gangs out,” Junginger said. Undercover cops in plain clothes often patrol the MAX train stations as well where much of the violence happens as rival gang members may cross paths. Following an incident, Gresham works collaboratively with Portland on “cool down strategies” which includes saturating the area where the incident took place with law enforcement to lessen the chance of retaliation. A new partnership program with the Multnomah County District’s Attorney — Prosecution and Law Enforcement Unified Strategies — will use data to target specific drivers of crime in Rockwood, Junginger said. “It’s based on a theory that a lot of times crime can be boiled down to a handful of individuals,” said Joe Walsh, Gresham’s gang prevention adviser.

AT: overstretch

Turn- the Plan prevents Police from being able to enforce law effectively

MacDonald 04 (Heather MacDonald is an American political commentator and journalist, “The Illegal-Alien Crime Wave,” Published in The City Journal Winter 2004, Date Accessed: 7/8/15, http://www.city-journal.org/html/14_1_the_illegal_alien.html, SZ)

Some of the most violent criminals at large today are illegal aliens. Yet in cities where the crime these aliens commit is highest, the police cannot use the most obvious tool to apprehend them: their immigration status. In Los Angeles, for example, dozens of members of a ruthless Salvadoran prison gang have sneaked back into town after having been deported for such crimes as murder, assault with a deadly weapon, and drug trafficking. Police officers know who they are and know that their mere presence in the country is a felony. Yet should a cop arrest an illegal gangbanger for felonious reentry, it is he who will be treated as a criminal, for violating the LAPD’s rule against enforcing immigration law. The LAPD’s ban on immigration enforcement mirrors bans in immigrant-saturated cities around the country, from New York and Chicago to San Diego, Austin, and Houston. These “sanctuary policies” generally prohibit city employees, including the cops, from reporting immigration violations to federal authorities. Such laws testify to the sheer political power of immigrant lobbies, a power so irresistible that police officials shrink from even mentioning the illegal-alien crime wave. “We can’t even talk about it,” says a frustrated LAPD captain. “People are afraid of a backlash from Hispanics.” Another LAPD commander in a predominantly Hispanic, gang-infested district sighs: “I would get a firestorm of criticism if I talked about [enforcing the immigration law against illegals].” Neither captain would speak for attribution. But however pernicious in themselves, sanctuary rules are a symptom of a much broader disease: the nation’s near-total loss of control over immigration policy. Fifty years ago, immigration policy might have driven immigration numbers, but today the numbers drive policy. The nonstop increase of immigration is reshaping the language and the law to dissolve any distinction between legal and illegal aliens and, ultimately, the very idea of national borders. It is a measure of how topsy-turvy the immigration environment has become that to ask police officials about the illegal-alien crime problem feels like a gross faux pas, not done in polite company. And a police official asked to violate this powerful taboo will give a strangled response—or, as in the case of a New York deputy commissioner, break off communication altogether. Meanwhile, millions of illegal aliens work, shop, travel, and commit crimes in plain view, utterly secure in their de facto immunity from the immigration law.

AT: organized crime

No security challenges – No connection between terrorism and organized crime – Proves no impact

Williams 14 (Phil Williams is a published author, has a PhD, and teaches and researches Security studies, foreign policy analysis, transnational organized crime, terrorism, “Organized Crime and Terrorism,” LACC Working Paper No. 2/2014, Date Accessed: 7/13/15, <https://lacc.fiu.edu/research/publications/working-paper-2-williams.pdf>, SZ)

The security challenges posed by terrorist-criminal cooperation and by terrorists engaged in drug trafficking, extortion, kidnapping and other activities are relatively modest.

Convergence and cooperation cannot be ignored, but do not represent the kind or level of threat sometimes claimed. Moreover, there is a downside for terrorists in both cooperation with traffickers and appropriation of trafficking methods. For terrorists, cooperation creates risks of betrayal by pragmatic criminals, especially those who have no affinity for the cause. Moreover, cooperating with criminals also increases the possibility of infiltration by law enforcement and intelligence agents. Similarly, trafficking and other criminal activities can undermine both the status and legitimacy of a terrorist organization, as well as cause internal arguments and even divisions over the allocation of increased resources. Governments can also develop counter-narratives that tarnish the appeal of high-minded terrorists by emphasizing their linkage to common criminals and common criminality. In the final analysis, therefore, not only can the threat be contained, but it might also provide opportunities that can be exploited by the United States and its allies.

Their authors are exaggerating – No real threat of organized crime

Williams 14 (Phil Williams is a published author, has a PhD, and teaches and researches Security studies, foreign policy analysis, transnational organized crime, terrorism, “Organized Crime and Terrorism,” LACC Working Paper No. 2/2014, Date Accessed: 7/13/15, <https://lacc.fiu.edu/research/publications/working-paper-2-williams.pdf>, SZ)

The notion of a nexus between criminal and terrorist organizations surfaced during the 1990s. The term narco-terrorism, however, was coined even earlier than this. Ironically, it initially referred to the Medellin drug trafficking organization in Colombia using terrorist tactics to coerce the government into abandoning its policy of extraditing drug traffickers to the United States; subsequently, its meaning was reversed and it was predominantly used to describe terrorist organizations using narcotics trafficking as a funding mechanism. After September 11, in particular, it was frequently used to refer to the FARC and the Taliban using income from the drug business to fund their insurgent activities. Meanwhile, the broader notion of a criminal-terrorist nexus that emerged during the 1990s, inspired by events in the Balkans, focused less on the appropriation of criminal activities by terrorists or terrorist activities by criminals, and more on direct cooperation between criminal and terrorist organizations—a cooperation that soon became enshrined in the concept of a criminal-terrorist nexus. The Madrid bombings in 2003, in which the attacks and their preparation were financed with the proceeds of drug trafficking, are also portrayed as an example of a nexus in action. This argument challenges widespread allegations of an emerging crime terrorism or trafficking-terrorism nexus, as well as a broader analytic trend emphasizing threat convergence. It suggests that most claims about the nexus are based on little more than flimsy anecdotal evidence, from which unwarranted and exaggerated inferences are drawn. One or even a few examples of cooperation between criminals and terrorists do not make a nexus. And they certainly do not provide evidence of a “grand shift” whereby “international drug traffickers and international terrorists are in a hedonistic marriage of design . . . linked at the hip, and . . . extremely wealthy.”¹ Yet such grandiose claims abound, fueled by worst-case thinking and unwarranted generalizations from the few to the many.

Threat of Organized crime is exaggerated

Andreas 14 (Peter Andreas is a Professor of Political Science and International Studies at Brown University, “Transnational Crime,” Written for CQ Researcher August 2014, Date Accessed: 7/12/15, <http://photo.pds.org:5012/cqresearcher/document.php?id=cqresrre2014082906>, sz)

For the most part, transnational crime is a fuzzy new term for an old practice: smuggling. Although the speed, content, methods and organization of smuggling have varied greatly across time and place, the basic activity has not fundamentally changed. Even though the global reach of some smuggling groups has accelerated with the integration of the global economy, the image of an octopus-like network of crime syndicates that runs the underworld is fiction. Even the most sophisticated smuggling schemes tend to be defined more by fragmentation and loose, informal networks than by concentration and hierarchical organization. And no so-called drug cartel actually fits the definition of a cartel. We are often told that the volume of organized transnational criminal activity has surged in recent decades. Of course, we have no idea how true those statistical claims are — they tend to be assertions and guesstimates rather than reliable and verifiable empirical evidence. Still, cross-border organized crime would simply have to keep pace with the illicit economy to grow at an impressive rate. But that does not necessarily mean it has increased as an overall percentage of global economic transactions. Indeed, the liberalization of trade in recent decades has sharply reduced incentives to engage in smuggling practices designed to evade taxes and tariffs, historically the backbone of illicit commerce.

And, Either organized crime has no effect on the economy - or it actually increases economic growth

Canadian Department of Justice 15 – (1/7/15, “Economic and Organized Crime: Challenges for Criminal Justice”, http://www.justice.gc.ca/eng/rp-pr/csj-sjc/jsp-sjp/rp02_12-dr02_12/p4.html#sec4_1), “LJH”

Others argue that aggregate crime statistics are meaningless, given how widely the sub-components vary in nature and social consequence, and that certain types of crimes, judged in strictly economic terms, constitute a net benefit by generating new incomes to some citizens. (Indeed, some go further, arguing that much economic activity in the underground economy is actually good in so far as it challenges “bad” laws that retard economic development.) [13] The reality is that both sides are right, for they are talking about two quite different things. Predatory crimes are crimes purely of redistribution of existing wealth . They do not generate new goods and services and therefore do not increase total income flows. Therefore, barring indirect consequences like the costs of increased security (which could be argued either way), their net effect on Gross National Product (GNP) is zero. By contrast, market-based crimes involve the production and distribution of new goods and services . Judged in strictly economic terms, they should have a positive impact on GNP. Indeed, it is now standard procedure in many countries to try to estimate the value of underground transactions in both legal and illegal goods and services, provided they are based on consensual exchanges, and to add that value to their existing national income data to get a better picture of just how “well” their economies are doing. Commercial crimes are more complex to judge. The essence of a commercial crime is to apply illegal methods to the production and distribution of legal goods and services that would otherwise be produced by someone else using legal methods. The supplier, for example, using illegal methods to reduce costs, does not gain at the expense of other suppliers or its own workers; it is a matter purely of redistribution. There is no net effect on the economy's total production of goods and services. The gains made by the supplier at the expense of customers by cutting quality or engaging in deceptive marketing, arguably the supply of goods and services conforming to what the customer thinks he or she is getting, are actually reduced. GNP, adjusted for the quality of goods, should fall in this case. On the other

hand, it is remotely possible that, on occasion, the commission of a commercial offence helps expand the supply of goods and services. If, for example, the fraud takes the form of something like illegal disposal of hazardous wastes, with the result that costs to consumers are reduced at the expense of environmental degradation, depending on how the economic impact of the environmental damage is reckoned, the result could be an actual increase in GNP even though sensible environmental accounting would dispel any notion this represents a net gain in economic welfare. Similarly, with social crime, the net effect depends entirely on how the measurement is done. If national income is estimated in the normal way, by examining total value of market transactions, then any production of new goods and services unambiguously increases society's total GNP and, with it, supposedly, economic welfare. [14] This is all the more true because in this case, unlike that of market-based crime, the new goods and services, being legal, can be directly measured. But if national income is measured in a broader way to take account of potential depreciation of human and ecological capital, there are unintended costs which should be subtracted. It is impossible to say a priori what the net effect will be. In all cases, when assessing the overall economic effects of criminal acts, it is necessary to distinguish between the immediate impact of the act at the micro level, and the consequences of increased expenditure for policing, prosecution and correction at the macro level. If an economy is at full employment, arguably the diversion of resources into economically unproductive activity associated with crime control is a net loss. But if the economy has unemployed resources, increased expenditure on police, prosecution and imprisonment operates just like any other net injection of funds to produce a positive multiplier effect. Indeed, one of the reasons the US economy did not stumble badly in the post-Cold War period may be that increased expenditure for the prison-industrial complex more than offset reductions in what previously went to the military-industrial complex. Over the last decade, the military budget has fallen about US\$50 billion, while the crime-control budget has risen by about \$100 billion. Furthermore, that the US employs so many people in construction and maintenance of prisons, and jails such a large percentage of its economically active population, may itself account for the fact that the US unemployment rate is lower than that of other wealthy Western countries.

The US isn't key to the global economy

Kenny 2015 (Charles; Why the Developing World Won't Catch the U.S. Economy's Cold; May 4; www.bloomberg.com/news/articles/2015-05-04/why-the-developing-world-won-t-catch-the-u-s-economy-s-cold; kdf)

Last week the U.S. Commerce Department announced that first-quarter GDP growth for 2015 was an anemic 0.2 percent. This immediately sparked fears that a U.S. slowdown could lead to a global recession. But the cliché about America sneezing and the rest of the world catching the cold doesn't hold like it used to. The U.S. isn't as contagious as it was, and developing countries in particular are far more robust to economic shocks. That's good news for everyone. It means less volatility in Asia, Africa, and Latin America, which contributes to happier people, greater political stability, and stronger long-term growth—all of which should help lift the U.S. out of its own doldrums. A team of IMF researchers has looked at the long-term record of the world's economies when it comes to growth and recession. They measured how long economies expanded without interruption, as well as the depth and length of downturns. Over the past two decades, low and middle-income economies have spent more time in expansions, while downturns and recoveries have become shallower and shorter. This suggests countries have become more resilient to shocks. In the 1970s and '80s, the median developing economy took more than 10 years after a downturn to recover to the GDP per capita it had prior to that slump. By the early 2000s, that recovery time had dropped to two years. In the 1970s and '80s, countries of the developing world spent more than a third of their time in downturns, but by the 2000s they spent 80 percent of their time in expansions. The first decade of the 21st century was the first time that developing economies saw more expansion and shorter downturns than did advanced economies: Median growth in the developing world was at its highest since 1950 and volatility at its lowest. Developing countries still face a larger risk of deeper recession when terms of trade turn against them, capital flows dry up, or advanced economies enter recessions themselves. But the scale of that risk has diminished. That's because low and middle-income economies have introduced policy reforms that increase resilience: flexible exchange rates, inflation targeting, and lower debt. Economies with inflation-targeting regimes see recovery periods less than a third as long as economies without targeting, for example. Larger reserves are associated with longer expansions. And median reserves in developing countries more than doubled as a percentage of GDP between the 1990s and 2010. Median external debt has dropped from 60 percent to 35 percent of GDP over that

same period. Such policy changes account for two-thirds of the increased recession-resilience of developing countries since the turn of the century, suggest the IMF researchers—leaving external factors, such as positive terms of trade, accounting for just one-third. That's good news for the developing world—not least because volatile growth is particularly bad for poorer people, who are most at risk of falling into malnutrition or being forced to take children out of school, which has long-term consequences for future earnings. That might help explain the relationship between growth volatility, slower reductions in poverty, and rising inequality. Sudden negative income shocks can also be a factor in sparking violence: When rains fail, the risk of civil war in Africa spikes, and when coffee prices in Colombia fall, municipalities cultivating more coffee see increased drug-related conflict. The African analysis suggests that a five percentage-point drop in income growth is associated with a 10 percent increase in the risk of civil conflict in the following year. Finally, because volatility increases the uncertainty attached to investments, it can also be a drag on overall long-term economic performance. Viktoria Hnatkovska and Norman Loayza of the World Bank estimated that moving from a comparatively stable to a relatively volatile growth trajectory is associated with a drop in average annual growth of as much as 2 percent of GDP. Lower volatility in the developing world and its associated long-term growth performance is also good news for the U.S. A strong global economy is still a positive force for growth in every country, including developed nations. And with the developing world accounting for about one-third of trade and GDP at market rates, as well as three-fifths of U.S. exports, its role in supporting American economic performance has never been greater. Those hoping for a recovery in U.S. output should be grateful for stronger economic immune systems in the rest of the world.

No existential threat from terrorists

Mueller and Stewart, 2/24/15 (John, Political scientist at Ohio State; Mark, engineer and risk analyst at the University of Newcastle in Australia; “Terrorism poses no existential threat to America. We must stop pretending otherwise”;
[//JPM">http://www.theguardian.com/commentisfree/2015/feb/24/terrorism-poses-no-existential-threat-to-america\)//JPM](http://www.theguardian.com/commentisfree/2015/feb/24/terrorism-poses-no-existential-threat-to-america)

One of the most unchallenged, zany assertions during the war on terror has been that terrorists present an existential threat to the United States, the modern state and civilization itself. This is important because the overwrought expression, if accepted as valid, could close off evaluation of security efforts. For example, no defense of civil liberties is likely to be terribly effective if people believe the threat from terrorism to be existential.¶ At long last, President Barack Obama and other top officials are beginning to back away from this absurd position. This much overdue development may not last, however. Extravagant alarmism about the pathological but self-destructive Islamic State (Isis) in areas of Syria and Iraq may cause us to backslide. ¶ The notion that international terrorism presents an existential threat was spawned by the traumatized in the immediate aftermath of 9/11. Rudy Giuliani, mayor of New York at the time, recalls that all “security experts” expected “dozens and dozens and multiyears of attacks like this” and, in her book The Dark Side, Jane Mayer observed that “the only certainty shared by virtually the entire American intelligence community” was that “a second wave of even more devastating terrorist attacks on America was imminent”. Duly terrified, US intelligence services were soon imaginatively calculating the number of trained al-Qaida operatives in the United States to be between 2,000 and 5,000.¶ Also compelling was the extrapolation that, because the 9/11 terrorists were successful with box-cutters, they might well be able to turn out nuclear weapons. Soon it was being authoritatively proclaimed that atomic terrorists could “destroy civilization as we know it” and that it was likely that a nuclear terrorist attack on the United States would transpire by 2014.¶ No atomic terrorists have yet appeared (al-Qaida’s entire budget in 2001 for research on all weapons of mass destruction totaled less than \$4,000), and intelligence has been far better at counting al-Qaida operatives in the country than at finding them.¶ But the notion that terrorism presents an existential threat has played on. By 2008, Homeland Security Secretary Michael Chertoff declared it to be a “significant existential” one - carefully differentiating it, apparently,

from all those insignificant existential threats Americans have faced in the past. The bizarre formulation survived into the Obama years. In October 2009, Bruce Riedel, an advisor to the new administration, publicly maintained the al-Qaida threat to the country to be existential.¶ In 2014, however, things began to change.¶ In a speech at Harvard in October, Vice President Joseph Biden offered the thought that “we face no existential threat – none – to our way of life or our ultimate security.” After a decent interval of three months, President Barack Obama reiterated this point at a press conference, and then expanded in an interview a few weeks later, adding that the US should not “provide a victory to these terrorist networks by over-inflating their importance and suggesting in some fashion that they are an existential threat to the United States or the world order.” Later, his national security advisor, Susan Rice, echoed the point in a formal speech.¶ It is astounding that these utterances – “blindingly obvious” as security specialist Bruce Schneier puts it – appear to mark the first time any officials in the United States have had the notion and the courage to say so in public

AT: racial profiling

DHS and ICE prohibit racial profiling – passage of the 2013 DHS Commitment to Nondiscriminatory Law Enforcement and Screening Activities proves

Department of Homeland Security '15 (Department of Homeland Security ;March 19, 2015 ;Acquisition and Use of License Plate Reader Data from a Commercial Service DHS/ICE/PIA-039; pg.8-pg.9; www.dhs.gov/sites/default/files/publications/privacy-pia-ice-lpr-march2015.pdf; 7-12-15; mbc)

ICE, in coordination with the DHS Chief Privacy Officer and the DHS Officer for Civil Rights and Civil Liberties, has included in this PIA a discussion of civil liberties issues raised by the use of LPRs to more completely address public concerns regarding the use of this technology. The inclusion of an individual rights and liberties discussion in this PIA will improve transparency and assist the public understanding of ICE's use of LPR technology. In addition to the above framework of privacy and civil liberties protections, existing DHS policies will foster the proper use of LPR data. DHS prohibits the consideration of race or ethnicity in investigation, screening, and law enforcement activities in all but the most exceptional instances. Accordingly, consistent with law and DHS policy, LPR data may not be collected, accessed, used, or retained to target or monitor an individual solely on the basis of actual or perceived race, ethnicity, or nationality. The following is the Department's official policy⁷ on this issue: "Racial profiling" is the invidious use of race or ethnicity as a criterion in conducting stops, searches, and other law enforcement, investigation, or screening activities. It is premised on the erroneous assumption that any particular individual of one race or ethnicity is more likely to engage in misconduct than any particular individual of another race or ethnicity. The Department of Homeland Security (DHS) has explicitly adopted the Department of Justice's "Guidance Regarding the Use of Race by Federal Law Enforcement Agencies," issued in 7 Janet Napolitano, "The Department of Homeland Security's Commitment to Nondiscriminatory Law Enforcement and Screening Activities" (Apr. 26, 2013). Privacy Impact Assessment ICE/LPR Page 8 June 2003. It is the policy of DHS to prohibit the consideration of race or ethnicity in our daily law enforcement and screening activities in all but the most exceptional instances, as defined in the DOJ Guidance. DHS personnel may use race or ethnicity only when a compelling governmental interest is present, and only in a way narrowly tailored to meet that compelling interest. Of course, race or ethnicity-based information that is specific to particular suspects or incidents, or ongoing criminal activities, schemes or enterprises, may be considered, as stated in the DOJ Guidance.

Fear of racial profiling stems from the perception of police bias – Aff can't solve

Simmons '12 (Kami Chavis; 2011; Beginning to End Racial Profiling: Definitive Solutions to an Elusive Problem; Kami Chavis Simmons is a Professor of Law and Director of the Criminal Justice Program at Wake Forest University School of Law. In 2015, she was appointed as a Senior Academic Fellow at the Joint Center for Political And Economic Studies.; poseidon01.ssrn.com/delivery.php?ID=289004112008113090031125110096017099025007057017006013098023078026017103009087090105005060043107058047118070066087085015006116019059007023093124006070074013100107011091032002072106083009115008101004120019099067104004015001116082104012093073114105006&EXT=pdf&TYPE=2; 7-12-15; mbc)

Many Americans have had interactions with police officers and other law-enforcement agents, and the majority of these police-citizen encounters occur in the context of traffic stops.' Although

mildly inconvenient, traffic stops are necessary not only for enforcing traffic rules and deterring traffic violations, but they are generally beneficial for broader public safety concerns. For many people, traffic stops are simply part of life. For many racial minorities, however, especially African-American and Latino men, 2 even a routine traffic stop takes on an entirely different meaning. Historically, the relationship between racial minorities and police has been strained, and many members of racial minority groups believe that law enforcement officers unfairly target them because of their race or ethnicity.³ It is widely known that many Americans, especially minorities, believe that police officers use race as a "proxy" for criminal involvement. There is strong evidence that racial minorities believe law enforcement officers engage in racial profiling. African-Americans have long argued that police officers scrutinize their behavior more closely, and many report that they are fearful of arrest even if they have done nothing illegal.⁴ The majority of African-Americans believe that racial profiling is wrong, yet is pervasive within their communities.⁵ The September 11th tragedy and increased attention surrounding immigration from Mexico, however, have caused other minority groups such as Arab-Americans and Latinos to become increasingly concerned that law-enforcement officers also unfairly target them based on their race or ethnicity. 6 Stories of the humiliation and helplessness of families stranded in the rain with their belongings strewn alongside the highway are commonplace for many members of society.⁷ Undoubtedly, the pernicious practice of racial profiling, or at least the perception that this practice occurs, has caused many citizens to alter their routine to avoid the indignity of yet another police stop. Unfortunately, there is a growing body of evidence that suggests that the perception that police unjustly target minorities is not merely an unsubstantiated feeling, but an uncomfortable reality. While all forms of police misconduct or corruption are disturbing, racial profiling occupies a unique place among such harmful practices because it presents several unique issues that make it difficult to address through standard police accountability measures. Society entrusts lawenforcement officers with a wide-breadth of discretion in order to perform their everyday duties.⁸ While the fast-paced nature of law enforcement necessitates discretion, if left unchecked, broad grants of discretion can lead police officers to abuse their position and engage in misconduct ranging from falsifying evidence, participating in violent excessive uses of force, and engaging in racial profiling. Many forms of police misconduct and corruption leave tangible evidence that allows law-enforcement agencies to implement remedial measures to alleviate the problem. ⁹ Racial profiling, however, is an elusive practice that can easily remain shrouded from view.

Courts rarely recognize victim's claims of being racially profiled – can't solve

Simmons '12 (Kami Chavis; 2011; Beginning to End Racial Profiling: Definitive Solutions to an Elusive Problem); Kami Chavis Simmons is a Professor of Law and Director of the Criminal Justice Program at Wake Forest University School of Law. In 2015, she was appointed as a Senior Academic Fellow at the Joint Center for Political And Economic Studies.;

poseidon01.ssrn.com/delivery.php?ID=289004112008113090031125110096017099025007057017006013098023078026017103009087090105005060043107058047118070066087085015006116019059007023093124006070074013100107011091032002072106083009115008101004120019099067104004015001116082104012093073114105006&EXT=pdf&TYPE=2; 7-12-15; mbc)

Remedying an elusive practice such as racial profiling remains a challenging issue for the judiciary and reformers must rely on other avenues for a solution. For example, even where evidence demonstrates that minorities are disproportionately stopped and searched, courts rarely recognize the victim's claim or provide relief.²¹ Thus, it is clear that courts will not be the

catalysts of change. This Article argues that while courts may be reluctant to provide judicial remedies, police departments themselves should not ignore the perceptions and should take measures to reduce any possible profiling and increase partnerships with communities. An indication that a police department may be engaging in racial profiling has a detrimental and far-reaching impact not only on the individuals who experience it first-hand, but also on other members of the targeted community. Ultimately, this pernicious practice threatens to undermine legitimacy in law enforcement and the criminal justice system for large segments of society, which impacts society as a whole. Part III concludes by suggesting proactive remedies institutions and policymakers should consider to alleviate the tensions between communities and police office with respect to racial profiling. Data collection efforts are imperative to educating the public and police agencies about racial profiling, but these efforts fall short as a long-term remedy. Therefore, in addition to data collection during traffic stops, this Article proposes several policy solutions that the federal government and state legislatures should implement to address racial profiling within local law enforcement agencies.

Profiling is situational, not about race

Cutler 15 (Michael Cutler is an Immigration and Naturalization Service Senior Special Agent for thirty years, "IMMIGRATION AND POLITICAL RACIAL 'PROFILING,'" 7/2/15, Date Accessed, 7/7/15, <http://www.frontpagemag.com/fpm/259319/immigration-and-political-racial-profiling-michael-cutler, sz>)

What is ignored by many journalists is that law enforcement must use profiling in order to be proactive and effective. However, ethical law enforcement profiling involves far more than the race or simple outward appearances of suspicious people. Effective and fair profiling must include situational and behavioral factors as integral components of such an effort. When I was an INS agent conducting surveillance in Harlem as part of a team of NYPD and DEA agents in conjunction with a narcotics investigation, we would take notice if, for the sake of argument, we spotted a Caucasian young man behind the wheel of a new high-priced vehicle, such as a BMW, with out-of-state license plates driving slowly up a block near a known drug location. If he was looking around furtively, as though he was expecting to meet someone, we might well have stopped him and ask who he was looking for and check his license, etc. Certainly we were basing our stop of the vehicle on a "profile" that had many components. More often than not, such stops yielded invaluable information and often led to arrests and seizures of narcotics and weapons. However identifying voters by a single element -- whether it is race, religion or ethnicity -- constitutes a different sort of profiling and one that is as insidious and ugly as it gets. To talk about the "Latino vote" is to postulate that all Latinos will vote the same way and presupposes that all Latinos have the same values, orientations and concerns. This is racism and bigotry plain and simple. It is unfair, it is insulting and it is divisive. The notion of the supposedly monolithic "Latino voter" does great harm in a number of important ways. It creates the false impression that immigration is all about race. In point of fact, our immigration laws are, as they should be, utterly and completely blind as to race, religion and ethnicity. Our immigration laws have two primary goals: protect innocent lives and the jobs of American workers. Nothing could be more reasonable. Title 8 U.S. Code § 1182: (Inadmissible Aliens) enumerates various categories of aliens who are to be prevented from entering the U.S. You will notice that there is nothing in this section of law that makes any distinction about such superficial issues as race, religion or ethnicity. The list of excludible classes of aliens includes aliens who suffer dangerous communicable diseases, severe mental illness, are fugitives from justice, aliens who are convicted felons, spies, terrorists, war criminals, human rights violators, and others whose presence would undermine national security and/or public safety. This section of law also addresses the issue of protecting the jobs, wages, and working conditions of the American worker. Here is the relevant portion of this section of law: (5) Labor certification and qualifications for certain immigrants (A) Labor certification (i) In general Any alien who seeks to enter the U.S. for the purpose of performing skilled or unskilled labor is inadmissible, unless the Secretary of Labor has determined and certified to the Secretary of State and the Attorney General that — (I) there are not sufficient workers who are able, willing, qualified (or equally qualified in the case of an alien described in clause (ii)) and available at the time of application for a visa and admission to the U.S. and at the place where the alien is to perform such skilled or unskilled labor, and (II) the employment of such alien will not adversely affect the wages and working conditions of workers in the

U.S. similarly employed. What does race have to do with the enforcement of our immigration laws? Making this an issue about race is unfair, unreasonable and pits Americans against Americans, creating the impression that Americans who want our borders secured and immigration laws enforced hate anyone of Latino ethnicity. This is a vicious lie. This is the equivalent of saying that if you lock your doors at night you are a xenophobic and anti-social misanthrope.

Absent of intentional forms of structural discrimination, police officer bias still maintains minorities' perception of racism

Simmons '12 (Kami Chavis; 2011; Beginning to End Racial Profiling: Definitive Solutions to an Elusive Problem; Kami Chavis Simmons is a Professor of Law and Director of the Criminal Justice Program at Wake Forest University School of Law. In 2015, she was appointed as a Senior Academic Fellow at the Joint Center for Political And Economic Studies.;

poseidon01.ssrn.com/delivery.php?ID=289004112008113090031125110096017099025007057017006013098023078026017103009087090105005060043107058047118070066087085015006116019059007023093124006070074013100107011091032002072106083009115008101004120019099067104004015001116082104012093073114105006&EXT=pdf&TYPE=2; 7-12-15; mbc)

Furthermore, racial profiling remains elusive and difficult to remediate because, even in the absence of intentional forms of discrimination, individual officers may be motivated by their unconscious racial biases. Despite much progress on racial issues, racial discrimination is not a "relic of the past" but instead remains a contemporary feature of modern society.⁶⁹ Today, overt displays of discrimination are rare, but racial prejudice "often goes unrecognized even by the individual who responds unconsciously to such motivation., ⁷⁰ For example, several psychological studies testing implicit bias demonstrate that images of African-Americans evoke more fear than other groups and confirm that members of minority groups, particularly African-American males, are associated with aggressive behavior.⁷¹ Whether or not there is definitive proof of discrimination, it is indisputable that many members of minority groups perceive that many police officers harbor and exercise racial animus when policing communities of color.⁷² This perception itself can be damaging to the credibility and legitimacy of a law-enforcement agency. practical impact for certain individuals or the police officers who work within those communities to keep residents safe. With or without the imprimatur of a court decision, it is indisputable that many members of minority groups perceive an injustice, and this perception is dangerous and harmful to both the community and law enforcement. Even the perception that certain groups are treated unfairly undermines the legitimacy of the law enforcement agency, and thus has a deleterious effect on crime control and prevention.

Legal immigrants experience the psychological burden of being portrayed as illegal by the police force

Simmons '12 (Kami Chavis; 2011; Beginning to End Racial Profiling: Definitive Solutions to an Elusive Problem; Kami Chavis Simmons is a Professor of Law and Director of the Criminal Justice Program at Wake Forest University School of Law. Racial profiling leads to the societal stigmatization of victims known as a "racial tax. 74 Both the individual and the targeted community as a whole suffer psychological and emotional harms of racial profiling. Casual observers may view multiple police stops as a mere inconvenience, but in reality this "mere inconvenience" is really a harsh form of social stigmatization. Those who become targets of racial profiling suffer the emotional and psychological burden of racial profiling, and some members of minority groups have reported psychological harms of humiliation and depression as a result of racial profiling.75 The "broad taint of suspected criminality" 76 that burdens the entire ethnic or racial group that has been profiled, has been referred to as a "racial tax. 77 Randall Kennedy, a professor at Harvard Law School, burdens placed upon African-American, Arabic, Latino and Asian minorities for their membership within their specific race/ethnic group.78 The "tax" has a particularly acute impact upon those of Latino descent, since they are often forced to prove their citizenship in addition to suffering the injustice of racial profiling.79 Officers create an environment where Latinos are "cast as foreigners," and those of the working class in emerging Latino communities are questioned more often since they might bear a resemblance to the "stereotypical image of what illegal immigrants supposedly look like."80 Because a large majority of Latinos live in the United States are citizens or legal immigrants, this means that legal and lawful residents unjustly bear the burden of these "citizenship encounters.", Each of these forms of racial taxation unduly burdens the targeted group, for no other reason than a person's membership to that group. 82

AT: Immigration Federalism

AT: Science Diplomacy

Visas are exploitative and exclusionary – don't solve scientific diplomacy

Rygiel '10 [Kim, Assistant Professor of Political Science at Wilfrid Laurier Univ. *Globalizing Citizenship*, 2010. Pg 5-6. Available Online via the University of Wisconsin's EBook Collection]

As forms of human mobility grow (e.g., displacement, asylum, travel for work, study, family, and leisure), and as regulatory controls become more restrictive, “legalized,” regular, and regulated forms of migration produce irregular, and what has increasingly become “illegalized,” forms of movement across borders (De Genova 2002). The increased implementation of border controls on the part of governing authorities has enabled the greater segregation (and differential treatment) of “‘legitimate’ mobilities such as leisure and business, from ‘illegitimate’ mobilities such as terrorism and illegal immigration” (Amoore 2006, 336). This “illegalization” of migration is produced by greater securitization, particularly by wealthy postindustrial societies in the North. In the process, certain bodies are perceived as threatening, disruptive, and risky and, therefore, in need of being securitized, regulated, and controlled. At the same time, these bodies are rendered vulnerable and are perceived as an invaluable source of cheap and exploitable labour (Bacon, 2008; Bigo 2002 and 2007; Bigo and Guild 2005; Ceyhan and Tsoukala 2002; Coleman 2005; Epstein 2007; Pickering and Weber 2006). Since 2001, they have frequently taken the form of the immigrant, the refugee or asylum claimant, and the undocumented migrant; however, they are also exchangeable and racialized, such that people of colour and those from countries in the South, as well as people of Muslim, Arab, and/or Middle Eastern background, have come to be viewed as risky subjects (Thobani 2004). It is within this context, then, that citizenship has increasingly become a way of governing individuals and populations. Despite the criss-crossing and transgression of territorial state borders and the reconfiguration of the state as a result of globalization, citizenship as a form of governing has been strengthened through innovative strategies and technologies of power, becoming an increasingly effective way of controlling populations in a globalizing environment. The reason for this is that, under the logic and discourse of citizenship, a host of strategies have been implemented to further open borders and liberalize trade and the flow of capital in ways that simultaneously maintain the role of the state with regard to controlling population and enforcing security. This is why Barry Hindess (2003, 24) argues that we can best understand this seeming contradiction between the promotion of open borders for goods, on the one hand, and the simultaneous restriction on the mobility of people, on the other, “if we view them both as parts of the one regime of population control.” This has been especially evident since the events of 11 September 2001 [9-11], which have led to the increasing use of citizenship as a means of governing the tension between an increasingly deterritorialized political economy and a territorialized political system. This is the context within which the principle arguments are situated.

Science Diplomacy Impact Defense

Science diplomacy doesn't spill over

Hormats 3/12 - Served Under Secretary of State for Economic Growth, Energy, and the Environment (Robert, “Science Diplomacy and Twenty-First Century Statecraft”) AAAS

<http://www.sciencediplomacy.org/perspective/2012/science-diplomacy-and-twenty-first-century-statecraft> (LT)

SCIENCE diplomacy is a central component of America's twenty-first century statecraft agenda. The United States must increasingly recognize the vital role science and technology can play in addressing major challenges, such as making our economy more competitive, tackling global health issues, and dealing with climate change. American leadership in global technological advances and scientific research, and the dynamism of our companies and universities in these areas, is a major source of our economic, foreign policy, and national security strength.

Additionally, it is a hallmark of the success of the American system. While some seek to delegitimize scientific ideas, we believe the United States should celebrate science and see it—as was the case since the time of Benjamin Franklin—as an opportunity to advance the prosperity, health, and overall well-being of Americans and the global community. Innovation policy is part of our science diplomacy engagement. More than ever before, modern economies are rooted in science and technology. It is estimated that America's knowledge-based industries represent 40 percent of our economic growth and 60 percent of our exports. Sustaining a vibrant knowledge-based economy, as well as a strong commitment to educational excellence and advanced research, provides an opportunity for our citizens to prosper and enjoy upward mobility. America attracts people from all over the world—scientists, engineers, inventors, and entrepreneurs—who want the opportunity to participate in, and contribute to, our innovation economy. At the same time, our bilateral and multilateral dialogues support science, technology, and innovation abroad by promoting improved education; research and development funding; good governance and transparent regulatory policies; markets that are open and competitive; and policies that allow researchers and companies to succeed, and, if they fail, to have the opportunity to try again. We advocate for governments to embrace and enforce an intellectual property system that allows innovators to reap the benefits of their ideas and also rewards their risk taking. Abraham Lincoln himself held a patent on an invention, a device for preventing ships from being grounded on shoals. He said in his “Second Lecture on Discoveries and Inventions” in 1859 that patents “added the fuel of interest to the fire of genius, in the discovery and production of new and useful things.” The practice of science is increasingly expanding from individuals to groups, from single disciplines to interdisciplinary, and from a national to an international scope. The Organisation for Economic Co-operation and Development reported that from 1985 to 2007, the number of scientific articles published by a single author decreased by 45 percent. During that same period, the number of scientific articles published with domestic co-authorship increased by 136 percent, and those with international co-authorship increased by 409 percent. The same trend holds for patents. Science collaboration is exciting because it takes advantage of expertise that exists around the country and around the globe. American researchers, innovators, and institutions, as well as their foreign counterparts, benefit through these international collaborations. Governments that restrict the flow of scientific expertise and data will find themselves isolated, cut off from the global networks that drive scientific and economic innovation. While the scientific partnerships that the United States builds with other nations, and international ties among universities and research labs, are a means to address shared challenges, they also contribute to broadening and strengthening our diplomatic relationships. Scientific partnerships are based on disciplines and values that transcend politics, languages, borders, and cultures. Processes that define the scientific community—such as merit review, critical thinking, diversity of thought, and transparency—are fundamental values from which the global community can reap benefits. History provides many examples of how scientific cooperation can bolster diplomatic ties and cultural exchange.

American scientists collaborated with Russian and Chinese counterparts for decades, even as other aspects of our relationship proved more challenging. Similarly, the science and technology behind the agricultural “Green Revolution” of the 1960s and ‘70s was the product of American, Mexican, and Indian researchers working toward a common goal. Today, the United States has formal science and technology agreements with over fifty countries. We are committed to finding new ways to work with other countries in science and technology, to conduct mutually beneficial joint research activities, and to advance the interests of the U.S. science and technology community. Twenty-first century statecraft also requires that we build greater people-to-people relationships. Science and technology cooperation makes that possible. For example, through the Science Envoy program, announced by President Obama in 2009 in Cairo, Egypt, eminent U.S. scientists have met with counterparts throughout Asia, Africa, and the Middle East to build relationships and identify opportunities for sustained cooperation. With over half of the world’s population under the age of thirty, we are developing new ways to inspire the next generation of science and technology leaders. Over the past five years, the Department of State’s International Fulbright Science & Technology Award has brought more than two hundred exceptional students from seventy-three different countries to the United States to pursue graduate studies. Through the Global Innovation through Science and Technology Initiative, the United States recently invited young innovators from North Africa, the Middle East, and Asia to post YouTube videos describing solutions to problems they face at home. The top submissions will receive financial support, business mentorship, and networking opportunities.

Science diplomacy’s impact is marginal – it doesn’t create real diplomacy

Dickson 10 - director of SciDev.net (David, “Science in diplomacy: “On tap but not on top”, 6/28

<http://scidevnet.wordpress.com/category/science-diplomacy-conference-2010/>

There’s a general consensus in both the scientific and political worlds that the principle of science diplomacy, at least in the somewhat restricted sense of the need to get more and better science into international negotiations, is a desirable objective. There is less agreement, however, on how far the concept can – or indeed should – be extended to embrace broader goals and objectives, in particular attempts to use science to achieve political or diplomatic goals at the international level. Science, despite its international characteristics, is no substitute for effective diplomacy. Any more than diplomatic initiatives necessarily lead to good science. These seem to have been the broad conclusions to emerge from a three-day meeting at Wilton Park in Sussex, UK, organised by the British Foreign Office and the Royal Society, and attended by scientists, government officials and politicians from 17 countries around the world. The definition of science diplomacy varied widely among participants. Some saw it as a subcategory of “public diplomacy”, or what US diplomats have recently been promoting as “soft power” (“the carrot rather than the stick approach”, as a participant described it). Others preferred to see it as a core element of the broader concept of “innovation diplomacy”, covering the politics of engagement in the familiar fields of international scientific exchange and technology transfer, but raising these to a higher level as a diplomatic objective. Whatever definition is used, three particular aspects of the debate became the focus of attention during the Wilton Park meeting: how science can inform the diplomatic process; how diplomacy can assist science in achieving its objectives; and, finally, how science can provide a channel for quasi-diplomatic exchanges by forming an apparently neutral bridge between countries. There was little disagreement on the first of these. Indeed for many, given the increasing number of international issues with a scientific dimension that politicians have to deal with, this is essentially what the core of science diplomacy should be about. Chris Whitty, for example, chief scientist at the UK’s Department for International Development, described how knowledge about the threat raised by the spread of the [highly damaging plant disease stem rust](#) had been an important input by researchers into discussions by politicians and diplomats over strategies for persuading Afghan farmers to shift from the production of opium to wheat. Others pointed out that the scientific community had played a major role in drawing attention to issues such as the links between chlorofluorocarbons in the atmosphere and the growth of the ozone hole, or between carbon dioxide emissions and climate change. Each has made essential contributions to policy decisions. Acknowledging this role for science has some important implications. No-one dissented when Rohinton Medhora, from Canada’s International Development Research Centre, complained of the lack of adequate scientific expertise in the embassies of many countries of the developed and developing world alike. Nor – perhaps predictably – was there any major disagreement that diplomatic initiatives can both help and occasionally hinder the process of science. On the positive side, such diplomacy can play a significant role in facilitating science exchange and the launch of international science projects, both essential for the development of modern science. Europe’s framework programme of research programmes was quoted as a successful advantage of the first of these. Examples of the second range from the establishment of the European Organisation of Nuclear Research (usually known as CERN) in Switzerland after the Second World War, to current efforts to build a large new nuclear fusion facility (ITER). Less positively, increasing restrictions on entry to certain countries, and in particular the United States after the 9/11 attacks in New York and elsewhere, have significantly impeded scientific exchange programmes. Here the challenge for diplomats was seen as helping to find ways to ease the burdens of such restrictions. The broadest gaps in understanding the potential of scientific diplomacy lay in the third category,

namely the use of science as a channel of international diplomacy, either as a way of helping to forge consensus on contentious issues, or as a catalyst for peace in situations of conflict. On the first of these, SOME pointed to recent climate change negotiations, and in particular the work of the Intergovernmental Panel on Climate Change, as a good example, of the way that the scientific community can provide a strong rationale for joint international action. But others referred to the failure of the Copenhagen climate summit last December to come up with a meaningful agreement on action as a demonstration of the limitations of this way of thinking. It was argued that this failure had been partly due to a misplaced belief that scientific consensus would be sufficient to generate a commitment to collective action, without taking into account the political impact that scientific ideas would have. Another example that received considerable attention was the current construction of a synchrotron facility SESAME in Jordan, a project that is already bringing together researchers in a range of scientific disciplines from various countries in the Middle East (including Israel, Egypt and Palestine, as well as both Greece and Turkey). The promoters of SESAME hope that – as with the building of CERN 60 years ago, and its operation as a research centre involving, for example, physicists from both Russia and the United States – SESAME will become a symbol of what regional collaboration can achieve. In that sense, it would become what one participant described as a “beacon of hope” for the region. But others cautioned that, however successful SESAME may turn out to be in purely scientific terms, its potential impact on the Middle East peace process should not be exaggerated. Political conflicts have deep roots that cannot easily be papered over, however open-minded scientists may be to professional colleagues coming from other political contexts. Indeed, there was even a warning that in the developing world, high profile scientific projects, particular those with explicit political backing, could end up doing damage by inadvertently favouring one social group over another. Scientists should be wary of having their prestige used in this way; those who did so could come over as patronising, appearing unaware of political realities. Similarly, those who hold science in esteem as a practice committed to promoting the causes of peace and development were reminded of the need to take into account how advances in science – whether nuclear physics or genetic technology – have also led to new types of weaponry. Nor did science automatically lead to the reduction of global inequalities. “Science for diplomacy” therefore ended up with a highly mixed review. The consensus seemed to be that science can prepare the ground for diplomatic initiatives – and benefit from diplomatic agreements – but cannot provide the solutions to either.

Science diplomacy fails – multiple reasons

Dickson, 10 – Dave, Director of SciDev (“Science diplomacy: easier said than done,” SciDev, 6/24/10,

<http://scidevnet.wordpress.com/category/science-diplomacy-conference-2010/>) **Red**

But, as rapidly become clear in the opening session of the three-day meeting on science diplomacy being held at Wilton Park in Sussex, UK, putting the principle of such diplomacy into action presents many practical problems, some of which SciDev.Net aired last week (see Science diplomacy must be more ambitious). As several participants pointed out, this is particularly the case at a time when science budgets are under pressure, and scientists are being asked to justify their support from the public purse in terms of the practical contributions they make to national – rather than international – well-being. The dilemma was highlighted by the very first speaker at the meeting, Peter Fletcher, chair of panel that seeks to co-ordinate the international activities of Britain’s research councils. Fletcher outlined the many ways in which science can be effectively used as a diplomatic tool. He pointed out, for example, that scientific cooperation offered countries such as Britain an opportunity to establish good relations with the Muslim world in just the same way that it had helped them build bridges with China in the 1990s. “Science is a way of building relationships, sometimes even before politicians have agreed to talk.” Fletcher said. “Researchers are used to working across national boundaries. They understand people who are thinking about the same things as they are, and are used to working together in ways in which other people are not.” But he also pointed out that, with the UK having just announced a 25% reduction in its science budget, governments were increasingly requiring scientists to demonstrate the value of their work for those who paid for it. “How much are we prepared to commit to solving global challenges for mutual benefit [in this context]?” he asked. Other challenges were highlighted by Vaughan Turekian, director of the Center for Science Diplomacy, American Association for the Advancement of Science (AAAS), Washington DC Turekian pointed out that part of the attraction of using science for diplomatic purposes was its apolitical nature. In addition, the United States, for example, was well placed to exploit the fact that its science was held in much higher regard around the world than many of its other activities. He quoted a recent visit to Syria by a US scientific delegation that had met with President Assad – an ophthalmologist – as an example of how science diplomacy could help promote political engagement in situations where official relations were limited. “Science cooperation has provided a wonderful way to have a dialogue on issues of mutual interest,” Turekian said. But he also pointed to some of the barriers that prevent science diplomacy from operating effectively, such as asymmetries in scientific capabilities, economic or security concerns over providing access to certain types of key technologies, and a general lack of funding. In the discussion that followed, it became clear that these barriers are likely to become an important focus of attention over the next two days. Several participants,

for example, pointed to the obstacles to international scientific exchange presented by the increasing restrictions on entrance visas being placed by countries such as the United States. "It becomes so difficult for someone to get into the US that once they are there, they cannot afford to go home, even for a short visit, because they have no idea whether they will be able to get back in," was one typical comment.

Science diplomacy fails

David **Dickson**, SciDev.net, June 2, 2009. <http://scidevnet.wordpress.com/2009/06/02/science-diplomacy-the-case-for-caution/>

One of the frustrations of meetings at which scientists gather to discuss policy-related issues is the speed with which the requirements for evidence-based discussion they would expect in a professional context can go out of the window. Such has been the issue over the past two days in the meeting jointly organised in London by the American Association for the Advancement of Science (AAAS) and the Royal Society on the topic "New Frontiers in Science Diplomacy". There has been much lively discussion on the value of international collaboration in achieving scientific goals, on the need for researchers to work together on the scientific aspects of global challenges such as climate change and food security, and on the importance of science capacity building in developing countries in order to make this possible. But there remained little evidence at the end of the meeting on how useful it was to lump all these activities together under the umbrella term of "science diplomacy". More significantly, although numerous claims were made during the conference about the broader social and political value of scientific collaboration – for example, in establishing a framework for collaboration in other areas, and in particular reducing tensions between rival countries – little was produced to demonstrate whether this hypothesis is true. If it is not, then some of the arguments made on behalf of "science diplomacy", and in particular its value as a mechanism for exercising "soft power" in foreign policy, do not stand up to close scrutiny.

Diplomacy can't spillover

Daniel **Brumberg**, May 6, 2006. <http://hir.harvard.edu/development-and-modernization/hegemony-or-leadership>

Indeed, I agree with many of his points. US President George Bush's administration has alienated much of the world by its rejection of international treaties, advocacy of regime change, implicit rejection of national sovereignty, failure to push for a two-state solution to the Palestinian-Israeli conflict, and what many see as a self-serving and hypocritical approach to non-proliferation. I also agree that **much of the "hatred" toward the United States has more to do with US policies than US values.** **No amount of shrewd public diplomacy can overcome the basic policy clashes that separate Europe and Washington almost as decisively as they divide Washington and the Third World.** That said, Ambassador Zarif has simplified some of the inevitable challenges that the world's remaining superpower must encounter. Moreover, he ignores the daunting challenge that Iranian leaders still face in squaring their espousal of international norms and institutions with many of Iran's foreign policies. Unfortunately, some of these policies reflect the enduring influence of a hard-line clerical establishment that repudiates many of the very global norms that Ambassador Zarif advocates.

AT: State Experimentalism Good

State experimentation doesn't help immigration

Cunningham-Parmeter 11 Associate Professor of Law, Willamette University. J.D., Stanford University. copyright (c) 2011 U.C. Hastings College of the Law Hastings Law Journal July, 2011 Hastings Law Journal 62 Hastings L.J. 1673 LENGTH: 29161 words Article: Forced Federalism: States as Laboratories of Immigration Reform

Ever since Justice Louis Brandeis characterized states as laboratories of democracy, judges and scholars have championed the ability of states to offer a diverse array of solutions to complex national problems. Today, proponents of enhanced immigration restrictions apply the same

rationale to state immigration laws. This Article challenges the assertion that states can serve as valuable laboratories of immigration reform. States that enact their own immigration laws do **not internalize costs or yield replicable results** - two conditions needed for **viable experimentation**. When states internalize costs, other jurisdictions can effectively evaluate outcomes. Replication occurs when states take diverse approaches to common problems. Unfortunately, current state immigration laws do not meet these criteria because states operate in a system of "forced federalism": a division of power between the two levels of government in which subnational jurisdictions attempt to force the federal government to accept state-defined immigration enforcement schemes. But as states thrust their chosen levels of immigration control on the federal government, their potential to innovate on immigration matters is quite restricted. Essentially, forced federalism limits states to a narrow set of enforcement decisions based on federally defined norms - far from the type of diverse testing associated with true innovation and replication. Today's state immigration experiments also fail to internalize costs - another condition of successful subnational tests. Restrictionist states that encourage unauthorized immigrants to resettle in other jurisdictions export the economic damage they claim illegal immigration causes. In addition to economic spillovers, laboratory states export social costs to the nation by fundamentally altering the concept of a shared national identity. For example, when immigrants flee restrictionist states in order to avoid racial profiling or harassment, the national commitment to values such as egalitarianism and nondiscrimination is weakened. These harms are not confined to restrictionist states alone but are felt by the nation as a whole. **Not all subjects are ripe for local experimentation and not all tests produce valid results. Despite the appealing image of states as laboratories, today's immigration experiments will not advance the nation's ongoing search for sounder immigration policies.**

Federal control over immigration is super resilient – Arizona ruling

Vincent J **Cannato** Fall 20**12**; associate professor of history at the University of Massachusetts, Boston, and the author of American Passage: The History of Ellis Island. "Our Evolving Immigration Policy" National Affairs Issue 13 Fall 2012 <http://www.nationalaffairs.com/publications/detail/our-evolving-immigration-policy>

For all the debate that surrounds America's immigration policy, just who is responsible for enforcing that policy has rarely been in dispute in recent decades — until Arizona adopted the statute S.B. 1070. Arguing that the federal government had proved incapable of stopping the illegal immigration wreaking havoc in the state, Arizona lawmakers took matters into their own hands, enacting legislation that used state penalties and state police to try to give meaningful force to federal laws already on the books. Washington, for its part, resisted, claiming that Arizona's approach intruded on federal prerogatives. The federal-state power struggle ultimately landed before the Supreme Court, which, amid a swirl of politicized commentary on both sides of the matter, issued its ruling in June. "The Government of the United States has **broad, undoubted power** over the subject of immigration and the status of aliens....The federal power to determine immigration policy is **well settled**," opined Justice Anthony Kennedy, writing for the Court's majority in Arizona v. United States. In a 5-3 decision (Justice Elena Kagan recused herself), the Court struck down most of the Arizona law and limited the permissible range of state activity in the realm of immigration enforcement. To allow each of the 50 states to enact its own immigration-control laws — even if those laws did not conflict with, but instead complemented, federal law — would, in the Court's view, violate the doctrine that "the States are precluded from regulating conduct in a field that Congress, acting within its proper authority, has determined must be regulated by its exclusive governance." In the eyes of the Court's majority, the regulation of immigration has been so thoroughly dominated by the federal government as to leave **virtually no room** for action by the states. Justice Antonin Scalia disagreed, writing in his dissent that such a ruling "deprives States of what most would consider the defining characteristic of sovereignty: the power to exclude from the sovereign's territory people who have no right to be there." The majority's opinion, he contended, is supported by "neither the Constitution itself nor even any law passed by Congress."

The plan doesn't create legal clarity to encourage state action – Court ruling wouldn't solve federal reassertion of power, either

Tamar **Jacoby** 4-22-20**12**; a fellow of the New America Foundation, is president of ImmigrationWorks USA, a national federation of small business owners working for better immigration law. “States Should Experiment on Immigration Policy” NYT, <http://www.nytimes.com/roomfordebate/2012/04/22/how-states-should-approach-immigration/states-should-experiment-on-immigration-policy?gwh=48DC6026D5DF65A992E332FAEEE2FFBB&gwt=pay&assetType=opinion>

If only it were clear what is within the states' power on immigration and what isn't. That would make things a lot easier for everyone. The problem is **we don't know**. Throughout American history, the pendulum of states' rights and federal power has swung back and forth, and not just on immigration. Today, we're in the middle of a federalist revolution of historic proportions, with states across the country taking immigration lawmaking into their own hands – and getting a yellow if not green light from the U.S. Supreme Court. This summer, the court will issue its second immigration opinion in two years, and I predict that again it will be at least a yellow light. So what are states to do? Virtually all the state immigration laws enacted in the last decade have been enforcement measures. That's understandable; lawmakers and voters want to get control of illegal immigration.

States are just incompetent at immigration – only federal policy solves

Adam **Cohen** 5-7-20**12**; teaches at Yale Law School. “Why States Shouldn't Control Immigration: Whatever the Supreme Court's decision on Arizona's controversial law, it should be a wake-up call about why American immigration policy must be established on a national — not state — level” <http://ideas.time.com/2012/05/07/why-states-shouldnt-control-immigration/>

Advocates for illegal immigrants are, naturally, worried — they fear harsh new laws and crackdowns in state after state. But even people who take a harder line on immigration should not be particularly pleased if this is how things go. There is a good reason that we look to the federal government — and not the states — to take the lead on immigration law. Only Congress can address the issue in all its complexity, taking on the many concerns on all sides. (MORE: Do Elected Officials Have to Speak English?) The Comprehensive Immigration Reform Act of 2007, which never passed, showed what Congress could do. That bill would have created a clear path to citizenship for the estimated 11 million illegal immigrants currently in the U.S. It also had real get-tough provisions, including increased enforcement along the U.S.-Mexico border and a national database for employers to check the immigration status of job applicants. States cannot do anything this ambitious. They may be able to hound individual immigrants into leaving the country or drive the ones who remain to live their lives in the shadows. But states cannot give people a path to citizenship or create a national database. They cannot fix a national system that almost everyone agrees is badly broken. The main reason that Arizona, Alabama and other states have begun acting aggressively on immigration is that Washington has failed for years to address the problem. Even if the Supreme Court says that states have the legal right to enact immigration laws like Arizona's, that does not mean that it makes any sense for the nation's immigration policy to be established at the state level. Whatever the outcome of the challenge to Arizona's law, it should be a wake-up call to Congress that the American people are tired of waiting for immigration reform.

Federal control is inevitable and good

Tamar **Jacoby** 2-24-20**12**; Tamar Jacoby, a fellow at the New America Foundation, president of ImmigrationWorks USA, a national federation of small business owners in favor of immigration reform. “What if justices let states make immigration policy?” <http://www.cnn.com/2012/04/24/opinion/jacoby-immigration-supreme-court/>

Those who want Washington to make immigration policy have a hundred years of history and a raft of persuasive arguments on their side. The Constitution reserves some powers for Congress: naturalization and, by extension, determining who and how many immigrants we admit. Federal law carves out other areas, including most worksite enforcement. And sheer practicality argues for one national policy on the border.

Tons of state experimentation on immigration in the squo

Elias '13

[Asse Prof Law Iowa. "The New Immigration Federalism" 2013
<http://moritzlaw.osu.edu/students/groups/oslj/files/2013/12/6-Elias.pdf//jv>]

During the 2011 and 2012 legislative sessions, comprehensive immigration reform was once again a topic of vibrant debate and speculation in Congress, in the media, and in the legal academy. On June 27, 2013, the Senate passed S. 744, the "Border Security, Economic Opportunity, and Immigration Modernization Act."³ Speculation abounded—and indeed continues to abound—as to what action, if any, the House of Representatives might take. But, as federal lawmakers and commentators argued the relative merits of different proposed solutions to cut visa backlogs, attract immigrants with skills in science and technology, and address the challenges posed by approximately 11.2 million undocumented migrants,⁴ some of the most important stakeholders—the governments of the fifty states—were unusually silent. This was particularly noteworthy, because until the summer of 2012, those very state governments were often at the forefront of efforts to influence the reform of immigration law and policy; in 2010, for example, 346 separate bills pertaining to immigration and alienage were passed by state legislatures.⁵ The catalyst for the change in states' immigration-related rulemaking was the United States Supreme Court's June 25, 2012 decision in *Arizona v. United States*,⁶ which reasserted the federal government's primacy in the immigration arena and clarified the boundaries of federal, state, and local rulemaking pertaining to immigration enforcement and immigration-related criminal sanctions. In the wake of the *Arizona* ruling, a number of states suspended immigration enforcement operations and ceased to promulgate anti- unauthorized-immigrant laws. At the same time, immigration law scholars and commentators—some of whom had previously argued that it would be "conceptually unstable" to accord the federal government exclusive power over immigration enforcement, while allowing states and localities to "choose different methods of integrating immigrants"⁷—suggested that the Court's reaffirmation of federal primacy in the sphere of immigration enforcement signaled the demise of "immigration federalism,"⁸ or at the very least a return to state inaction in both immigration and alienage rulemaking.⁹ I disagree. *Arizona v. United States* may mark a watershed in U.S. immigration law and policy, but it does not mark the end of state and local engagement in immigration regulation. Instead, it portends a "new" direction for "immigration federalism."¹⁰ The *Arizona* Court's reinvigoration of the doctrine of broad federal power in the immigration arena does not foreclose all state action pertaining to immigrants and immigration. Rather, the post-*Arizona* legal landscape provides ample opportunity for different varieties of state and local engagement with noncitizen residents—some of which will be novel and some of which will involve the further development or redirection of preexisting laws and policies. This "new immigration federalism" is and will be grounded in immigrant-inclusionary rulemaking, which has the potential to complement (as well as occasionally contradict) federal efforts at comprehensive immigration reform. Early analyses of post-*Arizona* state lawmaking support this understanding of the new framework of immigration federalism. After a lull during 2012, which coincided with the Court's consideration of *Arizona*, state rulemaking pertaining to immigrants rebounded in the first six months of 2013. By the end of June of 2013, forty-three states and the District of Columbia had passed a total of 377 laws and resolutions related to immigration; an 83% increase from the first half of 2012.¹⁰ Notably, just one state, Georgia, passed immigrant-

exclusionary legislation in early 2013; the other forty-two states enacted immigrant-inclusionary measures.^{¶ 11} Legislation intended to expand access to driver's licenses for all immigrants was introduced in at least nineteen states, as well as in the District of Columbia and Puerto Rico.^{¶ 12} Bills designed to provide access to in-state tuition rates for students, regardless of their immigration status, so-called "State DREAM Acts," were introduced in at least sixteen states, and proposals for greater access to scholarships and/or financial aid for immigrant students were considered in several states.^{¶ 13} At the same time, five state legislatures debated new measures to provide greater workplace protections to immigrant domestic workers.^{¶ 14} These recent developments portend the future direction of immigration federalism in the United States.

Your evidence says that NASA needs to fund and prioritize asteroid readiness – the status quo solves that

King '14

[Ledyard. USA Today Staff. "NASA budget would ramp up asteroid mission" 3/4/14
<http://www.usatoday.com/story/news/nation/2014/03/04/nasa-budget-asteroid-mission/6021269//jv>]

NASA's proposed budget for fiscal 2015 would ramp up funding to fly astronauts to an asteroid by 2025 as part of a steppingstone approach to Mars, a mission some lawmakers want to replace with a return trip to the moon.[¶] The \$133 million for the mission, which would deflect a small asteroid into near-Earth orbit so astronauts could practice landing on it and study its characteristics, is part of the space agency's proposed \$17.46 billion budget released by the administration Tuesday.[¶] Fiscal 2015 begins on Oct. 1 and ends on Sept. 30, 2015.[¶] The budget also includes funding to continue NASA's other top priorities: a deep-space Space Launch System rocket and the Orion multi-purpose vehicle it will carry to Mars, the James Webb Space Telescope due for launch in 2018, and the Commercial Crew Program that helps fund private efforts to send astronauts from the U.S. to the International Space Station.[¶] The budget is about \$185 million below the fiscal 2014 level but roughly \$600 million more than NASA received in fiscal 2013, when sequestration cut discretionary spending across the board.[¶] NASA could have access to another \$900 million as well — its share of a \$56 billion Opportunity, Growth and Security Initiative that would be separate from the regular budget.

Sufficient detection and deflection efforts now – but increased US asteroid leadership guts those
CSM '10

(May 14, "Who is responsible for averting an asteroid strike?"
<http://www.csmonitor.com/Innovation/2009/0514/who-is-responsible-for-averting-an-asteroid-strike>)

Asteroid hunters have good news – and a challenge – for the rest of us. After an extensive search for asteroids a kilometer or more across, engineer Steve Chesley says that "we can now say with confidence that no asteroids large enough to cause such a global calamity [as killing off the dinosaurs] are headed our way." But if one of them – or even a smaller, city-destroying rock – were detected on a collision course, would the world community be prepared to handle it? A conference of legal experts that discussed this question at the University of Nebraska in Lincoln last month answered it with a resounding "No." Scientists and engineers who have studied the problem of deflecting a dangerous asteroid believe the technical issues are difficult but solvable. The challenge now is figuring out the legal issues of who takes action on behalf of humankind and of what their responsibilities and liabilities will be. Asteroid hunters believe they can give us plenty of warning. There is "a fair chance that the next Earth impactor will actually be identified with many decades and perhaps centuries of warning time," explains Mr. Chesley of the NASA

Jet Propulsion Laboratory in Pasadena, Calif., in the March/April issue of the Planetary Report. That's plenty of time to develop a spacecraft whose gravitational attraction might nudge an asteroid aside – or a rocket or some application of nuclear explosives to do the job. However, if a single country – or small group of nations – tries to take the initiative on its own, the international reaction could stall any action at all. "The international political reactions to the US shooting down one of its own satellites a year ago to prevent presumably dangerous and toxic rocket fuel from reaching Earth only foreshadows what would happen if the US would detonate nukes claiming to destroy an incoming asteroid," said Frans von der Dunk, a University of Nebraska space law expert, at the Nebraska conference, according to Space News. Overlooking the hype about nuclear weapons, which engineers consider an unlikely, extreme measure, Professor von der Dunk has pointed out the main issue. Averting a regional or global asteroid threat may involve unforeseen collateral damage – such as splintered chunks making their way to Earth or worse. Therefore, the world community has to have a say in how that threat is handled. Right now, to use von der Dunk's word, that community is "underorganized" to meet this challenge.

No extinction impact

BENNETT 10

(James, Eminent Scholar at George Mason University and holds the William P. Snavely Chair of Political Economy and Public Policy in the Department of Economics and is Director of the John M. Olin Institute for Employment Practice and Policy. He received his Ph.D. from Case Western Reserve University in 1970 and has specialized in research related to public policy issues, the economics of government and bureaucracy, labor unions, and health charities. *The Doomsday Lobby: Hype and Panic from Sputniks, Martians, and Marauding Meteors*, p. 157-158

It should be noted that the Alvarez et al. hypothesis was not universally accepted. As Peter M. Sheehan and Dale A. Russell wrote in their paper "Faunal Change Following the Cretaceous–Tertiary Impact: Using Paleontological Data to Assess the Hazards of Impacts," published in *Hazards Due to Comets & Asteroids* (1994), edited by Tom Gehrels, "many paleontologists resist accepting a cause and effect relationship" between the iridium evidence, the Chicxulub crater, and the mass extinction of 65 million years ago.¹⁵ For instance, Dennis V. Kent of the Lamont–Doherty Geological Observatory of Columbia University, writing in *Science*, disputed that a high concentration of iridium is necessarily "associated with an extraordinary extraterrestrial event" and that, moreover, "a large asteroid... is not likely to have had the dire consequences to life on the earth that they propose."¹⁶ Briefly, Kent argues that the Alvarez team mistakenly chose the 1883 Krakatoa eruption as the standard from which to extrapolate the effects of stratospheric material upon sunlight. Yet Krakatoa was too small a volcanic eruption from which to draw any such conclusions; better, says Kent, is the Toba caldera in Sumatra, remnant of an enormous eruption 75,000 years ago. (A caldera is the imprint left upon the earth from a volcanic eruption.) The volume of the Toba caldera is 400 times as great as that of Krakatoa – considerably closer to the effect that an asteroid impact might have. Yet the sunlight "attenuation factor [for Toba] is not nearly as large as the one postulated by Alvarez et al. for the asteroid impact." Indeed, the Toba eruption is not associated with any mass extinctions, leading Kent to believe that "the cause of the massive extinctions is not closely related to a drastic reduction in sunlight alone."¹⁷ Reporting in *Science*, Richard A. Kerr wrote that "Many geologists, paleontologists, astronomers, and statisticians... find the geological evidence merely suggestive or even nonexistent and the supposed underlying mechanisms improbable at best." Even the iridium anomalies have been challenged: Bruce Corliss of the Woods Hole Oceanographic Institute argues that the major extinctions associated with the K–T event were not immediate and catastrophic but "gradual and apparently linked to progressive climate change."¹⁸ Others argue that a massive volcanic event predating the Alvarezian killer asteroid created an overwhelming greenhouse effect and set the dinosaurs up for the knockout punch. A considerable number of scientists believe that gradually changing sea levels were the primary cause of the K–T Extinction. If either of these hypotheses is true – and a substantial number of geologists hold these positions — then the "killer asteroid" is getting credit that it does not deserve. Even if the

K-T Extinction was the work of a rock from space, the Alvarez team credits a "probable interval of 100 million years between collisions with 10-km-diameter objects."¹⁹ The next rendezvous with annihilation won't be overdue for about 40 million years. We have time.

2NC Space Impacts

If the status quo doesn't solve, then neither does the aff – NASA's NEO program is a dumpster fire

AFP '14

[The Agence France Presse. "NASA asteroid defense program falls short: audit" 9/15/14
<http://phys.org/news/2014-09-nasa-asteroid-defense-falls-short.html/jv>]

The US space agency's program to detect and protect the Earth from incoming asteroids is poorly managed and far behind schedule, said a government audit report on Monday.¶ **Just one million of the program's \$40 million annual budget is spent on strategies to deflect an incoming asteroid or evacuate areas in danger of impact**, said the report by NASA inspector General Paul Martin.¶ NASA was tasked by Congress in 2005 to establish a program for tracking near-Earth objects (NEO) greater than 140 meters in diameter (460 feet), to decide on their threat and to catalogue 90 percent of these objects by 2020.¶ **"While the program has discovered, categorized, and plotted the orbits of more than 11,000 NEOs since 1998, NASA estimates that it has identified only 10 percent of all asteroids** 140 meters and larger and will not meet the 2020 deadline," said the audit.¶ Furthermore, it described **NASA's NEO Program as organized under "a single program executive who manages a loosely structured, non-integrated conglomerate of research activities with little coordination, insufficient program oversight, and no established milestones to track progress."**¶ The report noted that most NEOs are harmless and disintegrate before they reach the surface of the Earth.¶ However, some survive, it said, pointing to the 18-meter (57-foot) meteor that exploded above the city of Chelyabinsk, Russia in 2013 "with the force of 30 atomic bombs, blowing out windows, destroying buildings, and injuring more than 1,000 people."¶ **Other problems with NASA management of the program included an asteroid redirect mission that was not managed by the NEO program, and "inadequate controls to ensure proper accounting of agency-funded grants and task orders."**¶ **The "lack of planning and resources has prevented the NEO Program from developing additional agreements that could help achieve program goals,"** it added.¶ "For example, establishing formal partnerships with the Department of Defense, the National Science Foundation, and international agencies could give the NEO Program access to additional Earth-based telescopes and thereby increase its ability to detect, track, and characterize a greater number of NEOs."¶ The report said **NASA spends just seven percent of its \$40 million budget on "studying mitigation strategies to defend the Earth from the effects of NEO impacts,"** including civil defense strategies, emergency evacuations or "attempting to destroy or deflect the trajectory of an Earth-bound NEO."

The status quo should be enough to solve your internal link, because it's all about data and collaboration – we're doing all of that stuff now

Economist '10

("Data, data everywhere," Feb 24, <http://www.economist.com/node/15557443>)

WHEN the Sloan Digital Sky Survey started work in 2000, its telescope in New Mexico collected more data in its first few weeks than had been amassed in the entire history of astronomy. Now, a decade later, its archive contains a whopping 140 terabytes of information. A successor, the Large Synoptic Survey Telescope, due to come on stream in Chile in 2016, will acquire that quantity of data every five days. Such astronomical amounts of information can be found closer to Earth too. Wal-Mart, a retail giant, handles more than 1m customer transactions every hour, feeding databases estimated at more than 2.5 petabytes—the equivalent of 167 times the books in America’s Library of Congress (see article for an explanation of how data are quantified). Facebook, a social-networking website, is home to 40 billion photos. And decoding the human genome involves analysing 3 billion base pairs—which took ten years the first time it was done, in 2003, but can now be achieved in one week. All these examples tell the same story: that the world contains an unimaginably vast amount of digital information which is getting ever vaster ever more rapidly. This makes it possible to do many things that previously could not be done: spot business trends, prevent diseases, combat crime and so on. Managed well, the data can be used to unlock new sources of economic value, provide fresh insights into science and hold governments to account. But they are also creating a host of new problems. Despite the abundance of tools to capture, process and share all this information—sensors, computers, mobile phones and the like—it already exceeds the available storage space (see chart 1). Moreover, ensuring data security and protecting privacy is becoming harder as the information multiplies and is shared ever more widely around the world. Alex Szalay, an astrophysicist at Johns Hopkins University, notes that the proliferation of data is making them increasingly inaccessible. “How to make sense of all these data? People should be worried about how we train the next generation, not just of scientists, but people in government and industry,” he says. “We are at a different period because of so much information,” says James Cortada of IBM, who has written a couple of dozen books on the history of information in society. Joe Hellerstein, a computer scientist at the University of California in Berkeley, calls it “the industrial revolution of data”. The effect is being felt everywhere, from business to science, from government to the arts. Scientists and computer engineers have coined a new term for the phenomenon: “big data”. Epistemologically speaking, information is made up of a collection of data and knowledge is made up of different strands of information. But this special report uses “data” and “information” interchangeably because, as it will argue, the two are increasingly difficult to tell apart. Given enough raw data, today’s algorithms and powerful computers can reveal new insights that would previously have remained hidden. The business of information management—helping organisations to make sense of their proliferating data—is growing by leaps and bounds. In recent years Oracle, IBM, Microsoft and SAP between them have spent more than \$15 billion on buying software firms specialising in data management and analytics. This industry is estimated to be worth more than \$100 billion and growing at almost 10% a year, roughly twice as fast as the software business as a whole. Chief information officers (CIOs) have become somewhat more prominent in the executive suite, and a new kind of professional has emerged, the data scientist, who combines the skills of software programmer, statistician and storyteller/artist to extract the nuggets of gold hidden under mountains of data. Hal Varian, Google’s chief economist, predicts that the job of statistician will become the “sexiest” around. Data, he explains, are widely available; what is scarce is the ability to extract wisdom from them. More of everything There are many reasons for the information explosion. The most obvious one is technology. As the capabilities of digital devices soar and prices plummet, sensors and gadgets are digitising lots of information that was previously unavailable. And many more people have access to far more powerful tools. For example, there are 4.6 billion mobile-phone subscriptions worldwide (though many people have more than one, so the world’s 6.8 billion people are not quite as well supplied as these figures suggest), and 1 billion-2 billion people use the internet. Moreover, there are now many more people who interact with information. Between 1990 and 2005 more than 1 billion people worldwide entered the middle class. As they get richer they become more literate, which fuels information growth, notes Mr Cortada. The results are showing up in politics, economics and the law as well. “Revolutions in science have often been preceded by revolutions in measurement,” says Sinan Aral, a business professor at New York University. Just as the microscope transformed biology by exposing germs, and the electron microscope changed physics, all these data are turning the social sciences upside down, he explains. Researchers are now able to understand human behaviour at the population level rather than the individual level. The amount of digital information increases tenfold every five years. Moore’s law, which the computer industry now takes for granted, says that the processing power and storage capacity of computer chips double or their prices halve roughly every 18 months. The software programs are getting better too. Edward Felten, a computer scientist at Princeton University, reckons that the improvements in the algorithms driving computer applications have played as important a part as Moore’s law for decades. A vast amount of that information is shared. By 2013 the amount of traffic flowing over the internet annually will reach 667 exabytes, according to Cisco, a maker of communications gear. And the quantity of data continues to grow faster than the ability of the network to carry it all. People have long groused that they were swamped by information. Back in 1917 the manager of a Connecticut manufacturing firm complained about the effects of the telephone: “Time is lost, confusion results and money is spent.” Yet what is happening now goes way beyond incremental growth. The quantitative change has begun to make a qualitative difference. This shift from information scarcity to surfeit has broad effects. “What we are seeing is the ability to have economies form around the data—and that to me is the big change at a societal and even macroeconomic level,” says Craig Mundie, head of research and strategy at Microsoft. Data are becoming the new raw material of business: an economic input almost on a par with capital and labour. “Every day I wake up and ask, ‘how can I flow data better, manage data better, analyse data better?’” says Rollin Ford, the CIO of Wal-Mart. Sophisticated quantitative analysis is being applied to many aspects of life, not just missile trajectories or financial hedging strategies, as in the past. For example, Farecast, a part of Microsoft’s search engine Bing, can advise customers whether to buy an airline ticket now or wait for the price to come down by examining 225 billion flight and price records. The same idea is being extended to hotel rooms, cars and similar items. Personal-finance websites and banks are aggregating their customer data to show up macroeconomic trends, which may develop into ancillary businesses in their own right. Number-crunchers have even uncovered match-fixing in Japanese sumo wrestling. Dross into gold “Data exhaust”—the trail of clicks that internet users leave behind from which value can be extracted—is becoming a mainstay of the internet economy. One example is Google’s search engine, which is partly guided by the number of clicks on an item to help determine its relevance to a search query. If the eighth listing for a search term is the one most people go to, the algorithm puts it higher up. As the world is becoming increasingly digital, aggregating and analysing data is likely to bring huge benefits in other fields as well. For example, Mr Mundie of Microsoft and Eric Schmidt, the boss of Google, sit on a presidential task force to reform American health care. “Early on in this process Eric and I both said: ‘Look, if you really want to transform health care, you basically build a sort of health-care economy around the data that relate to people.’” Mr Mundie explains. “You would not just think of data as the ‘exhaust’ of providing health services, but rather they become a central asset in trying to figure out how you would improve every aspect of health care. It’s a bit of an inversion.” To be sure, digital records should make life easier for doctors, bring down costs for providers and patients and improve the quality of care. But in aggregate the data can also be mined to spot unwanted drug interactions, identify the most effective treatments and predict the onset of disease before symptoms emerge. Computers already attempt to do these things, but need to be explicitly programmed for them. In a world of big data the correlations surface almost by themselves. Sometimes those data reveal more than was intended. For example, the city of Oakland, California, releases information on where and when arrests were made, which is put out on a private website, Oakland Crimspotting. At one point a few clicks revealed that police swept the whole of a busy street for prostitution every evening except on Wednesdays, a tactic they probably meant to keep to themselves. But big data can have far more serious consequences than that. During the recent financial crisis it became clear that banks and rating agencies had been relying on models which, although they required a vast amount of information to be fed in, failed to reflect financial risk in the real world. This was the first crisis to be sparked by big data—and there will be more.

Tons of international asteroid coop now

NRC 10

[National Research Council, Committee to Review NEO Surveys and Hazard Mitigation Strategies and Space Studies Board Aeronautics and Space Engineering Board Division on Engineering and Physical Sciences, "Defending Planet Earth: Near-Earth-Object Surveys and Hazard Mitigation Strategies" Retrieved from Google Books]

Recognizing that impacts from near-Earth objects represent a hazard to humanity, the United States, the European Union, Japan, and other countries cooperatively organized to identify, track, and study NEOs in an effort termed "Spaceguard." From this organization, a nonprofit group named the Spaceguard Foundation was created to coordinate NEO detection and studies: it is currently located at the European Space Agency's (ESA's) Centre for Earth Observation (ESRIN) in Frascati, Italy. The United States input to this collective effort comprises three aspects: telescopic search efforts to find NEOs, the Minor Planet Center (MPC) at the Harvard-Smithsonian Center for Astrophysics, and the NASA NEO Program Office at the Jet Propulsion Laboratory. Existing, retired, and proposed telescopic systems for the U.S. NEO searches are detailed below. Other telescopic survey, detection, and characterization efforts are conducted worldwide and work synergistically with U.S. telescopic searches (e.g., Asiago-DLR Asteroid Survey, jointly operated by the University of Padua and the German Aerospace Center [DLR], Campo Imperatore Near-Earth Object Survey at Rome Observatory; and the Bisei Spaceguard Center of the Japanese Spaceguard Association). To date, the U.S. search effort has been the major contributor to the number of known NEOs. The functions of the two U.S. data- and information-gathering offices, the MPC and the NEO Program Office, are complementary. A European data- and information-gathering office, the Near-Earth Objects Dynamic Site (NEODyS) is maintained at the University of Pisa in Italy, with a mirror site at the University of Valladolid in Spain. These three services are described below.

The squo solves your coop and travel internal links – but increased US leadership on the matter just causes confusion and data overload

Economist '10

("Data, data everywhere," Feb 24, <http://www.economist.com/node/15557443>)

Is this everybody's future? Probably not. But as the torrent of information increases, it is not surprising that people feel overwhelmed. "There is an immense risk of cognitive overload," explains Carl Pabo, a molecular biologist who studies cognition. The mind can handle seven pieces of information in its short-term memory and can generally deal with only four concepts or relationships at once. If there is more information to process, or it is especially complex, people become confused. Moreover, knowledge has become so specialised that it is impossible for any individual to grasp the whole picture. A true understanding of climate change, for instance, requires a knowledge of meteorology, chemistry, economics and law, among many other things. And whereas doctors a century ago were expected to keep up with the entire field of medicine, now they would need to be familiar with about 10,000 diseases, 3,000 drugs and more than 1,000 lab tests. A study in 2004 suggested that in epidemiology alone it would take 21 hours of work a day just to stay current. And as more people around the world become more educated, the flow of knowledge will increase even further. The number of peer-reviewed scientific papers in China alone has increased 14-fold since 1990 (see chart 3, next page). "What information consumes is rather obvious: it consumes the attention of its recipients," wrote Herbert Simon, an economist, in 1971. "Hence a wealth of information creates a poverty of attention." But just as it is machines that are generating most of the data deluge, so they can also be put to work to deal with it. That highlights the role of "information intermediaries". People rarely deal with raw data but consume them in processed form, once they have been aggregated or winnowed by computers. Indeed, many of the technologies described in this report, from business analytics to recursive machine-learning to visualisation software, exist to make data more digestible for humans. Some applications have already become so widespread that they are taken for granted. For example, banks use credit scores, based on data about past financial transactions, to judge an applicant's ability to repay a loan. That makes the process less subjective than the say-so of a bank manager. Likewise, landing a plane requires a lot of mental effort, so the process has been largely automated, and both pilots and passengers feel safer. And in health care the trend is towards "evidence-based medicine", where not only doctors but computers too get involved in diagnosis and treatment. The dangers of complacency In the age of big data, algorithms will be doing more of the thinking for people. But that carries risks. The technology is far less reliable than people realise. For every success with big data there are many failures. The inability of banks to understand their risks in the lead-up to the financial crisis is one example. The deficient system used to identify potential terrorists is another. On Christmas Day last year a Nigerian man, Umar Farouk Abdulmutallab, tried to ignite a hidden bomb as his plane was landing in Detroit. It turned out his father had informed American officials that he posed a threat. His name was entered into a big database of around 550,000 people who potentially posed a security risk. But the database is notoriously flawed. It contains many duplicates, and names are regularly lost during back-ups. The officials had followed all the right procedures, but the system still did not

prevent the suspect from boarding the plane. One big worry is what happens if the technology stops working altogether. This is not a far-fetched idea. In January 2000 the torrent of data pouring into America's National Security Agency (NSA) brought the system to a crashing halt. The agency was "brain-dead" for three-and-a-half days, General Michael Hayden, then its director, said publicly in 2002. "We were dark. Our ability to process information was gone." If an intelligence agency can be hit in this way, the chances are that most other users are at even greater risk. Part of the solution will be to pour more resources into improving the performance of existing technologies, not just pursue more innovations. The computer industry went through a similar period of reassessment in 2001-02 when Microsoft and others announced that they were concentrating on making their products much more secure rather than adding new features. Another concern is energy consumption. Processing huge amounts of data takes a lot of power. "In two to three years we will saturate the electric cables running into the building," says Alex Szalay at Johns Hopkins University. "The next challenge is how to do the same things as today, but with ten to 100 times less power." It is a worry that affects many organisations. The NSA in 2006 came close to exceeding its power supply, which would have blown out its electrical infrastructure. Both Google and Microsoft have had to put some of their huge data centres next to hydroelectric plants to ensure access to enough energy at a reasonable price. Some people are even questioning whether the scramble for ever more information is a good idea. Nick Bostrom, a philosopher at Oxford University, identifies "information hazards" which result from disseminating information that is likely to cause harm, such as publishing the blueprint for a nuclear bomb or broadcasting news of a race riot that could provoke further violence. "It is said that a little knowledge is a dangerous thing," he writes. "It is an open question whether more knowledge is safer." Yet similar concerns have been raised through the ages, and mostly proved overblown.

The tech's not good enough to deflect

Barbee and Nuth '9

(*Aerospace Engineer and Planetary Defense Scientist, Emergent Space Technologies, Inc AND **Senior Scientist for Primitive Bodies, Solar System Exploration Division, NASA's Goddard Space Flight Center (10/31/2009, Brent and Joseph, "Asteroid Impact Threats: Advancements in Asteroid Science to Enable Rapid and Effective Deflection Missions", Journal of Cosmology, Vol 2, pgs. 386-410, <http://journalofcosmology.com/Extinction109.html>)

We begin with the premise that Earth is to be protected from the incoming asteroid and therefore we do not seek to move the Earth from the collision point. That would of course be both undesirable and unachievable for myriad reasons. Therefore we seek to act upon the asteroid. Annihilating the asteroid, either by vaporizing it or pulverizing it into a fine grain dust cloud is nowhere near achievable with current or foreseeable technology. Breaking an asteroid into fragments in a controlled fashion is possible in theory, but studies have shown that the required technology is not yet within our reach (Barbee et al., 2007). Fragmenting an incoming asteroid in an uncontrolled fashion is highly undesirable because there is no way to guarantee that all the fragments will be small enough to burn up harmlessly in our atmosphere should they go on to hit the Earth, or that all fragments of sufficient size to do ground damage would miss the Earth subsequent to the fragmentation of the asteroid (Sanchez et al., 2008).

Rotation of the asteroid makes deflection impossible

Walker Et. Al 05

[Roger, European Space Agency Advanced Concepts Team, European Space Agency, "Concepts For Near- Earth Asteroid Deflection Using Spacecraft With Advanced Nuclear and Solar Electric Propulsion Systems," 2005, SM, Accessed: 7/11/11, <http://www.esa.int/gsp/ACT/doc/PRO/ACT-RPR-PRO-2005-ConceptsForNear.pdf>]

For any deflection technique to be used, clearly its response time capability must be within the given warning time of an impact. If the warning time is only a few months to a year, then

the only possible option would be a mass evacuation of the impact zone. The use of nuclear weapons would be unsuitable, since the dispersion of fragments from the disrupted body would not be sufficient and the hazard would be simply spread over a much wider area of the Earth's surface. For longer warning times of a few years, space-based intercept/impulsive methods are possible but their effectiveness would strongly depend upon the asteroid mass. With only a few revolutions before impact, the required delta-V to be imparted to the body (order 10-20 cm/s) is at least an order of magnitude higher than with warning times of a decade or more⁵. Rendezvous/propulsive methods would not be feasible in this scenario due to the time required for rendezvous and thrusting in addition to the coast time for a miss. Typical warning times for asteroid impact are expected to be on the order of 10-50 years⁶ with current optical survey capabilities. Over these timescales, both intercept/impulsive methods and rendezvous/propulsive methods become feasible (assuming that the rendezvous delta-V is not too high). There are a number of significant challenges associated with the propulsive deflection method. Most asteroids rotate about their principal moment of inertia, but some asteroids have been observed to be tumbling about all three axes, e.g. the slow, excited rotation state of NEA Toutatis⁷. In the latter scenario, it may be very difficult to stabilise and control its attitude motion so that propulsive thrusting for the deflection can occur. Additionally, if the asteroid angular momentum is too large (e.g. it is a fast rotator and/or dense), a high delta-V on-board the spacecraft will be required to re-orient the spin axis by the desired amount prior to deflection thrusting, thus reducing the deflection effectiveness. With irregular (but measurable) rotation states and gravity fields due to inhomogeneous internal mass distributions, a safe landing on the surface of an asteroid may also be difficult operationally, though not impossible⁸

We can only deflect the small ones – no shot of stopping anything big enough to cause extinction

Shapiro et al '10

“Slow push” or “slow pull” methods. For these options the orbit of the target object would be changed so that it avoided collision with Earth. The most effective way to change the orbit, given a constraint on the energy that would be available, is to change the velocity of the object, either in or opposite to the direction in which it is moving (direct deflection—moving the object “sideways”—is much less efficient). These options take considerable time to be effective, of the order of decades, and even then would be useful only for objects whose diameters are no larger than 100 meters or so.

Even if we could, political hurdles mean we wouldn't get our stuff together in time

Chapman '5

(Clark R., Southwest Research Institute, B.S. in Astronomy, Harvard University, 1967 M.S. in Meteorology, Massachusetts Institute of Technology, 1968 Ph.D. in Planetary Science, Massachusetts Institute of Technology, 1972, "The asteroid impact hazard and interdisciplinary issues")

The most salient fact about integration of asteroid impact disaster planning into the broader responsibilities of public disaster management agencies is that there has been none. Despite publication of a few papers on the topic (e.g. Garshnek et al. 2000), I am aware of no consideration at all of the impact hazard by United States or international agencies responsible for managing a broad spectrum of other disasters. Theoretically, one might expect that an "all-hazards" approach would suffice for the impact hazard, because of some of the similarities. But I expect that there are sufficient differences between this particular never-before-witnessed kind of disaster and others that a specific focus on the unusual or unique features of the impact hazard is also essential.

Indeed, even as NASA tries to formalize procedures for communications within that agency if the cognizant official is notified by astronomers of an impact prediction, it remains uncertain who the NASA Administrator should notify within the Federal Emergency Management Agency (a part of the U.S. Dept. for Homeland Security) or whether anyone is prepared to receive such information and would know what to do with it. Although Britain has established an NEO Information Centre (<http://www.nearearthobjects.co.uk>), I am unaware that the British government, any other national agency, or the United Nations has even a rudimentary plan for responding to announcement of an impending impact. The only significant steps that have been taken have been by astronomers: (a) formulation of an impact prediction evaluation process by the Working Group on Near Earth Objects of the International Astronomical Union (a member of ICSU), (b) the development and promulgation of the Torino Scale (Binzel 2000) for articulating the significance of an impact prediction to the public through the news media, and (c) the maintenance of several web sites where up-to-date information is available on NEAs (<http://neo.jpl.nasa.gov/>, <http://newton.dm.unipi.it/cgi-bin/neodys/neoibo?>, and <http://spaceguard.rm.iasf.cnr.it/>; background information is maintained at <http://www.nearearthobjects.co.uk> and <http://impact.arc.nasa.gov/index.html>, among other sites. But for an end-to-end disaster management plan to be effective, astronomers constitute only the first link in a lengthy, so-far-undefined chain of communications and responsibilities.

Doesn't cause extinction

Kluger '9

[Jeffrey Kluger, senior writer for Time Magazine, winner of the Overseas Press Club's Award for best reporting on environmental issues, and former professor of science and journalism at NYU; "Maybe an Asteroid Didn't Kill the Dinosaurs;" published 4/27/2009; <http://www.time.com/time/health/article/0,8599,1894225,00.html>;]

When a scientific principle is common knowledge even in grammar school, you know it has long since crossed the line from theory to established fact. That's the case with dinosaur extinction. Some 65 million years ago — as we've all come to know — an asteroid struck the earth, sending up a cloud that blocked the sun and cooled the planet. That, in turn, wiped out the dinosaurs and made way for the rise of mammals. The suddenness with which so many species vanished after that time always suggested a single cataclysmic event, and the 1978 discovery of a 112-mile, 65-million-year-old crater off the Yucatán Peninsula near the town of Chicxulub seemed to seal the deal. Now, however, a study in the *Journal of the Geological Society* throws all that into question. The asteroid impact and dinosaur extinction, say the authors, may not have been simultaneous, instead occurring 300,000 years apart. That's an eyeblink in geologic time, but it's a relevant eyeblink all the same — one that occurred at just the right moment in ancient history to send the extinction theory entirely awry. (See pictures of meteors striking the earth.) The controversial paper was written by geoscientists Gerta Keller of Princeton University and Thierry Adatte of the University of Lausanne, in Switzerland. Both researchers knew that challenging the impact doctrine would not be easy. The asteroid charged with killing the dinosaurs, after all, left more than the Chicxulub crater as its calling card. At the same 65-million-year depth, the geologic record reveals that a thin layer of iridium was deposited pretty much everywhere in the world. Iridium is an element that's rare on Earth but common in asteroids, and a fine global dusting of the stuff is precisely what you'd expect to find if an asteroid struck the ground, vaporized on impact and eventually rained its remains back down. Below that iridium layer, the fossil record shows that a riot of species was thriving; above it, 65% of them went suddenly missing. (Read about China's dinosaur fossils.) But Keller and Adatte worried that we were misreading both the geologic and fossil records. They conducted surveys at numerous sites in Mexico, including a spot called El Peñón, near the impact crater. They were especially interested in a 30-ft. layer of sediment just above the iridium layer. That sediment, they calculate, was laid down at a rate of about 0.8 in. to 1.2 in. per thousand years, meaning that all 30 feet took 300,000 years to settle into place. Analyzing the fossils at this small site, they counted 52 distinct species just below the iridium layer. Then they counted the species above it. The result: the same 52. It wasn't until they sampled 30 feet higher — and 300,000 years later — that they saw the die-offs. "The mass extinction level can be seen above this interval," Keller says. "Not a single species went extinct as a result of the Chicxulub impact." Keller's and Adatte's species samplings are not, of course, conclusive, and plenty of other surveys since 1978 do tie the extinctions closely to the asteroid. But since the new digs were so close to ground zero, the immediate species loss ought to have been — if anything — greater there than anywhere else in the world. Instead, the animals seemed to escape unharmed. Other paleontologists, however, believe that the very proximity of El Peñón to the impact site makes the results even less reliable. Earthquakes and tsunamis that resulted from the collision could have wrought havoc on the sedimentary record, causing discrete strata to swirl together and completely scrambling time lines. Keller disagrees, pointing out that the slow accretion of sediment that she and Adatte recorded is completely inconsistent with a sudden event like a tsunami. (See pictures of animals in space.) "The sandstone complex was not deposited over hours or days," she says. "Deposition occurred over a very long time period." So if the Chicxulub asteroid didn't kill the dinosaurs, what did? Paleontologists have advanced all manner of other theories over the years, including the appearance of land bridges that allowed different species to migrate to different continents, bringing with them diseases to which native species hadn't developed immunity. Keller and Adatte do not see any reason to stray so far from the prevailing model. Some kind of atmospheric haze might indeed have blocked the sun, making the planet too cold for the dinosaurs — it just didn't have to have come from an asteroid. Rather,

they say, the source might have been massive volcanoes, like the ones that blew in the Deccan Traps in what is now India at just the right point in history. For the dinosaurs that perished 65 million years ago, extinction was extinction and the precise cause was immaterial. But for the bipedal mammals who were allowed to rise once the big lizards were finally gone, it is a matter of enduring fascination.

Turn: Uncooperative Federalism

Uncooperative federalism spills to immigration specifically

Hu 12 Copyright (c) 2012 Regents of the University of California UC Davis Law Review December, 2012 UC Davis Law Review 46 U.C. Davis L. Rev. 535 LENGTH: 38814 words ARTICLE: Reverse-Commandeering NAME: Margaret Hu* isiting Assistant Professor, Duke Law School.

The federal government's **encroachment** upon the states' historic police power through the domestication of immigration policy weakens the federal government's argument that it is defending its exclusive power to control immigration under the Supremacy Clause. Conversely, the **cooperative** nature of immigration enforcement activities between the federal and state governments weakens a state government's argument that this domestication is a form of commandeering or a Tenth Amendment violation of state sovereignty. n17 Nevertheless, this **contested boundary** is becoming the target of increasing controversy, as witnessed by recent legal challenges. Multiple state and local jurisdictions are increasingly **rejecting federal proposals** for further **cooperation** in federal immigration enforcement efforts. n18 As **this movement of "uncooperative federalism"** n19 **grows into a new wave of immigration** [*566] **federalism**, **it** is likely that **state and local governments will raise anti-commandeering principles under the Tenth Amendment as a method to challenge this encroachment by the federal government into states' historic police powers.**

State noncooperation creates superior immigration federalism

Elias, 13 – Associate Professor of Law, University of Iowa College of Law (Stella, “The New Immigration Federalism” OHIO STATE LAW JOURNAL [Vol. 74:5])

A broad definition of “immigration federalism” is therefore needed to encompass involvement by multiple tiers of government—at the federal, state, and local levels—in the promulgation of laws and regulations implicating immigration and alienage that may pertain to either immigrant exclusion or immigrant inclusion. (Re)defining “immigration federalism” as “the engagement by national, state, and local governmental actors in immigration regulation,” recognizes states’ and localities’ potential to engage both in **anti-unauthorized-immigrant rulemaking and in the promulgation of laws designed to foster immigrant inclusion.** As this Article will demonstrate, such a broad definition is necessary to accurately capture the new direction of immigration federalism in the aftermath of Arizona and Whiting, wherein immigrant-exclusionary rulemaking is broadly constrained, whilst immigrant-inclusionary lawmaking is not. This broad definition of “immigration federalism” also implicitly acknowledges that allowing the immigration debate to play out at multiple levels may provide an opportunity for a variety of different legislative and regulatory outcomes.²⁷ Immigration rulemaking, the enforcement of those rules, and dissent from those rules now implicate an increasingly complicated patchwork of federal–state, state–local, and in some instances even federal–local or federal–state–local relationships. As I discuss *infra*, in recent years, despite well-established doctrine mandating federal primacy, states have acted either under the supervision of the federal government, concurrently with the federal government, in competition with the federal government, or in dissent from the federal government to both exclude immigrants and to include them.²⁸ Moreover, the engagement by state and local governmental actors in immigration regulation does not necessarily involve state and local authorities acting in uniform ways to cooperate and coordinate their actions with those of the federal government.²⁹ The “new immigration federalism,” in the post- Arizona legal landscape, may thus involve differentiated dissenting or uncooperative rulemaking by states and localities,³⁰ whether with respect to immigrant-exclusionary measures such as laws directing local police officers to question individuals about their immigration status or immigrant-inclusionary measures such as the sanctuary city movement or state DREAM Act legislation.³¹ In sum, a broad and inclusive definition of immigration federalism is now warranted to characterize the current nature and future direction of state, local, and federal engagement with immigration regulation. I turn, therefore, in the next Part of this Article, to the parameters of this new immigration federalism, as articulated in the United States Supreme Court’s recent immigration preemption cases.

Turn: States Bad

Congress won't be able to step in – states will ruin everything

Emily **Chiang** 2003; Associate – Cravath, Swaine & Moore LLP, “Think Locally, Act Globally? Dormant Federal Common Law Preemption of State and Local Activities Affecting Foreign Affairs,” 53 Syracuse L. Rev. 923, Lexis

Pro-preemption scholars frequently contend that requiring Congress to act affirmatively to preempt state and local activities it finds threatening to the nation ignores the political realities of how Congress functions and the potential damage such activities may create before Congress acts to forestall them. 171 Not only does sheer institutional inertia act to limit the likelihood that Congress will act, but the political popularity of many of the state activities, such as the Massachusetts Burma law or the South Africa divestment statutes, also ensures that even statutes damaging to the nation's foreign policy have a high chance of survival. 172 One might well contend that the failure of Congress to preempt politically popular statutes is not a failure at all, but rather democracy at work, with representatives properly taking the political preferences of their constituents into account when casting their votes. The United States does not, however, operate as a pure democracy, but rather as a democratic republic that differentiates between state legislatures and the national legislature for [*959] a reason. One should perhaps put a finer point on the pro-preemption argument just described and make it more nuanced: the problem is not when members of Congress vote not to preempt a state statute they actually favor (whether because their constituents favor it and it is the right thing to do politically or because they personally favor the statute) but rather when members of Congress vote not to preempt a statute they oppose on national interest grounds because they fear the political consequences of doing so. Perhaps one can differentiate between the two instances by asking whether Congress would ever pass a similar federal statute; if it would not because of the international relations consequences, but the state statute is permitted to pass preemption anyway, one might properly deem that its passing is a failure of our republican system to act as an adequate filter for state actions when the national interest is involved.

Collapses foreign policy credibility

Emily **Chiang** 2003; Associate – Cravath, Swaine & Moore LLP, “Think Locally, Act Globally? Dormant Federal Common Law Preemption of State and Local Activities Affecting Foreign Affairs,” 53 Syracuse L. Rev. 923, Lexis

The problem with these anti-preemption contentions is twofold. First, one consideration typically given short shrift is the possibility that state and local actions may interfere with federal foreign policy when silence itself is a part of that policy. 178 Some commentators have suggested that Congress has various political incentives not to overrule politically popular state and local actions such as the Massachusetts Burma Law; these political incentives may also have a foreign policy facet. For example, when Congress agrees with the substantive ends of a statute, but nevertheless should overrule it for international political reasons, because it has angered valuable trading partners perhaps, overruling the statute may send the offending nation the wrong signal or imply substantive disagreement with the statute it [*961] would prefer not to. As the Court in Sabbatino noted, “often the State Department will wish to refrain from taking an official position, particularly at a moment that would be dictated by the development of private litigation but might be inopportune diplomatically. Adverse domestic consequences might flow from an official stand which could be assuaged, if at all, only by revealing matters best kept secret.” 179 Setting the default rule at preemption, unless Congress gives the states a green light, avoids this problem by freeing Congress to decide when and on what issues it wishes to speak. 180

Causes net under-pre-emption – Congress won't have the guts to step in

CHIANG '03 (Emily; Associate – Cravath, Swaine & Moore LLP, “Think Locally, Act Globally? Dormant Federal Common Law Preemption of State and Local Activities Affecting Foreign Affairs,” 53 Syracuse L. Rev. 923, 1/n)

Most of the anti-preemption commentary also fails to take into account the frictions of legislating in Congress. 182 Given the impediments to passing even popular legislation, it is likely that Congress will often fail to preempt or overrule even those statutes that do catch its attention and that it feels should be overruled. The likely result given the political realities of Congressional

action is under-preemption, where the ideal level of preemption is what would exist in a world of frictionless legislation. In a world of frictionless legislation, the default rule would not matter because Congress could and would simply preempt or overrule all state and local activity it [*962] found troubling. The problem of where to set the default arises only because legislation is not frictionless: given the anti-preemption consensus that the last word on foreign affairs, so to speak, belongs to the political branches, 183 it seems that the default rule should attempt to obtain the optimal level of preemption that would hold in a world of frictionless legislation, i.e. come closest to what Congress would prefer to do but cannot given the contingencies of legislating.

Turn: Causes Racism

State power increases discrimination against undocumented immigrants

Varsanyi et al. 2012 Associate Professor of Political Science at John Jay College of Criminal Justice (Monica, “Immigration Federalism: Which Policy Prevails?”), [//AN">http://www.migrationpolicy.org/article/immigration-federalism-which-policy-prevails\)//AN](http://www.migrationpolicy.org/article/immigration-federalism-which-policy-prevails)

Immigration federalism, defined as the role of the states and localities in making and implementing immigration law and policy, has become an increasingly relevant issue. Contemporary scholarship explores two emerging dynamics: (1) the devolution of immigration authority to subnational jurisdictions, authorized in 1996 by IIRIRA and the 1996 welfare reform law formally known as the Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA), and (2) the recent explosion of grassroots immigration policies and enforcement practices. Legal scholars are divided between those arguing for and against the constitutionality and desirability of immigration federalism. Peter Spiro, an early proponent of immigration federalism, argued for “steam valve federalism” in immigration policymaking, and also supported state-level immigration policy activism. Under steam valve federalism, the pressure on the federal government to pass a potentially undesirable national-level policy is lowered by allowing localities to determine their own enforcement approach. Some scholars suggest that immigration policymaking at subnational levels will not necessarily be hostile to immigrants, while others view the devolution of immigration policing authority as a crucial force multiplier in the war on terror, because only roughly 2,000 U.S. Immigration and Customs Enforcement (ICE) agents were assigned to interior enforcement as of 2009. Other scholars are principally concerned that devolution and grassroots immigration policy activism together have opened the door to discrimination against noncitizens. They view the devolution of federal authority as an erosion of the traditional barrier imposed by the 14th Amendment, against state and local discrimination on the basis of national origin. Under immigration federalism, immigrants are much more at the mercy of the discriminatory powers of the local state.

State officers lack fundamental training in immigration law—that risk racial profiling and alienation of communities

Chavez 13 Juris Doctor Northwestern University School of Law (Eduardo Reyes, “IMMIGRATION FEDERALISM: THE CASE OF IMMIGRATION ENFORCEMENT BY NON-FEDERAL AGENCIES”, [//AN">http://epubs.utah.edu/index.php/HJP/article/viewFile/967/729\)//AN](http://epubs.utah.edu/index.php/HJP/article/viewFile/967/729)

By enforcing immigration laws, state and local governments jeopardize overstepping and violating constitutional rights of non-citizens. In addition, their enforcement also breeds alienation between the community and the local authorities. In a country where local community collaboration is essential to combat local crime, alienation from the local police can result in an increased percentage of crime rates. Not only that, since immigration is a very complex field, state and local officers sometimes do not receive enough training to truly understand immigration laws, especially criminal and civil laws. In many cases, this lack of understanding these laws has resulted in violation of civil rights and racial profiling. In a time when money is not as available as it used to be, state and local agencies should use their resources wisely and only engage in law enforcement that falls under the local jurisdiction. Even though in some case enforcing immigration laws can serve as a security measure, those laws are federal laws and should

therefore be enforced by the federal government. Instead, the local officers should focus in building bridges among cultures and strengthening their connection with the entire community. Even though the United States Constitution does not specify who is entitled to enforce immigration law, the federal government has established itself as the exclusive enforcer through congressional legislation and recognition by Supreme Court rulings. State and local governments may voluntarily come into written agreements with the federal government to enforce criminal and, to some extent, civil provisions of the U.S. immigration law but they are still restricted to federal preemption. Therefore, states and localities should not engage in immigration enforcement since the likelihood of overstepping their legal boundaries may occur due to the lack of expertise and the risk of violating civil rights and civil liberties of racial minorities.

Federal immigration enforcement is critical—anything else risks police violence and racism
Varsanyi et al. 2012 Associate Professor of Political Science at John Jay College of Criminal Justice (Monica, “Immigration Federalism: Which Policy Prevails?”,
<http://www.migrationpolicy.org/article/immigration-federalism-which-policy-prevails>)//AN

Devolution of governmental authority creates variation in local policy regimes that is often celebrated as a way to better reflect the needs and preferences of local residents, or as a way to experiment with new and different ways of carrying out public services. Those who argue for devolution of immigration enforcement authority stress these qualities, suggesting that devolution reduces pressure on the central government in a hotly contested policy area. Such variation is certainly apparent in our surveys, and has various implications for local governments and immigrants. Immigration enforcement, however, cannot be grouped with policy domains such as education or employment training. Immigration enforcement can be described as "intermestic" policy, standing at the juncture of foreign and domestic policy. The implications of enforcement are significant for both individuals and communities, raising fundamental issues about who belongs. Enforcement decisions can also have international ramifications. This is a complex area of law, and the standards are not even entirely clear to legal scholars, who remain sharply divided over whether local police can legitimately enforce civil immigration violations. Nor does immigration federalism fit the usual model of "cooperative federalism," because it bypasses the traditional role of the state government in policy implementation in favor of local governments, where coordination among neighboring jurisdictions is lacking. Municipal police departments and sheriffs often act in isolation, without considering policies in nearby areas, as they decide whether and how to participate in enforcement. The decisions localities make are influenced by local political dynamics, and there is no effort to achieve consensus among law enforcement leaders. The implications of the trend toward more formal local engagement in immigration enforcement are significant. Approximately 4 percent of the U.S. population lacks legal status. Enforcement efforts that target unauthorized immigrants can also draw U.S. citizens and legal permanent residents into intrusive contacts with the police. The enforcement effort may be perceived as racist or haphazard because there is discretion at the individual level and because police departments may operate in overlapping jurisdictions. A 2007 Pew Hispanic Center report noted that over half of all Latinos in the United States fear that they, or someone close to them, may be deported. The MJP means that no local government can allay that fear, and the federal government cannot ensure that enforcement will protect the civil rights and liberties of American citizens and legal residents. The federal government has remained largely silent regarding alleged abuses by local law enforcement when it has partnered to deport residents, though certainly the Justice Department has closely monitored developments in Maricopa County and the Department of Homeland Security ended 287(g) authorities there. It has at times responded aggressively to local policies of non-enforcement, as the New Haven case illustrates. The devolution of immigration enforcement, combined with the absence of a consistent federal policy, has created a "no-policy policy" where enforcement programs and practices vary from jurisdiction to jurisdiction. The federal government has extended its reach, even as it has reduced its oversight.

States CP

States solve for immigration federalism better than the Courts or Congress

Ramakrishan 2013(Karthick; Associate Professor University of California, Riverside, "The importance of the Political in Immigration Federalism", poseidon01.ssrn.com/delivery.php?&EXT=pdf&TYPE=2, January 13)//ADS

Importantly, elected officials and restriction advocates have paired these demographic claims with a complaint that the federal government has forsaken its constitutional and statutory responsibility to control unwanted immigration. In signing Arizona's E-Verify law, then-Governor **Janet Napolitano** (now **Secretary of the Department of Homeland Security**) **declared: "Immigration is a federal responsibility, but I signed [the law] because it is now abundantly clear that Congress finds itself incapable of coping with the comprehensive immigration reforms our country needs."** 11 Unable to wait any longer for the federal government to seal the border and vigorously enforce provisions of the Immigration and Nationality Act, 12 states and localities had to legislate to protect their residents and solve their impending demographic crisis. Undoubtedly, this conventional wisdom is appealing. However, it is, at best, an incomplete account of the rise of subnational immigration regulation; at worst, it is purposefully misleading. **In prior empirical work, we cast doubt on the factual premise undergirding much of the new immigration federalism, showing that state and local immigration laws are not, as commonly assumed, policy responses tailored to immigration induced demographic problems.** 13 That is, the primary justifications undergirding most scholarly, political, and judicial explanations for this recent spate of state and local immigration regulations have little empirical support. Instead, restrictionist state and local laws are largely the product of political partisanship, with Republican-heavy areas especially ripe for political action.

Foucault Links

Devolution of authority from the Migration State to the local level becomes another justification for controlling immigrant bodies—their practice just shifts the burden of populace regulation to the local—that results in insecurity

Coleman 2012 PhD in the Department of Geography at UCLA in 2005, Associate Professor, Department of Geography at Ohio State University (Matthew, "The "Local" Migration State: The Site-Specific Devolution of Immigration Enforcement in the U.S. South", Law & Policy, Volume 34: 159–190)//AN

Three basic sets of conclusions about the migration state, following Hollifield, can be gleaned from the two case studies above. First, nonfederal immigration enforcement—in this case in the form of 287(g) authority and Secure Communities—is heavily mediated by local practices and policies. Indeed, the studies above show that because nonfederal immigration enforcement, even if federally sanctioned, varies enormously depending on where it takes place, the mere fact that a nonfederal law enforcement agency is enrolled in a partnership with federal authorities to police immigration tells us neither about how the power over immigration is being enacted nor to what effect. In the two adjacent cases in Raleigh-Durham, for example, ostensibly similar immigration enforcement powers have been shaped remarkably differently by political, legal, policing, and biographical contexts. The relevant factors are, on the one hand, Durham City's long-standing and widely supported community policing and no-cooperation policies, Durham Police Department's use of immigration partnerships with ICE to supplement specifically antigang enforcement, and Durham Police Chief Lopez's leadership on steering 287(g) authority away from non-rimnal naturalization investigations within the larger noncooperation context by virtue of his personal belief in, and advocacy for, community policing. In Wake County, on the other hand, 287(g) and Secure Communities plays out very differently as a result of the sheriff's "Cracker Jack" or "spitting on sidewalks" approach to 287(g)/Secure Communities policing, the Raleigh-based NCSA's aggressive stance on "illegal alien invaders," federal elected officials' support for the program in the county, and the county's role as an experimental site for devolutionary immigration enforcement. In the latter case, 287(g)/Secure Communities has resulted in thousands of deportations; in the former case, local immigration enforcement is a relatively focused antigang investigations tool and has produced two orders of magnitude fewer deportations. In sum, **by virtue of the devolution of immigration enforcement to nonfederal authorities,** as well as the ways in which nonfederal contexts shape this process, **we can conclude that the migration state comprises a complex landscape of spatially uneven enforcement practices.** What this theoretically points to is that the migration state be tackled explicitly in terms of how localized conditions of possibility mediate, at least theoretically, standardized federal initiatives. In other words, the "local" migration state is an aggregation of site-specific practices that, even if in part provided for by macrolevel initiatives, constitute detention and deportation regimes in the plural. Second, the **Wake County** example—as well as the counter example in Durham—shows how immigrant mobility is increasingly a central concern of the migration state. Indeed, Wake County's implementation of 287(g)/Secure Communities, indicative of broader enforcement practices shared by its NCSA partners, suggests that the local surveillance of immigrant "automobility" (Urry 2004) specifically is an all-important way in which noncitizens are brought into contact with nonfederal authorities and eventually transferred to federal custody for deportation. In the central North Carolina case, the focus on immigrant automobility is in significant measure due to the broadly discretionary aspects of traffic enforcement as well as the saturation of traffic enforcement **practices in low-income and Latino neighborhoods;** it also **reflects the way in which state legislators have explicitly linked traffic enforcement to questions about citizenship and naturalization.** More generally, the problem of immigration policing via routine traffic enforcement points to an important second aspect of the "local" migration state, in addition to its site-specificity: its attachment of serious civil immigration penalties (i.e., deportation), to nonserious "criminal" activity (i.e., minor infractions and/or misdemeanors), by virtue of the civil deputization of primarily criminal law enforcement officers. Third, and lastly, the Wake County example shows that non-287(g) and/or non-Secure Communities agencies may be as important, if not more so, than formally deputized or otherwise formally cooperative law enforcement agencies when it comes to measuring the impact of local immigration enforcement practices in specific sites. As noted above, this is because nonenrolled agencies may engage in policing practices, which they may reasonably

expect to result in an immigration check in the case that a 287(g) or Secure Communities agreement is in effect at a shared detention site. This problem is best called a “hub and spokes” enlargement of official 287(g) and Secure Communities sites by virtue of local detention practices. What the hub and spokes problem suggests is that the “local” migration state, in addition to its spatial unevenness, as well as punitive melding of civil and criminal enforcement, comprises increasingly informal, off-the-radar policing practices. In other words, the devolution of federal immigration responsibilities to identifiable nonfederal proxies may also have

heralded the dissolution of immigration enforcement across countless law enforcement agencies with no immediately identifiable linkages with either federal or deputized immigration agencies. **In effect**

this obscures who is doing immigration enforcement and how. The hub and spokes dilemma is more than a conceptual or theoretical issue; it is also immediately relevant to reforms to 287(g) and Secure Communities undertaken in late 2009, based ultimately on the Durham City model, which advise a focus on “criminal aliens who pose a threat to public safety or danger to the community” rather than on lesser offenders. The impetus for this change was a January 2009 congressional report, which found that the 287(g) program lacked overall policy objectives, encouraged non-uniform applications, and had unclear and uneven federal supervision (U.S. Government Accountability Office 2009; in the North Carolina context, see also Gill and Nguyen 2010; Weissman and Headen 2009). Task force 287(g)s were the focus of the reform effort, on the presumption that the power of warrantless arrest built into these agreements could encourage mass street sweeps for minor infractions or for immigration violations alone. For example, newly included language in task force 287(g) agreements stresses that the power to detain “solely based on an immigration violation . . . will be delegated only on a case-by-case basis” and on the prior authority of an ICE official who will prioritize the removal of “gang members, smugglers and traffickers and when reasonable suspicion exists to believe the alien is or

was involved in criminal activity.” In comparison, **changes to the jail model operations are slight; although the explicit “criminal alien” language above applies also to the jail models,** the latter are, in practice, **left to work as they did prior to 2009.** Crucially, the attention to the task force model neglects how, in practice, the **jail model programs are just as likely to encourage large-scale “round ups”**—only in this case by non-enrolled law enforcement agencies engaged in mass enforcement campaigns around minor infractions with

the understanding that immigration documents will be checked later at a shared detention facility. I want to conclude with a caveat about the problem of site-specificity as developed above. **My debt to**

feminist geographers working specifically on “studying up” the state, as noted at the outset of the article, **has in this project entailed a decentralization and destabilization of the state,** which is too often regarded as an all-powerful and stable constellation of knowledges and practices. **Rather than a “global” form of power** (i.e., seamless and encompassing in a socio-spatial sense), **my deployment of “studying up” vis-à-vis 287(g) and Secure Communities has been with the aim of investigating the migration state's regulation of immigrant bodies unevenly and “in formation” across a multiplicity of locations.** In other words, the **devolutionary trend** in

immigration enforcement, which accounts for both 287(g) and Secure Communities, **is not simply a problem of “downloading” a federal enforcement toolbox that then gets enacted at the local scale** by nonfederal proxies in a relatively uniform manner. Collier and Ong (2005)

develop interesting language for theorizing this problem, which **they refer to as the “actual global” of power relationships conventionally imagined in terms of a global-local continuity, rather than a “mobile” and “immutable” strategy,** in which a global initiative is transported in whole to the local, **what they suggest is approaching power as a strategy that is situated in the sense of a geographically contingent generativity.** As they argue, “a global variable does not produce similar effects everywhere, and its function may be limited by direct conflicts with other variables in specific sub-modules of a program. Its operation and significance, thus, are defined as

much by these exclusions or conflicts in particular modules as by the variable's global character” (ibid., 13). **An alternative citation would be Foucault's (1980) work on power as a “strategic elaboration,”** meaning that the regimes of truth and institutional practices that constitute power relations are elaborated in often geographically and historically precise and open-ended ways. However, in the case of immigration enforcement practices authored by programs like 287(g) and Secure Communities, the **problem of site-specificity strikes me as**

unuseful if it means that we cannot talk about the more general properties programs like 287(g) and Secure Communities exhibit. In other words, **if the concept of site-specificity is a good way of approaching what happens** when nonfederal police are given the power to police immigration, **I nonetheless think it important to be able to articulate the suprasite implications of these programs.** What, then, can be said in the aggregate about 287(g) and Secure Communities? Perhaps the most important generalizable aspect of these **programs,** despite their practiced

specificities, is how they **shift immigration policing into immigrant populations' everyday spaces.** But not just any space. For example, neither of the programs puts a premium on worksite enforcement. This is a new development in terms of interior policing. While large worksite operations like the raid at the Agriprocessors Inc. meatpacking facility in Postville, Iowa, in May 2008 have generated significant headlines, in general worksite enforcement now does not contribute significantly to the aggregate detention and deportation numbers examined above. This is particularly so in comparison to the ramping up of worksite raids during the 1990s—a tactic abandoned in 1999 in response to mounting criticism in Congress about the rising costs, as well as

economic disruptiveness, of worksite enforcement. In light of this general deemphasis on worksite policing, **the finding from central North Carolina that 287(g) and Secure Communities targets mostly individuals who come into routine contact with police for nonserious reasons,** the near majority of which are immigrant automobile operators, **is significant because it shows that spaces of immigrant social reproduction are now ground zero for interior immigration enforcement.** Indeed, it is increasingly the case in central North Carolina that driving between spaces of work, leisure, education, shopping, religious practice, and so on is more dangerous for

undocumented immigrants in terms of risking deportation than actually working without papers (Stuesse 2010; Nuñez and Heyman 2007). **The point then is that programs like 287(g) and Secure Communities work,** despite their specificities, **to generate insecurity**—namely, **the ever-present threat of detention and deportation—for undocumented populations who are,** as a result, increasingly **structurally cut off in social reproduction terms from the society in which they nonetheless labor.**

Immigration surveillance has created a *migration border*—this has transformed the life of an immigrant into a panoptic reality—every place becomes a symbol of insecurity from the overarching state

Kalhan 2014 Associate Professor of Law, Drexel University (Anil, “Immigration Surveillance”—Maryland Law Review, Vol. 74, Issue 1, Article 2, pg. 58, [//AN](http://digitalcommons.law.umaryland.edu/cgi/viewcontent.cgi?article=3646&context=mlr)

A. Deterritorializing the Migration Border Borders, it is routinely observed, are malleable constructions rather than fixed realities: “less than definite, permeable, and subject to shifts and changes.”²³⁴ As such, to speak of “the border” in the context of immigration governance can be misleading and insufficiently nuanced. While territorial borders have long played a constitutive role in defining nation-state sovereignty under international law, like other kinds of boundaries they can be relevant and important for some purposes but not for others, and in varying degrees.²³⁵ In some contexts, nonterritorial demarcations are more consequential than territorial borders. The significance and meanings given to both territorial and nonterritorial boundaries are legally, politically, socially, economically, and culturally defined, and can evolve and shift over time.²³⁶ The deployment of new technologies and practices of immigration surveillance has accelerated a long-term process of decoupling the territorial border of the United States from what I term its migration border: the set of boundary points at which nation-states authorize individuals to enter or be admitted, prevent or allow their entry or admission, or subject them to possible expulsion.²³⁷ Of course, migration borders have never been fully coextensive with territorial borders as a literal matter. Indeed, a longstanding cluster of legal fictions treats individuals as being “at the border” or seeking “entry” when they have been paroled into the United States or arrive at boundary points that, strictly speaking, are well within the country’s territorial limits.²³⁸ Like other nation-states, the United States also has long acted extraterritorially to prevent individuals from entering—for example, by interdicting and turning away would-be migrants while they are still traveling to the United States through international waters.²³⁹ Migration boundary points also typically exist within broader zones that often are treated as roughly equivalent, in varying degrees, to the actual boundary points themselves.²⁴⁰ Nevertheless, a powerful and commonplace narrative assumes that migration borders are and should be coextensive with territorial borders—as reflected in the very fact that the doctrinal principles that comprise entry-related legal fictions are understood as “fictions” in the first place rather than simply as doctrinal nuances or complexities. However, in combination with immense expansions of immigration enforcement activities, immigration surveillance has hastened the detachment of migration borders from territorial borders. On the one hand, the changes in rules and practices for use of drones along the U.S.-Mexico border, visa issuance, the Visa Waiver Program, preinspection and screening of travelers outside the United States, and pre-departure collection and analysis of travelers’ data from international carriers all seek—self-consciously and by design—to push the migration border extraterritorially outward.²⁴¹ This objective long predates the 2001 terrorist attacks. As volumes of cross-border traffic into the United States became considerably larger, officials began to implement extraterritorial screening mechanisms as a means of facilitating more efficient immigration and customs screening when individuals and goods arrived in the United States.²⁴² Since the late 1990s, however, and especially since the 2001 attacks, the expansion of extraterritorial migration and mobility screening mechanisms increasingly has been justified with reference to antiterrorism, national security, and public safety-related concerns—as seen in Congress’s explicit 2004 finding that “[t]he further away from the borders of the United States that screening occurs, the more security benefits the United States will gain.”²⁴³ DHS understands its own mission in precisely these terms: to “push[] our operational borders outward so that our physical borders become our last line of defense and not our first.”²⁴⁴ On the other hand, the expansion of both direct and indirect post-entry enforcement simultaneously draws the migration border inward, selfconsciously constructing virtual, domestic border checkpoints throughout the country’s interior by identifying “events that are necessary for life in a modern society” where it may be possible to “exercise control” over individuals in a manner analogous to the control exercised at the territorial border.²⁴⁵ The particular approaches of these post-entry enforcement initiatives vary considerably, and each one involves a distinct set of public and private actors—including law enforcement and criminal justice officials, but also welfare agencies, public hospitals and health agencies, motor vehicle licensing agencies, private employers, private landlords, and potentially others. Collectively, however, these initiatives establish a kind of immigration panopticism, which eliminates zones in society where immigration status is invisible and irrelevant and puts this large array of public and private actors in the position of identifying individuals and determining immigration status; collecting, analyzing, and storing personal information; screening and identifying potential immigration law violators; and sharing information with federal immigration authorities.²⁴⁶ While these initiatives increase the likelihood of placing many individuals in removal proceedings, proponents place even greater emphasis on their ability to trigger a process they characterize as “self-deportation,” which disciplines potentially deportable noncitizens into internalizing the perception

that their immigration status is constantly being monitored and, ultimately, into both revealing their status in a range of day-to-day settings and conforming to social expectations that they depart the country.²⁴⁷

racial profiling indict

Their studies are flawed – and if there’s racial profiling the law it’s on the individual level – law can’t solve

Charles 14 (Patrick J. Charles- Cleveland-Marshall College of Law Doctor of Law (J.D.) in Law, Comparative Law, Constitutional History and Queen Mary-University of London LLM in Legal Theory and History, Distinction. "Weighing the Constitutionality of State Immigration Verification Laws in the Wake of Arizona v. United States." Journal of Civil Rights and Economic Development. Winter 2014. 27 J. Civ. Rts. & Econ. Dev. 441. Lexis.)//lb

It should be noted here that even before state immigration verification laws were enacted, verification of immigration status was already taking place accordance with 8 U.S.C. § 1357(g)(10). In these instances, state and local law enforcement were not required to verify immigration status in accordance with state law. The officer maintained individual discretion in contacting Immigration and Customs Enforcement (ICE).ⁿ⁹⁷ And despite [*461] this already existent enforcement at the state and federal levels, **there has yet to be a study affirmatively linking immigration verification with racial profiling.** This includes lawful vehicular stops, which are statistically monitored by most states. Certainly, immigration rights groups and liberal immigration law professors may continue to claim otherwise, but their evidentiary links are tenuous and built on personal suspicions rather than hard data.ⁿ⁹⁸ According to the United States Bureau of Justice statistics, national traffic stops are being conducted nearly proportionate to race; white (8.4%), black (8.8%), and Hispanic (9.1%).ⁿ⁹⁹ In other words, the potential for persons to be questioned about their immigration status during vehicular stops is not disproportionate according to race. This does not negate that there may be certain police districts or officials that intentionally profile based on race, but there is no substantiated evidence this will be the result of state immigration enforcement as a whole.ⁿ¹⁰⁰ A study by the reputable Chief Justice Earl Warren Institute on Race, [*462] Ethnicity & Diversity has provided the most detailed data set asserting otherwise.ⁿ¹⁰¹ The study examined ICE's Criminal Alien Program (CAP) in Irving, Texas from September 2006 to November 2007. The CAP seeks to target the deportation of criminal aliens booked or processed in state and local jails.ⁿ¹⁰² Although the CAP is designed to target deportable aliens with criminal histories, the study convincingly shows that aliens with civil immigration violations were deported at a substantially higher rate than criminal aliens.ⁿ¹⁰³ It is from this conclusion that the study infers cooperation with ICE led the Irving Police Department to engage in racial profiling.ⁿ¹⁰⁴ A general glance at the study's tables and data seems to support this stance. Yet a closer look at the evidence reveals the conclusions are mere inferences that lack sufficient data points. For instance, the study argues that racial profiling is proven by two data sets. The first is a chart tracking the overall arrests of persons according to race. Excluding the month of July 2007, the percentage of arrests according to race remained consistent with census data. If anything, the data shows that persons of white complexion were arrested at a higher rate than Hispanics when they constituted 7% less of the population total.ⁿ¹⁰⁵ July 2007 was arguably the only month in which Hispanics were arrested consistently with census data according to race. The second data set is much more problematic. Upon the

implementation of the CAP, the chart indicates that the arrests of Hispanics for Class-C misdemeanors rose exponentially before tailing off. n106 Because arrests for Class-C misdemeanors are at the discretion of the officer, the study concludes that race proved instrumental in that discretion. What the study fails to take into account is the two additional data sets necessary to make this connection: (a) data on the nature of the misdemeanor and (b) data on [*463] whether Class-C misdemeanors rose as a whole. The nature of the misdemeanor is rather important. A general comparison of the increase in Hispanic traffic arrests with the overall Hispanic arrests during the same period reveals that the July 2007 rise was almost solely the result of traffic violations. n107 It is likely that these arrests were the result of driving without a valid license (a Class-C misdemeanor in Texas), lack of insurance or valid immigration papers, and other potential factors that would lead a reasonably prudent officer to inquire about immigration status. It would be upon this inquiry and checking with ICE about issuing a detainer that the officer likely made an arrest. Circumstances like this do not indicate racial profiling, but the active enforcement of federal immigration law at the state level. The two are very distinct in terms of constitutionality. The former (deliberate racial profiling) is unconstitutional, and the latter (enforcing the law and cooperating with federal authorities) is constitutional. It must be noted, however, the circumstances of the vehicular stops mentioned above are merely speculation. The study never sought to answer this all important question, nor did it track data of vehicular stops as a whole. Thus, many questions are left unanswered in order to affirmatively link racial profiling with state and local immigration enforcement. Did vehicular stops rise upon the implementation of the CAP? Did the racial composition of vehicular stops rise or change dramatically? Did the arresting officer first arrest the person and contact ICE later or did the officer contact ICE after a reasonable suspicion of unlawful status? The lack of sufficient data points on vehicular stops also applies to lawful stops or investigations for breaches of the peace and drunken behavior. n108 Did the lawful stops increase as a result of the CAP or did the officers merely become aware that they could legally cooperate with federal authorities? The answer to this question is significant, for the officers may have been unaware of their ability to cooperate with ICE, unfamiliar with detecting fraudulent immigration documents, and other immigration enforcement procedures before partnering with ICE. Overall, the study does not prove what it contends - i.e. racial profiling increases when state and local law enforcement cooperate with ICE. The only conclusion that the study supports is ICE deports more unlawful aliens for civil violations than criminal activity. Its authors believe this should not be the case because it is inconsistent with congressional intent in instituting the CAP. However, the federal immigration scheme as a whole allows [*464] for the deportation of any unlawful immigrant, not just criminal immigrants. In fact, it is more reasonable to argue that if ICE did not act it would violate the executive branch's duty to enforce the law as prescribed by Congress. n109 Naturally, this does not dispel that state immigration verification laws may lead to ancillary burdens not contemplated by Congress such as the repeated interception and detention of lawfully present aliens or unconstitutional racial profiling. n110 If either of these scenarios should present themselves the respective state immigration verification law is preempted. However, the evidentiary foundation necessary to prove such unconstitutional ancillary burdens must be clear and convincing, not a plausible conclusion based upon the manipulation of evidence. n111 As was seen in the case of the Justice Earl Warren Institute on Race, Ethnicity & Diversity report, it is rather easy for analysts to manipulate data to support a desired conclusion. It is for this reason that the data points must be intimately related and connected as to prove the verification of immigration status results in unconstitutional violations across the board. n112 There will indeed be instances where individual persons are improperly detained or racially profiled. There will also

be instances where a respective city, town, or county improperly enforces the law as to impose unconstitutional [*465] ancillary burdens. In such cases, however, it is not the law that is unconstitutional, but the enforcement. And in such cases, the legal redress is civil rights litigation against the respective offenders, not the preemption of the law itself. To be clear, there is a strong legal distinction between a law that imposes unconstitutional ancillary burdens and individuals that choose to impose unconstitutional ancillary burdens, such as racial profiling, based upon a poor reading and application of the law.

Circumvention/Solvency

Shadow enforcement means aff can't solve – locals will still profile

Sweeney 14 (Maureen A. Sweeney JD, 1989, Yale Law School. "Criminal Law: Shadow Immigration Enforcement and Its Constitutional Dangers." Journal of Criminal Law & Criminology. Spring, 2014. 104 J. Crim. L. & Criminology 227. Lexis.)//b

Shadow immigration enforcement is the distorted exercise of regular policing powers by a state or local officer who has no immigration enforcement authority for the purpose of increasing immigration enforcement. In a regular law enforcement environment, shadow enforcement involves the disproportionate targeting of vulnerable "foreign-seeming" populations for hyper-enforcement for reasons wholly independent of suspected involvement in criminal activity as defined by state or local law. Shadow enforcement occurs at the margins of regular police work, external to the enforcement mandate of state troopers, local police, and sheriffs' deputies. In the vast majority of cases, these officers have no training, mandate, or authority to enforce federal immigration law. Their involvement in the routine communication of immigration information to federal authorities, however, can create strong and sometimes perverse incentives that distort the ways in which they carry out their mandated policing duties. The lure of possible immigration checks, for example, can influence the officers' choice of targets for traffic enforcement or whether to merely cite people for offenses or to arrest them (and thus bring them into the station for fingerprint checks that can reveal immigration status). n5 This dynamic generally goes unacknowledged and unregulated within regular police structures. It operates under the table, in the shadows. The effects of shadow immigration incentives are widespread and profound for the relationship between local law enforcement and the broad communities they serve, especially with regard to community trust and guarantees against biased policing based on race or national origin. A few concrete illustrations help to describe the phenomenon of shadow enforcement and to highlight its dangers. The U.S. Department of Justice (DOJ) Civil Rights Division recently conducted a number of investigations of biased policing that revealed compelling evidence of shadow immigration enforcement, which both distorted the conduct of regular policing in local jurisdictions and resulted in rampant civil rights violations. One of these investigations focused on the sheriff's office in [*231] Alamance, North Carolina. After an exhaustive two-year investigation that included statistics and records review; review of policies, procedures, and training materials; and over 125 interviews, DOJ concluded that the sheriff's office engaged in a pervasive pattern or practice of biased policing targeted against Latinos. n6 Among other problems, DOJ found that Latino drivers were targeted for traffic enforcement at a rate between four and ten times greater than non-Latino drivers. n7 Notably, DOJ found that many of the deputies' discriminatory practices were specifically intended to facilitate immigration checks on

the targeted Latinos, thus connecting the racially targeted policing to shadow immigration enforcement. n8

Officers without authority illegally detain undocumented citizens – aff can't solve

Sweeney 14 (Maureen A. Sweeney JD, 1989, Yale Law School. "Criminal Law: Shadow Immigration Enforcement and Its Constitutional Dangers." Journal of Criminal Law & Criminology. Spring, 2014. 104 J. Crim. L. & Criminology 227. Lexis.)/lb

Another illustration of these dynamics in a different context can be seen in the recent investigations of Transportation Security Administration (TSA) officers at various airports. n9 The officers in question were specially trained "assessors" as part of a model behavior detection antiterrorism program tasked with detecting unusual behavior in passengers that could indicate a security threat. But officers reported that managers in Boston, anxious to boost numbers and justify their program, pressured their assessors to meet certain threshold numbers for referrals to other law enforcement agencies, including the state police and immigration officials. To meet those thresholds, significant numbers of officers explicitly targeted blacks and Latinos in the hope that searches would yield drugs or immigration problems. n10 In the words of an attorney who interviewed eight officers who complained about the rampant practice, "Selecting people based on race or ethnicity was a way of finding easy marks." n11 Officers reported that as many as 80% of passengers searched during certain shifts were minorities and that so many minorities were referred to the state police that officers there questioned why minorities represented such a disproportionate number of those referred. n12 In Newark, New Jersey, the racial profiling of Mexicans and Dominicans was so blatant that fellow TSA officers called that airport's behavior detection group "the great Mexican hunters." n13 Officers reported that the direction for these practices came to them from their superiors who conveyed that they were "to go look [*232] for illegal aliens and make up behaviors" with which they could justify and document a referral to immigration authorities. n14 Finally, there are instances when even this thin veneer of regular law enforcement disappears, leaving a state officer with absolutely no justification for an arrest other than immigration enforcement that is wholly outside his authority. Recently, in Maryland, a Latino man was called to the scene of a traffic stop to recover his car, which someone else had been driving. When he arrived at the scene (at the officer's request and having committed no violation of traffic or other state law), he was immediately questioned by the officer about his immigration status; had his keys taken; and was removed from the car, handcuffed, taken to a holding cell, and held for approximately two hours for purposes of "immigration investigation" before he was turned over to Immigration and Customs Enforcement (ICE). n15 The state officer had no delegated federal authority to conduct civil immigration enforcement, and he did not have authority under state law to detain or arrest this man for a (nonexistent) state crime or for a federal administrative violation. When the officer was questioned in immigration court about the legal basis for his actions, he acknowledged that he had no authority to enforce federal civil immigration violations and explained that this was why he had merely "detained," rather than arrested, the man. n16 He further explained that he was not required to inform the man of his right to remain silent under Miranda or to comply with other arrest procedures because the man was not being accused of a crime. n17 In other words, precisely because the officer was acting without legal authority, he took the position that the usual legal limits to his authority did not apply, leaving him free to act without constitutional justification. These examples demonstrate how the lure of the easy, collateral immigration arrest has proved to be strong for officers in a

variety of contexts. In some cases, politically accountable enforcement policymakers, such as sheriffs, encourage officers to be tough on immigration and to increase immigration-related arrests. In others, officers seem to internalize and respond to rhetoric that has increasingly cast unlawful immigration as a [*233] law-and-order issue rather than a response to a complex web of influences such as family, economics, politics, and opportunity. n18 As a result, many officers have come to understand immigration enforcement as part of their general duty to enforce the law. They may experience satisfaction in making more immigration arrests, even if those arrests are not part of their law enforcement mandate. This motivation to carry out their duties so as to maximize immigration arrests takes a toll on these officers' primary law enforcement focus. The officers in the above examples were mandated to carry out a specific task - to screen for terrorism, or to enforce the criminal and traffic laws of the state. Instead of focusing on those tasks, however, the lure of the "easy mark" led them to distort (or ignore) their primary jobs in favor of increasing immigration apprehensions. In the process, of course, they also engaged in wholesale violations of the constitutional rights of those subjected to race-based stops, searches, and interrogations. n19

No oversight means aff can't solve – empirics prove local law enforcement circumvents

Sweeney 14 (Maureen A. Sweeney JD, 1989, Yale Law School. "Criminal Law: Shadow Immigration Enforcement and Its Constitutional Dangers." Journal of Criminal Law & Criminology. Spring, 2014. 104 J. Crim. L. & Criminology 227. Lexis.)//lb

Just as no central regulations govern state and local enforcement of federal immigration law, **no standardized training curriculum for, or oversight of, state and local officers exists regarding immigration enforcement or the proper sharing of immigration status information with federal authorities.** Most departments likely provide no training on these aspects of the job; the peripheral nature of officers' involvement in immigration enforcement virtually ensures that departments' training and oversight will not focus specifically on immigration activities, even when shadow immigration enforcement creates particular constitutional dangers. The fact that law enforcement officials are elected in many jurisdictions where immigrants have little political voice further means that those officials have few political incentives to invest resources in vigorously protecting immigrants' civil liberties. n193 [*270] Unfortunately, the Maricopa and Alamance County sheriff's offices again provide examples of what can happen in a local office when officers have inadequate training or politically compromised oversight on suspects' constitutional protections. Maricopa County Sheriff Joe Arpaio has made no secret of his strong political views about immigrants, and DOJ found that he had created "a general culture of bias" in the office and encouraged broadly discriminatory policing targeted against Latinos. Significantly, DOJ's investigation concluded, among its many findings, that **specific failures in training and oversight allowed for and exacerbated this discriminatory culture: [Maricopa County Sheriff's Office] fosters and perpetuates discriminatory police and jail practices by failing to operate in accordance with basic policing and correctional practices and by failing to develop and implement policing and correctional safeguards against discrimination in such areas as training, supervision, and accountability systems.** n194 The investigation likewise found that the office retaliated directly against individuals who complained about or criticized its practices. n195 Testimony in a racial

profiling lawsuit brought by private plaintiffs against the county and its sheriff's office additionally focused on deputy training and oversight. n196 The interaction of these elements is, of course, not unique to that county but rather demonstrates dynamics that play out in perhaps less dramatic fashion in various programs and in departments all over the country. DHS's own Homeland Security Advisory Council's Task Force on Secure Communities found in September 2011 that the program's integrity suffered because state and local jurisdictions were **not sufficiently accountable** for civil rights abuses connected with Secure Communities. n197 The Task Force recommended reforms to the complaint process, active ICE monitoring for improper policing connected with Secure Communities, and the establishment of a pilot multidisciplinary panel to review complaints. n198 In response, ICE has developed additional training materials and has [*271] publicized its complaint procedure, n199 but it has been unable to compel state and local law enforcement to use those training materials or cooperate in investigations of abuse. In its July 2012 report on Secure Communities, GAO continued to identify as a problem for civil rights protections the lack of accountability of state and local jurisdictions. n200 DOJ's Alamance County investigation similarly found a culture of bias that began with the sheriff and permeated the department. Specifically, it found that poor reporting of its activities made oversight of the department difficult by masking racial profiling and other discriminatory practices. n201

Anti-profiling laws empirically fail – officers discriminate subconsciously

Benin 13 (Cynthia Benin NYU School of Law . "Randomizing Immigration Enforcement: Exploring a New Fourth Amendment Regime." New York University Law Review. November 2013. 88 N.Y.U.L. Rev. 1735. Lexis.)//lb

The observation that racial profiling is common practice is not to suggest that the government encourages immigration officers to do so. Agencies have attempted to guide officer discretion through stipulated factors that inform individualized suspicion. ICE has published "indicators" for certified local officers to consider in making immigration arrests, including proximity to the border, number of occupants in a vehicle, disheveled manner of dress, and English-speaking ability. n86 [*1750] Arizona law enforcement officers are given a similar non-exclusive list of considerations when formulating reasonable suspicion of unlawful presence. n87 The Supreme Court itself effectively created a profile in Brignoni-Ponce by stipulating a laundry list of factors that a Border Patrol officer may consider in making stops along the border. n88

The failure of such profiles to prevent racial profiling is manifest. Most obviously, both the ICE indicators and the Brignoni-Ponce factors permit consideration of race or ethnicity so long as those traits are not relied on exclusively. n89 Parts II.B and II.C of this Note include a broader discussion of race and ethnicity in the immigration context and consider whether, if Hispanic appearance is statistically correlated with unauthorized status, its use by law enforcement amounts to the kind of "illegitimate" profiling the authors seek to avoid. This normative debate notwithstanding, scholars note that even a "statistically legitimate 'profile that includes race'" is likely to become discriminatory in effect. n90 Where one factor is more salient than others - as is the case with race, gender, or ethnicity - that factor tends to acquire disproportionate weight. n91 Officers acting on the Brignoni-Ponce and ICE factors will unduly rely on Hispanic appearance, creating a vastly [*1751] overinclusive profile that subjects masses of U.S. citizens and lawful residents to unwarranted investigation. n92

Even if Hispanic appearance was not an approved factor in officially sanctioned profiles, its exclusion would not prevent officers from considering it. Officers at Chicago's O'Hare Airport employing a drug courier profile, which did not include race or ethnicity as a factor, disproportionately stopped African-American women and subjected them to humiliating body-cavity searches. n93 Unfettered bigotry is not the only explanation for racial profiling. An officer's own experience may lead him to believe race and ethnicity are legitimate indicators. Unofficial norms may develop within agencies as officers share information and develop a profile of "the usual suspects." n94 Finally, officers may discriminate unwittingly through what one scholar describes as "the unconscious failure to extend to a minority the same recognition of humanity, and hence the same sympathy and care, given as a matter of course to one's own group." n95 A wealth of literature suggests the danger of implicit bias is real and prevalent. n96

States pass immigration legislation- Arizona Supreme Court ruling proves

Lewis et. Al. 12 (Paul G. Lewis from Arizona State Univeristy, Doris Marie Provine from Arizona State Univeristy, Monica W. Varsanyi from John Jay College, and Scott H. Decker from Arizona State Univeristy. "Why Do (Some) City Police Departments Enforce Federal Immigration Law? Political, Demographic, and Organizational Influences on Local Choices." Journal of Public Administration Research and Theory. October 4, 2012.)//lb

At least two kinds of legislative pressures bear on local police agencies in their interactions with immigrants. First, an increasing number of states and local governments have passed legislation specifically authorizing or requiring local police to assume a more proactive posture in identifying unauthorized immigrants. Arizona's SB1070, for instance, requires local police to check for immigration violations when they encounter someone they suspect may be an unauthorized immigrant and forbids local governments from limiting police cooperation with federal immigration authorities. Similar laws were passed in other states, but their legitimacy has been challenged in the courts. In its June 2012 decision in US v. Arizona (567US ____ (2012)), the US Supreme Court placed strict limits on the power of police to detain the persons they stop to check immigration status, whereas nevertheless allowing the law's so-called "show me your papers" provision to stand. The courts are also considering claims that racial profiling will be encouraged by such laws.

2NC Ext. Organized Crime

AT: Organized Crime

Undocumented immigrants have zero trust in state and local police—that decks solvency for organized crime

Chávez 2013 Department of Political Science, University of Utah (Eduardo Reyes, "IMMIGRATION FEDERALISM: THE CASE OF IMMIGRATION ENFORCEMENT BY NON-FEDERAL AGENCIES", <http://epubs.utah.edu/index.php/HJP/article/viewFile/967/729>)//AN

When **state and local** police enforce immigration laws, the relationship between them and their respective communities can be jeopardized. When the community fears the local police force, the level of trust and cooperation is seriously undermined. In the case of undocumented immigrants, **they are less likely to come forward and report crimes due to the possibility of deportation.** When the community does not cooperate with the local police, the ability for the police force to effectively perform their duties is destabilized. Most immigrants would be

discouraged to participate with the local police either because of fear of deportation or distrust. Thus, a great number of prospective witnesses of crime would not be willing to cooperate, decreasing the chances of a case being solved. For instance, “Many...immigration groups that may be vulnerable to high rates of victimization come from countries where distrust of authorities” is common (Decker et al., 2008, p. 170). So, when local residents perceive their local officers to have business with federal immigration officers, they would be reluctant to participate due to fear and lack of trust.

There’s no decrease in trust, and decreasing programs like S-Comm won’t revitalize it—prefer our ev—it’s the most comprehensive analysis

Cox and Miles 2014 † Professor of Law, NYU School of Law; Clifton R. Musser Professor of Law and Economics and Walter Mander Research Scholar, University of Chicago Law School. (Adam and Thomas, “The Real World of Immigration Federalism”, http://www.law.nyu.edu/sites/default/files/upload_documents/Adam%20Cox%20The%20Real%20World%20of%20Immigration%20Federalism_2.pdf)//AN

In short, we find no meaningful evidence that the largest integration of local police into federal immigration enforcement in the history of the United States undermined the efficacy of local law enforcement. This core finding calls into question many of the strong claims made by the literatures on cooperative immigration federalism and procedural justice. It also raises an obvious question: where did these claims go wrong? Sussing this out is beyond the scope of this project, but in closing we offer a few speculative thoughts. First, theorists of cooperative immigration federalism may have been working with an excessively optimistic account of what immigrant-police relationships look like in the absence of local involvement in federal immigration enforcement. A longstanding finding in the procedural justice literature is that the communities most likely to have large numbers of immigrants—urban centers with large minority populations, higher rates of poverty, and so on—are places where there is already a considerable lack of trust in the police. If baseline levels of trust are low, there isn’t much lower to go when a new program like Secure Communities is introduced. Relatedly, if immigrants (like many citizens) often view different “law enforcement” entities as a single undifferentiated mass—seeing local cops, federal investigative services like the FBI and DEA, and immigration enforcement arms like CBP and ICE as all of a piece—then changes in the extent of cooperation between these entities will actually have little effect on public attitudes. Second, the procedural justice work on public attitudes about the police may have a reverse causation problem. As we described earlier, that literature makes quite detailed claims about how the public comes to hold particular beliefs about law enforcement officials. Beliefs about fair treatment are driven by actual police practices, and those beliefs in shape perceptions of police legitimacy, with legitimacy shaping willingness to comply with the law and cooperate with law enforcement. While there is no doubt some truth to this account, it also seem plausible that causation often runs the other way: that a person’s perception of whether the police are legitimate shapes her beliefs about whether the police are likely to treat her fairly. To the extent causation runs in this direction, discrete policy interventions—even a widely publicized and highly salient one like Secure Communities—are extremely unlikely to have much of an effect on one’s willingness to help out the police. Third, accounts of law enforcement success that turn on the cooperation of the community at large, rather than on other law enforcement techniques may be overblown. The sort of cooperation contemplated by those accounts may be important for a limited set of offenses—perhaps paradigmatically for cases involving domestic abuse and other forms of violence among intimates. But other investigative techniques, including the very different sort of “cooperation” that is often obtained from co-conspirators or others involved in a criminal enterprise, may be much more important. Thus, even in a world where Secure Communities sows distrust of the police among immigrants, that distrust may not interfere with the bulk of what police do in order to solve most crimes.

2NC Ext. Gang Violence Low

Gang Violence decreasing now- LA proves

Reicher 15 (Mike Reicher is an investigative reporter for the Los Angeles News Group with a focus on government accountability, “Decline in gang violence leads to dramatic drop in Los Angeles homicides,” 1/23/15, Date Accessed: 7/10/15, <http://www.dailynews.com/general-news/20150123/decline-in-gang-violence-leads-to-dramatic-drop-in-los-angeles-homicides>, SZ)

They moved away, found peace or were locked up. However it happened, fewer gang members have been killing others since the early 2000s, and the decline has fueled a dramatic drop in all Los Angeles County homicides, experts say. Nearly all of the nation has benefited from a drop in crime, but Los Angeles County stands out. In 2002, 1,231 people died at the hands of others, but by 2010, the figure dropped below 700. Fueling the countywide drop, the city of Los Angeles’ homicide rate fell at about twice the pace of New York’s between 2000 and 2010, according to U.S. Census and FBI statistics. Why has L.A. succeeded so strikingly? Sociologists, police officials, social workers and criminologists haven’t been able to explain, let alone give one key reason. Instead, they point to trends and efforts on the national and local levels: more effective policing, the absence of a drug epidemic, stricter sentencing laws, gang intervention programs and demographic changes. “I don’t think anybody can tell you,” said Wes McBride, executive director of the California Gang Investigators Association. “I think it’s all these issues working together. I think it’s a change in attitude with the younger people. They’re tired of it.” Some of them are hustling in less violent businesses or moving to new markets. Instead of dealing narcotics, they might be forging immigration papers, birth certificates or driver’s licenses, McBride said. A sustained police crackdown in the Los Angeles area also pushed many gang members to economically depressed portions of the Inland Empire or to Las Vegas, said Jorja Leap, professor at the UCLA Luskin School of Public Affairs.

2NC Ext. Exaggerated/No Impact

Their authors are exaggerating – No real threat of organized crime

Williams 14 (Phil Williams is a published author, has a PhD, and teaches and researches Security studies, foreign policy analysis, transnational organized crime, terrorism, “Organized Crime and Terrorism,” LACC Working Paper No. 2/2014, Date Accessed: 7/13/15, <https://lacc.fiu.edu/research/publications/working-paper-2-williams.pdf>, SZ)

The notion of a nexus between criminal and terrorist organizations surfaced during the 1990s. The term narco-terrorism, however, was coined even earlier than this. Ironically, it initially referred to the Medellin drug trafficking organization in Colombia using terrorist tactics to coerce the government into abandoning its policy of extraditing drug traffickers to the United States; subsequently, its meaning was reversed and it was predominantly used to describe terrorist organizations using narcotics trafficking as a funding mechanism. After September 11, in particular, it was frequently used to refer to the FARC and the Taliban using income from the drug business to fund their insurgent activities. Meanwhile, the broader notion of a criminal-terrorist nexus that emerged during the 1990s, inspired by events in the Balkans, focused less on the appropriation of criminal activities by terrorists or terrorist activities by criminals, and more on direct cooperation between criminal and terrorist organizations—a cooperation that soon became enshrined in the concept of a criminal-terrorist nexus. The Madrid bombings in 2003, in which the attacks and their preparation were financed with the proceeds of drug trafficking, are also portrayed as an example of a nexus in action. This argument challenges widespread allegations of an emerging crime terrorism or trafficking-terrorism nexus, as well as a broader analytic trend emphasizing threat convergence. It suggests that most claims about the nexus are based on little more than flimsy anecdotal evidence, from which unwarranted and exaggerated inferences are drawn. One or even a few examples of cooperation between criminals and terrorists do not make a nexus. And they certainly do not provide evidence of a “grand shift” whereby “international drug traffickers and international terrorists are in a hedonistic marriage of

design . . . linked at the hip, and . . . extremely wealthy.”¹ Yet such grandiose claims abound, fueled by worst-case thinking and unwarranted generalizations from the few to the many.

No security challenges – No connection between terrorism and organized crime – Proves no impact

Williams 14 (Phil Williams is a published author, has a PhD, and teaches and researches Security studies, foreign policy analysis, transnational organized crime, terrorism, “Organized Crime and Terrorism,” LACC Working Paper No. 2/2014, Date Accessed: 7/13/15, <https://lacc.fiu.edu/research/publications/working-paper-2-williams.pdf>, SZ)

The security challenges posed by terrorist-criminal cooperation and by terrorists engaged in drug trafficking, extortion, kidnapping and other activities are relatively modest.

Convergence and cooperation cannot be ignored, but do not represent the kind or level of threat sometimes claimed. Moreover, there is a downside for terrorists in both cooperation with traffickers and appropriation of trafficking methods. For terrorists, cooperation creates risks of betrayal by pragmatic criminals, especially those who have no affinity for the cause. Moreover, cooperating with criminals also increases the possibility of infiltration by law enforcement and intelligence agents. Similarly, trafficking and other criminal activities can undermine both the status and legitimacy of a terrorist organization, as well as cause internal arguments and even divisions over the allocation of increased resources. Governments can also develop counter-narratives that tarnish the appeal of high-minded terrorists by emphasizing their linkage to common criminals and common criminality. In the final analysis, therefore, not only can the threat be contained, but it might also provide opportunities that can be exploited by the United States and its allies.

2NC Ext. Non-Inherent

End Racial Profiling Act of 2015 was introduced- Proves the plan is non-inherent

Gregg 15 (Remington Gregg serves as legislative counsel at the Human Rights Campaign, principally counseling the organization on federal legal and policy issues, “End Racial Profiling Act of 2015 Introduced in Congress,” 4/24/15, Date Accessed: 7/10/15, <http://www.hrc.org/blog/entry/end-racial-profiling-act-of-2015-introduced-in-congress>, SZ)

On Wednesday, Senator Ben Cardin (D-MD) and Rep. John Conyers (D-MI) introduced the End Racial Profiling Act of 2015. The bill creates a federal prohibition on racial profiling that includes targeting a person based on their race, ethnicity, national origin, religion, gender, gender identity, or sexual orientation gender identity or sexual orientation. Recent incidents of racial profiling which have ended tragically has brought renewed national attention to the issue in every corner of this country. Profiling of LGBT individuals also continues to be problem, especially for LGBT people of color and members of the transgender community. In a recent report on profiling by law enforcement, the NAACP found: As a number of the human impact stories above show, members of the LGBT community, particularly LGBT people of color, face discrimination at every stage of the criminal justice system. A 2014 national survey indicates that 73 percent of LGBT people and people with HIV report having had face-to-face contact with the police. In another study, a quarter of LGBT people and people with HIV who reported in-person contact with law enforcement said they experienced one form of harassment or misconduct—including profiling, verbal or physical assault, sexual harassment, or assault and false arrest. In a separate survey of transgender discrimination, 22 percent of transgender individuals who had police interactions reported harassment, 6 percent reported physical assault and 2 percent reported being sexually assaulted by officers. In December 2014, the Department of Justice updated guidance which prohibited

federal law enforcement officials from profiling an individual based on their race, ethnicity, national origin, and religion to include gender, gender identity, and sexual orientation. While an important step, the guidance is unable to address issues at the state and local level. The End Racial Profiling Act of 2015 would prohibit federal, state, and local law enforcement from targeting a person based on actual or perceived race, ethnicity, national origin, religion, gender, gender identity, or sexual orientation without trustworthy information that is relevant to linking a person to a crime. The bill also requires federal law enforcement to maintain adequate policies and procedures designed to eliminate racial profiling (defined broadly), including data collecting and processes for investigating and responding to complaints alleging racial profiling.

AT: Health Care

Case answers

AT: Economy

Turn: Giving healthcare to undocumented immigrants will cause major economic downfall

Work 15 (Workpermit.com, July 1st 2015, "California will subsidize health care of illegal immigrant children", <http://www.workpermit.com/news/2015-07-01/california-will-subsidize-health-care-of-illgal-immigrant-children>)

A recently announced budget deal in California could pave the way for children, living in the USA illegally, to receive state-funded healthcare coverage. California would be the first state in the US to subsidize the healthcare costs of illegal immigrant children. A deal struck between Governor Jerry Brown and legislative leaders would provide cover for an estimated 170,000 immigrants aged 18 years and under. It's expected that the plan will easily pass the state Senate and Assembly. To subsidize the healthcare costs of 170,000 illegal immigrant children, it's estimated that the new plan will cost taxpayers \$40 million over the first 12 months, beginning May 2016. According to the Los Angeles Times it will then cost \$132 million annually, after the first year, to extend Medi-Cal coverage to low-income children under the age of 19 irrespective of their legal status. Senior research fellow on poverty and the US welfare system for the right wing Heritage Foundation, Robert Rector, said: "It's a fact that illegal immigrants cost approximately \$60 billion per year – meaning that they receive \$60 billion more in US government benefits than they pay in taxes. The new plan in California will simply increase the amount of tax." California's healthcare provision forms part of a \$115.4 billion budget agreement for the state's upcoming fiscal year. Supporters of expanded healthcare spending say that 'it's a necessity because of federal inaction.' State senate leader, Kevin de León, said: "As Washington dithers because it can't get things done, we are in need of immigration reform. The fact is, many of these children require some form of healthcare and they get it in the emergency room." However, according to the Associated Press, Republicans are arguing that expanded healthcare provisions won't improve access for illegal immigrants as there are not enough doctors that accept 'Medi-Cal' patients – California's Medicaid program. Generous laws for illegal immigrants Mr de León said: "This budget highlights that in California immigrants matter, irrespective of who they are and where they come from. California boasts some of the USA's most generous immigration laws when it comes to illegal immigrants." California is well-known for its liberal approach to illegal immigrants. In 2014, the state permitted those in the US illegally to apply for a driving licence. By April 2015, the state had received over 200,000 applications for a driving licence from undocumented immigrants, while the California Department of Motor Vehicles (DMV) predicts that 1.4 million licences will be issued to illegal immigrants over the next three years. Spokesman for the anti-immigration Federation for American Immigration Reform (FAIR) - Ira Mehlman, criticised the plan to expand healthcare provisions saying: "I don't care how generous California thinks it is being this is just another example of the state paying massive bills in a continued and relentless effort to accommodate illegal US immigration." He added: "It is forcing taxpayers to pay money to provide healthcare that could be supporting other crucial needs in the state. God knows there are many vital needs not being met in California."

Economic collapse inevitable

Moran 15 (Andrew Moran, July 10th 2015, "U.S. economy to collapse like Greece if country stays on current path", <http://economiccollapsenews.com/2015/07/10/peter-schiff-u-s-economy-to-collapse-like-greece-if-country-stays-on-current-path/>)

The United States could become the next Greece, a bankrupt economy and an insolvent government, if the country maintains the current path. When politicians promise the moon without sufficient funding then this is what you get, says Peter Schiff, CEO of Euro Pacific Capital. Speaking in an interview with Newsmax on Monday, Schiff noted that the only difference between Greece and the U.S. is that creditors have finally realized that Athens is broke. For some reason, "America's creditors are still delusional." "They still think that we're good for our debts and the only reason that delusion is possible is because interest rates are still at zero," said Schiff. "[If] interest rates ever allowed to rise, it would become obvious that we can't pay our bills and we would have a crisis similar to what Greece is looking at now." This is why, suggests

Schiff, the U.S. has to look to Greece as an economic lesson. “This is what happens when politicians promise more than their taxpayers can pay,” he added. “Politicians on both sides of the Atlantic are guilty of this. They pander [to] the voters, they make all sorts of promises and when the bills come due, it’s a crisis and they’re going to come due in more countries than Greece.” Eventually, the bills will come due in the U.S., but those bill will be a lot more than what the country can afford to pay. And quantitative easing from the Federal Reserve has become the issue because the central bank monetized government debt. This leads to excessive money printing. Unfortunately, the same thing will happen in Greece once they leave the European Union and adopt the drachma, the Greek currency. Since Greeks don’t want to make any serious reforms, like pension payments, everything will be worth a lot less. “That’s the fate that awaits Greece if they return to the drachma,” Schiff stated. “The Greeks don’t want to accept cuts to their pensions, but if they end up getting their pensions in drachma instead of euros, those pension payments will be worth a lot less.” Again, the same thing will occur in the U.S., except it won’t change currencies. “We’re not going to change currencies, but the only way the U.S. government can make good on its obligations is to print the money,” Schiff posited. “When they do that, the money is not going to have very much value when the Social Security recipients or the bondholders ultimately get paid.”

Turn-Healthcare is bad for the economy

Sanger-Katz 13 (Margot Sanger-Katz, correspondent at the New York Times, “Health Care: Great For the Economy Today, Terrible later”, Jan 31, 2013, [//AS](http://www.nationaljournal.com/magazine/health-care-great-for-the-economy-today-terrible-later-20130131))

In the short term, the Affordable Care Act will create even more health care jobs. But over the long term, it is likely to push down salaries, not in- flate them.¶ Some 40 million uninsured Americans stand to benefit from the law’s new subsidies in the next 10 years. And evidence suggests that once they get insurance, they’ll seek more care. At the same time, the programs to reduce utilization will exert significant downward pressure on health spending. Hospitals have begun facing penalties if too many patients who leave the hospital return within 30 days. Soon, doctors will begin earning bonus payments based on how their care measures up to quality standards.¶ In doctors’ offices, health care professionals are trying to work “at the top of their license.” Nurses, instead of doctors, administer flu shots. Medical assistants, instead of nurses, take patients’ vital signs. Medical assistants can check blood pressure. This transformation may not reduce the total number of jobs, but it could push the distribution of health professions down the income scale. You don’t need an M.D. to phone a patient and ask him his weight or remind him to come in for a blood test. Indeed, the fastest-growing subspecialty is home health. Aides in this field require minimal training and command low salaries, but they can help prevent the kind of catastrophic health problems that lead to expensive hospitalizations.

Health care remained strong through the economic recession – wouldn’t bring it down, actually brought it back up

Lobb 9 (Annelena; [reporter for MarketWatch]; “US Stocks Bounce; Health-Care Strong; Banks, GM Weak”; 2/3/2009; <http://www.marketwatch.com/story/us-stocks-bounce-health-care-strong>) JKS

A rise for health-care stocks and an unexpected increase in pending-home sales Tuesday helped major indexes break a three-session losing streak and sent the Dow Jones Industrial Average up more than 100 points. Weakness for financial stocks and car makers served as a reminder of the shaky state of some of the pillars of the U.S. economy. Tuesday’s move felt like the continuation of a technical bounce that began when the S&P 500 and Dow Jones Industrial Average tested

their lows for the year Monday, said Joe Kinahan, chief derivatives strategist for options brokerage thinkorswim. Financial stocks were conspicuously absent from the rally, however, as Bank of America fell by more than 10%, coming within 25 cents of its lowest mark of the crisis, and Citigroup was off 4.4%. "What's discouraging in today's market is that the financials are taking it on the chin," Kinahan said. "There is no way we have any kind of long-term recovery without the financials being at least a stabilizer, if not a leader." Nobody is willing to buy into the financial sector before the Treasury Department plan that's supposed to surface next week, Kinahan said. "Are we nationalized, or are we not nationalized? Is it 'good bank/bad bank' and who falls under what category? There's so much uncertainty right now." In the latest round of earnings reports, drug maker Merck was one of the few bright spots, up 4.4% in recent trading, after posting a profit for the fourth quarter. Large health care firms have been one of the stalwarts in equities to start 2009, with traders highlighting their defensive nature and strong balance sheets. But the ascendancy of defensive stocks, which are thought to be hiding in the worst of times, points to a trading environment where economic concerns remain at the forefront. The Dow was recently up 129 points, or 1.6%, to 8065, led by Merck. Even at that level, the Dow is just over 500 points from its bear-market closing low, set on Nov. 20. General Motors shed 3.5% to \$2.79 after saying its light-vehicle sales plunged 59% in January. Fleet sales, or sales to rental-car companies and other mass users, fell to 13,000, the lowest monthly tally since 1975. Ford Motor said January light vehicle sales fell 40%, below already low expectations. And though the S&P 500 Index was up 1.3% at 836, its financial sector was down 2.4%. PNC Financial Services shares declined by 12% after the bank posted a loss and said it plans to cut jobs as it integrates National City, which it acquired in December. Other regional lenders also declined, with SunTrust Banks falling 23%. The National Association of Realtors reported a 6.3% rise in its gauge of pending home sales in December. Lower prices are drawing in buyers, the trade group said. Lawrence Yun, chief economist for NAR, observed that the "biggest gains were in areas with the biggest improvements in affordability." Traders say a turnaround in the housing market will likely precede any economic recovery. The SPDR S&P Homebuilders ETF added 6.9% to \$10.98. The Nasdaq Composite Index was recently up 13 points, or 0.9%, at 1508. Gordon Charlop, managing director at Rosenblatt Securities Inc., said, "I'm still not getting any sense we have our feet under us." More than half of the S&P 500 has now reported earnings, Mr. Charlop noted, so traders have turned more attention on the Obama stimulus plan and any information out of Washington that might move the markets. "It's going to be things like the fiscal stimulus and what we're seeing on regulation that we're keeping an eye on," he said. There is also anticipation ahead of what is presumably a gloomy monthly employment report Friday, he said, but "it's unlikely that we're going to get surprised," he said. "You can't put too much into it."

Health care strong in weak times

Vyas 9 (Kejal; [writer for Dow Jones Newswires' Caracas bureau]; "US Stocks In Tight Range: Health Care Strong"; 3/13/2009; <http://www.marketwatch.com/story/us-stocks-in-tight-range-health>)

U.S. stocks traded slightly higher Friday, after swinging much of the day between gains and losses, on the heels of a three-day surge. Coming into the trading day, technicians and analysts expected some declines as lingering uncertainty in the credit markets and the overall economy likely will influence investors to take short-term profit. But for much of the day, stocks have moved between positive and negative territory, with no real certainty as to which way the market

might close. "The market doesn't seem to have any sense of what it wants to do today," said Chris Colarik, portfolio manager at Glenmede Investment Management. "A lot of people felt the move up went so quickly. There may be some reluctance to put money back to work." In a note to investors, Oppenheimer chief market technician Carter Worth said stocks are likely to remain around current depressed levels for another two or three months, mirroring the seven- to eight-month bear market in 2002 and 2003. Some market observers say this week's rally was likely initiated by traders and money managers buying back bets against stocks. Once the tide turns in a market where short-selling is popular, rallies can be exacerbated by the bears' rush to limit losses by buying back their bets. That's known as a "short squeeze." "I definitely believe this started with a 'short squeeze,' then some people came out of the woodwork and put a little money into the market," said Frank Beck, chief investment officer at Capital Financial Group, adding he himself had sold some clients' positions in the Grizzly Short Fund, an exchange-traded fund that takes short positions on financial and other individual stocks. He anticipates a "bear-market rally" comparable to the gains between the lows on Nov. 20 and the 2009 peak in January. Recently, the Dow Jones Industrial Average, which has leapt 623 points, or 9.5% since Monday, was up 44 points at 7213. General Motors rose 25%. Microsoft, however, slid 3.1% amid an earlier broad decline in large technology stocks. The tech-focused Nasdaq Composite Index was up 2 to 1428. The S&P 500 was up 3 at 753. Health-care and utilities stocks, traditional defensive sectors, were higher, a sign that risk appetite may not be as high as the previous three sessions suggested. Humana shares were recently trading up 9.7%, on heavy options activity, which some believe may indicate the company may be an acquisition target. Assurances from top executives at major banks that the companies have been profitable so far this year have helped drive the market's gains this week, but some market watchers say banks must now walk the walk, having set an expectation.

AT: Disease

Immigrants have greater immunity to disease

Ross 15 (Philip Ross, July 7th 2015, gcb, "Do Mexican Immigrants Bring Disease Into The US? Donald Trump Says There's A Health Scare, But Statistics Say Otherwise", <http://www.ibtimes.com/do-mexican-immigrants-bring-disease-us-donald-trump-says-theres-health-scare-1997922>)

Not only are Mexican immigrants wreaking criminal mayhem in America, they're also unleashing their diseases on the country, according to real estate mogul and White House hopeful Donald Trump, who defended his recent explosive claims about immigrants being rapists and felons with more outrageous allegations, saying they pose a public health threat. In reality, the idea that immigrants pose such a threat is a notion as tenuous as Trump's political prospects. **Immigrants from Mexico and Central America pose very little risk to U.S. residents in terms of spreading disease. Immunization rates for common infectious illnesses in Mexico and in other countries from which most U.S. immigrants originate are actually relatively high -- in some instances, Mexican and Central American immigrants are even better protected against diseases than Americans.** While some immigrants crossing the U.S.-Mexico border are indeed ill, very rarely are there cases of swine flu, dengue fever or tuberculosis, as politicians have previously claimed. That's not to say the risk is zero. Some children who end up in U.S. detention centers, for instance, do test positive for tuberculosis, an upper respiratory disease for which treatments are available and effective. And outbreaks of chickenpox have at times plagued immigrant facilities. But it's hardly the torrent of "tremendous infectious disease" Trump has made it out to be. Immigrants tend to arrive in the U.S. tired, dehydrated and with injuries like twisted ankles, not dangerous diseases. The chance an unauthorized Mexican immigrant has been vaccinated against common infectious diseases is pretty high, given that Mexico has a

relatively robust immunization program and healthy immunization rates. The country has a 99 percent vaccination rate for measles, which is actually higher than the U.S. rate of 92 percent. For other infectious diseases, the U.S. and Mexico have comparable immunization rates, according to the World Bank. Of course, immigrants aren't arriving in the U.S. only from Mexico. They're also coming from Guatemala, Honduras and El Salvador, countries that also have high vaccination rates, around 93 percent -- still higher than in the U.S. (There are 113 countries that have higher immunization rates for some infectious diseases, including measles, than the

U.S.) A child from Guatemala is more likely to have been immunized for most infectious diseases than a young person from Texas, which, along with California, Florida, New York, New Jersey and Illinois, handles the bulk of new immigrants arriving in the U.S., both legally and illegally. Many children and adults coming into the U.S. actually carry their vaccination cards with them, according to NBC News. Anyone arriving in the U.S. legally is given a thorough health screening through a Department of Health and Human Services program and quarantined if there are any red flags. Not that all immigrants coming into the U.S. are perfectly healthy. Immigrant detention centers have at times had to deal with flare-ups of diseases, including tuberculosis and chickenpox. However, the chickenpox vaccination is part of the U.S. immunization plan anyway, so there's no risk to anyone who has already been vaccinated or exposed to it. And tuberculosis has long history in the U.S. In 2013, there were 9,500 cases of tuberculosis in the country, according to the Centers for Disease Control and Prevention. Trump announced his presidential bid June 16. During his announcement speech in New York, Trump said if he were elected, he would "terminate" President Barack Obama's executive order allowing undocumented immigrants to apply for work visas and claimed Mexico was "sending people [across the border] that have lots of problems, and they're bringing those problems with us. They're bringing drugs. They're bringing crime. They're rapists." The billionaire tycoon, who hopes to win the Republican nomination for the 2016 presidential race -- and is actually neck-and-neck with former Florida Gov. Jeb Bush as the party favorite among likely Republican voters -- later doubled down on his remarks about immigrants being rapists and criminals during an interview with CNN in early July. He again defended the comments in a statement Monday, and went one step further by accusing immigrants of being vectors of "tremendous infectious diseases." The remarks have been met with criticism from Trump's opponents, his business partners and even his own party. Trump has lost several business deals because of the claims about Mexicans, including his partnerships with Macy's department store, NBC, Serta and Nascar. Former Texas Gov. Rick Perry, also a 2016 presidential aspirant, said he was "offended" by Trump's remarks. "To paint with that broad a brush that Donald Trump did is -- I mean he's going to have to defend those remarks," Perry said. "I never will. And I will stand up and say that those are offensive, which they were." **The idea that immigrants are bringing disease into the U.S. isn't true.** Politicians and political pundits, from U.S. Rep. Randy Weber, R-Texas, to conservative television personality Pat Buchanan and author and radio host Lou Dobbs, have often underscored the threat of disease to stigmatize foreigners and immigrants. Such claims have frequently been used to argue immigrant children and mothers should be sent back across the border or to boot out immigrants working legally. **Health officials have denounced such claims as rooted in fear-mongering and political gain, not science.** When measles struck California earlier this year, some were quick to blame the outbreak on undocumented immigrants. Rep. Mo Brooks, R-Ala., said a "lot of the diseases" that enter the U.S. are "borne by [an] illegal alien," and pinned the outbreak that sickened dozens across several states on immigrants. The measles probably did start because of a virus brought to the U.S. from overseas, but not from Mexico. Health officials said it likely came from a foreign tourist visiting Southern California or from an American who returned with the virus after traveling abroad. For the most part, **there's nothing coming across the border that U.S. health officials wouldn't expect to encounter or with which they've never dealt.** The most common diseases immigration health officials have encountered are the everyday cold and other respiratory infections, as well as certain stomach bugs and diarrheal conditions. Most health problems in immigration detention facilities have sprung from a lack of hand-washing, according to the Texas Department of State Health, not diseases immigrants brought with them.

Health care remained strong through the economic recession – wouldn't bring it down, actually brought it back up

Lobb 9 (Annelena; [reporter for MarketWatch]; "US Stocks Bounce; Health-Care Strong; Banks, GM Weak"; 2/3/2009; <http://www.marketwatch.com/story/us-stocks-bounce-health-care-strong>)
JKS

A rise for health-care stocks and an unexpected increase in pending-home sales Tuesday helped major indexes break a three-session losing streak and sent the Dow Jones Industrial Average up

more than 100 points. Weakness for financial stocks and car makers served as a reminder of the shaky state of some of the pillars of the U.S. economy. Tuesday's move felt like the continuation of a technical bounce that began when the S&P 500 and Dow Jones Industrial Average tested their lows for the year Monday, said Joe Kinahan, chief derivatives strategist for options brokerage thinkorswim. Financial stocks were conspicuously absent from the rally, however, as Bank of America fell by more than 10%, coming within 25 cents of its lowest mark of the crisis, and Citigroup was off 4.4%. "What's discouraging in today's market is that the financials are taking it on the chin," Kinahan said. "There is no way we have any kind of long-term recovery without the financials being at least a stabilizer, if not a leader." Nobody is willing to buy into the financial sector before the Treasury Department plan that's supposed to surface next week, Kinahan said. "Are we nationalized, or are we not nationalized? Is it 'good bank/bad bank' and who falls under what category? There's so much uncertainty right now." In the latest round of earnings reports, drug maker Merck was one of the few bright spots, up 4.4% in recent trading, after posting a profit for the fourth quarter. Large health care firms have been one of the stalwarts in equities to start 2009, with traders highlighting their defensive nature and strong balance sheets. But the ascendancy of defensive stocks, which are thought to be hiding in the worst of times, points to a trading environment where economic concerns remain at the forefront. The Dow was recently up 129 points, or 1.6%, to 8065, led by Merck. Even at that level, the Dow is just over 500 points from its bear-market closing low, set on Nov. 20. General Motors shed 3.5% to \$2.79 after saying its light-vehicle sales plunged 59% in January. Fleet sales, or sales to rental-car companies and other mass users, fell to 13,000, the lowest monthly tally since 1975. Ford Motor said January light vehicle sales fell 40%, below already low expectations. And though the S&P 500 Index was up 1.3% at 836, its financial sector was down 2.4%. PNC Financial Services shares declined by 12% after the bank posted a loss and said it plans to cut jobs as it integrates National City, which it acquired in December. Other regional lenders also declined, with SunTrust Banks falling 23%. The National Association of Realtors reported a 6.3% rise in its gauge of pending home sales in December. Lower prices are drawing in buyers, the trade group said. Lawrence Yun, chief economist for NAR, observed that the "biggest gains were in areas with the biggest improvements in affordability." Traders say a turnaround in the housing market will likely precede any economic recovery. The SPDR S&P Homebuilders ETF added 6.9% to \$10.98. The Nasdaq Composite Index was recently up 13 points, or 0.9%, at 1508. Gordon Charlop, managing director at Rosenblatt Securities Inc., said, "I'm still not getting any sense we have our feet under us." More than half of the S&P 500 has now reported earnings, Mr. Charlop noted, so traders have turned more attention on the Obama stimulus plan and any information out of Washington that might move the markets. "It's going to be things like the fiscal stimulus and what we're seeing on regulation that we're keeping an eye on," he said. There is also anticipation ahead of what is presumably a gloomy monthly employment report Friday, he said, but "it's unlikely that we're going to get surprised," he said. "You can't put too much into it."

Health care strong in weak times

Vyas 9 (Kejal; [writer for Dow Jones Newswires' Caracas bureau]; "US Stocks In Tight Range: Health Care Strong"; 3/13/2009; <http://www.marketwatch.com/story/us-stocks-in-tight-range-health>)

U.S. stocks traded slightly higher Friday, after swinging much of the day between gains and losses, on the heels of a three-day surge. Coming into the trading day, technicians and analysts

expected some declines as lingering uncertainty in the credit markets and the overall economy likely will influence investors to take short-term profit. But for much of the day, stocks have moved between positive and negative territory, with no real certainty as to which way the market might close. "The market doesn't seem to have any sense of what it wants to do today," said Chris Colarik, portfolio manager at Glenmede Investment Management. "A lot of people felt the move up went so quickly. There may be some reluctance to put money back to work." In a note to investors, Oppenheimer chief market technician Carter Worth said stocks are likely to remain around current depressed levels for another two or three months, mirroring the seven- to eight-month bear market in 2002 and 2003. Some market observers say this week's rally was likely initiated by traders and money managers buying back bets against stocks. Once the tide turns in a market where short-selling is popular, rallies can be exacerbated by the bears' rush to limit losses by buying back their bets. That's known as a "short squeeze." "I definitely believe this started with a 'short squeeze,' then some people came out of the woodwork and put a little money into the market," said Frank Beck, chief investment officer at Capital Financial Group, adding he himself had sold some clients' positions in the Grizzly Short Fund, an exchange-traded fund that takes short positions on financial and other individual stocks. He anticipates a "bear-market rally" comparable to the gains between the lows on Nov. 20 and the 2009 peak in January. Recently, the Dow Jones Industrial Average, which has leapt 623 points, or 9.5% since Monday, was up 44 points at 7213. General Motors rose 25%. Microsoft, however, slid 3.1% amid an earlier broad decline in large technology stocks. The tech-focused Nasdaq Composite Index was up 2 to 1428. The S&P 500 was up 3 at 753. Health-care and utilities stocks, traditional defensive sectors, were higher, a sign that risk appetite may not be as high as the previous three sessions suggested. Humana shares were recently trading up 9.7%, on heavy options activity, which some believe may indicate the company may be an acquisition target. Assurances from top executives at major banks that the companies have been profitable so far this year have helped drive the market's gains this week, but some market watchers say banks must now walk the walk, having set an expectation.

Advantage CP

1NC

Text: The United States Federal Government should expand health care coverage to all immigrants by banning deportation of undocumented immigrants.

CP solves – gives all undocumented immigrants health care

Congress 15 (Elaine; [MSW, DSW, LCSW, graduate school of social service, Fordham University]; "Expanding Health Care Coverage to All Immigrants"; 2015; <https://apha.confex.com/apha/143am/webprogram/Paper319772.html>) JKS

The Affordable Health Care Act (ACA) made health care possible for millions who had previously been uninsured. Yet there are many who are still excluded because of their immigration status. The face of America is changing, as there are more immigrants (40,000,000) in the United States than ever before of whom over one quarter (11,700,000) are undocumented

(US Census, 2014). Because this large undocumented population is not able to purchase health insurance, receive tax credits for the purchase of health care under ACA, or apply for Medicaid, they have no health care coverage. According to the Pew Hispanic Center (2014), nine million families can be referred to as mixed status families with undocumented parents and children who are U.S. citizens. In these families each family member may have different health care coverage. While undocumented parents can apply for their children with U.S. citizenship to receive Medicaid coverage, they themselves are not eligible for Medicaid or to receive health care coverage through employers. The widely acclaimed Presidential Executive Orders that provided a pathway to legal status for undocumented children (DACA) and their parents (DAPA) still did not extend health care to children and parents who are undocumented. Public health social workers have a professional and ethical responsibility to provide health care equity for all and thus strive to decrease health disparities. Yet they frequently encounter undocumented people who cannot access regular health care. The need for advocacy to extend health care coverage to all including undocumented immigrants will be discussed.

CP is possible – Obama is very interested in these immigration policies

FNL 7-10 (Fox News Latino; [News network for Latin American people of the United States]; “Obama administration seeks judges' OK for executive actions on immigration”; 7/10/2015; <http://latino.foxnews.com/latino/news/2015/07/10/obama-administration-seeks-judges-ok-for-executive-actions-on-immigration/>) JKS

President Barack Obama's administration tried again Friday to convince the 5th U.S. Circuit Court of Appeals in New Orleans to allow executive orders benefiting roughly 5 million undocumented immigrants to take effect. Those actions were blocked via a preliminary injunction handed down by U.S. District Court Judge Andrew Hanen on Feb. 16, and since then the Obama administration has sought to reverse that decision. Last November, Obama expanded the population eligible for the Deferred Action for Childhood Arrivals, or DACA, program, which was started in mid-2012 and has thus far has allowed more than 500,000 immigrants who came to the United States as children to receive a renewable two-year work permit and exemption from deportation. He also issued an order creating a new program, known as Deferred Action for Parents of Americans and Lawful Permanent Residents, or DAPA, that would allow some immigrants who are parents of U.S. citizens and lawful permanent residents to apply for work permits and a reprieve from deportation. Obama took those actions, neither of which provide a path to citizenship, after Congress did not pass a broad immigration overhaul bill last year. Justice Department attorneys argued Friday before a panel of three judges - the Republican-appointed Jennifer Walker Elrod and Jerry Edwin Smith and the Democratic-appointed Carolyn Dineen King - that those actions were lawful and necessary to fix a "broken" immigration system. But a coalition of 26 mostly Republican-led states, led by Texas, asked the judges to uphold the injunction handed down by Hanen, saying Obama had abused his presidential power. In an earlier decision in May, Elrod and Smith rejected the administration's request to lift the hold on the executive actions. A study released last November by the Migration Policy Institute, a Washington-based think tank, put the number of potential beneficiaries of DAPA and DACA at more than 5.2 million, or half of all unauthorized immigrants residing in the United States. Of that total, 3.7 million would be beneficiaries of DAPA and 1.5 million of DACA, including 300,000 people newly eligible under the expanded guidelines. EFE

CP Net-Benefit

CP would create a major boost of the economy

Livio 7-10 (Susan K.; [writer for NJ.com]; “Obama immigration order would boost N.J.'s sputtering economy, group says”; 7/10/2015; http://www.nj.com/politics/index.ssf/2015/07/obamas_immigration_executive_order_would_allow_200.html) JKS

More than 200,000 unauthorized immigrants living in New Jersey could provide a much-needed boost to the state's sputtering economy if President Obama's executive actions on immigration policy were allowed to proceed, according to a report by New Jersey Policy Perspective. Released in advance of a federal district court hearing in Texas on Friday challenging the president's executive order, the report predicts New Jersey would see 1,500 jobs and \$29 million in state and local taxes added to its economy each year. The executive order would protect from deportation 55,000 children in New Jersey who were brought to America before they were 16, and would allow 146,000 parents of children who are legal immigrants to apply for work authorization. Another 277,000 immigrants who entered the country illegally would not qualify, according to the report. "These federal actions on immigration are a clear, simple and important step forward for millions of immigrants across the nation. And as a state with many immigrants, New Jersey clearly has a lot to gain," says New Jersey Policy Perspective policy analyst Erika J. Nava, the author of the brief for the left-leaning group. "Most importantly, more than 200,000 New Jerseyans would directly benefit and be better integrated into the state's social and economic fabric. And when these folks are allowed to participate more fully in our communities, they'll help give an important boost to the state's economy, as well as put their own families on clearer paths out of poverty," she said. In February, a federal judge in Texas blocked the president's executive order, saying the federal government "has adopted a new rule that substantially changes both the status and employability of ... 4.3 million removable aliens." "In fact the law mandates that these illegally present individuals be removed," according to the decision. New Jersey has the sixth largest number of unauthorized immigrants who would qualify for the Deferred Action for Parents of Americans and Lawful Permanent Residents or DAPA program and expand the existing Deferred Action for Childhood Arrivals DACA program, according to the report. The child program applied to people 30 and older before the president's 2014 executive order. Although they are scattered throughout the state, the majority live Hudson, Bergen, Middlesex, Essex, Passaic and Union counties, according to the report. About 40 percent of qualified applicants in New Jersey are from India and Mexico. "Of the undocumented New Jerseyans hailing from India, over half would be eligible for these executive actions — the highest share of the largest origin countries," according to the report. Undocumented New Jerseyans directly affected by these policies would likely see a wage bump between 5 and 10 percent, "which would help to close the enormous gap between the average annual income of the state's undocumented families (\$34,500) and all New Jersey families (\$113,394)," the report said.

Counterplans

Oversight CP

Potential Text: Local police departments should adopt an internal system of oversight for pulling drivers over, and one that requires officers to demonstrate probable cause in order to receive authorization by a supervisor conduct searches.

The counterplan solves racism in local law enforcement

Epp et. Al 14 (Charles R. Epp - Ph.D. in Political Science from the University of Wisconsin-Madison, Stephen Maynard-Moody- Ph.D. Cornell University, Ithaca, NY, and Donald P. Haider-Markel- University of Wisconsin-Milwaukee Ph.D., Political Science. *Pulled Over How Police Stops Define Race and Citizenship*. University of Chicago Press. Published in 2014.)//lb

Second, to enforce this requirement, police departments should adopt internal guidelines and systems of oversight governing the decision to make a stop and conduct investigatory intrusions that are modeled on how departments regulate uses of force.²⁶ Thus, departments should prohibit pretextual stops except when justified by an overriding public safety exigency. To oversee this guidance, departments should require officers in every stop to articulate and record their reason for the stop and departments should conduct internal reviews of these reasons. Departments should strive to make pretextual stops the rare exception rather than the common pattern. Further, a computerized search of the person's name in crime records should be allowed only after the legal basis for the stop is reported and recorded. These recording and oversight procedures would severely limit the use of pretext stops in the hunt for crime and deliberately so—but **this is an essential step in limiting the racial bias now so evident in investigatory stops.** The essential third step is to prohibit searches unless based on **probable cause** to believe a crime has been committed. Consent searches authorize unfettered police discretion to search whoever they wish, even though a driver's consent cannot be considered freely given. Drivers told us that they felt they were "incarcerated" when pulled over and that they had no choice but to consent. Training police officers to solicit permission to search cars or persons takes undue advantage of individuals who are psychologically, if not legally, held by the police. Such consent relies on manipulation, as documented in Charles Remsberg's police training manual.²⁷ Searches should be conducted only after receiving specific **authorization by a supervisor** and should be allowed on an articulation of probable cause, or, in other words, particularized evidence to believe the person has committed a crime. This evidence should be recorded and evaluated by supervisors.

DOJ CP

Counterplan Text: Under 42 U.S.C. § 14141, the United States federal government should require the DOJ to repeal all local and state police authorities ability to racially profile under any circumstance, and sue for injunctive relief of police forces found to be racially profiling by regular complaint investigations, under Section 14141.

Solves racial profiling and police force credibility

Simmons '12 (Kami Chavis; 2011; Beginning to End Racial Profiling: Definitive Solutions to an Elusive Problem; Kami Chavis Simmons is a Professor of Law and Director of the Criminal Justice Program at Wake Forest University School of Law. In 2015, she was appointed as a Senior Academic Fellow at the Joint Center for Political And Economic Studies.;

poseidon01.ssrn.com/delivery.php?ID=289004112008113090031125110096017099025007057017006013098023078026017103009087090105005060043107058047118070066087085015006116019059007023093124006070074013100107011091032002072106083009115008101004120019099067104004015001116082104012093073114105006&EXT=pdf&TYPE=2; 7-12-15; mbc)

Much of the contemporary debate related to racial profiling focuses upon whether definitive proof exists regarding an officer's intentional discrimination or whether an agency has a policy or custom of racial profiling.⁹ It is unlikely that an officer will admit his or her bias or that an agency will produce their racially-biased policy, thus making definitive proof of profiling difficult to ascertain. A more effective strategy to address racial profiling involves ameliorating systemic policies and practices that encourage or tolerate racial profiling and to assist the police department in implementing practices that will rehabilitate minority's confidence in the police department. It is now widely accepted among scholars that much police misconduct is attributable to an organizational culture within law enforcement agencies that "cultivates or tolerates" police misbehavior.⁰ Experts have agreed that adjudicatory remedies that are focused on the past misconduct of individual officers are largely ineffective, and that the best way to address police misconduct is to implement proactive practices that encourage broader institutional changes." For example, the Christopher Commission, which examined the Los Angeles Police Department after the infamous police beating of Rodney King, found that a small number of officers within a police department were responsible for the majority of complaints."² Therefore, many experts theorize that identifying, monitoring, re-training, or disciplining "problem" officers is likely to lead to the greatest reduction in misconduct.¹ Civil rights suits against officers and municipalities, internal investigations, and citizen-complaint review boards are all tools to address police misconduct. These tools, however, are reactionary and are only utilized to remedy previous, discrete instances of misconduct. It is clear that these adjudicatory measures are inadequate to change the culture of a police department that engages in racial profiling or other systemic issues of misconduct. An institutional culture that encourages or tolerates racial profiling necessitates an institutional remedy. One of the most promising models to remedy systemic police misconduct is the DOJ's "pattern or practice" authority, which the federal government has used to implement systemic reforms within several local police departments nationwide. In 1994, Congress enacted 42 U.S.C. § 14141, a statute that seeks to address the policies and practices of a police agency, and has shown great promise in spurring institutional reforms in several local law-enforcement agencies.¹⁴ Pursuant to its "pattern or practice" authority under 42 U.S.C. § 14141, the DOJ has required several police departments nationwide, including the Los Angeles Police Department and the District of Columbia Metropolitan Police Department, to reform their policies and practices.¹¹⁵ Section 14141 grants the U.S. government the authority to sue for injunctive relief to change policies within a local police department where DOJ has found a pattern or practice of constitutional violations.¹⁶ Generally, the resulting consent decrees or agreements have included reforms of both substantive and procedural policies to create more transparency and ensure accountability.¹⁷ One reform includes modifying use of force policies to provide guidelines regarding what type of force is appropriate in apprehending a suspect and defining or limiting circumstances when certain uses of force are appropriate.¹⁸ Another common reform DOJ has required is the implementation of an early-warning tracking system to help supervisors identify officers who might need to be re-trained or disciplined.¹⁹ Collecting this type of information and using it to make training and personnel decisions may deter the intentional wrongdoing of individual officers. Yet another reform is the implementation of fair and comprehensive complaint processes for citizens who wish to report

alleged misconduct. ¹²⁰ Many citizens, especially minorities, are reluctant to file complaints against police officers because they simply believe that their complaints will not be fairly processed. To ensure fairness and reduce the possibility for retaliation, officers assigned to investigate citizen complaints should be sufficiently independent from the officers they are investigating. Notably, DOJ has also required several jurisdictions to compile information related to racial profiling.¹² Compiling and publishing information related to race and traffic stops and searches may help jurisdictions determine whether officers are disproportionately stopping racial minorities. With vigorous enforcement, DOJ's pattern or practice authority could lead to reforms that will ultimately address many of the systemic issues contributing to tension between minorities and the police.

Racial profiling kills police force legitimacy

Simmons '12 (Kami Chavis; 2011; Beginning to End Racial Profiling: Definitive Solutions to an Elusive Problem; Kami Chavis Simmons is a Professor of Law and Director of the Criminal Justice Program at Wake Forest University School of Law. In 2015, she was appointed as a Senior Academic Fellow at the Joint Center for Political And Economic Studies.;

poseidon01.ssrn.com/delivery.php?ID=289004112008113090031125110096017099025007057017006013098023078026017103009087090105005060043107058047118070066087085015006116019059007023093124006070074013100107011091032002072106083009115008101004120019099067104004015001116082104012093073114105006&EXT=pdf&TYPE=2; 7-12-15; mbc)

Finally, and perhaps most importantly, the perception that certain groups are treated unfairly undermines the legitimacy of the law enforcement agency, and thus has a deleterious effect on crime control and prevention.⁹⁴ Many members of minority communities are also disproportionately victims of crime and may live in areas that experience higher rates of crime.⁹⁵ For example, in many large urban areas, a disproportionate number of crime victims are African American, and thus partnerships between citizens and police are essential to crime prevention.⁹⁶ As one scholar noted, "[T]here is a causal link between the perception of the law and levels of compliance. Unfortunately, the perception in many poor and minority communities is that the law, as exemplified by the police, is illegitimate, a perception that encourages non-compliance." ⁹⁷ It follows that areas in need of the greatest amount of law enforcement protection are also likely to have a large proportion of residents who distrust law enforcement. Racial profiling also exacerbates tensions between racial minorities and law enforcement, and undermines the rationale for community policing. Thus, efforts to engage these citizens in crime prevention partnerships with law enforcement face challenges that may not be present in other communities. David Harris also notes that racial profiling can have a negative impact on the way in which minority groups view law enforcement. Harris writes, "Racially targeted traffic stops cause deep cynicism among blacks about the fairness and legitimacy of law enforcement and courts Thus it is no wonder that Blacks view the criminal justice system in totally different terms than whites do."⁹⁸ For example, San Diego Police Chief Jerome Sanders and the San Diego Police Department voiced concern that the "growing public perception that police target minority drivers [] was eroding public trust and need[ed] to be addressed if community policing. . . [was] [] to be successful."⁹⁹ Not only is racial profiling harmful to individuals and communities, but, as previously discussed, there is evidence demonstrating that racial profiling is an ineffective law-enforcement tool. Despite the disproportionate number of stops and searches of African-Americans and Latinos, studies show that when searched, these groups were less likely than Whites to have contraband.¹⁰⁰ Together, these facts confirm not only the existence of racial profiling, but that racial profiling is an ineffective tool for law enforcement whose costs outweigh

any negligible benefit. Given these societal costs, innovative solutions are required to address racial profiling.

ICE and DHS reform unpopular – prison lobbyists prove

Lee '15 (Esther Yu-Hsi; April 16, 2015; Millions Spent Lobbying By Private Prison Corporations To Keep A Quota Of Arrested Immigrants, Report Says; She received her B.A. in Psychology and Middle East and Islamic Studies and a M.A. in Psychology from New York University. A Deferred Action for Childhood Arrivals (DACA) beneficiary, Esther is passionate about immigration issues from all sides of the debate. She is also a White House Champion of Change recipient.; thinkprogress.org/immigration/2015/04/16/3647407/immigrant-detention-private-prison-11-million-lobbying/; 7-13-15; mbc)

Private prison corporations spent \$11 million over six years to lobby Congress to keep immigrants in detention centers, a new report released Wednesday found. The Grassroots Leadership report, Payoff: How Congress Ensures Private Prison Profit with an Immigrant Detention Quota, found that lobbying efforts of the two largest private prison corporations have made them the main beneficiaries of aggressive immigration detention policies. For-profit family detention centers have come under scrutiny in recent times as migrant women renewed a hunger strike this week in Texas, demanding that they be released on bond with their children. Since 2007, Congress has approved federal funding for the Immigration and Customs Enforcement (ICE) agency to detain at least 33,400 people (increased to 34,000 in 2014) per day in detention facilities. Provisions in this budget have long been referred to as an “immigrant detention quota” and “bed mandate” on the rationale that they require a certain number of immigrants be detained at any given time. Last year, about 33,000 immigrants were held on a daily basis. “Defenders of the bed mandate say it remains a useful tool to compel ICE to devote the maximum amount of resources to catching and deporting illegal migrants and foreign-born legal residents who commit crimes, including dangerous gang members, rapists and other violent felons,” the Washington Post reported in 2013. A record number of immigrants have been kept in detention, but the majority are not violent offenders. When ICE released more than 2,000 detainees in 2013 to save money, House Homeland Security Committee Chairman Michael McCaul, R-Texas wrote a letter to then ICE director John Morton stating that ICE was “in clear violation of statute” for not maintaining all 34,000 bed spaces with immigrant detainees. Morton indicated that a continuing resolution funded ICE to “maintain an average daily population of approximately 34,000 individuals.” But DHS Homeland Secretary Jeh Johnson insisted during a House Appropriations Committee hearing last year that the quota wasn’t mandatory and that ICE should only “maintain the capability” for 34,000 beds, some of which “might be empty at any given time.” Rep. John Culberson (R-TX) contended at the time that the DHS should fill all the beds and enforcement officials do not have the authority to use discretion because they must “enforce the law as it is written.” In a possible sign that Johnson’s statement may signal a change in the interpretation of the statute, the daily detainee population for the first five months of 2015 dropped to around 26,000. The Grassroots Leadership report found that private prison corporations operate 62 percent of ICE immigrant detention beds, while nine of the ten largest ICE immigrant detention facilities are operated by for-profit prison corporations. The report also found that Corrections Corporation of America (CCA), one of the major private prison companies, “spent at least 75 percent of its lobbying expenditures in quarters where it has lobbied directly on the [Department of Homeland Security] Appropriations Subcommittee.” Meanwhile, GEO Group, another major private prison company, “has not directly lobbied the DHS Appropriations Subcommittee” but the report authors said that “the company recently began lobbying on immigration and immigrant detention issues, spending \$460,000 between 2011 and 2014 in quarters when they lobbied on these issues.” Last year CCA made \$195,022,000, while GEO made \$143,840,000 in profits. During a teleconference Wednesday, Rep. Adam Smith (D-WA) explained that the only way that Congress could get rid of a bed mandate would be through the annual DHS appropriations budget. “The Republican majority has resisted allowing those amendments to come up,” Smith said. He said that introducing a stand-alone bill getting rid of the mandate hasn’t

worked in the past. Reps. Bill Foster (D-IL) and Ted Deutch (D-FL) previously introduced such a bill, calling the mandate “a costly and inhumane directive,” but the bill hasn’t moved through Congress. Smith said that eliminating the bed mandate would be “the first step to eliminating privatization. It’s a huge thing that drives their profits.” Watchdog and activist groups across the country have long criticized the growing political influence of the private prison industry. The National Institute on Money and Politics found that GEO Group contributed \$5,709,456 to candidates over the past 12 years. Contribution money has gone to both Republican, Democrats, and third party candidates. According to the Center for Responsive Politics, companies like GEO Group, Corrections Corp. of America, and Management and Training Corp. all spent “significantly more lobbying in state capitals than on Capitol Hill... In 2014 alone, they spent nearly \$2 million lobbying Congress, and individuals from these companies gave well over \$500,000 to congressional candidates as well.” Republican candidates received more money overall, though GEO Group gave the highest individual contribution to Gov. Jerry Brown (D-CA). Overall, GEO Group contributed nearly \$3 million to the Florida Republican Party.

Plan partisan- private prison lobbyists prove

National Immigration Forum Staff '13 (National Immigration Forum; August 22, 2013; THE MATH OF IMMIGRATION DETENTION; <https://immigrationforum.org/blog/themathofimmigrationdetention/>; 7-13-15-;mbc)

As previously indicated, the expansion of the immigration detention system has created a profitable market for those involved in operating county and state jails. The private prison industry has also benefited directly from this expansion. Corrections Corporation of America (CCA) is the largest ICE detention contractor, operating a total of fifteen ICE-contracted facilities with a total of 5,800 beds.[35] GEO Group, Inc. (GEO), the second largest ICE contractor, operates seven facilities with a total of 7,183 beds.[36] In FY2012 CCA and GEO reported annual revenues of \$1.8 billion[37] and \$1.5 billion[38] respectively. In December 2010, GEO purchased B.I. Incorporated, a company that has lucrative government contracts with ICE as the sole administrator of its alternatives to detention program.[39] Private prison companies in 2011 housed nearly half of all immigration detainees.[40] Private prison corporations have also exerted their influence on legislators by lobbying for laws that detain immigrants more frequently and for longer periods of time.[41] According to the Associated Press, the three corporations holding the largest percentage of ICE detention contracts, including CCA and GEO, collectively spent at least \$45 million in the past decade on campaign donations and lobbyists at the state and federal levels.[42] The relationships between legislators and private prison corporations are perhaps best illustrated by Arizona’s controversial S.B. 1070 bill, which was drafted in the presence of officials from CCA.[43] Of the 36 co-sponsors of S.B. 1070, 30 received campaign contributions from private prison lobbyists or companies, including CCA.[44] With the recent activity on immigration reform in both the House and the Senate, these companies have a vested interest in any reform related to interior enforcement. While both GEO and CCA have denied lobbying on immigration reform, the Lobbying Disclosure Act database shows that both companies have regularly lobbied the House and Senate on immigration matters in recent years.[45] With regards to the current effort to pass immigration reform legislation, GEO initially told media outlets that “The GEO Group has never directly or indirectly lobbied to influence immigration policy. We have not discussed any immigration reform related matters with any members of Congress, and we will not participate in the current immigration reform debate.” However their recent lobbying disclosure forms show that they have hired the DC based lobby group Navigators Global to lobby on behalf of the company with both houses of Congress on “issues related to comprehensive immigration reform”[46]. In June, S. 744, the Border Security, Economic Opportunity, and Immigration Modernization Act, which is the Senate’s version of a comprehensive immigration reform bill, passed the Senate. The CBO estimates this bill could increase the prison population by 14,000, and further estimates a \$1.6 billion budget over the next decade.[47] Private estimates

suggest that private prisons will acquire 80 percent of the bed increase in government contracts, a significant profit for shareholders.[48] The influence of private prison corporations is even more troubling given persistent and numerous complaints by detainees held at private facilities, including sexual abuse,[49] inadequate access to translators, prolonged detention, and insufficient medical treatment.[50] ICE detention standards, designed to guide the operation of immigration detention facilities, are not expressly enforceable at many of the facilities under contract with ICE.[51] Given the lack of strict standards and proper oversight at these facilities, it is no surprise that sub-par conditions persist at these locations.

Conservative prison lobbies make the plan unpopular

Markowitz '15 (Eric; April 19, 15; Report: Private Prison Lobbyists Spend Millions To Keep Immigrants Locked Up; Eric Markowitz is a senior writer with the International Business Times, where focuses mostly on long-form feature writing. He is graduate of New York University's Arthur L. Carter journalism school.; www.ibtimes.com/report-private-prison-lobbyists-spend-millions-keep-immigrants-locked-1887875; 7-17-15; mbc)

In 2010, the Department of Homeland Security adopted a bed quota that required Immigration and Customs Enforcement (ICE) to detain about 34,000 individuals on any given day. The quota certainly did not benefit immigrants -- but it did prove to be extraordinarily lucrative for the private prison companies that picked up the new business. A report released last week by Grassroots Leadership, a Texas non-profit, details how private prison companies have spent five years lobbying the government, not only to maintain the quota, but to enact conservative immigration reform that would continue to ensure a steady flow of inmates into its detention centers. "Payoff: How Congress Ensures Private Prison Profit with an Immigrant Detention," says 62 percent of all ICE detention beds now are operated by for-profit prison companies. In fact, nine out of the 10 largest immigrant detention camps are private, with eight owned by only two corporations -- Corrections Corporation of America and the GEO Group. Those two corporations reaped about \$500 million in 2014 alone. To protect their interests, these companies -- particularly CCA -- have spent millions in conservative lobbying efforts. "Contrary to private prison corporation claims that they do not lobby on issues related to immigration policy, between 2008 and 2014, CCA spent \$10.56 million in quarters where they lobbied on issues related to immigrant detention and immigration reform," the authors note. The report also found since the 2010 bed quota was instituted, the two companies have expanded operations in a number of states, now detaining "3,600 refugee mothers and children, at enormous profit to these corporations." Critics say the conditions at these facilities are abysmal, and access to medical care is scant. The report detailed the experience of Henry Taracena, an immigrant who was detained for five months at the GEO-run Northwest Detention Center in Tacoma, Washington. Taracena participated in a hunger strike while detained to bring publicity to the facility's conditions.

Immigration reform partisan now – Republicans will block it until Obama backs down over immigration executive action

Everett and Seung '15(Burgess and Min Kim; 3/9/15; Immigration reform looks dead in this Congress; Everett is originally from Maine and a University of Maryland graduate. He got his start in journalism at the Portland Press Herald + Seung Min Kim is an assistant editor who covers Congress for POLITICO; www.politico.com/story/2015/03/immigration-reform-congress-115880.html; 7-17-15; mbc)

Singed by their defeat in the battle over Homeland Security funding, Republicans aren't about to renew their fight against President Barack Obama's executive actions on immigration anytime

soon. When the GOP-controlled Senate bent to Democratic demands to fund the Department of Homeland Security, effectively undercutting conservatives who were willing to allow the agency to shut

down until Obama backed down, there was talk of Senate GOP leaders returning to the immigration issue to find new ways to thwart Obama's orders. Story Continued Below But few within the GOP expect any kind of immigration debate in the Senate in the foreseeable future. The issue has been relegated to the back burner as Republicans instead focus on the budget, trade deals and, possibly, tax reform. "At this point, we have a lot of other issues to do," said Sen. Susan Collins (R-Maine), who authored stand-alone legislation to block Obama's immigration directives. "I'm very happy the Department of Homeland Security is funded, and I think the issue of the president's overreach with his executive order of last November is probably going to end up being decided by the courts. And that's not a bad option." Senate Republican leadership aides also indicated that the chamber is not likely to return to the Collins legislation in the next several weeks — a work period that will be dominated by anti-trafficking legislation, nominations, a fiscal 2016 budget and perhaps an Iran bill. In the House, committees are humming along on some immigration bills, but leadership has shown no indication when — or if — they will come to the floor. The inaction on immigration comes as the GOP is trying to improve its standing among Latinos in the 2016 presidential election. An "autopsy" of the party's problems after the 2012 election warned that Republicans "must embrace and champion comprehensive immigration reform. If we do not, our Party's appeal will continue to shrink." Reform advocates were buoyed when the Senate overwhelmingly passed a sweeping bipartisan bill in June 2013. But the measure stalled in the House. And immigration, until at least after the next election, is more likely to be fodder for the campaign trail than congressional action. And if there was any question, Obama's executive actions, which are deeply despised by Republicans, likely extinguished any remaining prospects of this White House working with the GOP on immigration. In a meeting with advocates last month, Obama said he was not hopeful this Republican-led Congress would pass immigration bills that he would be able to sign, one person who attended the meeting said. Senate Majority Leader Mitch McConnell (R-Ky.) left himself the option of bringing back the measure to stymie Obama's directives. And GOP leaders, wary of criticism from conservatives who are girding for combat over immigration, won't close the door entirely on revisiting it.

Department of Homeland Security commits human rights violations

Dagnal-Myron '14 (Cynthia; 11/04/14; Report Alleges Human Rights Abuses at DHS Facilities on the Mexican Border; Cynthia Dagnal-Myron is an award-winning former reporter for both the Chicago Sun Times and Arizona Daily Star and author of The Keka Collection.; www.huffingtonpost.com/cynthia-dagnalmyron/report-alleges-aystematic_b_6070102.html; 7-7-15; mbc)

Detainees at short-term Department of Homeland Security facilities in Southern Arizona have faced "a long term pattern of human rights violations" according to a report released today by the Guatemala Acupuncture and Medical Aid Project (GUAMAP), a non-governmental international health organization based in Tucson. In an email exchange, Blake Gentry, GUAMAP member and author of Deprivation Not Deterrence said the report was meant to "use our experience in health care and with the cultures of Guatemala in interpreting what conditions Central Americans were migrating from and what they were migrating to." GUAMAP, which has trained rural Guatemalan health care workers for over 20 years, conducted 45 minute interviews with 68 detainees over a two month period. According to Gentry, two dozen additional families were interviewed, but asked that their responses not be made public, "even with the guarantee that personal identifying information would not be published." The families felt "anxiety over their future US immigration proceedings." Among the violations reported by detainees were: Insufficient, spoiled and sub-standard food Insufficient or tainted drinking water Psychological, physical, or verbal abuse Insufficient medical care, most notably for pregnant women and children Anecdotal evidence of the latter was given by a Honduran mother who said her young son, "began to bleed from the nose" while in detention. She said a border agent told her that "this is normal," and refused to allow medical personnel to attend to the sick child. Along with tales of abuse and statistics to support those allegations, the report also "debunks... the public perception of immigrants as terrorists and criminals," Gentry asserted. Economic displacement created by NAFTA and CAFTA trade

agreements drove and continues to drive rural agricultural workers out of those countries in order that they can survive," Gentry said. Gentry added that some 6.6 million of the approximately 11 million undocumented in the United States are "farm workers who are migrating to survive economic collapse in the agricultural labor market." "In plain terms their jobs were destroyed by large plantation agriculture now reaping enormous profits and US commercial agriculture that exports basic crops to those areas where they used to grow such crops." Gentry also believes the report proves "the DHS (Department of Homeland Security) policy of subjecting immigrants to harsh treatment in border patrol stations in order to deter them from coming has failed." "We perceive looming international threats but are being guided by fear and those who traffic in selling fear," Gentry said, also comparing current immigration policies to those which eventually sent several Native American tribes--once also considered "illegals"--down the infamous Trail of Tears. "However, this time, [it is] our neighbors in North America and Central America, whose immigrants account for 73% of all undocumented in the United States," Gentry said. "We do not live in an isolated region any longer. If you make international trade deals to exchange goods, capital investments and technology, but exclude the people hurt by the worst by those trade deals, more illegal people will be coming unless the deals are fixed. We can no longer afford not to [fix them]--unless taxpayers want to shell out more money for a problem we were told was going to be solved in 1995."

States CP

federal enforcement bad

Federal crime enforcement is ineffective – Proves the Counterplan Solves

Muhlhausen and Little 7 (David B Muhlhausen PhD is a leading expert on criminal justice programs in The Heritage Foundation's Center for Data Analysis and Erica Little is a staff member at The Heritage Foundation, "Gang Crime: Effective and Constitutional Policies to Stop Violent Gangs," 6/6/07, Date Accessed: 7/13/15, <http://www.heritage.org/research/reports/2007/06/gang-crime-effective-and-constitutional-policies-to-stop-violent-gangs>, SZ)

Overfederalization of Crime. The tendency to search for a solution at the national level is mis-guided and problematic. Federal crimes should address problems reserved to the national government in the Constitution. In a speech to the American Law Institute, the late Chief Justice William Rehnquist reiterated what the Judicial Conference of the United States had stated years before: "Civil and criminal juris-diction should be assigned to the federal courts only to further clearly defined and justified national interests."[7] He went on to list the types of crimes to which the federal government should be limited: offenses against the federal government or its interests, crimes with a substantial multi-state or international aspect, crimes involving complex commercial or institutional enterprises, serious state or local government corruption, and crimes raising highly sensitive local issues.[8] Criminal street gangs are a problem common to all of the states, but the crimes that they commit are almost entirely and inherently local in nature and regulated by state criminal law, law enforcement, and courts. For example, despite the fact that an automobile theft could involve interstate travel, it does not do so in most instances. State agencies investigate and prosecute such crimes. Adding the label of "gang crime" does not change the offense in a way that justifies or constitution-ally authorizes federal involvement unless there really is significant interstate activity that has a direct and substantial effect on interstate commerce. In the same speech to the American Law Institute, Rehnquist repeated a principle enunciated by President Abraham Lincoln in the 19th century and President Dwight D. Eisenhower in the 20th century: "Matters that can be adequately handled by the states should be left to them, [and] matters that cannot be so handled should be undertaken by the federal government." [9] When Congress adds to the federal criminal law, it generally claims to do so based on its power under Article I, Section 8 of the Constitution, which is known as the Commerce Clause, arguing that the activity being criminalized has some sort of effect on interstate commerce. This use of the Commerce Clause is far from the true meaning of the Constitution. As Justice Clarence Thomas wrote in his concurring opinion in *United States v. Lopez*, if Congress had been given authority over matters that simply "affect" interstate commerce, most of Article I, Section 8, which enumerates Congress's powers, would be rendered surplusage.[10] In addition to violating the constitutional structure of the U.S. government, federalizing crime also reduces accountability and efficiency as law enforcement agencies fight crime. By involving the federal government, Congress undermines the responsibility of state and local law enforcement to develop effective crime-reduction policies. Local officials can pass the buck by pointing the finger at federal enforcement authorities. The problem is compounded because federal action is often ineffective. Federalizing a crime is frequently a symbolic gesture, enabling Congress to say that it has addressed the problem without regard to whether or not the new laws will actually be implemented, much less actually reduce crime.[11] Although it may appear harmless, Congress's gesture only impedes state and local enforcement in addressing a problem that should be solved primarily at the state and local levels. In addition to undermining state and local accountability, federal involvement in crime fighting is detrimental to quintessential federal responsibilities. Enforcing criminal law that is not really national in scope is a misuse of federal resources and a distraction from true national concerns. By increasing the federal role in traditional state and local responsibilities, Congress needlessly drains federal resources that should be used for more urgent priorities such as pursuing foreign spies, combating counterfeiting, fighting international terrorism, and improving homeland security.

solves human rights

All 50 States failed both the UN and Amnesty International's standards for protection of life

Laughland and Lartey '15 (Oliver and Jamiles; June 18, 15; Oliver Laughland is senior reporter for Guardian + Lartey is a reporter for the Guardian US US; www.theguardian.com/us-news/2015/jun/18/us-states-police-use-of-force-standards-amnesty; 7-13-15; mbc)

Every state in the US fails to comply with international standards on the lethal use of force by law enforcement officers, according to a report by Amnesty International USA, which also says 13 US states fall beneath even lower legal standards enshrined in US constitutional law and that nine states currently have no laws at all to deal with the issue. The stinging review comes amid a national debate over police violence and widespread protest following the high-profile deaths of 18-year-old Michael Brown in Ferguson, Missouri; 43-year-old Eric Garner in New York; 50-year-old Walter Scott in South Carolina; and 25-year-old Freddie Gray in Baltimore – all unarmed black men killed by police within the past 11 months. Amnesty USA's executive director, Steven Hawkins, told the Guardian the findings represented a "shocking lack of fundamental respect for the sanctity of human life". "While law enforcement in the United States is given the authority to use lethal force, there is no equal obligation to respect and preserve human life. It's shocking that while we give law enforcement this extraordinary power, so many states either have no regulation on their books or nothing that complies with international standards," Hawkins said. The Counted: people killed by police in the United States in 2015 – interactive The Guardian is counting the people killed by US law enforcement agencies this year. Read their stories and contribute to our ongoing, crowdsourced project Read more The analysis, which Hawkins said he believed was the first of its kind, compared state statutes on law enforcement's use of lethal force with international legislation, including the enshrinement of the right to life, as well as United Nations principles limiting lethal use of force to "unavoidable" instances "in order to protect life" after "less extreme means" have failed. Further UN guidelines state that officers should attempt to identify themselves and give warning of intent to use lethal force. Advertisement Amnesty found that in all 50 states and Washington DC, written statutes were too broad to fit these international standards, concluding: "None of the laws establish the requirement that lethal force may only be used as a last resort with non-violent means and less harmful means to be tried first. The vast majority of laws do not require officers to give a warning of their intent to use firearms." The report arrived just weeks after the recommendations of Barack Obama's police taskforce were made public and his executive actions on police reform criticized for not going far enough to curtail police violence. The presidential commission stated that "not only should there be policies for deadly and non-deadly uses of force", but that a "clearly stated 'sanctity of life' philosophy must also be in the forefront of every officer's mind". The Amnesty review found that only eight states require a verbal warning to be given before an officer engages in lethal force. In nine states, law enforcement officers are legally allowed to use lethal force during riot. In Pennsylvania, for instance, the use of force statute mandates that deadly force is justifiable if it is "necessary to suppress a riot or mutiny after the rioters or mutineers have been ordered to disperse". Further, Amnesty found that in 20 states it is legally permissible for law enforcement officers to employ lethal force against an individual attempting to escape prison or jail, even if they pose no threat. In Mississippi, for instance, law declares "the killing of a human being ... justifiable ... [w]hen necessarily committed by public officers, or those acting by their command in their aid and assistance, in retaking any felon who has been rescued or has escaped". Amnesty's report also charges that the laws on lethal force in 13 states

do not even meet the less stringent constitutional standard set by the 1985 US supreme court case Tennessee v Garner. The case was centered on the death of an unarmed black 15-year-old, Edward Garner, a suspect in a home burglary. He was shot in the back of the head as he fled by officers acting under a Tennessee state statute which permitted “use all the necessary means” to make an arrest of a fleeing subject. The 6-3 majority decision declared that police may not use deadly force to prevent a suspect from escaping unless “the officer has probable cause to believe that the suspect poses a significant threat of death or serious physical injury to the officer or others”. The states whose laws do not meet this constitutional standard, according to Amnesty, tend to include permissive or vague language around the use of force. North Dakota’s statute, for example, permits deadly force against “an individual who has committed or attempted to commit a felony involving violence”, without defining the level of violence that might warrant deadly force. Amnesty identifies nine states – Maryland, Massachusetts, Michigan, Ohio, South Carolina, Virginia, West Virginia, Wisconsin and Wyoming – alongside Washington DC where no law enforcement officer lethal force statutes exist.

solves immigration

States work out immigration issues while Congress argues

Grovum 2014 (Jake [Staff Writer for Stateline]; With No Federal Fix, States Are Addressing Immigration on Their Own; August 25, 2014; www.governing.com/news/headlines/with-no-federal-fix-states-are-addressing-immigration.html; jDUBS)

With Congress at a standstill on immigration issues, states have pursued their own solutions, with some offering in-state tuition and financial aid to unauthorized students and others approving more spending to enforce immigration laws. “While Congress cannot seem to take action on immigration issues, states remain engaged in debating and solving immigration challenges, whether we are discussing services or enforcement.” state Sen. John Watkins, a Virginia Republican and co-chair of the National Conference of State Legislatures’ immigration task force, said in releasing an immigration report during NCSL’s annual meeting last week. States have enacted 132 immigration-related laws this year, according to the report. The number is only slightly down from last year, even though some states, including immigration hot spot Texas, held no legislative session this year. Seven states approved resolutions calling on Congress or the White House to act on a immigration issues like deportation policy and a general overhaul of federal laws. In many cases, the laws enacted in the states continued a trend of opening the door to recent immigrants, authorized and unauthorized, to be more engaged in civic life and the community. The measures include employment and labor regulations, education policies and health-care access. Among the notable examples: Florida and Tennessee joined 15 other states that offer in-state tuition by law for unauthorized immigrants. Four states offer it through their higher education systems’ boards of regents. Washington state went further this year, joining California, New Mexico and Texas in offering financial aid to unauthorized students. Florida also made it possible for unauthorized immigrants to be members of the state bar association. In New York and Oregon, lawmakers approved measures to expand health care access to immigrants, including those who are unauthorized and in general excluded from federal safety-net programs like Medicaid, the federal-state health care program for the poor. New York’s measure aims to make medical assistance available to those who might be otherwise ineligible because of their immigration status under federal law. Oregon will spend \$60,000 to study creating a basic health plan that could serve legal resident immigrants who are excluded from other programs. California, meanwhile, continued to be a leader in pushing for more immigrant-friendly laws. Lawmakers approved a measure that would bar employers from pursuing punitive immigration enforcement actions against their workers for any reason. Other states went in the opposite direction. Missouri, for example, approved a law blocking any in-state tuition benefit for unauthorized immigrants. Six other states have also moved to block in-state tuition for those immigrants. Arizona lawmakers approved a change to make it a felony to assume someone else’s identity to be declared eligible to work. In South Carolina, notaries public must now read and write English and be registered to vote. Utah repealed a law that urged its Commission on Immigration and Migration to coordinate with local, state and federal officials to help integrate immigrants into the state. Despite the flurry of state activity, however, few of the measures approved in 2014 generated the sort of controversy that engulfed states such as Arizona and Alabama in recent years. According to the NCSL report, no states moved to offer driver’s licenses to unauthorized immigrants this year (11 states and the District of Columbia already offer them), a step that has ignited strong opposition in some states. There were no broad-based immigration omnibus measures passed in the states this year either, according to the report. Much of the legislative action covered in the NCSL report, however, predated the national focus on the flood of unaccompanied child immigrants flooding across the U.S.-Mexico border. In just the early weeks of that crisis, many states moved to respond to the situation. Some states, such as Maryland, led by Democratic Gov. Martin O’Malley, took steps to welcome child immigrants, calling on religious and other private groups to provide shelter for them. Other governors, such as Dave Heineman of Nebraska and Terry Branstad of Iowa, both Republicans, criticized federal officials for considering their states as potential landing zones for immigrant children. Massachusetts Democratic Gov. Deval Patrick saw a backlash from his initial openness to house immigrant children, and the state ended up not sheltering any children. The child immigrant situation could lead to more action in general, but also to a further divide among the states in how they treat immigration in general. Already, Republican Gov. Rick Perry of Texas has led the way in strong reactions to the immigrant crisis, sending his state’s National Guard to the border for extra security. Washington state Rep. Sharon Tomiko Santos, a Democrat who also co-chairs the NCSL immigration task force, said action in the states might have been down a bit this year because people had hoped Congress might do something. Because it didn’t, “states are going to try to fill that vacuum,” she said. “Our motto is that the federal government has the responsibility to address the immigration policy,” she said, “but states have the responsibility to address immigrant integration.”

States solve immigration issues better than the federal government

Nowrasteh 6/16 (Alex [Immigration Policy Analyst at the Cato Institute]; Immigration reform: Let the states lead the way; June 16, 2015; www.latimes.com/opinion/op-ed/la-oe-nowrasteh-let-states-issue-guest-worker-visas-20150613-story.html; jDUBS)

Texas and California are trying to reform legal migration on their own. The politics in these two states couldn't be more different, but legislators in both states recently proposed running their own guest-worker visa programs to get around the federal immigration reform gridlock. Relying on states to create their own migration systems may well be the solution to America's immigration woes. One-size-fits-all national immigration laws aren't working. Federal reform efforts have repeatedly failed, so why not let states take a crack at it? States experiment with education, welfare and drug policies — immigration should be next. A state-based guest-worker visa seems like a radical idea because immigration rules generally fall under federal jurisdiction in the United States. However, Canada and Australia — which like the U.S. are continent-spanning, economically diverse countries with traditions of federalism — each have such programs. In a recent report, Canada called its Provincial Nominee Program a success; 96% of the program's immigrants to Manitoba, British Columbia, Alberta and Saskatchewan were employed within a year, many filling niche rolls in the labor market. If the U.S. government followed that example and relinquished some migration powers to state governments, we'd see a proliferation of different visas regulated in various ways. California might create a state visa for high-tech workers and agricultural laborers, while Texas might create visas for agriculture, construction and high tech. Michigan could create one for real estate investors in Detroit. There could be hundreds of different visas all tuned to local economic demands rather than just one or two temporary federal visas forced to fit the needs of the entire U.S. economy. Texas and California could be the first to succeed with pilot programs. Texas' brief legislative session saw three bipartisan bills introduced to create a state-based guest-worker visa program. The California Assembly just passed a guest-worker visa bill authored by Assemblyman Luis Alejo (D-Salinas). After noting the failure of federal immigration reform, Alejo said, "If California wants change in immigration policy, we as state officials must stand up and lead." His bill would create a guest visa work permit for unauthorized farmworkers already working in the state. None of the Texas bills would have legalized any current unlawful migrants, but they would have provided for the future entry of legal migrant workers to Texas. In both states, the bills require that the federal government grant a waiver or permission to run their own programs. That has been a stumbling block for Kansas, Utah and Colorado, which have also tried to establish their own guest-worker programs in recent years. The waivers weren't forthcoming, but Washington would have a much harder time ignoring politically powerful California and Texas, which have the two largest economies in the United States. State-based guest-worker programs admittedly bring up some potentially thorny issues. One is that migrants who enter the U.S. in one state could simply leave and work in another illegally. That problem would probably be a minor one. Only about 2% of current visa "overstays" involve guest workers, while 87% are tourists and vacationers. Guest workers are more closely regulated than tourists, and they have much more to fear from deportation, so fewer of them overstay. If, however, state guest workers do disappear, states have more flexibility to experiment with responses and prevention measures. They might make guest workers pay a bond that they forfeit if they violated the program, or levy fines against employers when their workers leave, or deduct some amount of wages to be returned when the worker leaves the U.S. as agreed. Another concern is abuse of guest workers, as has happened in the past. Allowing guest workers' visas to be tied to employment in a state rather than to specific employers would go a long way toward preventing such abuses. States are in a better position than the federal government to discover, appropriately punish and design programs to prevent worker abuse. State guest workers would not be eligible for citizenship. The Constitution unambiguously assigns naturalization — the process of becoming a U.S. citizen — to the federal government. A decentralized guest-worker visa would merely allow states to create narrow and enforceable migrant worker programs tailored to local needs. With immigration reform deadlocked on the federal level, Washington should get out of the way and let the states devise their own migration policies.

Congress immigration reform better than states

Joaquin 2014 (Linton [General Counsel of the National Immigration Law Center]; Congress, not states, should handle immigration reform; 2014; www.progressive.org/news/2013/05/182221/congress-not-states-should-handle-immigration-reform; jDUBS)

Congress should enact common-sense immigration reform to put an end to the frustration that has led to a patchwork of poorly conceived anti-immigrant laws at the state level. While a panel of U.S. senators debates how to repair the immigration

system, a federal appellate court panel seated 109 miles south in Richmond, Va., will be considering whether to allow parts of South Carolina's anti-immigrant law, modeled after Arizona's notorious SB1070, to take effect. Almost a year ago, the U.S. Supreme Court found that several key provisions of Arizona's law were unconstitutional, affirming that the federal government has supreme authority over immigration law and enforcement. Congress should exercise that authority now. Its failure to deal with the problems created by our out-of-date immigration laws led to a patchwork of harsh and discriminatory state laws sharing a common thread: to make life so miserable for immigrants that they "self-deport," a term coined by the architect of several of these state laws and made famous by Mitt Romney. Some of the provisions in these laws have included keeping undocumented immigrants from exercising their First Amendment rights, or from getting rides to work or being able to rent a house. Enforcement of the laws would certainly have subjected people of color to racial profiling. Our organization, the National Immigration Law Center, with assistance from the Mexican American Legal Defense and Educational Fund, the American Civil Liberties Union and the Southern Poverty Law Center, has challenged these laws in Alabama, Arizona, Georgia, Indiana, South Carolina and Utah.

solves organized crime

Counterplan solves organized crime

Muhlhausen and Little 7 (David B Muhlhausen PhD is a leading expert on criminal justice programs in The Heritage Foundation's Center for Data Analysis and Erica Little is a staff member at The Heritage Foundation, "Gang Crime: Effective and Constitutional Policies to Stop ViolentGangs," 6/6/07, Date Accessed: 7/13/15, <http://www.heritage.org/research/reports/2007/06/gang-crime-effective-and-constitutional-policies-to-stop-violent-gangs>, SZ)

The best way to prevent and suppress gang-related crime is to adhere to federalist principles that respect the allocation of responsibilities among national, state, and local governments. To address gang-related crime appropriately, the national government should limit itself to handling tasks that are within its constitutionally designed sphere and that state and local governments cannot perform by themselves. The national government should secure the nation's borders, deport gang members who are illegal immigrants, incarcerate them if they return to the United States illegally, and produce research and coordinate information sharing on law enforcement activities that involve interstate gang-related crime. While criminal street gangs are a problem common to all of the states, the crimes that they commit are almost entirely and inherently local in nature and regulated by state criminal law, law enforcement, and courts. For this reason, state and local governments are the most appropriate level of government to develop policies to prevent and suppress most gang-related crime. On the prevention side, Boys and Girls Clubs and multisystemic therapy have a track record of success in preventing delinquency and may be promising gang-related crime prevention programs. For gang suppression, Boston's Operation Ceasefire demonstrated that a law enforcement strategy based on generating a strong deterrent to gang violence can make a difference.

solves racial profiling

State citizenship solves for racial profiling

Markowitz 15 (Peter L. Markowitz has his J.D. from New York University School of Law. "UNDOCUMENTED NO MORE: THE POWER OF STATE CITIZENSHIP." Stanford law review 67.4 (2015): 869-915. ProQuest. Web. 7 July 2015.)//lb

Our national dialogue on immigration is stuck. Millions of individuals living without legal documentation are nonetheless deeply integrated into our economy and our families, and have become something of a semipermanent underclass. All reasonable observers agree that these individuals are largely here to stay. Nevertheless, they are unable to participate in our political process, thereby undermining our democracy, and the instability caused by their status not only visits hardships on immigrant communities but also negatively impacts our collective well-being. While a significant majority of Americans favor federal reform, including a legalization program for undocumented immigrants, Congress is unlikely to act soon. States thus have an opportunity to take the lead on the immigration issue. By adopting a broad definition of state citizenship and formally welcoming immigrant populations into state political communities, states can begin to move our national conversation forward. At the same time, they can substantially improve the lives of marginalized immigrant communities and improve the health, safety, and economies of the states as a whole.

States CP

1nc States CP

Text:

The 50 states and all relevant territories in the United States should collectively announce that, pursuant to all allowances in current laws, they are no longer participating in any law enforcement or surveillance activities with U.S. Immigration and Customs Enforcement. All states and local police departments should adopt an internal system of oversight for pulling drivers over and require officers to demonstrate probable cause in order to receive authorization by a supervisor conduct searches.

States can empirically pass legislation to opt out of cooperation with ICE policies

Wessler, 13 --- independent reporter in New York who has reported from across the United States, Mexico and the Caribbean on immigration, the safety net, criminal justice, poverty and the human fallout of the financial collapse (6/3/2013, Scott Freed Wessler, "Connecticut Limits Cooperation With Secure Communities," <http://www.colorlines.com/articles/connecticut-limits-cooperation-secure-communities>, JMP)

The Connecticut State Senate voted unanimously on Friday to substantially limit cooperation between local police departments and federal deportation officials. The House already approved the bill. It will now move to the governor, who has vowed to sign it. The state will be the first in the country to pass a version of the so-called Trust Act, which prohibits local authorities from detaining most non-citizens at the request of Immigration and Customs Enforcement unless the individual has been convicted of a felony or was already ordered deported.

The bill comes in response to the Secure Communities program, a federal-state data sharing program that sends finger print records from local arrests to the federal government. Though ICE has consistently claimed that it uses the program to target people with criminal convictions, over half of those removed from the country under the program were charged with no crime or a minor violation.

"It's now unanimous in Connecticut: not one more innocent person should be racially profiled and turned over to Immigration Customs Enforcement," Megan Fountain of the group Unidad Latina en Acción said in a statement. "Not one more worker should be unable to report abuse to the police."

Critics say S-Comm feeds on unaccountable local policing, including the use of racial profiling and breeds fear in immigrant communities. A recent study by a University of Illinois Chicago professor found that 44% of the 1000 immigrants and Latinos surveyed said the program made them less likely to contact cops if they are the victims of crime. Nearly 40 percent of respondents said that local immigration enforcement programs make them fearful of leaving their home.

Since the S-Comm program was first rolled out in 2008, 140,000 of the 266,000 people deported through data sharing were convicted of no criminal charge or a low-level charge. The Connecticut

legislation will limit local compliance with the program to cases involving serious convictions, as well as to people with outstanding arrest warrants, existing deportation orders, or who've been listed on federal gang and terrorism databases. The bill also permits local authorities to detain an immigrant at ICE's request if cops deem them to "present an unacceptable risk to public safety."

A version of the Trust Act has been introduced in other states, including California, where California Gov. Jerry Brown vetoed the bill last year. A more limited version has been introduced in the California state legislature. As of March of this year, 80,000 people had been deported from California through S-Comm. In the two years it's been operational in Connecticut, where Gov. Dan Malloy has said he will sign the bill into law, just 456 immigrants were removed from that state. Immigrant rights advocates say that's hundreds too many.

"This is a monumental victory for the immigrant rights movement, Ana Maria Rivera, of the New Haven group Junta for Progressive Action, said in a statement. "The fact that advocates, our Governor and the entire Connecticut legislature worked together to **send the message to ICE that we will not allow our communities to be separated** is historic."

The Connecticut bill is the second in a week in that state to protect the rights of undocumented immigrants. On Thursday, the state legislature there passed a bill that let's all residents, including those lacking immigration papers, to apply for driver's licenses.

The key variable is drawing a clear distinction between ICE and state and local police roles --- the counterplan does this

Lansdowne, 7/25/15 --- served as chief of police in San Diego, Richmond and San Jose (William, "Keep clear, separate roles for local law enforcement and ICE," <http://www.sacbee.com/opinion/op-ed/soapbox/article28641010.html>, JMP)

The tragic killing of Kathryn Steinle by an undocumented immigrant in San Francisco has drawn national attention to the relationship between local police and immigration enforcement. In my four decades in uniform and 20 years as police chief, I saw again and again politicians' temptation to respond to a singular, heart-wrenching incident with sweeping policy change. In my experience, this always does more harm than good.

In response to Steinle's senseless death, some have called for an end to policies that limit local agencies' entanglement with federal immigration enforcement, blaming San Francisco for this tragedy. In the wake of a devastating incident like this, it is difficult, yet important, to take a step back to examine why it is that so many law enforcement officers believe **it is critical to maintain clear and separate roles for local law enforcement and federal Immigration and Customs Enforcement.** Carrying out our respective roles, we keep our communities and country safe.

Helping to advance the technique of community-oriented policing is one of my proudest accomplishments in my decades of law enforcement service. Having officers meet regularly and frequently with the community members they are sworn to protect and serve is the foundational element of this proven technique. Requiring those same officers to inquire about the immigration status of a victim, witness or even a suspect dismantles the trust we are working to build and undermines our ability to investigate and prevent crime.

When police officers and sheriff's deputies are tasked with carrying out federal immigration enforcement, immigrant families – many of whom are of mixed status, with some members legal and some undocumented – understandably become fearful of any encounter with law enforcement.

This has the ill effect of making routine law enforcement duties much more difficult and in some cases impossible. A study by the University of Illinois at Chicago found that 44 percent of Latinos surveyed said they would be less likely to contact police officers if they were the victims of a crime because they feared any interaction with police might lead officers to ask about their immigration status or that of family members.

Sound policing requires trust between law enforcers and the members of the public, so that community members share information that helps prevent crimes from occurring and so that victims and witnesses come forward to help police solve crimes. For years, we saw the negative consequences when cities and counties were forced to bear the costs of complying with federal immigration policies. We learned the hard way that wedding local law enforcement agencies' work to the federal government's deportation tactics breeds deep-seated mistrust in the police.

To date, more than 320 localities throughout the country, including 50 in California, have stopped holding individuals beyond their ordinary release merely on the basis of an ICE detainer request. **Instead, sheriffs and police departments have adopted due process protections to operate within the law, reduce the risk of deterring innocent crime victims and witnesses from coming forward, and restore community trust.** In the tragic killing of Steinle, all ICE would have had to do is present San Francisco with a judicial order authorizing detention, and local authorities could legally have kept Lopez-Sanchez in custody.

Instead of using Steinle's tragic death as a vehicle to tear down smart policing policies across our state, our members of Congress should use this moment as an opportunity to ask law enforcement officials why they have worked so hard to establish trust and cooperation with immigrant communities.

Solvency --- State / Locals Key

Counterplan solves --- most profiling occurs by state and local agents

Hannon, 14 (12/8/2014, Elliot, "Justice Department Announces New Limits on Racial Profiling by Law Enforcement,"

http://www.slate.com/blogs/the_slatest/2014/12/08/new_limits_on_racial_profiling_by_law_enforcement_announced.html, JMP)

The Obama administration released a new set of guidelines on Monday aimed at curtailing the profiling of specific groups by law enforcement. The Justice Department issued the expanded rules prohibiting profiling on the basis of race, religion, national identity, gender, sexual orientation, and gender identity by federal law enforcement—such as the FBI. The new policy broadens the Bush administration's 2003 policy that banned racial and ethnic profiling, except for cases of national security. The new rules, however, "won't apply to screening at borders and airports, where Department of Homeland Security personnel have long given extra scrutiny to

people from certain countries,” the Wall Street Journal reports. “The policy also doesn’t apply to local or state law enforcement, beyond those personnel assigned to federal task forces.”

Attorney General Eric Holder ordered the review to the Justice Department policy in 2009 and the new guidelines were announced this week as local police tactics faced enormous criticism following the deaths of Michael Brown and Eric Garner. While the newly announced guidelines extend the restrictions on the use of profiling, **“[c]oncerns about racial profiling on the part of civil-liberties groups mostly have to do with traffic stops and pat-downs of pedestrians,”** according to the Journal. **“Because federal law-enforcement agents rarely engage in those activities, barring them from profiling may have little impact on how and why people are stopped in their everyday lives.”**

State and local officers commit most of the abuses

Saab, 14 --- Senior Government Relations Analyst at Deloitte (12/8/2014, Maria, “One Step Forward, Two Steps Back: DOJ Profiling Guidance Revisions Fail to Ban Profiling,” <http://www.aaiusa.org/blog/entry/one-step-forward-two-steps-back-doj-profiling-guideline-revisions-fail-to-a/>, JMP)

Holder’s new guidelines arrive during a time where law enforcement activities are under intense scrutiny. Conversations regarding immigration reform, border security, and recent events in Ferguson, MO., New York City, and Cleveland not only emphasize the need to address such activities, but also highlight how little these new guidelines will address the real issues at stake. For one thing, the changes will only apply to federal law enforcement agencies, and will not extend to local and state law enforcement officers, which have been the source of a number of related controversies. The Obama Administration hopes that the new guidelines will serve as a possible roadmap for local police to reform their own practices regarding profiling, but **this does not ultimately guarantee change on behalf of local police forces that work closely with particularly vulnerable communities.**

Solvency --- Internal Guidelines

The counterplan solves overreach and racism by police departments

Epp et. Al 14 (Charles R. Epp - Ph.D. in Political Science from the University of Wisconsin-Madison, Stephen Maynard-Moody- Ph.D. Cornell University, Ithaca, NY, and Donald P. Haider-Markel- University of Wisconsin-Milwaukee Ph.D., Political Science. *Pulled Over How Police Stops Define Race and Citizenship.* University of Chicago Press. Published in 2014.)//lb

Second, to enforce this requirement, police departments should adopt internal guidelines and systems of oversight governing the decision to make a stop and conduct investigatory intrusions that are modeled on how departments regulate uses of force.²⁶ Thus, departments should prohibit pretextual stops except when justified by an overriding public safety exigency. To oversee this guidance, departments should require officers in every stop to articulate and record their reason for the stop and departments should conduct internal reviews of these reasons. Departments should strive to make pretextual stops the rare exception rather than the common pattern. Further, a computerized search of the person’s name in crime records should be allowed only after the

legal basis for the stop is reported and recorded. These recording and oversight procedures would severely limit the use of pretext stops in the hunt for crime and deliberately so—but **this is an essential step in limiting the racial bias now so evident in investigatory stops.** The essential third step is to prohibit searches unless based on probable cause to believe a crime has been committed. Consent searches authorize unfettered police discretion to search whoever they wish, even though a driver’s consent cannot be considered freely given. Drivers told us that they felt they were “incarcerated” when pulled over and that they had no choice but to consent. Training police officers to solicit permission to search cars or persons takes undue advantage of individuals who are psychologically, if not legally, held by the police. Such consent relies on manipulation, as documented in Charles Remsberg’s police training manual.²⁷ Searches should be conducted only after receiving specific authorization by a supervisor and should be allowed on an articulation of probable cause, or, in other words, particularized evidence to believe the person has committed a crime. This evidence should be recorded and evaluated by supervisors.

AT: Can’t Solve --- USFG Forces Cooperation

Connecticut proves that’s states can pass legislation to block state and local police cooperation with ICE. That’s Wessler.
